The `monitor ethernet delay-measurement` command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

- Table 82 on page 11292 lists the run-time output fields for the `monitor ethernet delay-measurement one-way` command.
- Table 83 on page 11292 lists the run-time output fields for the `monitor ethernet delay-measurement two-way` command.

Output fields are listed in the approximate order in which they appear.

Table 82: monitor ethernet delay-measurement one-way Output Fields

Output Field Name	Output Field Description
One-way ETH-DM request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
1DM Frames sent	PDU frames sent to the remote MEP in this ETH-DM session.
Packets transmitted	Total number of 1DM PDU frames sent to the remote MEP during this measurement session.
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

NOTE: For one-way delay measurement, these CLI output fields display **NA** (“not applicable”) at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.

Table 83: monitor ethernet delay-measurement two-way Output Fields

Output Field Name	Output Field Description
Two-way Ethernet frame delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.

Table 83: monitor ethernet delay-measurement two-way Output Fields *(Continued)*

Output Field Name	Output Field Description
DMR received from	Unicast MAC address of the remote MEP that transmitted this DMR frame in response to a DMM frame.
Delay	Two-way delay, in microseconds, for the initiator-transmitted DMM frame.
Delay variation	Difference, in microseconds, between the current and previous delay values. This is also known as frame jitter.
Packets transmitted	Total number of DMM PDU frames sent to the remote MEP in this measurement session.
Valid packets received	Total number of DMR PDU frames received from the remote MEP in this measurement session.
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

Sample Output

monitor ethernet delay-measurement one-way

```
user@host> monitor ethernet delay-measurement one-way 00:05:85:73:39:4a maintenance-domain md6

<xml>
```

Description

Start an ITU-T Y.1731 Ethernet frame loss measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a count of transmitted and received data frames between the pair of MEPs. Frame loss measurement statistics are stored at one of the MEPs for later retrieval. For MX Series routers, supports point-to-point down MEPs for Ethernet interfaces (as per IEEE 802.1ag over VPWS).

> **NOTE**: If you attempt to monitor loss to a nonexistent MAC address, you must type Ctrl + c to explicitly quit the `monitor ethernet loss-measurement` command and return to the CLI command prompt.

To start an Ethernet frame loss measurement session, the router first sends frames with ETH-LM information to a peer MEP and similarly receives frames with ETH-LM information from the peer MEP. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPs. The loss measurement statistics are retrieved as the output of the `monitor ethernet loss-measurement` command and are also stored at the initiator. The frames counts are stored at both the initiator and the receiver MEPs for later retrieval.

Options

maintenance-domain ***md-name***	Name of an existing CFM maintenance domain.
maintenance-association ***ma-name***	Name of an existing CFM maintenance association.
mep ***remote-mep-id***	Numeric identifier of the peer MEP with which to perform Ethernet frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8192.
remote-mac-address	Unicast MAC address of the peer MEP with which to perform Ethernet frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: ***nnnn.nnnn.nnnn*** or ***nn:nn:nn:nn:nn:nn*** (for example, **0011.2233.4455** or **00:11:22:33:44:55**). Multicast MAC addresses are not supported.

count *frame-count*	(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65535 frames. The default value is 10 frames.
local-mep *mep-id*	(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.
wait *interval-seconds*	(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.
priority *802.1p value*	(Optional) Priority of the delay measurement request frame. The range of values is from 0 through 7. The default value is 1 second.
no-session-id-tlv	(Optional) Disable the **session id TLV** argument set in the request frame.
xml	(Optional) Allow the output of the command to be displayed in XML format.

Additional Information

To display the interator output for an LM session, run the following command:

- `show oam ethernet connectivity-fault-management sla-iterator-statistics sla-iterator <profile> maintenance-association <MA> maintenance-domain <MD> local-mep <MEP> remote-mep <RMEP>`

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- `show oam ethernet connectivity-fault-management loss-statistics`
- `show oam ethernet connectivity-fault-management interfaces detail`
- `show oam ethernet connectivity-fault-management mep-database`
- `show oam ethernet connectivity-fault-management mep-statistics`

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- `show oam ethernet connectivity-fault-management delay-statistics`
- `show oam ethernet connectivity-fault-management mep-statistics`

To clear both the frame counts and the statistics collected for MEPs, use the `clear oam ethernet connectivity-fault-management loss-statistics maintenance-domain` *`md-name`* `maintenance-association` *`ma-name`* command, as described in the CLI Explorer.

For a complete description of Ethernet frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos OS Network Interfaces Library for Routing Devices.

Output Fields

Table 84 on page 11298 lists the output fields for the `monitor ethernet loss-measurement` command and their descriptions. Output fields are listed in the approximate order in which they appear.

Table 84: monitor ethernet loss-measurement output fields

Output Field Name	Output Field Description
Ethernet loss delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
LMR received from	Unicast MAC address of the remote MEP that transmitted this LMR frame in response to a loss measurement message (LMM) frame.
Near-end frame loss	Count of frame loss associated with ingress data frames.
Far-end frame loss	Count of frame loss associated with egress data frames.
Near-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface.
Far-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.
LMM packets transmitted	Total number of LMM PDU frames sent to the remote MEP in this measurement session.

Table 84: monitor ethernet loss-measurement output fields *(Continued)*

Output Field Name	Output Field Description
LMR packets received	Total number of LMR PDU frames received from the remote MEP in this measurement session.
Average near-end frame loss	Average frame loss measured in this session associated with ingress data frames.
Average near-end loss ratio	Average frame loss ratio measured in this session associated with ingress data frames.
Average far-end frame loss	Average frame loss measured in this session associated with egress data frames.
Average far-end loss ratio	Average frame loss ratio measured in this session associated with egress data frames.
Near-end best case frame loss	Lowest frame loss measured in this session associated with ingress data frames.
Near-end best case loss ratio	Lowest frame loss ratio measured in this session associated with ingress data frames.
Near-end worst case frame loss	Highest frame loss measured in this session associated with ingress data frames.
Near-end worst case loss ratio	Highest frame loss ratio measured in this session associated with ingress data frames.
Far-end best case frame loss	Lowest frame loss measured in this session associated with egress data frames.
Far-end best case loss ratio	Lowest frame loss ratio measured in this session associated with egress data frames.

Table 84: monitor ethernet loss-measurement output fields *(Continued)*

Output Field Name	Output Field Description
Far-end worst case frame loss	Highest frame loss measured in this session associated with egress data frames.
Far-end worst case loss ratio	Highest frame loss ratio measured in this session associated with egress data frames.

Note that in the preceding table, the term *number of service frames not delivered* is the difference between the number of service frames arriving at the ingress Ethernet flow point and the number of service frames delivered at the egress Ethernet flow point in a point-to-point Ethernet connection.

Description

(MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPs for later retrieval.

> **NOTE**: If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl +c to explicitly quit the `monitor ethernet synthetic-loss-measurement` command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the `monitor ethernet synthetic-loss-measurement` command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay—The difference, in microseconds, between the time a frame is sent and when it is received.

Frame delay variation—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

Options

maintenance-domain *md-name*	Name of an existing CFM maintenance domain.
maintenance-association *ma-name*	Name of an existing CFM maintenance association.
mep *remote-mep-id*	Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.
remote-mac-address	Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn*.*nnnn*.*nnnn* or *nn*:*nn*:*nn*:*nn*:*nn*:*nn*. For example, `0011.2233.4455` or `00:11:22:33:44:55`. Multicast MAC addresses are not supported.
count *frame-count*	(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.
local-mep *mep-id*	(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.
wait *interval-milliseconds*	(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50000 milliseconds. The default value is 100 milliseconds.
priority *802.1p value*	(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.
size	(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.
xml	(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the `xml` argument. The `display xml` command does not work.

Additional Information

To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer:

- `show oam ethernet connectivity-fault-management interfaces detail`
- `show oam ethernet connectivity-fault-management mep-database`

- `show oam ethernet connectivity-fault-management mep-statistics`

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer.

- `show oam ethernet connectivity-fault-management synthetic-loss-measurement`
- `show oam ethernet connectivity-fault-management mep-statistics`

To clear both the frame counts and the statistics collected for MEPs, use the `clear oam ethernet connectivity-fault-management statistics` command, described in the CLI Explorer.

For a complete description of Ethernet synthetic frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos OS Network Interfaces Library for Routing Devices.

Required Privilege Level

trace and maintenance

Output Fields

The `monitor ethernet synthetic-loss-measurement` command displays different output at the CLI, depending on when you start a synthetic frame loss measurement:

- Table 85 on page 11305 lists the run-time output fields for the `monitor ethernet synthetic-loss-measurement` command.

Output fields are listed in the approximate order in which they appear.

Table 85: monitor ethernet synthetic-loss-measurement Output Fields

Output Field Name	Output Field Description
`ETH-SLM request to`	Unicast MAC address of the remote peer MEP.
`Interface`	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
`SLM packets sent`	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.

Table 85: monitor ethernet synthetic-loss-measurement Output Fields *(Continued)*

Output Field Name	Output Field Description
`SLR packets received`	Total number of synthetic loss reply (SLR) PDU frames received by the source MEP from the remote MEP during this measurement session.
`Local TXFC1 value`	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
`Local RXFC1 value`	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
`Last Received SLR frame TXFCf(tc)`	Value of the local counter TxFCl at the time of SLM frame transmission.
`Last Received SLR frame TXFCb(t`	Value of the local counter RxFCl at the time of SLR frame transmission.
`Frame loss (near-end)`	Count of frame loss associated with ingress data frames.
`Frame loss (far-end)`	Count of frame loss associated with egress data frames.

Sample Output

Syntax

```
monitor interface error
```

Description

You can use the `monitor interface error` command to display errors in packet headers that are transmitted through all network interfaces. Use the following options at the end of the command for more specific information.

Options

`interface-name` (Optional) Displays packet header errors for a specified interface or interfaces. If an interface is not specified, all interfaces are monitored.

Required Privilege Level

view

Output Fields

Table 1 lists the output fields for the `monitor interface error` command.

Table 86: monitor interface error Output Fields

Field Name	Field Description
`CRC Errors`	Displays the number of CRC errors on the selected interfaces since you started monitoring.
`Corr errors`	Displays the number of FEC corrected errors since monitoring began.
`FEC Mode`	Displays the FEC mode configured on the interface.
`Interface Name`	Displays the interface name.

Table 86: monitor interface error Output Fields *(Continued)*

Field Name	Field Description
Link Flaps	Displays the number of link flaps observed during the current monitoring session.
Link Status	Displays the interface link status.
PCS bit err sec	Displays the PCS bit error count.
PCS err blk sec	Displays the number of PCS error blocks found.
Pre-FEC BER	Displays the pre-FEC bit error rate (BER). This is used to monitor the condition of an optical transport network (OTN) link.
Speed	Displays the speed of the interface.
Since	Displays the time since the error table was cleared/updated.
Uncorr errors	Displays the number of FEC uncorrected errors since monitoring began.

Sample Output

monitor interface error

```
user@host> monitor interface error
```

```

Monitor Interfaces (overview)

monitor interface | **11310**

monitor interface

IN THIS SECTION

- Syntax | **11311**
- Description | **11311**

- Options | 11311
- Additional Information | 11312
- Required Privilege Level | 11313
- Output Fields | 11313
- Sample Output | 11316
- Release Information | 11328

Syntax

```
monitor interface
<interface-name | traffic <detail>>
```

Description

Display real-time statistics about interfaces, updating the statistics every second. Check for and display common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors.

NOTE: On Junos OS Evolved, you can use the `monitor interface` command over SSH sessions, but console and Telnet sessions are not supported.

NOTE: This command is not supported on the QFX3000 QFabric switch.

Options

none	Display real-time statistics for all interfaces.
detail	(Optional) With traffic option only, display detailed output.
interface-name	(Optional) Display real-time statistics for the specified interface. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified line-card chassis (LCC) only.

traffic (Optional) Display traffic data for all active interfaces. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified LCC only.

Additional Information

The output of this command shows how much each field has changed since you started the command or since you cleared the counters by pressing the c key. For a description of the statistical information provided in the output of this command, see the `show interfaces extensive` command for a particular interface type in the CLI Explorer. To control the output of the `monitor interface` command while it is running, use the keys listed in Table 87 on page 11312. The keys are not case-sensitive.

Table 87: Output Control Keys for the monitor interface interface-name Command

Key	Action
c	Clears (returns to zero) the delta counters since `monitor interface` was started. This does not clear the accumulative counter. To clear the accumulative counter, use the `clear interfaces interval` command.
f	Freezes the display, halting the display of updated statistics and delta counters.
i	Displays information about a different interface. The command prompts you for the name of a specific interface.
n	Displays information about the next interface. The `monitor interface` command displays the physical or logical interfaces in the same order as the `show interfaces terse` command.
q or Esc	Quits the command and returns to the command prompt.
t	Thaws the display, resuming the update of the statistics and delta counters.

To control the output of the `monitor interface traffic` command while it is running, use the keys listed in Table 88 on page 11313. The keys are not case-sensitive.

Table 88: Output Control Keys for the monitor interface traffic Command

Key	Action
b	Displays the statistics in units of bytes and bits per second (bps).
c	Clears (return to 0) the delta counters in the `Current Delta` column. The statistics counters are not cleared.
d	Displays the `Current Delta` column (instead of the rate column) in bps or packets per second (pps).
p	Displays the statistics in units of packets and packets per second (pps).
q or Esc	Quits the command and returns to the command prompt.
r	Displays the rate column (instead of the `Current Delta` column) in bps and pps.

trace

Output Fields

Table 89 on page 11313 describes the output fields for the `monitor interface` command. Output fields are listed in the approximate order in which they appear.

Table 89: monitor interface Output Fields

Field Name	Field Description	Level of Output
`router1`	Hostname of the router.	All levels
`Seconds`	How long the monitor interface command has been running or how long since you last cleared the counters.	All levels
`Time`	Current time (UTC).	All levels

Table 89: monitor interface Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Delay` *x*/*y*/*z*	Time difference between when the statistics were displayed and the actual clock time. • *x*—Time taken for the last polling (in milliseconds). • *y*—Minimum time taken across all pollings (in milliseconds). • *z*—Maximum time taken across all pollings (in milliseconds).	All levels
`Interface`	Short description of the interface, including its name, status, and encapsulation.	All levels
`Link`	State of the link: `Up`, `Down`, or `Test`.	All levels
`Current delta`	Cumulative number for the counter in question since the time shown in the Seconds field, which is the time since you started the command or last cleared the counters.	All levels
`Local Statistics`	(Logical interfaces only) Number and rate of bytes and packets destined to the router or switch through the specified interface. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. • `Input bytes`—Number of bytes received on the interface. • `Output bytes`—Number of bytes transmitted on the interface. • `Input packets`—Number of packets received on the interface. • `Output packets`—Number of packets transmitted on the interface.	All levels

Table 89: monitor interface Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Remote Statistics`	(Logical interfaces only) Statistics for traffic transiting the router or switch. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. • `Input bytes`—Number of bytes received on the interface. • `Output bytes`—Number of bytes transmitted on the interface. • `Input packets`—Number of packets received on the interface. • `Output packets`—Number of packets transmitted on the interface.	All levels
Traffic statistics	Total number of bytes and packets received and transmitted on the interface. These statistics are the sum of the local and remote statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. • `Input bytes`—Number of bytes received on the interface. • `Output bytes`—Number of bytes transmitted on the interface. • `Input packets`—Number of packets received on the interface. • `Output packets`—Number of packets transmitted on the interface.	All levels
`Description`	With the `traffic` option, displays the interface description configured at the [`edit interfaces` *`interface-name`*] hierarchy level.	`detail`
Input Errors	Sum of incoming frame aborts and FCS errors.	All levels
Input Drops	Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.	All levels
Input Framing errors	Number of packets received with an invalid frame checksum (FCS).	All levels

Table 89: monitor interface Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Policed discards	Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.	All levels
L3 incompletes	Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the `ignore-l3-incompletes` statement.	All levels
L2 channel errors	Number of times the software did not find a valid logical interface for an incoming frame.	All levels
L2 mismatch timeouts	Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.	All levels

Sample Output

monitor interface (Physical)

```
user@host> monitor interface so-0/0/0

Release Information

Command introduced before Junos OS Release 7.4.

monitor label-switched-path

IN THIS SECTION

- Syntax | 11329
- Description | 11329
- Options | 11329
- Additional Information | 11329
- Required Privilege Level | 11330
- Output Fields | 11330
- Sample Output | 11332
- Release Information | 11333

Syntax

```
monitor label-switched-path lsp-name
<logical-system (logical-system-name)>
```

Description

Display the real-time status of the specified RSVP label-switched path (LSP). You can also use this command to monitor LSPs configured within logical systems.

Options

logical-system (***logical-system-name*** **)**	(Optional) Perform this operation on all logical systems or on a particular logical system.
lsp-name	Name of the LSP.

Additional Information

You can track the amount of traffic traversing an RSVP LSP and observe its essential parameters, such as uptime, ingress and egress addresses, labels, routes, and ports. Values are typically sampled every

second. The display also allows you to scroll to other currently running LSPs. You cannot use this command to display information about static LSPs or LDP-signaled LSPs.

The output of this command shows how much each field has changed since you started the command or since you cleared the counters by using the c key. To control the output of the `monitor label-switched-path` command while it is running, use the keys listed in Table 90 on page 11330. The keys are not case-sensitive.

Table 90: Output Control Keys for the monitor label-switched-path Command

Key	Action
c	Clears the screen and refreshes the display for this LSP.
f	Freezes the display, preventing new information from being displayed.
l	Monitors a different LSP. After you type l, you can type the new LSP name.
n	Displays information about the next LSP (whose name is alphabetically higher than the current LSP name) configured on the router.
p	Goes to the previous LSP (whose name is alphabetically lower than the current LSP name) configured on the router.
q or Esc	Quits the command and returns to the command prompt.
t	Thaws, or restarts, the data display for this LSP.

Required Privilege Level

trace

Output Fields

Table 91 on page 11331 describes the output fields for the `monitor label-switched-path` command. Output fields are listed in the approximate order in which they appear.

Table 91: monitor label-switched-path Output Fields

Field Name	Field Description
(1)	Displays the following information: • *hostname*—Name of the router. • Seconds—Time elapsed since this display was started. • Time—Current local time.
(2)	Delay—Length of the time delay, in milliseconds, required to obtain the information in the monitor display. The first number shows the current sampling delay. The second number shows the shortest delay recorded to date. The third number shows the worst delay recorded to date. This delay can vary substantially depending on the system load.
(3)	Displays the following: • To—Destination address of the LSP. • From—Originating address of the LSP. • State—Current state of the LSP: Up or Down.
(4)	Displays the following: • LSPName—Name of the LSP. • Type—Type of LSP: Ingress, Egress, or Transit.
(5)	Displays the following: • Label in—Incoming label of the LSP. • Label out—Outgoing label of the LSP.
(6)	Port number—Port number for the sending router, the port number for the receiving router, and the protocol ID. For MPLS traffic engineering applications, the protocol ID is always 0.
(7/8)	Record route—All intermediate and egress router addresses for this LSP.

Table 91: monitor label-switched-path Output Fields *(Continued)*

Field Name	Field Description
(9/10/11)	Displays traffic statistics: • Output packets—Number of packets that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago. • Output bytes—Number of bytes that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago.
(12)	Displays any errors the router encountered while attempting to retrieve information on the LSP.
(13)	Lists the keyboard commands you can use to navigate to other LSPs. For a description of the keyboard commands, see Table 90 on page 11330.

Sample Output

monitor label-switched-path

```
user@host> monitor label-switched-path
(1) host                                Seconds: 112              Time: 15:32:22
(2)                                                                Delay: 0/0/0
(3) To 10.10.10.16, From 10.10.10.17, state: Up
(4)   LSPname: k, type: Ingress
(5)   Label in: -, Label out: 126000
(6)   Port number: sender 1, receiver 45583, protocol 0
(7)   Record Route: <self> 192.168.224.196
(8)     192.168.224.202 192.168.224.179
(9)   Traffic statistics:                                          Current delta
(10)    Output packets:                       0                             [0]
(11)    Output bytes:                         0                             [0]
(12)
(13)Next='n', Prev='p', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c',     LSP='l'
```

Release Information

Command introduced before Junos OS Release 7.4.

Logical system support introduced in Junos OS Release 9.4.

- Release Information | 11336

Syntax

```
monitor list
```

Description

Display the status of monitored log and trace files.

Options

This command has no options.

Additional Information

Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the `syslog` statement at the `[edit system]` hierarchy level and the `options` statement at the `[edit routing-options]` hierarchy level. The trace files generated by the routing protocol process are those configured with `traceoptions` statements at the `[edit routing-options]`, `[edit interfaces]`, and `[edit protocols` *`protocol`*`]` hierarchy levels.

monitor mpls delay rsvp

IN THIS SECTION

- Syntax | 11337
- Description | 11337
- Options | 11337
- Required Privilege Level | 11338
- Output Fields | 11338
- Sample Output | 11340
- Release Information | 11342

Syntax

```
monitor mpls delay rsvp lsp-name
<detail>
<count count>
<interval seconds>
<padding-size padding-size>
<traffic-class traffic-class>
```

Description

Perform an on-demand delay measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

Options

lsp-name Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed.

detail (Optional) Display detailed output of the LSP delay measurement.

count *count* (Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.

- **Default:** 10
- **Range:** 1 through 1000000

interval *seconds* (Optional) Specify in seconds the interval between two successive query messages.

- **Range:** 1 through 255 seconds

padding-size *padding-size* (Optional) Specify the length of padding TLV to be included in the query message.

- **Range:** 0 through 1500

traffic-class *traffic-class* (Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.

- **Range:** 0 though 7

Output Fields

Table 93 on page 11338 describes the output fields for the `monitor mpls delay rsvp` command. Output fields are listed in the approximate order in which they appear.

Table 93: monitor mpls delay rsvp Output Fields

Field Name	Field Description	Level of Output
Current two-way channel delay	Sum of packet delays, excluding the processing time of the remote provider edge (PE) router.	All Levels
Current round-trip-time	Total time taken for completing round-trip of packet.	All Levels
Best two-way channel delay	Best available two-way channel delay count.	All Levels
Worst two-way channel delay	Worst available two-way channel delay count.	All Levels
Average two-way channel delay	Average of the available two-way channel delay counts.	All Levels
Best round-trip-time	Best available round-trip-time count.	All Levels
Worst round-trip-time	Worst available round-trip-time count.	All Levels
Average round-trip-time	Average of the available round-trip-time counts.	All Levels
Average forward delay variation	Average of the variation in forward delay.	All Levels

Table 93: monitor mpls delay rsvp Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Average reverse delay variation	Average of the variation in reverse delay.	All Levels
DM queries sent	Number of queries sent for delay measurement.	All Levels
DM responses received	Number of responses received for delay measurement queries.	All Levels
DM queries timedout	Number of timed out queries sent for delay measurement.	All Levels
DM responses dropped due to errors	Number of loss measurement responses dropped due to errors.	All Levels
Response code	Status of the messages used for delay measurement. Response code can be one of the following: • `Success`—Successful response code. • `Failed`—Failed response code.	`detail`
Querier transmit timestamp	Timestamp on the query message when the message is sent out the ingress PE router (querier). This is done in the hardware before packet is sent out of an interface.	`detail`
Responder receive timestamp	Timestamp on the response message when the message is received by the egress PE router (responder). This is done in the hardware before packet is received by an interface.	`detail`
Responder transmit timestamp	Timestamp on the query message when the message is sent out the egress PE router (responder). This is done in the hardware before packet is sent out of an interface.	`detail`
Querier receive timestamp	Timestamp on the response message when the message is received by the ingress PE router (querier). This is done in the hardware before packet is received by an interface.	`detail`

monitor mpls loss rsvp

IN THIS SECTION

- Syntax | **11343**

- Description | 11343
- Options | 11343
- Required Privilege Level | 11344
- Output Fields | 11344
- Sample Output | 11347
- Release Information | 11349

Syntax

```
monitor mpls loss rsvp lsp-name
<detail>
<bytes>
<count count>
<interval seconds>
<traffic-class traffic-class>
```

Description

Perform an on-demand loss measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

Options

lsp-name Name of the associated bidirectional MPLS UHP LSP for which the loss measurement is performed.

detail (Optional) Display detailed output of the LSP loss measurement.

bytes (Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

> **NOTE**: The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

count *count* (Optional) Specify the number of loss measurements to be carried out for the MPLS UHP LSP. For LSP loss measurement, the number of queries sent is the specified count number plus one additional query, because the LSP loss is measured using successive messages.

- **Default:** 10
- **Range:** 1 through 1000000

interval *seconds* (Optional) Specify in seconds the interval between two successive query messages.

- **Range:** 1 through 255 seconds

traffic-class *traffic-class* (Optional) Specify the traffic class and enable traffic-class-statistics for the LSP loss measurement.

- **Range:** 0 though 7

Output Fields

Table 94 on page 11344 describes the output fields for the `monitor mpls loss rsvp` command. Output fields are listed in the approximate order in which they appear.

Table 94: monitor mpls loss rsvp Output Fields

Field Name	Field Description	Level of Output
Current forward loss	Difference between the current forward transmit count and the current forward receive count.	All Levels
Current forward loss ratio	Total packet loss (current forward loss divided by current forward transmit count).	All Levels
Current forward throughput	Current forward transmit count divided by 1000.	All Levels
Current reverse loss	Difference between the current reverse transmit count and the current reverse receive count.	All Levels

Table 94: monitor mpls loss rsvp Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Current reverse loss ratio	Total packet loss (current reverse loss divided by current reverse transmit count).	All Levels
Current reverse throughput	Current reverse transmit count divided by 1000.	All Levels
Cumulative forward transmit count	Cumulative forward transmit counter value at the time the loss measurement message was originated.	All Levels
Cumulative forward loss	Cumulative forward loss counter value at the time the loss measurement message was originated.	All Levels
Average forward loss ratio	Average packet loss (current forward loss divided by current forward transmit count).	All Levels
Average forward throughput	Average forward transmit count divided by 1000.	All Levels
Cumulative reverse transmit count	Cumulative reverse transmit counter value at the time the loss measurement message was originated.	All Levels
Cumulative reverse loss	Difference between the cumulative reverse transmit count and the cumulative reverse receive count.	All Levels
Average reverse loss ratio	Average packet loss (average reverse loss divided by average reverse transmit count).	All Levels
Average reverse throughput	Average reverse transmit count divided by 1000.	All Levels
LM queries sent	Number of queries sent for loss measurement.	All Levels
LM responses received	Number of responses received for loss measurement queries.	All Levels

Table 94: monitor mpls loss rsvp Output Fields *(Continued)*

Field Name	Field Description	Level of Output
LM queries timedout	Number of timed out queries sent for loss measurement.	All Levels
LM responses dropped due to errors	Number of loss measurement responses dropped due to errors.	All Levels
Response code	Status of the messages used for loss measurement. Response code can be one of the following: • `Success`—Successful response code. • `Failed`—Failed response code.	`detail`
Origin timestamp	Time and date the loss measurement message is originated without any specific format (NTP and PTP).	`detail`
Forward transmit count	Forward transmit counter value at the time the loss measurement message was originated.	`detail`
Forward receive count	Forward receive counter value at the time the loss measurement message was originated.	`detail`
Reverse transmit count	Reverse transmit counter value at the time the loss measurement message was originated.	`detail`
Reverse receive count	Reverse receive counter value at the time the loss measurement message was originated.	`detail`
Current forward transmit count	Difference between the current forward transit count and the previous forward transit count.	`detail`
Current forward receive count	Difference between the current forward receive count and the previous forward receive count.	`detail`

Table 94: monitor mpls loss rsvp Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Current reverse transmit count	Difference between the current reverse transit count and the previous reverse transit count.	`detail`
Current reverse receive count	Difference between the current reverse receive count and the previous reverse receive count.	`detail`

Sample Output

monitor mpls lsp loss rsvp count

```
user@host> monitor mpls lsp loss rsvp count 2

(1)

monitor mpls delay rsvp | **11336**

monitor mpls loss-delay rsvp | **11350**

Example: Configuring On-Demand Loss and Delay Measurement

monitor mpls loss-delay rsvp

IN THIS SECTION

- Syntax | 11350
- Description | 11350
- Options | 11350
- Required Privilege Level | 11351
- Output Fields | 11351
- Sample Output | 11352
- Release Information | 11355

Syntax

```
monitor mpls loss-delay rsvp lsp-name
<detail>
<bytes>
<count count>
<interval seconds>
<padding-size padding-size>
<traffic-class traffic-class>
```

Description

Perform a simultaneous on-demand loss and delay measurement using combined loss and delay messages, and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

Options

lsp-name Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed.

detail (Optional) Display detailed output of the LSP delay measurement.

bytes

(Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

> **NOTE**: The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

count ***count***

(Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.

- **Default:** 10
- **Range:** 1 through 1000000

interval ***seconds***

(Optional) Specify in seconds the interval between two successive query messages.

- **Range:** 1 through 255 seconds

padding-size ***padding-size***

(Optional) Specify the length of padding TLV to be included in the query message.

- **Range:** 0 through 1500

traffic-class ***traffic-class***

(Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.

- **Range:** 0 though 7

Required Privilege Level

<print-ascii>
<print-hex>
<read-file filename>
<resolve-timeout>
<size size>
<vlan-id>
<vnid>
<write-file filename>
```

Description

Display packet headers or packets that are received and sent from the packet forwarding engine for monitoring and verifying the functionality of on-box packet sniffing capabilities.

Options

absolute-sequence	Display absolute TCP sequence numbers.
brief | detail | extensive	Display the specified level of output.
byte-offset	Display the specified level of output.
count *count*	Specify the number of packet headers to display (0 through 1,000,000).
egress	Egress data traffic monitoring.
egress-interface	Specify the egress interface where loopback is enabled.
ingress	Ingress data traffic monitoring.

inner-dmac | inner-dst-ipv4 | inner-smac | inner-src-ipv4	Display the inner header addresses to monitor traffic and packet headers.
layer2-headers	Display the link-level header on each line.
no-domain-names	Suppress the display of the domain portion of hostnames.
no-promiscuous	Do not put the interface into promiscuous mode.
no-resolve	Do not attempt to convert host addresses to names.
no-timestamp	Suppress timestamps on displayed packets.
outer-dmac | outer-dst-ipv4 | outer-smac | outer-src-ipv4	Display the outer header addresses to monitor traffic and packet headers.
print-ascii	Display each packet in ASCII format.
print-hex	Display each packet in hexadecimal format.
resolve-timeout *timeout*	Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds.
size *size*	Snap length of the frame to be captured, in bytes.
vlan-id	VLAN identifier to monitor traffic.
vnid	VXLAN identifier to monitor traffic.
write-file *filename*	Write packets to the file specified.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To view this statement in the configuration.

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

monitor pfe traffic interface *interface-name* ingress outer-dmac *destination MAC address*

```
user@host> monitor pfe traffic interface xe-0/0/0:0 ingress outer-dmac 00:00:00:00:00:0C
verbose output suppressed, use  or  for full protocol decode
Address resolution is ON. Use  to avoid any reverse lookup delay.
Address resolution timeout is 4s.
Listening on xe-0/0/0:0, capture size 96 bytes

Reverse lookup for 192.85.1.2 failed (check DNS reachability).
Other reverse lookup failures will not be reported.
Use  to avoid reverse lookups on IP addresses.

10:19:07.579828  In IP truncated-ip - 50 bytes missing! 192.85.1.2 > 192.85.1.3:  ip-proto-253 86
10:19:07.579833  In IP truncated-ip - 50 bytes missing! 192.85.1.2 > 192.85.1.3:  ip-proto-253 86
```

monitor pfe traffic interface *interface-name* egress egress-interface *interface-name* vnid 1000 byte-offset 12

```
user@host> monitor pfe traffic interface xe-0/0/0:0 egress egress-interface xe-0/0/30:0 vnid
1000 byte-offset 12

verbose output suppressed, use  or  for full protocol decode
Address resolution is ON. Use  to avoid any reverse lookup delay.
Address resolution timeout is 4s.
Listening on xe-0/0/30:0, capture size 96 bytes

Reverse lookup for 204.1.1.1 failed (check DNS reachability).
Other reverse lookup failures will not be reported.
Use  to avoid reverse lookups on IP addresses.

```

Release Information

Command introduced before Junos OS Release 24.4R1.

monitor security flow file

IN THIS SECTION

- Syntax | 11359
- Description | 11359
- Options | 11359
- Required Privilege Level | 11360
- Output Fields | 11360
- Release Information | 11360

Syntax

```
monitor security flow file
<file-name>
<files number>
<match regular-expression>
<size maximum-file-size>
<(world-readable | no-world-readable)>
```

Description

Configure options for the security flow monitoring output.

Options

filename Name of the file to receive the output of the monitoring operation. All output is saved in the `/var/log/` directory.

files *number*

Maximum number of output files. If you specify a maximum number of files, you must also specify a maximum file size with the `size` option.

Range: 2 through 1000 files

Default: 10 files

match *regular-expression*

Refine the output to include lines that contain the regular expression.

size *maximum-file-size*

Maximum size of each output file. When an output file named *`output`* reaches this size, it is renamed *`output`*`.0`. When the output file again reaches its maximum size, *`output`*`.0` is renamed *`output`*`.1` and `output` file is renamed *`output`*`.0`. This renaming scheme continues until the maximum number of output files is reached. Then the oldest output file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of output files with the `files` option.

Range: 10 KB through 1 GB

Default: 128 KB

(world-readable | no-world-readable)

By default, the output files can be accessed only by the user who configures the monitoring operation. The `world-readable` option enables all users to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

Required Privilege Level

trace

Output Fields

This command produces no output.

Release Information

Command introduced in Junos OS Release 12.1X46-D10.

Monitoring Security Flow Sessions Overview

monitor security flow filter | **11361**

monitor security flow start | 11363
show monitor security flow | 23060

monitor security flow filter

IN THIS SECTION

- Syntax | 11361
- Description | 11361
- Options | 11362
- Required Privilege Level | 11362
- Release Information | 11362

Syntax

```
monitor security flow filter filter-name
<conn-tag session-connection-tag>
<destination-port (port-range | protocol-name)>
<destination-prefix destination-prefix>
<interface interface-name>
<logical-system logical-system-name>
<protocol (protocol name | protocol number)>
<root-logical-system>
<source-port  (port-range | protocol-name)>
<source-prefix source-prefix>
```

Description

Set security flow filters to define flow sessions that you want to monitor. A maximum of 64 filters is supported at a time.

Defining the filters themselves does not trigger monitoring. You must explicitly use the `monitor security flow start` command to enable monitoring. Once monitoring starts, any traffic that matches the specified filters is saved in an output file in the `/var/log/` directory.

> **NOTE**: Unlike filters defined in the configuration mode, these filters defined using operational mode commands are cleared when you reboot your system. They are used expressly for debugging purposes.

Options

filter *filter-name*	Specify a name for the filter. The filter name can contain letters, numbers, underscores (_) and hyphens (-) and can be up to 64 characters long.
conn-tag	Specify the session connection tag. The session connection tag uniquely identifies a session.
destination-port (*port-range* | *protocol-name*)	Specify the TCP or UDP destination port to match. You can also specify a range of TCP or UDP destination ports and monitor all traffic in this group.
destination-prefix *destination-prefix*	Specify the destination IPv4 or IPv6 address prefix to match.
interface *interface-name*	Specify the logical interface name to match.
logical-system *logical-system-name*	Specify the logical system name to match.
protocol (*protocol name* | *protocol number*)	Specify the IP protocol type to match.
root-logical-system	(Default) Specify the root logical system to match.
source-port (*port-range* | *protocol-name*)	Specify the TCP or UDP source port to match. You can also specify a range of TCP or UDP source ports and monitor all traffic in this group.
source-prefix *source-prefix*	Specify the source IP address prefix to match.

Required Privilege Level

view

Release Information

Command introduced in Junos OS Release 12.1X46-D10. The was updated in Junos OS Release 15.1X49-D70 with the addition of the conn-tag filter parameter.

monitor security packet-drop

IN THIS SECTION

- Syntax | 11366
- Description | 11366
- Options | 11367
- Required Privilege Level | 11367
- Sample Output | 11367
- Release Information | 11370

Syntax

```
monitor security packet-drop
<source-prefix>
<destination-prefix>
<source-port>
<destination-port>
<ingress-interface-name>
<protocol>
<logical-system-name>
<count-number>
```

Description

Displays the packet-drop information without committing the configuration, which allows you to trace and monitor the traffic flow. This command output is displayed on the screen until you press **Ctrl+c** or until the security device collects the requested number of packet drops. The command includes various filters to generate the output fields per your requirement.

You can save the packet pocket records to a file using the `monitor security packet-drop | append /var/log/filename.log` command.

Options

source-prefix Display the packet drop information for the given source IP or source prefix address.

destination-prefix Display the packet drop information for the given destination IP or source prefix address.

source-port Display the packet drop information for the given source port.

destination-port Display the packet drop information for the given destination port.

ingress-interface-name Display the packet drop information for the given ingress interface address.

protocol Display the packet drop information for the given protocol number.

logical-system-name Display the packet drop information for the logical system name.

count-number Display the packet drop information for the given count.
Range: 1 thru 8000

Default: 50

monitor start

IN THIS SECTION

- Syntax | 11374
- Description | 11374
- Options | 11374
- Additional Information | 11374
- Required Privilege Level | 11374
- Output Fields | 11374
- Sample Output | 11375
- Release Information | 11375

Syntax

```
monitor start filename
```

Description

CAUTION: Running monitoring can adversely impact scale and performance and may increase security risk. We strongly recommend using these commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately stop monitoring to minimize risk and restore normal system performance.

Start displaying the system log or trace file and additional entries being added to those files.

Options

filename	Specific log or trace file.

Additional Information

Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the `syslog` statement at the `[edit system]` hierarchy level and the `options` statement at the `[edit routing-options]` hierarchy level. The trace files generated by the routing protocol process are configured with `traceoptions` statements at the `[edit routing-options]`, `[edit interfaces]`, and `[edit protocols protocol]` hierarchy levels.

NOTE: To monitor a log file within a logical system, issue the `monitor start logical-system-name/filename` command.

```

Description

CAUTION: Running monitoring can adversely impact scale and performance and may increase security risk. We strongly recommend using these commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately stop monitoring to minimize risk and restore normal system performance.

Display packet headers or packets received and sent from the Routing Engine.

NOTE:

- Using the `monitor-traffic` command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the `no-resolve` option.

NOTE: This command is not supported on the QFabric system.

Options

none	(Optional) Display packet headers transmitted through fxp0. On a TX Matrix Plus router, display packet headers transmitted through em0.
brief | detail | extensive	(Optional) Display the specified level of output.
absolute-sequence	(Optional) Display absolute TCP sequence numbers.
count *count*	(Optional) Specify the number of packet headers to display (0 through 1,000,000). The monitor traffic command quits automatically after displaying the number of packets specified.
interface *interface-name*	(Optional) Specify the interface on which the `monitor traffic` command displays packet data. If no interface is specified, the `monitor traffic` command displays packet data arriving on the lowest-numbered interface. In Junos OS Evolved: • If you modify an interface that you are monitoring with the `monitor traffic interface` command, the monitoring session ends with the message: pcap_loop: read: Device not configured. To continue monitoring the interface, rerun the `monitor traffic interface` command. However, if the monitored interface is removed, the command session continues, but there will be no packets or errors reported. • When you use the command `monitor traffic interface` *`interface-name`* on a logical interface, the output displays all packets received or transmitted on that interface, including Layer 2 traffic. When you use this command on a physical interface, the output only displays packets received and transmitted on the physical interface and does not include traffic from the logical interface.

layer2-headers	(Optional) Display the link-level header on each line.
matching ***matching***	(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the `monitor traffic` command filters and displays packet data.
no-domain-names	(Optional) Suppress the display of the domain portion of hostnames. With the `no-domain-names` option enabled, the `monitor traffic` command displays only `team` for the hostname **team.company.net**.
no-promiscuous	(Optional) Do not put the interface into promiscuous mode.
no-resolve	(Optional) Suppress reverse lookup of the IP addresses.
no-timestamp	(Optional) Suppress timestamps on displayed packets.
print-ascii	(Optional) Display each packet in ASCII format.
print-hex	(Optional) Display each packet, except the link-level header, in hexadecimal format.
read-file ***filename***	Read packets from the file specified.
resolve-timeout ***timeout***	(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the `print-ascii`, `print-hex`, or `extensive` option.
size ***size***	(Optional) Read but do not display up to the specified number of bytes for each packet. When set to `brief` output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to `detail` and `extensive` output, the default packet size is 1514. The `monitor traffic` command truncates displayed packets if the matched data exceeds the configured size.
write-file ***filename***	Write packets to the file specified.

NOTE: Starting in Junos OS Evolved 20.4R1, the `write-file` option at the `monitor traffic interface` hierarchy level takes precedence over the `extensive` option when you configure them simultaneously. If you try to configure these options at the same time, Junos OS Evolved gives you a warning message that the options are not compatible, and it only runs the `monitor traffic interface write-file` command.

Additional Information

In the `monitor traffic` command, you can specify an expression to match by using the `matching` option and including the expression in quotation marks:

```
monitor traffic matching "expression"
```

Replace *expression* with one or more of the match conditions listed in Table 97 on page 11382.

Table 97: Match Conditions for the monitor traffic Command

Match Type	Condition	Description
Entity	`host [address | hostname]`	Matches packets that contain the specified address or hostname. The protocol match conditions `arp`, `ip`, or `rarp`, or any of the directional match conditions can be prepended to the `host` match condition.
	`net address`	Matches packets with source or destination addresses containing the specified network address.
	`net address mask mask`	Matches packets containing the specified network address and subnet mask.
	`port (port-number | port-name)`	Matches packets containing the specified source or destination TCP or UDP port number or port name. In place of the numeric port address, you can specify a text synonym, such as `bgp` (179), `dhcp` (67), or `domain` (53) (the port numbers are also listed).

Table 97: Match Conditions for the monitor traffic Command *(Continued)*

Match Type	Condition	Description
Directional	`dst`	Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.
	`src`	Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.
	`src` and `dst`	Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.
	`src` or `dst`	Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.
Packet Length	`less` *`value`*	Matches packets shorter than or equal to the specified value, in bytes.
	`greater` *`value`*	Matches packets longer than or equal to the specified value, in bytes.
Protocol	`amt`	Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.
	`arp`	Matches all ARP packets.
	`ether`	Matches all Ethernet packets.

Table 97: Match Conditions for the monitor traffic Command *(Continued)*

Match Type	Condition	Description
	`ether (broadcast | multicast)`	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with`src` and `dst`.
	`ether` *`protocol`* `(`*`address`*` | (arp | ip | rarp))`	Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The `ether protocol` arguments `arp`, `ip`, and `rarp` are also independent match conditions, so they must be preceded by a backslash (\) when used in the `ether protocol` match condition.
	`icmp`	Matches all ICMP packets.
	`ip`	Matches all IP packets.
	`ip (broadcast | multicast)`	Matches broadcast or multicast IP packets.
	`ip protocol (`*`address`*` | (icmp | igrp | tcp | udp))`	Matches packets with the specified address or protocol type. The `ip protocol` arguments `icmp`, `tcp`, and `udp` are also independent match conditions, so they must be preceded by a backslash (\) when used in the `ip protocol` match condition.
	`isis`	Matches all IS-IS routing messages.
	`proto` *`ip-protocol-number`*	Matches packets whose headers contain the specified IP protocol number.

Table 97: Match Conditions for the monitor traffic Command *(Continued)*

Match Type	Condition	Description
	`rarp`	Matches all RARP packets.
	`tcp`	Matches all TCP datagrams.
	`udp`	Matches all UDP datagrams.

To combine expressions, use the logical operators listed in Table 98 on page 11385.

Table 98: Logical Operators for the monitor traffic Command

Logical Operator (Highest to Lowest Precedence)	Description
`!`	Logical NOT. If the first condition does not match, the next condition is evaluated.
`&&`	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
`||`	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
`( )`	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0" "arithmetic_expression relational_operator
arithmetic_expression"
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in Table 99 on page 11386.

NOTE: Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The `monitor traffic` command cannot apply match conditions to inbound traffic.
- The `monitor traffic interface` command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the `match` pipe option (`| match`) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see Table 97 on page 11382.
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the `monitor traffic interface ae[x]` command for aggregated Ethernet interfaces (such as) only shows inbound traffic data, the command does not show VLAN tag information in the output.

Table 99: Arithmetic and Relational Operators for the monitor traffic Command

Arithmetic or Relational Operator	Description
Arithmetic Operator	
+	Addition operator.
-	Subtraction operator.

Table 99: Arithmetic and Relational Operators for the monitor traffic Command *(Continued)*

Arithmetic or Relational Operator	Description
/	Division operator.
&	Bitwise AND.
*	Bitwise exclusive OR.
|	Bitwise inclusive OR.
Relational Operator (Highest to Lowest Precedence)	
<=	If the first expression is less than or equal to the second, the packet matches.
>=	If the first expression is greater than or equal to the second, the packet matches.
<	If the first expression is less than the second, the packet matches.
>	If the first expression is greater than the second, the packet matches.
=	If the compared expressions are equal, the packet matches.
!=	If the compared expressions are unequal, the packet matches.

0 packets dropped by kernel
```

Release Information

Command introduced before Junos OS Release 7.4.

Options `read-file` and `write-file` introduced in Junos OS Release 19.1R1.

monitor-bandwidth

IN THIS SECTION

- Syntax | 11396
- Hierarchy Level | 11397
- Description | 11397
- Required Privilege Level | 11397
- Release Information | 11397

Syntax

```
monitor-bandwidth;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name auto-
bandwidth],
[edit protocols mpls label-switched-path lsp-name auto-bandwidth]
```

Description

Do not automatically adjust bandwidth allocation. However, the maximum average bandwidth utilization is monitored on the LSP, and the information is recorded in the MPLS statistics file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

```

Description

SRG monitoring object

Options

name SRG monitoring object name.

- Range - 1 through 32.

bfd-liveliness Configure BFD monitoring for the specific monitoring object.

interface Interface to monitor for the specific monitoring object.

- interface-name *interface-name*—Destination IP address to monitor.
  - weight—Weight assigned to the interface. A higher weight value indicates a greater importance.
- threshold—Threshould value assigned to the interface that influences failover.

ip *ip-address* IP address to monitor for the specific monitoring object.

- destination-ip *destination-ip-address*—Destination IP address to monitor.

- weight—Weight assigned to the interface or monitored IP address. A higher weight value indicates a greater importance.
- routing-instance—Routing instance to locate the destination route.

- threshold—Threshould value assigned to the IP address that influences failover.

object-threshold SRG monitoring object threshold value. This is the threshold value assigned to the monitoring-object that influences SRG failover.

- **Range:** 1 through 1000

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.4R1.

Multinode High Availability Monitoring Options

Multinode High Availability

monitor-profile

IN THIS SECTION

- Syntax | 11402
- Hierarchy Level | 11402
- Description | 11402
- Options | 11403

Required Privilege Level | 11403
Release Information | 11403

Syntax

```
monitor-profile monitor-profile-name {
    lower-threshold lower-threshold;
    notification-type(alarm | none | syslog);
    upper-threshold upper-threshold;
}
```

Hierarchy Level

```
[edit system packet-forwarding-options hw-resource-monitor]
```

Description

Map a monitor profile to a configured resource list (optional) to monitor hardware resource utilization and set thresholds to trigger notifications as well as the type of notification you would like to receive when a resource breach occurs. Monitoring resource utilization for a hardware resource as it nears or crosses the maximum capacity threshold that you set can enable you to take appropriate and timely actions to prevent unintended consequences in your network, such as traffic loss.

You can use the same monitor profile multiple resource lists, but a single resource list cannot be mapped to multiple monitor profiles. A resource list can only be mapped only to a single monitor-profile. Configure a monitor profile prior to mapping it to a resource list.

To associate a monitor profile with the resource list, in configuration mode, go to the `[edit system packet-forwarding-options hw-resource-monitor resource-list]` hierarchy level and map a monitor profile:

```
[edit]
user@host# edit system packet-forwarding-options hw-resource-monitor resource-list <resource-list-name> monitor-profile <monitor-profile-name>
```

Options

monitor-profile-name The hardware resource monitor profile name.

lower-threshold The lower threshold, by percent. A lower threshold breach raises a minor notification

- **Range:** 1 through 100 percent
- **Default:** 50 percent

notification-type The notification type for threshold breaches.

- alarm—System sends an alarm for threshold breaches.
- none—No notification issued for threshold breaches.
- syslog—System sends a syslog for threshold breaches.
- **Default:** none

upper-threshold The upper threshold, by percent. An upper threshold breach raises a major notification

- **Range:** 1 through 100 percent
- **Default:** 90 percent

Required Privilege Level

monitor-session

IN THIS SECTION

- Syntax | 11404
- Hierarchy Level | 11404
- Description | 11404
- Default | 11405
- Options | 11405
- Required Privilege Level | 11405
- Release Information | 11405

Syntax

```
monitor-session (interface-name | all);
```

Hierarchy Level

```
[edit protocols ppp]
```

Description

Monitor PPP packet exchanges. When monitoring is enabled, packets exchanged during a session are logged to the default log of `/var/log/pppd`.

Default

If you do not include this statement, no PPPD-specific monitoring operations are performed.

Options

`all`—Monitor PPP packet exchanges on all sessions.

`interface-name`—Logical interface name on which to enable session monitoring.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

```

Hierarchy Level

```
[edit unified-edge pcef pcc-action-profiles profile-name]
```

Description

Specify the monitoring key that controls TDF subscriber usage monitoring for traffic that matches the data flows or applications identified in the predefined PCC rules containing the PCC action profile. The monitoring key is defined by the PCRF.

Options

key_string	Identifier for the monitoring key.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

RELATED DOCUMENTATION

Configuring TDF Subscriber Usage Monitoring for Traffic That Matches Predefined PCC Rules

Understanding Usage Monitoring for TDF Subscribers

monitoring-profile

IN THIS SECTION

- Syntax | 11417
- Hierarchy Level | 11417
- Description | 11417
- Options | 11417
- Required Privilege Level | 11419

Release Information | 11419

Syntax

```
monitoring-profile profile-name {
    export-filters filter-name {
        peak-queue-length {
            percent percent;
        }
        queue [queue(s)];
    }
}
```

Hierarchy Level

```
[edit class-of-service],
[edit dynamic-profiles name class-of-service]
```

Description

Define a queue-length monitor to measure peak queue occupancy of a virtual output queue (VOQ).

In a typical deployment scenario that uses strict-priority scheduling, a `HIGH` priority queue can starve `LOW` priority queues. Thus the packets in such `LOW` priority queues can remain longer than desired. Use this VOQ queue-length monitoring feature, along with queue transmit statistics, to detect such stalled conditions.

Options

monitoring-profile (Required) Name of the monitoring profile.

Use the monitoring profile name to attach the monitoring profile to one or more interfaces. Each monitoring profile contains one or more export filters.

export-filters (Required) Name of the export filter.

Each export filter consists of an optional peak queue length percentage filter and one or more queues.

peak-queue-length percent

(Optional) The percentage of the peak queue length filter.

When configured, Junos exports VOQ telemetry only when the hardware-captured peak queue length exceeds the configured value. When not configured, Junos always exports VOQ telemetry.

- **Range:** 0 through 100
- **Default:** 0

queue

(Required) The queue, or queues, for the export filter to monitor.

- **Range:** 0 through 7

Attach the monitoring profile at the `[edit class-of-service interfaces interface-name]` hierarchy level. For example:

```
[edit class-of-service]
user@host# show
interfaces {

    ae0 {
        monitoring-profile mp1 shared;
    }
    et-0/0/1 {
        monitoring-profile mp1;
    }
}
```

The monitoring profile reports virtual output queue (VOQ) depth individually on each interface. However, given finite number of hardware monitoring profile IDs on a system, this process can quickly consume the maximum supported hardware monitoring profile IDs on large systems. By default, a monitoring profile that you assign to an ae- interface replicates across all members of the ae- interface. Therefore, to conserve monitoring profile IDs, include the `shared` option at the `[set class-of-service interfaces ae-interface monitoring-profile profile-name]` hierarchy level. The configured `shared` option creates only one monitoring profile ID to share across all member interfaces. The option also reports the largest peak on a member interface as the common peak for the ae- interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 22.2R1.

- Release Information | 11434

Syntax

```
mpls-flow-table-size units;
```

Hierarchy Level

```
[edit chassis fpc slot-number inline-services flow-table-size]
```

Description

Configure the size of the MPLS flow table in units of 256,000 entries.

NOTE: Starting with Junos OS Release 17.3R1, the maximum number of 256K flow entries that you can configure for IPv4 flow tables and IPv6 flow tables is 256 on MPC5Es and MPC6Es with with 4 GB DDR3 memory or higher. The maximum number of 256K flow entries that you can configure for IPv4 flow tables and IPv6 flow tables is 245 on MPC5Es and MPC6Es with DDR3 memory lower than 4 GB.

NOTE: The recommended flow table size is 4 so that it can scale up to 4x256K flows, which is 1M. You can configure more, however, the system will issue a warning message.

Options

units Number of 256,000 flow entries available for the MPLS flow table.

- **Range:** 1 through 245
- **Default:** 15 (3,840,000)

Required Privilege Level

interface—To view this statement in the configuration.

mpls-inet6

IN THIS SECTION

- Syntax | 11435
- Hierarchy Level | 11435
- Description | 11435
- Required Privilege Level | 11435
- Release Information | 11436

Syntax

```
mpls-inet6;
```

Hierarchy Level

```
[edit routing-instances name protocols evpn encapsulation]
```

Description

Enables the use of the EVPN-VXLAN and point-to-point (P2P) services over an MPLS-based IPv6 underlay on the PE routers using Segment Routing with Multiprotocol Label Switching (SR-MPLS). The services also operate on the segment routing–traffic engineering (SR-TE) addresses that are responsible for the path calculation between the EVPN PE devices. You can use the EVPN-MPLS commands with the MPLS-based IPv6 underlays.

To enable EVPN-MPLS over IPv6 functionality, include the `protocols evpn encapsulation mpls-inet6` configuration statement at the `[edit routing-instance name]` hierarchy level for each EVPN routing instance.

Required Privilege Level

routing

Release Information

Statement introduced in Junos OS Release 21.2.

mpls-internet-multicast

IN THIS SECTION

- Syntax | 11436
- Hierarchy Level | 11436

Syntax

```
mpls-ipvx-template;
```

Hierarchy Level

```
[edit services flow-monitoring version9 template template-name],
[edit services flow-monitoring version-ipfix template template-name]
```

Description

In Junos OS Release 18.1, specify the version 9 or IPFIX template for inline monitoring an MPLS-over-UDP flow that is encapsulated in an RSVP-TE LSP on PTX Series routers. This monitoring looks past the tunnel header to report the inner payload of the packets. To use the template for MPLS-over-UDP flows, you must also configure `tunnel-observation mpls-over-udp` at the `[edit services flow-monitoring (version 9 | version-ipfix) template template-name]` hierarchy level.

Starting in Junos OS Release 18.2R1, use `mpls-template` instead of `mpls-ipvx-template`.

> **NOTE**: For an MPLS-over-UDP flow that is carried between IPv4 endpoints, configure `ipv4-template` at the `[edit services flow-monitoring (version9 | version-ipfix) template template-name]` hierarchy level.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.1R1.

RELATED DOCUMENTATION

Inline Active Flow Monitoring of MPLS-over-UDP Flows on PTX Series Routers

mpls-template

IN THIS SECTION

- Syntax | 11440
- Hierarchy Level | 11441
- Description | 11441
- Required Privilege Level | 11441
- Release Information | 11441

Syntax

```
mpls-template {
    label-position [positions ];
}
```

Hierarchy Level

```
[edit services flow-monitoring version9 template template-name],
[edit services flow-monitoring version-ipfix template template-name]
```

Description

Specify the flow aggregation IPFIX or version 9 properties for templates used only for MPLS records.

Starting in Junos OS Release 18.2R1, you can also use `mpls-template` to specify the version 9 or IPFIX template for inline monitoring an MPLS-over-UDP flow that is encapsulated in an RSVP-TE LSP on PTX Series routers. (In Junos OS Release 18.1, use `mpls-ipvx-template` instead of `mpls-template`.) This monitoring looks past the tunnel header to report the inner payload of the packets. To use the template for MPLS-over-UDP flows, you must also configure `tunnel-observation mpls-over-udp` at the `[edit services flow-monitoring (version 9 | version-ipfix) template template-name]` hierarchy level.

> **NOTE**: For an MPLS-over-UDP flow that is carried between IPv4 endpoints, configure `ipv4-template` at the `[edit services flow-monitoring (version9 | version-ipfix) template template-name]` hierarchy level.

Starting in Junos OS Release 18.4R1, use `mpls-template` instead of `mpls-ipv4-template` for inline flow monitoring of MPLS-IPv4 flows on the MX Series. You must also configure `tunnel-observation ipv4` at the `[edit services flow-monitoring (version-ipfix | version9) template template-name]` hierarchy level.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

Support at the `[edit services flow-monitoring version-ipfix template template-name]` hierarchy level introduced in Junos OS Release 16.1.

Statement introduced in Junos OS Release 18.2R1 on PTX Series routers.

mpls-tp-mode

IN THIS SECTION

- Syntax | 11442
- Hierarchy Level | 11442
- Description | 11442
- Required Privilege Level | 11443
- Release Information | 11443

Syntax

```
mpls-tp-mode;
lsping-channel-type;
```

Hierarchy Level

```
[edit protocols mpls label-switched-path lsp-name oam],
[edit protocols mpls oam]
```

Description

Enable GAL or G-Ach OAM operation without IP encapsulation on a label-switched path (LSP).

Include this statement at the `[edit protocols mpls oam]` hierarchy level to enable GAL or G-Ach OAM operation without IP encapsulation on all LSPs in the MPLS network. Include this statement at the `[edit protocols mpls label-switched-path lsp-name oam]` hierarchy level to enable GAL and G-Ach OAM operation without IP encapsulation on a specific LSP.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

`lsping-channel-type` statement introduced in Junos OS Release 16.1.

mrru

IN THIS SECTION

- Syntax | 11443
- Hierarchy Level | 11444
- Description | 11444
- Options | 11444
- Required Privilege Level | 11444
- Release Information | 11444

Syntax

```
mrru bytes;
```

Hierarchy Level

```
[edit interfaces ls-fpc/pic/port:channel mlfr-uni-nni-bundle-options],
[edit interfaces (ml-fpc/pic/port| ls-fpc/pic/port) unit logical-unit-number],
[edit logical-systems logical-system-name interfaces ls-fpc/pic/port:channel mlfr-uni-nni-bundle-
options],
[edit logical-systems logical-system-name interfaces (ml-fpc/pic/port| ls-fpc/pic/port) unit
logical-unit-number]
```

Description

For multilink or link services interfaces only, set the maximum received reconstructed unit (MRRU). The MRRU is similar to the maximum transmission unit (MTU), but is specific to multilink interfaces.

Options

bytes—MRRU size.

- **Range:** 1500 through 4500 bytes
- **Default:** 1500 bytes

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

> *Configuring MRRU on Multilink and Link Services Logical Interfaces*

mru (Congestion Notification Profiles)

IN THIS SECTION

- Syntax | 11445
- Hierarchy Level | 11445
- Description | 11445
- Default | 11446
- Options | 11446
- Required Privilege Level | 11446
- Release Information | 11446

Syntax

```
mru mru-value;
```

Hierarchy Level

```
[edit class-of-service congestion-notification-profile profile-name input dscp code-point code-point-bits pfc],
[edit class-of-service congestion-notification-profile profile-name input ieee-802.1 code-point code-point-bits pfc]
```

Description

Configure the maximum receive unit (MRU) of the interface in bytes. The system uses the MRU and the cable length to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The lower the MRU and the shorter the cable length, the less headroom buffer space is required for PFC.

> **NOTE**: You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the `mtu` statement at the `[edit interfaces interface-name]` hierarchy level.

Default

For priority 3 traffic, the default MRU value is 2500 bytes.

For priority 4 traffic, the default MRU value is 9216 bytes.

For user-configured priorities, the default MRU value is 2500 bytes.

Options

mru-value—Value of the maximum packet receive unit size in bytes (generally from 1500 to 9216 bytes, but there is no configuration restriction).

Required Privilege Level

interfaces—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

Support added in `dscp` statement hierarchy in Junos OS Release 17.4R1 for the QFX Series.

mru (Gigabit Ethernet Options)

IN THIS SECTION

- Syntax | 11449
- Hierarchy Level | 11449
- Hierarchy Level: SRX Series | 11449
- Description | 11449
- Options | 11449

Required Privilege Level | 11450
Release Information | 11450

Syntax

```
mru mru;
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces name gigether-options],
[edit dynamic-profiles name logical-systems name interfaces name gigether-options],
[edit interfaces name gigether-options]
```

Hierarchy Level: SRX Series

```
[edit interfaces name gigether-options]
```

Description

Configure the maximum receive unit (MRU) of the interface in bytes. The maximum receive unit of an interface indicates the largest size of a packet that the interface can accept. You can configure the parameters so that the value of MRU equals the value of MTU. You can also configure different values for MRU and MTU. When a device receives packets whose size is greater than the interface MRU, those packets are dropped by the device's forwarding plane.

Options

mru MRU size in bytes.

- **Range:** 256 through 16008 bytes.
- **Range (SRX Series) :** 256 through 9200 bytes.

Required Privilege Level

interface

```

Description

Configures Multiple Spanning Tree Protocol (MSTP). MSTP is defined in the IEEE 802.1Q-2003 specification and is used to create a loop-free topology in networks with multiple spanning tree regions.

> **NOTE**: MX Series routers and QFX5100 switches do not support the `interface all` statement to enable MSTP on all interfaces with one command.
>
> On MX Series routers, you must enable MSTP on interfaces individually using the `set ... protocols mstp interface interface-name` statement.
>
> On QFX5100 switches, to apply MSTP configuration to more than one interface, you must first configure one or more interface ranges for the interfaces on which you want to configure MSTP, and then issue the `set protocols mstp interface interface-name` command using each interface range as the *interface-name* parameter.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

`bpdu-block-on-edge` statement added in Junos OS Release 9.4.

`bpdu-timeout-action` statement added in Junos OS Release 9.4.

Support for logical systems added in Junos OS Release 9.6.

mtls-profile

IN THIS SECTION

- Syntax | 11465
- Hierarchy Level | 11465
- Description | 11465
- Options | 11465
- Required Privilege Level | 11465
- Release Information | 11465

Syntax

```
mtls-profile profile-name;
```

Hierarchy Level

```
[edit security firewall-authentication]
```

Description

Enable passwordless user authentication based on client/server certificate validation using a public/private key.

Options

profile name—Maximum length of the profile subject is 250 characters. Supports maximum of 10 profiles.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.4R1.

RELATED DOCUMENTATION

Example: Configure Mutual-TLS (mTLS) Authentication

[edit security firewall-authentication]

mtls-profile-fallback-password

IN THIS SECTION

- Syntax | 11466
- Hierarchy Level | 11466
- Description | 11466
- Options | 11466
- Required Privilege Level | 11466
- Release Information | 11467

Syntax

```
mtls-profile-fallback-password;
```

Hierarchy Level

```
[edit security firewall-authentication]
```

Description

Enable user authentication with mTLS and fallback to standard login when it fails.

Options

You can use the fallback-password mechanism to revert to username-password authentication when mtls-profile subject matching fails. Ensures an uninterrupted access when certificate-based matching is unavailable.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.4R1.

mtrace from-source

IN THIS SECTION

- Syntax | 11467
- Description | 11468
- Options | 11468
- Required Privilege Level | 11469
- Output Fields | 11469
- Sample Output | 11470
- Release Information | 11471

Syntax

```
mtrace from-source source source
<brief | detail>
<extra-hops extra-hops>
<group group>
<interval interval>
<loop>
<max-hops max-hops>
<max-queries max-queries>
<multicast-response | unicast-response>
<no-resolve>
```

```
<no-router-alert>
<response response>
<routing-instance routing-instance-name>
<ttl ttl>
<wait-time wait-time>
```

Description

Display trace information about an IP multicast path from a source to this router or switch. If you specify a group address with this command, Junos OS returns additional information, such as packet rates and losses.

Options

brief | detail	(Optional) Display the specified level of output.
extra-hops ***extra-hops***	(Optional) Number of hops to take after reaching a nonresponsive router. You can specify a number between **0** and **255**.
group ***group***	(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.
interval ***interval***	(Optional) Number of seconds to wait before gathering statistics again. The default value is **10** seconds.
loop	(Optional) Loop indefinitely, displaying rate and loss statistics.
max-hops ***max-hops***	(Optional) Maximum hops to trace toward the source. The range of values is **0** through **255**. The default value is **32** hops.
max-queries ***max-queries***	(Optional) Maximum number of query attempts for any hop. The range of values is **1** through **32**. The default is **3**.
multicast-response	(Optional) Always request the response using multicast.
no-resolve	(Optional) Do not attempt to display addresses symbolically.
no-router-alert	(Optional) Do not use the router-alert IP option.
response ***response***	(Optional) Send trace response to a host or multicast address.
routing-instance ***routing-instance-name***	(Optional) Trace a particular routing instance.

source *source*	Source hostname or address.
ttl *ttl*	(Optional) IP time-to-live (TTL) value. You can specify a number between **0** and **255**. Local queries to the multicast group use a value of **1**. Otherwise, the default value is **127**.
unicast-response	(Optional) Always request the response using unicast.
wait-time *wait-time*	(Optional) Number of seconds to wait for a response. The default value is **3**.

Output Fields

Table 100 on page 11469 describes the output fields for the `mtrace from-source` command. Output fields are listed in the approximate order in which they appear.

Table 100: mtrace from-source Output Fields

Field Name	Field Description
Mtrace from	IP address of the receiver.
to	IP address of the source.
via group	IP address of the multicast group (if any).
Querying full reverse path	Indicates the full reverse path query has begun.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.

Table 100: mtrace from-source Output Fields *(Continued)*

Field Name	Field Description
protocol	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.
source	Source address.
Response Dest	Response destination address.
Overall	Average packet rate for all traffic at each hop.
Packet Statistics for Traffic From	Number of packets lost, number of packets sent, percentage of packets lost, and average packet rate at each hop.
Receiver	IP address receiving the multicast.
Query source	IP address sending the mtrace query.

Sample Output

mtrace from-source

```
user@host> mtrace from-source source 192.168.4.2 group 233.252.0.1
Mtrace from 192.168.4.2 to 192.168.1.2 via group 233.252.0.1
Querying full reverse path... * *

<no-resolve>
<no-router-alert>
<response response>
<routing-instance routing-instance-name>
<ttl ttl>
<unicast-response>
<wait-time wait-time>
```

Description

Display trace information about a multicast path from this router or switch to a gateway router or switch.

Options

gateway *gateway*	Send the trace query to a gateway multicast address.
brief | detail	(Optional) Display the specified level of output.
extra-hops *extra-hops*	(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between **0** and **255**.

group *group*	(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.
interface *interface-name*	(Optional) Source address for sending the trace query.
interval *interval*	(Optional) Number of seconds to wait before gathering statistics again. The default value is **10**.
loop	(Optional) Loop indefinitely, displaying rate and loss statistics.
max-hops *max-hops*	(Optional) Maximum hops to trace toward the source. You can specify a number between **0** and **255**.. The default value is **32**.
max-queries *max-queries*	(Optional) Maximum number of query attempts for any hop. You can specify a number between **0** and **255**. The default value is **3**.
multicast-response	(Optional) Always request the response using multicast.
no-resolve	(Optional) Do not attempt to display addresses symbolically.
no-router-alert	(Optional) Do not use the router-alert IP option.
response *response*	(Optional) Send trace response to a host or multicast address.
routing-instance *routing-instance-name*	(Optional) Trace a particular routing instance.
ttl *ttl*	(Optional) IP time-to-live value. You can specify a number between **0** and **225**. Local queries to the multicast group use TTL **1**. Otherwise, the default value is **127**.
unicast-response	(Optional) Always request the response using unicast.
wait-time *wait-time*	(Optional) Number of seconds to wait for a response. The default value is **3**.

mtrace

IN THIS SECTION

- Syntax | 11477
- Description | 11477
- Options | 11478
- Additional Information | 11478
- Required Privilege Level | 11478
- Output Fields | 11478
- Sample Output | 11479
- Release Information | 11479

Syntax

```
mtrace source
<logical-system logical-system-name>
<routing-instance routing-instance-name>
```

Description

Display trace information about an IP multicast path.

Options

source	Source hostname or address.
logical-system (*logical-system-name*)	(Optional) Perform this operation on a logical system.
routing-instance *routing-instance-name*	(Optional) Trace a particular routing instance.

Additional Information

The **mtrace** command for multicast traffic is similar to the `traceroute` command used for unicast traffic. Unlike **traceroute**, **mtrace** traces traffic backwards, from the receiver to the source.

unit ppp-options],
[edit interfaces pp0 unit unit-number ppp-options],
[edit interfaces si interface-id unit unit-number ppp-options]
```

Description

Specify the size of maximum transmission unit (MTU) for the PPP connection. For a PPP connection, the MTU size defines the largest data unit that can be forwarded without fragmentation. This size does not include the overhead of the lower layers.

Options

size	MTU size in bytes for a PPP connection.

- **Range:** 64–65,535

use-lower-layer Set the PPP MTU size to the interface MTU size excluding the overhead of the lower layers.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

mtu mtu;
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces name unit name family inet ],
[edit dynamic-profiles name logical-systems name interfaces name unit name family inet ],
[edit interfaces name unit name family inet ]
```

Description

Configure a per-subscriber maximum transmission unit (MTU) on a logical interface. A subscriber logical interface can specify MTU through its dynamic profile for the same underlying physical interfaces. The dynamic logical interface MTU must be no greater than the physical interface MTU minus the dynamic VLAN header size). You can configure either a static value or the predefined variable, $junos-interface-mtu. The value of the variable is returned by RADIUS during authentication in the Framed-MTU attribute (12). By default, the variable value is the MTU of the payload.

If you specify the predefined variable but RADIUS does not return a value in the Framed-MTU attribute,

Options

mtu MTU for the subscriber logical interface. You can specify a static value or the predefined variable, $junos-interface-mtu.

Required Privilege Level

interface

```

Description

Specify the maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

If a packet whose size is larger than the configured MTU size is received on the receiving interface, the packet is eventually dropped. The value considered for MRU (maximum receive unit) size is also the same as the MTU size configured on that interface.

Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. You cannot configure an MTU for:

- Management Ethernet interfaces (fxp0, em0, or me0)
- Service interfaces (ms, vms, or ams)
- Loopback, multilink, and multicast tunnel devices

MTU for IRB interfaces is calculated by removing the Ethernet header overhead (`6(DMAC)+6(SMAC)+2(EtherType)`), and the MTU is a minimum of the two values:

- Configured MTU
- Associated bridge domain's physical or logical interface MTU
  - For Layer 2 logical interfaces configured with `flexible-vlan-tagging`, IRB MTU is calculated by including 8 bytes overhead (`SVLAN+CVLAN`).
  - For Layer 2 logical interfaces configured with `vlan-tagging`, IRB MTU is calculated by including single VLAN 4 bytes overhead.

> **NOTE**: Changing the Layer 2 logical interface option from `vlan-tagging` to `flexible-vlan-tagging` or vice versa adjusts the logical interface MTU by 4 bytes with the existing MTU size. As a result, the Layer 2 logical interface is deleted and re-added, and the IRB MTU is re-computed appropriately.

On EX Series switches, to route jumbo data packets on an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI), you must configure the jumbo MTU size on the member physical

interfaces of the VLAN that you have associated with the IRB interface or RVI, as well as on the IRB interface or RVI itself (the interface named `irb` or `vlan`, respectively).

> **CAUTION**: For EX Series switches, setting or deleting the jumbo MTU size on an IRB interface or RVI while the switch is transmitting packets might cause packets to be dropped.

On ACX Series routers, you can configure the protocol MTU by including the `mtu` statement at the `[edit interfaces` *`interface-name`* `unit` *`logical-unit-number`* `family inet]` or `[edit interfaces` *`interface-name`* `unit` *`logical-unit-number`* `family inet6]` hierarchy level.

- If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
- If you are configuring the protocol MTU for both `inet` and `inet6` families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for `inet` and `inet6` families that are configured on the same logical interface.

The following is the maximum MTUs supported on the ACX Series routers for data and control plane traffic:

Data plane MTU:

- The maximum MTU supported for data traffic (transit) through all the interfaces on the ACX Series routers is 10,000 bytes.

Control plane MTU:

- The maximum MTU for control plane traffic on the ACX7100, ACX7509, and ACX7024 routers is 9,280 bytes.
- The maximum MTU for control plane traffic on the ACX7332 and ACX7348 routers is 9,522 bytes.

For more information about configuring MTU for specific interfaces and router or switch combinations, see *Configure the Media MTU*.

Options

`bytes`—MTU size.

- **Range:** 256 through 9192 bytes
  - ACX710-48L, ACX710-32C, ACX7509, and ACX7024: 256 through 9216 bytes
  - EX Series switch interfaces: 256 through 9216

- MX Series routers: 256 through 9500 bytes
- PTX Series routers: 256 through 9500 bytes

Starting in Junos OS Evolved Release 21.2R1, MTU 16KB is only for transiting traffic of WAN interfaces on the PTX10001-36MR, PTX10008 and PTX10004 routers. MTU is 9500B for protocols and 16KB for transit traffic.

> **NOTE**: Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:
>
> - MPC1
> - MPC2
> - MPC2E
> - MPC3E
> - MPC4E
> - MPC5E
> - MPC6E

- **Default:**
  - INET, INET6, and ISO families: 1500 bytes
  - EX Series switch interfaces: 1514 bytes
  - MPLS: 1448 bytes

Required Privilege Level

Configuring the MTU for Layer 2 Interfaces

mtu (Multilink and Link Services Logical Interface)

IN THIS SECTION

- Syntax | 11487
- Hierarchy Level | 11487
- Description | 11488
- Options | 11488
- Required Privilege Level | 11488
- Release Information | 11488

Syntax

```
mtu bytes;
```

Hierarchy Level

```
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number family family],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family family]
```

Description

Maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values.

Options

bytes—MTU size.

- **Range:** 0 through 5012 bytes
- **Default:** 1500 bytes (`inet`, `inet6`, and `iso` families), 1448 bytes (`mpls`)

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

mtu (QFX Series)

IN THIS SECTION

- Syntax | 11489
- Hierarchy Level | 11489
- Description | 11489

- Options | 11490
- Required Privilege Level | 11490
- Release Information | 11490

Syntax

```
mtu bytes;
```

Hierarchy Level

```
[edit interfaces interface-name],
[edit interfaces interface-range interface-name]
```

Description

Specify the maximum transmission unit (MTU) size for the media. Changing the media MTU size causes an interface to be deleted and added again. On QFX3500, QFX3600, QFX5100, and OCX Series switches, either standalone or as part of the QFabric system, the maximum MTU value on an untagged packet transiting through an ingress Gigabit Ethernet interface must be no more than the currently configured MTU value plus four, whereas the maximum MTU value on a tagged packet transiting through an ingress Gigabit Ethernet interface must be no more than the currently configured MTU value plus eight. The maximum MTU value on an untagged or tagged packet transiting through an ingress 10-Gigabit Ethernet interface must be no more than the currently configured MTU value plus eight.

Keep the following points in mind if you are configuring MTU size for jumbo frames on these special types of interfaces:

- For LAG interfaces—Configuring the jumbo MTU size on a link aggregation group (LAG) interface (**ae*x***) automatically configures the jumbo MTU size on the member links.

- For RVIs—Jumbo frames of up to 9216 bytes are supported on the routed VLAN interface (RVI), which is named **vlan**. The RVI functions as a logical router. To route jumbo data packets on the RVI, you must configure the jumbo MTU size on the member physical interfaces of the RVI and not on the RVI itself (the **vlan** interface). However, for jumbo control packets—for example, to ping the RVI with a packet size of 6000 bytes or more—you must explicitly configure the jumbo MTU size on the interface named **vlan** (the RVI). On a QFX5100 switch jumbo frames on the RVI are configured on the basis of the interface MTU.

NOTE: RVIs are not supported on OCX Series switches.

CAUTION: Setting or deleting the jumbo MTU size on the RVI (the **vlan** interface) while the switch is transmitting packets might result in dropped packets.

Options

bytes —MTU size.

- **Range:** 64 through 9216 bytes
- **Default:** 1514 bytes

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

```

Description

Configure TCP path maximum transmission unit (MTU) discovery.

TCP path MTU discovery enables BGP to automatically discover the best TCP path MTU for each BGP session. In Junos OS, TCP path MTU discovery is disabled by default for all BGP neighbor sessions.

When MTU discovery is disabled, TCP sessions that are not directly connected transmit packets of 512-byte maximum segment size (MSS). These small packets minimize the chances of packet fragmentation at a device along the path to the destination. However, because most links use an MTU of at least 1500 bytes, 512-byte packets do not result in the most efficient use of link bandwidth. For directly connected EBGP sessions, MTU mismatches prevent the BGP session from being established. As a workaround, enable path MTU discovery within the EBGP group.

Path MTU discovery dynamically determines the MTU size on the network path between the source and the destination, with the goal of avoiding IP fragmentation. Path MTU discovery works by setting the Don't Fragment (DF) bit in the IP headers of outgoing packets. When a device along the path has an MTU that is smaller than the packet, the device drops the packet. The device also sends back an ICMP Fragmentation Needed (Type 3, Code 4) message that contains the device's MTU, thus allowing the source to reduce its path MTU appropriately. The process repeats until the MTU is small enough to traverse the entire path without fragmentation.

multi-bgp-path

IN THIS SECTION

- Syntax | 11498
- Hierarchy Level | 11498
- Description | 11498
- Default | 11499
- Required Privilege Level | 11499
- Release Information | 11499

Syntax

```
multi-bgp-path;
```

Hierarchy Level

```
[edit services flow-monitoring version-ipfix template template-name]
[edit services flow-monitoring version9 template template-name]
```

Description

(Junos OS only) Enable multiple BGP path support for reporting an accurate BGP next-hop address for traffic load-balanced over multiple BGP peers in the ingress direction only. Without this statement, we report only the first in a list of next hops. To contain this accurate BGP next-hop address, we use the IPv4 BGP Nexthop Address (IE 18) field in the IPv4 and MPLS-IPv4 templates and the IPv6 BGP Nexthop Address (IE 63) field in the IPv6 and MPLS-IPv6 templates, for both the IPFIX and the version 9 formats. For IPv6 and MPLS-IPv6 flows, you also need to configure the `ipv6-extended-attrib` statement at

the [edit chassis fpc *slot-number* inline-services flow-table-size] hierarchy level. When this feature is enabled, the fragmentIdentification (IE 54) field reports a value of 0.

For this feature to work, you must also configure the the nexthop-learning enable statement at the [edit services flow-monitoring version *version* template *template-name*] hierarchy level.

Existing flows must be manually cleared using the clear services accounting flow inline-jflow fpc-slot *slot-number* command when this feature is enabled or disabled, because common memory is used both for the fragmentIdentification (IE 54) field and for this feature. Otherwise, the export thread may wrongly misunderstand the fragment identifier of an existing flow as a next-hop address when enabled, or wrongly misunderstand the next-hop address of an existing flow as a fragment identifier when disabled. To avoid this situation, existing flows must be cleared from all FPC slots on which inline active flow monitoring is enabled.

When the number of BGP peers is 4000 or above, we cannot allocate an accurate BGP next-hop address for a new BGP peer. In such cases, a BGP next-hop address of zero is used for these BGP peers, and all flows destined to these BGP peers report the default BGP next-hop address, which is the first BGP next-hop address in a list of next hops. That is, this feature is not supported for these BGP peers with a BGP next-hop address of zero.

Default

Disabled. Without this statement, we report only the first in a list of BGP next hops.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 24.2R1.

        interface interface-name;
        }
    }
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, you can use this statement under the physical interface level to reduce the configuration at the logical interface level if the following assumption exists:

If there are n +1 logical interfaces under `ae0`, from `ae0.0` through `ae0.n`, there will be n + 1 logical interfaces under `ge-0/0/0` as well, from `ge-0/0/0.0` through `ge-0/0/0.n`, and each `ge-0/0/0` logical interface will be a protection link for the `ae0` logical interface.

NOTE: A bridge domain cannot have MC-AE logical interfaces which belong to different redundancy groups.

If the Inter-Chassis Control Protocol (ICCP) connection is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer.

The remaining statements are explained separately. See CLI Explorer.

    }
}
```

Hierarchy Level

```
[edit class-of-service]
[edit class-of-service interfaces interface-name]
```

Description

Define a CoS behavior aggregate (BA) classifier for multi-destination, or BUM (broadcast, unknown unicast, and multicast), traffic.

There is no default multi-destination classifier. Without explicit multi-destination classifier configuration, all BUM traffic is sent to the default multicast queue (queue 8), which receives 20 percent of the bandwidth by default. If you apply a multi-destination classifier to send BUM traffic to other multicast queues (queue 9 or queue 10), you must ensure the egress scheduler allocates bandwidth for those queues.

interface],
[edit protocols dot1x   authenticator              interface]
```

Description

Configure multi-domain authentication to restrict the number of authenticated data and VoIP sessions on the port. Multi-domain authentication is an extension of multiple supplicant mode for 802.1X authentication, and is designed to support VoIP and data clients on the same interface. The interface is divided into two domains; one is the data domain and the other is the voice domain.

In multiple supplicant mode, any number of VoIP or data sessions can be authenticated; the number of sessions can be restricted using MAC limiting, but there is no way to apply the limit specifically to either data or VoIP sessions. Multi-domain authentication maintains separate session counts based on the domain type.

The data device can be authenticated using 802.1X authentication or MAC RADIUS authentication. Multi-domain authentication does not enforce the order of authentication. For best results, the VoIP device should be authenticated before the data device.

You can configure the maximum number of authenticated data sessions allowed on the interface using the `max-data-session` statement. The number of VoIP sessions is not configurable; only one authenticated VoIP session is allowed.

If a new client attempts to authenticate on the interface after the maximum session count has been reached, the default action is to drop the packet and generate an error log message. You can also configure the action to shut down the interface. The port can be manually recovered from the down state by issuing the `clear dot1x recovery-timeout` command, or can recover automatically after a recovery timeout period. To configure automatic recovery, use the `recovery-timeout` option.

Options

max-data-session *max-data-sessions*

The maximum number of authenticated data sessions allowed in the data domain on the 802.1X-enabled interface.

- **Range:** 1 through 1,000 sessions
- **Default:** 1

packet-action (drop-and-log | shutdown)

Specify the action the device should take on packets that exceed the limit of authenticated sessions allowed on the interface. The limit for data sessions is configured using the `max-data-session` option. The number of VoIP sessions is not configurable; only one authenticated VoIP session is allowed.

- **Values:** Specify one of the following:
  - drop-and-log—Drop the packet and generate an error syslog message.

- shutdown—Shut down the interface.

- **Default:** drop-and-log

recovery-timeout *seconds*

If you configure the packet action with the shutdown option and you configure the recovery timeout, the interface is temporarily disabled when the maximum number of authenticated sessions is reached. The interface will recover automatically after the number of seconds specified.

- **Range:** 60 through 3600 seconds

- **Default:** none

NOTE: The default values of these optional parameters will be enforced when multi-domain is configured.

multi-sa

IN THIS SECTION

- Syntax | 11514
- Hierarchy Level | 11514
- Description | 11514
- Options | 11515
- Required Privilege Level | 11515
- Release Information | 11515

Syntax

```
multi-sa {
    forwarding-class expedited-forwarding | assured-forwarding | best-effort | network-control;
}
```

Hierarchy Level

```
[edit security ipsec vpn]
```

Description

Negotiate multiple security association (SAs) based on configuration choice. Multiple SAs negotiates with the same traffic selector on the same IKE SA. By negotiating multiple SAs, the peer gateways have more replay windows. If the peer gateways create separate multiple SAs for the configured Forwarding-

Classes (FC), then potentially a separate anti-replay window is available for each FC value. With this mapping, even if CoS can reorder packets, reordering is done with in a given multiple SA, thus avoiding packets drop due to the anti-replay checks.

Options

forwarding-class Forwarding classes (FCs) allow you to group packets for transmission and to assign packets to output queues.

- Values:
  - `expedited-forwarding`—Provides a low-loss, low-latency, low-jitter, assured-bandwidth, end-to-end service.
  - `assured-forwarding`—Provides a group of values you can define and includes four subclasses—AF1, AF2, AF3, and AF4—each with three drop probabilities (low, medium, and high).
  - `best-effort`—Provides no service profile. For the BE forwarding class, loss priority is typically not carried in a class-of-service (CoS) value, and random early detection (RED) drop profiles are more aggressive.
  - `network-control`—This class is typically high priority because it supports protocol control.

Required Privilege Level

security

Release Information

Statement introduced in Junos OS Release 18.2R1.

multi-tenant-hash

IN THIS SECTION

- Syntax | 11516
- Hierarchy Level | 11516
- Description | 11516
- Options | 11517
- Required Privilege Level | 11517
- Release Information | 11517

Syntax

```
multi-tenant-hash {
file-hash-key {
ascii-text;
hexa-decimal;
}
hash-method {

ascii-text;
hexa-decimal;
}
}
```

Hierarchy Level

```
[edit services web-filter]
```

Description

Configure the hash key and hash method to validate the file-hash present at the end of the hashed indicator file.

When `multi-tenant-hash` is configured, It indicates that the global DNS feed file consists of only encrypted feeds. When `multi-tenant-hash` is not configured, it indicates that the feeds present in the global DNS feed file are in plain text format.

Options

file-hash-key Define the web-filter global file key.

hash-method Define the authentication algorithm.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.1R1.

Support added in Junos OS Release 21.1R1 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

multi-tenant-support

IN THIS SECTION

- Syntax | 11518
- Hierarchy Level | 11518
- Description | 11518
- Required Privilege Level | 11518
- Release Information | 11518

Syntax

```
multi-tenant-support
```

Hierarchy Level

```
[edit services service-set service-set-name web-filter
```

Description

Configure domain-names and actions for multiple tenants such that domain feeds can be managed per tenant basis. Thus, you can achieve hierarchical management of the domain feeds per customer (Profile), partitioning the customer into multiple entities (Templates), and further partitioning IP-addresses within that entity into subnets/CIDR/Single IP (Term).

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.1R1.

Support added in Junos OS Release 21.1R1 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

multicast (Dynamic Routing Options)

IN THIS SECTION

- Syntax | 11519
- Hierarchy Level | 11519
- Description | 11519
- Required Privilege Level | 11520
- Release Information | 11520

Syntax

```
multicast {
    interface interface-name {
        no-qos-adjust;
    }
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name routing-options],
[edit dynamic-profiles profile-name routing-instances routing-instance-name routing-options]
```

NOTE: You cannot apply a scope policy to a specific routing instance. That is, all scoping policies are applied to all routing instances. However, the `scope` statement does apply individually to a specific routing instance.

Description

Dynamically configure interface-specific multicast routing options properties in a dynamic client profile.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

multicast (Protocols Router Discovery)

IN THIS SECTION

- Syntax | 11520
- Hierarchy Level | 11521
- Description | 11521
- Default | 11521
- Required Privilege Level | 11521
- Release Information | 11521

Syntax

```
(multicast | broadcast);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-discovery address address],
[edit protocols router-discovery address address]
```

Description

Specify when the server should include the IP addresses in router advertisement packets. On the same physical interfaces, some addresses might be included only in multicast packets, while others might be included only in broadcast packets.

If you specify **multicast**, the server includes the addresses in router advertisement packets only if the packets are multicast. If the router supports IP multicast, and if the interface supports IP multicast, **multicast** is the default. Otherwise, the addresses are included in broadcast router advertisement packets. If the router does not support IP multicast, the addresses are not included.

Default

multicast if the router supports IP multicast; **broadcast** if the router does not support IP multicast.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

multicast (Tunnel Services)

IN THIS SECTION

- Syntax | 11526
- Hierarchy Level (ACX series) | 11526
- Description | 11526
- Required Privilege Level | 11527
- Release Information | 11527

Syntax

```
multicast;
```

Hierarchy Level (ACX series)

```
[edit chassis feb slot slot-number pfe number core number channel number tunnel-services],
[edit chassis fpc slot-number pfe number core number channel number tunnel-services]
```

Description

For ACX7K Series routers, you can create a multicast tunnel (mt) interface and reserve bandwidth for multicast tunnel services using this configuration statement.

For example:

```
set chassis fpc 0 pfe 0 core 0 channel 3 tunnel-services multicast bandwidth 10g
```

This configuration will create multicast tunnel interface `mt-0/0/0:3` with a reserved bandwidth of 10Gbps.

On ACX7K Series routers, the bandwidth value options for using multicast tunnel services are as follows (depending on the specific device):

- 1g
- 10g
- 25g
- 40g
- 50g
- 100g
- 200g
- 400g

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 25.4R1EVO.

multicast-loadbalance

IN THIS SECTION

- Syntax | 11535
- Hierarchy Level | 11535
- Description | 11535
- Default | 11536
- Options | 11536
- Required Privilege Level | 11536
- Release Information | 11536

Syntax

```
multicast-loadbalance {
    disable (Multicast Load Balancing);
    hash-mode mode;
}
```

Hierarchy Level

```
[edit chassis]
```

Description

(EX8200 switches only) Enable multicast load balancing to evenly distribute the Layer 3 routed multicast traffic on aggregated 10-gigabit Ethernet interfaces. When multicast load balancing is enabled on the EX8200 switch, it takes effect on aggregated 10-gigabit Ethernet interfaces that are currently configured as well as those that are configured later.

Crc-sgip mode is the default. If the default mode is implemented and the Layer 3 routed multicast traffic on the aggregated interfaces is not evenly distributed, you can try the other hashing algorithms. Use the algorithm that best balances your Layer 3 routed multicast traffic.

> **NOTE**: If you change the hashing algorithm when multicast load balancing is disabled, the new algorithm takes effect after you reenable multicast load balancing.

Default

Multicast load balancing is enabled.

Options

hash-mode ***mode***—Specify one of these hashing algorithms:

balanced Use a round-robin method to determine the aggregated Ethernet links with the least amount of traffic.

crc-gip Use multicast packets' group IP address as a key to a CRC algorithm to get the hash index. The hashing algorithm used is CRC.

crc-sgip Use multicast packets' source IP address and group IP address for hashing. The hashing algorithm used is CRC.

crc-sip Use multicast packets' source IP address for hashing. The hashing algorithm used is CRC.

simple-gip Use multicast packets' group IP address for hashing. The hashing algorithm used is XOR.

simple-sgip Use multicast packets' GIP bits to calculate the hash index. The hashing algorithm used is XOR.

simple-sip Use multicast packets' source IP address bits for hashing. The hashing algorithm used is XOR.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2 for EX Series switches.

- Release Information | 11541

Syntax

```
multicast-replication {
    evpn {
        irb (local-only | local-remote | oism | enhanced-oism);
        smet-forwarding;
        smet-nexthop-limit smet-nexthop-limit;
    }
    ingress;
    local-latency-fairness;
}
```

Hierarchy Level

```
[edit forwarding-options]
```

Description

Configure the mode of multicast replication that helps to optimize multicast latency.

> **NOTE**: The `multicast-replication` statement is supported only on platforms with the `enhanced-ip` mode enabled.

Default

This statement is disabled by default.

Options

> **NOTE**: The options in the `evpn` hierarchy are specific to EVPN configurations. The `ingress` and the `local-latency-fairness` options do not apply to EVPN configurations.

`ingress` Complete ingress replication of the multicast data packets where all the egress Packet Forwarding Engines receive packets from the ingress Packet Forwarding Engines directly.

`local-latency-fairness` Complete parallel replication of the multicast data packets.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.

```

```
vlan-id igmp-snooping interface interface-name],
[edit protocols igmp-snooping vlan vlan-name interface interface-name],
```

Description

Statically configure the interface as an IGMP snooping multicast-router interface—that is, an interface that faces toward a multicast router or other IGMP querier.

> **NOTE**: If the specified interface is a trunk port, the interface becomes a multicast-routing device interface for all VLANs configured on the trunk port. In addition, all unregistered multicast packets, whether they are IPv4 or IPv6 packets, are forwarded to the multicast routing device interface, even if the interface is configured as a multicast routing device interface only for IGMP snooping.
>
> Configure an interface as a bridge interface toward other multicast routing devices.

Default

Disabled. If this statement is disabled, the interface drops IGMP messages it receives.

The interface can either be a host-side or multicast-routing device interface.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Hierarchy Level

```
[edit protocols mld-snooping vlan (all | vlan-name) interface (all | interface-name)],
[edit routing-instances instance-name protocols mld-snooping vlan vlan-name interface interface-
name]
```

Description

Statically configure the interface as a multicast-router interface—that is, an interface that faces towards a multicast router or other MLD querier.

NOTE: If the specified interface is a trunk port, the interface becomes a multicast-router interface for all VLANs configured on the trunk port. In addition, all unregistered multicast packets, whether they are IPv4 or IPv6 packets, are forwarded to the multicast router interface, even if the interface is configured as a multicast-router interface only for MLD snooping.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

Support at the [edit routing-instances *instance-name* protocols mld-snooping vlan *vlan-name* interface *interface-name*] hierarchy level introduced in Junos OS Release 13.3 for EX Series switches.

multicast-statistics (packet-forwarding-options)

IN THIS SECTION

- Syntax | 11547
- Hierarchy Level | 11548
- Description | 11548
- Required Privilege Level | 11548
- Release Information | 11548

Syntax

```
multicast-statistics;
```

Hierarchy Level

```
[edit system packet-forwarding-options]
```

Description

Counts packets and checks the bandwidth of IPv4 and IPv6 multicast traffic received from a host and group in a routing instance by using firewall filters.

With `multicast-statistics` enabled, route statistics are updated by a firewall counter for the next 512 multicast routes. Statistics are attached and collected on a first-come, first-served basis. To count the packets and bandwidth, the switch uses ingress filters to match on the source IP, destination IP and VRF ID fields. These filters reside in an ingress filter processor (IFP) group that contains a list of routes and their corresponding filter IDs.

When using this command, consider the following:

- You cannot configure filters for reserved multicast addresses.
- The multicast statistic group is the group with the least priority. If there's a rule conflict in another group, the action for the group with the higher priority takes effect.
- Each route takes up one entry in the IFP ternary content-addressable memory (TCAM). If no TCAM space is available, the filter installation fails.
- If you delete this command, any installed firewall rules for multicast statistics are deleted. If you delete a route, the corresponding filter entry is also deleted. When you delete the last entry, the group is automatically removed.

To check the rate and bandwidth per route, enter the "show multicast route" on page 23251 *extensive* command. To see how many filters are on the switch, enter the VTY command `show filter hw groups`. To clear the route counters, enter the "clear multicast statistics" on page 3941 command.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.2R1.

```

Description

Configure an EBGP multihop session.

For Layer 3 VPNs, you configure the EBGP multihop session between the *PE* and *CE* routing devices. This allows you to configure one or more routing devices between the PE and CE routing devices.

An external confederation peer is a special case that allows unconnected third-party next hops. You do not need to configure multihop sessions explicitly in this particular case because multihop behavior is implied.

If you have external BGP confederation peer-to-loopback addresses, you still need the multihop configuration.

> **NOTE**: You cannot configure the `accept-remote-nexthop` statement at the same time.

Default

If you omit this statement, all EBGP peers are assumed to be directly connected (that is, you are establishing a nonmultihop, or "regular," BGP session), and the default time-to-live (TTL) value is 1.

> **NOTE**: In Junos, you can configure TTL for both IPv4 and IPv6 multi-hop eBGP sessions. TTL for IPv6 multi-hop eBGP session refers to hop-limit setting.

Options

no-nexthop-change

Specify that the BGP next-hop value not be changed.

An external confederation peer is a special case that allows unconnected third-party next hops. You do not need to configure multihop sessions explicitly in this particular case; multihop behavior is implied.

If you have external BGP confederation peer-to-loopback addresses, you still need the multihop configuration.

> **NOTE**: You cannot configure the `accept-remote-nexthop` statement at the same time.

- **Default:** If you omit this statement, all EBGP peers are assumed to be directly connected (that is, you are establishing a nonmultihop, or "regular," BGP session), and the default time-to-live (TTL) value is 1.

ttl *ttl-value*

Configure the maximum time-to-live (TTL) value for the TTL in the IP header of BGP packets.

Configure the maximum time-to-live (TTL) value for the TTL in the IP header of BGP packets.

For BGP multihop scenarios, in which EBGP peers are not directly connected to each other, setting a TTL is optional. The default setting is 64.

When configuring PPPoE access model, the recommended multihop BGP TTL value is 2.

For BGP single-hop scenarios, in which external EBGP peers are directly connected to each other, you can, optionally, set the TTL to 255 and configure an inbound firewall filter to allow only BGP control packets with the TTL set to 255. This is in accordance with RFC 3682, *The Generalized TTL Security Mechanism (GTSM)*. For example:

Send all BGP control packets with the TTL set to 255:

```
user@host# show protocols
bgp {
    group toAS2 {
        type external;
        peer-as 2;
        ttl 255;
        neighbor 10.1.2.3;
        neighbor 10.3.4.5;
        neighbor 10.5.6.7;
    }
}
```

Accept only BGP control packets that have the TTL set to 255:

```
user@host# show firewall
filter ttl-security {
    term gtsm {
        from {
            source-address {
                10.1.2.3/32;
                10.3.4.5/32;
                10.5.6.7/32;
            }
            protocol tcp;
            ttl-except 255;
            port 179;
        }
        then {
            discard;
        }
```

```
    }
    term else {
        then {
            accept;
        }
    }
}
```

Apply the firewall filter to the inbound interface for the EBGP single-hop peer:

```
user@host# show interfaces
ge-1/0/0 {
    unit 0 {
        family inet {
            filter {
                input ttl-security;
            }
        }
    }
}
```

- **Range:** 1 through 255, for multihop peers
- **Default:** 64 (for multihop EBGP sessions, confederations, and IBGP sessions)
- **Range:** 1 or 255, for single-hop peers
- **Default:** 1 (for single-hop EBGP sessions)

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for setting the TTL on single-hop external BGP (EBGP) peers introduced in Junos OS Release 13.3.

- Description | **11560**
- Options | **11560**
- Required Privilege Level | **11560**
- Release Information | **11560**

Syntax

```
multilink {
    drop-timeout milliseconds;
    fragment-threshold bytes;
}
```

Hierarchy Level

```
[edit access profile profile-name client client-name l2tp]
```

Description

Configure Multilink PPP for Layer 2 Tunneling Protocol (L2TP).

NOTE: This statement is not supported for L2TP LNS on MX Series routers.

Options

drop-timeout (M Series, MX Series, PTX Series, T Series only) Configure the drop timeout for a multilink bundle.

- Values:
  - *milliseconds*—Number of milliseconds for the timeout that is associated with the first fragment on the reassembly queue. If the timeout expires before all the fragments have been collected, the fragments at the beginning of the reassembly queue are dropped. If the drop timeout is not specified, the Junos OS holds on to the fragments. (Fragments may still be dropped if the multilink reassembly algorithm determines that another fragment belonging to the packet on a reassembly queue has been lost.)

fragment-threshold (M Series, MX Series, PTX Series, T Series only) Configure the fragmentation threshold for a multilink bundle.

- Values:
  - *bytes*—The maximum number of bytes in a packet. If a packet exceeds the fragmentation threshold, the Junos OS fragments it into two or more multilink fragments.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Syntax

```
multipath [
    weighted {
        one-hop;
    }
}
```

Hierarchy Level

```
[edit protocols ospf spf-options]
```

Description

Enable weighted equal-cost multipath (ECMP) for load-sharing data based on the bandwidth for incoming traffic destined to OSPFv2 neighbors that are at a one-hop distance. The OSPFv2 protocol gets the logical interface bandwidth information associated with the gateways of ECMP next hop and shares this information with the routing protocol process (rpd) and the Packet Forwarding Engine.

Instead of distributing traffic equally over multiple paths, weighted equal-cost multipath (ECMP) routing distributes traffic based on the total available bandwidth for each gateway of a next hop. It thereby distributes traffic unequally over multiple paths and utilizes available bandwidth more efficiently for better load balancing.

NOTE: Weighted equal-cost multipath routing displays unequal traffic distribution prominently when the traffic flow is as heavy as 10000 flows.

Options

weighted Enable weighted ECMP for efficient load sharing.

one-hop Enable weighted ECMP load balancing on IOSPFv2 neighbors that are just one hop away based on the interface bandwidth.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

```
[edit tenants name routing-instances name  protocols bgp group group-name]
[edit tenants name routing-instances name  protocols bgp group group-name neighbor]
```

Description

Allow load sharing among multiple EBGP paths and multiple IBGP paths. A path is considered a BGP equal-cost path (and will be used for forwarding) if a tie-break is performed. The tie-break is performed after the BGP route path selection step that chooses the next-hop path that is resolved through the IGP route with the lowest metric. All paths with the same neighboring AS, learned by a multipath-enabled BGP neighbor, are considered.

From 23.4R1 release Junos supports EBGP and IBGP (EIBGP) multipath. In the existing BGP multipath, EBGP routes take priority over IBGP routes because both have different metrics. After you enable EIBGP multipath and there is equal load sharing between EBGP and IBGP routes, Junos OS initiates ECMP using a blend of both EBGP and IBGP.

Feature-specific policies specify prefixes that support EIBGP multipath. You can configure the policy to choose the prefixes based on any match condition.

NOTE: BGP multiple path options must be consistent for all routes forming a BGP multiple path. If BGP multiple path options differ, the multiple path feature chooses a preference, and the multiple path feature might not function as intended.

NOTE: Starting in Junos OS Release 18.1, BGP multipath is supported globally at the `[edit protocols bgp]` hierarchy level. You can selectively disable multipath on some BGP groups and neighbors. Include `disable` at `[edit protocols bgp group group-name multipath]` hierarchy level to disable the multipath option for a group or a specific BGP neighbor.

Options

allow-external-internal Allows IBGP paths to coexist with EBGP paths, and considers both EBGP and IBGP paths equal when path selection between them reaches a point where EBGP paths are preferred.

allow-protection Allows BGP multipath and protection to co-exist. When `allow-protection` is configured there may be a change in `show route` output: N+1 nexthop formation (N ecmp plus 1 backup paths).

disable Disable the multipath option either at the global level for BGP or for a specific group or neighbor and still allow multipath for other groups or neighbors. Before disabling

multipath for specific groups or neighbors, ensure that you have enabled multipath at the global level, by configuring the `multipath` statement at the `[edit protocols bgp]` hierarchy level.

list-nexthop Enable SRv6 service route multipath

`multiple-as` Disable the default check requiring that paths accepted by BGP multipath must have the same neighboring AS.

`prioritization` Prioritization in multipath BGP involves selecting and load-sharing traffic across multiple equal-cost BGP paths, including both EBGP and IBGP routes. Prioritization can be used to prioritize critical routes in BGP multipath computations with low-, medium-, and high-priority queues.

`starving-age` The time and entry has been in one of the multipath priority queues in which it is considered starving and eligible for being serviced based on age instead of priority. The default value is 60 seconds.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`disable` option introduced in Junos OS Release 18.1R1.

`allow-protection` option introduced in Junos OS Release 18.4R1.

`allow-external-internal` option introduced in Junos OS Release 23.4R1.

```
multipath [
    weighted {
        one-hop;
    }
}
```

Hierarchy Level

```
[edit protocols isis spf-options]
```

Description

Enable weighted equal-cost multipath (WECMP) routing to load-balance traffic in proportion to the changing aggregated ethernet link bandwidth on an equal cost path (ECMP) between directly connected routers. Distributing traffic equally on all equal cost path (ECMP) might lead to imbalanced link utilization if a change occurs in the capacity of any of the local links. In this case, weighted ECMP facilitates load balancing of traffic between equal cost paths only in proportion to the capacity of the local links. After you enable the new configuration statement, whenever an interface change happens, route installation gets scheduled with the updated bandwidth value to distribute traffic accordingly.

Options

weighted Enable weighted ECMP for efficient load sharing.

one-hop Enable weighted ECMP load balancing on IS-IS neighbors that are just one hop away based on the interface bandwidth.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F4.

multipath-build-priority

IN THIS SECTION

- Syntax | 11572
- Hierarchy Level | 11572
- Description | 11573
- Required Privilege Level | 11573
- Release Information | 11573

Syntax

```
multipath-build-priority {
    ( low | medium);
}
```

Hierarchy Level

```
[edit fabric protocols bgp],
[edit logical-systems name protocols bgp],
[edit logical-systems name routing-instances name protocols bgp],
[edit protocols bgp],
[edit routing-instances name protocols bgp]
```

Description

Configure a priority for multipath resolution during load balancing. When multipath is enabled on a route reflector, BGP calculates the multipaths each time a new route is added or whenever an existing route is changed, which uses up system resources and slows down the BGP RIB resolution. Configure BGP multipath job priority to delay the multipath calculation and to improve the RIB, also known as the routing table learning rate.

Required Privilege Level

routing

Release Information

Statement introduced in Junos OS Release 18.1R1.

Understanding BGP Multipath

multipath-rule

IN THIS SECTION

- Syntax | 11574
- Hierarchy Level | 11574
- Description | 11574
- Options | 11574
- Required Privilege Level | 11575
- Release Information | 11575

Syntax

```
multipath-rule name {
      application;
      application-group;
      bandwidth-limit bandwidth-limit;
      enable-reverse-wing;
      link-preferences;
      link-type (IP | MPLS);
      number-of-paths number-of-paths;
      }
```

Hierarchy Level

```
[edit security advance-policy-based-routing]
```

Description

Configure application-based multipath routing options.

A multipath rule is attached to an SLA rule. The SLA rule is an action part of the APBR rule in a APBR profile. So, whenever a traffic matches the APBR profile, the SLA rule and the multipath rule gets applied and hence multipathing is enabled for that traffic.

Options

name Name of the multipath rule.

application Dynamic application type to match.

application-group Dynamic application group type to match.

bandwidth-limit Bandwidth limit on slowest link to avoid saturation in percentage.

- Range: 1 through 100
- Default: 50% of 1 Gbps

enable-reverse-wing Enable packet copy in the reverse direction flow.

link-preferences Specify link preference for overlay interfaces. You can specify interfaces such as generic routing encapsulation (GRE) and secure tunnel (st)

If you have not configured the `link-preference`, then the AMR selects links from the first two available links from the configured paths.

link-type Specify the underlay interface user defined link types. If you do not configure `link-type`, then AMR selects the first two links from the configured paths.

number-of-path Allocate the number of paths for multipath routing.

- Range: 2 to 16
- Default: 2

Required Privilege Level

must-secure

IN THIS SECTION

- Syntax | 11590
- Hierarchy Level | 11590
- Description | 11590
- Default | 11591
- Required Privilege Level | 11591
- Release Information | 11591

Syntax

```
must-secure;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name mka]
```

Description

Specifies that all traffic travelling on the MACsec-secured link must be MACsec-secured to be forwarded onward.

When the `must-secure` option is enabled, all traffic that is not MACsec-secured that is received on the interface is dropped.

When the `must-secure` option is disabled, all traffic from devices that support MACsec is MACsec-secured while traffic received from devices that do no support MACsec is forwarded through the network.

The `must-secure` option is particularly useful in scenarios where multiple devices, such as a phone and a PC, are accessing the network through the same Ethernet interface. If one of the devices supports MACsec while the other device does not support MACsec, the device that doesn't support MACsec can continue to send and receive traffic over the network—provided the `must-secure` option is disabled—while

traffic to and from the device that supports MACsec is MACsec-secured. In this scenario, traffic to the device that is not MACsec-secured must be VLAN-tagged.

Default

The `must-secure` option is disabled.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Release Information

Statement introduced in Junos OS Release 8.4.

Support for the `traceoptions` statement at the `[edit protocols mvpn]` hierarchy level introduced in Junos OS Release 13.3.

Support for the `inter-region-template` statement at the `[edit protocols mvpn]` hierarchy level introduced in Junos OS Release 15.1.

RELATED DOCUMENTATION

Configuring Routing Instances for an MBGP MVPN

mvpn-iana-rt-import

IN THIS SECTION

- Syntax | 11599
- Hierarchy Level | 11600
- Description | 11600
- Default | 11600
- Required Privilege Level | 11600
- Release Information | 11600

Syntax

```
mvpn-iana-rt-import;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols bgp group group-name],
[edit protocols bgp group group-name]
```

Description

Enables the use of *IANA* assigned rt-import type values (0x010b) for mutlicast VPNs. You can configure this statement on ingress PE routers only.

> **NOTE**: If you configure the `mvpn-iana-rt-import` statement in Junos OS release 10.4R2 and later, the Juniper Networks router can inter-operate with other vendors routers for multicast VPNs. However, the Juniper Networks router cannot inter-operate with Juniper Networks routers running Junos OS release 10.4R1 and earlier.
>
> If you do not configure the `mvpn-iana-rt-import` statement in Junos OS release 10.4R2 and later, the Juniper Networks router cannot inter-operate with other vendors routers for multicast VPNs. However, the Juniper Networks router can inter-operate with Juniper Networks routers running Junos OS release 10.4R1 and earlier.

Default

The default rt-import type value is 0x010a.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS release 10.4R2.

Statement deprecated in Junos OS release 17.3, which means it no longer appears in the CLI but can be accessed by scripts or by typing the command name until it is finally removed.

mvpn-mode

IN THIS SECTION

- Syntax | 11601
- Hierarchy Level | 11601
- Description | 11601
- Default | 11601
- Required Privilege Level | 11601
- Release Information | 11602

Syntax

```
mvpn-mode (rpt-spt | spt-only);
```

Hierarchy Level

```
[edit logical-systems profile-name routing-instances instance-name protocols mvpn],
[edit routing-instances instance-name protocols mvpn]
```

Description

Configure the mode for customer PIM (C-PIM) join messages. Mixing MVPN modes within the same VPN is not supported. For example, you cannot have spt-only mode on a source PE and rpt-spt mode on the receiver PE.

Default

`spt-only`

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

```
[edit protocols],
[edit routing-instances routing-instance-name protocols]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

For Layer 2 networks, configure Multiple VLAN Registration Protocol (MVRP) to dynamically share VLAN information and dynamically configure needed VLANs. Maintaining VLAN configurations based on active VLANs reduces the amount of traffic traveling in the network, saving network resources. MVRP is configured on trunk interfaces.

Configure Multiple VLAN Registration Protocol (MVRP) on a trunk interface to ensure that the VLAN membership information on the trunk interface is updated as the switch's access interfaces become active or inactive in the configured VLANs.

> **NOTE**: At Junos OS Release 11.3, MVRP was updated to conform to the IEEE standard 802.1ak. This update might result in compatibility issues in mixed release networks. For details, see *Configuring Multiple VLAN Registration Protocol (MVRP) on Switches* .

The remaining statements are explained separately. See CLI Explorer.

Default

MVRP is disabled by default.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

Syntax

```
name-format "format";
```

Hierarchy Level

```
[edit services flow-collector file-specification variant variant-number]
```

Description

Specify the name format for a specific file format. The files can include supported macros. Use macros to organize files on the external machine to which they are exported from the collector PIC.

Options

format—Specify the filename format, within quotation marks. The name format can include the following macros, typed in braces:

- `{%D}`—Date
- `{%T)`—Time when the file is created
- `{%I}`—Description string for the logical interface configured using the `collector` statement at the `[edit services flow-collector interface-map]` hierarchy level

- {%N}—Unique, sequential number for each new file created
- {am_pm}—AM or PM
- {date}—Current date using the{year} {month} {day} macros
- {day}—From01 through 31
- {day_abbr}—Sun through Sat
- {day_full}—Sunday through Saturday
- {generation number}—Unique, sequential number for each new file created
- {hour_12}—From 01 through 12
- {hour_24}—From 00 through 23
- {ifalias}—Description string for the logical interface configured using the collector statement at the [edit services flow-collector interface-map] hierarchy level
- {minute}—From 00 through 59
- {month}—From 01through 12
- {month_abbr}—Jan through Dec
- {month_full}—January through December
- {num_zone}—From -2359 through +2359; this macro is not supported
- {second}—From 00 through 60
- {time}—Time the file is created, using the {hour_24} {minute} {second} macros
- {time_zone}—Time zone code name of the locale; for example,gmt (this macro is not supported).
- {year}—In the format YYYY; for example, 1970
- {year_abbr}—From 00 through 99

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Syntax

```
name-format (character-string | none | dns | mac+2oct);
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]
```

Description

Specify the format of the maintenance domain name.

Options

`character-string`—The name is an ASCII character string.

`none`—The maintenance domain name is not used.

`dns`—The name is in domain name service (DNS) format. For example: www.juniper.net.

`mac+2oct`—Name is the MAC address plus a two-octet maintenance association identifier. For example: 08:00:22:33:44:55.100.

- **Default:** `character-string`

Required Privilege Level

interface—To view this statement in the configuration.

    }
}
```

Hierarchy Level

```
[edit system],
[edit system services dhcp],
[edit system services dhcp pool subnet-address],
[edit system services dhcp static-binding mac-address]
```

Description

Configure one or more Domain Name System (DNS) name servers.

Options

address

Address of the name server. To configure multiple name servers, include a maximum of three *address* options. The system uses only the first three configured addresses even if you configure additional addresses.

routing-instance mgmt_junos

Configure the routing instance through which the name server is reachable as the management routing instance (`mgmt_junos`).

> **NOTE**: Use Feature Explorer to determine which platforms support this feature.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`routing-instance` option introduced in Junos OS Release 19.2R1 and Junos OS Evolved Release 20.1R1 under the `[edit system]` hierarchy level only.

    vlan-width bits;
    vpi-width bits;
}
```

Hierarchy Level

```
[edit interfaces interface-name radius-options nas-port-options nas-port-options-name]
```

Description

Configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width in bits of the fields in the NAS-Port attribute.

Options

`adapter-width` *width*—Number of bits in the adapter field.

`ae-width` *width*—Number of bits in the aggregated Ethernet identifier field.

`port-width` *width*—Number of bits in the port field.

`slot-width` *width*—Number of bits in the slot field.

`stacked`—Include stacked VLAN IDs, in addition to VLAN IDs, in the NAS-Port extended format.

`stacked-vlan-width` *width*—Number of bits in the SVLAN ID field.

`vci-width` *width*—Number of bits in the ATM virtual circuit identifier (VCI) field.

`vlan-width` *width*—Number of bits in the VLAN ID field.

`vpi-width` *width*—Number of bits in the ATM virtual path identifier (VPI) field.

> **NOTE**: Each field can be 0 through 32 bits wide; however, the total of the widths of all fields must not exceed 32 bits, or the configuration fails.
>
> The router may truncate the values of individual fields depending on the bit width you specify.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

Options `vci-width` and `vpi-width` introduced in Junos OS Release 12.3R3 and supported in later 12.3R*x* releases.

Options `vci-width` and `vpi-width` supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

- Hierarchy Level | 11645
- Description | 11645
- Options | 11645
- Required Privilege Level | 11646
- Release Information | 11646

Syntax

```
nas-port-extended-format {
    adapter-width bits;
    ae-width bits;
    atm {
        adapter-width bits;
        port-width bits;
        slot-width bits;
        vci-width bits;
        vpi-width bits;
    }
    port-width bits;
    pw-width bits;
    slot-width bits;
    stacked-vlan-width bits;
```

```
    vlan-width bits;
}
```

Hierarchy Level

```
[edit access profile profile-name radius options]
```

Description

Configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width in bits of the fields in the NAS-Port attribute.

The NAS-Port attribute specifies the physical port number of the NAS that is authenticating the user, and is formed by a combination of the physical port's slot number, port number, adapter number, VLAN ID, and S-VLAN ID. The NAS-Port extended format specifies the number of bits (bit width) for each field in the NAS-Port attribute: slot, adapter, port, aggregated, Ethernet, VLAN, and S-VLAN.

> **NOTE**: The combined total of the widths of all fields for a subscriber must not exceed 32 bits, or the configuration fails. The router may truncate the values of individual fields depending on the bit width you specify.

Options

`adapter-width` *width*—Number of bits in the adapter field.

`ae-width` *width*—(Ethernet subscribers only) Number of bits in the aggregated Ethernet identifier field.

`atm`—Specify width for fields for ATM subscribers.

`port-width` *width*—Number of bits in the port field.

`pw-width` *width*—(Ethernet subscribers only) Number of bits in the pseudowire field. Appears in the Cisco NAS-Port-Info AVP (100).

`slot-width` *width*—Number of bits in the slot field.

`stacked-vlan-width` *width*—Number of bits in the SVLAN ID field.

`vci-width` *width*—(ATM subscribers only) Number of bits in the ATM virtual circuit identifier (VCI) field.

`vlan-width` *width*—Number of bits in the VLAN ID field.

`vpi-width` *width*—(ATM subscribers only) Number of bits in the ATM virtual path identifier (VPI) field.

NOTE: The total of the widths must not exceed 32 bits, or the configuration will fail.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

`ae-width` option added in Junos OS Release 12.1.

`atm` option added in Junos OS Release 12.3R3 and supported in later 12.3R*x* releases.

`atm` option supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

`pw-width` option added in Junos OS Release 15.1.

}
```

Hierarchy Level

```
[edit access profile profile-name radius options]
```

Description

Specify the optional information that the router includes in the NAS-Port-ID (RADIUS attribute 87) that is passed to the RADIUS server during authentication and accounting. You can include any combination of the optional values.

When you specify the values for the NAS-Port-ID, you can configure the values to appear in either the default order or a custom order of your choice.

> **NOTE**: The default and custom order methods are mutually exclusive. The configuration fails if you attempt to configure a NAS-Port-ID that includes values in both types of orders.

To specify that the optional values appear in the default order in the NAS-Port-ID, configure the values directly under the `nas-port-id-format` statement. The default order is as follows, in which the `#` character is the delimiter:

```
nas-identifier # interface-description # interface-text-description # agent-circuit-id # agent-remote-id #
postpend-vlan-tags
```

To specify a custom order for the NAS-Port-ID string, you use the `order` option. Include the `order` option before each optional value you want to include in the string, in the order in which you want the options to appear. For example, the configuration, `order interface-text-description order nas-identifier order agent-remote-id` produces the following NAS-Port-ID, in which the `#` character is the delimiter:

```
interface-text-description # nas-identifier # agent-remote-id
```

Starting in Junos OS Release 21.3R1, we have introduced a new NAS-Port-ID format for RADIUS server access request. The NAS-Port-ID format is `S-VLAN<concatenated 0's>C-VLAN:S-VLAN-C-VLAN`. For customer-VLAN (C-VLAN), if the number of digits is less than four, prepend it with zeroes. For example, NAS-Port-ID for an S-VLAN 72 and C-VLAN 82 is `720082:72-82`.

Default

The router includes the interface description in the NAS-Port-ID when no optional values are specified.

Options

`agent-circuit-id`—Include the agent circuit ID from either DHCP option 82 or the DSL forum VSAs.

`agent-remote-id`—Include the agent remote ID from either DHCP option 82 or the DSL forum VSAs.

`concatenated-vlan-tags`—Include the vlan tags as a concatenated string.

`fixed-size-inner-tag`—Fixed size inner VLAN tag value of 4 octets.

`fixed-size-outer-tag`—Fixed size outer VLAN tag value of 4 octets.

`interface-description`—Include the interface description (interface identifier).

`interface-text-description`—Include the textual interface description (the text description that is statically configured in the CLI).

`nas-identifier`—Include the NAS identifier value (RADIUS attribute 32).

`order`—Specify the optional values you want to include in the NAS-Port-ID and the customized order in which you want the values to appear. You must include the `order` option before each optional value (for example, `order agent-circuit-id order interface-description`).

`postpend-vlan-tags`—Include the VLAN tags. The router includes the tags in the format `:<outer-tag>-<inner-tag>` for a double-tagged VLAN, or `:<outer-tag>` for a single-tagged VLAN.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Options `interface-text-description`, `order`, and `postpend-vlan-tags` introduced in Junos OS Release 15.1.

}
```

Hierarchy Level

```
[edit interfaces interface-name radius-options]
```

Description

Create a NAS-Port options definition to configure the NAS-Port-Type (61) RADIUS IETF attribute, and an extended format for the NAS-Port (5) RADIUS IETF attribute, on a per-physical interface, per-VLAN, or per-stacked VLAN (S-VLAN) basis. Each NAS-Port options definition includes the NAS-Port extended format, the NAS-Port-Type, and either the VLAN range of subscribers or the S-VLAN range of subscribers to which the definition applies.

> **NOTE**: You can configure a maximum of 16 NAS-Port options definitions per physical interface. Each definition can include a maximum of 32 VLAN ranges or 32 S-VLAN ranges, but cannot include a combination of VLAN ranges and S-VLAN ranges.

Options

nas-port-options-name	Name of the NAS-Port options definition.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

Syntax

```
nas-port-type port-type;
```

Hierarchy Level

```
[edit interfaces interface-name radius-options nas-port-options nas-port-options-name]
```

Description

Specify the port type used to authenticate subscribers. The router includes the port type in the NAS-Port-Type (61) RADIUS IETF attribute.

Default

If you do not include the `nas-port-type` statement at the `[edit interfaces interface-name radius-options nas-port-options nas-port-options-name]` hierarchy level, the global value configured for `nas-port-type` at the `[edit access profile profile-name radius options]` hierarchy level takes effect.

Options

port-type One of the following port types:

- *value*—A value from 0 through 65535
- `adsl-cap`—Asymmetric DSL, carrierless amplitude phase (CAP) modulation
- `adsl-dmt`— Asymmetric DSL, discrete mutilating (DOT)
- `async`—Asynchronous
- `cable`—Cable
- `ethernet`—Ethernet
- `fddi`—Fiber Distributed Data Interface
- `g3-fax`—G.3 Fax
- `hdlc-clear-channel`—HDLC Clear Channel
- `iapp`—Inter-Access Point Protocol (IAPP)
- `idsl`—ISDN DSL
- `isdn-sync`—ISDN Synchronous
- `isdn-v110`—ISDN Async V.110
- `isdn-v120`—ISDN Async V.120
- `piafs`—Personal Handyphone System (PHS) Internet Access Forum Standard
- `sdsl`—Symmetric DSL
- `sync`—Synchronous
- `token-ring`—Token Ring
- `virtual`—Virtual
- `wireless`—Other wireless
- `wireless-1x-ev`—Wireless 1xEV
- `wireless-cdma2000`—Wireless code division multiple access (CDMA) 2000

- `wireless-ieee80211`—Wireless 802.11
- `wireless-umts`—Wireless universal mobile telecommunications system (UMTS)
- `x25`—X.25
- `x75`—X.75
- `xdsl`—DSL of unknown type

nasreq (Diameter Application)

IN THIS SECTION

- Syntax | 11661
- Hierarchy Level | 11661
- Description | 11661
- Options | 11662
- Required Privilege Level | 11662

Release Information | 11662

Syntax

```
nasreq
    max-outstanding-requests number;
    partition partition-name {
        destination-host hostname;
        destination-realm realm-name;
        diameter-instance master;
    }
    request-retry retries;
    timeout seconds;
}
```

Hierarchy Level

```
[edit access]
```

Description

Specify the destination and transmission parameters for the Diameter Network Access Server Requirements (NASREQ) protocol.

NASREQ is a Diameter-based authentication and authorization protocol. The NASREQ client has two queues, the transmit queue and response queue. The transmit queue stores outbound packets until sent to Diameter, and includes requests and responses. The response queue stores request packets until Diameter responds to the request, and includes only requests waiting for a response.

The following configuration options control transmission flow and use of the queues:

- `max-outstanding-requests` option specifies the maximum number of requests (includes AAR and STR) that the NASREQ client sends to Diameter for wireline transmissions. Effectively, this is the maximum count of requests on the response-queue (the maximum number of in-flight requests for which there has not been a response or timeout); it does not include sent responses.

- The `request-retry` option specifies how many times the NASREQ client retries transmitting a packet to the Diameter server when a timeout is received from the Diameter server for the request.
- The `timeout` option specifies the number of seconds that an outbound packet remains in the transmit queue before it is declared to have timed out. The NASREQ client does not transmit packets that have timed out. The timeout value applies to all packets in the transmit queue, including both requests and responses to be sent. Diameter manages packets that time out after transmission.

Options

number Maximum number of requests that the NASREQ client sends to Diameter.

- **Range:** 20 through 100

retries Number of times to re-send a timeout request to Diameter after the initial request. This value applies only to requests in the response queue. A value of 0 indicates to try transmission once and then do not retry.

- **Range:** 0 through 3

seconds Number of seconds that an outbound packet remains in the transmit queue before it is declared to have timed out.

- **Range:** 5 through 30

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

                            routing-instance (default | routing-instance-name);
                        }
                    }
                }
            }
        }
    }
    traceoptions {
        file {
            filename;
            files number;
            match regular-expression;
            size maximum-file-size;
            (world-readable | no-world-readable);
        }
        flag flag;
        no-remote-trace;
    }
}
```

Hierarchy Level

```
[edit security]
[edit tenants tenant-name security]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure Network Address Translation (NAT) for NFX Series and SRX Series Firewalls.

Options

destination	Configure Destination NAT.
natv6v4	Configure NAT between IPv6 and IPv4 options.
no-v6-frag-header	Configure to disable adding fragment header in non-fragmented IPv6 packets when performing IPv4 to IPv6 translation.
proxy-arp	Configure Proxy ARP.
proxy-ndp	Configure Proxy NDP.
source	Configure Source NAT.
static	Configure Static NAT.
traceoptions	Configure NAT traceoptions.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.6.

The `description` option added in Junos OS Release 12.1.

The tenant option is introduced in Junos OS Release 18.3R1.

The `radius-accounting` and `subscriber-extension` options are introduced in Junnos OS Release 24.2R1.

Understanding Logical Systems Network Address Translation

nat-cone-binding

IN THIS SECTION

- Syntax | 11669
- Hierarchy Level | 11669
- Description | 11669
- Options | 11670
- Required Privilege Level | 11670
- Release Information | 11670

Syntax

```
nat-cone-binding {
    maximum maximum;
    reserved reserved;
}
```

Hierarchy Level

```
[edit system security-profile]
```

Description

Specify the number of NAT cone binding configurations that user logical system administrators and primary logical system administrators can configure for their logical systems if the security profile is bound to the logical systems.

The primary administrator:

- uses security profiles to provision logical systems with resources.
- binds security profiles to user logical systems and the primary logical system.

- can configure more than one security profile, specifying different amounts of resource allocations in various profiles.

Only the primary administrator can create security profiles and bind them to logical systems.

Options

maximum A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows it can utilize resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems compete for global resources.

- **Range:** 0 through 2097152

reserved A reserved quota that guarantees that the resource amount specified is always available to the logical system.

- **Default:** 0

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

Release Information

Statement introduced in Junos OS Release 25.4R1.

native-vlan-id

IN THIS SECTION

- Syntax | 11704
- Hierarchy Level | 11704
- Description | 11704
- Default | 11705
- Options | 11705
- Required Privilege Level | 11705
- Release Information | 11706

Syntax

```
native-vlan-id vlan-id;
```

Hierarchy Level

For platforms without ELS:

```
[edit interfaces interface-name unit 0 family ethernet-switching]
```

For MX Series routers and platforms with ELS:

```
[edit interfaces interface-name]
```

Description

Configure the VLAN identifier to associate untagged packets received on a trunk interface.

You must configure a logical interface with the VLAN ID that is same as the native VLAN ID confiured on the interface, to receive the untagged packets on the interface.

To configure the logical interface, include the `vlan-id` statement (matching the `native-vlan-id` statement on the physical interface) at the `[edit interfaces` *`interface-name`* `unit` *`logical-unit-number`*`] hierarchy level`.

When the `native-vlan-id` statement is included with the "flexible-vlan-tagging" on page 7578 statement, untagged packets are accepted on the same mixed VLAN-tagged port and on the interfaces that are configured for Q-in-Q tunneling.

When the `native-vlan-id` statement is combined with the "interface-mode" on page 9438 statement, untagged packets are accepted and forwarded within the bridge domain or VLAN that is configured with the matching VLAN ID.

> **NOTE**: Starting in Junos OS Release 17.1R1, you can send untagged traffic without a native VLAN ID to the remote end of the network. To do this, remove the native VLAN ID from the untagged traffic configuration by setting the `no-native-vlan-insert` statement. If you do not configure this statement, the native VLAN ID is added to the untagged traffic.

> **NOTE**: Starting in Junos OS Release 25.2R1-EVO, the QFX5230 and QFX5240 platfoms support the `native-vlan-id` CLI command at the system level. You can configure a native VLAN ID on one interface, but you cannot reuse that VLAN ID as a trunk VLAN ID on another interface. For example, if you set a `native-vlan-id` of 100 on the *et-0/0/1* interface, 100 won't be a valid trunk VLAN ID on other interfaces. You can use any other VLAN ID as a trunk VLAN ID.

Default

By default, the untagged packets are dropped on trunk interfaces. That is, if you do not configure the `native-vlan-id` option on trunk interfaces, the untagged packets are dropped.

Options

vlan-id—Numeric identifier of the VLAN.

- **Range:** 1 through 4094

number—VLAN ID number.

- **Range:** 0 through 4094.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Syntax

```
nd6-max-cache nd6-max-cache;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family inet6]
```

Description

Specify the maximum number of entries that can be added to the Neighbor Discovery Protocol (NDP) IPv6 neighbor discovery cache for an interface. When this maximum is reached, no new entries are allowed.

Default

- 100,000 for M Series and PTX Series.
- 75,000 for MX Series and QFX Series.
- 20,000 for EX Series.

Options

nd6-max-cache Maximum size of the neighbor discovery next-hop cache for an interface.

- **Range:** 1 through 2,000,000 for MX Series, PTX Series or QFX Series.
- **Range:** 1 through 700,000 for M Series.

nd-retransmit-timer

IN THIS SECTION

- Syntax | 11719
- Hierarchy Level | 11719
- Description | 11719
- Options | 11719
- Required Privilege Level | 11719

Release Information | 11719

Syntax

```
nd-retransmit-timer milliseconds;
```

Hierarchy Level

```
[edit system]
```

Description

Set the retransmit timer for neighbor discovery messages. Whenever the state of a neighbor during the Neighbor Discovery (ND) process changes from stale to probe, the value of the retransmit timer controls the interval between the neighbor solicitation messages that are sent out. Also, the retransmit timer controls the time for which the neighbor is in the probe state. A device sends a neighbor solicitation message after the specified number of milliseconds in the nd-retransmit-timer statement, until a reachability confirmation is received. If a solicited neighbor advertisement (NA) message is not received from the neighbor in response to the soliciation message sent from the device, the neighbor remains in the probe state.

Options

milliseconds—Retransmission frequency.

- **Default:** 0 milliseconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols bgp group group-name]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Explicitly configure a neighbor (peer). To configure multiple BGP peers, include multiple `neighbor` statements.

By default, the peer's options are identical to those of the group. You can override these options by including peer-specific option statements within the `neighbor` statement.

The `neighbor` statement is one of the statements you can include in the configuration to define a minimal BGP configuration on the routing device. (You can include an `allow all` statement in place of a `neighbor` statement.)

> **NOTE**: On MX Series routers configured with enhanced subscriber management, you can use this statement to statically provision a subscriber's client IP address as the BGP neighbor IP address. This is supported for only LNS subscribers. With enhanced subscriber management, you must also configure the `routing-services` statement at the [`edit dynamic-profiles` *`profile-name`* `interfaces` *`interface-name`* `unit` *`logical-unit-number`*] hierarchy level.

Options

address—IPv6 or IPv4 address of a single peer. When you configure the BGP neighbors, use the PPPoE client IP addresses as the BGP neighbor addresses.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols l2circuit],
[edit protocols l2circuit]
```

Description

Each Layer 2 circuit is represented by the logical interface connecting the local provider edge (PE) router or switch to the local customer edge (CE) router or switch. All the Layer 2 circuits using a particular remote PE router or switch designated for remote CE routers or switches are listed under the `neighbor` statement (neighbor designates the PE router or switch). Each neighbor is identified by its IP address and is usually the end-point destination for the LSP tunnel (transporting the Layer 2 circuit).

Options

address—IP address of a neighboring router or switch.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

neighbor (Protocols LDP)

IN THIS SECTION

- Syntax | 11738
- Hierarchy Level | 11738
- Description | 11738
- Options | 11738
- Required Privilege Level | 11738
- Release Information | 11738

Syntax

```
neighbor neighbor-address;
```

Hierarchy Level

```
[edit protocols ldp]
```

Description

Configure an LDP targeted neighbor.

LDP sends a targeted hello message to the configured remote neighbor with a targeted request-send-targeted hello message (T) bit set. If the remote neighbor allows receipt of asymmetric hello messages, or if it is configured with the source address as the targeted neighbor, it responds with a targeted hello message. The receipt of a targeted hello message establishes a targeted adjacency with the remote neighbor as described in RFC 5036. Subsequently, a targeted session is established to the remote neighbor.

Options

neighbor-address	IP address of the remote LDP neighbor.

Required Privilege Level

routing

Release Information

Statement introduced before Junos OS Release 14.2R1.

}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
vpls],
[edit routing-instances routing-instance-name protocols vpls]
```

Description

Specify each of the PE routers participating in the VPLS domain. Configuring this statement enables LDP for signaling VPLS.

> **NOTE**: In the VPLS documentation, the word *router* in terms such as *PE router* is used to refer to any device that provides routing functions.

Options

neighbor-id—Specify the neighbor identifier for each PE router participating in the VPLS domain.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

The `pseudowire-status-tlv` option was added in Junos OS Release 10.0.

The `vpls-id-list` option was added in Junos OS Release 14.2 for MX Series routers to provide support for multiple pseudowires between the same pair of PEs in LDP-VPLS.

            no-remote-trace;
        }
    }
}
```

Hierarchy Level

```
[edit protocols]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable Secure Neighbor Discovery.

Options

dad-proxy Configure DAD proxy behaviour.

- no-proxy-on-resolve—Disable proxy on unresolved address

ndp-proxy Configure NDP proxy behaviour.

- no-proxy-on-resolve—Disable proxy on unresolved address
- proxy-force-resolve—Enable Neighbor Solicitation for already learned address

no-dad-on-state-change Disable DAD on interface state change.

The remaining statements are explained separately. See CLI Explorer.

Default

Disabled

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Option `proxy-force-resolve` introduced onn SRX Series and vSRX Virtual Firewall 3.0 platforms in Junos OS Release 22.1R1.

RELATED DOCUMENTATION

Secure IPv6 Neighbor Discovery

neighbor-discovery-inspection

IN THIS SECTION

- Syntax | 11748
- Hierarchy Level | 11748
- Description | 11748
- Default | 11748
- Required Privilege Level | 11748
- Release Information | 11749

Syntax

```
neighbor-discovery-inspection;
```

Hierarchy Level

```
[edit vlans vlan-name forwarding-options dhcp-security],
[edit ethernet-switching-options secure-access-port vlan (all | vlan-name)]
```

Description

Perform dynamic IPv6 neighbor discovery inspection on the specified VLAN.

When neighbor discovery inspection is configured, the switch inspects IPv6 packets with neighbor discovery messages and validates them against the DHCPv6 binding table. The source IP address and source MAC address of each packet are checked against the table, and if a valid match is not found, the packet is dropped.

> **NOTE**: If you configure the `neighbor-discovery-inspection` statement at the `[edit vlans vlan-name forwarding-options dhcp-security]` hierarchy level, DHCPv6 snooping is automatically enabled for the specified VLAN.
> See *IPv6 Neighbor Discovery Inspection* for more information about this configuration.
>
> If you configure the `neighbor-discovery-inspection` statement at the `[edit ethernet-switching-options secure-access-port vlan (all | vlan-name)]` hierarchy level, you must also enable DHCPv6 snooping for the specified VLAN or VLANs.

Default

Disabled.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X51-D20.

Support at the `[edit ethernet-switching-options secure-access-port vlan (all | vlan-name)]` hierarchy level introduced in Junos OS Release 14.1X53-D10 for EX Series switches.

Starting in Junos OS Release 25.4R1, GBP tagging and enforcement works on ND packets even when `dhcp-security neighbor-discovery-inspection` is enabled.

netconf (Remote Device Management)

IN THIS SECTION

- Syntax | 11757
- Hierarchy Level | 11758
- Description | 11758
- Options | 11758
- Required Privilege Level | 11760
- Release Information | 11760

Syntax

```
netconf {
    bulk-interval milliseconds;
    bulk-limit number;
    connection-retry-interval seconds;
    password password;
    port port-number;
    reconfigure-bulk-limit number;
    response-timeout seconds;
    response-timeout-count number;
    user-name name;
}
```

Hierarchy Level

```
[edit routing-instances routing-instance-name system services remote-device-management service-device device-name provisioning-method],
[edit system services remote-device-management service-device device-name provisioning-method]
```

Description

Configure the NETCONF XML management protocol as the method for provisioning and deprovisioning services on the remote device.

Options

bulk-interval *milliseconds*

(Optional) Interval during which multiple services are provisioned or deprovisioned based on the assigned dictionary before the configuration is committed to the service device. When the interval times out, the service actions are committed in bulk before additional actions for the device can take place. You can use the interval (together with the `bulk-limit` option) to optimize your service device configuration during scaled subscriber negotiation and service provisioning or subscriber termination and service deprovisioning.

> **NOTE**: The `bulk-interval` configuration is ignored when the `bulk-limit` is set to 1.

- **Range:** 500 through 5000
- **Default:** 1

bulk-limit *number*

(Optional) Maximum number of services provisioned or deprovisioned based on the assigned dictionary during the bulk interval before the configuration is committed to the service device. When the limit is reached, the service actions are committed in bulk before additional actions for the device can take place. You can use the limit (together with the `bulk-interval` option) to optimize your service device configuration during scaled subscriber negotiation and service provisioning or subscriber termination and service deprovisioning.

- **Range:** 1 through 1000
- **Default:** 1

connection-retry-interval *seconds*

(Optional) The interval between successive attempts to establish a NETCONF session with the remote device.

- **Range:** 1 through 10
- **Default:** 3

password *password*

Password used by the NETCONF protocol to access the remote device during service management. The maximum length of the password is 64 bytes.

> **NOTE**: If you change the password when any active subscriber services are mapped to the device, the change takes effect only when the device reconnects.

port *port-number*

(Optional) TCP port number for the NETCONF session.

> **NOTE**: You cannot change the port number for the device when any active subscriber services are mapped to it.

- **Range:** 1 through 65,535
- **Default:** 830 (NETCONF over SSH)

reconfigure-bulk-limit *number*

(Optional) When the device is reconfigured, this is the maximum number of services provisioned or deprovisioned on the service device for the access domain based on the assigned dictionary before the configuration is committed to the service device. When the limit is reached, the service actions are committed in bulk before additional actions for the device can take place.

If the access domain is not yet configured, this option has no effect, because there are no matching services to install.

- **Range:** 1 through 1000
- **Default:** 100

response-timeout *seconds*

(Optional) Period during which the device must respond to an attempt to provision or deprovision a service. For a subscriber service over a NETCONF connection, the timeout is a failure equivalent to an explicit failure response received from the device.

- **Range:** 1 through 180
- **Default:** 3

response-timeout-count *number*

(Optional) Number of consecutive response timeouts that can occur before the BNG takes action. The default action is to close and reopen the NETCONF connection.

- **Range:** 1 through 10
- **Default:** 3

user-name *name*

Name used to access the remote device during service management. The maximum length of the name is 64 bytes.

> **NOTE:** If you change the username when any active subscriber services are mapped to the device, the change takes effect only when the device reconnects.

Required Privilege Level

system—To view this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1.

    }
}
```

Hierarchy Level

```
[edit system services]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions

commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure the NETCONF XML management protocol.

Default

If you do not include the `netconf` statement, NETCONF connections are not permitted.

Options

`flatten-commit-results` Suppress the `<commit-results>` XML subtree in the NETCONF server's response for `<commit>` operations. This statement must be configured in conjunction with the `rfc-compliant` statement.

> **NOTE**: You should configure the `flatten-commit-results` statement outside of a NETCONF session, for example, in the CLI. If you configure the statement in a NETCONF session and commit and synchronize the configuration, the RPC reply might return unclosed or mismatched XML tags.

version-1.1 Make NETCONF sessions compliant to RFC 6242, *Using the NETCONF Protocol over Secure Shell (SSH)*. This statement must be configured in conjunction with the `rfc-compliant` statement.

When you enable RFC 6242-compliant NETCONF sessions and both peers advertise the `:base:1.1` capability, the NETCONF session uses chunked framing instead of the end-of-message character sequence (]]>]]>) to define message boundaries.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

`flatten-commit-results` option added in Junos OS Release 21.2R1.

`version-1.1` statement added in Junos OS Release 24.4R1 and Junos OS Evolved Release 24.4R1.

        retrieve-custom-yang-modules;
        retrieve-standard-yang-modules;
    }
}
```

Hierarchy Level

```
[edit system services netconf]
```

Description

Configure NETCONF monitoring options.

Options

netconf-state-schemas Specify the schemas that the NETCONF server should return when a client application retrieves the list of supported schemas, which by default includes only the Junos OS native schema. The following statements are supported:

- `retrieve-custom-yang-modules`—Include third-party YANG modules installed on the device.
- `retrieve-standard-yang-modules`—Include standard YANG modules supported by the device, for example, OpenConfig modules.

Client applications can request the list of supported schemas by using the following RPC:

```
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <get>
    <filter type="subtree">
      <netconf-state xmlns="urn:ietf:params:xml:ns:yang:ietf-netconf-monitoring">
        <schemas/>
      </netconf-state>
    </filter>
  </get>
</rpc>
```

Required Privilege Level

network-isolation

IN THIS SECTION

- Syntax | 11781
- Hierarchy Level | 11782
- Description | 11782
- Options | 11782
- Required Privilege Level | 11783
- Release Information | 11783

Syntax

```
network-isolation {
  group name {
    detection {
      hold-time <down milliseconds><up milliseconds>;
      link-tracking {
        failure-type link;
        interface name;
        minimum-links minimum-links;
      }
      service-tracking {
        core-isolation;
      }
    }
    service-tracking-action (lacp-out-of-sync | link-down);
```

```
  }
}
```

Hierarchy Level

```
[edit protocols]
```

Description

Configure a network isolation group in an EVPN network to define the parameters the device uses to determine network isolation condition changes and act upon them.

A network isolation condition means a bridge domain or EVPN instance (EVI) becomes isolated from the EVPN core network, usually for one or more of the following reasons:

- The associated interconnecting physical or logical links are down.
- The device doesn't have routes to the remote endpoints in the EVI, bridge domain, or VLAN.

The parameters you define in a network isolation group comprise a network isolation group profile. You use the `network-isolation-profile group` *`name`* statement to apply the profile as follows:

- When you define the group with the `link-tracking` option, you can assign the network isolation profile to an EVPN instance (EVI) or to a particular bridge domain or VLAN in an EVI. See "link-tracking (Network Isolation Groups)" on page 10248 for details.
- When you define the group with the `service-tracking` option, you can assign the network isolation profile to an interface. See "service-tracking (Network Isolation Groups)" on page 17369 for details.

You can configure either the `link-tracking` option or the `service-tracking` option in a particular network isolation group, and assign that group as a network isolation profile. You can't define link tracking and service tracking parameters in the same network isolation group.

Options

group ***name*** (Required) Network isolation group name. You can define up to 64 network isolation groups.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS and Junos OS Evolved Release 23.1R1.

`service-tracking` and `service-tracking-action` options added in Junos OS and Junos OS Evolved Release 23.2R1.

[edit routing-instances name switch-options],
[edit routing-instances name vlans name switch-options],
[edit switch-options],
[edit vlans name switch-options]
```

Description

On a provider edge (PE) device in an EVPN network, assign a network isolation group profile to an EVPN instance (EVI), to a particular bridge domain or VLAN in an EVI, or to an interface.

A network isolation group encompasses the parameters that the device uses to:

- Detect when an EVPN instance. a bridge domain, or a VLAN is in a network isolation state.
- Take actions on the associated interfaces after the device detects a network isolation status change.

You use the `network-isolation group name` statement at the `[edit protocols]` hierarchy level to configure the parameters that define a network isolation group. You can define link tracking or service tracking parameters with that statement.

Then configure the `network-isolation-profile` statement to assign the network isolation group as follows:

- If the network isolation group uses the `link-tracking` option, you can assign the network isolation profile to:
  - An EVPN instance (EVI).
  - A particular bridge domain or VLAN in an EVI.
- If the network isolation group uses the `service-tracking` option, you can assign the network isolation profile to an interface. The interface can be a Layer 2 (L2) interface that is:
  - A logical single link or aggregated Ethernet (AE) link bundle (LAG) to a single-homed customer edge device in the network.
  - An Ethernet segment identifier (ESI) LAG interface to a multihomed customer edge device in the network.
  - A physical interface.

> **NOTE**: You can configure either the `link-tracking` option or the `service-tracking` option in a particular network isolation group, and assign that group as a network isolation profile. You can't define link tracking and service tracking parameters in the same network isolation group.

Options

group ***name*** Group name of the network isolation profile you want to assign to the desired EVI, bridge domain, VLAN, or interface (depending on the configuration hierarchy level you use with this statement).

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

network-management

IN THIS SECTION

- Syntax | 11786
- Hierarchy Level | 11786
- Description | 11786
- Options | 11786
- Required Privilege Level | 11787
- Release Information | 11787

Syntax

```
network-management {
    cluster-master;
}
```

Hierarchy Level

```
[edit chassis cluster]
```

Description

Define parameters for network management. To manage an SRX Series Services Gateway cluster through a non-fxp0 interface, use this command to define the node as a virtual chassis in NSM. This command establishes a single DMI connection from the primary node to the NSM server. This connection is used to manage both nodes in the cluster. Note that the non-fxp0 interface (regardless of which node it is present on) is always controlled by the primary node in the cluster. The output of a *<get-system-information>* RPC returns a *<chassis-cluster>* tag in all SRX Series Firewalls. When NSM receives this tag, it models SRX Series clusters as devices with autonomous control planes.

Options

`cluster-master`—Enable in-band management on the primary cluster node through NSM.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

network-option

IN THIS SECTION

- Syntax | 11787
- Hierarchy Level | 11787
- Description | 11788
- Options | 11788
- Required Privilege Level | 11788
- Release Information | 11788

Syntax

```
network-option (option-1 | option-2);
```

Hierarchy Level

```
[edit chassis synchronization]
```

Description

Configure the Ethernet equipment clock (EEC) synchronization networking type.

NOTE: For SCB, this option is set with the `set chassis synchronization network-type (option-1 | option-2)` configuration command at the `[edit]` hierarchy level.

NOTE: For Junos OS releases 11.2R4 through 13.3R3 for MX240, MX480, and MX960 with SCB, SCBE, and SCBE2; and MX2010 and MX2020 with SCB or SCBE; you must execute the following commands after you change the network option at the `[edit chassis synchronization]` hierarchy level. This is because the loop bandwidth does not change automatically when you change the network option.

```
user@host# deactivate chassis synchronization
user@host# activate chassis synchronization
```

Options

Depending on the configuration of the Synchronization Status Messages (SSM) quality level, the network option functions in the following ways:

- `option-1`—Maps to the G.813 option 1 (EEC1).
- `option-2`—Maps to the G.812 type IV clock (EEC1).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

network-services

IN THIS SECTION

- Syntax | 11789
- Hierarchy Level | 11789
- Description | 11789
- Default | 11789
- Options | 11790
- Required Privilege Level | 11790
- Release Information | 11790

Syntax

```
network-services (ethernet | enhanced-ethernet | ip | enhanced-ip | lan);
```

Hierarchy Level

```
[edit chassis]
```

Description

Set the router's network services to a specific mode of operation. On MX240, MX480, and MX960 routers, MPC5E and MPC7E power on only if the network services mode configured is `enhanced-ip` or `enhanced-ethernet`.

MX2010 and MX2020 support only `enhanced-ip` and `enhanced-ethernet` network services modes.

Default

- MX80, MX104, MX2010, MX2020—`enhanced-ip`
- MX240, MX480, MX960—`ip`

Options

`ethernet`—Set the router's network services to Ethernet and use standard, compiled firewall filter format.

`enhanced-ethernet`—Set the router's network services to enhanced Ethernet and use enhanced mode capabilities. Only MPCs and MS-DPCs are powered on in the chassis.

`ip`—Set the router's network services to Internet Protocol and use standard, compiled firewall filter format.

`enhanced-ip`—Set the router's network services to enhanced Internet Protocol and use enhanced mode capabilities. Only MPCs and MS-DPCs are powered on in the chassis. Non-service DPCs do not work with enhanced network services mode options. This feature is enabled by default on MX80, MX104, MX2010, and MX2020 Universal Routing Platforms. For MX960 platform, `enhanced-ip` configuration must be enabled on both REs together. After committing the configuration, GRES configuration must be disabled and both REs must be rebooted to ensure that all the FPCs reboot and have the same network-services as REs. Any mismatch in network services between RE0, RE1, FPCs will lead to unexpected results.

`lan`—Set the router's network services to LAN and use standard, compiled firewall filter format. Reboot the system after setting the router's network services to LAN.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 8.5.

`enhanced-ethernet` and `enhanced-ip` options introduced in Junos OS Release 11.4.

`limited-ifl-scaling` option introduced in Junos OS Release 15.1R3 for MX Series routers.

network-slices

IN THIS SECTION

- Syntax | 11791
- Hierarchy Level | 11791
- Description | 11792
- Required Privilege Level | 11792
- Release Information | 11792

Syntax

```
network-slices {
    guest-network-functions{
        gnf  id {
            control-plane-bandwidth-percent percent;
            description description;
            fpcs fpcs;
            af-name
            collapsed-forward
        }
    }
}
```

Hierarchy Level

```
[edit chassis]
```

Description

Configure Junos node slicing.

Junos node slicing enables a single MX Series router to be partitioned to appear as multiple, independent routers. Each partition has its own Junos control plane, which runs as a virtual machine (VM), and a dedicated set of line cards. Each partition is called a guest network function (GNF).

The remaining statements are explained separately.

Required Privilege Level

view-level—To view this statement in the configuration.

control-level—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2.

network-slicing

IN THIS SECTION

- Syntax | 11793
- Hierarchy Level | 11793
- Description | 11793
- Required Privilege Level | 11793
- Release Information | 11793

Syntax

```
network-slicing {
    slice slice-name;
}
```

Hierarchy Level

```
[edit services]
```

Description

Specify the network slice(s) on the device.

Network slicing is the partitioning of a physical network into multiple logical networks. Each logical network is called a slice. By virtue of being a logical network, a slice is a designated set of network resources, such as interfaces, firewall filters, policers, virtual output queues, schedulers, shapers, traffic control profiles, etc. See *Hierarchical Class of Service for Network Slicing* for more information.

Required Privilege Level

- interface—To view this statement in the configuration
- interface-control—To add this statement to the configuration

Release Information

Statement introduced in Junos OS Release 22.2R1.

next-hop (Access Internal)

IN THIS SECTION

- Syntax | 11797
- Hierarchy Level | 11797
- Description | 11797
- Options | 11798
- Required Privilege Level | 11798
- Release Information | 11798

Syntax

```
next-hop next-hop;
```

Hierarchy Level

```
[edit routing-options access-internal route ip-prefix</prefix-length>]
```

Description

Configure the next-hop address for an internal access route. Access routes are typically unnumbered interfaces.

NOTE: Starting in Junos OS Release 15.1R4, the router no longer supports a configuration where a static route points to a next hop that is tied to a subscriber. Typically, this might occur when RADIUS assigns the next hop with the Framed-IP-Address attribute. An alternative to this misconfiguration is to have the RADIUS server provide a Framed-Route attribute that matches the static route.

Options

next-hop Specific next-hop address you want to assign to the internal access route.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

next-hop (Dynamic Access Routes)

IN THIS SECTION

- Syntax | 11801
- Hierarchy Level | 11801
- Description | 11801
- Options | 11801

Required Privilege Level | 11802
Release Information | 11802

Syntax

```
next-hop next-hop;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options
access route prefix],
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options
rib routing-table-name access route prefix],
[edit dynamic-profiles profile-name routing-options access route prefix]
```

Description

Dynamically configure the next-hop address for an access route. Access routes are typically unnumbered interfaces.

The next-hop gateway can be specified explicitly in the framed route, as either the subscriber's fixed address (common for business subscribers) or 0.0.0.0. Alternatively, the absence of the gateway address implies address 0.0.0.0. The address 0.0.0.0, whether implicit or explicitly configured, resolves to the subscriber's assigned address (host route).

If the RADIUS Framed-Route attribute (22) or Framed-IPv6-Route attribute [99] does not specify the next-hop gateway—as is common—the variable representing the next-hop automatically resolves to the subscriber's IP address.

Options

next-hop—Either the specific next-hop address you want to assign to the access route or one of the following next-hop address predefined variables.

- For IPv4 access routes, use the variable, `$junos-framed-route-nexthop`. The route prefix variable is dynamically replaced with the value in Framed-Route RADIUS attribute [22].

- For IPv6 access routes, use the variable, `$junos-framed-route-ipv6-nexthop`. The variable is dynamically replaced with the value in Framed-IPv6-Route RADIUS attribute [99].

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

Support at the `[edit dynamic-profiles` *`profile-name`* `routing-instances $junos-routing-instance routing-options access route` *`prefix`*`]` and `[edit dynamic-profiles` *`profile-name`* `routing-instances $junos-routing-instance routing-options rib` *`routing-table-name`* `access route` *`prefix`*`]` hierarchy levels introduced in Junos OS Release 10.1.

next-hop (VXLAN Routing)

IN THIS SECTION

- Syntax | 11810
- Hierarchy Level | 11810
- Description | 11810
- Options | 11810
- Required Privilege Level | 11811
- Release Information | 11811

Syntax

```
next-hop integer;
```

Hierarchy Level

```
[edit forwarding-options vxlan-routing]
```

Description

Configure the maximum number of next hops reserved for use in an Ethernet VPN-Virtual Extensible LAN (EVPN-VXLAN) overlay network.

Juniper Networks switches can store a maximum number of next hops for use in either an underlay network or an EVPN-VXLAN overlay network. By default, a switch allocates 8192 next hops for use in an EVPN-VXLAN network, which leaves the remaining next hops for use in an underlay network. For example, a QFX5110 switch can store a maximum of 45056 next hops. Subtracting the default setting of 8192 next hops from that maximum number leaves 36864 next hops for use in an underlay network. The `next-hop` configuration statement enables you to re-allocate the maximum number of next hops reserved for use in an EVPN-VXLAN network.

If you do not plan to use a switch in an EVPN-VXLAN network, you can set the `next-hop` configuration statement to 0, which allocates all next hops for use in an underlay network.

Conversely, if you plan to use a switch in an EVPN-VXLAN network, you can re-allocate a greater number of the next hops to the EVPN-VXLAN network.

> **NOTE**: Changing the default number of next hops reserved for use in an EVPN-VXLAN network causes the Packet Forwarding Engine to restart. Restarting the Packet Forwarding Engine interrupts all forwarding operations. Therefore, we strongly recommend using this configuration statement before the EVPN-VXLAN network becomes operational.

Options

integer Maximum number of next hops reserved for use in an EVPN-VXLAN overlay network on a switch.

- **Range:** QFX5110 switches: 0 through 45056. QFX5120 switches: 0 through 61440. The integer you specify must be a multiple of 4096—for example, 4096, 8192, 12288, and so on.
- **Default:** 8192

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.3R1.

next-hop-based-tunnel (Routing Options)

IN THIS SECTION

- Syntax | 11811
- Hierarchy Level | 11812
- Description | 11812
- Required Privilege Level | 11812
- Release Information | 11812

Syntax

```
next-hop-based-tunnel;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options dynamic-tunnels gre next-hop-based-tunnel],
[edit routing-options dynamic-tunnels gre next-hop-based-tunnel]
```

Description

Enable dynamic next hop based GRE tunnels.

Create a tunnel composite next hop for every dynamic GRE tunnel configured. The tunnel composite next hop includes the dynamic tunnel's encapsulation data and a VPN label (when chained composite next hop is not enabled). When this option is not configured, the default interface-based tunnel mode is enabled. By configuring this option, a device can scale up to 32,000 IP tunnels, which is otherwise restricted to the system limit on the number of interfaces supported.

At a given point in time, either the next-hop-based dynamic tunnel or the default interface-based dynamic GRE tunnel can exist on a device. A switchover from one tunnel mode to another deletes the existing tunnels and creates new tunnels in the new tunnel mode. As a result, a tunnel mode switchover can impact network performance.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

```
next-hop-group group-name {
  group-type layer-2;
  interface interface-name;
}
```

Hierarchy Level

```
[edit forwarding-options]
```

Description

Specify the next-hop address for sending copies of packets to an analyzer.

(This paragraph applies only to routers.) The commit operation fails when a next-hop group has only one interface configured. It is implicitly assumed that a subgroup is up only if more than one interface in the subgroup is up.

NOTE: (This Note applies only to routers.) In Junos OS releases earlier through Release 14.2, the `next-hop-group` statement is present in the `forwarding-options` stanza for a routing instance, but the `next-hop-group` statement is not allowed in a routing instance. In other words, in a routing instance, `[edit routing-instances routing-instance-name forwarding-options next-hop-group]` is not supported. You will get an error message if you try to commit this type of configuration. Starting in Junos OS Release 14.2, the `next-hop-group` statement is not present in `[edit routing-instances routing-instance-name forwarding-options]`.

Options

interface *interface-name*	Name of interface used to reach the next-hop destination.
group-type layer-2	(Applies only to EX switches) Group type of the next-hop group. The allowed value for `group-type` is `layer-2`.
next-hop *address*	(Applies only to routers) IP address of the next-hop router. Each next-hop group supports up to 16 next-hop addresses. Up to 30 next-hop groups are supported. Each next-hop group must have at least two next-hop addresses.
next-hop-group *group-name*	Name of the next-hop group. The next-hop group can contain Layer 2 members, Layer 3 members, and subgroups that are either unit list (mirroring packets to each interface) or load-balanced (mirroring packets to one of several interfaces). • Routers—Up to 30 next-hop groups are supported. Each next-hop group must have at least two next-hop addresses. • Switches—Up to 4 next-hop groups are supported.
next-hop-subgroup *subgroup-name*	Name of a next-hop subgroup. Subgroups are either unit list (mirroring packets to each interface) or load-balanced (mirroring packets to one of several interfaces)

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 22.4R1 for EX3400, EX4100, EX4100-F, EX4300-MP, and EX4400 switches.

        }
    }
}
```

Hierarchy Level

```
[edit forwarding-options port-mirroring family inet6 output]
```

Description

Specify the next-hop group through which to send port-mirror traffic to an analyzer. This configuration enables multipacket port mirroring on MX Series routers with or without the use of a Tunnel PIC. It is implicitly assumed that a subgroup is up only if more than one interface in the subgroup is up.

Options

group-name—Name of the next-hop group. Up to 30 next-hop groups are supported for the router. Each next-hop group must have at least two next-hop addresses.

interface-name—Name of the interface used to reach the next-hop destination.

ipv6-address—IPv6 address of the next-hop router. Each next-hop group supports up to 16 next-hop addresses. Each next-hop subgroup can have up to 16 next-hop groups.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

next-hop-service

IN THIS SECTION

- Syntax | 11823
- Hierarchy Level | 11824
- Description | 11824
- Options | 11824
- Required Privilege Level | 11824
- Release Information | 11824

Syntax

```
next-hop-service {
    inside-service-interface interface-name.unit-number;
    outside-service-interface interface-name.unit-number;
    outside-service-interface-type interface-type;
```

```
    service-interface-pool name;
}
```

Hierarchy Level

```
[edit services service-set service-set-name]
```

Description

Specify interface names or a service interface pool for the forwarding next-hop service set. You cannot specify both a service interface pool and an inside or outside interface.

Options

`inside-service-interface` *`interface-name.unit-number`*—Name and logical unit number of the service interface associated with the service set applied inside the network.

`outside-service-interface` *`interface-name.unit-number`*—Name and logical unit number of the service interface associated with the service set applied outside the network.

outside-service-interface-type *interface-type*—Identifies the interface type of the service interface associated with the service set applied outside the network. For inline IP reassembly, set the interface type to local.

`service-interface-pool` *`name`*—Name of the pool of logical interfaces configured at the `[edit services service-interface-pools pool` *`pool-name`*`]` hierarchy level. You can configure a service interface pool only if the service set has a PGCP rule configured. The service set cannot contain any other type of rule.

NOTE: **service-interface-pool** is not applicable for IP reassembly configuration on L2TP.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`service-interface-pool` option added in Junos OS Release 9.3.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

next-hop-tunnel

IN THIS SECTION

- Syntax | 11825
- Hierarchy Level | 11825
- Description | 11826
- Options | 11826
- Required Privilege Level | 11826
- Release Information | 11826

Syntax

```
next-hop-tunnel gateway-address ipsec-vpn vpn-name;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family-name]
```

Description

For the secure tunnel (st) interface, create entries in the Next-Hop Tunnel Binding (NHTB) table, which is used to map the next-hop gateway IP address to a particular IP Security (IPsec) Virtual Private Network (VPN) tunnel. NHTB allows the binding of multiple IPsec VPN tunnels to a single IPsec tunnel interface.

Options

- *gateway-address*—Next-hop gateway IP address.
- ipsec-vpn *vpn-name* —VPN to which the next-hop gateway IP address is mapped.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls static-label-switched-path lsp-name
bypass],
[edit protocols mpls static-label-switched-path lsp-name bypass]
```

Description

Specify the routing table used to resolve the IPv4 or IPv6 next hop for a bypass LSP.

NOTE:

- The transit LSP that's associated with a bypass LSP that uses `next-table` must use a label in the range of *1000000-1048575*
- The transit LSP that's associated with a bypass LSP that uses `next-table` must be configured with a `pop` function to allow for an IPv4 or IPv6 lookup in the specified routing table.
- The transit LSP that's associated with a bypass LSP that uses `next-table` cannot specify a `next-hop`. The `next-hop` and the `next-table` options are mutually exclusive.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

- Required Privilege Level | 11831
- Release Information | 11831

Syntax

```
nexthop-ecmp (value | equal | greater-than | greater-than-equal | less-than | less-than-equal);
```

Hierarchy Level

```
[edit logical-systems name policy-options policy-statement name from],
[edit policy-options policy-statement name from]
```

Description

Qualify nexthop equal cost multipath gateways. The BGP export policy compares the number of ECMP next hops for the BGP route against the value you configure with the `from nexthop-ecmp` statement at either of these hierarchies: `[edit policy-options policy-statement policy-name]` or `[edit policy-options policy-statement policy-name term term-name]`.

Options

value	The exact number of ECMP gateways (1 through 512) required to meet the condition.
equal	The number of gateways must be equal to the configured value.
greater-than	The number of gateways must be greater than the configured value.
greater-than-equal	The number of gateways must be greater than or equal to the configured value.
less-than	The number of gateways must be less than the configured value.
less-than-equal	The number of gateways must be less than or equal to the configured value.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

nexthop-learning

IN THIS SECTION

- Syntax | 11833
- Hierarchy Level | 11833
- Description | 11834
- Options | 11835
- Required Privilege Level | 11835
- Release Information | 11835

Syntax

```
nexthop-learning (disable | enable);
```

Hierarchy Level

```
[edit services flow-monitoring (version-ipfix |version9) template template-name]
```

Description

Enable learning of next-hop addresses to correctly report the next hop address, output SNMP, destination IP address, destination IP mask values, the packet loss priority, and the first two characters of the configured forwarding class name in the flow records when a destination is reachable through multiple paths. By default, this behavior of learning the next-hop addresses is disabled for inline active flow monitoring.

For PTX Series, starting in Junos OS Evolved 21.2R1 and in Junos OS Release 21.3R1, every sampled packet is considered to be a flow. When the sampled packet is received, the flow is created and immediately timed out as inactive, and the software exports a record to the collector. The effect of the `nexthop-learning` statement on this behavior varies depending upon the operating system. For Junos OS Evolved, we do not recommend that you configure the `nexthop-learning` statement, as it reduces the number of packets that can be processed. For Junos OS, you can configure the `nexthop-learning` statement to change this default no-flow behavior and once again create and maintain flows, then attach the template to all sampling instances associated with FPCs that require the previous behavior.

When learning of next-hop addresses is disabled, data is reported as follows:

- If the destination address of the sampled IPv4 flow is reachable through multiple paths, the ipNextHopIPv4Address (Element ID 15) and egressInterface (Element ID 14) in the IPv4 flow record are set to the gateway IP address and SNMP index of the first path seen in the forwarding table.
- If the destination address of the sampled IPv6 flow is reachable through multiple paths, the ipNextHopIPv6Address (Element ID 62) and egressInterface (Element ID 14) in the IPv6 flow records are set to 0.
- The Incoming Interface (IIF) and Outgoing Interface (OIF) should be part of the same VRF. If the OIF is in a different VRF, destinationIPv4PrefixLength (Element ID 13), bgpDestinationAsNumber (Element ID 17), ipNextHopIPv4Address (Element ID 15), and egressInterface (Element ID 14) are set to 0 in IPv4 flow records and destinationIPv6PrefixLength (Element ID 30), bgpDestinationAsNumber (Element ID 17), ipNextHopIPv6Address (Element ID 62), and egressInterface (Element ID 14) are set to 0 in IPv6 flow records.
- The packet loss priority and forwarding class information is not reported for the PTX1000, PTX10008 (without the JNP10008-SF3), and PTX10016 routers.

When learning of next-hop addresses is enabled, output SNMP, destination IP address, destination IP mask values, the packet loss priority, and the first two characters of the configured forwarding class in the flow records are reported correctly. In addition, when enabled, mplsTopLabelIPv4Address (Element ID 47) in IPv4 flow records reports correctly when MPLS ingress sampling is enabled.

> **NOTE**: Nexthop learning is supported only when sampling is implemented on the PFE. This is known as inline active flow monitoring. Nexthop learning does not work when sampling is configured on the MS-DPC/MS-MPC/MS-MIC service cards.

Options

`disable`—Disable the learning of next-hop information required for inline active flow monitoring.

`enable`—Enable the learning of next-hop information required for inline active flow monitoring.

- **Default:** disable

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F2.

`nexthop-learning` is supported for the `bridge-template` statement in Junos OS Release 18.2R1 for MX Series routers.

Support introduced in Junos OS Release 20.3R1 to correctly report the packet loss priority and the first two characters of the configured forwarding class in the IPv4 and IPv6 IPFIX templates for the PTX1000, PTX10008 (without the JNP10008-SF3), and PTX10016 routers.

    timeout timeout;
}
```

Hierarchy Level

```
[edit security utm default-configuration web-filtering]
[edit security utm feature-profile web-filtering ng-juniper profile name]
```

Description

Configure the Juniper NextGen Web filtering engine. Juniper NextGen Web filtering acts as a gateway for the SRX Series devices seeking URL reputation or category from the Juniper NextGen Web Filtering (NGWF) cloud.

> **NOTE**: You must configure SSL initiation profile for NGWF to communicate through HTTPS connections.

The following is a configuration sample for SSL initiation profile:

1. Create a self-signed certificate that can be used for SSL handshake with the Content Security server.

```
request security pki generate-key-pair certificate-id utmcert size 1024 type rsa
request security pki local-certificate generate-self-signed certificate-id utmcert subject
"DC=Domain_component,CN=utmcert,OU=SLT_QA,O=Juniper,L=Sunnyvale,ST=CA,C=US" ip-address 0.0.0.0 domain-
name juniper.net
```

2. Configure the SSL initiation profile by calling the certificate that you created.

```
set services ssl initiation profile ssl_init_prof client-certificate utmcert
set services ssl initiation profile ssl_init_prof actions ignore-server-auth-failure
set services ssl initiation profile ssl_init_prof trusted-ca all
```

> **NOTE**: The command `set services ssl initiation profile ssl_init_prof actions ignore-server-auth-failure` is mandatory. This command configures an SSL initiation profile named ssl_init_prof to ignore server authentication failures. This means that the SRX Series Firewall will not drop the SSL connection if it encounters errors during the server certificate verification process.

The following is a sample of the configurations that are required for NGWF to work:

```
set security policies from-zone trust to-zone untrust policy fw_policy match source-address any
set security policies from-zone trust to-zone untrust policy fw_policy match destination-address any
set security policies from-zone trust to-zone untrust policy fw_policy match application any
set security policies from-zone trust to-zone untrust policy fw_policy then permit application-services ssl-proxy profile-name ssl-profile
set security policies from-zone trust to-zone untrust policy fw_policy then permit application-services utm-policy WF
```

Options

base-filter Juniper base filter.

ng-default-filter Juniper default base filter.

category *name* Juniper NextGen category name.

action Action to perform when web traffic matches category. The possible options are block, log and permit, permit, and quarantine.

custom-message Custom message for the action taken when web traffic matches category.

default Juniper NextGen default profile.

fallback-settings Juniper NextGen fallback settings.

no-safe-search Do not perform safe-search for Juniper NextGen protocol.

server Configure Juniper NextGen server.

host Server host IP address or string host name.

port Server port number.

- Range: 1 thru 65535

routing-instance Routing instance name.

source-address Source IP address used to connect the server.

tls-profile SSL initiation profile.

ngfw

IN THIS SECTION

- Syntax | 11839
- Hierarchy Level | 11840
- Description | 11840
- Options | 11840
- Required Privilege Level | 11841
- Release Information | 11841

Syntax

```
ngfw {
    default-profile {
        application-traffic-control {
```

```
            rule-set rule-set;
        }
        ssl-proxy {
            profile-name profile-name;
        }
    }
}
```

Hierarchy Level

```
[edit security],
[edit security logical-systems logical-system-name]
```

Description

Specify a default profile to manage conflicts when a security policy lookup returns a list of policies before the final application is identified.

The initial policy lookup phase occurs prior to identifying a dynamic application. If there are multiple policies present in the potential policy list that contain different SSL proxy profiles, then the SRX Series Firewall applies the default profile until a more explicit match has occurred.

You can configure a default profile for an SSL proxy and for an application quality of service (AppQoS) under the `[edit security ngfw]` hierarchy level.

You can configure an SSL proxy profile under the `[edit services ssl proxy]` hierarchy level, which can be applied as the default SSL proxy profile under the `[edit security ngfw]` hierarchy level. Similarly, you can configure application traffic rule sets under the `[edit class-of-service]` hierarchy level, and apply the rule set under the `[edit security ngfw]` hierarchy level as the default AppQoS rule set.

Options

application-traffic-control Specify the application traffic control rule as the default rule.

- **rule-set *rule-set*** Rule set name of the application traffic control.

ssl-proxy Specify the SSL forward proxy profile or the SSL reverse proxy profile as the default profile.

profile-name ***profile-name***	Name of the SSL forward proxy profile or the SSL reverse proxy profile.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

```

Description

Configure BFD sessions not to adapt to changing network conditions. We recommend that you *do not* disable BFD adaptation unless it is preferable to have BFD adaptation disabled in your network.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. However, include the `no-adaptation` statement in the configuration if you do not want BFD sessions to adapt to changing network conditions.

You can use the `clear bfd adaptation` command to return BFD interval timers to their configured values. The `clear bfd adaptation` command does not affect traffic flow on the routing device.

no-adjacency-down-notification (Protocols IS-IS)

IN THIS SECTION

- Syntax | 11853
- Hierarchy Level | 11853
- Description | 11853
- Required Privilege Level | 11854
- Release Information | 11854

Syntax

```
no-adjacency-down-notification;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis interface interface-name],
[edit protocols isis interface interface-name]
```

Description

Disable adjacency down notification for IS-IS to allow for migration from IS-IS to OSPF without disruption of the RSVP neighbors and associated RSVP-signaled label-switched paths (LSPs).

Whenever IS-IS is deactivated, the IS-IS adjacencies are brought down. IS-IS signals to RSVP to bring down any RSVP neighbors associated with the IS-IS adjacencies, and this further causes the associated LSPs signaled by RSVP to go down as well.

A similar process occurs whenever OSPF is deactivated. The OSPF neighbors are brought down. OSPF signals to RSVP to bring down any of the RSVP neighbors associated with the OSPF neighbors, and this further causes the associated LSPs signaled by RSVP to go down as well.

If you need to migrate from IS-IS to OSPF or from OSPF to IS-IS, the internal gateway protocol (IGP) notification to RSVP for an adjacency or neighbor down event needs to be ignored. Using the `no-adjacency-down-notification` or `no-neighbor-down-notification` statements, you can disable IS-IS adjacency

down notification or OSPF neighbor down notification, respectively, until the migration is complete. The network administrator is responsible for configuring the statements before the migration, and then removing them from the configuration afterward, so that IGP notification can function normally.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

```

Description

Prevent different routing devices within an AS from creating aggregate routes that contain different AS paths.

Junos OS performs route aggregation, which is the process of combining the characteristics of different routes so that only a single route is advertised. Aggregation reduces the amount of information that BGP must store and exchange with other BGP systems. When aggregation occurs, the local routing device adds the local AS number and the router ID to the aggregator path attiribute. The `no-aggregator-id`

statement causes Junos OS to place a 0 in the router ID field and thus eliminate the possibility of having multiple aggregate advertisements in the network, each with different path information.

Default

If you omit this statement, the router ID is included in the BGP aggregator path attribute.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Syntax

```
no-allow-url;
```

Hierarchy Level

```
[edit system scripts op]
```

Description

Prohibit the remote execution of Junos OS op scripts. When you include this configuration statement, the `op url` operational mode command does not support executing op scripts from a remote site and generates an error.

Default

If you do not include the `no-allow-url` statement, authorized users can issue the `op url` command to execute op scripts from a remote site.

> **NOTE**: You must configure the `allow-url-for-python` statement in order to execute Python automation scripts from a remote site. The `no-allow-url` statement takes precedence over the `allow-url-for-python` statement; if both statements are configured, you cannot execute Python op scripts from a remote site on the device.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

no-anti-replay (Services Service Set)

IN THIS SECTION

- Syntax | 11866
- Hierarchy Level | 11866
- Description | 11866
- Required Privilege Level | 11867
- Release Information | 11867

Syntax

```
no-anti-replay;
```

Hierarchy Level

```
[edit services service-set service-set-name ipsec-vpn-options]
```

Description

Disable IPsec antireplay service for this service set, which occasionally causes interoperability issues for security associations. This statement is useful for dynamic endpoint tunnels for which you cannot configure the `no-anti-reply` statement at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level.

For static IPsec tunnels, this statement disables the antireplay check for all the tunnels within this service set. If antireplay check has to be enabled for a particular tunnel, then set the `anti-replay-window-size` statement at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level.

> **NOTE**: Setting the `anti-replay-window-size` and `no-anti-replay` statements at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level overrides the settings specified at the `[edit services service-set service-set-name ipsec-vpn-options]` hierarchy level.

- Description | 11873
- Required Privilege Level | 11873
- Release Information | 11874

Syntax

```
no-attribute-length-in-pdu;
```

Hierarchy Level

```
[edit protocols mvrp]
```

Description

Include an extra byte in protocol data units (PDUs) sent by the Multiple VLAN Registration Protocol (MVRP). You can disable the extra byte to address a compatibility issue between MVRP in Junos OS Releases 13.2 and later for EX Series switches with support for the Enhanced Layer 2 Software (ELS), which includes the extra byte, and MVRP in Junos OS Releases 11.3 and later for EX Series switches that do not support ELS, which does not include the extra byte. If this compatibility issue arises, the ELS version of MVRP does not recognize PDUs without the extra byte sent by the non-ELS version of MVRP.

You can recognize an MVRP version compatibility issue by observing the switch running the ELS version of MVRP. Because a switch running the ELS version of MVRP cannot interpret an unmodified PDU from a switch running the non-ELS version of MVRP, the switch will not add VLANs from the non-ELS version of MVRP. When you execute the command `show mvrp statistics` in the ELS version of MVRP, the values for `Received Join Empty` and `Received Join In` will incorrectly display zero, even though the value for the `Received MVRP PDUs without error` has been increased. Another indication that MVRP is having a version compatibility issue is that unexpected VLAN activity, such as multiple VLAN creation, takes place on the switch running the ELS version of MVRP.

Required Privilege Level

routing—To view this statement in the configuration.

IN THIS SECTION

- Syntax | 11875
- Hierarchy Level | 11875
- Description | 11876
- Required Privilege Level | 11876
- Release Information | 11876

Syntax

```
no-auto-conversion;
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

Disable automatic Virtual Chassis port (VCP) conversion in a Virtual Chassis.

> **NOTE**: This statement is available as of Junos OS Releases 14.1X53-D47, 17.4R2, 18.1R3, 18.2R2, and 18.3R1 only on EX Series and QFX Series switches in a Virtual Chassis that have automatic VCP conversion enabled by default, which include all EX4300, EX4600, EX4650, and QFX Series switches that support Virtual Chassis. See for details.

Configuring this statement disables the feature for the entire Virtual Chassis, and subsequently removing this statement returns the Virtual Chassis to the default behavior with automatic VCP conversion enabled.

VCP links connect members in a Virtual Chassis using supported VCP ports on the member switches. Ports that are supported as VCPs and are not dedicated VCPs or configured as VCPs by default must be converted into VCPs to use them to interconnect Virtual Chassis members. You can manually convert a supported port into a VCP port using the `request virtual-chassis vc-port` command, or when automatic VCP conversion is enabled, a port will be automatically converted into a VCP under the following conditions:

- LLDP is enabled on the interfaces for the members on both sides of the link. The two interfaces exchange LLDP packets to accomplish the port conversion.
- The Virtual Chassis must be preprovisioned with the switches on both sides of the link already configured in the members list of the Virtual Chassis using the `set virtual-chassis member` command.
- The ports on both ends of the link are supported as VCPs and are *not* already configured as VCPs.

If you want to deterministically control VCP port conversion during a preprovisioned Virtual Chassis configuration or expansion, you might want to disable this feature and set up all VCPs manually. Otherwise, you can use the default automatic VCP conversion behavior in a “plug and play” approach to simplify adding a new switch to an existing Virtual Chassis or adding a redundant VCP link between two existing members of a Virtual Chassis.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Releases 14.1X53-D47, 17.4R2, 18.1R3, 18.2R2, and 18.3R1.

Syntax

```
no-auto-iccp-provisioning;
```

Hierarchy Level

```
[edit chassis satellite-management redundancy-groups redundancy-group-name peer-chassis-id peer-chassis-id-number]
```

Description

Disable automatic ICCP provisioning of an interchassis link (ICL) for the redundancy group used to configure dual aggregation devices in a Junos Fusion topology.

Automatic ICCP provisioning of an interchassis link (ICL) simplifies configuration of a Junos Fusion with dual aggregation devices by automatically provisioning the ICCP configuration within the Junos Fusion, instead of requiring the user to manually configure all ICCP parameters. Automatic ICCP Provisioning of an interchassis link (ICL) is enabled by default for a Junos Fusion using a dual aggregation device topology; this statement disables automatic ICCP provisioning.

If this statement is entered, the user has to manually configure ICCP in the redundancy group used to configure dual aggregation devices in a Junos Fusion topology.

This statement is optional. You can manually configure any available ICCP configuration parameters in the redundancy group when automatic ICCP provisioning is enabled. In cases where a user configures an ICCP parameter when automatic ICCP provisioning is enabled, the user-configured ICCP configuration is used over the automatically-provisioned ICCP configuration parameter.

User configuration of ICCP in a Junos Fusion is not required. This statement is recommended for use by expert users only.

Default

Automatic ICCP Provisioning is enabled by default in redundancy groups used to configure dual aggregation devices in a Junos Fusion topology.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R1.

- Description | **11887**
- Default | **11887**
- Required Privilege Level | **11887**
- Release Information | **11888**

Syntax

```
no-bfd-triggered-local-repair;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options],
[edit routing-options]
```

Description

Disable Bidirectional Forwarding Detection (BFD) sessions to trigger fast reroute (FRR) using MPLS-FRR and loop-free alternates (LFAs). When this statement is configured, no BFD-triggered local repair is supported. However, logical interface down-based local repair is in force.

When using this statement to disable local repair, you also must restart routing to ensure proper behavior. To restart routing, include the **graceful-restart** command for the interior gateway protocol (IGP) used in your configuration. For example, if your IGP is OSPF, include the **graceful-restart** statement at the [edit protocols ospf] hierarchy level.

Default

BFD-triggered local repair is the default behavior. The loss of a neighbor results in BFD local repair for all next hops that derive themselves from the base next hop with which the BFD session is established.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

Syntax

```
no-birectional-mode;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols pim graceful-restart],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim
graceful-restart],
```

```
[edit protocols pim graceful-restart],
[edit routing-instances routing-instance-name protocols pim graceful-restart]
```

Description

Disable forwarding for bidirectional PIM routes during graceful restart recovery, both in cases of a routing protocol process (rpd) restart and graceful Routing Engine switchover.

Bidirectional PIM accepts packets for a bidirectional route on multiple interfaces. This means that some topologies might develop multicast routing loops if all PIM neighbors are not synchronized with regard to the identity of the designated forwarder (DF) on each link. If one router is forwarding without actively participating in DF elections, particularly after unicast routing changes, multicast routing loops might occur.

If graceful restart for PIM is enabled and the forwarding of packets on bidirectional routes is disallowed (by including the **no-bidirectional-mode** statement in the configuration), PIM behaves conservatively to avoid multicast routing loops during the recovery period. When the routing protocol process (rpd) restarts, all bidirectional routes are deleted. After graceful restart has completed, the routes are re-added, based on the converged unicast and bidirectional PIM state. While graceful restart is active, bidirectional multicast flows drop packets.

Default

If graceful restart for PIM is enabled and the bidirectional PIM is enabled, the default graceful restart behavior is to continue forwarding packets on bidirectional routes. If the gracefully restarting router was serving as a DF for some interfaces to rendezvous points, the restarting router sends a DF Winner message with a metric of 0 on each of these RP interfaces. This ensures that a neighbor router does not become the DF due to unicast topology changes that might occur during the graceful restart period. Sending a DF Winner message with a metric of 0 prevents another PIM neighbor from assuming the DF role until after graceful restart completes. When graceful restart completes, the gracefully restarted router sends another DF Winner message with the actual converged unicast metric.

NOTE: Graceful Routing Engine switchover operates independently of the graceful restart behavior. If graceful Routing Engine switchover is configured without graceful restart, all PIM routes for all modes are deleted when the rpd process restarts. If graceful Routing Engine switchover is configured with graceful restart, the behavior is the same as described here, except that the recovery happens on the Routing Engine that assumes primary role.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

Syntax

```
no-broadcast;
```

Hierarchy Level

For platforms with Enhanced Layer 2 Software (ELS)
(EX Series switches and MX Series routers):

```
[edit forwarding-options storm-control-profiles profile-name all]
```

Description

Disable storm control for broadcast traffic for the specified interface or for all interfaces.

Default

- On EX2200, EX3200, EX3300, and EX4200 switches—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams. You can selectively disable storm control on broadcast, multicast, or unknown-unicast traffic.
- On EX4300 switches—The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams. You can selectively disable storm control on any type of traffic.
- On EX4500 and EX8200 switches—The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams. On EX8200 switches, you can selectively disable storm control on registered multicast traffic, on unregistered multicast traffic, or on both types of multicast traffic.
- On EX6200 switches—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams. You can selectively disable storm control for each type of traffic individually.
- On EX9200 switches—Storm control is not enabled by default.

- On MX Series routers—Storm control is not enabled by default.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

Hierarchy level `[edit forwarding-options]` introduced in Junos OS Release 13.2X50-D10. (See Using the Enhanced Layer 2 Software CLI for information about ELS.)

secondary) path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

Description

Disable constrained-path LSP computation.

An explicit-path LSP is completely configured through operator action. Once configured, it is initiated only along the explicitly specified path.

A constrained-path LSP relies on an ingress router to compute the complete path. The ingress router takes into account the following information during the computation:

- Interior gateway protocol (IGP) topology database
- Link utilization information from extensions in the IGP link-state database
- Administrative group information from extensions in the IGP link-state database
- LSP requirements, including bandwidth, hop count, and administrative group

Constrained-path LSPs can generally avoid link failures and congested links. They also permit recomputation (therefore, a new path) during topology changes or unsuccessful setup.

Default

Constrained-path LSP computation enabled.

> **NOTE**: On PTX and MX routers the `no-local-reversion` option is enabled by default starting with Junos OS release 16.1. If you use the `no-cspf` option on these platforms with either link protection or node-link protection enabled, you must also configure the `local-reversion` option to enure proper behavior,

Required Privilege Level

secondary) path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

Description

Disable normal time-to-live (TTL) decrementing, which decrements the TTL field in the IP header by 1. This statement decrements the IP TTL by 1 before encapsulating the IP packet within an MPLS packet. When the penultimate router pops off the top label, it does not use the standard write-back procedure of writing the MPLS TTL into the IP TTL field. Therefore, the IP packet is decremented by 1. The ultimate router then decrements the packet by one more for a total cloud appearance of 2, thus hiding the network topology.

Default

Normal TTL decrementing enabled; the TTL field value is decremented by 1 as the packet passes through each label-switched router in the LSP.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Evolved Release 20.1R1 on PTX10008.

no-delegate-processing

IN THIS SECTION

Syntax | 11909

- Hierarchy Level | 11909
- Description | 11909
- Default | 11909
- Required Privilege Level | 11909
- Release Information | 11910

Syntax

```
no-delegate-processing;
```

Hierarchy Level

```
[edit routing-options ppm]
```

Description

Disable distributed periodic packet management (PPM) processing and run all PPM processing on the Routing Engine.

PPM processing cannot be completely disabled on EX Series switches. You can only configure whether PPM processing is distributed between the access ports (EX3200 and EX4200 switches) or the line cards (EX8200 switches) and the Routing Engine or is handled just on the Routing Engine.

BEST PRACTICE: Generally, you should only disable distributed PPM if Juniper Networks Customer Service advised you to do so. You should only disable distributed PPM if you have a compelling reason to disable it.

Default

Distributed PPM processing is enabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

no-dhcp-flood

IN THIS SECTION

- Syntax | 11910
- Hierarchy Level | 11910

- Required Privilege Level | 11911
- Release Information | 11911

Syntax

```
no-dhcp-flood;
```

Hierarchy Level

```
[edit interfaces name unit]
```

Description

In an EVPN-VXLAN fabric where DHCP relay is configured with integrated routing and bridging (IRB) interfaces on leaf devices, it is possible for DHCP Discover packets to be flooded across a VXLAN attached to an IRB. This scenario leads to multiple copies of DHCP packets flooded across the fabric. To

counter this behavior, configure the `no-dhcp-flood` knob at the `[edit interfaces irb unit <unit-number>]` hierarchy.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 22.4R1 and Junos OS Evolved Release 22.4R1 for the QFX5xxx Series switches, EX4100 Series switches, and EX4400 Series switches.

no-dr-flood (PIM Snooping)

IN THIS SECTION

- Syntax | 11920
- Hierarchy Level | 11920
- Description | 11920
- Required Privilege Level | 11921
- Release Information | 11921

Syntax

```
no-dr-flood;
```

Hierarchy Level

```
[edit routing-instances <instance-name> protocols pim-snooping traceoptions],
[edit logical-systems <logical-system-name> routing-instances <instance-name> protocols pim-
snooping traceoptions],
[edit routing-instances <instance-name> protocols pim-snooping vlan <vlan-id>],
[edit logical-systems <logical-system-name> routing-instances <instance-name> protocols pim-
snooping  vlan<vlan-id>]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Disable default flooding of multicast data on the PIM designated router port.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

no-dynamic-vlan

IN THIS SECTION

- Syntax | 11921

- Release Information | 11922

Syntax

```
no-dynamic-vlan;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mvrp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
mvrp],
[edit protocols mvrp],
[edit routing-instances routing-instance-name protocols mvrp]
```

Description

Disable the dynamic creation of VLANs using Multiple VLAN Registration Protocol (MVRP) for interfaces participating in MVRP.

Dynamic VLAN configuration can be enabled on an interface independent of MVRP. The MVRP dynamic VLAN configuration setting does not override the interface configuration dynamic VLAN configuration setting. If dynamic VLAN creation is disabled on the interface in the interface configuration, no dynamic VLANs are created on the interface, including dynamic VLANs created using MVRP.

This option can only be applied globally; it cannot be applied per interface.

Default

If MVRP is enabled, the dynamic creation of VLANs as a result of MVRP protocol exchange messages is enabled.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

no-encryption (MACsec for MX Series)

IN THIS SECTION

- Syntax | 11923
- Hierarchy Level | 11923
- Description | 11923
- Default | 11924
- Required Privilege Level | 11924
- Release Information | 11924

Syntax

```
no-encryption;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name]
```

Description

Disables MACsec encryption for a connectivity association that is configured to enable MACsec using static connectivity association key (CAK) or dynamic security mode.

You can enable MACsec without enabling encryption. If a connectivity association that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the packet, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic does not represent a security threat.

This command is used to disable encryption when MACsec is configured using static CAK or dynamic security mode only. When MACsec is configuring using static secure association key (SAK) security mode, the encryption setting is managed in the secure channel using the `encryption` configuration statement.

Default

MACsec encryption is enabled if MACsec is enabled using static CAK or dynamic security mode.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

IN THIS SECTION

- Syntax | 11924
- Hierarchy Level | 11925
- Description | 11925
- Default | 11925
- Required Privilege Level | 11925
- Release Information | 11926

Syntax

```
no-encryption;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name]
```

Description

Disables MACsec encryption for a connectivity association that is configured to enable MACsec using static connectivity association key (CAK) or dynamic security mode.

MACsec encryption is disabled when MACsec is configured, by default.

You can enable MACsec without enabling encryption. If a connectivity association that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the packet, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic does not represent a security threat.

This command is used to disable encryption when MACsec is configured using static CAK or dynamic security mode only. When MACsec is configuring using static secure association key (SAK) security mode, the encryption setting is managed in the secure channel using the "encryption" on page 6606 configuration statement.

Enable MACsec encryption within a secure channel.

Traffic traversing a MAC-enabled point-to-point Ethernet link traverses the link at the same speed regardless of whether encryption is enabled or disabled. You cannot increase the speed of traffic traversing a MACsec-enabled Ethernet link by disabling encryption.

When MACsec is configuring using static connectivity association key (CAK) security mode, the encryption setting is configured outside of the secure channel using the `no-encryption` configuration statement.

Default

MACsec encryption is enabled if MACsec is enabled using static CAK or dynamic security mode.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

no-fcoe-lag

IN THIS SECTION

- Syntax | 11932
- Hierarchy Level | 11932
- Description | 11933
- Required Privilege Level | 11933
- Release Information | 11933

Syntax

```
no-fcoe-lag;
```

Hierarchy Level

```
[edit interfaces lag-interface-name aggregated-ether-options]
```

Description

Convert an FCoE LAG into a standard LAG. When you convert an FCoE LAG into a standard LAG, the standard LAG no longer works reliably for FCoE traffic. This is because FCoE traffic must use the same physical link within a LAG interface for communication between the FCoE device and the Fibre Channel SAN across a QFabric system Node device. A standard LAG uses a hashing algorithm to determine the link to use for each transmission, so there is no way to guarantee that a response will use the same link on which a device receives a request. An FCoE LAG guarantees that the same physical LAG link is used for communication between an FCoE device and the QFabric system Node device.

If you convert an FCoE LAG into a standard LAG, do not use the standard LAG for FCoE traffic.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

no-fcoe-trusted

IN THIS SECTION

- Syntax | **11934**

- Hierarchy Level | 11934
- Description | 11934
- Required Privilege Level | 11935
- Release Information | 11935

Syntax

```
no-fcoe-trusted;
```

Hierarchy Level

Original CLI

```
[edit ethernet-switching-options secure-access-port interface interface-name]
```

ELS CLI for Platforms that Support FCoE

```
[edit vlans vlan-name forwarding-options fip-security interface interface-name]
```

NOTE: The `no-fcoe-trusted` configuration statement is in a different hierarchy on the original CLI than on the Enhanced Layer 2 Software (ELS) CLI.

Description

Configure the specified 10-Gigabit Ethernet interface not to trust Fibre Channel over Ethernet (FCoE) traffic. If an interface is directly connected to an FCoE device, the interface should not be configured as an FCoE trusted interface. If an interface that you want to connect to an FCoE device has been configured as an FCoE trusted interface, use the `no-fcoe-trusted` statement to convert the interface to an untrusted interface. Untrusted interfaces can perform FIP snooping to provide access security for FCoE traffic.

However, if an interface is connected to another switch such as an FCoE forwarder (FCF) or a transit switch, you can configure the interface as trusted so that the interface forwards FCoE traffic from the switch to the FCoE devices without installing FIP snooping filters.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Hierarchy Level (FCoE Transit Switch)

```
[edit ethernet-switching-options secure-access-port vlan (all | vlan-name) examine-fip]
```

Description

Disable FIP snooping scaling on all FCoE VLANs on an FCoE-FC gateway, or disable FIP snooping scaling on the specified FCoE VLAN on an FCoE transit switch.

Disabling FIP snooping scaling reduces the maximum number of FIP snooping sessions from 2,500 sessions (the maximum with FIP snooping scaling enabled) to 376 sessions. FIP snooping scaling is enabled by default.

Use this statement to disable FIP snooping scaling if you want to configure an FCoE LAG on an FCoE-FC gateway that contains one or more untrusted FC fabrics. Untrusted FC fabrics do not support FIP snooping scaling.

On an FCoE transit switch, you can use this statement to disable FIP snooping scaling on a specified FCoE VLAN.

Default

FIP snooping scaling is enabled by default.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X52-D10.

no-flood-to-multicast-router-interfaces (IGMP and MLD Snooping)

IN THIS SECTION

- Syntax | 11938
- Hierarchy Level | 11939
- Description | 11939
- Release Information | 11939

Syntax

```
no-flood-to-multicast-router-interfaces;
```

Hierarchy Level

```
[edit protocols igmp-snooping vlan vlan-name no-flood-to-multicast-router-interfaces],
[edit protocols mld-snooping vlan vlan-name no-flood-to-multicast-router-interfaces],
[edit routing-instances routing-instance-name protocols igmp-snooping vlan vlan-name no-flood-to-multicast-router-interfaces],
[edit routing-instances routing-instance-name protocols mld-snooping vlan vlan-name no-flood-to-multicast-router-interfaces],
[edit bridge-domains bridge-domain-name protocols igmp-snooping no-flood-to-multicast-router-interfaces],
[edit bridge-domains bridge-domain-name protocols mld-snooping no-flood-to-multicast-router-interfaces],
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name protocols igmp-snooping no-flood-to-multicast-router-interfaces],
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name protocols mld-snooping no-flood-to-multicast-router-interfaces]
```

Description

Limit the flooding of multicast streams to multicast-router interfaces on a per VLAN or bridge domain level. Based on the receipt of IGMP or MLD join messages from interested receivers from behind the multicast-router interface, only known multicast traffic is sent to the multicast-router interface resulting in improved bandwidth utilization.

Release Information

Statement introduced in Junos OS Release 24.4R1.

no-fragmentation

IN THIS SECTION

- Syntax | 11943
- Hierarchy Level | 11943
- Description | 11943
- Default | 11943
- Required Privilege Level | 11943
- Release Information | 11943

Syntax

```
no-fragmentation;
```

Hierarchy Level

```
[edit class-of-service fragmentation-maps forwarding-class class-name]
```

Description

For link services IQ (`lsq`) interfaces only, set traffic on a particular forwarding class to be interleaved, rather than fragmented. This statement specifies that no extra fragmentation header is prepended to the packets received on this queue and that static-link load balancing is used to ensure in-order packet delivery.

Static-link load balancing is done based on packet payload. For IP version 4 (IPv4) and IP version 6 (IPv6) traffic, the link is chosen based on a hash computed from the source address, destination address, and protocol. If the IP payload is Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) traffic, the hash also includes source port and destination port. For MPLS traffic, the hash includes all MPLS labels and fields in the payload, whether the MPLS payload is IPv4 or IPv6.

Default

If you do not include this statement, the traffic in forwarding class *class-name* is fragmented.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

no-gratuitous-arp-request

IN THIS SECTION

- Syntax | 11945
- Hierarchy Level | 11945
- Description | 11945
- Default | 11946
- Required Privilege Level | 11946
- Release Information | 11946

Syntax

```
no-gratuitous-arp-request;
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

Configure the switch not to respond to gratuitous ARP requests. You can disable responses to gratuitous ARP requests on Layer 2 Ethernet switching interfaces, and integrated routing and bridging (IRB)

interfaces or routed VLAN interfaces (RVIs). (On EX Series switches that use Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style, the feature is known as an IRB interface. On EX Series switches that use Junos OS that does not support ELS, the feature is known as an RVI.)

Default

Gratuitous ARP responses are enabled on all Ethernet switching interfaces, and IRB interfaces or RVIs.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

no-hidden-commands

IN THIS SECTION

- Syntax | 11947
- Hierarchy Level | 11947
- Description | 11947
- Default | 11947
- Options | 11947

Required Privilege Level | 11947
Release Information | 11947

Syntax

```
no-hidden-commands;
```

Hierarchy Level

```
[edit system]
```

Description

Hidden commands are software commands that are not published but could be run on a router. Hidden commands serve a specific purpose, but for most part are not expected to be used, and as such are not actively supported. The `no-hidden-commands` statement allows you to block all hidden commands to all users except the root users.

Default

Hidden commands are enabled by default.

Options

This command has no options.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R1.

no-hierarchical-ecmp

IN THIS SECTION

- Syntax | 11948
- Hierarchy Level | 11948
- Description | 11948
- Required Privilege Level | 11949
- Release Information | 11949

Syntax

```
no-hierarchical-ecmp;
```

Hierarchy Level

```
[edit forwarding-options]
```

Description

Disable hierarchical equal-cost multipath (ECMP) groups at system start time. Hierarchical ECMP is enabled by default and provides for two-level route resolution. Disabling hierarchical ECMP effectively increases the number of ECMP groups available for route resolution because hierarchical ECMP allocates separate groups for overlay and underlay routes. Increasing the number of ECMP groups available is potentially useful in a virtual extensible LAN (VXLAN) environment or when MPLS LDP forwarding equivalence classes (FECs) are configured.

CAUTION: Disabling hierarchical ECMP causes the Packet Forwarding Engine to restart.

To reenable hierarchical ECMP, use the following command: `delete forwarding-options no-hierarchical-ecmp`. Reenabling hierarhical ECMP also causes the Packet Forwarding Engine to restart.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X53-D210.

no-intelligent-prescreening

IN THIS SECTION

- Syntax | 11956
- Hierarchy Level | 11956
- Description | 11956
- Required Privilege Level | 11957
- Release Information | 11957

Syntax

```
no-intelligent-prescreening;
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus juniper-express-engine profile profile-name scan-options]
[edit security utm feature-profile anti-virus kaspersky-lab-engine profile profile-name scan-options]
```

Description

Disables intelligent prescreening.

Intelligent prescreening tells the antivirus module to begin scanning a file much earlier. In this case, the scan engine uses the first packet or the first several packets to determine if a file could possibly contain malicious code. The scan engine does a quick check on these first packets and if the scan engine finds that it is unlikely that the file is infected, it then determines that it is safe to bypass the normal scanning procedure.

You can enable intelligent prescreening with the `intelligent-prescreening` statement.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

no-interface-hello

IN THIS SECTION

- Syntax | 11957
- Hierarchy Level | 11957
- Description | 11958
- Required Privilege Level | 11958
- Release Information | 11958

Syntax

```
no-interface-hello;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

Description

Explicitly disable RSVP interface hellos globally on the router.

> **NOTE**: For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling RSVP interface hellos globally, the `no-interface-hello` command triggers a switch back to the previous profile for all label-switched paths (LSPs.)

This type of configuration might be necessary in networks where the Juniper Networks router has numerous RSVP connections with equipment from other vendors. However, if you disable RSVP interface hellos globally, you can also configure a hello interval on an RSVP interface using the "hello-interval" on page 8400 statement. This configuration disables RSVP interface hellos globally but enables RSVP interface hellos on the specified interface. This configuration might be necessary in a heterogeneous network where some devices support RSVP node-ID hellos and other devices support RSVP interface hellos.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]
```

Description

Disable IP version 4 (IPv4) routing.

Disabling IPv4 routing has the following results:

- The routing device does not advertise the network layer protocol identifier (NLPID) for IPv4 in the Junos OS link-state PDU fragment zero.
- The routing device does not advertise any IPv4 prefixes in Junos OS link-state PDUs.
- The routing device does not advertise the NLPID for IPv4 in Junos OS hello packets.
- The routing device does not advertise any IPv4 addresses in Junos OS hello packets.
- The routing device does not calculate any IPv4 routes.

> **NOTE**: Note: Even when **no-ipv4-routing** is configured, an IS-IS traceoptions log can list rejected IPv4 addresses. When a configuration is committed, IS-IS schedules a scan of the routing table to determine whether any routes need to be exported into the IS-IS link state database. The implicit default export policy action is to reject everything. IPv4 addresses from the routing table are examined for export, rejected by the default policy, and the rejections are logged.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

no-l2vpn {
    l2ckt;
    l3vpn;
    labeled-bgp;
    no-l2ckt;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options forwarding-table chained-composite-
next-hop ingress],
[edit routing-options forwarding-table chained-composite-next-hop ingress]
```

Description

Disable composite chained next hop for ingress Layer 2 virtual private networkk (VPN) label-switched paths (LSPs).

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

no-listen

IN THIS SECTION

- Syntax | 11972
- Hierarchy Level | 11972
- Description | 11973
- Required Privilege Level | 11973
- Release Information | 11973

Syntax

```
no-listen;
```

Hierarchy Level

```
[edit forwarding-options helpers bootp interface (interface-name | interface-group)],
[edit forwarding-options helpers domain interface interface-name],
[edit forwarding-options helpers port port-number interface interface-name],
[edit forwarding-options helpers tftp interface interface-name]
```

Description

Disable recognition of DNS requests or stop packets from being forwarded on a logical interface, a group of logical interfaces, a router, or a switch.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

no-load-balance-label-capability

IN THIS SECTION

- Syntax | 11974
- Hierarchy Level | 11974
- Description | 11974
- Required Privilege Level | 11974
- Release Information | 11974

Syntax

```
no-load-balance-label-capability;
```

Hierarchy Level

```
[edit forwarding-options]
```

Description

Disables advertisement of entropy label capability in LDP and RSVP.

When you configure the `no-load-balance-label-capability` statement, it also disables the flow-aware transport of pseudowires (FAT) flow label for FEC 128.

The `load-balance-label-capability` and `no-load-balance-label-capability` statements at the `[edit forwarding-options]` hierarchy level are mutually exclusive, and at a given point in time, configuring one statement overrides the other.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

- Required Privilege Level | 11975
- Release Information | 11975

Syntax

```
no-load-throttle;
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

The no-load-throttle statement disables line card load-based throttling. Load-based throttling is also disabled when you configure the no-throttle statement.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.3R1.

no-local-reversion

IN THIS SECTION

- Syntax | 11976
- Hierarchy Level | 11976
- Description | 11976
- Required Privilege Level | 11977
- Release Information | 11977

Syntax

```
local-reversion;
no-local-reversion;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

Description

Disable RSVP local revertive mode as specified in RFC 4090, *Fast Reroute Extensions to RSVP-TE for LSP Tunnels*.

> **NOTE**: For Junos OS Release 16.1 running on MX Series or PTX Series routers, `no-local-reversion` is enabled by default, that is, local reversion is not running, and the statement has been deprecated. To enable local reversion, use the `local-reversion` statement.

RSVP local revertive mode is supported on all Juniper Networks routers running Junos OS. It is the default behavior. If you include this statement, the Juniper Networks router uses global revertive mode instead. You might need to disable RSVP local revertive mode on Juniper Networks routers if your network includes equipment that does not support this mode.

The following information can also be found in RFC 4090. Refer to the RFC for additional information. When an LSP fails, the connection can be repaired locally using a traffic protection mechanism such as fast reroute. To restore the LSP to a full working path, RFC 4090 specifies the following strategies:

- Local revertive mode—Upon detecting that the path is restored, the point of local repair (PLR) resignals each of the LSPs that were formerly routed over the restored path. Every LSP successfully resignaled along the restored path is switched back.
- Global revertive mode—The ingress router of each tunnel is responsible for reoptimizing the LSPs that used the failed path. There are several potential reoptimization triggers: RSVP error messages, inspection of OSPF LSAs or IS-IS LSPs, and timers. This re-optimization process can proceed as soon as the failure is detected. It is not tied to the restoration of the failed path.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

no-local-switching (VLAN)

IN THIS SECTION

- Syntax | 11978
- Hierarchy Level | 11978
- Description | 11978
- Required Privilege Level | 11978
- Release Information | 11978

Syntax

```
no-local-switching
```

Hierarchy Level

```
[edit vlans vlan-name]
```

Description

Specify that access ports in this VLAN domain do not forward packets to each other. You use this statement with primary VLANs and isolated secondary VLANs. You can also disable local switching on both customer edge (CE) and VPLS edge (VE) mesh-groups. Access and core-facing interfaces are included in the system-generated CE mesh-group and VE mesh-group, respectively. Traffic originating on access interfaces, including EVPN tunnel traffic, will be flooded only to core-facing interfaces. Traffic originating on core-facing interfaces, including EVPN tunnel traffic, will be flooded only to access interfaces.

NOTE: (MX80, MX104, and the 16x10GE MPC, MPC1, or MPC2 on MX240, MX480, MX960, MX2010, and MX2020 only) If you configure the `no-local-switching` command at the `[edit bridge-domains bridge-domain-name]` hierarchy level, it might not prevent multicast traffic from being forwarded between the CE-facing interfaces of the bridge domain. Broadcast, unknown unicast, and known multicast traffic does not exhibit this behavior.

Required Privilege Level

system—To view this statement in the configuration.

system–control—To add this statement to the configuration.

routing—To view this statement in the configuration.

routing–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Support for EVPN-MPLS on PTX Series routers added in Junos OS Evolved Release 23.1R1.

no-local-switching (VPLS)

IN THIS SECTION

- Syntax | 11979
- Hierarchy Level | 11979
- Description | 11979
- Required Privilege Level | 11980
- Release Information | 11980

Syntax

```
no-local-switching;
```

Hierarchy Level

```
[edit bridge-domains bridge-domain-name]
```

Description

Prevent CE devices from communicating directly with each other. If the `no-local-switching` statement is configured, frames arriving on a CE interface are sent to a VPLS edge (VE) device or core-facing interfaces only.

NOTE: (MX80, MX104, and the 16x10GE MPC, MPC1, or MPC2 on MX240, MX480, MX960, MX2010, and MX2020 only) If you configure the `no-local-switching` command at

the [edit bridge-domains *bridge-domain-name*] hierarchy level, it might not prevent multicast traffic from being forwarded between the CE-facing interfaces of the bridge domain. Broadcast, unknown unicast, and known multicast traffic does not exhibit this behavior.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 25.4R1.

no-mac-flush-on-aa-ae-down

IN THIS SECTION

- Syntax | 11984
- Hierarchy Level | 11984
- Description | 11984
- Default | 11984
- Options | 11985
- Required Privilege Level | 11985
- Release Information | 11985

Syntax

```
no-mac-flush-on-aa-ae-down (enable | disable);
```

Hierarchy Level

```
[edit protocols l2-learning platform-parameters]
```

Description

Don't flush MAC and MAC-IP routing table entries when an aggregated Ethernet (AE) interface in all-active mode goes down.

This statement helps to minimize network disruption during rapid active link switchovers when an AE interface connection is unstable and the connection status flaps (goes up and down quickly and repeatedly).

Default

If you don't configure this statement, by default, the device flushes MAC and MAC-IP routing table entries when the interface goes down.

If you set this statement but don't specify either the `enable` option or the `disable` option, the behavior is the same as setting this statement with the *enable* option—the device doesn't flush the MAC and MAC-IP entries when the interface goes down.

Options

enable (Optional) Don't flush the MAC and MAC-IP entries when the interface goes down.

disable Return to the default interface behavior to flush MAC and MAC-IP entries when the interface goes down.

> **NOTE**: This option has the same effect as deleting the `no-mac-flush-on-aa-ae-down` statement from the configuration.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration

Release Information

Statement introduced in Junos OS Release 21.3R2 and Junos OS Release 21.4R1.

[edit switch-options],
[edit switch-options],
[edit switch-options interface interface-name],
[edit vlans vlan-name switch-options]
```

Description

For QFX Series, EX Series switches and SRX Series Firewalls, disables MAC address learning for the specified VLAN.

For QFX Series and EX4600, disable MAC address learning for the specified interface. Disabling MAC address learning on an interface disables learning for all the VLANs of which that interface is a member.

For QFX5130 and QFX5700, disable MAC learning for a VLAN or for a specific logical interface. Disabling MAC address learning on an interface disables learning for all the VLANs on that interface.

For EX Series switches' Q-in-Q interfaces, disables MAC address learning for the specified interface. Disabling MAC address learning on an interface disables learning for all the VLANs of which that interface is a member.

For MX Series routers and EX Series switches with ELS support, disables MAC learning for a virtual switch, for a bridge domain or VLAN, for a specific logical interface in a bridge domain or VLAN, or for a set of bridge domains or VLANs associated with a Layer 2 trunk port. On platforms that support EVPNs, you can disable MAC learning on an EVPN.

NOTE: When MAC learning is disabled for a VPLS routing instance, traffic is not load-balanced and only one of the equal-cost next hops is used.

Default

MAC learning is enabled.

Required Privilege Level

system—To view this statement in the configuration.

system–control—To add this statement to the configuration.

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Support for the `switch-options` statement added in Junos OS Release 9.2.

Support for top-level configuration for the `virtual-switch` type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or bridge domain configured within a virtual switch.

Support for logical systems added in Junos OS Release 9.6.

`[edit switch-options]`, `[edit switch-options interface interface-name]`, `[edit vlans vlan-name switch-options]`, and `[edit vlans vlan-name switch-options interface interface-name]` hierarchy levels introduced in Junos OS Release 12.3 R2 for EX Series switches.

Support for EVPNs added in Junos OS Release 13.2 for MX 3D Series routers.

Hierarchy levels `[edit switch-options interface interface-name]` and `[edit vlans vlan-name switch-options]` introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Support for EVPN-MPLS on PTX Series routers added in Junos OS Evolved Release 23.1R1.

Support for QFX5130 and QFX5700 added in Junos OS Evolved Release 25.4R1.

no-make-before-break

IN THIS SECTION

- Syntax | 11991
- Hierarchy Level | 11991
- Description | 11991
- Required Privilege Level | 11991
- Release Information | 11992

Syntax

```
no-make-before-break;
```

Hierarchy Level

```
[edit fabric routing-options multicast]
```

Description

(QFabric systems only) Disable the default *make-before-break* multicast feature on QFabric systems to prevent the duplication of system traffic. This feature increases the speed of data plane traffic, but carries the risk of minor traffic losses when compared with the default make-before-break method of creating new multicast fabric paths before tearing down the old paths. The absence of the `no-make-before-break` configuration statement implies that the make-before-break default system behavior is in effect.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

no-management-vlan

IN THIS SECTION

- Syntax | 11992
- Hierarchy Level | 11992
- Description | 11992
- Required Privilege Level | 11993
- Release Information | 11993

Syntax

```
no-management-vlan;
```

Hierarchy Level

```
[edit virtual-chassis member member-id]
```

Description

Remove the specified member's out-of-band management port from the virtual management Ethernet (VME) global management VLAN of the Virtual Chassis or VCF configuration.

For a member that is functioning in a linecard role, you can use this configuration to reserve the member's management Ethernet port for local troubleshooting:

```
virtual-chassis {
    member 2 {
        no-management-vlan;
        }
    }
```

You cannot configure the IP address for a local management Ethernet port using the CLI or the J-Web interface. To do this, you need to use the shell `ifconfig` command.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

no-mcast-replication

IN THIS SECTION

- Syntax | 11994
- Hierarchy Level | 11994
- Description | 11994
- Default | 11994
- Required Privilege Level | 11994

Release Information | 11994

Syntax

```
no-mcast-replication;
```

Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number],
[edit chassis lcc number fpc slot-number pic pic-number]
```

Description

For point-to-multipoint LSPs configured on T Series routers, protect the Packet Forwarding Engine (PFE) from bandwidth saturation. When a PFE does not need to replicate traffic, the PFE's bandwidth is less likely to become saturated. When you include the `no-mcast-replication` statement, the PFE is forced to be a leaf node in the binary tree. Leaf nodes, unlike branch nodes, do not replicate traffic in the process of forwarding traffic. Because leaf nodes have no children, they do not need to replicate traffic, and thus are less likely to become saturated with traffic.

Default

If you omit the `no-mcast-replication` statement, the PFE can become a branch node or a leaf node. When the PFE becomes a branch node, the PFE must replicate traffic.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.3.

Point-to-Multipoint LSPs Overview

no-multicast

IN THIS SECTION

- Syntax | 11995
- Hierarchy Level | 11995
- Description | 11996
- Default | 11996
- Required Privilege Level | 11996
- Release Information | 11996

Syntax

```
no-multicast;
```

Hierarchy Level

For platforms with Enhanced Layer 2 Software (ELS)
(EX Series switches and MX Series routers):

```
[edit forwarding-options storm-control-profiles profile-name all]
```

For platforms without ELS:

```
[edit ethernet-switching-options storm-control interface (all | interface-name)]
```

Description

Disable storm control for all multicast traffic (both registered multicast and unregistered multicast) for the specified interface or for all interfaces.

Default

- On EX2200, EX3200, EX3300, and EX4200 switches—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams.
- On EX4300 switches—The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams. You can selectively disable storm control on any type of traffic.
- On EX4500 and EX8200 switches—The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams. On EX8200 switches, you can selectively disable storm control on registered multicast traffic, on unregistered multicast traffic, or on both types of multicast traffic.
- On EX6200 switches—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams. You can selectively disable storm control for each type of traffic individually.
- On EX9200 switches—Storm control is not enabled by default.
- On MX Series routers—Storm control is not enabled by default.

Required Privilege Level

- Description | 12000
- Default | 12001

Required Privilege Level | 12001
Release Information | 12001

Syntax

```
no-native-vlan-insert;
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

Send traffic without the native VLAN ID ("native-vlan-id" on page 11704) to the remote end of the network if untagged traffic is received.

If this statement is not configured, then "native-vlan-id" on page 11704 is added to untagged traffic. But if this statement is configured, then "native-vlan-id" on page 11704 is not added to untagged traffic.

NOTE:

- If you use the `no-native-vlan-insert` statement on MX Series routers, you'll need an MPC/MIC. Configuring this statement on MX Series routers with DPCs results is no behavioral change. However, if you configure the statement on aggregated Ethernet (ae) interfaces with logical interfaces across MPCs/MICs and DPCs, then the MPCs/MICs and DPCs behave differently.

- In the egress direction, this feature is disrupted by VLAN normalization. Because of normalization, the egress interface cannot distinguish between untagged traffic and tagged traffic. And untagged traffic is sent out with "native-vlan-id" on page 11704. Consider this while configuring both VLAN normalization and new "native-vlan-id" on page 11704 statement.

There will be a problem with ingress firewall filter if filter term includes "native-vlan-id" on page 11704. With `no-native-vlan-insert` statement configured, "native-vlan-id" on page 11704 will not be inserted to untagged traffic. So, firewall filter term will not match with untagged traffic. But if incoming traffic have VLAN ID which is equal to "native-vlan-id" on page 11704, then firewall filter term will match and firewall will work.

- When this feature is used with AE, all sub-interfaces of AE should be in same type of FPC.

Default

By default, "native-vlan-id" on page 11704 is inserted to untagged traffic. That is, if this statement is not configured, then "native-vlan-id" on page 11704 is inserted to untagged traffic.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1R1.

Statement introduced in Junos OS Release 25.2R1-EVO for ACX Series switches.

no-nested-application

IN THIS SECTION

- Syntax | 12005
- Hierarchy Level | 12005
- Description | 12005
- Required Privilege Level | 12005
- Release Information | 12005

Syntax

```
no-nested-application;
```

Hierarchy Level

```
[edit services application-identification nested-application-settings]
```

Description

Sometimes there is a need to identify multiple different applications running on the same Layer 7 protocols. For example, both Facebook and Yahoo Messenger can run over HTTP, but there is a need to identify them as two different applications. To do this, the application layer is split into two layers: Layer 7 applications and Layer 7 protocols. This function is turned on by default. Use the `no-nested-application` statement to turn it off.

Required Privilege Level

system—To view this statement in the configuration.

system control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

Statement deprecated in Junos OS Release 12.3X48-D10.

no-next-header-to-payload-protocol-mapping

IN THIS SECTION

- Syntax | 12006
- Hierarchy Level | 12006
- Description | 12006
- Required Privilege Level | 12007
- Release Information | 12007

Syntax

```
no-next-header-to-payload-protocol-mapping
```

Hierarchy Level

```
[edit firewall]
```

Description

Is used to control the behavior of the next-header match condition. When enabled, next-header matches the first extension header and if disabled next-header matches value of the payload/upper-layer protocol.

The next-header and payload-protocol match conditions were introduced in Junos releases 21.4R2-S1-EVO, 21.4R3-S1-EVO, 22.2R2-S1-EVO, 22.3R1-EVO and onwards. Previous to these releases, such as 21.4R3-EVO and 22.1R1-EVO, payload-protocol match condition did not exist; next-header was used to match the value of the payload/upper-layer protocol.

Currently, on Junos releases that support next-header and payload-protocol, the next-header match condition cannot be used when the filter using this match condition is bound to a WAN egress interface and/or the lo0 ingress interface. Customers upgrading to such Junos releases could have next-header match conditions attached to a WAN egress interface and/or the lo0 ingress interface. The upgrade fails in such scenarios.

Even if the filter is bound to supported interfaces, customers might get unexpected behavior. It is because of the change in semantics of the next-header match condition, where on previous releases it was expected to match the payload-protocol, but on newer releases, Junos automatically does an internal conversion to make it match the first extension header.

Customers are expected to modify their configurations before an upgrade to avoid such issues. The `no-next-header-to-payload-protocol-mapping` allows customers time to adapt to the new behavior of next-header to prevent a failure during upgrade or prevent unexpected behavior. This configuration command helps the user to control whether the next-header match condition should exhibit its previous behavior of matching the payload-protocol or current behavior of matching the first extension header.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.2

no-node-hello-on-bypass

IN THIS SECTION

- Syntax | 12007
- Hierarchy Level | 12008
- Description | 12008
- Required Privilege Level | 12008
- Release Information | 12008

Syntax

```
no-node-hello-on-bypass;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

Description

Disable the sending of RSVP hellos over a bypass LSP. Starting with Junos release 16.1, Junos routers send RSVP hello packets over a bypass LSP (when one is present), instead of the IGP next hop. To return to the original behavior specify the `no-node-hello-on-bypass` option.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

RELATED DOCUMENTATION

Configuring RSVP Node-ID Hellos

no-node-id-subobject

IN THIS SECTION

- Syntax | 12009
- Hierarchy Level | 12009
- Description | 12009
- Required Privilege Level | 12009
- Release Information | 12009

Syntax

```
no-node-id-subobject;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

Description

Disable the record route object (RRO) node-ID subobject for compatibility with earlier versions of Junos OS.

> **NOTE**: For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling the record route object (RRO) node ID sub-object, the `no-node-id-subobject` command triggers a switch back to the previous profile for all label-switched paths (LSPs).

To interoperate with other vendors' equipment, Junos OS supports the RRO node-ID subobject for use in inter-AS link and node protection configurations.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

RELATED DOCUMENTATION

no-normalization

IN THIS SECTION

- Syntax | 12010
- Hierarchy Level | 12010
- Description | 12010
- Required Privilege Level | 12011
- Release Information | 12011

Syntax

```
no-normalization;
```

Hierarchy Level

```
[edit logical-systems name routing-instances name],
[edit logical-systems name routing-instances name bridge-domains name bridge-options],
[edit routing-instances name ],
[edit routing-instances name bridge-domains name bridge-options]
```

Description

The `no-normalization` statement disables VLAN ID (VID) normalization for interfaces. This allows the configuration of VLAN-based service for EVPN with VID translation. This means the customer can have a different VID per Ethernet segment per PE with a strict compliance of RFC 7432. Use of this statement sets the Ethernet tag ID to zero.

Configuration of `vlan-id none` and `no-normalization` statements together enable transportation of dual-tagged frames across the EVPN core network in a virtual switch instance type.

Following are examples of the prerequisites for and use of the `no-normalization` statement on routing instance r1:

- `no-normalization` statement can be configured Only for EVPN instances:

```
set routing-instances r1 instance-type evpn
set routing-instances r1 no-normalization
```

- `no-normalization` of VLAN can be configured Only when `instance-type virtual-switch` along with `protocols evpn` is preconfigured:

```
set routing-instances r1 instance-type virtual-switch
set routing-instances r1 protocols evpn
set routing-instances r1 bridge-domains xyz bridge-options no-normalization
```

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.3R1.

Security Policies Overview

no-power-budget

IN THIS SECTION

- Syntax | 12034
- Hierarchy Level | 12034
- Description | 12034
- Required Privilege Level | 12035
- Release Information | 12035

Syntax

```
no-power-budget;
```

Hierarchy Level

```
[edit chassis]
```

Description

Disable power budgeting. If you disable the power management on the PTX10008, the router keeps all the FRUs powered on by default. The router does not move any of the FRUs to offline state even if it does not have sufficient power. However, in case of a power shortage, a power redundancy alarm is raised as shown in the following example.

```
user@router> show system alarms

1 alarm currently active

Alarm time Class Description

2019-07-25 21:16:25 UTC Major chassis No Redundant Power
```

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 20.1R2.

no-pre-classifier

IN THIS SECTION

- Syntax | 12035
- Hierarchy Level | 12035
- Description | 12036
- Default | 12036
- Required Privilege Level | 12036
- Release Information | 12036

Syntax

```
no-pre-classifier;
```

Hierarchy Level

```
[edit chassis fpc n pic n]
```

Description

Specify disabling the control queue for all ports on the 10-Gigabit Ethernet LAN/WAN PIC. Deleting this configuration re-enables the control queue feature on all ports of the 10-Gigabit Ethernet LAN/WAN PIC.

> **NOTE**: For the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PD-5-10XGE-SFPP), the control queue has a rate limiter to limit the control traffic to 2 Mbps (fixed, not user-configurable) per port. If the transit control traffic crosses this limit, then it can cause drops on locally terminating control traffic, causing flap of protocols such as BGP and OSPF. To avoid the control traffic being dropped, configure the `no-pre-classifier` statement to disable the control queue.

Default

The `no-pre-classifier` statement is not configured and the control queue is operational.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

no-propagate-ttl

IN THIS SECTION

- Syntax | 12037
- Hierarchy Level | 12037
- Description | 12037
- Default | 12037
- Required Privilege Level | 12038
- Release Information | 12038

Syntax

```
no-propagate-ttl;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

Description

Disable normal time-to-live (TTL) decrementing. You configure this statement once per router, and it affects all RSVP-signaled or LDP-signaled LSPs. When this router acts as an ingress router for an LSP, it pushes an MPLS header with a TTL value of 255, regardless of the IP packet TTL. When the router acts as the penultimate router, it pops the MPLS header without writing the MPLS TTL into the IP packet.

When you add the `no-propagate-ttl` statement to the configuration or delete it from the configuration, the effect takes place immediately. There is no need to clear existing RSVP LSPs or LDP sessions.

Default

Normal TTL decrementing enabled; the TTL field value is decremented by 1 as the packet passes through each label-switched router in the LSP.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Evolved Release 20.1R1 on PTX10008.

no-redirects (IPv4 Traffic)

IN THIS SECTION

- Syntax | 12045
- Hierarchy Level | 12045
- Description | 12045

- Default | 12045
- Required Privilege Level | 12046
- Release Information | 12046

Syntax

```
no-redirects;
```

Hierarchy Level

```
[edit system]
[edit interfaces interface-name unit logical-unit-number family family]
```

Description

Stop protocol redirect messages for IPv4 traffic from being sent on the entire device or on an interface on the device.

To disable the sending of protocol redirect messages for the entire device, include the `no-redirects` statement at the `[edit system]` hierarchy level.

To disable the sending of protocol redirect messages on a specific interface, include the `no-redirects` statement at the `[edit interfaces interface-name unit logical-unit-number family family]` hierarchy level.

NOTE: Hyper-mode is the default forwarding mode on the SCBE3-MX. In Junos versions prior to 19.2R1, ICMP redirects are disabled by default and cannot be re-enabled in hyper mode.

Default

For EX Series Switches: The interface sends redirect messages.

For other devices: The device sends redirect messages.

Required Privilege Level

For EX Series Switches:

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

For other devices:

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

Syntax

```
no-registered-multicast;
```

Hierarchy Level

For platforms with Enhanced Layer 2 Software (ELS)
(EX Series switches and MX Series routers):

```
[edit forwarding-options storm-control-profiles profile-name all]
```

For platforms without ELS:

```
[edit ethernet-switching-options storm-control interface (all | interface-name)]
```

Description

(EX8200 switches only) Disable storm control for registered multicast traffic for the specified interface or for all interfaces.

(EX4300 and EX9200 switches only) Exclude storm control for registered multicast traffic from a storm control profile.

(MX Series routers only) Exclude storm control for registered multicast traffic from a storm control profile.

Default

EX4300 and EX8200 switches—Storm control is enabled for unknown unicast traffic, multicast traffic, and broadcast traffic. The default storm control level is 80 percent of the available bandwidth used by the combined applicable traffic streams.

EX9200 switches—Storm control is not enabled by default.

MX Series routers—Storm control is not enabled by default.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

- Release Information | 12055

Syntax

```
no-remove-srv6-last-sid;
```

Hierarchy Level

```
[edit logical-systems name protocols source-packet-routing],
[edit protocols source-packet-routing],
[edit protocols source-packet-routing segment-list name],
[edit protocols source-packet-routing source-routing-path-template template-name],
[edit protocols source-packet-routing source-routing-path tunnel name]
```

Description

Do not remove the last SID for SRv6-TE ingress routes.

In older Junos releases, the last SID of the SRv6 TE tunnel was replaced with the service SID to avoid double termination at the egress node. The last SID of the SRv6-TE tunnel is ideally the Node SID of the egress Node. But in a deployment where the transit prefix without service SID resolves over a SRv6 TE tunnel the last SID must be retained, so that the ingress SRv6 TE tunnel acts as a transit tunnel to forward transit traffic with SRv6 encapsulation.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 25.4R1.

Syntax

```
no-revert;
```

Hierarchy Level

```
[edit protocols l2circuit local-switching interfaces interface-name]
[edit protocols l2circuit local-switching interfaces interface-name end-interface interface-name]
```

Description

(Optional) Prevent the local switching interface from reverting to the primary interface.

> **NOTE**: The protect interface must be configured prior to configuring the `no-revert` statement.

Typically, when the primary interface goes down, the pseudowire starts using the protect interface. By default, when the primary interface comes back online, the interface is switched-over back from the protect interface to the primary interface. To prevent the switchover back to the primary interface, unless the primary interface goes down, include the `no-revert` statement. This prevents loss of traffic during the switchover.

> **NOTE**: If the protect interface fails, the interface is switched-over back to the primary interface, irrespective of whether or not the `no-revert` statement is included in the configuration.

This statement can be configured both for the starting interface and the ending interface.

Required Privilege Level

```

Description

Configures an interface to be a spanning-tree designated port. If the bridge receives superior STP bridge protocol data units (BPDUs) on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge from being elected the root bridge. When the bridge stops receiving superior STP BPDUs on the root-protected interface, interface traffic is no longer blocked.

Required Privilege Level

- Release Information | 12064

Syntax

```
no-rpf-fbf-handling
```

Hierarchy Level

```
[edit forwarding-options no-rpf-fbf-handling]
```

Description

When Unicast Reverse Path Forwarding (uRPF) and filter based forwarding (FBF) are configured on an interface, the source IP address (SIP) lookup of an incoming packet is done by uRPF in the routing instance that the interface points to and destination IP addrress lookup is done in the routing instance specified by the FBF filter. You use `set forwarding-options no-rpf-fbf-handling` to override this default behavior. When you apply this configuration, the SIP lookup of an incoming packet is done by uRPF in the routing instance specified by the FBF filter.

NOTE:

- This is a hidden command - the CLI will not provide autofill assistance. You need to type the full command.
- After issuing this command the router or linecard reboots.

Required Privilege Level

no-send-pads-ac-info

IN THIS SECTION

Syntax | 12066

- Hierarchy Level | 12066
- Description | 12066
- Required Privilege Level | 12066
- Release Information | 12066

Syntax

```
no-send-pads-ac-info;
```

Hierarchy Level

```
[edit protocols pppoe]
```

Description

Prevent the router from sending the AC-Name and AC-Cookie tags in the PPPoE Active Discovery Session (PADS) packet. When you configure this statement, it affects PADS packets sent on all PPPoE interfaces configured on the router after the command is issued; it has no effect on previously created PPPoE interfaces. By default, the AC-Name and AC-Cookie tags are transmitted in the PADS packet, along with the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags.

NOTE: In Junos OS Release 12.1 and earlier, only the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags are contained in the PADS packet by default. The AC-Name and AC-Cookie tags are not transmitted in the PADS packet by default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

no-snoop (DHCP Local Server and Relay Agent)

IN THIS SECTION

- Syntax | 12072
- Hierarchy Level | 12072
- Description | 12072
- Required Privilege Level | 12073
- Release Information | 12073

Syntax

```
no-snoop;
```

Hierarchy Level

```
[edit forwarding-options dhcp-relay],
[edit forwarding-options dhcp-relay dhcpv6],
[edit logical-systems logical-system-name ...],
[edit logical-systems logical-system-name routing-instances routing-instance-name ...],
[edit routing-instances routing-instance-name ...],
[edit system services dhcp-local-server],
[edit system services dhcp-local-server dhcpv6]
```

Description

Disable DHCP snooping filters.

DHCP snooping provides DHCP security by identifying incoming DHCP packets. In the default DHCP snooping configuration, all traffic is snooped. You can optionally use the `forward-snooped-clients` statement to evaluate the snooped traffic and to determine if the traffic is forwarded or dropped, based on whether or not the interface is configured as part of a group.

> **NOTE**: Starting in Junos OS Release 22.4R1, 'no-snoop' (DHCP Local Server and Relay Agent) is supported for DHCPV6 on QFX10K platforms.
>
> The "no-snoop" option is not supported on PTX1000 and PTX10002-60C devices.

In both the default configuration and in configurations using the `forward-snooped-clients` statement, all DHCP traffic is forwarded from the hardware control plane to the routing plane of the routing instance to ensure that all DHCP packets are intercepted. In certain topologies, such as a Metropolitan Routing Ring topology, forwarding all DHCP traffic to the control plane can result in excessive traffic. The `no-snoop` configuration statement disables the snooping filter for DHCP traffic that can be directly forwarded on the hardware control plane, such as Layer 3 unicast packets with a valid route, causing those DHCP packets to bypass the slower routing plane.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1R2.

no-split-detection (MX Series Virtual Chassis)

IN THIS SECTION

- Syntax | 12075
- Hierarchy Level | 12075
- Description | 12075
- Required Privilege Level | 12076
- Release Information | 12076

Syntax

```
no-split-detection;
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

As part of the preprovisioned configuration for an MX Series Virtual Chassis, disable detection of a split in the Virtual Chassis configuration. By default, split detection in the Virtual Chassis is enabled. To maintain the Virtual Chassis configuration in the event of a failure of one of the two member routers, we recommend that you use the `no-split-detection` statement to disable split detection in Virtual Chassis configurations in which you think the backup router is more likely to fail than the link to the backup router.

BEST PRACTICE: We recommend that you use the `no-split-detection` statement to disable split detection for a two-member MX Series Virtual Chassis configuration if you think the backup router is more likely to fail than the Virtual Chassis port links to the backup router. Configuring redundant Virtual Chassis ports on different line cards in each

member router reduces the likelihood that all Virtual Chassis port interfaces to the backup router can fail.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

no-split-detection

IN THIS SECTION

- Syntax | 12077
- Hierarchy Level | 12077
- Description | 12077
- Default | 12077
- Required Privilege Level | 12077
- Release Information | 12077

Syntax

```
no-split-detection;
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

Disable the split and merge feature in a Virtual Chassis or VCF configuration.

The split and merge feature is enabled by default when you initially set up a Virtual Chassis. If you have only two members in your Virtual Chassis, we strongly recommend that you configure `no-split-detection` to disable the split and merge feature. This feature makes sure both switches remain in the correct Virtual Chassis roles in the event of a Virtual Chassis split. If you expand the two-member Virtual Chassis later to add more members, delete the `no-split-detection` configuration item to re-enable the split and merge feature again.

Default

The split and merge feature is enabled.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

no-throttle (Resource Monitor)

IN THIS SECTION

- Syntax | 12088
- Hierarchy Level | 12088
- Description | 12088
- Options | 12089
- Required Privilege Level | 12089
- Release Information | 12089

Syntax

```
no-throttle;
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

Disable the throttling of subscriber services and sessions when the utilization of memory resources exceeds the threshold levels. For the subscriber service management, sessions are throttled based on line card resources, such as heap, counter memory, expansion memory, and firewall counter memory. If the resource has been used above a certain threshold, the subscribers and services are throttled to prevent the system from being overloaded and resulting in a breakdown. This feature gathers input from each of the line cards and transfers this statistical detail to the Routing Engine process using a well-known internal port. This information is scanned by the daemon on the Routine Engine and using the shared memory space built into the the session database, the existing active subscribers and sessions

are throttled. You can configure the resource-monitoring capability on MX240, MX480, MX960, MX2010, and MX2020 routers with I-chip-based DPCs and Trio-based FPCs.

Options

`no-throttle` Disable the throttling of subscriber services and sessions when the utilization of memory resources exceeds the threshold levels. The throttling capability is enabled by default.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

```
[edit logical-systems logical-system-name protocols vpls static-vpls],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
vpls],
[edit protocols vpls static-vpls],
[edit routing-instances routing-instance-name protocols vpls]
```

Description

Configure VPLS on a router without a Tunnel Services PIC. Configuring the `no-tunnel-services` statement creates a label-switched interface (LSI) to provide VPLS functionality. An LSI MPLS label is used as the inner label for VPLS. This label maps to a VPLS routing instance. On the PE router, the LSI label is stripped and then mapped to a logical LSI interface. The Layer 2 Ethernet frame is then forwarded using the LSI interface to the correct VPLS routing instance.

NOTE: In VPLS documentation, the word *Router* in terms such as *PR Router* is used to refer to any device that provides routing functions.

NOTE: On MX Series routers, label-switched interfaces configured with the `no-tunnel-services` statement are not supported with GRE tunnels when the GRE interface resides on a DPC.

NOTE: Although visible in the CLI, the `no-tunnel-services` statement is not supported on DPC cards at the `[edit logical-systems logical-system-name protocols vpls static-vpls]` and the `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols vpls]` hierarchy levels.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.6.

Support for static VPLS added in Junos OS Release 10.2.

- Description | 12098
- Default | 12098
- Required Privilege Level | 12099
- Release Information | 12099

Syntax

```
no-unknown-unicast;
```

Hierarchy Level

For platforms with Enhanced Layer 2 Software (ELS)
(EX Series switches and MX Series routers):

```
[edit forwarding-options storm-control-profiles profile-name all]
```

For platforms without ELS:

```
[edit ethernet-switching-options storm-control interface (all | interface-name)]
```

Description

Disable storm control for unknown unicast traffic for the specified interface or for all interfaces.

Default

- On EX2200, EX3200, EX3300, and EX4200 switches—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams. You can selectively disable storm control on broadcast, multicast, or unknown-unicast traffic.

- On EX4300 switches—The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams. You can selectively disable storm control on any type of traffic.
- On EX4500 and EX8200 switches—The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams. On EX8200 switches, you can selectively disable storm control on registered multicast traffic, on unregistered multicast traffic, or on both types of multicast traffic.
- On EX6200 switches—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams. You can selectively disable storm control for each type of traffic individually.
- On EX9200 switches—Storm control is not enabled by default.
- MX Series routers—Storm control is not enabled by default.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

Hierarchy level `[edit forwarding-options]` introduced in Junos OS Release 13.2X50-D10. (See Using the Enhanced Layer 2 Software CLI for information about ELS.)

no-unregistered-multicast

IN THIS SECTION

- Syntax | 12100
- Hierarchy Level | 12100
- Description | 12100
- Default | 12101
- Required Privilege Level | 12101
- Release Information | 12101

Syntax

```
no-unregistered-multicast;
```

Hierarchy Level

For platforms with Enhanced Layer 2 Software (ELS)
(EX Series switches and MX Series routers):

```
[edit forwarding-options storm-control-profiles profile-name all]
```

For platforms without ELS:

```
[edit ethernet-switching-options storm-control interface (all | interface-name)]
```

Description

(EX8200 switches only) Disable storm control for unregistered multicast traffic for the specified interface or for all interfaces.

(EX4300 and EX9200 switches only) Exclude storm control for unregistered multicast traffic from a storm control profile.

(MX Series routers) Exclude storm control for unregistered multicast traffic from a storm control profile.

Default

EX4300 and EX8200 switches—Storm control is enabled for unknown unicast traffic, multicast traffic, and broadcast traffic. The default storm control level is 80 percent of the available bandwidth used by the combined applicable traffic streams.

EX9200 switches—Storm control is not enabled by default.

MX Series routers—Storm control is not enabled by default.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.3.

Hierarchy level `[edit forwarding-options]` introduced in Junos OS Release 13.2X50-D10. (See Using the Enhanced Layer 2 Software CLI for information about ELS.)

no-unsolicited-ra (Enhanced Subscriber Management)

IN THIS SECTION

- Syntax | 12102
- Hierarchy Level | 12102
- Description | 12102
- Required Privilege Level | 12102
- Release Information | 12103

Syntax

```
no-unsolicited-ra;
```

Hierarchy Level

```
[edit system services subscriber-management overrides]
```

Description

Disable the default transmission and periodic refresh of unsolicited Router Advertisement messages by the router when the subscriber interface is created, and at configured periodic intervals thereafter. When you include the `no-unsolicited-ra` statement, the router sends Router Advertisement messages and associated periodic refresh messages only when it receives a Router Solicitation message from the subscriber.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1R3.

no-uri-check

IN THIS SECTION

- Syntax | 12103
- Hierarchy Level | 12103
- Description | 12103
- Required Privilege Level | 12104
- Release Information | 12104

Syntax

```
no-uri-check;
```

Hierarchy Level

```
[edit security utm default-configuration anti-virus scan-options]
```

Description

Do not perform Sophos antivirus Uniform Resource Identifier (URI) checking. URI checking is performed by analyzing HTTP traffic URI content against a remote Sophos database server to identify malware or malicious content. URI checking is on by default.

NOTE: Starting in Junos OS release 18.4R1, the URI checking is off by default.

You can enable Sophos antivirus URI checking with the `uri-check` statement.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

no-user-query (Services User Identification)

IN THIS SECTION

- Syntax | 12104
- Hierarchy Level | 12105
- Description | 12105
- Required Privilege Level | 12105
- Release Information | 12105

Syntax

```
no-user-query;
```

Hierarchy Level

```
[edit services user-identification authentication-source (Services User Identification ClearPass)
aruba-clearpass]
```

Description

Disable the integrated ClearPass authentication and enforcement user query function, if it is configured. You can use the no-user-query statement to turn off the user query function without having to delete the configuration.

The user query function allows the SRX Series Firewall to query the ClearPass webserver for authentication and identity information for an individual user whose information was not posted to the SRX Series Firewall by ClearPass.

Required Privilege Level

services	To view this statement in the configuration.
services-control	To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

no-validate

IN THIS SECTION

- Syntax | 12106
- Hierarchy Level | 12106
- Description | 12106
- Options | 12107
- Required Privilege Level | 12107

Release Information | 12107

Syntax

```
no-validate policy-name;
```

Hierarchy Level

```
[edit protocols bgp group group-name family (inet | inet flow)],
[edit protocols bgp group group-name neighbor address family (inet | inet flow)],
[edit routing-instances routing-instance-name protocols bgp group group-name family (inet | inet
flow)],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address
family (inet | inet flow)]
```

Description

When BGP is carrying flow-specification network layer reachability information (NLRI) messages, the `no-validate` statement omits the flow route validation procedure after packets are accepted by a policy.

The receiving BGP-enabled device accepts a flow route if it passes the following criteria:

- The originator of a flow route matches the originator of the best match unicast route for the destination address that is embedded in the route.
- There are no more specific unicast routes, when compared to the destination address of the flow route, for which the active route has been received from a different next-hop autonomous system.

The first criterion ensures that the filter is being advertised by the next-hop used by unicast forwarding for the destination address embedded in the flow route. For example, if a flow route is given as 10.1.1.1, proto=6, port=80, the receiving BGP-enabled device selects the more specific unicast route in the unicast routing table that matches the destination prefix 10.1.1.1/32. On a unicast routing table containing 10.1/16 and 10.1.1/24, the latter is chosen as the unicast route to compare against. Only the active unicast route entry is considered. This follows the concept that a flow route is valid if advertised by the originator of the best unicast route.

The second criterion addresses situations in which a given address block is allocated to different entities. Flows that resolve to a best-match unicast route that is an aggregate route are only accepted if they do not cover more specific routes that are being routed to different next-hop autonomous systems.

You can bypass the validation process and use your own specific import policy. To disable the validation procedure and use an import policy instead, include the `no-validate` statement in the configuration.

Flow routes configured for VPNs with family **inet-vpn** are not automatically validated, so the `no-validate` statement is not supported at the `[edit protocols bgp group group-name family inet-vpn]` hierarchy level. No validation is needed if the flow routes are configured locally between devices in a single AS.

Options

policy-name—Import policy to match NLRI messages.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Required Privilege Level | 12110
Release Information | 12110

Syntax

```
no-vlan-interface-name;
```

Hierarchy Level

```
[edit forwarding-options dhcp-relay dhcpv6 (relay-agent-interface-id | relay-agent-remote-id)],
[edit forwarding-options dhcp-relay dhcpv6 group group-name (relay-agent-interface-id | relay-agent-
remote-id)],
[edit forwarding-options dhcp-relay relay-option-82 (circuit-id | remote-id)],
[edit forwarding-options dhcp-relay group group-name relay-option-82 (circuit-id | remote-id)],
[edit logical-systems logical-system-name ... forwarding-options dhcp-relay dhcpv6 (relay-agent-
interface-id | relay-agent-remote-id)],
[edit logical-systems logical-system-name ... forwarding-options dhcp-relay ... relay-option-82
(circuit-id | remote-id)],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay dhcpv6  (relay-agent-
interface-id | relay-agent-remote-id)],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ... relay-option-82
(circuit-id | remote-id)],
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options option-18],
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options option-37]
```

Description

When you do not want bridge domain or VLAN tag information, do not include the VLAN ID nor the VLAN interface name (the default) in the circuit or remote ID value in the DHCP option 82 information.

NOTE: The `no-vlan-interface-name` statement is mutually exclusive with the `use-interface-description` and `use-vlan-id` statements.

When you configure the `no-vlan-interface-name` statement only, the format displays only the Layer 3 interface:

```
irb.subunit
```

NOTE: The *subunit* is required and used to differentiate the interface for remote systems.

When you configure the `no-vlan-interface-name` and `use-interface-description` statements, the format displays the IRB interface description:

```
irb_descr
```

If you configure the `no-vlan-interface-name` and `use-interface-description` statements, and no description for the IRB interface is found, the format displays the IRB interface name:

```
irb.subunit
```

When you configure the `no-vlan-interface-name` and `include-irb-and-l2` statements, the format displays the Layer 2 logical interface name and the IRB interface name:

```
(fe | ge)-fpc/pic/port.subunit+irb.subunit
```

When you configure the `no-vlan-interface-name`, `include-irb-and-l2` and `use-interface-name` statements, the format displays the Layer 2 interface description and the IRB interface name:

```
l2_descr+irb.subunit
```

If you configure the `no-vlan-interface-name`, `include-irb-and-l2` and `use-interface-name` statements, and no description for the Layer 2 interface is found, the format displays the Layer 2 logical interface name and the IRB interface name:

```
(fe | ge)-fpc/pic/port.subunit+irb.subunit
```

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

> **NOTE**: The EX Series switches that support the `no-vlan-interface-name` statement are the EX4300, EX4600, and EX9200 switches.

no-vrf-advertise

IN THIS SECTION

- Syntax | 12110
- Hierarchy Level | 12111
- Description | 12111
- Required Privilege Level | 12111
- Release Information | 12111

Syntax

```
no-vrf-advertise;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit routing-instances routing-instance-name]
```

Description

Prevent advertising VPN routes from a VRF routing instance to remote PE routers.

Within a hub-and-spoke configuration, you can configure a PE router to not advertise VPN routes from the primary (hub) routing instance. Instead, these routes are advertised from the secondary (downstream) routing instance. You can do this without configuring routing table groups, by using the `no-vrf-advertise` statement.

> **NOTE**: This statement does not prevent the exportation of VPN routes to other VRF routing instances on the same router by configuring the `[edit routing-options auto-export]` statement.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

no-vrf-propagate-ttl

IN THIS SECTION

- Syntax | 12112
- Hierarchy Level | 12112
- Description | 12112
- Default | 12112
- Required Privilege Level | 12113
- Release Information | 12113

Syntax

```
no-vrf-propagate-ttl;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit routing-instances routing-instance-name]
```

Description

Disable normal time-to-live (TTL) decrementing in a VRF routing instance. You configure this statement once per routing instance, and it affects only RSVP-signaled or LDP-signaled LSPs in the routing instance. When this router acts as an ingress router for an LSP, it pushes an MPLS header with a TTL value of 255, regardless of the IP packet TTL. When the router acts as the penultimate router, it pops the MPLS header without writing the MPLS TTL into the IP packet.

Default

Normal TTL decrementing enabled; the TTL field value is decremented by 1 as the packet passes through each label-switched router in the LSP.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

RELATED DOCUMENTATION

no-walkup

IN THIS SECTION

- Syntax | 12113
- Hierarchy Level | 12114
- Description | 12114
- Default | 12114
- Required Privilege Level | 12114
- Release Information | 12114

Syntax

```
no-walkup;
```

Hierarchy Level

```
[edit logical-systems logical-system-name policy-options defaults route-filter],
[edit logical-systems logical-system-name policy-options policy-statement policy-statement-name
defaults route-filter]
```

Description

Override route filter walkup globally or locally for a particular policy statement. The walkup feature examines more than the longest match route filters in a policy statement term with more than one route filter, allowing consolidation of terms and a potential performance enhancement.

Default

By default, the policy statement performs the type of route filter processing that is enabled at the global level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

no-world-readable (Next Gen Services Global System Logging)

IN THIS SECTION

- Syntax | 12115
- Hierarchy Level | 12115
- Description | 12115
- Default | 12116
- Options | 12116
- Required Privilege Level | 12116
- Release Information | 12116

Syntax

```
no-world-readable
```

Hierarchy Level

```
[edit services rtlog traceoptions file]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Do not allow any user to read the log file. Use this option to revert to `no-world-readable` configuration from `world-readable` setting.

Default

By default, `no-world-readable` option is set. No user is allowed to read the log file.

Options

world-readable Do not allow any user to read the log file

Required Privilege Level

system

Release Information

no-zero-suppression

IN THIS SECTION

- Syntax | 12117
- Hierarchy Level | 12117
- Description | 12117
- Required Privilege Level | 12117

Syntax

```
no-zero-suppression
```

Hierarchy Level

```
[edit services analytics zero-suppression]
```

Description

Disable zero suppression for gRPC-based sensors. When this feature is enabled, data for a sensor is sent to the collector if the sensor value is zero. You can expect to see all counters, even ones with a value of zero. All key value pair updates will be streamed to a collector without performing any zero suppression. The default behavior without zero suppression is that a device will suppress zero values from streamed data.

To enable zero suppression again (the default), delete the configuration by entering **#delete services analytics zero-suppression no-zero-suppression**.

Whenever this feature is set or deleted, any existing collector is disconnected.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

21.4R1	Statement introduced in Junos OS Release 21.4R1 for MX240, MX280, and MX960 operating with MPC10E-10-MRATE, MPC10E-10C-MRATE, MPC10E-15C-MRATE line cards and MX2010 and MX2020 operating with the MX2K-MPC11E line card.
21.1R1	Statement introduced in Junos Evolved OS Release 21.1R1 for PTX10003-80C and PTX10003-160C and PTX10008.

20.4R2	Statement introduced in Junos Evolved OS Release 20.4R2 for PTX10008.

node (Chassis Cluster Redundancy Group)

IN THIS SECTION

- Syntax | 12118
- Hierarchy Level | 12118
- Description | 12118
- Options | 12119
- Required Privilege Level | 12119
- Release Information | 12119

Syntax

```
node (0 | 1 ) {
    priority number;
}
```

Hierarchy Level

```
[edit chassis cluster redundancy-group          group-number        ]
```

Description

Identify each cluster node in a redundancy group and set its relative priority for primary role.

A redundancy group is collection of objects. A redundancy group contains objects on both nodes. A redundancy group is primary on one node and backup on the other at any time. When a redundancy group is said to be primary on a node, its objects on that node are active. The primacy of a redundancy group is dependent on the priority configured for the node, the node ID (in case of tied priorities), and the order in which the node comes up.

Options

node Cluster node number, You can set with the `set chassis cluster node` *`node-number`* statement.

- Values:
  - `0`—Node identifier 0
  - `1`—Node identifier 1

priority *number* Priority value of the node. Each node is given a priority within a redundancy group. The eligible node with the highest priority is elected primary. Initiating a failover with the `request chassis cluster failover node` or `request chassis cluster failover redundancy-group` command overrides the priority settings.

- **Range:** `1-254`

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

node-detection (EVPN-VXLAN)

IN THIS SECTION

- Syntax | 12121
- Hierarchy Level | 12122
- Description | 12122
- Options | 12122
- Required Privilege Level | 12123
- Release Information | 12123

Syntax

```
node-detection {
  action (laser-off | trigger-node-isolation);
  bfd-liveness-detection {
   no-adaptation;
   detection-time {
    threshold milliseconds;
   }
   inline-disable;
   minimum-interval milliseconds;
   minimum-receive-interval milliseconds;
   multiplier multiplier;
   neighbor neighbor;
   pdu-size pdu-size;
   transmit-interval {
    minimum-interval milliseconds;
    threshold milliseconds;
   }
   version(0 | 1 | automatic);
  }
```

```
 next-hop next-hop interface;
}
```

Hierarchy Level

```
[edit logical-systems name protocols evpn],
[edit protocols evpn]
```

Description

Configure node detection to enable "bfd-liveness-detection" on page 3128 in a multihomed environment. Node detection monitors the liveness of EVPN BGP peers using Bidirectional Forwarding Detection (BFD) protocol. Configure one of the peers to take `action` to forward traffic through the network based on the status of the BGP and BFD sessions. The two options for the `action` configuration are turning the interface lasers off and triggering node isolation. When the `action` is turning the lasers off, the lasers are off for the ESI LAG interfaces during core isolation. The trigger node isolation `action` puts the ESI LAG interfaces in a link-down state.

Each option for the `action` configuration also requires additional configuration.

- The `laser-off` action requires that "asynchronous-notification" on page 2718 be configured on the ESI-LAG interfaces.
- The `trigger-node-isolation` action requires a "network-isolation" on page 11781 profile and a "service-tracking-action link-down" on page 17370 configuration that brings the interface down on core-isolation.

The BFD session can run over standard interfaces or over the management interfaces between the EVPN BGP peers.

NOTE: Junos OS Evolved platforms do not support BFD over management ports.

Options

action Configure the isolation action only on one device and not both. The isolation action determines how to implement the core isolation.

- laser-off—Will trigger laser-off on core-isolation
- trigger-node-isolation—Will trigger link-down on core-isolation

next-hop Next-hop interface connected to the node detection peer

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

Syntax

```
node-device node-device-name {
    assigned-node-device-name;
}
```

Hierarchy Level

```
[edit fabric aliases]
```

Description

(QFabric systems only) Specify the mapping of user-defined names to QFabric system Node devices.

NOTE: The following rules apply to QFabric component alias naming:

- Alias names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of an alias name is 30 characters.
- Alias names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names `all`, `fabric`, or `director-group` as an alias name.

Options

node-device-name	Specify a user-defined name for a QFabric system Node device.
assigned-node-device-name	Specify the Node device identifier or name that has been provided. Identifiers are usually autogenerated by the Director software, and names are usually provided by the administrator of the default partition.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

- Options | 12128
- Required Privilege Level | 12128
- Release Information | 12128

Syntax

```
node-device (node-device-name | serial-ID | alias );
```

Hierarchy Level

```
[edit fabric flow-groups flow-group-name]
```

Description

In a QFabric system, a hash function is used to select an Interconnect device to forward traffic between two Node devices. Since this hash function is performed on all available Interconnect devices, it is possible for redundant multicast streams to flow through one Interconnect device, making that Interconnect device a potential single point of failure for the redundant flows. You can enforce the use of specific Interconnect devices by using the QFabric system `flow-groups` statement.

NOTE: A Node device can belong to only one flow group.

```
root@qfabric# set fabric flow-groups test1 node-device ?
Possible completions:
 <node-device-name> Serial ID or alias of node-device
P3686-C                 Node device
TA3713480203      Node device
TA3713500165     Node device
TA3713500185     Node device
TA3713500307     Node device
```

Options

node-device-name (or *serial-ID* or *alias*)	selects the indicated ingress Node device switch for a flow group

node-group node-group-name {
    network-domain;
```

```
    node-device node-device-name;
}
```

Hierarchy Level

```
[edit fabric resources]
```

Description

(QFabric systems only) Define Node groups within a QFabric system.

NOTE: The following rules apply to QFabric Node group naming:

- The network Node group must use the predefined name *NW-NG-0*. You must use this name when adding Node devices to the network Node group. You cannot specify a different name. Also, you can configure only one network Node group per partition.
- Node group names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of a Node group name is 30 characters.
- Node group names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names `all`, `fabric`, or `director-group` as a Node group name.

The remaining statements are explained separately. See CLI Explorer.

node-hello

IN THIS SECTION

- Syntax | 12135
- Hierarchy Level | 12135
- Description | 12135
- Required Privilege Level | 12136
- Release Information | 12136

Syntax

```
(node-hello | no-node-hello);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

Description

Enable node-ID based RSVP hellos globally on all of the RSVP interfaces on the router to allow Juniper Networks routers to interoperate with the equipment of other vendors. By default, node-ID based RSVP hellos are enabled. To disable node-id based hello sessions, use the `no-node-hello` statement. If you have disabled RSVP node IDs on the router, Junos OS does not accept any node-ID hello packets.

NOTE: For Junos OS Release 15.1 or earlier, node-ID based hellos are disabled by default. To enable node-id based hello sessions on routers running Junos OS Release 15.1 or earlier, use the **node-hello** statement.

NOTE: If `link-protection` is enabled, remote node hellos that are initiated by the Point of Local Repair (PLR) to Node Protecting Merge Point (NP-MP) are enabled automatically. However, if `no-enhanced-frr-bypass` is enabled (that is, enhanced FRR is off), remote node hellos are automatically disabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

source-packet-routing],
[edit protocols ospf source-packet-routing],
[edit routing-instances routing-instance-name protocols ospf source-packet-routing]
```

Description

Enable source packet routing in networking (SPRING) at all levels. SPRING, or segment routing, is a control-plane architecture that enables an ingress router to steer a packet through a specific set of nodes and links in the network without relying on the intermediate nodes in the network to determine the actual path it should take.

> **NOTE**: You can provision an IPv4 node segment index for a routing instance, not for a specific OSPF area. A node segment index is attached to the IPv4 router-id, if the router-ids are configured on the loopback interface. Otherwise, the lowest IP address on the loopback interface is chosen to attach the node segment identifier..

Options

index-range *index range*

Range of node segment indices allowed.

- **Default:** 4096
- **Range:** 32 through 4096

ipv4-index *index*

IPv4 node segment index.

- **Range:** 0 through 4095

non-revertive;
```

Hierarchy Level

```
[edit chassis aggregated-devices ethernet lacp link-protection]
```

Description

Disable the ability to switch to a better priority link (if one is available) once a link is established as active and a collection or distribution is enabled.

BEST PRACTICE: (MX Series) By default, Link Aggregation Control Protocol link protection is revertive. This means that after the current link becomes active, the router switches to a higher-priority link if one becomes operational or is added to the aggregated Ethernet bundle. In a highly scaled configuration over aggregated Ethernet,

we recommend that you prevent the router from performing such a switch by including the `non-revertive` statement. Failure to do so may result in some traffic loss if a MIC on which a member interface is located reboots. Using the `non-revertive` statement for this purpose is not effective if both the primary and secondary interfaces are on the MIC that reboots.

Required Privilege Level

```

Description

For routing platforms with two Routing Engines, a primary Routing Engine is configured to switch over gracefully to a backup Routing Engine. This allows the routing protocol information to be preserved even after failover. Support of precision-timers in the kernel is a feature where the kernel takes over autogeneration of BGP keepalives right after the switchover from backup to primary event occurs. The kernel in the Routing Engine continues this autogeneration until RPD is able to take over the session or until a maximum period has elapsed since the switchover event occurred.

NOTE: This maximum period configuration applies only when at least one client protocol such as BGP registers for the automatic keepalive generation service provided by the

kernel, and the kernel timer generates control plane session keepalives on behalf of that protocol after a switchover event.

Options

precision-timers-max-period *precision-timers-max-period*

The maximum period for which the kernel auto generates keepalives on behalf of BGP after a switchover event from backup to primary.

> **NOTE**: You can verify the `precision-timers-max-period` using "show nonstop-routing" on page 23518 command.

- **Default:** 600 seconds
- **Range:** 60 seconds to 1800 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.2.

- Required Privilege Level | 12164
- Release Information | 12164

Syntax

```
normalization;
```

Hierarchy Level

```
[edit routing-instances name protocols evpn]
```

Description

Enable normalization, which translates ingress or egress VLANs to another VLAN ID.

Default

Routing instances configure as `instance-type evpn` have normalization enabled by default.

Routing instances configured as `instance-type mac-vrf` have normalization disabled by default.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 21.3R1

    normalization-retry-limits number;
```

```
    normalize-interval seconds;
}
```

Hierarchy Level

```
[edit protocols mpls container-label-switched-path lsp-name splitting-merging]
```

Description

Perform normalization.

Options

failover-normalization

Enable the ingress router to pro-actively normalize or re-distribute traffic when a link or node failure happens on a member LSP. A member LSP can go down between two scheduled normalization events because of a link-failure or pre-emption.

- **Default:** Disabled

no-incremental-normalize

Disables automatic switchover by the ingress router to a new instance of the container LSP until the desired demand is satisfied, although the given number of LSPs can be successfully signaled such that the new aggregate bandwidth value exceeds the old aggregate bandwidth value.

- **Default:** False (disabled)

normalization-retry-duration *seconds*

Specifies the duration before which the ingress router performs a normalization reattempt when the previous normalization has not been successful. Normalization is done until a sufficient number of LSPs come up with an aggregate bandwidth that is more than the current aggregate or desired bandwidth.

- **Default:** 30 seconds

normalization-retry-limits *number*

Specifies the maximum number of times the ingress router performs normalization reattempts until a sufficient number of LSPs come up successfully with new bandwidth values.

- **Default:** 1

normalize-interval *seconds*

Specifies the duration between two normalization events.

- **Range:** 300 seconds through 315360000 seconds
- **Default:** 86400 seconds

Required Privilege Level

notification (NETCONF)

IN THIS SECTION

- Syntax | 12174
- Hierarchy Level | 12174
- Description | 12174
- Default | 12175
- Options | 12175
- Required Privilege Level | 12175
- Release Information | 12175

Syntax

```
notification {
    interleave;
}
```

Hierarchy Level

```
[edit system services netconf]
```

Description

Enable the NETCONF event notification service. When this service is enabled on supported devices, the NETCONF server sends asynchronous event notifications to clients that subscribe to notifications within a NETCONF session.

NOTE: We recommend that you configure and stream only one set of notifications, either NETCONF notifications or telemetry data, at a time. If you configure a device to enable NETCONF notifications, the device streams all notifications over the NETCONF channel and does not stream telemetry notifications over gRPC.

Default

If you do not include the `notification` statement, NETCONF clients cannot subscribe to event notifications in a NETCONF session.

Options

`interleave` Enable the NETCONF client and server to exchange RPCs and RPC replies within a NETCONF session that subscribes to event notifications.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 21.2R1.

`interleave` statement introduced in Junos OS Evolved Release 23.4R1.

Select management targets for SNMPv3 notifications as well as the type of notifications. Notifications can be either traps or informs.

Options

name—Name assigned to the notification.

tag-name—Notifications are sent to all targets configured with this tag.

`type`—Notification type is `trap` or `inform`. Traps are unconfirmed notifications. Informs are confirmed notifications.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`type inform` option added in Junos OS Release 7.4.

notify-filter (Applying to the Management Target)

IN THIS SECTION

- Syntax | 12190
- Hierarchy Level | 12190
- Description | 12190

- Options | 12190
- Required Privilege Level | 12190
- Release Information | 12190

Syntax

```
notify-filter profile-name;
```

Hierarchy Level

```
[edit snmp v3 target-parameters target-parameters-name]
```

Description

Specify the notify filter to be used by a specific set of target parameters.

Options

profile-name—Name of the notify filter to apply to notifications.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

notify-filter (Configuring the Profile Name)

IN THIS SECTION

- Syntax | 12191
- Hierarchy Level | 12191
- Description | 12191
- Options | 12191
- Required Privilege Level | 12192
- Release Information | 12192

Syntax

```
notify-filter profile-name {
    oid oid (include | exclude);
}
```

Hierarchy Level

```
[edit snmp v3]
```

Description

Specify a group of MIB objects for which you define access. The notify filter limits the type of traps or informs sent to the network management system.

Options

profile-name—Name assigned to the notify filter.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-
prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]
```

Description

Associate the notify view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).

Options

view-name—Name of the view to which the SNMP user group has access.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

np-cache (Flexible PIC Concentrator)

IN THIS SECTION

- Syntax | 12199
- Hierarchy Level | 12199
- Description | 12199
- Options | 12199
- Required Privilege Level | 12199
- Release Information | 12200

Syntax

```
np-cache;
```

Hierarchy Level

```
[edit chassis fpc fpc-slot-number]
```

Description

Enable session cache table on IOC.

Starting with Junos OS Release 15.1X49-D10 and and Junos OS Release 17.3R1, NP cache is supported on the SRX5K-MPC (IOC2), SRX5K-MPC3-100G10G (IOC3), and SRX5K-MPC3-40G10G (IOC3) for SRX5400, SRX5600, and SRX5800 devices.

From Junos OS Release 21.2R1, `np-cache` is enabled by default.

The security policy determines whether a session is for Express Path (formerly known as *services offloading*) mode on the selected Flexible PIC Concentrator (FPC).

NOTE: The IOC2 and the IOC3 utilize the delay sessions delete mechanism. The same sessions (sessions with the same five tuples) that are deleted and then reinstalled immediately are not cached on the IOCs.

NOTE: In a cluster deployment, when you configure `np-cache` for an IOC card from node0, the IOC cards on both cluster nodes are activated.

NOTE: To enable IPsec VPN affinity, you must also enable the session cache on IOCs (IOC2 and IOC3) by using the `set chassis fpc <fpc-slot> np-cache` command.

Options

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D10.

nptv6-prefix

IN THIS SECTION

nsr-phantom-holdtime

IN THIS SECTION

- Syntax | 12203
- Hierarchy Level | 12203
- Description | 12203
- Options | 12203
- Required Privilege Level | 12203
- Release Information | 12204

Syntax

```
nsr-phantom-holdtime seconds;
```

Hierarchy Level

```
[edit routing-options]
```

Description

Specify to hold phantom IP addresses, that is, prevent these routes from being added to routing tables, for a specified period of time. During this hold-time interval, these routes are maintained in the kernel. After the hold time expires, the routes are added to the routing tables.

You use this option with the Graceful Routing Engine switchover (GRES) feature with nonstop routing (NSR). We strongly recommend that you configure this statement on switches in the QFX10000 line with redundant Routing Engines before you initiate a GRES operation. Doing so prevents traffic loss because routes are added to the routing tables after the hold-time interval expires, but before they are deleted from the kernel during a switchover.

NOTE: This statement doesn't apply to QFX10002 switches because those devices don't have redundant Routing Engines and don't support GRES.

Options

seconds Specify the interval of time to prevent phantom IP addresses from being added to the routing tables. After this interval expires, the routes are added to the routing tables.

BEST PRACTICE: In an EVPN/VXLAN environment with NSR and GRES enabled, the recommended hold-time value is 300 (5 minutes)

- **Range:** 0 through 10000

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1x53-D60.

[edit routing-instances routing-instance-name protocols (ospf | ospf3) area area-id],
[edit routing-instances routing-instance-name protocols ospf3 realm (ipv4-unicast | ipv4-
multicast | ipv6-multicast)]
```

Description

Configure a not-so-stubby area (NSSA). An NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas.

You cannot configure an area as being both a stub area and an NSSA.

The remaining statements are explained separately. See CLI Explorer.

Options

summaries | no-summaries Configure whether or not area border routers advertise summary routes into an not-so-stubby area (NSSA):

- `summaries`—Flood summary link-state advertisements (LSAs) into the NSSA.
- `no-summaries`—Prevent area border routers from advertising summaries into an NSSA. If `default-metric` is configured for an NSSA, a Type 3 LSA is injected into the area by default.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for the `realm` statement introduced in Junos OS Release 9.2.

Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.

stub | 29777

nssu

IN THIS SECTION

- Syntax | 12207
- Hierarchy Level | 12207
- Description | 12207
- Default | 12208
- Required Privilege Level | 12208
- Release Information | 12208

Syntax

```
nssu {
    rcp-count number;
    upgrade-group group-name {
        fpcs (slot-number | [list-of-slot-numbers]);
        member member-id {
            fpcs (slot-number | [list-of-slot-numbers]);
        }
    }
}
```

Hierarchy Level

```
[edit chassis]
```

Description

Configure parameters that affect the nonstop software upgrade (NSSU) process.

> **NOTE**: You use the "request system software nonstop-upgrade" on page 15892 command to initiate NSSU.

The `rcp-count` option (available only on QFX5100 switches) sets the number of parallel `rcp` sessions that NSSU uses to copy the new software to multiple Virtual Chassis or VCF member switches at a time.

The `upgrade-group` options define line-card upgrade groups for NSSU. When you initiate NSSU with at least one upgrade group configured, NSSU upgrades the line cards or Virtual Chassis or VCF members in each upgrade group to the new software version at the same time, in the order in which you configured them. Upgrade groups reduce the time required to complete an NSSU operation and control the order in which the line cards or members are upgraded.

Line-card upgrade groups are supported on some EX Series switches and EX Series Virtual Chassis that support NSSU and on a QFX5100 VCF.

These statements are all explained separately. You can also consult CLI Explorer.

Default

If you do not configure `rcp-count`, NSSU uses a default algorithm to determine the number of parallel `rcp` sessions to use based on the number of members in the Virtual Chassis or VCF.

If you do not define any line-card upgrade groups, NSSU upgrades line cards or members of a Virtual Chassis or VCF one at a time in ascending order by slot or member number.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

`rcp-count` statement introduced in Junos OS Release 14.1X53-D40 for QFX5100 switches only.

ntp threshold

IN THIS SECTION

- Syntax | 12210
- Syntax | 12210
- Hierarchy Level | 12210
- Description | 12210
- Options | 12211
- Required Privilege Level | 12211
- Release Information | 12211

Syntax

```
threshold value <action (accept | reject)>;
```

Syntax

```
threshold action (accept | reject) value;
```

Hierarchy Level

```
[edit system ntp]
```

Description

Assign a threshold value for Network Time Protocol (NTP) adjustment that is outside of the acceptable NTP update and specify whether to accept or reject NTP synchronization when the proposed time from the NTP server exceeds the configured threshold value. If **accept** is the specified action, the system synchronizes the device time with the NTP server, but logs the time difference between the configured threshold and the time proposed by the NTP server; if **reject** is the specified action, synchronization with the time proposed by the NTP server is rejected, but the system provides the option of manually

synchronizing the device time with the time proposed by the NTP server and logs the time difference between the configured threshold and the time proposed by the NTP server. By logging the time difference and rejecting synchronization when the configured threshold is exceeded, this feature helps improve security on the NTP service.

If this command is not configured or by default, the NTP will allow time adjustments for up to 1000 seconds except for first time adjustment. After NTP synchronization starts, it will allow first time adjustment to happen without any time limit. After first time adjustment happens, 1000 seconds time limit will be enforced for future time adjustments.

Options

value Specify the maximum value in seconds allowed for NTP adjustment.

- **Range:** 1 through 600.
- **Default:** The default value is 400.

action Specify the actions for NTP abnormal adjustment.

- `accept`—Enable log mode for abnormal NTP adjustment. When the proposed time from the NTP server is outside of the configured threshold value, the device time synchronizes with the NTP server, but the system logs the time difference between the configured threshold and the time proposed by the NTP server.
- `reject`—Enable log and reject mode for abnormal NTP adjustment. When the proposed time from the NTP server is outside of the configured threshold value, the system rejects synchronization, but provides the option for manually synchronizing the time and logs the time difference between the configured threshold and the time proposed by the NTP server.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D70.

Statement qualified for Junos OS Evolved Release 25.4R1.

}
```

Hierarchy Level

```
[edit system]
```

Description

Configure NTP on the device. In both standalone and chassis cluster modes, the primary Routing Engine runs the NTP process to get the time from the external NTP server. Although the secondary Routing Engine runs the NTP process in an attempt to get the time from the external NTP server, this attempt fails because of network issues. For this reason, the secondary Routing Engine uses NTP to get the time from the primary Routing Engine.

When configuring the NTP service in the management VRF (`mgmt_junos`), you must configure at least one IP address on a physical or logical interface within the default routing instance and ensure that this interface is up in order for the NTP service to work with the mgmt_junos VRF.

Options

authentication-key ***key_number***

Configure key (key ID, key type, and key value) to authenticate NTP packets with the devices (servers and clients). The authentication key has two fields:

- `type`—When authentication is specified, the key identifier (key ID) followed by the message digest is appended to the NTP packet header. The supported message digest formats are md5, sha1, sha256.

NOTE:

- For sha256 message digest format note the following aspects:
  - Keys with less than or equal to 20 characters are treated as ASCII strings
  - Keys with more than 20 characters are treated as hexadecimal strings
  - Keys with more than 20 characters and containing invalid hexadecimal characters are skipped with an error
- EX4600 does not support SHA256 authentication for NTP and supports MD5 only.

- `value`—If the key value is available in ASCII format and without special characters, it can be entered directly. If the key value contains special characters or is available in hex format, consider the following:

  For specifying the keys in hex format, prepend a "\x" for each two characters. For hex key example, af60112f...39af4ced, `set system ntp authentication-key <ID> value "\xaf\x60\x11\x2f\....\x39\xaf\x4c \xed"`.

  If the key contains one of the characters from `(null) 0x00, (space) 0x20, " 0x22, & 0x26, ( 0x28 ) 0x29` prepend a "\\x" . For example, `\\x22`.

- **Range:** 1 to 65534

boot-server (*address* | *hostname*)

Configure the server that NTP queries when the device boots to determine the local date and time.

When you boot the device, it issues an ntpdate request, which polls a network server to determine the local date and time. You must configure an NTP boot server that the device uses to determine the time when the device boots. Otherwise, NTP cannot synchronize to a time server if the server time significantly differs from the local device's time.

If you configure an NTP boot server, then when the device boots, it immediately synchronizes with the boot server even if the NTP process is explicitly disabled or if the time difference between the client and the boot server exceeds the threshold value of 1000 seconds.

- **Values:** Configure one of the following:
  - *address*—IP address of an NTP boot server.
  - *hostname*—Hostname of an NTP boot server. If you configure a hostname instead of an IP address, the ntpdate request resolves the hostname to an IP address when the device boots up.

> **NOTE**: This option is deprecated starting in Junos OS Release 20.4R1. NTP boot-server is not supported in Junos OS Evolved. Configure the server using *set system ntp server* under the *edit system ntp server* hierarchy.

broadcast <*address*> <key *key-number*> <routing-instance-name *routing-instance-name*> <ttl *value*> <version *value*>

Configure the device to operate in broadcast mode with the remote system at the specified address. In this mode, the device sends periodic broadcast messages to a client population at the specified broadcast or multicast address. Normally, you include this statement only when the device is operating as a transmitter.

address

Configure the broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be `224.0.1.1`. Configure the multicast protocols PIM and IGMP in order to facilitate the device to transmit NTP packets over multicast address 224.0.1.1.

> **NOTE**: NTP over multicast is not supported within the routing instance on the device.

key *key-number*

(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number (any unsigned 32-bit integer except 0). The key corresponds to the key number you specified in the authentication-key statement.

routing-instance-name *routing-instance-name*

(Optional) Configure the routing instance name in which the interface has an address in the broadcast subnet.

- **Default:** The default routing instance is used to broadcast packets.

ttl *value*

(Optional) Configure the time-to-live (TTL) value.

- **Range:** 1 through 255
- **Default:** 1

version *value* — (Optional) Specify the version number to be used in outgoing NTP packets.

- **Range:** 1 through 4
- **Default:** 4

broadcast-client — Configure the local device to listen for broadcast messages on the local network to discover other servers on the same subnet. To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

interval-range *value* — Configure the poll interval range.

- **Range:** 0 through 3

multicast-client *<address>* — Configure the local device to listen for multicast messages on the local network. To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

- **Syntax:** *<address>*—(Optional) Specify one or more IP addresses. If you specify addresses, the device joins those multicast groups.
- **Default:** 224.0.1.1

nts <local-certificate *local-certificate*> **<trusted-ca (trusted-ca-group** *trusted-ca-group* **| trusted-ca-profile** *trusted-ca-profile*) — Configure the Network Time Security (NTS) features for NTP on your device.

local-certificate *local-certificate* — Specify the certificate loaded in your device during certificate enrollment or loaded manually by specifying certificate file.

trusted-ca — Specify a trusted CA group or a CA profile. This configuration is optional. If you do not specify a trusted CA profile the NTP trust all CA profiles configured for NTS.

trusted-ca-group *trusted-ca-group* — Specify the trusted CA group defined under [`set security pki trusted-ca-group`].

trusted-ca-profile ***trusted-ca-profile*** Specify the trusted CA profile.

peer ***address*** **<key** ***key-number*****> <prefer> <version** ***value*****>**

Configure the local device to operate in symmetric active mode with the remote system at the specified address. In this mode, the local device and the remote system can synchronize with each other. This configuration is useful in a network in which either the local device or the remote system might be a better source of time.

address Address of the remote system. You must specify an address, not a hostname.

key ***key-number*** (Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number (any unsigned 32-bit integer except 0). The key corresponds to the key number you specified in the authentication-key statement.

prefer (Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.

version ***value*** (Optional) Specify the NTP version number to be used in outgoing NTP packets.

- **Range:** 1 through 4
- **Default:** 4

restrict ***address*** **mask** ***network-mask*** **noquery**

Restrict packets from hosts (including remote time servers) and subnets.

- **Syntax:**
  - *address*—Specify the IP address for a host or network.
  - mask *network-mask*—Specify the network mask for a host or network.
  - noquery—Deny ntpq and ntpdc queries from hosts and subnets. These queries can be used in amplification attacks.

server

Configure the local device to operate in client mode with the remote system at the specified address. In this mode, the device can be synchronized with the remote system, but the remote system can never be synchronized with the device.

If the NTP client time drifts so that the difference in time from the NTP server exceeds 128 milliseconds, the client is automatically stepped back into synchronization. If the offset between the NTP client and server exceeds the 1000-second threshold, the client still synchronizes with the server, but it also generates a system log message noting that the threshold was exceeded.

address — Address of the remote system. You must specify an address, not a hostname.

key *key-number* — (Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number (any unsigned 32-bit integer except 0). The key corresponds to the key number you specified in the authentication-key statement.

prefer — (Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.

routing-instance *routing-instance* — (Optional) Routing instance through which the server is reachable.

nts — Enables NTS, which uses Transport Layer Security (TLS) protocol and Authenticated Encryption with Associated Data (AEAD) to obtain network time in an authenticated manner to the users. Specified server must also support the NTS feature when you enable NTS on a client device.

version *value* — (Optional) Specify the NTP version number to be used in outgoing NTP packets.

- **Range:** 1 through 4
- **Default:** 4

source-address *source-address* <routing-instance *[routing-instance-name]*> — A valid IP address configured on one of the device's interfaces to be used as the source address for messages sent to the NTP server, and optionally, the routing instance in which the source address is configured.

- **Default:** The primary address of the interface

threshold *seconds* action (accept | reject) — Configure the maximum threshold in seconds allowed for NTP adjustment and specify the mode for NTP abnormal adjustment.

- **Range:** 1 through 600 seconds
- **Values:** Configure one of the following:
  - accept—Enable log mode for abnormal NTP adjustment.
  - reject—Enable reject mode for abnormal NTP adjustment.

trusted-key [*key-numbers*]

Configure one or more keys you are allowed to use to authenticate other time servers, when you configure the local device to synchronize its time with other systems on the network. Each key can be any 32-bit unsigned integer except 0. The key corresponds to the key number you specify in the authentication-key statement.

By default, network time synchronization is unauthenticated. The device synchronizes to whatever system appears to have the most accurate time. We strongly encourage you to configure authentication of network time services.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`routing-instance` option for the `server` statement introduced in Junos OS Release 18.1.

`restrict` statement introduced in Junos OS Release 20.1.

nullpdu

IN THIS SECTION

- Syntax | 12220
- Hierarchy Level | 12220
- Description | 12220
- Options | 12221
- Required Privilege Level | 12221
- Release Information | 12221

Syntax

```
nullpdu {
    protocol (ID-0x0000 | ID-0xFFFF);
}
```

Hierarchy Level

```
[edit security sctp]
```

Description

Use the nullpdu function to configure the Stream Control Transmission Protocol (SCTP) null protocol data unit (PDU) value. If you set the null PDU value to 0xFFFF, then the payload protocol identifier value is replaced with 0xFFFF and the user data field is not modified. If you set the null PDU value to 0x0000, then the payload protocol identifier value is replaced with 0x0000 and the first four bytes of the user data field is replaced with zeroes. If all chunks in a packet are null PDUs, the SCTP firewall drops the packet.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs sctp]` hierarchy level is replaced by `[edit security sctp]`.

Options

`protocol`—To specify the SCTP null PDU payload protocol identifier.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X47-D10.

num-65-127-prefix

IN THIS SECTION

- Syntax | 12221
- Hierarchy Level | 12222
- Description | 12222
- Options | 12222
- Required Privilege Level | 12223
- Release Information | 12223

Syntax

```
num-65-127-prefix number;
```

Hierarchy Level

```
[edit chassis forwarding-options profile-name]
```

Description

For the Unified Forwarding Table (UFT) feature, specify how much forwarding table memory to allocate for IPv6 entries with prefix lengths in the range of /65 through /127. The ability to allocate flexibly the memory for IPv6 entries with prefixes in this range extends the use of this memory space to accommodate the appropriate mix of longest-prefix match (LPM) entries that best suits your network. The LPM table stores IPv4 unicast prefixes, IPv6 prefixes with lengths equal to or less than 64, and IPv6 prefixes with lengths from 65 through 127. With this option, you can increase, decrease, or allocate no memory for IPv6 prefixes with lengths from 65 through 127, depending on which version of Junos OS you are using.

NOTE: This statement is supported only for the following forwarding table memory profiles: `l2-profile-one`, `l2-profile-three`, `l2-profile-two`, and `l3-profile`. Do not use this statement with the `custom-profile` or the `lpm-profile` statements.

NOTE: The values you can configure are different depending on the version of Junos OS you are using.

Options

number Specify a numerical value.

- **Range:** (Junos OS Release 13.2x51-D10 only) 1 through 128. Each increment represents 16 IPv6 prefixes with lengths in the range of /65 through /127, for a total maximum of 2,058 prefixes (16 x 128 = 2,048).
- **Default:** 1 (16 IPv6 prefixes with lengths in the range of /65 through /127).
- **Range:** (Junos OS Release 13.2X51-D15 or later) 0 through 4. Each increment allocates memory for 1,000 IPv6 prefixes with lengths in the range of /65 through /127, for a maximum of 4,000 such IPv6 prefixes.
- **Default:** 1 (1,000 IPv6 prefixes with lengths in the range of /65 through /127).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Support for QFX5200 Series switches introduced in Junos OS Release 15.1X53-D30.

Description

Administratively enable physical ports, for example, to prevent oversubscription of the line card fabric interface. By default, all available ports are enabled. When disabled, the LED on the affected line card will appear yellow on capable line cards.

(MX Series with 16x10GE MPC, MPC3, MPC4, MPC5, and MPC6) You can disable a subset of the physical ports available on the Packet Forwarding Engines of the 16x10GE MPC, and for MICs installed in MPC3, MPC4, MPC5, and MPC6. Specify either 8 or 12 ports by using this statement. When eight active ports are configured, two ports per Packet Forwarding Engine are disabled, and the LEDs on the MPC appear **yellow**. When you specify 12 active ports, one port per Packet Forwarding Engine is disabled and the corresponding LED appear **yellow**. When you do not include this statement in the configuration, all 16 default ports on the MPC are active.

(MX Series with MPC7E-MRATE, MPC8E, and MPC9E) To ensure guaranteed bandwidth by preventing fabric oversubscription, you can disable a subset of the physical ports available on MPC7E-MRATE, MPC8E, and MPC9E. For information about the active ports for MPC7E-MRATE, MPC8E, and MPC9E, see Supported Active Physical Ports on MPC7E-MRATE to Prevent Oversubscription, Supported Active Physical Ports on MIC-MRATE to Prevent Oversubscription.

(MX240, MX480, MX960, MX2010, and MX2020 routers with MIC 10x10GE SFPP and 10x1GE SFP on MPC2E-NG and MPC3E-NG) To ensure guaranteed bandwidth by preventing fabric oversubscription, you can disable a subset of the physical ports available on MPC2E-NG and MPC3E-NG.

(MX204 routers) To ensure guaranteed bandwidth by preventing oversubscription, you can disable a subset of the physical ports available on MX204 routers. For information about the active ports for MX204 routers, see Supported Active Physical Ports on MX204 to Prevent Oversubscription.

Options

number-of-active-physical-ports—Specify the number of physical ports to enable on PICs or MICs on an MPC.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

oam (Layer 2 Circuit Protocols)

IN THIS SECTION

- Syntax | 12235
- Hierarchy Level | 12235
- Description | 12235
- Options | 12236
- Required Privilege Level | 12236
- Release Information | 12236

Syntax

```
oam {
    bfd-liveness-detection;
    ping-interval;
    ping-multiplier ping-count;
}
```

Hierarchy Level

```
[edit routing-instances routing-instance-name protocols l2vpn],
[edit routing-instances routing-instance-name protocols vpls],
[edit routing-instances routing-instance-name protocols vpls neighbor address],
[edit protocols l2circuit neighbor address interface interface-name]
```

Description

Allows you to configure bidirectional forwarding detection (BFD) and a control channel for a pseudowire, in addition to the corresponding operations and management functions to be used over that control channel. BFD provides a low resource fault detection mechanism for the continuous monitoring of the pseudowire data path and for detecting data plane failures. The `control-channel` statement is not applicable to Layer 2 circuit pseudowires.

Options

bfd-liveness-detection The `bfd-liveness-detection` statement and substatements are described in the Junos OS Routing Protocols Library.

ping-multiplier *ping-count* Specify the number of LSP ping packets to delay the virtual circuit connectivity verification (VCCV) Bidirectional Forwarding Detection (BFD) session from going down. The VCCV BFD session is signaled down only after the specified number of LSP ping packets are lost. This feature is supported for Layer 2 Circuit, Layer 2 VPN, and VPLS technologies.

The other statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

Support for VPLS FEC 129 introduced in Junos OS Release 12.2.

`ping-multiplier` statement introduced in Junos OS Release 16.1.

Description

Configure Operation, Administration, and Maintenance (OAM) and Bidirectional Forwarding Detection (BFD) protocol for LDP.

Options

`fec` *`fec-address`*—Specify the forwarding equivalence class (FEC) address. You must either specify a FEC address or configure an OAM ingress policy to ensure that the BFD session comes up.

`lsp-ping-interval` *`seconds`*—Specify the duration of the LSP ping interval in seconds. To issue a ping on an LDP-signaled LSP, use the `ping mpls ldp` command.

- **Default:** 60 seconds
- **Range:** 30 through 3,600 seconds

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.6.

`lsp-ping-interval` option introduced in Junos OS Release 9.4.

oam-on-svlan (Ethernet Interfaces)

IN THIS SECTION

- Syntax | 12251
- Hierarchy Level | 12252
- Description | 12252
- Required Privilege Level | 12252
- Release Information | 12252

Syntax

```
oam-on-svlan;
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

Enable propagation of the Ethernet IEEE 802.1ag Operation, Administration, and Maintenance (OAM) state of a static single-tagged service VLAN (S-VLAN) logical interface to the dynamic or static double-tagged customer VLAN (C-VLAN) logical interface and associated subscriber interfaces configured on the S-VLAN. The static S-VLAN logical interface must be configured with Ethernet OAM connectivity fault management (CFM) on a Gigabit Ethernet, 10-Gigabit Ethernet, or aggregated Ethernet physical interface. The C-VLAN logical interface must have the same S-VLAN (outer) tag as the S-VLAN logical interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.1.

Syntax

```
object-cache-size value;
```

Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-
provider]
```

Description

Configure the size of the object cache. When this setting is changed, the PIC reboots.

Options

value—Amount of object cache, in MB. Only values in increments of 128 MB are allowed.

- **Range:** For Multiservices 100 PIC, range is 128 MB through 512 MB. If the `wired-process-mem-size` statement at the same hierarchy level has a value of 512 MB, the maximum value for this statement is 128 MB.
- **Range:** For Multiservices 400 PIC, range is 128 MB through 1280 MB. If the `wired-process-mem-size` statement at the same hierarchy level has a value of 512 MB, the maximum value for this statement is 512 MB.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

observation-domain-id

IN THIS SECTION

- Syntax | 12256
- Hierarchy Level | 12256
- Description | 12256
- Options | 12256
- Required Privilege Level | 12257
- Release Information | 12257

Syntax

```
observation-domain-id domain-id;
```

Hierarchy Level

```
[edit services flow-monitoring version-ipfix template template-name]
```

Description

For IPFIX flows, an identifier of an observation domain is locally unique to an exporting process of the templates. The export process uses the observation domain ID to uniquely identify to the collection process in which the flows were metered. We recommend that you configure this ID to be unique for each IPFIX flow. A value of 0 indicates that no specific observation domain is identified by this information element. The ID configured here is contained within Information Element 149.

MX and QFX Series: Typically, this attribute is used to limit the scope of other information elements. If the observation domain is not unique, the collector cannot uniquely identify an IPFIX device. If you configure the same observation domain ID for different template types, such as for IPv4 and IPv6, it does not impact flow monitoring because the actual or the base observation domain ID is transmitted in the flow. The actual observation domain ID is derived from the value you configure and plus other parameters such as the slot number, lookup chip (LU) instance, and Packet Forwarding Engine instance. Such a method of computation of the observation domain ID ensures that this ID is not the same for two IPFIX devices.

PTX Series: When you configure the observation domain ID, the software attaches the ID to a particular template type. If you configure the same observation domain ID for two different template types, such as for IPv4 and IPv6, this does not impact flow monitoring, because the configured ID is not what is being sent. The value sent in the packets is derived from that configured value and the FPC slot value. This method ensures two IPFIX devices can never have the same value of observation domain ID.

Options

domain-id—Identifier for the observation domain for IPFIX flows.

- **Range:** 0 through 255

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Description

Configure the Online Charging System (OCS) global attributes and partition. The OCS interacts with the Policy and Charging Enforcement Function (PCEF). The PCEF optionally reports usage and receives additional authorizations from the OCS using the 3rd Generation Partnership Project (3GPP) Gy protocol. Broadband PCEF (BPCEF) interactions with the OCS use online session charging with centralized unit determination and centralized rating.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

ocsp (Security PKI)

IN THIS SECTION

- Syntax | **12261**
- Hierarchy Level | **12262**
- Description | **12262**
- Options | **12262**
- Required Privilege Level | **12263**
- Release Information | **12263**

Syntax

```
ocsp {
    connection-failure (disable | fallback-crl);
```

```
    disable-responder-revocation-check;
    nonce-payload (enable | disable);
    url ocsp-url;
}
```

Hierarchy Level

```
[edit security pki ca-profile ca-profile-name revocation-check]
```

Description

Configure Online Certificate Status Protocol (OCSP) to check the revocation status of a certificate.

Options

connection-failure (Optional) Specify action to take if there is a connection failure to the OCSP responder. If this option is not configured and there is no response from the OCSP responder, certificate validation will fail.

- **disable** Skip the revocation check if the OCSP responder is not reachable.
- **fallback-crl** Use CRL to check the revocation status of the certificate.

disable-responder-revocation-check (Optional) Disable revocation check for the CA certificate received in an OCSP response. The certificates received in an OCSP response generally have shorter lifetimes and revocation check is not required.

nonce-payload (Optional) Send a nonce payload to prevent replay attack. A nonce payload is sent by default unless it is explicitly disabled. If enabled, the SRX Series Firewall expects OCSP responses to contain a nonce payload, otherwise the revocation check will fail. If OCSP responders are not capable of responding with a nonce payload, disable this option.

- **disable** Explicitly disable the sending of a nonce payload.
- **enable** Enable the sending of a nonce payload. This is the default.

url *ocsp-url* Specify HTTP addresses for OCSP responders. A maximum of two HTTP URL addresses can be configured. If the configured URLs are not reachable, or URLs are not configured, the URL from the certificate being verified is checked.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

interface (Protocols PIM) interface-name bidirectional df-election],
[edit protocols pim interface (Protocols PIM) interface-name bidirectional df-election],
[edit routing-instances routing-instance-name protocols pim interface (Protocols PIM)  interface-
name bidirectional df-election]
```

Description

Configure the designated forwarder (DF) election offer period for bidirectional PIM. When a DF election Offer or Winner message fails to be received, the message is retransmitted. The `offer-period` statement modifies the interval between repeated DF election messages. The `robustness-count` statement determines the minimum number of DF election messages that must fail to be received for DF election to fail. To prevent routing loops, all routing devices on the link must have a consistent view of the DF. When the DF election fails because DF election messages are not received, forwarding on bidirectional PIM routes is suspended.

If a router receives from a neighbor a better offer than its own, the router stops participating in the election for a period of `robustness-count` * `offer-period`. Eventually, all routers except the best candidate stop sending Offer messages.

Options

milliseconds—Interval to wait before retransmitting DF Offer and Winner messages.

- **Range:** 100 through 10,000 milliseconds
- **Default:** 100

Required Privilege Level

offset (MX Series)

IN THIS SECTION

- Syntax | 12278
- Hierarchy Level | 12278
- Description | 12278
- Default | 12279
- Options | 12279
- Required Privilege Level | 12279
- Release Information | 12280

Syntax

```
offset (0 |30 | 50);
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name],
[edit security macsec connectivity-association connectivity-association-name secure-channel
secure-channel-name]
```

Description

Specifies the number of octets in an Ethernet frame that are sent in unencrypted plain-text when encryption is enabled for MACsec.

Setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the remaining traffic. Setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the remaining traffic.

You would typically forward traffic with the first 30 or 50 octets unencrypted if a feature needed to see the data in the octets to perform a function, but you otherwise prefer to encrypt the remaining data in

the frames traversing the link. Load balancing features, in particular, typically need to see the IP and TCP/UDP headers in the first 30 or 50 octets to properly load balance traffic.

You configure the `offset` in the [`edit security macsec connectivity-association` *`connectivity-association-name`*] hierarchy when you are enabling MACsec using static connectivity association key (CAK) or dynamic security mode.

You configure the `offset` in the [`edit security macsec connectivity-association` *`connectivity-association-name`* `secure-channel` *`secure-channel-name`*] hierarchy when you are enabling MACsec using static secure association key (SAK) security mode.

Default

0

Options

0 Specifies that no octets are unencrypted. When you set the offset to 0, all traffic on the interface where the connectivity association or secure channel is applied is encrypted.

30 Specifies that the first 30 octets of each Ethernet frame are unencrypted.

> **NOTE**: In IPv4 traffic, setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 30, therefore, is typically used when a feature needs this information to perform a task on IPv4 traffic.

50 Specified that the first 50 octets of each Ethernet frame are unencrypted.

> **NOTE**: In IPv6 traffic, setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 50, therefore, is typically used when a feature needs this information to perform a task on IPv6 traffic.

[edit security macsec connectivity-association connectivity-association-name]
[edit security macsec connectivity-association connectivity-association-name secure-channel secure-channel-name]
```

Description

Specifies the number of octets in an Ethernet frame that are sent in unencrypted plain-text when encryption is enabled for MACsec.

Configure a confidentiality offset for MACsec. When MACsec is enabled with encryption, the confidentiality offset specifies a number of octets in an Ethernet frame that are sent in unencrypted plain-text.

Per 802.1AE-2006, confidentiality offset is relevant for switch-to-host connections by allowing a system that is incapable of terminating the secure association before distributing the load to perform load balancing across multiple processors based on the first few bytes of packets. Additionally, confidentiality offset can be used to expose IPv4 or IPv6 headers to bump-in-the-wire devices, such as transparent firewalls or monitoring devices.

Setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the remaining traffic. Setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the remaining traffic.

You would typically forward traffic with the first 30 or 50 octets unencrypted if a feature needed to see the data in the octets to perform a function, but you otherwise prefer to encrypt the remaining data in the frames traversing the link. Load balancing features, in particular, typically need to see the IP and TCP/UDP headers in the first 30 or 50 octets to properly load balance traffic.

You configure the `offset` in the [`edit security macsec connectivity-association` *`connectivity-association-name`*] hierarchy when you are enabling MACsec using static connectivity association key (CAK) or dynamic security mode.

You configure the `offset` in the [`edit security macsec connectivity-association` *`connectivity-association-name`* `secure-channel` *`secure-channel-name`*] hierarchy when you are enabling MACsec using static secure association key (SAK) security mode.

Default

0

Options

0 Specifies that no octets are unencrypted. When you set the offset to 0, all traffic on the interface where the connectivity association or secure channel is applied is encrypted.

30 Specifies that the first 30 octets of each Ethernet frame are unencrypted.

> **NOTE**: In IPv4 traffic, setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 30, therefore, is typically used when a feature needs this information to perform a task on IPv4 traffic.

50 Specified that the first 50 octets of each Ethernet frame are unencrypted.

> **NOTE**: In IPv6 traffic, setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 50, therefore, is typically used when a feature needs this information to perform a task on IPv6 traffic.

oism (Multicast Snooping Options)

IN THIS SECTION

- Syntax | 12292
- Hierarchy Level | 12292
- Description | 12292
- Options | 12293
- Required Privilege Level | 12294
- Release Information | 12294

Syntax

```
oism {
    (conserve-mcast-routes-in-pfe | install-star-g-routes);
}
```

Hierarchy Level

```
[edit multicast-snooping-options],
[edit routing-instances name multicast-snooping-options]
```

Description

Set optimized intersubnet multicast (OISM) options. You can use OISM to optimize multicast traffic flow in an EVPN-VXLAN fabric.

NOTE: The functions of the `conserve-mcast-routes-in-pfe` option and the `install-star-g-routes` option are mutually exclusive, so you can use only one or the other of these options in a routing instance. See the descriptions of these options below for details on when to use each option.

Options

`conserve-mcast-routes-in-pfe`

(ACX Series routers, QFX5130 switches, and QFX5700 switches) Conserve Packet Forwarding Engine (PFE) multicast route table space on the device by not installing Layer 2 (L2) multicast snooping (*,G) and (S,G) states in the PFE when the device receives EVPN Type 6 routes. The device uses only the Layer 3 (L3) multicast routes in the PFE to forward multicast traffic. Without this option, these devices install L2 multicast group entries in the PFE for all OISM revenue bridge domain VLANs and the SBD.

We require you configure this option on ACX Series routers, QFX5130 switches, and QFX5700 switches in EVPN-VXLAN networks running OISM in the server leaf or border leaf role. With this option, these devices conserve PFE table space by installing only the L3 multicast routes; they avoid installing L2 multicast snooping routes.

QFX5130 or QFX5700 switches running as standalone AR replicators with OISM conserve PFE multicast snooping route table space by default. As a result, don't use this option when you configure those switches in the assisted replication (AR) replicator role with OISM.

See *OISM and AR Scaling with Many VLANs* for more information on using this option.

`install-star-g-routes`

Set the Routing Engine to immediately install (*,G) multicast routes (upon receiving an EVPN Type 6 route) on the PFE for all of the revenue VLANs in the routing instance.

Without this option, the device prioritizes saving resources on the PFE by not installing multicast routes until the multicast traffic arrives. The default behavior avoids issues with scaling on lower-end devices.

If you configure this option, the device ensures the PFE has multicast routing information available before any multicast traffic arrives. This option minimizes packet loss at the onset of a multicast flow. However, the device consumes extra PFE resources for routes that are not even being used yet (and might never be used). As a result, when you configure this option, you trade off taking up the extra PFE resources to improve network latency.

This option acts only on VLANs associated with a Layer 3 virtual routing and forwarding (VRF) instance with OISM enabled.

Set this option:

- Globally if you configure EVPN in the default-switch instance.
- In the MAC-VRF instances if you configure EVPN in instances of type `mac-vrf`.

We require that you configure `install-star-g-routes` with OISM on the QFX10000 line of switches, QFX5130-32CD switches, and QFX700 switches when you configure those devices with AR in the AR replicator role.

In releases prior to Junos OS and Junos OS Evolved Release 23.4R1, you must also configure the `install-star-g-routes` option on the following devices when you configure them as OISM server leaf or border leaf devices:

- The QFX10000 line of switches.
- PTX10001-36MR, PTX10004, PTX10008, and PTX10016 routers.

Starting in Junos OS and Junos OS Evolved Release 23.4R1, we no longer require this option on any platform when you configure the device as an OISM server leaf or border leaf device.

We don't recommend setting this option other than in the use cases mentioned above. Consider this option only if you have very stringent latency requirements and can trade off higher scaling to achieve better network latency.

For more information about how this option works, see *Latency and Scaling Trade-Offs for Installing Multicast Routes with OISM (install-star-g-routes Option)* .

```

Hierarchy Level

```
[edit protocols evpn],
[edit routing-instances name protocols evpn]
```

Description

Set optimized intersubnet multicast (OISM) options in a Layer 3 (L3) virtual routing and forwarding (VRF) routing instance or in the default L3 routing instance on an EVPN fabric device.

See Feature Explorer for the devices that support this statement in the default L3 routing instance (at the `[edit protocols evpn]` hierarchy level).

Options

`originate-smet-on-revenue-vlan-too`

Originate selective multicast Ethernet tag (SMET) routes on revenue VLANs (or bridge domains) upon receiving a local IGMP report. SMET routes are EVPN Type 6 routes. The revenue VLANs are the customer VLANs that serve the hosts on the access side.

By default, when an OISM device receives a local IGMP join request, it originates a Type 6 route on the OISM supplemental bridge domain (SBD). With this option, the device also sends Type 6 routes on the revenue VLANs.

This option is helpful for compatibility with other vendor devices that don't support OISM. Those devices can't create the right states for the revenue bridge domain VLANs upon receiving Type 6 routes on the SBD.

`supplemental-bridge-domain-irb` *`irb-interface-name`*

Associate an IRB interface with the OISM SBD for an L3 VRF instance or a default L3 routing instance on a device where you have enabled OISM.

The remaining statements are explained separately. See CLI Explorer for all options.

```

Description

Cause the no-export BGP community to be prevented from being automatically added to routes advertised to external BGP neighbors (presumed to be CE routers). The no-export routes containing this community name are not advertised outside a BGP confederation boundary. In VPN deployments, for example, BGP is often used as a PE-CE protocol. It might be a practical necessity in such deployments to accommodate interoperation with CEs that cannot easily be upgraded to support specifications such as this one. This requirement causes a problem while ensuring that "stale" routing information does not leak beyond the perimeter of routers that support these procedures where one or more IBGP routers are not upgraded. In the VPN PE-CE case, the protocol in use is EBGP, and the LOCAL_PREF, an IBGP-only path attribute, is used.

The principal motivation for restricting the propagation of "stale" routing information is the reason to prevent it from spreading without limit once it exits the BGP confederation boundary. VPN deployments are typically topologically constrained, removing this concern. For this reason, an implementation might advertise stale routes over a PE-CE session, when explicitly configured. In such a scenario, the

implementation must attach the NO_EXPORT community to the routes in question by default, as an additional protection against stale routes spreading without limit. Attachment of the NO_EXPORT community can be disabled explicitly to accommodate exceptional cases. It might be necessary to advertise stale routes to a CE in some VPN deployments, even if the CE does not support this specification. In that case, if you configure the PE routers to advertise such routes, you must notify the operator of the CE receiving the routes, and the CE must be configured to depreference the routes. Typical BGP implementations perform this operation by matching on the LLGR_STALE community, and setting the LOCAL_PREF for matching routes to zero.

When the `omit-no-export` option is added or removed, the session is reset. This rest of a session enables LLGR stale routes to be readvertised with or without the no- export community (which is added outside of the export policy).

[edit interfaces pp0 unit unit-number ppp-options],
[edit protocols ppp-service]
```

Description

For IPv4 and IPv6 dual-stack PPP subscribers, enables on-demand allocation and de-allocation of an IPv4 address after initial PPP authentication for a subscriber who does not have an existing IPv4 address.

Configuration changes take effect as follows:

- When you change this setting for a dynamic PPP interface (at the `[edit dynamic-profiles]` hierarchy level), the change takes effect only for new subscriber logins.
- When you change this setting for a static PPP interface (at the `[edit interfaces pp0]` hierarchy level, the subscribers on the interface are logged out.
- When you change this setting globally (at the `[edit protocols ppp-service]` hierarchy level), the change takes effect only for new subscriber logins.

If you enable on-demand allocation at both the interface and global levels, the global configuration takes precedence and changes take effect for new subscriber logins.

Default

This functionality is disabled by default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Options

`raise-alarm`—Generate and display a chassis alarm in case of an error.

`power cycle`—Reboot the FPC or FEB or CFEB after generating a core file. This statement is useful in case of temporary software errors that are eliminated after reboot.

`power off`—Halt the FPC or FEB or CFEB and keep it offline. This statement is useful in case of permanent hardware failures.

CAUTION: The `power off` statement halts the FPC or FEB or CFEB. Ensure that you have backup paths through different FPC or FEB or CFEB to avoid service outage.

NOTE: The `power cycle` and `power off` statements are mutually exclusive: You can configure either the `power cycle` or the `power off` statement for an error.

`write-coredump`—Trigger the core file in case of an error.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Configuring Sanity Polling

sanity-poll | 16903

retry-count (FPC Error Condition) | 16294

on-link (Dynamic Router Advertisement)

IN THIS SECTION

- Syntax | 12309
- Hierarchy Level | 12309
- Description | 12309
- Default | 12310
- Required Privilege Level | 12310
- Release Information | 12310

Syntax

```
(on-link | no-on-link);
```

Hierarchy Level

```
[edit dynamic-profiles profile-name protocols router-advertisement interface interface-nameprefix prefix]
```

Description

Specify whether to enable prefixes to be used for onlink determination:

- `no-on-link`—Disable prefixes from being used for onlink determination.
- `on-link`—Enable prefixes to be used for onlink determination.

Default

The configured object is enabled unless explicitly disabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

Dynamic Router Advertisement Configuration Overview

on-link

IN THIS SECTION

- Syntax | 12310
- Hierarchy Level | 12311
- Description | 12311
- Default | 12311
- Required Privilege Level | 12311
- Release Information | 12311

Syntax

```
(on-link | no-on-link);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-name prefix prefix],
[edit protocols router-advertisement interface interface-name prefix prefix]
```

Description

Specify whether to enable prefixes to be used for onlink determination:

- **no-on-link**—Disable prefixes from being used for onlink determination.
- **on-link**—Enable prefixes to be used for onlink determination.

Router advertisement messages carry prefixes and information about them. A prefix is onlink when it is assigned to an interface on a specified link. The prefixes specify whether they are onlink or not onlink. A node considers a prefix to be onlink if it is represented by one of the link's prefixes, a neighboring router specifies the address as the target of a redirect message, a neighbor advertisement message is received for the (target) address, or any neighbor discovery message is received from the address. These prefixes are also used for address autoconfiguration. The information about the prefixes specifies the lifetime of the prefixes, whether the prefix is autonomous, and whether the prefix is onlink.

Default

Prefixes are onlink unless explicitly disabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

on-loss-of-keepalives

IN THIS SECTION

- Syntax | 12312
- Hierarchy Level | 12312
- Description | 12312
- Default | 12312
- Required Privilege Level | 12313
- Release Information | 12313

Syntax

```
on-loss-of-keepalives;
```

Hierarchy Level

```
[edit chassis redundancy failover]
```

Description

Instruct the backup router to take primary role if it detects a loss of keepalive signal from the primary Routing Engine.

Default

The `on-loss-of-keepalives` statement must be included at the `[edit chassis redundancy failover]` hierarchy level for failover to occur.

When the `on-loss-of-keepalives` statement is included but graceful Routing Engine switchover *is not* configured, failover occurs after 300 seconds (5 minutes).

When the `on-loss-of-keepalives` statement is included and graceful Routing Engine switchover *is* configured, the keepalive signal is automatically enabled and the failover time is set to 2 seconds (4 seconds on M20 routers) . The keepalive time is not configurable.

> **NOTE**: The `on-loss-of-keepalives` statement at the `[edit chassis redundancy]` hierarchy is not supported on PTX platforms running Junos Evolved. These platforms default to a switchover when keepalive messages are not detected.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

one-to-one (Aggregated Multiservices)

IN THIS SECTION

- Syntax | 12315
- Hierarchy Level | 12315
- Description | 12315
- Options | 12316
- Required Privilege Level | 12316
- Release Information | 12316

Syntax

```
one-to-one {
    preferred-backup preferred-backup;
}
```

Hierarchy Level

```
[edit interfaces interface-name load-balancing-options high-availability-options]
```

Description

Configure a single interface to be the preferred one-to-one (1:1) backup for an active aggregated multiservices (AMS) interface. If the active interface fails, the backup interface takes over. A 1:1 (stateful) configuration synchronizes traffic states and data structures between the active and backup PICs. This is required for high availability of IPsec connections. 1:1 configuration is supported only on MS-MPCs but is not currently supported on MX-SPC3s.

NOTE: The preferred backup must be one of the member interfaces (mams–) that have already been configured at the [`edit interfaces interface-name load-balancing-options`] hierarchy level.

Options

preferred-backup
preferred-backup

Use the specified interface as the preferred backup member interface. The member interface format is mams-*a*/*b*/0, where *a* is the Flexible PIC Concentrator (FPC) slot number and *b* is the PIC slot number.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.2.

one-way-hardware-timestamp

IN THIS SECTION

- Syntax | **12317**
- Hierarchy Level | **12317**
- Description | **12317**
- Required Privilege Level | **12317**
- Release Information | **12317**

Syntax

```
one-way-hardware-timestamp;
```

Hierarchy Level

```
[edit services rpm probe owner test test-name]
```

Description

Enable timestamping of RPM probe messages for one-way delay and jitter measurements. You must configure this statement along with the `destination-interface` statement to invoke timestamping. This feature is supported only with `icmp-ping`, `icmp-ping-timestamp`, `udp-ping`, and `udp-ping-timestamp` probe types.

> **NOTE**: Starting in Junos OS Evolved Release 20.1R1, the function provided by this statement has been replaced by the `offload-type (none|pfe-timestamp)` statement.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Statement introduced in Junos OS Release 19.1 for PTX Series routers.

onlink-subnet-only

IN THIS SECTION

- Syntax | 12318
- Hierarchy Level | 12318
- Description | 12318
- Default | 12318
- Required Privilege Level | 12319
- Release Information | 12319

Syntax

```
onlink-subnet-only;
```

Hierarchy Level

```
[edit protocols neighbor-discovery]
```

Description

Enable this option to prevent the device from responding to a neighbor solicitation (NS) from a prefix that is not included as one of the device interface prefixes.

After configuring the `onlink-subnet-only` statement, the Routing Engine needs to be restarted using the `request system reboot both-routing-engines` command. If the attacker's IPv6 destination address is already in the forwarding-table, it is not removed after you configure the `onlink-subnet-only` statement, and therefore the device continues to respond to ping NSs. Restarting the Routing Engine removes the entry from the forwarding table.

Default

Disabled

Required Privilege Level

admin— To view this statement in the configuration.

admin-control— To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

Storing and Enabling Scripts

op invoke-debugger cli

IN THIS SECTION

Syntax | 12322

- Description | 12322
- Options | 12322
- Required Privilege Level | 12322
- Output Fields | 12323
- Sample Output | 12323
- Release Information | 12323

Syntax

```
op invoke-debugger cli filename
<detail>
<argument-name argument-value>
```

Description

Invoke an interactive debugger to trace the execution of an op script that is enabled in the configuration.

When you execute this command for a SLAX script, the device invokes the SLAX debugger and displays the (sdb) prompt. When you execute this command for a Python script, the device invokes the `pdb` interactive debugger for Python programs and displays the (Pdb) prompt. For more information about the Python debugger, see the official Python documentation.

Options

detail	Display detailed output.
argument-name argument-value	(Optional) Specify one or more arguments for the script. For each argument you include on the command line, you must specify a corresponding value for the argument.
filename	Script filename

Required Privilege Level

maintenance

Output Fields

When you enter the `op invoke-debugger cli` command, depending on the script type, the CLI displays either the (sdb) or (Pdb) prompt where you can enter debugging commands.

Sample Output

op invoke-debugger cli (SLAX script)

```
user@host> op invoke-debugger cli script1.slax
sdb: The SLAX Debugger (version )
Type 'help' for help
(sdb)
```

op invoke-debugger cli (Python script)

```
user@host> op invoke-debugger cli script1.py
(Pdb)
```

op invoke-debugger cli script argument1 value1

```
user@host> op invoke-debugger cli script2.slax interface ge-0/2/0.0
sdb: The SLAX Debugger (version )
Type 'help' for help
(sdb)
```

Release Information

Command introduced in Junos OS Release 13.1.

Support for the Python debugger added in Junos OS Release 16.1.

RELATED DOCUMENTATION

SLAX Debugger, Profiler, and callflow

op

IN THIS SECTION

- Syntax | 12324
- Description | 12324
- Options | 12325
- Additional Information | 12325
- Required Privilege Level | 12325
- Output Fields | 12326
- Sample Output | 12326
- Release Information | 12326

Syntax

```
op filename
<detail>
<argument-name argument-value>
<key (md5 | sha-256 | sha1) key-value
<url url>
```

Description

Execute an op script. To execute local op scripts, you must configure the op script filename at the `[edit system scripts op file]` hierarchy level.

Op scripts can be stored in one of the following locations:

- On the local device in the **/var/db/scripts/op** directory on the hard disk
- On the local device in the **/config/scripts/op** directory on the flash drive.

  To execute op scripts from the flash drive, you must configure the `load-scripts-from-flash` statement at the `[edit system scripts]` hierarchy level.
- At a remote URL

Op scripts are executed with the access privileges of the user who invokes the command to execute the script.

> **NOTE**: If you include the `op url` command under the `[edit event-options policy` *`policy-name`* `then execute-commands commands]` hierarchy to execute a remote op script as an event policy action, Python scripts are executed using the access privileges of the generic, unprivileged user and group `nobody`. If you do not configure the `user-name` statement, SLAX and XSLT scripts are executed with root privileges.

Options

detail	(Optional) Display detailed output.
argument-name argument-value	(Optional) Specify one or more arguments to the script. For each argument you include on the command line, you must specify a corresponding value for the argument.
key (md5 | sha-256 | sha1) ***key-value***	(Optional) With the `url` option, specify a checksum hash to verify the integrity of the remote op script. Starting in Junos OS Release 18.2R2 and 18.3R1, Junos OS supports only the SHA-256 hash function for script checksum hashes. Earlier releases support the *MD5*, *SHA-1*, and SHA-256 hash functions.
url ***url***	(Optional) Specify the URL for a remote script.

> **NOTE**: Statements configured under the `[edit system scripts op]` hierarchy level are only enforced for op scripts that are local to the device. If you configure memory allocation, script dampening, script start options, traceoptions, or other op script-specific statements within that hierarchy, the device does not apply the configuration when you execute a remote script using the `op url` command.

Additional Information

For more information about op scripts, see the Automation Scripting User Guide.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

op

```
user@host> op script1 interface ge-0/2/0.0 protocol inet
```

op url

```
user@host> op url https://www.example.net/opscripts/script1.slax key sha-256

- Description | 12334
- Default | 12334
- Options | 12335
- Required Privilege Level | 12335
- Release Information | 12335

Syntax

```
optical-options {
disable-edfa;
disable-osc;
expansion-card {
fpc fpc-slot;
}
express-in {
fpc fpc-slot;
}
no-disable-edfa;
no-disable-osc;
switch interface-name{
}
tca tca-identifier (enable-tca | no-enable-tca) (threshold number | threshold-24hrs number) ;
wavelength nm{
wss-express-in fpc-slot;
}
}
}
```

Hierarchy Level

```
[edit chassis chassis fpc slot]
```

Description

Configure the settings for the integrated photonic line card (IPLC). The options under this statement enables you to increase the IPLC channel capacity to 64 channels, configure express in and out traffic from another IPLC base module, create a single two-degree IPLC node, switch express traffic to optical interfaces in the local or remote chassis, optically bypass channels, and fine-tune performance monitors.

Default

Options

slot Specify the slot number the IPLC resides in.

- Range: 0 through 15

disable-edfa Disable both erbium-doped fiber amplifiers on the IPLC. Disabling the erbium-doped fiber amplifiers on the IPLC is required as a preliminary step whenever the you need to disconnect the fiber span from the `Line IN` and `Line OUT` ports for troubleshooting.

disable-osc Disable the optical supervisory channel laser.

no-disable-edfa Enable both erbium-doped fiber amplifiers on the IPLC. By default, both erbium-doped fiber amplifiers are enabled.

no-disable-osc Enable the optical supervisory channel. By default, the optical supervisory channel is enabled.

> **BEST PRACTICE**: Anytime you need to disconnect or connect the fiber span from the `Line IN` and `Line OUT` ports on the IPLC module, we recommend you disable the optical supervisory channel and the erbium-doped fiber amplifiers on the IPLC.
>
> Always refer to the PTX3000 Packet Transport Router Hardware Guide when connecting or disconnecting cables on the IPLC modules. See PTX3000 Packet Transport Router Hardware Guide.

All other options are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Releases 15.1F6 and 17.1R1.

RELATED DOCUMENTATION

optics (Chassis)

IN THIS SECTION

- Syntax | 12336
- Hierarchy Level | 12336
- Description | 12336
- Options | 12336
- Required Privilege Level | 12337
- Release Information | 12337

Syntax

```
optics {
      pm {
            interval-length (10s|30s|1min|5min|15min);
      }
}
```

Hierarchy Level

```
[edit chassis]
```

Description

Enable the optics performance monitor to manage and maintain optical networks by continuously collecting and storing diagnostic data for optical parameters.

Options

pm

- interval-length—Set the interval length

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 25.2R1 for PTX Series routers.

```

Description

For 10-Gigabit Ethernet, 100-Gigabit Ethernet, or 400-Gigabit Ethernet ZR/ZR+ dense wavelength-division multiplexing (DWDM) interfaces only, configure full C-band International Telecommunication Union (ITU)-Grid tunable optics.

Options

- `application hostid id mediaid id [ domainid id ]` —Displays host ID, media ID of a selected application.
- `appselid`—Configure the appsel number.
- `host-side-fec`—Enable or disable the FEC on the host side optics.
- `high-power-mode`

  — Configures a port in high-power mode.
- `loopback` —Configures the media side output loopback by default.
- `loopback loopbacktype` *`loopbacktype`* —Configures the loopback with an option. You can choose any of the following loopback options:
  - media-side-out
  - media-side-in
  - host-side-in
  - host-side-out
- `los-alarm-threshold`—Specify the Loss of Signal (LOS) threshold above which an alarm is raised.
- `los-warning-threshold`—Specify the Loss of Signal (LOS) threshold above which a warning is issued.
- `low-power-mode`—Forces the optics to be on low power mode. By default, it is disabled. On channelized interfaces, you can configure the `low-power-mode` on channel 0 only.
- `media-side-fec`—Enable of disable the FEC on media side optics.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`alarm` option and `warning` options introduced in Junos OS Release 10.0.

Statement and `tx-power` option introduced in Junos OS Release 13.2 for PTX Series routers.

`tca` option introduced in Junos OS Release 14.2 for PTX Series routers.

`los-alarm-threshold` and `los-alarm-warning` options introduced in Junos OS Release 14.2.

`loopback` option introduced in Junos OS Release 19.2R1 for QSFP-100GE-DWDM2 transceiver on MX10003, MX10008, MX10016, and MX204 routers.

`lane`, `lane-allhost-side-fec`, and `media-side-fec` options introduced in Junos OS Evolved Release 21.1R1

`local` loopback option introduced in Junos OS Evolved Release 21.2R1 for PTX10001-36MR.

`media-side-in`, `host-side-in`, `host-side-out` loopback types introduced in 23.1R1 for PTX10001-36MR.

`application hostid <> mediaid <> [ domainid <> ]` introduced in 23.1R1 for PTX10001-36MR.

`appselid` option introduced in Junos OS Evolved Release 25.2R1 for PTX10001-36MR, PTX10002-36QDD, PTX10004, PTX10008, and PTX10016 routers.

optimal-route-reflection

optimize-adaptive-teardown

IN THIS SECTION

- Syntax | 12342
- Hierarchy Level | 12342
- Description | 12342
- Options | 12343
- Required Privilege Level | 12343
- Release Information | 12343

Syntax

```
optimize-adaptive-teardown {
    p2p;
    delay;
    timeout;
}
```

Hierarchy Level

```
[edit protocols mpls]
```

Description

Uses RPD infrastructure to determine when all the routes using the old LSP instance have fully shifted to the new LSP instance after MBB switchover. When this statement is configured, the `optimize-hold-dead-delay` statement, which delays the teardown of the old LSP instance after MBB switchover, is ignored.

Options

`p2p` Only point-to-point LSPs configured in the system will be affected.

`delay` *delay-value* Delays the tearing down of old optimized LSP paths based on the configured value.

- **Range:** from 3 through 65535 seconds
- **Default:** 10 seconds

> **NOTE**: The delay CLI statement is introduced from Junos OS Release 17.2 onwards.

`timeout` *timeout* Timeout for adaptive teardown to clean up LSP

- **Range:** from 1 through 65535 seconds
- **Default:** 600 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1R1.

- Description | 12344
- Required Privilege Level | 12345

Syntax

```
aggregated-ether-options {
   minimum-links 2;
   optimize-aggregate-frr;
   link-speed 10g;
   lacp {
      active;
   }
}
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces name aggregated-ether-options],
[edit dynamic-profiles name logical-systems name interfaces name aggregated-ether-options],
[edit interfaces name aggregated-ether-options]
```

Description

Enable Aggregate fast reroute optimization.

NOTE: This knob has been deprecated.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

optimize-aggressive

IN THIS SECTION

- Syntax | 12345
- Hierarchy Level | 12345
- Description | 12345
- Default | 12346
- Required Privilege Level | 12346
- Release Information | 12346

Syntax

```
optimize-aggressive;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

Description

If enabled, the LSP reoptimization is based solely on the IGP metric. The reoptimization process ignores the available bandwidth ratio calculations, the least-fill 10 percent congestion improvement rule, and the hop-counts rule. This statement makes reoptimization more aggressive than the default.

Default

Aggressive optimization is disabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

optimize-hold-dead-delay

IN THIS SECTION

- Syntax | 12346
- Hierarchy Level | 12347
- Description | 12347
- Options | 12347
- Required Privilege Level | 12347

Syntax

```
optimize-hold-dead-delay seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switch-path lsp-name],
[edit protocols mpls],
[edit protocols mpls label-switch-path lsp-name]
```

Description

Allows you to specify the amount of time to delay the tear down of old paths after the router has switched traffic to new optimized paths. This delay timer starts when the timer specified by the `optimize-switchover-delay` statement has elapsed, which is typically 30 seconds, and at the start of the next retry sequence (in other words, the delay is not an absolute countdown of the seconds configured here).

You only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers). The specified delay helps to ensure that old paths are not torn down before all routes have been switched over to the new optimized paths.

Options

seconds Configure the time in seconds to wait before tearing down the old paths that were in use prior to the last LSP optimization.

- **Default:** 60 to 90 seconds
- **Range:** 0 through 65,535 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

optimize-switchover-delay

IN THIS SECTION

- Syntax | 12348
- Hierarchy Level | 12348
- Description | 12348
- Options | 12348
- Required Privilege Level | 12349
- Release Information | 12349

Syntax

```
optimize-switchover-delay seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

Description

Delays the switch over of LSPs to newly optimized paths. You only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers). The specified delay helps to ensure that the new optimized paths have been established before traffic is switched over from the old paths.

Options

seconds Configure the time in seconds to wait before switching LSPs to newly optimized paths.

- **Default:** 1 second
- **Range:** 1 through 900 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1R1.

optimize-timer (Protocols MPLS) | 12349

optimize-timer (Protocols MPLS)

IN THIS SECTION

- Syntax | 12349
- Hierarchy Level | 12350
- Description | 12350
- Default | 12350
- Options | 12350
- Required Privilege Level | 12350
- Release Information | 12351

Syntax

```
optimize-timer seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name (primary |
secondary) path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

Description

Enable periodic reoptimization of an LSP that is already set up. If topology changes occur, an existing path might become suboptimal, and a subsequent recomputation might be able to determine a better path.

> **NOTE**: This feature is useful only on LSPs for which constrained-path computation is enabled; that is, for which the `no-cspf` statement is not configured. Also, you only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers).

To avoid extensive resource consumption that might result because of frequent path recomputations, or to avoid destabilizing the network as a result of constantly changing LSPs, we recommend that you either leave the timer value sufficiently large or disable the timer value.

Default

The optimize timer is disabled.

Options

seconds—Length of the optimize timer, in seconds.

- **Range:** 0 through 65,535 seconds
- **Default:** 0 seconds (the optimize timer is disabled)

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Syntax

```
optimize-timer seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit protocols rsvp interface interface-name link-protection]
```

Description

Configure an optimize timer for a bypass LSP. The optimize timer initiates a periodic optimization process that reshuffles data LSPs among bypass LSPs to achieve the most efficient use of network resources. The optimization process attempts to either minimize the number of bypasses currently in use, minimize the total amount of bandwidth reserved for all bypasses, or both.

Options

seconds—Specify the number of seconds between optimizations.

- **Range:** 0 through 65,535 seconds
- **Default:** 0 (disabled)

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

option (DHCP server)

IN THIS SECTION

- Syntax | 12353
- Hierarchy Level | 12353
- Description | 12353
- Options | 12353

Required Privilege Level | 12354
Release Information | 12354

Syntax

```
option {
    [ (id-number option-type option-value) | (id-number array option-type option-value) ];
}
```

Hierarchy Level

```
[edit system services dhcp],
[edit system services dhcp pool],
[edit system services dhcp static-binding]
```

Description

Configure one or more user-defined options that are not included in the Junos default implementation of the DHCP server. For example, if a client requests a DHCP option that is not included in the DHCP server, you can create a user-defined option that enables the server to respond to the client's request.

Options

- *id-number*—Any whole number. The ID number is used to index the option and must be unique across a DHCP server.
- *option-type*—Any of the following types: `byte`, `byte-stream`, `flag`, `integer`, `ip-address`, `short`, `string`, `unsigned-integer`, `unsigned-short`.
- `array`—An option can include an array of values.
- *option-value*—Value associated with an option. The option value must be compatible with the option type (for example, an `On` or `Off` value for a `flag` type).

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 .

Syntax

```
option-16 {
    use-string string;
}
```

Hierarchy Level

```
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options]
```

Description

Configure the DHCPv6 Vendor ID option (option 16) to be included in DHCPv6 requests from clients before forwarding them to a DHCPv6 server. Option 16 provides the server with information about the vendor that manufactured the hardware on which the DHCP client is running. When configured, the switch will overwrite any existing option 16 information sent by clients in the DHCPv6 packets.

Option 16 is the DHCPv6 equivalent of the `vendor-id` sub-option of DHCP option 82.

Options

use-string *string*	Define a custom string to be used as the DHCPv6 vendor identifier.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53-D10 .

    use-string string;
}
```

Hierarchy Level

```
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options]
```

Description

Configure the DHCPv6 Relay Agent Interface ID option (option 18) to insert information in DHCPv6 requests from clients before forwarding them to a DHCPv6 server. Option 18 provides information about the port on which the request was received, which the server can use to assign IP addresses, prefixes, and other configuration parameters for the client.

When option 18 is configured, a unique interface ID is inserted into the DHCPv6 packet headers. Suboptions can be configured to include a prefix with the interface ID or to change the type of information used to identify the interface. The default fields included in option 18 are the Juniper Enterprise ID, VLAN, and MAC address of the interface.

Option 18 is the DHCPv6 equivalent of the `circuit-id` sub-option of DHCP option 82.

> **NOTE**: DHCPv6 packets that already contain option 18 information when received from a client are dropped by the switch.

Options

use-interface-mac	Use the MAC address of the interface in the DHCPv6 interface ID.
use-string *string*	Use a custom string in the DHCPv6 interface ID.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.

Description

Configure the DHCPv6 Relay Agent Remote ID option (option 37) to insert information in DHCPv6 requests from clients before forwarding them to a DHCPv6 server. Option 37 provides information about the remote host, which the server can use to assign IP addresses, prefixes, and other configuration parameters for the client.

When option 37 is configured, a unique remote ID is inserted into the DHCPv6 packet headers. Suboptions can be configured to include a prefix with the remote ID or to change the interface portion of the ID. The default fields included in option 37 are the Juniper Enterprise ID, VLAN, and MAC address of the interface.

Option 37 is the DHCPv6 equivalent of the `remote-id` sub-option of DHCP option 82.

> **NOTE**: DHCPv6 packets that already contain option 37 information when received from a client are dropped by the switch.

Options

`use-interface-mac`	Use the MAC address of the interface in the DHCPv6 remote ID.
`use-string` *`string`*	Use a custom string in the DHCPv6 remote ID.

DHCPv4 and DHCPv6 Forward-Only Action for Relay Traffic with Unknown DHCP Server Address

option-79

IN THIS SECTION

- Syntax | 12376
- Hierarchy Level | 12376
- Description | 12376
- Required Privilege Level | 12377
- Release Information | 12377

Syntax

```
option-79;
```

Hierarchy Level

```
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options]
```

Description

Configure the DHCPv6 client link layer option (option 79) to include the source MAC address in DHCPv6 requests from clients before the messages are forwarded to a DHCPv6 server. In a dual-stack network environment in which devices act as both DHCPv4 and DHCPv6 clients, the client MAC address can be used to associate DHCPv4 and DHCPv6 messages with the same client interface. The client MAC address also provides network operators with additional information for event debugging and logging related to the client at the relay agent and the server.

You can configure `option-79` to enable DHCPv6 option 79 for a lightweight DHCPv6 relay agent (LDRA). When DHCPv6 option 79 is enabled, the LDRA reads the source MAC address of DHCPv6 Solicit and DHCPv6 Request messages that it receives from a client. The LDRA encapsulates the Solicit and

Request messages within a DHCPv6 Relay-Forward message, and inserts the client MAC address as option 79 in the Relay-Forward header before relaying the message to the server.

You can also configure DHCPv6 option 79 for a layer 3 DHCPv6 relay agent using the `relay-agent-option-79` statement.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Syntax

```
option-82 {
    circuit-id value range named-range;
    remote-id value range named-range;
}
```

Hierarchy Level

```
[edit access address-assignment pool pool-name family inet dhcp-attributes option-match],
[edit access protocol-attributes attribute-set-name option-match]
```

Description

Specify the list of option 82 suboption match criteria used to select the named address range used for the client. The server matches the option 82 value in the user PDU to the specified option 82 match criteria and uses the named address range associated with the string.

Options

circuit-id Configure the address-assignment pool named-range to use for a particular option 82 Agent Circuit ID value.

- Values:
  - *value*—String for the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option (option 82) in DHCP packets.
  - range *named-range*—Name of the address-assignment pool range to use.

remote-id Specify the address-assignment pool named range to use based on the particular option 82 Agent Remote ID value.

- Values:
  - range *named-range*—Name of the address-assignment pool range to use.
  - *value*—String for Agent Remote ID suboption (suboption 2) of the DHCP relay agent information option (option 82) in DHCP packets.

Required Privilege Level

[edit routing-instances routing-instance-name system services dhcp-local-server pool-match-order],
[edit system services dhcp-local-server pool-match-order]
```

Description

Configure the extended DHCP local server to use the option 82 value in the DHCP client DHCP PDU together with the ip-address-first method to determine which address-assignment pool to use. You must configure the `ip-address-first` statement before configuring the `option-82` statement. The DHCP local server first determines which address-assignment pool to use based on the ip-address-first method. Then, the local server matches the option 82 value in the client PDU with the option 82 configuration in the address-assignment pool. This statement is supported for IPv4 address-assignment pools only.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

option-82 <circuit-id> <remote-id>;
```

Hierarchy Level

```
[edit interfaces interface-name auto-configure vlan-ranges authentication username-include],
[edit interfaces interface-name auto-configure stacked-vlan-ranges authentication username-include]
```

Description

Specify that the option 82 information from the client PDU is concatenated with the username during the subscriber authentication process.

For autosense VLANs, you can additionally specify Option 82 suboption information that is concatenated with the username. You can specify either both or neither of the Agent Circuit ID (suboption 1) and Agent Remote ID (suboption 1). If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If you specify that neither suboption is supplied, the raw payload of Option 82 from the PDU is concatenated to the username.

> **NOTE**: The option 82 value used in creating the username is based on the option 82 value that is encoded in the incoming DHCP discover packet. The use of suboptions is supported for DHCPv4 only.

Options

none	Use the raw payload of Option 82 from the PDU.
circuit-id	(Optional) Use the Agent Circuit ID suboption (suboption 1).
remote-id	(Optional) Use the Agent Remote ID suboption (suboption 2).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

Options `circuit-id` and `remote-id` introduced in Junos OS Release 11.4.

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security]
```

Description

Have the device insert DHCP option 82 (also known as the DHCP relay agent information option) information in the DHCP request packet header of a DHCP request that it receives from a DHCP client connected to one of its interfaces before it forwards or relays that DHCP request to a DHCP server. The server uses the option 82 information, which provides details about the circuit and host the request came from. However, in formulating the reply, the server does not make any changes to the option 82 information in the packet header. The device receives the reply and then removes the DHCP option 82 information before forwarding the reply to the client.

The remaining statements are explained separately. See CLI Explorer.

Default

Insertion of DHCP option 82 information is not enabled.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X50-D10.

option-match

IN THIS SECTION

- Syntax | **12388**
- Hierarchy Level | **12389**
- Description | **12389**
- Required Privilege Level | **12389**
- Release Information | **12389**

Syntax

```
option-match {
    option-82 {
        circuit-id value range named-range;
        remote-id value range named-range;
    }
}
```

Hierarchy Level

```
[edit access address-assignment pool pool-name family inet dhcp-attributes],
[edit access protocol-attributes attribute-set-name]
```

Description

Specify a list of match criteria used to determine which named address range in the address-assignment pool to use. The extended DHCP local server matches this information to the match criteria specified in the client PDUs. For example, for option 82 match criteria, the server matches the option 82 value in the user PDU to the specified option 82 string and uses the named range associated with the string.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-
options dhcp-relay ...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]
```

Description

Specify the DHCP option DHCP relay agent uses for selective processing of client traffic. You can configure support globally or for a named group of interfaces. You can also configure support for the extended DHCP relay agent on a per logical system and per routing instance basis.

Use the `[edit forwarding-options dhcp-relay dhcpv6]` hierarchy level to configure the DHCPv6 relay agent support.

Options

option-number—The DHCP or DHCPv6 option in the incoming traffic.

NOTE: EX Series switches do not support the User Class Options.

- 15 (DHCPv6 only)—Use DHCPv6 option 15 (User Class Option) in packets
- 16 (DHCPv6 only)—(MX Series routers and EX Series switches only) Use DHCPv6 option 16 (Vendor Class Option) in packets
- 60 (DHCPv4 only)—(MX Series routers and EX Series switches only) Use DHCP option 60 (Vendor Class Identifier) in DHCP packets
- 77 (DHCPv4 only)—Use DHCP option 77 (User Class Identifier) in packets

Required Privilege Level

Syntax

```
option-refresh-rate
```

Hierarchy Level

```
[edit services flow-monitoring version9 template template-name]
```

Description

Specifies the frequency at which the flow generator needs to send the Jflow options template (both template and system scope) to the collector.

Option refresh rate can be configured as number of packets. If the number of packets configured is “n”, it indicates that after every export of “n” data packets to the collector, the options template (both template and system scope) should be exported to the collector.

Option refresh rate can also be configured in seconds. If the seconds configured is “n”, it indicates that after every “n” seconds, the options template (both template and system scope) should be exported to the collector.

The options template provides information such as flow active timeout, flow inactive timeout, sampling interval, and sampling algorithm.

Options

- `packets`—Specify the number of packets. The range is from 1 through 480,000.
- `seconds`—Specify the number of seconds. The range is from 10 through 600.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

optional (Commit Scripts)

IN THIS SECTION

- Syntax | 12398
- Hierarchy Level | 12399
- Description | 12399
- Default | 12399
- Required Privilege Level | 12399
- Release Information | 12399

Syntax

```
optional;
```

Hierarchy Level

```
[edit system scripts commit file filename]
```

Description

Allow a commit operation to succeed even if the commit script specified in the `file` statement is missing from the appropriate commit script directory on the device.

> **NOTE**: Commit scripts are stored on a device's hard disk in the **/var/db/scripts/commit** directory or on the flash drive in the **/config/scripts/commit** directory. On the QFabric system, commit scripts are stored in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit/** directory on the Director device.

Default

If you do not include the `optional` statement for a commit script, the commit operation fails if that script is absent from the commit script directory.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 7.4.

Controlling Execution of Commit Scripts During Commit Operations

optional (Event Scripts)

IN THIS SECTION

- Syntax | 12400
- Hierarchy Level | 12400
- Description | 12400
- Default | 12401
- Required Privilege Level | 12401
- Release Information | 12401

Syntax

```
optional;
```

Hierarchy Level

```
[edit event-options event-script]
```

Description

For Junos OS event scripts, globally indicate the physical presence of the scripts as optional to allow commits to proceed if they are missing. Scripts can be missing, for example, if the primary storage on the device running Junos OS becomes corrupted.

If you do not configure the `optional` statement, the event process (eventd) validates the physical existence of event scripts during the commit process. If a configured script is not physically accessible, the commit fails.

If you configure the `optional` statement, the event process (eventd) ignores missing event scripts during the commit process and proceeds with the commit. If an event script is present but invalid, the commit fails.

Default

By default, optional is not set. Event scripts are required to be accessible during commit operations.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

```

Hierarchy Level

```
[edit access profile profile-name radius]
```

Description

Configure the options used by RADIUS authentication and accounting servers.

Options

accounting-session-id-format

(EX Series, MX Series only) Configure the format the router or switch uses to identify the accounting session. The default is `decimal`.

- Values:
  - decimal—Use the decimal format.
  - description—Use the generic format, in the form: `jnpr` *`interface-specifier`*:*`subscriber-session-id`*.

calling-station-id-delimiter

(MX Series, T Series only) Starting in Junos OS Release 13.1, specify the character that the router uses as a separator between the concatenated values in the Calling-Station-ID (RADIUS IETF attribute 31) string. The router uses the delimiter when you configure more than one value in the `calling-station-id-format` statement. The default is the hash (`#`) character.

- Values:
  - *delimiter-character*—Character to use for the delimiter. You must enclose the delimiter character in quotation marks (“ ”).

chap-challenge-in-request-authenticator

(MX Series only) Starting in Junos OS Release 15.1, configure the `authd` process to insert the random challenge generated by the NAS into the Request Authenticator field of Access-Request packets, if the challenge value is 16 bytes long. If you enable the `chap-challenge-in -request-authenticator` statement and the random challenge is not

16 bytes long, `authd` ignores the statement and uses the default behavior, which inserts the random challenge as the CHAP-Challenge attribute (RADIUS attribute 60) in Access-Request packets.

client-accounting-algorithm

(EX Series, MX Series, SRX3xx and SRX550HMonly) Starting in Junos OS Release 13.2X50-D10 for EX Series switches, configure the access method the router uses to access RADIUS accounting servers. The default is the `direct` option. The default behaviour applies for devices which do not support this configuration option.

- Values:
  - direct—Use the direct method.
  - round-robin—Use the round-robin method.

client-authentication-algorithm

(EX Series, M Series, MX Series only) Starting in Junos OS Release 13.2X50-D10 for EX Series switches, configure the method that the authenticator uses to access RADIUS authentication servers when there are multiple servers configured. Initially, a RADIUS client sends a request to a RADIUS authentication or accounting server. The router or switch, acting as the authenticator, waits for a response from the server before sending another request.

When there are multiple RADIUS server connections configured for a client, the authenticator attempts to reach the different servers in the order that they are configured. If there is no response from the first RADIUS server, the authenticator attempts to reach the next RADIUS server. This process repeats until the client is either granted access or there are no more configured servers.

If the `direct` method is configured, the authenticator always treats the first server in the list as the primary server. The authenticator moves on to the second server only if the attempt to reach the first server fails. If the `round-robin` method is configured, the server chosen first will be rotated based on which server was used last. The first server in the list is treated as a primary for the first authentication request, but for the second request, the second server configured is treated as primary, and so on. With this method, all of the configured servers receive roughly the same number of requests on average so that no single server has to handle all of the requests.

> **NOTE**: The `round-robin` access method is not supported on EX Series switches.

- **Default:** The default is the `direct` option.

- Values:
  - direct—Use the direct access method. The authenticator contacts the first RADIUS server on the list for each request, the second server if the first one fails, and so on.
  - round-robin—Use the round-robin method. The authenticator contacts the first RADIUS server for the first request, the second server for the second request, and so on.

coa-dynamic-variable-validation

(EX Series, M Series, MX Series only) Starting in Junos OS Release 13.2X50-D10 for EX Series switches, specify that when a CoA operation includes a change to a client profile dynamic variable that cannot be applied (such as an update to a non-existent filter), the router does not apply any changes to client profile dynamic variables in the request, and responds with a NACK message.

- **Default:** If you do not configure this statement, the router does not apply any incorrect variable updates, but does make any other changes to the client profile dynamic variables, and responds with an ACK message.

ethernet-port-type-virtual

(EX Series, M Series, MX Seriesonly) Specify the physical port type the router or switch uses to authenticate clients. The router or switch passes a port type of `ethernet` in RADIUS attribute 61 (NAS-Port-Type) by default. This statement specifies a port type of `virtual`.

> **NOTE**: This statement takes precedence over the `nas-port-type` statement if you include both statements in the same access profile.The `client-authentication-algorithm` option is unavailable in SRX series devices. Direct access method is used if multiple RADIUS authentication servers are configured.

access-loop-id-local

Specify that the Agent-Remote-Id and Agent-Circuit-Id are generated locally when these values are not present in the client database.

ip-address-change-notify

(MX Series only) Starting in Junos OS Release 13.1, for on-demand address allocation for dual-stack PPP subscribers, specify that the BNG includes the IPv4-Release-Control VSA (26–164) in the Access-Request that is sent during on-demand IP address allocation and in the Interim-Accounting messages that are sent to report an address change. The configuration of this statement has no effect when on-demand IP address allocation or deallocation is not configured.

Optionally, configure a message that is included in the VSA when it is sent to the RADIUS server.

- **Default:** This functionality is disabled by default.
- **Values:** ***message***—VSA message.
- **Range:** Up to 32 characters.

juniper-access-line-attributes

Configure AAA to add Juniper Networks access line VSAs to the RADIUS authentication and accounting request messages for subscribers. If the router has not received and processed the corresponding ANCP attributes from the access node, then AAA provides only the following in these RADIUS messages:

- Downstream-Calculated-QoS-Rate (IANA 4874, 26-141)—Default configured advisory transmit speed.
- Upstream-Calculated-QoS-Rate (IANA 4874, 26-142)—Default configured advisory receive speed.

> **NOTE**: Starting in Junos OS Release 19.2R1, the `juniper-access-line-attributes` option replaces the `juniper-dsl-attributes` option. The difference between these options is that `juniper-dsl-attributes` supported only DSL TLVs received in the ANCP Port Status message. The `juniper-access-line-attributes` option supports PON TLVs in addition to DSL TLVs, and will be extensible to future access technologies.
>
> For backward compatibility with existing scripts, the `juniper-dsl-attributes` option redirects to the new `juniper-access-line-attributes` option. We recommend that you use `juniper-access-line-attributes`.

> **NOTE**: The `juniper-access-line-attributes` option is not backward compatible with Junos OS Release 19.1 or earlier releases. This means that if you have configured `juniper-access-line-attributes` option in Junos OS Release 19.2 or higher releases, you must perform the following steps to downgrade to Junos OS Release 19.1 or earlier releases:
>
> 1. Delete the `juniper-access-line-attributes` option from all access profiles that include it.
> 2. Perform the software downgrade.

3. Add the `juniper-dsl-attributes` option to the affected access profiles.

- **Default:** The Juniper Networks access line VSAs are not added to the RADIUS authentication and accounting request messages. However, the DSL Forum VSA—if available—is added to RADIUS messages by default.

nas-identifier

(EX Series, MX Series, SRX Series only) Configure the value for the client RADIUS attribute 32 (NAS-Identifier). This attribute is used for authentication and accounting requests. This statement was introduced in Junos OS Release 15.1X49-D110 for SRX300, SRX320, SRX340, SRX345, and SRX550M Series devices.

- **Values:** *identifier-value*—String to use for authentication and accounting requests.
- **Range:** 1 through 64 characters.

nas-port-id-delimiter

(MX Series only) Starting in Junos OS Release 11.4, specify the character that the router uses as a separator between the concatenated values in the NAS-Port-ID string. The router uses the delimiter when you configure more than one value in the `nas-port-id-format` statement. The default is the hash (`#`) character. This statement was introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

- **Values:** *delimiter-character*—Character used for the delimiter.

remote-circuit-id-delimiter

(MX Series only) Starting in Junos OS Release 13.3R1 on MX Series, configure a delimiter character for the remote circuit ID string when you use the `remote-circuit-id-format` statement to configure the string to use instead of the Calling-Station ID in L2TP Calling Number AVP 22. If more than one value is configured for the remote circuit ID format, the delimiter character is used as a separator between the concatenated values in the resulting remote circuit ID string. The default is the hash (`#`) character.

- **Values:** *delimiter*—Delimiter character to be used between components of the remote circuit ID string.

remote-circuit-id-fallback

(MX Series only) Starting in Junos OS Release 13.3R1 on MX Series, configure the fallback value for the LAC to send in L2TP Calling Number AVP 22, either the configured Calling-Station-ID or the default underlying interface. Use of the fallback value is triggered when the components of the override string you configured with the `remote-circuit-id-format` statement—the ACI, the ARI, or both ACI and ARI—are not received by the LAC in the PPPoE Active Discovery Request (PADR) packet.

- Values:
  - configured-calling-station-id—Send the configured Calling-Station-ID in the Calling Number AVP.
  - default—Send the underlying interface value in the Calling Number AVP.

remote-circuit-id-format

(MX Series only) Starting in Junos OS Release 13.3R1 on MX Series, configure the format of the string that overrides the Calling-Station-ID format in the Calling Number AVP 22 sent by the LAC to the LNS in the ICRQ packet when an L2TP session is being established. You can specify the ACI, the ARI, or both the ACI and ARI. This statement enables you to decouple the AVP 22 value from the RADIUS Calling-Station-ID attribute (31); the values for AVP 22 and the Calling-Station-ID attribute are the same when you use the `calling-station-id-format` statement to configure AVP 22.

> **NOTE**: You must configure the `override calling-circuit-id remote-circuit-id` statement for the remote circuit ID format to be used in the calling number AVP.

- Values:
  - agent-circuit-id—Specifies use of the ACI string that uniquely identifies the subscriber's access node and the digital subscriber line (DSL) on the access node. For PPPoE traffic, the ACI string is in the DSL Forum Agent-Circuit-ID VSA [26-1] of PPPoE Active Discovery Initiation (PADI) and PPPoE Active Discovery Request (PADR) control packets.
  - agent-remote-id—Specifies use of the ARI string that identifies the subscriber on the digital subscriber line access multiplexer (DSLAM) interface that initiated the service request. The agent remote identifier (ARI) string is stored in the DSL Forum Agent-Remote-ID VSA [26-2] for PPPoE traffic.

service-activation

(MX Series only) Starting in Junos OS Release 16.2, specify whether subscribers are allowed to log in even when service activation failures related to configuration errors occur during family activation request processing by authd for a newly authenticated subscriber. Configuration errors include missing or incorrect syntax, missing or incomplete references to dynamic profiles, and missing or incomplete variables.

> **NOTE**: This configuration does not apply to services activated by means of RADIUS CoA requests, JSRC Push-Profile-Request (PPR) messages, or subscriber secure policies.

You can enable separate configurations for subscriber login services for two `service-activation` types: `dynamic-profile` and `extensible-service`. You configure the `dynamic-profile` type services in the dynamic profile at the `[edit dynamic-profiles]` hierarchy level; the profile is used to provide dynamic subscriber access and services for broadband applications. The `extensible-service` type is for business services configured in an operation script and provisioned by the Extensible Subscriber Services Manager daemon (essmd).

- Default:

  Default behavior depends on the service type:

  - For `extensible-service` services: `optional-at-login`.
  - For `dynamic-profile` services: `required-at-login`.

- Values:

  - optional-at-login—Service activation is optional. Failure due to configuration errors does not prevent activation of the address family; it allows subscriber access. Failure for any other reason causes network family activation to fail. If no other network family is already active for the subscriber, then the client application logs out the subscriber.
  - required-at-login—Service activation is required. Failure for any reason causes the Network-Family-Activate-Request for that network family to fail. If no other network family is already active for the subscriber, then the client application logs out the subscriber.

vlan-nas-port-stacked-format (MX Series only) Configure RADIUS attribute 5 (NAS-Port) to include the S-VLAN ID, in addition to the VLAN ID, for subscribers on Ethernet interfaces.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

`juniper-dsl-attributes` introduced in Junos OS Release 11.4.

`nas-port-id-delimiter` introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

`calling-station-id-delimiter` introduced in Junos OS Release 13.1.

`ip-address-change-notify` introduced in Junos OS Release 13.1.

`coa-dynamic-variable-validation`, `client-authentication-algorithm`, and `client-accounting-algorithm` introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

`remote-circuit-id-delimiter`, `remote-circuit-id-fallback`, and `remote-circuit-id-format` introduced in Junos OS Release 13.3R1 on MX Series.

`chap-challenge-in-request-authenticator` introduced in Junos OS Release 15.1.

`nas-identifier` introduced in Junos OS Release 15.1X49-D110 for SRX300, SRX320, SRX340, SRX345, and SRX550M Series devices.

`service-activation` introduced in Junos OS Release 16.2.

`juniper-access-line-attributes` introduced in Junos OS Release 19.2R1.

options],

[edit logical-systems logical-system-name routing-options],
[edit routing-instances routing-instance-name routing-options],
[edit routing-options]
```

Description

Configure the types of system logging messages sent about the routing protocols process to the system message logging file. These messages are also displayed on the system console. You can log messages at a particular level, or up to and including a particular level.

Options

level *level*—Severity of the message. It can be one or more of the following levels, in order of decreasing urgency:

- **alert**—Conditions that should be corrected immediately, such as a corrupted system database.
- **critical**—Critical conditions, such as hard drive errors.
- **debug**—Software debugging messages.
- **emergency**—Panic or other conditions that cause the system to become unusable.

- **error**—Standard error conditions.
- **info**—Informational messages.
- **notice**—Conditions that are not error conditions, but might warrant special handling.
- **warning**—System warning messages.

upto level ***level***—Log all messages up to a particular level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Statement introduced in Junos OS Evolved Release 25.4R1.

options-template-id

IN THIS SECTION

- Syntax | 12416
- Hierarchy Level | 12416
- Description | 12416
- Options | 12417
- Required Privilege Level | 12417
- Release Information | 12417

Syntax

```
options-template-id id;
```

Hierarchy Level

```
[edit services flow-monitoring version9 template template-name],
[edit services flow-monitoring version-ipfix template template-name]
```

Description

Define a unique options template ID to be used for flow aggregation of version 9 and IPFIX flows. After a re-start of the exporting process, the software may re-assign option template IDs.

MX and QFX Series

The options template ID can be a value in the range of 1024 through 65535. If you do not configure values for the options template ID, a default value is assumed for this ID, which is different for the various address families. If you configure the same options template ID value for different address families, such a setting is not processed properly and might cause unexpected behavior. For example, if you configure the same options template ID value for both IPv4 and IPv6, the collector validates the export data based on the options template ID value that it last receives. In this case, if IPv6 is configured after IPv4, the value is effective for IPv6 and the default value is used for IPv4.

PTX Series

If you choose to configure the options template ID, the range is 1024 to 65520. If you do not configure this ID, the default value that is set is in the range 256-511 and is different for each template.

You can configure the `option-template-id` statement for family `inet`, `inet6`, and `mpls` only.

You must not configure the same ID for different templates (option or data template). The operating system does not check to ensure that you do not configure the same ID value for different templates. If you configure the same ID value, such a setting is not processed properly and might cause unexpected behavior.

The options template ID range [configured `options-template-id` value + 20) is reserved and you must not configure any another ID in this range. The difference between configured options template IDs across families should be at least 20; for example, if `options-template-id 1056` is configured for family `inet`, you should not configure template IDs in the range of 1056 to 1075 for any other families.

For Junos OS, if you change the options template ID, all flows are inactively timed out. New flows are learned afresh.

For Junos OS Evolved, if you change the options template ID, this change does not impact the flows.

Options

id—Unique identifier for the options template to be used for version 9 or IPFIX flows. The range 0-255 is reserved and is used for template sets, options template sets, and for future expansion. If you do not configure an options template ID, the software generates a template ID for you.

- **Range:** 1024 through 65,535

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

maximum-length prefix-length],
[edit routing-instances instance-name routing-options validation static record destination
maximum-length prefix-length],
[edit routing-options validation static record destination maximum-length prefix-length]
```

Description

Configure the legitimate originator autonomous system (AS). This is a required statement.

Options

as-number Configure a legitimate originator AS number.

validation-state (invalid | valid) Configure the validation state for a route validation record.

- **Values:** Configure one of two mutually exclusive validation states:
  - invalid—A negative (invalid) validation state. Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.
  - valid—A positive (valid) validation state. Indicates that the prefix and AS pair are found in the database.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

```
[edit logical-systems logical-system-name protocols],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols],
[edit protocols],
[edit routing-instances routing-instance-name protocols]
```

Description

Enable OSPFv3 routing on the routing device. You must include the `ospf3` statement to enable OSPFv3. By default, OSPFv3 is disabled.

Options

domain-id *domain-id*

The domain ID identifies the OSPF domain from which the route originated. If the router ID is not configured in the routing instance, the router ID is derived from an interface address belonging to the routing instance. The default OSPF domain ID is the null value 0.0.0.0.

domain-vpn-tag *number*

Set a virtual private network (VPN) tag for OSPFv2 external routes generated by the provider edge (PE) routing device. The *number* corresponds to the VPN tag.

route-type-community (iana | vendor)

Specify an extended community value to encode the OSPF route type. Each extended community is coded as an eight-octet value. This statement sets the most significant bit to either an IANA or vendor-specific route type.

- `iana`—Encode a route type with the value 0x0306. This is the default value.
- `vendor`—Encode the route type with the value 0x8000.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Description

Enable OSPF routing on the routing device. You must include the `ospf` statement to enable OSPF on the routing device. By default, OSPF is disabled.

Options

domain-id *domain-id*

The domain ID identifies the OSPF domain from which the route originated. If the router ID is not configured in the routing instance, the router ID is derived from an interface address belonging to the routing instance. The default OSPF domain ID is the null value 0.0.0.0.

domain-vpn-tag *number*

Set a virtual private network (VPN) tag for OSPFv2 external routes generated by the provider edge (PE) routing device. The *number* corresponds to the VPN tag.

route-type-community (iana | vendor)

Specify an extended community value to encode the OSPF route type. Each extended community is coded as an eight-octet value. This statement sets the most significant bit to either an IANA or vendor-specific route type.

- `iana`—Encode a route type with the value 0x0306. This is the default value.
- `vendor`—Encode the route type with the value 0x8000.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Understanding OSPF Configurations

ospf-instance

IN THIS SECTION

- Syntax | 12437
- Hierarchy Level | 12437
- Description | 12437
- Default | 12438
- Required Privilege Level | 12438
- Release Information | 12438

Syntax

```
ospf-instance igpinstance-
name{ ... }
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols],
[edit protocols]
```

Description

Enable multiple IGP instances of OSPFv2 routing on the routing device. The OSPFv2 IGP instance is associated with the default routing-instance and the default RIB. An OSPFv2 IGP instance exports routes installed in the RIB by another OSPFv2 IGP instance using standard Junos OS routing policy configuration. By default, the routes installed by different OSPFv2 IGP instances have the same route preference.

All the configuration options available under the `[edit protocols ospf-instance igpinstance-name]` hierarchy level are similar to the options available under the `[edit protocols ospf]` hierarchy level.

NOTE: The `ospf-instance` configuration statement is not supported at the [`edit routing-instances` *`routing-instance-name`* `protocols`] hierarchy level.

NOTE: Junos OS does not support configuring the same logical interface in multiple IGP instances of OSPFv2.

Starting in Junos OS and Junos OS Evolved Release 24.4R1, you can configure and run multiple independent interior gateway protocol (IGP) instances of OSPFv2 with segment routing (SR) on a router. You can create two or more OSPF instances and apply SR-MPLS on each instance. Multiple instances of OSPF can advertise different prefix-segment identifiers (prefix-SIDs). Other instances can use these SIDs for making routing decisions.

Default

OSPF is disabled on the routing device.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 24.2R1.

oss-map

IN THIS SECTION

- Syntax | 12439
- Hierarchy Level | 12439
- Description | 12439

- Options | 12439
- Required Privilege Level | 12439
- Release Information | 12440

Syntax

```
oss-map {
    model-name t640|t1600;
}
```

Hierarchy Level

```
[edit chassis]
```

Description

Configure the operations support systems (OSS) mapping feature to map a T4000 chassis to a T1600 chassis or a T640 chassis, so that the T4000 chassis is represented as a T1600 chassis or a T640 chassis, respectively. The configuration helps prevent requalifying the T1600 chassis and T640 chassis as a new chassis on the OSS.

Options

`model-name t640`—Perform OSS mapping on a T4000 chassis to represent it as a T640 chassis, thereby overriding the chassis model name as displayed in the output of the `show chassis hardware`, the `show snmp mib walk system`, and the `show snmp mib walk jnxBoxAnatomy` operational commands.

`model-name t1600`—Perform OSS mapping on a T4000 chassis to represent it as a T1600 chassis, thereby overriding the chassis model name as displayed in the output of the `show chassis hardware`, the `show snmp mib walk system`, and the `show snmp mib walk jnxBoxAnatomy` operational commands.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3R3, 13.1R2, and 13.2R1.

other-bytes

IN THIS SECTION

- Syntax | 12445
- Hierarchy Level | 12445
- Description | 12446
- Options | 12446
- Required Privilege Level | 12446
- Release Information | 12446

Syntax

```
other-bytes bytes;
```

Hierarchy Level

```
[edit protocols ancp qos-adjust]
```

Description

Adjust the number of frame overhead bytes by the specified number of bytes in the actual downstream rate reported in the ANCP Port Up message for an access line of DSL type OTHER. The ANCP agent reports the adjusted value to CoS. The adjusted value accounts for the traffic encapsulation overhead.

The router reports some access technology types—such as Gigabit passive optical network (GPON) lines—as DSL type OTHER.

> **NOTE**: Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the `other-overhead-bytes` option of the `access-line` statement at the `[edit system]` hierarchy level. The ANCP agent ignores the `other-bytes` statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the `access-line` statement.

Options

bytes Number of bytes added to or subtracted from the actual downstream frame overhead.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

```

Description

Control how often BGP and the routing table exchange route information by specifying how long a route must be present in the Junos OS routing table before it is exported to BGP. Use this time delay to help bundle routing updates and to avoid sending updates too often.

Alternatively or in addition, external BGP (EBGP) sessions can also use the route-flap damping mechanism upon the reception of BGP messages coming from an external neighbor.

BGP stores the route information it receives from update messages in the routing table, and the routing table exports active routes from the routing table into BGP. BGP then advertises the exported routes to its peers. The `out-delay` statement enables a form of rate limiting. The delay is added to each update for each prefix individually. When a routing device changes its best path to a destination prefix, the device does not inform its peer about the change unless the route has been present in its routing table for the specified `out-delay`. If you use `out-delay` to perform rate-limiting, you can expect a less bursty pattern of updates. You will see a pattern in which updates arrive in a steady flow, and two updates for the same prefix are always spaced by at least the `out-delay` timer value (for example, 30 seconds). Thus, the `out-delay` setting is useful for limiting oscillation (sometimes called *churn*) in a network. Keep in mind that, regardless of the `out-delay` setting, BGP peers exchange routes immediately after neighbor establishment. The `out-delay` setting is only designed to delay the exchange of routes between BGP and the local routing table.

Caution is warranted because an `out-delay` can delay convergence. If your network is configured in a way that avoids oscillation, setting an `out-delay` is not necessary.

When configured, the `out-delay` value displays as `Outbound Timer` when using `show bgp group` or `show bgp group neighbor` commands.

Default

By default, the exchange of route information between BGP and the routing table occurs immediately after the routes are received. This immediate exchange of route information might cause instabilities in the network reachability information. If you omit this statement, routes are exported to BGP immediately after they have been added to the routing table.

Options

seconds—Output delay time.

- **Range:** 0 through 65,535 seconds
- **Default:** 0 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

        secret password;
```

```
        waittime seconds;
    }
}
```

Hierarchy Level

```
[edit system services]
```

Description

Configure a Junos device that's behind a firewall to initiate outbound HTTPS connections to communicate with client management applications on the other side of the firewall. The `outbound-https` configuration is consumed by the outbound HTTPS extension service. You must configure this service at the `[edit system extensions extension-service application file nc_grpc_app.pyc]` hierarchy level in order to initiate the outbound HTTPS connections.

When you configure and start the outbound HTTPS extension service on supported Junos devices, the extension service uses the `outbound-https` configuration to connect to and authenticate each configured client, which corresponds to a gRPC server running on a network management system. The device and gRPC server establish a persistent HTTPS connection over a TLS-encrypted gRPC session. The device authenticates the gRPC server using an X.509 digital certificate, and the gRPC server uses the `device-id` and `shared-secret` values to authenticate the Junos device. An outbound HTTPS client can establish multiple NETCONF or shell sessions with the device.

You can configure multiple outbound HTTPS clients, and you can configure one or more backup gRPC servers for each client. The device connects to only one gRPC server in the client's server list at any one time.

Options

client *client-id*

Define a device-initiated outbound HTTPS connection.

This value serves to uniquely identify the `outbound-https` configuration stanza. Each stanza represents a connection to a single outbound HTTPS client. Thus, the administrator is free to assign the `client-id` any meaningful unique value. This attribute is not sent to the client management application.

address

Hostname or IPv4 address of the gRPC server running on the network management system.

The hostname or IP address must match the value of the Common Name (CN) field or the SubjectAltName IP Address field, respectively, in that gRPC server's X.509 certificate. You can configure multiple backup gRPC servers, but the device connects to only one server in the list at any given time.

You must configure the following connection parameters for each server:

- port *port*—Port on which the gRPC server is listening for outbound HTTPS connection requests.
- trusted-cert *trusted-cert*—Certificate information used to authenticate the gRPC server's X.509 certificate.

  If the server's certificate is self-signed, configure the contents of the gRPC server's certificate, omitting any newlines.

  If the server's certificate is authenticated using a certificate chain, concatenate any intermediate CA and root CA certificates in that order, remove all newlines, and configure the resulting single string.

device-id *device-id*

Identifies the Junos device to the management application. Each time the device establishes an outbound HTTPS connection, it sends its device identifier and shared secret to the management application, and the management application uses the values to authenticate the device.

reconnect-strategy (in-order | sticky)

(Optional) Method used to reestablish a disconnected outbound HTTPS connection.

- Values:
  - in-order—Attempt to reconnect to the first server in the list. If the server is unavailable, attempt to connect to the next server in the list, and so on, until the device establishes a connection.
  - sticky—Attempt to reconnect to the server to which the device was last connected. If the server is unavailable, attempt to connect to the next server in the list, and so on, until the device establishes a connection.
- **Default:** in-order

secret *password*

Shared secret between the Junos device and the management application. Each time the device establishes an outbound HTTPS connection, it sends its device identifier and shared secret to the management application, and the management application uses the values to authenticate the device.

waittime *seconds*

Number of seconds that the device waits before attempting to connect or reconnect to the servers in the list if none of the servers are available. That is, if the device reaches

the end of the configured server list and cannot establish a connection, it waits the specified number of seconds before again attempting to connect to each server in the list, starting from the top.

- **Default:** 30 seconds
- **Range:** 0 through 4,294,967,295 seconds

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.3R1.

Statement introduced in Junos OS Evolved Release 22.4R1.

```

Description

Configure a BGP peer to accept outbound route filters from a remote peer.

Options

accept—Specify that outbound route filters from a BGP peer be accepted.

inet—Specify that IPv4 prefix-based outbound route filters be accepted.

inet6—Specify that IPv6 prefix-based outbound route filters be accepted.

NOTE: You can specify that both IPv4 and IPv6 outbound route filters be accepted.

prefix-based—Specify that prefix-based filters be accepted.

The `bgp-orf-cisco-mode` statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Syntax

```
outbound-ssh {
    client client-id {
        address {
            port port-number;
            retry number;
            timeout seconds;
        }
        device-id device-id;
        keep-alive {
            retry number;
            timeout seconds;
        }
        proxy-server {
            dhcp;
            static {
                host hostname;
                port port-number;
                proxy-authorization {
                    password password;
                    user username;
                }
            }
        }
        reconnect-strategy (in-order | sticky);
        routing-instance routing-instance-name;
        secret password;
        services  netconf;
    }
    traceoptions {
        file <filename> <files number> <match regular-expression> <size size> <(world-readable |
no-world-readable)>;
        flag flag;
        no-remote-trace;
    }
}
```

Hierarchy Level

```
[edit system services]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure a device running the Junos OS behind a firewall to initiate outbound SSH connections to communicate with client management applications on the other side of the firewall.

Options

client *client-id*

Defines a device-initiated connection. This value serves to uniquely identify the outbound-ssh configuration stanza. Each outbound-ssh stanza represents a single outbound SSH connection. Thus, the administrator is free to assign the client-id any meaningful unique value. This attribute is not sent to the client management application.

address

Hostname, IPv4 address, or IPv6 address of the management application server.

> **NOTE**: Starting in Release 15.1, Junos OS supports outbound SSH connections with devices having IPv6 addresses.

- **Syntax:** You can list multiple servers by adding each server's IP address or hostname along with the following connection parameters:
  - port *port-number*—Specifies the port number at which a server listens for outbound SSH connection requests.

    Default: port 22
  - retry *number*—Specifies the maximum number of times the device attempts to establish an outbound SSH connection before giving up.

Default: 3 attempts

- timeout *seconds*—Specifies how long the device waits between attempts to reconnect to the specified IP address to establish an outbound SSH connection before giving up.

  Default: 15 seconds

device *device-id*

(Required) Identifies the device to the management application. Each time the device establishes an outbound SSH connection, it first sends an initiation sequence (device-id) to the management application.

keep-alive

(Optional) When configured, specifies that the device should send SSH protocol keepalive messages to the management application.

- **Syntax:** To configure keepalive messages, you must set both the retry and timeout attributes:
  - retry *number*—specifies how many keepalive messages the device sends without receiving a response from the application. When that number is exceeded, the device disconnects from the application, ending the outbound SSH connection.

    Default: 3 attempts
  - timeout *seconds*—specifies how long the device waits to receive data before sending a request for acknowledgment from the application.

    Default: 15 seconds

proxy-server (dhcp|static)

Specify the method used to connect via an HTTP proxy server.

- **Values:** Two methods are available:
  - dhcp—Fetch the proxy server information from the DHCP configuration.
  - static—Configure a static proxy server.

reconnect-strategy (in-order|sticky)

(Optional) Specify the method the device uses to reestablish a disconnected outbound SSH connection.

- **Values:** Two methods are available:
  - in-order—Configures the device to reconnect to the first configured server. If this server is unavailable, the device tries to connect to the next configured server.

The device keeps trying each server in the configured list until the device can establish a connection.

- sticky—Specify that the device should first attempt to reconnect to the management server from which it disconnected. If that server is unavailable, the device then attempts to connect to the next configured server. The device keeps trying each server in the configured list until the device can establish a connection.

routing-instance *routing-instance-name* — (SRX Series and MX Series only) Specify the name of the routing instance on which the outbound SSH connection needs to be established. If you do not specify a routing instance, your device will establish the outbound SSH connection using the default routing table.

secret *password* — Configures the device to send the device's public SSH host key when the device connects to the management server. This is the recommended method of maintaining a current copy of the device's public key.

services *netconf* — Configures the management application to accept NETCONF as an available service.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

- Required Privilege Level | **12475**
- Release Information | **12475**

Syntax

```
outgoing-queue {
    <high-watermark high-watermark>;
    <low-watermark low-watermark>;
    size size;
}
```

Hierarchy Level

```
[edit access diameter peer peer-name]
```

Description

Configure the outgoing queue properties for this peer. When the queue size reaches the high watermark, the peer is marked unavailable, any new messages to the Diameter network element are not sent to this peer, and the SNMP trap **Diameter_PeerOutQHiWMarkNotif** is generated. When the queue size descends below the low watermark after reaching the high watermark, the peer becomes available and the SNMP trap **Diameter_PeerLowQHiWMarkNotif** is generated.

Options

`high-watermark` *`high-watermark`*

(Optional) Use the specified high watermark for this peer.

- **Range:** 1 through 100 percent
- **Default:** 80

`low-watermark` *`low-watermark`*

(Optional) Use the specified low watermark for this peer.

- **Range:** 1 through 100 percent
- **Default:** 60

`size` *`size`*

Use the specified size of the queue. The default is 6000.

- **Range:** 1 through 65,535 packets

Required Privilege Level

access—To view this statement in the configuration.

        (world-readable | no-world-readable);
    }
    inline-jflow {
        source-address address;
        flow-export-rate rate;
    }
}
```

Hierarchy Level

```
[edit forwarding-options sampling instance instance-name family (inet |inet6 |mpls)],
[edit forwarding-options sampling family (inet |inet6 |mpls | vpls)]
```

Description

Configure cflowd or flow monitoring, output files and interfaces, and flow properties.

The remaining statements are explained separately. See CLI Explorer.

NOTE: The `inline-jflow` statement is valid only under the `[edit forwarding-options sampling instance instance-name family family output]` hierarchy level. The `file` statement is valid only under the `[edit forwarding-options sampling family inet output]` hierarchy level.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for IPv6 addresses for the `flow-server` *address* and `source-address` *address* statements within sampling instances introduced in Junos OS Evolved Release 23.1R1.

output (Security Forwarding Options)

IN THIS SECTION

- Syntax | 12491
- Hierarchy Level | 12492
- Description | 12492
- Options | 12492
- Required Privilege Level | 12492
- Release Information | 12492

Syntax

```
output {
    destination-mac mac-address;
```

```
    interface interface-name;
}
```

Hierarchy Level

```
[edit security forwarding-options mirror-filter filter-name]
```

Description

Specify the MAC address or interface for mirrored traffic.

Starting in Junos OS Release 18.4R1, if the output X2 interface of a mirror filter is configured for an st0 interface to filter traffic that you want to analyze, the packet is duplicated and encrypted by the IPsec tunnel bound to the st0 interface. This enhancement supports the SRX Series Firewalls to send traffic mirrored from a port on an IPsec tunnel.

Options

destination-mac *mac-address*	Specify the MAC address for the mirrored traffic.
interface *interface-name*	Specify the logical interface for the mirrored traffic.

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X46-D10.

output-chain

IN THIS SECTION

- Syntax | 12498
- Hierarchy Level | 12498
- Description | 12498
- Options | 12499
- Required Privilege Level | 12499
- Release Information | 12499

Syntax

```
output-chain [ filter-name ]
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family filter]
```

Description

The `output-chain` command works like the **next** filter term to allow multiple levels of filtering on the interface in both the ingress and egress direction. For example, you can implement a combination of classification and firewall filter rules for evaluation, wherein the first filter performs a generic filter classification and the subsequent filters go on to perform the actual filtering and actions.

To continue on to the next filter, the terminating action in the current filter must be **accept**.

The `output-chain` command is supported on all interfaces except loopback (lo0 and fxp0) and interfaces under logical systems.

Options

[*filter-names*]—Name of each filter in the chain that is to be evaluated when packets are received on the interface. Supports up to 8 ingress and 8 egress filters. Evaluation occurs in the order in which the names appear, from left to right.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.4R1.

Statement introduced in Junos OS Evolved Release 21.4R1 (PTX10001-36MR, PTX10004, PTX10008, and PTX10016).

output-filename (Event Policy)

IN THIS SECTION

- Syntax | **12500**
- Hierarchy Level | **12500**
- Description | **12500**
- Options | **12500**
- Required Privilege Level | **12501**

Release Information | 12501

Syntax

```
output-filename filename;
```

Hierarchy Level

```
[edit event-options policy policy-name then event-script filename],
[edit event-options policy policy-name then execute-commands]
```

Description

Instruct an event policy to write the output of the invoked commands or event script to a file. For op scripts, this statement is optional.

The `output-filename` argument is a descriptive string that is included in the filename of the output file. The name of the output file also includes the hostname and timestamp to ensure that the each filename is unique. If an event policy is triggered multiple times in a 1-second period, an index number is appended to the filename. The index number range is 001 through 999.

Prior to Junos OS Release 14.1R3, the filename has the following naming convention:

```
hostname_filename_YYYYMMDD_HHMMSS_index-number
```

Starting in Junos OS Release 14.1R3, the ***filename*** string is placed after the timestamp.

```
hostname_YYYYMMDD_HHMMSS_filename_index-number
```

Options

filename String included in the filename of the output file.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

Support at the `[edit event-options policy policy-name then event-script filename]` hierarchy level introduced in Junos OS Release 7.6.

- Description | 12502
- Default | 12502
- Options | 12502
- Required Privilege Level | 12502
- Release Information | 12502

Syntax

```
output-format (text | xml);
```

Hierarchy Level

```
[edit event-options policy policy-name then event-script filename],
[edit event-options policy policy-name then execute-commands]
```

Description

Specify the format (*ASCII* text or XML) for the output of event scripts or commands executed by an event policy.

> **NOTE**: Event script output is always emitted in XML format even if you configure the `output-format text` statement under the `[edit event-options policy policy-name then event-script filename]` hierarchy.

Default

If you do not include the `output-format` statement, the output is emitted in XML format.

Options

text Formatted ASCII text.

xml Junos Extensible Markup Language (XML) tags.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

Support at the `[edit event-options policy policy-name then event-script filename]` hierarchy level introduced in Junos OS Release 8.3.

[edit logical-systems logical-system-name protocols bgp group group-name family family-name sub-family],
[edit protocols bgp family family-name sub-family],
[edit protocols bgp group group-name neighbor neighbor-id family family-name]
```

Description

When configuring the queues for BGP route prioritization, the `output-queue-priority` statement allows you to specify the number of tokens that are available within each of the 17 BGP output priority queues. This allows you to balance the amount of work that can be done within the route prioritization queues.

When implementing BGP route prioritization, the `output-queue-priority` statement allows you to specify the priority at which a given BGP route or route type is serviced. BGP route prioritization can also be specified per BGP neighbor during BGP configuration within the `inet` address family.

Default

By default, each of the 17 BGP route priority queues (or buckets) is assigned 1 work token so that misconfigured queues do not result in starvation.

When implementing BGP route prioritization, the following types of update messages are assigned to the lowest priority queue (1) by default: route refresh, topology change, and route withdraw.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

    }
}
```

Hierarchy Level

```
[edit services analytics agent service-agents agent-name]
```

Description

Configure parameters for the Network Telemetry Framework (NTF) agent output plug-in.

NOTE: When you modify the output plug-in configuration of a service agent instance, the associated service agent daemon is restarted.

Options

file parameters

Configure parameters for sending data in a log file to a data collector.

path *pathname*

Path for the log file to which to save the data. For example, `path /tmp/example_file.log`

kafka parameters

Configure parameters for sending data to a Kafka data collector.

server *ip-address*

IP address of the Kafka server.

topic *filename*

Kafka topic name. The naming convention of the topic is *server-name*.jti.*encoding-type*. The encoding type options are `avro`, `json`, or `msgpack`.

encoding *encoding-type*

Encoding type. Options are `avro`, `json`, or `msgpack`.

output-ipfix parameters

Configure parameters for the IPFIX mediation service agent to send the IPFIX records that have been consolidated on the router to the IPFIX collector.

You must configure the IP address of the upstream IPFIX collector. When you optionally configure at least one of the collector certificate options (`collector-ca-certificate`, `collector-certificate`, and `collector-certificate-key`), the IPFIX mediator attempts to use TLS to connect with the collector. Otherwise, the mediator uses a TCP connection.

> **NOTE**: Any change you make to an existing `output-ipfix` output plug-in configuration restarts the IPFIX service agent daemon to apply the changes.

collector-address *ip-address*

IP address of the upstream IPFIX collector.

collector-ca-certificate *file-path*

(Optional) Path for the certificate, provided by a trusted certificate authority (CA), that is used to sign the peer certificate at the peer (IPFIX collector) level. The certificate is expected to be in .pem container format.

collector-certificate *file-path*

(Optional) Path for the client certificate that the server (IPFIX collector) uses to authenticate the client and enable mutual authentication. The fully-qualified domain name (FQDN) of both the client and the server are stored in the certificate's Subject Alternative Name field when the client and server certificates are generated. The certificate is expected to be in .pem container format.

collector-certificate-key *file-path*

(Optional) Private key file that is loaded to decrypt the encrypted message sent from the peer.

collector-connection-retry-interval *seconds*

(Optional) Interval in seconds at which the output plug-in retries connecting to the IPFIX collector.

- **Range:** 1 through 25
- **Default:** 20

collector-tcp-port *port-number*

(Optional) Number of the TCP port used to connect to the IPFIX collector.

- **Default:** 4740

collector-vrf-name *vrf-name*

(Optional) Name of the VRF (routing instance) in which IPFIX packets are routed.

- **Default:** default

Required Privilege Level

system

Release Information

Statement introduced in Junos OS Release 18.3R1.

```

Hierarchy Level

[edit services application-identification application *application-name*]

Description

Specify set of L4/L7 application that carries given application

Configure a custom signature based on Layer 4/Layer 7 applications. You create Layer 7-based custom application signatures for the identification of multiple applications running on the same Layer 7 protocols. For example, applications such as Facebook and Yahoo Messenger can both run over HTTP, but there is a need to identify them as two different applications running on the same Layer 7 protocol.

Options

protocol-type	Application protocol
"chain-order" on page 3485	The order of members is used to match the pattern (Next Gen Services)
signature *name*	Name of the custom application signature. Must be a unique name with a maximum length of 63 characters.
member *name*	Member name for a custom application signature. Custom signatures can contain multiple members that define attributes for an application. (The supported member name range is m01 through m15.)
context	Service-specific context, such as http-header-content-type.
direction	Connection direction of the packets to match pattern
patterns	(Optional) Deterministic finite automaton (DFA) pattern matched on the context. The DFA pattern specifies the pattern to be matched for the signature. Maximum length is 128.

depth Maximum number of bytes to check for context match. Use the byte limit for AppID to identify custom application pattern for applications running over TCP or UDP or Layer 7 applications.

port-range Port range. This option is applicable for TCP or UDP-based applications only.

The remaining statements are explained separately. See CLI Explorer.

overhead-accounting (ANCP)

IN THIS SECTION

- Syntax | 12534
- Hierarchy Level | 12534
- Description | 12534
- Required Privilege Level | 12535
- Release Information | 12535

Syntax

```
overhead-accounting;
```

Hierarchy Level

```
[edit protocols ancp interfaces interface-name]
```

Description

Prevent ANCP from performing an adjustment on the actual downstream data rate that ANCP receives from the DSLAM for the difference between the customer premise equipment (CPE) protocol overhead and the B-RAS protocol overhead. You include this statement when you want CoS to perform the adjustment on the data rate from the DSLAM according to the overhead accounting configuration in a CoS traffic control profile.

When this statement is not configured (the default condition), ANCP makes the traffic rate adjustment according to the configuration of the `qos-adjust-line-type` statements and reports that rate to CoS. CoS then applies (if configured) the adjustment set by the `overhead-accounting` statement in the CoS traffic profile.

NOTE: ANCP reports a traffic rate to CoS only if the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level has been configured.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

overload (Protocols IS-IS)

IN THIS SECTION

- Syntax | 12544
- Hierarchy Level | 12544

- Description | 12544
- Options | 12545
- Required Privilege Level | 12546
- Release Information | 12546

Syntax

```
overload {
    advertise-high-metrics;
    allow-route-leaking;
    external-prefixes;
    internal-prefixes;
    timeout seconds;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]
```

Description

Configure the local routing device so that it appears to be overloaded. This statement causes the routing device to continue participating in IS-IS routing, but prevents it from being used for transit traffic. Traffic destined to immediately attached subnets continues to transit the routing device.

You can also advertise maximum link metrics in network layer reachability information (NLRI) instead of setting the overload bit.

You configure or disable overload mode in IS-IS with or without a timeout. Without a timeout, overload mode is set until it is explicitly deleted from the configuration. With a timeout, overload mode is set if the time elapsed since the IS-IS instance started is less than the specified timeout.

A timer is started for the difference between the timeout and the time elapsed since the instance started. If the time elapsed after the IS-IS instance is enabled is less than the specified timeout, overload mode is set. When the timer expires, overload mode is cleared. In overload mode, the routing device IS-IS advertisements are originated with the overload bit set. This causes the transit traffic to take paths around the routing device. However, the overloaded routing device's own links are still accessible.

The value of the overload bit depends on these three scenarios:

1. When the overload bit has already been set to a given value and the routing process is restarted: Link-state PDUs are regenerated with the overload bit cleared.
2. When the overload bit is reset to a lesser value while the routing process is running: Link-state PDUs are regenerated with the overload bit cleared.
3. When the overload bit is reset to a greater value while the routing process is running: Link-state PDUs are regenerated with the overload bit set to the difference between the old and new value.

To understand the reason for setting the overload bit, consider that BGP converges slowly. It is not very good at detecting that a neighbor is down because it has slow-paced keepalive timers. Once the BGP neighbor is determined to be down, it can take up to 2 minutes for a BGP router to declare the neighbor down. IS-IS is much quicker. IS-IS only takes 10-30 seconds to detect absent peers. It is the slowness of BGP, more precisely the slowness of internal BGP (IBGP), that necessitates the use of the overload bit. IS-IS and BGP routing are mutually dependent on each other. If both do not converge at the same time, traffic is dropped without notification (black holed).

You might want to configure the routing device so that it appears to be overloaded when you are restarting routing on the device. Setting the overload bit for a fixed amount of time right after a restart of the routing protocol process (rpd) ensures that the router does not receive transit traffic while the routing protocols (especially IBGP) are still converging.

Setting the overload bit is useful when performing hardware or software maintenance work on a routing device. After the maintenance work, clear the overload bit to carry on forwarding transit traffic. Manual clearing of the overload bit is not always possible. What is needed is an automated way of clearing the overload bit after some amount of time. Most networks use a time value of 300 seconds. This 5-minute value provides a good balance, allowing time to bring up even large internal IBGP meshes, while still relatively quick.

Another appropriate application for setting for the overload bit is on dedicated devices such as BGP route reflectors, which are intentionally not meant to carry any transit traffic. In this case, you would not use the timer.

You can verify that the overload bit is set by running the `show isis database` command.

Options

`advertise-high-metrics`—Advertise maximum link metrics in NLRIs instead of setting the overload bit.

The `advertise-high-metric` setting is only valid while the routing device is in overload mode. When `advertise-high-metric` is configured, IS-IS does not set the overload bit. Rather, it sets the metric to 63 or 16,777,214, depending whether wide metrics are enabled. This allows the overloaded routing device to be used for transit as a last resort.

An L1-L2 router in overload mode stops leaking route information between L1 and L2 levels and clears its attached bit. This is also true when `advertise-high-metrics` is configured.

`allow-route-leaking`—Enable leaking of route information into the network even if the overload bit is set.

> **NOTE**: The `allow-route-leaking` option does not work if the routing device is in dynamic overload mode. Dynamic overload can occur if the device has exceeded its resource limits, such as the prefix limit. You can use the `auto-recovery` command to automatically exit from the IS-IS dynamic overload state.

`external-prefixes`—Enable this option to stop receiving local traffic destined to external prefixes unless this is the only router in the network that hosts the prefix. External prefixes are prefixes that IS-IS receives from other protocols. The overloaded router advertises these external prefixes with a high metric to stop receiving traffic. After the configured `timeout` lapses regular metric is restored to resume traffic reception.

`internal-prefixes`—Enable this option to stop receiving local traffic destined to internal prefixes unless this is the only router in the network that hosts the prefix. Internal prefixes are local IS-IS prefixes that the overloaded router advertises with a high metric to stop receiving traffic. After the configured `timeout` lapses regular metric is restored to resume traffic reception.

`timeout` *seconds*—Number of seconds at which the overloading is reset.

- **Range:** 60 through 1800 seconds
- **Default:** 0 seconds

name],
[edit routing-instances routing-instance-name protocols ospf3 realm (ipv4-unicast | ipv4-
multicast | ipv6-multicast)]
```

Description

Configure the local routing device so that it appears to be overloaded. You might do this when you want the routing device to participate in OSPF routing, but do not want it to be used for transit traffic.

> **NOTE**: Traffic destined to directly attached interfaces continues to reach the routing device.

Options

`timeout` *seconds*—(Optional) Number of seconds at which the overloading is reset. If no timeout interval is specified, the routing device remains in overload state until the `overload` statement is deleted or a timeout is set.

- **Range:** 60 through 1800 seconds
- **Default:** 0 seconds

The timeout is configured with a prefix-limit. If the number of prefixes exceeds the configured limit, the overload state is reached. The routing device remains in the overload state even though the prefixes have been reduced under the limit. Therefore, you need to clear the overload state using the "clear (ospf | ospf3) overload" on page 3618 command.

> **NOTE**: Multitopology Routing does not support the `timeout` option.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for Multitopology Routing introduced in Junos OS Release 9.0.

Support for Multitopology Routing introduced in Junos OS Release 9.0 for EX Series switches.

Support for the `realm` statement introduced in Junos OS Release 9.2.

Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.

override (RADIUS Options)

IN THIS SECTION

- Syntax | 12554
- Hierarchy Level | 12554
- Description | 12554
- Options | 12554

Required Privilege Level | 12555
Release Information | 12555

Syntax

```
override {
    calling-station-id remote-circuit-id;
    nas-ip-address tunnel-client-gateway-address;
    nas-port tunnel-client-nas-port;
    nas-port-type tunnel-client-nas-port-type;
}
```

Hierarchy Level

```
[edit access profile profile-name radius options]
```

Description

Override the values for certain RADIUS options.

Options

calling-station-id remote-circuit-id

Override the Calling-Station-ID format for the string that the LAC sends to the LNS in the Calling Number AVP 22. AVP 22 is included in the incoming-call request (ICRQ) packet when the L2TP session is being established.

If you have configured the `calling-station-id-format` statement, the LAC sends AVP 22 in a different format that can include other information in addition to the ACI or ARI. In this case, the LNS sends the value of AVP 22 to the RADIUS server as the Calling-Station-ID attribute (31).

If you do not want the AVP 22 value to be used as the Calling-Station-ID attribute (31) for some subscribers, you can override that format in the access profile by including the `calling-station-id remote-circuit-id` override option. You must also configure the new

format to be used with the `remote-circuit-id-format` statement; you can specify: the ACI, ARI, or both the ACI and ARI received from the PADR packet.

nas-ip-address tunnel-client-gateway-address Check the SDB to determine whether the session's LAC endpoint IP address is available. If so, use that value in the RADIUS NAS-IP-Address attribute (4). The LNS subsequently sends the attribute to the RADIUS server in Access-Request and accounting messages. If the value is not present, the attribute is not sent.

nas-port tunnel-client-nas-port Check the SDB to determine whether the LAC NAS port information is conveyed to the LNS in the Cisco Systems NAS Port Info AVP (100). If so, use that value in the RADIUS NAS-Port attribute (5). The LNS subsequently sends the attribute to the RADIUS server in Access-Request and accounting messages. If the value is not present, the LNS sends its local IP address.

nas-port-type tunnel-client-nas-port-type Check the SDB to determine whether the LAC NAS port information is conveyed to the LNS in the Cisco Systems NAS Port Info AVP (100). If so, override the value of the RADIUS NAS-Port-Type attribute (61) at the LNS with that value. Otherwise, use the original NAS-Port-Type in attribute 61.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3R1.

`nas-ip-address tunnel-client-gateway-address` and `nas-port tunnel-client-nas-port` options added in Junos OS Release 17.3R1 on MX Series.

`calling-station-id remote-circuit-id` option added in Junos OS Release 13.3R1 on MX Series.

- Description | 12558
- Required Privilege Level | 12558

Syntax

```
override-chap-password password;
```

Hierarchy Level

```
[edit access domain map domain-map-name]
```

Release Information

Statement introduced in Junos OS Release 21.3R1.

Description

Configure a CHAP password to override the existing password for authenticating any subscriber associated with the domain map. The override CHAP password replaces the CHAP challenge response that the PPP client sends to the server for authentication.

The CHAP challenge response is normally sent in the RADIUS Access-Request message as the CHAP-Password attribute (attribute 3). When you configure an override CHAP password, it is sent in the Access-Request as the User-Password attribute (attribute 2), and the CHAP-Password attribute is not included in the message.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement in the configuration.

Syntax

```
override-firewall;
```

Hierarchy Level

```
[edit class-of-service host-outbound-traffic],
[edit dynamic-profiles name class-of-service host-outbound-traffic]
```

Description

Junos OS release 16.1 and earlier support `forwarding-class` and `dscp-code-point` firewall filters. These settings would take precedence over the same configuration if set at the `class-of-service host-outbound-traffic` level of the hierarchy, as applied to Routing Engine output traffic.

Starting with Junos OS release 16.1, you can set `override-firewall` to have `forwarding-class` and `dscp-code-point` firewall filters set at the `class-of-service host-outbound-traffic` level of the hierarchy take precedence.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

```

```
services dhcp-local-server ...],
[edit logical-systems logical-system-name system services dhcp-local-server ...],
[edit routing-instances routing-instance-name system services dhcp-local-server ...]
```

Description

Override the default configuration settings for the extended DHCP local server. Specifying the `overrides` statement with no subordinate statements removes all DHCP local server overrides at that hierarchy level.

- To override global DHCP local server configuration options, include the `overrides` statement and its subordinate statements at the `[edit system services dhcp-local-server]` hierarchy level.
- To override configuration options for a named group of interfaces, include the statements at the `[edit system services dhcp-local-server group group-name]` hierarchy level.
- To override configuration options for a specific interface within a named group of interfaces, include the statements at the `[edit system services dhcp-local-server group group-name interface interface-name]` hierarchy level.
- Use the `[edit system services dhcp-local-server dhcpv6]` hierarchy level to override DHCPv6 configuration options.

> **NOTE**: By default, `jdhcp` does not process DHCPINFORM message. Only after you enable the overrides command using the `set system services dhcp-local-server overrides process-inform` statement, `jdhcp` starts processing the DHCPINFORM message.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

The `interface-client-limit` statement is not supported in the `[edit system services dhcp-local-server dhcpv6]` hierarchy level.

The `asymmetric-prefix-lease-time`, `delegated-pool`, `multi-address-embedded-option-response`, and `rapid-commit` statements are supported in the `[edit system services dhcp-local-server dhcpv6 ...]` hierarchy level only.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Support for the `allow-no-end` option introduced in Junos OS Release 14.1X53-D15 for EX Series switches.

```

Description

Override the default configuration settings for the extended DHCP relay agent. Specifying the `overrides` statement with no subordinate statements removes all DHCP relay agent overrides at that hierarchy level. Use the statement at the `[edit ... dhcpv6]` hierarchy levels to configure DHCPv6 support.

M120 and M320 routers do not support DHCPv6.

The following statements are supported at both the `[edit ... dhcp-relay]` and `[edit ... dhcpv6]` hierarchy levels.

- `allow-snooped-clients`
- `asymmetric-lease-time`
- `delete-binding-on-renegotiation`
- `dual-stack`
- `interface-client-limit`
- `no-allow-snooped-clients`
- `no-bind-on-request`
- `relay-source`
- `send-release-on-delete`

The following statements are supported at the `[edit ... dhcpv6]` hierarchy levels only.

- `asymmetric-prefix-lease-time`

All other statements are supported at the `[edit ... dhcp-relay]` hierarchy levels only.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

Support at the `[edit ... dhcpv6]` hierarchy levels introduced in Junos OS Release 11.4.

Force the output of the `show arp` command to display the IP address by the hostname of each device.

ra-initial-interval-max ***seconds***

Specify the high end of the range from which the router randomly selects an interval for sending the first three unsolicited IPv6 router advertisement messages. You must also configure the `ra-initial-interval-min` option.

- **Range:** 1 through 16

ra-initial-interval-min ***seconds***

Specify the low end of the range from which the router randomly selects an interval for sending the first three unsolicited IPv6 router advertisement messages. You must also configure the `ra-initial-interval-max` option.

> **BEST PRACTICE**: Always configure the value of `ra-initial-interval-min` to be less than or equal to the value of `ra-initial-interval-max`. If you configure the values to be the same, the initial router advertisement intervals are constant and not randomized.

- **Range:** 1 through 16

ipoe-dynamic-arp-enable Enable dynamic ARP to resolve the MAC address for IPv4 framed host (32-bit) routes. By default the framed route is permanently associated with the source MAC address received in the packet that triggered creation of the dynamic VLAN.

receive-gratuitous-arp Enable the router to compare the source MAC address received in a gratuitous ARP request or reply packet with the value in the ARP cache. The router updates the cache with the received MAC address when it determines this address is different from the cache entry.

This situation occurs when an IPv4 address is moved to a different device. The device broadcasts a gratuitous ARP reply packet with its MAC address as the source MAC address. When the `receive-gratuitous-arp` option is configured, the router compares the MAC addresses and updates the cache to associate the IPv4 address with the new MAC address.

If the `receive-gratuitous-arp` option is not configured, the router does not accept the gratuitous ARP request or reply packet and cannot quickly learn about the new address. Instead, the original dynamic ARP entry in the cache eventually times out. Before deleting the entry, the router sends an ARP request for the target IP address. The client responds with the new MAC address. This delay in learning about the new address means there is a period during which the MAC address in the ARP cache does not match the address in the new device's NIC.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1R3.

`ra-initial-interval-max` and `ra-initial-interval-min` options added in Junos OS Release 18.2R1.

`ipoe-dynamic-arp-enable` and `receive-gratuitous-arp` options added in Junos OS Release 18.4R1.

`force-show-arp-resolve` option added in Junos OS Release 23.1R1.

Hierarchy Level

```
[edit system services dhcp-local-server dhcpv6]
[edit system services dhcp-local-server dhcpv6 group group-name]
[edit system services dhcp-local-server dhcpv6 group group-name interface interface-name]
```

Description

Override the default configuration settings for the extended DHCP local server. Specifying the `overrides` statement with no subordinate statements removes all DHCP local server overrides at that hierarchy level.

- To override global DHCP local server configuration options, include the `overrides` statement and its subordinate statements at the `[edit system services dhcp-local-server]` hierarchy level.

- To override configuration options for a named group of interfaces, include the statements at the `[edit system services dhcp-local-server dhcpv6 group group-name]` hierarchy level.
- To override configuration options for a specific interface within a named group of interfaces, include the statements at the `[edit system services dhcp-local-server dhcpv6 group group-name interface interface-name]` hierarchy level.
- Use the DHCPv6 hierarchy levels to override DHCPv6 configuration options.

Options

`interface-client-limit number`—Sets the maximum number of DHCP clients per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group.

- **Range:** 1 through 500,000
- **Default:** No limit

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

oversize-message-drop

IN THIS SECTION

Syntax | 12579

- Hierarchy Level | 12579
- Description | 12579
- Options | 12579
- Required Privilege Level | 12580
- Release Information | 12580

Syntax

```
oversize-message-drop;
```

Hierarchy Level

```
[edit logical-systems name security alg dns],
[edit logical-systems name tenants name security alg dns],
[edit security alg dns],
[edit services alg dns],
[edit tenants name security alg dns]
```

Description

Enable or disable oversize message drop.

When you enable the `oversize-message-drop` command, Domain Name System (DNS) packets that exceed the threshold (range from 512 through 8192) are dropped.

When you disable the `oversize-message-drop` command, DNS Application Layer Gateway (ALG) will only record and forward the oversized DNS packets.

Options

`oversize-message-drop`—Drop the oversized DNS packets for which the packet length exceed the threshold value (range from 512 through 8192).

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

- Default | **12585**
- Required Privilege Level | **12585**
- Release Information | **12585**

Syntax

```
ovsdb {
    controller  ip-address {
        inactivity-probe-duration milliseconds;
        maximum-backoff-duration milliseconds;
        protocol  protocol {
            port number;
        }
    }
```

```
    interfaces interface-name;
    traceoptions {
        file <filename> <files number> <match regular-expression> <no-world-readable | world-
readable> <size size>;
        flag flag;
        no-remote-trace;
    }
}
```

Hierarchy Level

```
[edit protocols]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure support for the *Open vSwitch Database (OVSDB)* management protocol on a Juniper Networks device.

The remaining statements are explained separately. See CLI Explorer.

Default

The OVSDB management protocol is disabled on Juniper Networks devices.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1R2.

[edit bridge-domains bridge-domain-name vxlan],
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name vxlan],
[edit routing-instances routing-instance-name switch-options],
[edit routing-instances routing-instance-name vlans vlan-name vxlan],
[edit routing-instances routing-instance-name vxlan],
[edit switch-options],
[edit vlans vlan-name vxlan]
```

Description

Disable a Juniper Networks device from learning about other Juniper Networks devices that function as hardware *virtual tunnel endpoints (VTEPs)* in a specified Virtual Extensible LAN (VXLAN) and the media access control (MAC) addresses learned by the hardware VTEPs. Instead, the Juniper Networks device

uses the *Open vSwitch Database (OVSDB)* management protocol to learn about the hardware VTEPs in the VXLAN and the MAC addresses learned by the hardware VTEPs.

The specified VXLAN must have a VXLAN network identifier (VNI) configured, using the `vni` statement in the `[edit bridge-domains bridge-domain-name vxlan]`, `[edit routing-instance routing-instance-name vxlan]`, or `[edit vlans vlan-name vxlan]` hierarchy.

Also, for OVSDB-managed VXLANs, the multicast scheme described in *Understanding How Layer 2 BUM and Layer 3 Routed Multicast Traffic Are Handled with OVSDB* is used. Therefore, specifying the `multicast-group` statement in the `[edit bridge-domains bridge-domain-name vxlan]`, `[edit routing-instances routing-instance-name vxlan]`, or `[edit vlans vlan-name vxlan]` hierarchy has no effect.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

Description

Enable point-to-multipoint MPLS LSPs in an LDP-signaled LSP.

Options

no-rsvp-tunneling (Optional) Disable LDP point-to-multipoint LSPs from using RSVP-TE LSPs for tunneling, and use LDP paths instead.

> **NOTE**: The `no-rsvp-tunneling` option is introduced in Junos OS Release 16.1R5, 17.3R1, 17.2R2, 16.2R3, and later releases.

Starting in Junos OS Release 12.3R1, Junos OS provides support for Multipoint LDP (M-LDP) for Targeted LDP (T-LDP) sessions with unicast replication, in addition to link sessions. As a result, the default behavior of M-LDP over RSVP tunneling is similar to unicast LDP. However, because T-LDP is chosen over LDP and link sessions to signal point-to-multipoint LSPs, the `no-rsvp-tunelling` option enables LDP natively throughout the network.

recursive (Optional) Configure point-to-multipoint recursive parameters, including `route`.

route
(Optional) Allow recursive route resolution to signal point-to-multipoint Forwarding Equivalence Class (FEC).

fec
(Optional) Allow recursive opaque value to signal P2MP FEC.

root-address (Optional) Specify the root address of the point-to-multipoint LSP.

root-address

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

`no-rsvp-tunneling` option added in Junos OS Release 16.1R5.

`fec` option added in Junos OS and Junos OS Evolved Release 23.4R1.

Point-to-Multipoint LSPs Overview

p2mp (Protocols MPLS)

IN THIS SECTION

- Syntax | 12620
- Hierarchy Level | 12620
- Description | 12620
- Options | 12620
- Required Privilege Level | 12620
- Release Information | 12620

Syntax

```
p2mp p2mp-lsp-name;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name]
```

Description

Specify an LSP as either a point-to-multipoint LSP or as a branch LSP of a point-to-multipoint LSP by specifying the point-to-multipoint LSP path name.

Options

p2mp-lsp-name—Name of the point-to-multipoint LSP path that identifies the sequence of nodes that form the point-to-multipoint LSP. The name can contain up to 32 characters and can include letters, digits, periods, and hyphens. To include other characters or use a longer name, enclose the name in quotation marks. The name must be unique within the ingress router.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring the Primary Point-to-Multipoint LSP

p2mp-ldp-next-hop

IN THIS SECTION

- Syntax | 12621
- Hierarchy Level | 12621
- Description | 12621
- Options | 12622
- Required Privilege Level | 12622
- Release Information | 12622

Syntax

```
p2mp-ldp-next-hop {
root-address root-address{
    lsp-id id;
        }
    }
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options
static route destination-prefix],
[edit logical-systems logical-system-name routing-options static route destination-prefix],
[edit routing-instances routing-instance-name routing-options static route destination-prefix],
[edit routing-options static route destination-prefix]
```

Description

Specify a point-to-multipoint LDP label-switched path (LSP) as the next hop for a static route, and configure a root and provide an lsp-id on that LDP-signalled label-switched path.

Options

root-address ***root address***	Specify the root address of the point-to-multipoint LSP.
lsp-id ***id***	Specify the generic LSP identifier. The range is 1 through 65535.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

p2mp-lsp-next-hop

IN THIS SECTION

- Syntax | 12622
- Hierarchy Level | 12623
- Description | 12623
- Required Privilege Level | 12623
- Release Information | 12623

Syntax

```
p2mp-lsp-next-hop {
    metric metric;
    preference preference;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options

    receive-p2mp-lsp receiving-point-to-multipoint-lsp;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols connections],
[edit protocols connections]
```

Description

Configure the CCC switch for a point-to-multipoint LSP on the egress PE router.

Options

point-to-multipoint-switch-name—Point-to-multipoint CCC receive switch name.

`output-interface` *interface-name.unit-number*—Name of the egress interfaces for the point-to-multipoint LSP traffic. You can configure multiple output interfaces.

`receive-p2mp-lsp` *`receiving-point-to-multipoint-lsp`*—Name of the point-to-multipoint LSP that is switched to the output interface.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

p2mp-transmit-switch

IN THIS SECTION

- Syntax | 12625
- Hierarchy Level | 12626
- Description | 12626
- Options | 12626
- Required Privilege Level | 12626
- Release Information | 12626

Syntax

```
p2mp-transmit-switch point-to-multipoint-transmit-switch-name {
    input-interface interface-name.unit-number;
```

```
    transmit-p2mp-lsp transmitting-point-to-multipoint-lsp;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols connections],
[edit protocols connections]
```

Description

Configure the CCC switch for the point-to-multipoint LSP on the ingress PE router.

Options

point-to-multipoint-transmit-switch-name—Point-to-multipoint CCC transmit switch name.

`input-interface` *input-interface-name.unit-number*—Specify the name of the interface carrying incoming traffic to be switched to the point-to-multipoint LSP.

`transmit-p2mp-lsp` *transmitting-point-to-multipoint-lsp*—Specify the name of the point-to-multipoint LSP carrying traffic to the CCC switch on the egress PE router.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit vlans vlan-name switch-options mac-table-size limit][edit vlans vlan-name switch-options
interface-mac-limit limit],
[edit vlans vlan-name switch-options interface interface-name interface-mac-limit limit]
```

Description

Specify the action taken when packets with new source MAC addresses are received after the MAC address limit is reached. If this statement is not configured, packets with new source MAC addresses are forwarded by default.

NOTE: The `packet-action` statement is not supported on the QFX10002-60C switch.

NOTE: In ACX710 and ACX5448 Series devices, the VPLS mac-table-size and interface-mac-limit packet-action drop is not supported.

Default

> **NOTE**: On a QFX Series Virtual Chassis, if you include the `shutdown` option at the `[edit vlans vlan-name switch-options interface interface-name interface-mac-limit packet-action]` hierarchy level and issue the `commit` operation, the system generates a commit error. The system does not generate an error if you include the `shutdown` option at the `[edit switch-options interface interface-name interface-mac-limit packet-action]` hierarchy level.

Disabled. The default is for packets for new source MAC addresses to be forwarded after the MAC address limit is reached.

Options

drop (EX Series switches, QFX Series switches, and PTX Series routers in which Junos OS Evolved is installed) Drop packets with new source MAC addresses, and do not learn the new source MAC addresses.

> **NOTE**: On QFX10000 switches, if you include the drop option, you cannot configure unicast reverse-path forwarding (URFP) on integrated routing and bridging (IRB) and MAC limiting on the same interface. If you have an MC-LAG configuration, you cannot configure MAC limiting on the interchassis link (ICL) interface.

drop-and-log (EX Series switches, QFX Series switches, and PTX Series routers in which Junos OS Evolved is installed) Drop packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.

log (EX Series switches and QFX Series switches) Hold packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.

(PTX Series routers in which Junos OS Evolved is installed) Forward packets with the new source MAC addresses, and generate an alarm, an SNMP trap, and a system log entry when the MAC limit exceeds the configured value.

none (EX Series switches, QFX Series switches, and PTX Series routers in which Junos OS Evolved is installed) Forward packets with new source MAC addresses.

shutdown (EX Series switches, QFX Series switches, and PTX Series routers in which Junos OS Evolved is installed) Disable the specified interface, and generate an alarm, an SNMP trap, or a system log entry.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Support for the `switch-options` statement added in Junos OS Release 9.2.

Support for top-level configuration for the `virtual-switch` type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.

Support for logical systems added in Junos OS Release 9.6.

[edit switch-options interface *interface-name* interface-mac-limit *limit*], [edit switch-options interface-mac-limit *limit*], [edit switch-options mac-table-size *limit*], [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit *limit*], [edit vlans *vlan-name* switch-options interface-mac-limit *limit*], and [edit vlans *vlan-name* switch-options mac-table-size *limit*] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.

Support for EVPNs introduced in Junos OS Release 13.2 on MX Series 5G Universal Routing Platforms.

Support at the `[edit switch-options interface interface-name interface-mac-limit limit]` hierarchy level and hierarchy levels under `[edit vlans vlan-name]` introduced in Junos OS Release 13.2X50-D10 for EX Series switches and Junos OS Release 13.2 for the QFX Series.

Support for the `none` option introduced in Junos OS Evolved Release 20.4R1 for PTX Series routers.

Support for the `drop`, `drop-and-log`, `log`, and `shutdown` options introduced in Junos OS Evolved Release 22.4R1 for PTX Series routers.

packet-burst (Hierarchical Policer)

IN THIS SECTION

- Syntax | 12632
- Hierarchy Level | 12632
- Description | 12633
- Options | 12633
- Required Privilege Level | 12633
- Release Information | 12633

Syntax

```
packet-burst packets;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall hierarchical-policer hierarchical-policer-name aggregate
if-exceeding-pps],
[edit dynamic-profiles profile-name firewall hierarchical-policer hierarchical-policer-name premium
if-exceeding-pps],
[edit No Link Title hierarchical-policer hierarchical-policer-name aggregate if-exceeding-pps],
[edit No Link Title hierarchical-policer hierarchical-policer-name premium if-exceeding-pps]
```

Description

On MPCs hosted on MX Series routers, configure the packet burst limit for premium or aggregate traffic in a hierarchical policer. When used in combination with the if-exceeding-ppsand "pps-limit" on page 13506 statements, you can control the number of packets that will be allowed over a configured packets-per-second limit when traffic is in burst state.

Options

packets—Packet burst limit in packets. You can specify the number of packets either as a decimal number or as a decimal number followed by the abbreviation `k` (1000), or `m` (1000000).

- **Range:** 1 through 24414062

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

- Description | 12634
- Options | 12635
- Required Privilege Level | 12635
- Release Information | 12635

Syntax

```
packet-burst packets;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall policer policer-name if-exceeding-pps],
[edit firewall policer policer-name if-exceeding-pps],
[edit logical-systems logical-system-name firewall policer policer-name if-exceeding-pps]
```

Description

For a single-rate two-color policer, configure the `packet-burst` as a number of packets. Single-rate two-color policing uses the single token bucket algorithm to measure traffic-flow conformance to a two-color policer rate limit.

Traffic at the interface that conforms to the pps-limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with `low` packet loss priority (PLP) and then passed through the interface.

Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow

might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

NOTE: This statement specifies the packet burst limit as an absolute number of packets.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allows bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

Options

packets—Specify the number of packets either as a decimal number or as a decimal number followed by the abbreviation `k` (1000), or `m` (1000000).

- **Range:** 1 through 24414062
- **Default:** None

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

```

Hierarchy Level

```
[edit forwarding-options]
```

Description

Configure `packet-capture` that enables capturing real-time network data packets on the device for analysis and troubleshooting.

Options

disable

Disable packet-capture.

file

Parameters for file that contains captured packets

- `filename`—Name of the target file.
- `files`—Maximum number of files to capture.
  - **Range:** 2 through 10000.
- `no-world-readable`—Prevents any user to read the packet-capture files.
- `size`—Maximum file size.
  - **Range:** 1024 through 104857600
- `world-readable`—Any users can read the packet-capture files.

max-packets-per-second

Threshold of packet capture per second before dropping.

- **Range:** 1 through 160000
- **Default:** 65535

maximum-capture-size

Maximum packet size to be captured (bytes).

- **Range:** 68 through 10000

rate

Ratio of packets to be captured (1 out of N).

- **Range:** 1 through 16000000
- **Default:** 1

run-length Number of packet capture after initial trigger.

- **Range:** 0 through 20
- **Default:** 0

traceoptions Packet-capture trace options.

- Hierarchy Level | 12639
- Description | 12639
- Options | 12639
- Required Privilege Level | 12641
- Release Information | 12641

Syntax

```
packet-capture {
    aggressive-mode;
```

```
    buffer-packets-limit bytes;
    capture-interval capture-interval;
    capture-limit capture-limit;
    global;
    max-bytes bytes;
    max-files max-files;
    max-packets max-packets;
    no-inconclusive;
    storage-limit bytes;
}
```

Hierarchy Level

```
[edit services application-identification]
```

Description

Specify packet capture options to capture unknown application traffic.

You can use the packet capture of unknown applications functionality to gather more details about an unknown application on your security device. Once you've configured packet capture options on your security device, the unknown application traffic is gathered and stored on the device in a packet capture file (**.pcap**) at **/var/log/pcap/** location.

Options

aggressive-mode

Capture all traffic before AppID classifies the applications. In this mode, the system captures all application traffic irrespective of the application system cache (ASC) entry. Packet capture starts for the first packet of the first session.

buffer-packets-limit

Maximum memory to buffer packets (bytes). Use this option to limit the memory available in the Packet Forwarding Engine for packet capture functionality.

- **Default:** 1% of available data in shared memory
- **Range:** 40 bytes to 5% of available data in shared memory
- **Default:** 1 MB (for cSRX)
- **Range:** 40 bytes through 5 MB

capture-interval

Timeout value in minutes to avoid repetitive capture of the same traffic. After this interval, the system continues to capture newer packet details for unknown applications until the capture limit is reached.

- **Default:** 1440 minutes (24 hours).
- **Range:** 1 through 525,600 seconds

capture-limit

Number of repetitive captures of the same traffic. Use this option to limit the number of times the same traffic can be repeatedly captured before the cache entry times out.

- **Default:** 5
- **Range:** 1 through 1000

global

Enable packet capture globally to capture all unknown application traffic. Another option is to enable capturing of unknown application traffic specific to a security policy.

max-bytes

Maximum number of TCP bytes per session (bytes). For TCP sessions, the count includes the actual payload data length and excludes IP/TCP headers for the maximum bytes limit.

If you are setting the packet capture at the security policy level, the packet capture concludes only after the final policy is applied even if the configured limit is reached.

Limitation—Jumbo frames can have up to 1500 bytes of the payload saved in the capture file.

- **Default:** 6000 bytes
- **Range:** 40 through 1,073,741,824

max-files

Maximum number of unique packet capture files to create before the oldest file is overwritten by a new file created.

- **Default:** 100

  (Previously 25)
- **Range:** 1 through 2500

max-packets

Maximum number of UDP packets per session.

- **Default:** 10 packets
- **Range:** 1 through 1000

no-inconclusive

Disable packet capturing of inconclusive traffic. This option disables the packet capture for the following sessions:

- Sessions that are closed before the application identification or classification completes.
- Sessions that are not getting classified even whn they reach the maximum packet capture limit.

If you do not configure this option, by default, the system captures packets for inconclusive sessions.

storage-limit

Maximum disk space (bytes) that can be used in the Routing Engine for packet capture files.

- **Default:** 50 MB
- **Range:** 1,048,576 through 4,294,967,295 bytes

packet-filter

IN THIS SECTION

Syntax | 12642
Hierarchy Level | 12642

- Description | 12642
- Options | 12643
- Required Privilege Level | 12643
- Release Information | 12643

Syntax

```
packet-filter packet-filter-name {
    action-profile profile-name {
    destination-port (Security Forwarding Options) (port-range | protocol-name);
    destination-prefix destination-prefix;
    interface logical-interface-name;
    protocol (Security Forwarding Options) (protocol-number | protocol-name;
    source-port (Security Forwarding Options) (port-range | protocol- name);
    source-prefix source-prefix;
    }
```

Hierarchy Level

```
[edit security datapath-debug]
```

Description

Set packet filter for taking the datapath-debug action. A filter is defined to filter traffic, then an action profile is applied to the filtered traffic. Be sure to configure multiple packet filters to capture the traffic. One packet filter only captures the traffic as specified in it, such as from one source to one destination. The same packet filter will not capture the traffic in the reverse direction. You need to configure another packet filter to capture the traffic in reverse direction and specify the source and destination according to the response packet in it. The action profile specifies a variety of actions on the processing unit. A maximum of four filters are supported at the same time. Packet filters can be configured with source and destination prefix and port (including ranges), and protocol.

Action-profile settings have no specific minimum setting, it is based on trace, count, packet summary and packet-dump. Enabling end-to-end debugging without or with a very broad filter is not recommended. This could result in a high PFE CPU usage. Therefore when selecting what to capture

through a filter care must be taken. List as many and specific criteria which then results in the minimum amount of traffic to be captured.

> **NOTE**: Packet filter is supported on SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800 devices.

Options

- `action-profile` *`profile-name`*—Identify the action profile to use. You can specify the name of the action profile to use. Using the request security action-profile command, you can set the action for the packet match for a specified filter. Action-profile must be defined.
- `destination-port` (*`port-range`* | *`protocol name`*)—Specify a destination port to match TCP/UDP destination port.
- `destination-prefix` *`destination-prefix`*—Specify a destination IPv4/IPv6 address prefix.
- `interface` *`logical-interface-name`*—Specify a logical interface name.
- `protocol` (*`protocol-number`* | *`protocol-name`*—Match IP protocol type.
- `source-port` (*`port-range`* | *`protocol-name`*—Match TCP/UDP source port.
- `source-prefix` *`source-prefix`*—Specify a source IP address prefix.

Required Privilege Level

security—To view this in the configuration

security-control—To add this to the configuration.

Release Information

Command introduced in Junos OS Release 9.6 ; Support for IPv6 addresses for the `destination-prefix` and `source-prefix` options added in Junos OS Release 10.4.

Syntax

```
packet-format-match {
    (mpls-packet-format-1 | mpls-packet-format-2 | mpls-packet-format-3 | mpls-packet-format-4 |
mpls-packet-format-5 | mpls-packet-format-6 | mpls-packet-format-7 | mpls-packet-format-8);
}
```

Hierarchy Level

```
[edit system packet-forwarding-options]
```

Description

Types of packet formats for MPLS labeled traffic.

NOTE: You must restart the PFE every time you configure this command. A PFE reboot forces disruptions to the data plane, a hit that can last several minutes while the component reboots, and is then repopulated with the current routing state.

Default

The default packet format is `mpls-packet-format-1`.

Options

You can specify a value from `1` through `8`.

mpls-packet-format-1	Untagged packet with one or two labels.
mpls-packet-format-2	Untagged packet with one label.
mpls-packet-format-3	Untagged packet with two labels.
mpls-packet-format-4	Single tagged packet with one or two labels.
mpls-packet-format-5	Single tagged packet with one label.
mpls-packet-format-6	Single tagged packet with two labels
mpls-packet-format-7	Untagged and single tagged packets with one label.
mpls-packet-format-8	Untagged and single tagged packets with two labels.

Description

Configure packet forwarding options. The packet forwarding option specifies that data is forwarded to the specified forwarding destination.

Options

bpdu-trap-to-cpu Stop sending Bridge Protocol Data Units (BPDU) packets to the CPU for processing.

- `apply-groups` — Groups from which configuration data is inherited.
- `apply-groups-except` — Groups from inherited configuration data is excluded.
- `deactivate` — Disable CPU trap for all BPDU packets and restart the PFE.

eracl-ip6-match IPv6 match for ERACL, source or destination. The default is destination only.

- `srcip6-and-destip6`—Match on both the source and destination.
- `srcip6-only`—Match on source only.

firewall-profile Set the firewall profile.

- `default-profile`—Set the profile to support default services.
- `evpn-mh-profile`—Set the profile to support EVPN-MH.
- `mef-profile`—Set the profile to support MEF services.
- `profile-one`—Selects profile one feature set.
- `profile-two`—Selects profile two feature set.

forwarding-profile (default-profile | host-acl-profile | host-profile | lpm-profile)

Configure the profile for the unified forwarding table.

- `default-profile`—MAC: 32K, L3-host: 32K, LPM: 720K, FP-Compression: 18K. Restarts PFE.
- `host-acl-profile`—MAC: 160K, L3-host: 160K, LPM: 65K, FP-Compression: 18K. Restarts PFE.
- `host-profile`—MAC: 160K, L3-host: 160K, LPM: 72K, FP-Compression: 0. Restarts PFE.
- `lpm-profile`—MAC: 32K, L3-host: 32K, LPM: 1.24M, ARP: 61K, FP-Compression: 0, Tunnels: 0. Restarts PFE.

hw-db-profile

Set the hardware database profile.

- `(balanced | balanced-exem | l2-xl | l3-xl)`—Select the profile type. Restarts PFE.
- (Mandatory) `lpm-distribution (1 | 2 | 200 | 3 | 4)`—Specify route distribution between public and private (VRF/VPN) routes in longest prefix match (LPM). Default is 1.
  - `1`—Set the LPM distribution to 1
  - `2`—Set the LPM distribution to 2. Not valid for the `balanced` profile.
  - `200`—Set the LPM distribution to 200. Valid only for the `balanced` profile.
  - `3`—Set the LPM distribution to 3. Not valid for the `balanced` profile.
  - `4`—Set the LPM distribution to 4. Valid only for the `l2-xl` profile.

internal-forwarding-bandwidth

Set the internal forwarding bandwidth.

ipfix-sw-mode

(QFX5120 only) Enable software-based IPFIX processing, used to enable flow-based telemetry for VXLANs. Must reboot for this option to take effect.

l2-profile Set the L2 profile.

- `fast-flush-profile`—Set the profile to support fast flush.

lag-profile Set link aggregation group (LAG) configuration mode.

- `default-profile`—Allow to create 256 LAGs and maximum 64 members per LAG.
- `lag-mode-high`—Allow to create 1024 LAGs and maximum 16 members per LAG.
- `lag-mode-medium`—Allow to create 512 LAGs and maximum 32 members per LAG.

mcast-repl-type Set multicast replication type. Restarts PFE.

mef-forwarding-profile Enable MEF Forwarding profile, restart PFE.

multicast-profile Set the multicast profile.

- `strict-ttl-check-profile`—Set the profile to support strict TTL check for multicast traffic.

multicast-statistics Enable multicast statistics support.

no-ip-tos-rewrite (ACX7100 only) Disable L3 code point rewrite at system level, restart PFE.

packet-format-match Packet format match conditions based on VLAN tags and MPLS labels. The default match is an untagged packet with one or two labels.

- `mpls-packet-format-2`—Untagged packet with one label.
- `mpls-packet-format-3`—Untagged packet with two labels.
- `mpls-packet-format-4`—Single tagged packet with one or two labels.
- `mpls-packet-format-5`—Single tagged packet with one label.
- `mpls-packet-format-6`—Single tagged packet with two labels.
- `mpls-packet-format-7`—Untagged or single tagged packet with one label.
- `mpls-packet-format-8`—Untagged or single tagged packet with two labels.

recycle-bandwidth-profiles Configure a profile that maps a feature to the recycle port bandwidth.

system-profile Specify the system-profile

- default-profile—Select the default system profile.
- vpls-meshgroups—Select the VPLS mesh group system profile.
- vxlan-extended—Select the vxlan-extended system profile.
- vxlan-stitching—Select the vxlan-stitching system profile.

> **NOTE**: You are required to configure `set system packet-forwarding-options system-profile vxlan-stitching` on ACX series routers to enable Layer 2 stitching. The PFE will restart once this configuration is applied.

packet-capture `packet-capture-enable`— Enable packet capture. By default, this option is set to "false".

warm-boot Enable warm boot support.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Platform-Specific `packet-forwarding-options` Behavior

Use Feature Explorer to confirm platform, and release support for specific features.

Use the following table to review platform-specific behaviors for your platform:

Table 108: Platform-Specific Behavior

Platform	Difference
QFX5130-32CD| QFX5130E-32CD| QFX5130-48C| QFX5130-48CM|QFX5700| QFX5700E	• The `packet-forwarding-options` *`bpdu-trap-to-cpu`* `deactivate` command is valid on Junos OS Evolved Releases 23.4X100D40, and 25.4R1 and later. • Starting with Junos OS Evolved Releases 23.4X100D40, and 25.4R1 and later, use the `packet-forwarding-options` *`bpdu-trap-to-cpu`* `deactivate` command to stop sending Bridge Protocol Data Units (BPDU) packets to the CPU for processing. This command forwards L2 control packets along with the `vlan-rewrite` feature using firewall filters.

Release Information

Statement introduced prior to Junos OS Release 21.1R1 and Junos OS Evolved Release 21.1R1.

`no-ip-tos-rewrite` option introduced in Junos OS Evolved Release 22.1R1.

`ipfix-sw-mode` option introduced in Junos OS Release 22.2R1.

`mef-forwarding-profile` option introduced in Junos OS Evolved Release 22.4R1.

`vpls-meshgroups` option introduced in Junos OS Evolved Release 24.2R1.

`packet-capture` option is introduced in JunoS OS Evolved Release 25.4R1.

`bpdu-trap-to-cpu` option is introduced in JunoS OS Evolved Release 25.4R1.

```

Description

Configure flow packet log.

Starting in Junos OS Release 17.3R1, SRX Series Firewalls support logging of unsynchronized out-of-state TCP packets that are dropped by the flow module.

The logging functionality will allow notifications to the administrators (or automated systems) about any of TCP out-of-state packets drops.

Options

enable	Enable log for dropped packets.
packet-filter	Configure packet log filter.
throttle-interval	Configure the interval as a power of two (0..32768 milliseconds).

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 17.3R1.

packet-log (Security IDP Policy)

IN THIS SECTION

- Syntax | 12654
- Hierarchy Level | 12654

    post-attack-timeout seconds;
    pre-attack number;
}
```

Hierarchy Level

```
[edit security idp idp-policy policy-name rulebase-ips rule rule-name then notification]
```

Description

In response to a rule match, capture the packets received before and after the attack for further offline analysis of attacker behavior. You can configure the number of pre-attack and post-attack packets to be captured for this attack, and limit the duration of post-attack packet capture by specifying a timeout value.

In case of multiple attacks that are hit for the same session, packets capture occurs for the first attack that was hit on that specific session ID.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

packet-log (Security IDP Sensor Configuration)

IN THIS SECTION

```

Hierarchy Level

```
[edit security idp sensor-configuration]
[edit tenants tenant name security idp sensor-configuration]
[edit logical-systems logical system name security idp sensor-configuration]
```

Description

Configure the sensor for packet capture. This configuration defines the amount of memory to be allocated for packet capture and the maximum number of sessions that can generate packet capture data for the device at one time. The configuration also identifies the source address and host address for transmission of the completed packet capture object.

Options

- `ssl-profile-name` *`profile-name`* —SSL initiation profile name to be used for encrypted packet log transmission.

  Starting in Junos OS Release 22.1R1, you can enable a secure SSL connection and send encrypted IDP packet capture log to the packet capture receiver. To establish the SSL connection, you must specify the SSL initiation profile that you want to use in the IDP packet log configuration.

  The SSL profile name must be configured in the SSL initiation profile configuration. SSL initiation profile configuration performs the required SSL certificates and SSL handshake operations to establish a secure connection. SSL versions are chosen based on the SSL initiation configuration. Also, SSL profile needs to be configured in each logical system separately.

If SSL profile name is not configured in SSL initiation profile configuration, then the following message is displayed **Referenced SSL initiation profile is not defined**.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

packet-loss-priority (RFC 2544 Benchmarking)

IN THIS SECTION

- Syntax | 12657
- Hierarchy Level | 12658
- Description | 12658
- Required Privilege Level | 12658
- Release Information | 12658

Syntax

```
packet-loss-priority;
```

Hierarchy Level

```
[edit services rpm rfc2544-benchmarkingtests test-name test-name]
```

Description

Specify the packet loss priority (PLP) value to be used for the test frames generated in the packet forwarding pipeline. If a value is not configured, then the default value of `low` is used.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X53.

packet-ordering-mode (Application Services)

IN THIS SECTION

- Syntax | **12659**
- Hierarchy Level | **12659**
- Description | **12659**
- Options | **12659**
- Required Privilege Level | **12659**

Release Information | 12660

Syntax

```
packet-ordering-mode {
    (hardware | software);
}
```

Hierarchy Level

```
[edit security forwarding-process application-services]
```

Description

Enables or disables the packet-ordering functionality using the Packet Ordering Engine. By default, packet-ordering functionality using the Packet Ordering Engine (hardware) is enabled.

A system reboot is required when this feature is enabled or disabled, and a warning message is displayed during the commit.

NOTE: Packet-ordering functionality using Packet Ordering Engine is supported on SRX5800 and SRX5600 devices with next-generation SPCs. Starting from Junos OS release 12.1X46-D10, SRX5400 device with next-generation SPCs also supports this feature.

Options

hardware Enables packet-ordering functionality using the Packet Ordering Engine.

software Disables packet-ordering functionality using the Packet Ordering Engine.

Required Privilege Level

- security—To view this in the configuration.

- security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10. This statement is supported.

packet-scheduling

IN THIS SECTION

- Syntax | 12660
- Hierarchy Level | 12660
- Description | 12661
- Default | 12661
- Options | 12661
- Required Privilege Level | 12661
- Release Information | 12661

Syntax

```
(packet-scheduling | no-packet-scheduling);
```

Hierarchy Level

```
[edit chassis]
```

Description

(M 160 routers only) Enable packet-scheduling mode, in which the Packet Director application-specific integrated circuit (ASIC) schedules packet dispatches to compensate for transport delay differences. This preserves the interpacket gaps as the packets are distributed from the Packet Director ASIC to the Packet Forwarding Engine.

Default

no-packet-scheduling

> **NOTE**: The packet-scheduling feature is available on M160 routers only.

Options

no-packet-scheduling—Do not schedule packets.

packet-scheduling—Schedule packets to preserve interpacket gaps.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

packet-size [bytes];
```

Hierarchy Level (Junos OS)

```
[edit services rpm rfc2544-benchmarking profiles test-profile profile-name]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rfc2544 test-profile profile-name]
```

Description

Define up to 10 packet sizes that are used sequentially for the test.

Options

bytes Size of the test packet. If you enter multiple packet sizes, you must separate each number with a space. You should base the test packet size on the configured MTU.

- **Range:** 64 through 9136 bytes
- **Minimum Packet Sizes (Junos OS Evolved):**
  - Untagged egress logical interface: 64 bytes
  - Single tagged interface: 66 bytes
  - Dual-tagged egress interface: 70 bytes

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X53.

Statement introduced in Junos OS Evolved 23.4R1.

packet-timestamp

IN THIS SECTION

- Syntax | 12664
- Hierarchy Level | 12664
- Description | 12664
- Options | 12664
- Required Privilege Level | 12665
- Release Information | 12665

Syntax

```
packet-timestamp {
    enable;
}
```

Hierarchy Level

```
[edit chassis fpc slot-number traffic-manager]
```

Description

On MX Series routers, enable timestamping of class-of-service (CoS) queues for a configured Flexible PIC Concentrator (FPC).

Options

enable Display the last time a packet was enqueued as day, date, time, and year in the format *day-of-the-week month day-date hh:mm:ss yyyy*, for example, `Mon Jul 7 07:36:46 2014`. The Packet Forwarding Engine collects the timestamp for all inbound and outbound queue counters for all subscribers that are configured on the FPC and, when requested, also returns statistics corresponding to data traffic on the router.

If the timestamp is not enabled for the CoS queue, the `Last-packet enqueued` field is not displayed in statistics.

> **NOTE**: When you commit the change after enabling or disabling the timestamp feature for a particular FPC *after* that is already up, the FPC is automatically restarted and the change takes effect when it is back up.

The Routing Engine generates a system log message in the following situations:

- When `packet-timestamp` is enabled and committed for an FPC slot, but the FPC inserted into that slot does not support timestamping.
- When `packet-timestamp` is enabled and committed for an FPC slot, but an FPC that does not support timestamping is later inserted into that slot.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

- Release Information | 12668

Syntax

```
packet-types [packet-types]
```

Hierarchy Level

```
[edit interfaces interface-name auto-configure vlan-ranges authentication],
[edit interfaces interface-name auto-configure stacked-vlan-ranges authentication]
```

Description

Specify one or more packet types to trigger authentication of an auto-configured dynamic VLAN. The packet types must be a subset of the packet types configured in the VLAN dynamic profile to trigger creation of the dynamic VLAN.

Options

packet-type—One or more of the following packet types that triggers VLAN authentication:

- `any`—Any packet type.
- `dhcp-v4`—IPv4 DHCP packet type.
- `dhcp-v6`—IPv6 DHCP packet type.

- `inet`—IPv4 Ethernet and ARP packet type.
- `inet6`—IPv6 Ethernet packet type.
- `pppoe`—Point-to-Point Protocol over Ethernet packet type.

> **NOTE**: The `pppoe` VLAN Ethernet packet type option is supported only for MIC and MPC interfaces.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

pair-policy

IN THIS SECTION

- Syntax | 12670
- Hierarchy Level | 12670
- Description | 12670
- Required Privilege Level | 12671
- Release Information | 12671

Syntax

```
pair-policy pair-policy ;
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
tunnel]
```

Description

Link the policy that you are configuring with another policy that references the same VPN tunnel so that both policies share one proxy ID and one security association (SA). Policy pairing is useful when you want to allow bidirectional traffic over a policy-based VPN that is using source or destination address translation with a dynamic IP address pool or destination address translation with a mapped IP (MIP) or dynamic IP (DIP) address pool.

Without policy pairing, the device derives a different proxy ID from the outbound and inbound policies. Two proxy IDs causes a problem for the remote peer with a single proxy ID for the VPN tunnel.

Pairing two policies solves the proxy ID problem for the remote peer and conserves SA resources. The single proxy ID is derived from the policy you configured last.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

```
[edit interfaces interface-name ppp-options],
[edit interfaces interface-name unit logical-unit-number ppp-options],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-
options]
```

Description

Configure the Password Authentication Protocol (PAP). Use PAP authentication as a means to provide a simple method for the peer to establish its identity using a two-way handshake. This is done only upon initial link establishment.

After the link is established, an ID and password pair is repeatedly sent by the peer to the authenticator until authentication is acknowledged or the connection is terminated.

BEST PRACTICE: On inline service (si) interfaces for L2TP, only the `pap` statement itself is typically used for subscriber management. We recommend that you leave the subordinate statements at their default values.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

parse-direction (Access Profile)

IN THIS SECTION

- Syntax | 12678
- Hierarchy Level | 12678
- Description | 12679
- Default | 12679
- Options | 12679
- Required Privilege Level | 12679
- Release Information | 12679

Syntax

```
parse-direction (left-to-right | right-to-left);
```

Hierarchy Level

```
[edit access profile profile-name session-options strip-user-name]
```

Description

Specify the direction in which a subscriber login string is parsed to identify the first delimiter that matches one configured with the "delimiter" on page 5537 statement. When subscriber username stripping is configured in a subscriber access profile, the characters to the right of the identified delimiter are stripped and discarded along with the delimiter. characters become the new, modified username.

Default

`left-to-right`

Options

left-to-right Parse the subscriber login string from left to right up to the delimiter.

For example, when the direction is `left-to-right`, the characters `/@$%#` are configured as the delimiters, and the login string is `drgt21@example.com$84`, the `@` is reached before the `$`, so the username is modified to `drgt21`.

right-to-left Parse the subscriber login string from right to left up to the delimiter.

For example, when the direction is `right-to-left`, the characters `/@$%#` are configured as the delimiters, and the login string is `drgt21@example.com$84`, the `$` is reached before the `@`, so the username is modified to `drgt21@example.com`.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

- Description | 12680
- Default | 12680
- Options | 12681
- Required Privilege Level | 12681
- Release Information | 12681

Syntax

```
parse-direction (left-to-right | right-to-left);
```

Hierarchy Level

```
[edit access domain]
```

Description

Specify the direction in which the router searches for the domain name in a username.

Default

`left-to-right`

Options

`left-to-right`—The router searches starting at the left-most character. When the router reaches a domain delimiter, it uses anything to the right of the delimiter as the domain name.

`right-to-left`—The router searches starting at the right-most character. When the router reaches a domain delimiter, it uses anything to the right of the delimiter as the domain name.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

- Release Information | 12682

Syntax

```
parse-order (domain-first | realm-first);
```

Hierarchy Level

```
[edit access domain]
```

Description

Specify the order in which the router searches for a domain name, either the domain first, or the realm first.

Default

`domain-first`

Options

`domain-first`—The router searches for a domain name first. When the router reaches a domain delimiter, it uses anything to the right of the delimiter as the domain name.. If no domain is found, then the router searches for a realm. If the router does not find either a domain or realm, then there is no domain.

`realm-first`—The router searches for a realm name first. When the router reaches a realm delimiter, it uses anything to the left of the delimiter as the domain name. If no realm is found, then the router searches for a domain. If the router does not find either a domain or realm, then there is no domain.

Hierarchy Level

```
[edit access pcrf]
```

Description

Configure a Policy and Charging Rules Function (PCRF) partition (a specific logical system:routing instance context) and its parameters to define subscription ID information, destination host and realm names, and reporting for rules and resources. The PCRF is a centralized policy decision point that deploys business policy rules to allocate broadband network resources and manages flow-based charges for subscribers and services.

Options

partition-name Name of the PCRF partition. You can define only one partition for the PCRF.

use-session-stamp (Optional) Adds a 32-bit string to the end of the PCRF session ID for new subscribers. Existing subscribers are not affected when you configure this option. The string, called the session stamp or the session timestamp, consists of the UTC time when the router creates the CCR-GX-I. Appending the timestamp is considered to be an extended format for the session ID. You can use the extended-format session ID when you need an eternally unique ID or when you configure local reinitialization.

> **NOTE**: You must configure the `use-session-stamp` option when you configure local reinitialization with the `reinit-on-failure` or `reinit-on-rar` options with the "local-decision" on page 10355 statement.

> **NOTE**: This configuration also affects OCS sessions without any further configuration. The session ID for a given subscriber is the same for both Gx and Gy sessions.

Click a linked statement in the Syntax section for more information about that statement.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

`use-session-stamp` option added in Junos OS Release 20.1R1.

Syntax

```
partition name {
    destination-host destination-host;
    destination-realm destination-realm;
    diameter-instance diameter-instance;
    max-outstanding-requests max-outstanding-requests;
    response-timeout seconds;
}
```

Hierarchy Level

```
[edit access s6a]
```

Description

Define the s6a partition by specifying the destination host and realm where the application resides and specify the endpoint origin, the remote peers, and the network elements that associate routes with

peers to control diameter forwarding of S6a messages. Only the `master` routing instance is supported for the application partition.

Options

name Name of the S6a partition.

destination-host Name of the host where the S6A server application resides; generally, this value is not set unless needed.

destination-realm Name of the realm where the S6a server application resides.

diameter-instance Specifies that the master Diameter instance is used. `master` is the only supported value.

max-outstanding-requests Configure the maximum number of outstanding requests for the S6a application.

- **Default:** 40
- **Range:** 2 through 1024

response-timeout Configure the amount of time in seconds that the Mobility Management Entity (MME) waits to receive a response from the Home Subscriber Server (HSS).

- **Default:** 15
- **Range:** 1 through 30

```

Description

Configure pass-through , when a host or user from one zone needs to access a protected resource in another zone. A user must use an FTP, Telnet, or HTTP client to access the IP address of the protected resource and get authenticated by the firewall. The device uses FTP, Telnet, and HTTP to collect username and password information. Subsequent traffic from the user or host is allowed or denied based on the result of this authentication. After the user is authenticated, the firewall proxies the connection.

Options

default-profile Name of profile to use if not specified in policy

The remaining statements are explained separately. See CLI Explorer.

pass-through (Security Policy)

IN THIS SECTION

- Syntax | 12698
- Hierarchy Level | 12698
- Description | 12698
- Options | 12699
- Required Privilege Level | 12699
- Release Information | 12699

Syntax

```
pass-through {
    access-profile profile-name;
    client-match user-or-group-name;
    ssl-termination-profile profile-name;
    web-redirect;
    web-redirect-to-https;
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication]
```

Description

Configure pass-through firewall user authentication. The user needs to use an FTP, Telnet, or HTTP client to access the IP address of the protected resource in another zone. Subsequent traffic from the user or host is allowed or denied based on the result of this authentication. Once authenticated, the firewall proxies the connection.

Options

- `access-profile` *`profile-name`* —(Optional) Specify the name of the access profile.
- `client-match` *`user-or-group`* —(Optional) Specify the name of the users or user groups in a profile who are allowed access by this policy. If you do not specify any users or user groups, any user who is successfully authenticated is allowed access.
- `ssl-termination-profile` *`profile-name`* —(Optional) Specify the SSL termination profile used for SSL offloading.
- `web-redirect`—(Optional) Enable redirecting an HTTP request to the device and redirecting the client system to a webpage for authentication. Including this statement allows users an easier authentication process because they need to know only the name or IP address of the resource they are trying to access.
- `web-redirect-to-https`—(Optional) Redirect unauthenticated HTTP requests to the internal HTTPS Web server of the device.

> **NOTE**: If `web-redirect-to-https` is set, then you must specify the SSL termination profile used for SSL offloading.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5. Support for `ssl-termination-profile` and `web-redirect-to-https` options added in Junos OS Release 12.1X44-D10.

[edit protocols isis interface interface-name level level-number],
[edit routing-instances routing-instance-name protocols isis interface interface-name],
[edit routing-instances routing-instance-name protocols isis interface interface-name level level-number]
```

Description

Advertise the direct interface addresses on an interface or into a level on the interface without actually running IS-IS on that interface or level.

This statement effectively prevents IS-IS from running on the interface. To enable IS-IS on an interface, include the `interface` statement at the `[edit protocols isis]` or the `[edit routing-instances routing-instance-name protocols isis]` hierarchy level. To disable it, include the `disable` statement at those hierarchy levels. The three states—enabling, disabling, or not running IS-IS on an interface—are mutually exclusive.

> **NOTE**: Configuring IS-IS on a loopback interface automatically renders it as a passive interface, irrespective of whether the `passive` statement was used in the configuration of the interface.

If neither passive mode nor the `family iso` option is configured on the IS-IS interface, then the routing device treats the interface as not being operational, and no direct IPv4/IPv6 routes are exported into IS-IS. (You configure the `family iso` option at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level.)

Default

By default, IS-IS must be configured on an interface or a level for direct interface addresses to be advertised into that level.

Options

remote-node-id *address*	IP address of the remote link.
remote-node-iso *iso-id*	ISO ID of the remote node.

> **NOTE**: The options `remote-node-id address` and `remote-node-iso iso-id` do not apply under the `[edit routing-instances routing-instance-name protocols isis]` hierarchy level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`remote-node-id` *address* option introduced in Junos OS Release 14.2.

`remote-node-iso` *iso-id* option introduced in Junos OS Release 14.2.

interface-name],
[edit routing-instances routing-instance-name protocols ospf3 realm (ipv4-unicast | ipv4-
multicast | ipv6-multicast) area area-id interface interface-name]
```

Description

Advertise the direct interface addresses on an interface without actually running OSPF on that interface. A passive interface is one for which the address information is advertised as an internal route in OSPF, but on which the protocol does not run.

To configure an interface in OSPF passive traffic engineering mode, include the `traffic-engineering` statement. Configuring OSPF passive traffic engineering mode enables the dynamic discovery of OSPF AS boundary routers.

Enable OSPF on an interface by including the `interface` statement at the [`edit protocols (ospf | ospf3) area` *`area-id`*] or the [`edit routing-instances` *`routing-instance-name`* `protocols ospf area` *`area-id`*] hierarchy levels. Disable it by including the `disable` statement, To prevent OSPF from running on an interface, include the `passive` statement. These three states are mutually exclusive.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

- Release Information | 12719

Syntax

```
passive-mode;
```

Hierarchy Level

```
[edit logical-systems name protocols router-advertisement interface],
[edit protocols router-advertisement interface]
```

Description

Configure passive mode on an interface. When you configure this option on the interface, the interface only reieves and processes the RA packets and does not send the RAs (receive-only mode). The commit fails if the interface has both downstream and passive-mode option configured.

Configure RA receive only mode

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 22.1R1.

passive-mode-tunneling (Security IPsec)

IN THIS SECTION

- Syntax | 12719
- Hierarchy Level | 12719
- Description | 12719
- Options | 12720
- Required Privilege Level | 12720
- Platform-Specific Passive Mode Tunneling Behavior | 12720
- Release Information | 12722

Syntax

```
passive-mode-tunneling;
```

Hierarchy Level

```
[edit security ipsec vpn vpn-name]
```

Description

Allows tunneling of malformed packets. By default, the feature is disabled. When you enable this feature using the configuration statement `set security ipsec vpn vpn-name passive-mode-tunneling`:

- Traffic bypasses the usual active IP checks such as the version, TTL, protocol, options, and address.
- There is no effect on the TTL value (decrement) as IPsec tunnel is not treated as the next hop.

- Even if the packet size exceeds the tunnel MTU value, it doesn't generate ICMP error message or perform fragmentation.

Options

No specific options are needed. If you configure the statement, the feature is enabled.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Platform-Specific Passive Mode Tunneling Behavior

Use Feature Explorer to confirm platform and release support for specific features.

Use the following table to review platform-specific behavior for your platforms.

Platform	Difference
MX Series	• MX-SPC3 services card that support this feature allows the packets to bypass the flow processing and directly undergo encapsulation and decapsulation when passing through the passive mode tunnel. As a result, the device does not create session flow output. You'll not see session details in the output of the `show security flow session` command with packet based processing of IPsec traffic in passive mode tunnels. • You must configure `passive-monitor-mode` statement before enabling `passive-mode-tunneling` statement so that the malformed packets can reach the MX-SPC3 services card from the Packet Forwarding Engine (PFE). See passive-monitor-mode. • MX-SPC3 services card supports `header-integrity-check` statement in the `service-set` configuration to verify the packet header for anomalies in IP, TCP, UDP, and ICMP information. It is important to note that this functionality is opposite to that of the `passive-mode-tunneling` statement. So configuring both the `header-integrity-check` statement and the `passive-mode-tunneling` statement, results in an error during the configuration commit. See header-integrity-check. • In MX-SPC3 services card with `passive-mode-tunneling` enabled and `header-integrity-check` configured in the `service-set`, the following implications apply to multiple VPN configurations: • If the `header-integrity-check` statement is enabled, `passive-mode-tunneling` statement must be disabled for all VPNs. Additionally, `service-set` cannot have two or more IPsec VPNs with different `passive-mode-tunneling` values. This means that if `header-integrity-check` statement is enabled, a `service-set` can have only one type

(Continued)

Platform	Difference
	of VPN configured with either `passive-mode-tunneling` enabled or disabled. • If the `header-integrity-check` statement is disabled, then a `service-set` can have two or more IPsec VPNs with different `passive-mode-tunneling` values.
SRX Series	• SRX Series Firewalls that support this feature allows the firewall to process malformed packets and create a flow session. You can view the session flow details using the `show security flow session` command. The flow process checks the passive mode tunneling state and decides whether to bypass IP checks and prevent packet drops. • We do not support the feature for mixed mode configurations on your firewall. This implies that when you enable the feature on one IPsec VPN tunnel, it gets enabled for all the tunnels on your firewall. • Enabling passive mode tunneling on your firewall restricts the configuration of security features such as the screen options for attack detection and prevention, as well as the security policies (excluding the default permit all policy). Conversely, if you configure security features such as screens options and security policies, passive mode tunneling cannot be enabled. • We recommend you to configure the default permit all policy to avoid packet drop due to a policy match.

Release Information

Statement introduced in Junos OS Release 23.1R1.

passive-mode-tunneling

passive-mode-tunneling

IN THIS SECTION

- Syntax | 12723
- Hierarchy Level | 12723
- Description | 12723
- Required Privilege Level | 12724
- Release Information | 12724

Syntax

```
passive-mode-tunneling;
```

Hierarchy Level

```
[edit services service-set service-set-name ipsec-vpn-options]
```

Description

Allows tunneling of malformed packets. When this statement is enabled, traffic bypasses the usual active IP checks. The IPsec tunnel is not treated as a next hop and TTL is not decremented. If the packet size exceeds the tunnel MTU value, an ICMP error is not generated. Starting with Junos OS Release 13.3R4 and 14.2R1, passive mode tunneling is supported on MS-MICs and MS-MPCs.

NOTE: The `header-integrity-check` option that is supported on MS-MICs and MS-MPCs to verify the packet header for anomalies in IP, TCP, UDP, and ICMP information and flag

such anomalies and errors has a functionality that is opposite to the functionality caused by passive mode tunneling. If you configure both the `header-integrity-check` statement and the `passive-mode tunneling` statement on MS-MICs and MS-MPCs, and attempt to commit such a configuration, an error is displayed during commit.

The passive mode tunneling functionality (by including the `passive-mode-tunnelin` statement at the `[edit services service-set` *`service-set-name`* `ipsec-vpn-options]` hierarchy level) is a superset of the capability to disable IPsec tunnel endpoint in the traceroute output (by including `no-ipsec-tunnel-in-traceroute` statement at the `[edit services ipsec-vpn]` hierarchy level). Passive mode tunneling also bypasses the active IP checks and tunnel MTU check in addition to not treating an IPsec tunnel as a next-hop as configured by the `no-ipsec-tunnel-in-traceroute` statement.

    }
    type {
        book-ended;
    }
```

Hierarchy Level

```
[edit security advance-policy-based-routing]
```

Description

Configure the passive probe parameters with the SLA rule.

Passive probes measure the service quality of an application by inserting a custom probe header in the live traffic between the spoke and hub points and measuring the RTT, jitter and packet loss between the points of installation of the probes.

SLA violation is determined through passive probing of live application or application group traffic.

Options

sampling-percentage *percentage*

Indicates the percentage of sessions that are selected for a book-ended SLA measurement.

Example: If 18 sessions are available for a particular application are available, and if you have configured 25%, then 25% of the 18 sessions—that is 5 sessions out of 18 sessions, are evaluated.

- **Range:** 1-100

sampling-period *period*

Indicates a defined sampling period (in milliseconds) in which the number of violations are collected. Once this period is expired, the collected sampling data is purged and a new data is collected.

- **Range:** 2000-60,000
- **Default:** 5000 milliseconds

type

Indicates the type of probe measurement, only p-encap or book-ended supported.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1.

password (Login)

IN THIS SECTION

- Syntax | 12736
- Hierarchy Level | 12736
- Description | 12736

- Options | 12737
- Required Privilege Level | 12741
- Release Information | 12741

Syntax

```
password {
    change-type (character-sets | set-transitions);
    format (sha256 | sha512);
    maximum-length length;
    maximum-lifetime days;
    minimum-changes number;
    minimum-character-changes number;
    minimum-length length;
    minimum-lifetime days;
    minimum-lower-cases number;
    minimum-numerics number;
    minimum-punctuations number;
    minimum-reuse number;
    minimum-upper-cases number;
}
```

Hierarchy Level

```
[edit system login]
```

Description

Configure special requirements such as character length and encryption format for plain-text passwords. Newly created passwords must meet these requirements.

Using several password minimum requirement options will cause the `minimum-length` to be reset if the total sum of the required minimums exceeds the `minimum-length` setting.

Options

change-type

Set requirements for using character sets in plain-text passwords. When you combine this statement with the `minimum-changes` statement, you can check for the total number of character sets included in the password or for the total number of character-set changes in the password. Newly created passwords must meet these requirements.

- **Values:** Specify one of the following:
  - `character-sets`—The number of character sets in the password. Valid character sets include uppercase letters, lowercase letters, numbers, punctuation, and other special characters.
  - `set-transitions`—The number of transitions between character sets.

format

Configure the authentication algorithm for plain-text passwords. The hash algorithm that authenticates the password can be one of these algorithms:

- Values:
  - sha256—Secure Hash Algorithm 256. Produces a 256-bit digest. The encrypted password starts with 5.
  - sha512—Secure Hash Algorithm 512. Produces a 512-bit digest. The encrypted password starts with 6.
- **Default:** For Junos OS, the default encryption format is `sha512`.

maximum-length *length*

Specify the maximum number of characters allowed in plain-text passwords. Newly created passwords must meet this requirement.

- **Range:** 20 through 128 characters
- **Default:** For Junos-FIPS software, the maximum number of characters for plain-text passwords is 20. For Junos OS, no maximum is set.

maximum-lifetime *days*

Specify the maximum duration of a password in days, where the password expires after the maximum duration is reached. If you have the required permissions, you are able to control the maximum duration of a password. If the age of the password reaches the maximum time configured, the password expires and must be changed. If your password has expired, you cannot commit a configuration until you change your password. Only passwords for local user accounts can expire based on time configured on the maximum lifetime statement.

> **NOTE**: You cannot reuse the same password when the password expires, unless you also configure the number of times the password can be reused on the `minimum-reuse` statement. Older passwords cannot be re-configured on password expiry. Therefore, if you want to reuse an old password, you must configure the `minimum-reuse` statement as well as the `maximum-lifetime` statement in the new configuration, otherwise the commit fails.
>
> If the `maximum-lifetime` statement is configured, a validation check for an expired password is performed at the time of login and at the time of commit based on the password timestamp. For passwords configured before the `minimum-reuse` configuration statement is committed, the timestamp of the passwords is the time at which any configuration under the [edit system login] hierarchy is committed following the commit for the `minimum-reuse` statement. For passwords configured after `minimum-reuse` configuration statement is committed, the timestamp of the passwords is the time at which those passwords are committed.

- **Range:** 30 through 365 days

minimum-changes *number*

Specify the minimum number of character sets (or character set changes) required for plain-text passwords. Newly created passwords must meet this requirement.

This statement is used in combination with the `change-type` statement. If the change-type is `character-sets`, then the number of character sets included in the password is checked against the specified minimum. If change-type is `set-transitions`, then the number of character set changes in the password is checked against the specified minimum.

- **Default:** For Junos OS, the minimum number of changes is 1. For Junos-FIPS Software, the minimum number of changes is 3.

minimum-character-changes *number*

Specify the minimum number of character changes between old and new passwords. Newly created passwords must meet this requirement. If you have the required permissions, you are able to configure the number of character changes between passwords. If the number of character changes between the old password and new password is greater than or equal to the configured value for minimum number of character changes, the new password is accepted. If the number of character changes is less than the configured value, the new password is rejected.

- **Range:** 4 through 15 characters

minimum-length *length*

Specify the minimum number of characters required in plain-text passwords. Newly created passwords must meet this requirement.

This statement can be used in combination with all of the other requirement options for plain-text passwords, such as `minimum-upper-cases`, `minimum-punctuations`, `minimum-lower-cases`, and so on.

Using several password minimum requirement options will cause the minimum password length to be reset if the total sum of the required minimums exceeds the setting configured on the `minimum-length` statement.

- **Default:** For Junos OS, the minimum number of characters for plain-text passwords is six. For Junos-FIPS software, the minimum number of characters for plain-text passwords is 10.
- **Range:** 6 through 20 characters

minimum-lifetime *days*

Specify in days the minimum duration of a password before the password can be changed. If you have the required permissions, you are able to control the minimum lifetime of a password. You cannot change the password if the age of the password does not exceed the duration configured on the `minimum-lifetime` statement. When you change a password, the age of the existing password is retrieved based on the time at which the password was configured and the current time is fetched. If the age of the password is less than or equal to the configured value for the `minimum-lifetime` statement, the new password is not accepted and an error message is displayed. If the age of the password is more than the configured value for the `minimum-lifetime` statement, the new password is accepted.

> **NOTE**: The `minimum-lifetime` statement can be committed only after configuring the `minimum-reuse` statement. The `minimum lifetime` statement works in coordination with password history requirements, else the commit fails and an error message is displayed.
>
> If `minimum-lifetime` is configured, password change for a user is accepted or rejected based on the timestamp of the current password for that user. For passwords configured before the `minimum-reuse` configuration statement is committed, the timestamp of the passwords is the time at which any configuration under the [edit system login] hierarchy is committed following the commit for the `minimum-reuse` statement. For passwords configured after `minimum-reuse` configuration statement is committed, the timestamp of the passwords is the time at which those passwords are committed.

- **Range:** 1 through 30 days

minimum-lower-cases *number*

Specify the minimum number of lower-case letters required in plain-text passwords. Newly created passwords must meet this requirement.

This statement can be used in combination with all of the other requirement options for plain-text passwords, such as `minimum-length`, `minimum-punctuations`, `minimum-upper-cases`, and so on.

Using several password minimum requirement options will cause the minimum password length to be reset if the total sum of the required minimums exceeds the setting configured on the `minimum-length` statement.

- **Range:** 1 through 128 lower-case letters

minimum-numerics *number*

Specify the minimum number of numeric-class characters required in plain-text passwords. Newly created passwords must meet this requirement.

This statement can be used in combination with all of the other requirement options for plain-text passwords, such as `minimum-length`, `minimum-punctuations`, `minimum-lower-cases`, and so on.

Using several password minimum requirement options will cause the minimum password length to be reset if the total sum of the required minimums exceeds the setting configured on the `minimum-length` statement.

- **Range:** 1 through 128 numeric-class characters

minimum-punctuations *number*

Specify the minimum number of punctuation-class characters required in plain-text passwords. Newly created passwords must meet this requirement.

This statement can be used in combination with all of the other requirement options for plain-text passwords, such as `minimum-length`, `minimum-upper-cases`, `minimum-lower-cases`, and so on.

Using several password minimum requirement options will cause the minimum password length to be reset if the total sum of the required minimums exceeds the setting configured on the `minimum-length` statement.

- **Range:** 1 through 128 punctuation-class characters

minimum-reuse *number*

Specify the number of old passwords which should not match the new password. Newly created passwords must meet this requirement. If you have the required permissions, you are able to control the number of old passwords that need to be compared. The number of old passwords to compare with the new password depends on the value configured. If a match is found between the new password and any of the

old passwords, the device rejects the new password and terminates. If the new password is different from the configured number of old passwords, the new password is accepted.

- **Range:** 1 through 20 passwords

minimum-upper-cases

Specify the minimum number of upper-case letters required in plain-text passwords. Newly created passwords must meet this requirement.

This statement can be used in combination with all of the other requirement options for plain-text passwords, such as `minimum-length`, `minimum-punctuations`, `minimum-lower-cases`, and so on.

Using several password minimum requirement options will cause the minimum password length to be reset if the total sum of the required minimums exceeds the setting configured on the `minimum-length` statement.

- **Range:** 1 through 128 upper-case letters

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.4.

Statements `minimum-lower-cases`, `minimum-numerics`, `minimum-punctuations`, and `minimum-upper-cases` introduced in Junos OS Release 12.1.

All of the previously mentioned statements were introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Statements `minimum-reuse` and `minimum-character-changes` introduced in Junos OS Release 18.3.

Statements `maximum-lifetime` and `minimum-lifetime` introduced in Junos OS Release 18.4.

Option `sha1` is not supported in Junos OS Evolved.

`sha1` option deprecated in Junos OS Release 22.2R1.

- Release Information | 12743

Syntax

```
password password-string;
```

Hierarchy Level

```
[edit protocols dot1x authenticator mac-radius]
```

Description

Configure a global password to be used as the password (instead of the MAC address) for all sessions that use MAC RADIUS authentication. Use of a global password is supported on all three MAC RADIUS-based authentication protocols (eap-md5, eap-peap, pap).

> **NOTE**: When enabled (or disabled), currently active dot1x sessions are not affected. MAC RADIUS authentication will use the configured password from the time of reauthentication.

Default

Disabled.

Options

password-string

Authentication password.

Password can be between 1 and 128 characters in length.

Password can include most character classes (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters), excluding space.

If you use any of the following character(s), enclose the character(s) within double quotation marks ("):

- [
-]
- &
- &&
- ||
- (
-)

Required Privilege Level

routing—To view this statement in the configuration.

Description

Specify the password that the SRX Series Firewall should send to the IC Series device to establish communications. The SRX Series Firewall sends the password in its first message to the IC Series device.

This statement is required when you are configuring the SRX Series Firewall to act as a Junos OS Enforcer in a Unified Access Control (UAC) deployment. When deployed as a Junos OS Enforcer, the SRX Series Firewall enforces the policies that are defined on the UAC's IC Series device.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

password-options

IN THIS SECTION

- Syntax | 12751
- Hierarchy Level | 12751
- Description | 12751
- Options | 12751
- Required Privilege Level | 12752
- Release Information | 12752

Syntax

```
password-options {
    apply-groups;
    apply-groups-except;
    tacplus-authorization;
}
```

Hierarchy Level

```
[edit system]
```

Description

Configure options for local authentication.

NOTE: Starting in Junos OS Evolved Release 25.4R1 and Junos OS Release 25.4R1, you need not configure `password` under `edit system authentication-order` to enable `password-options`.

Options

`apply-groups`—Choose the groups from which to inherit configuration data.

`apply-groups-except`—Choose the groups to be excluded from configuration data being inherited.

`tacplus-authorization`—Configure remote authorization on the TACACS+ server for locally authenticated users. Authorization parameters configured remotely for that user are combined with the authorization parameters configured locally.

- **Default:** If a user is authenticated locally, authorization for that user is done locally.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R1.

Option `tacplus-authorization` introduced in Junos OS Release 19.3R1 on MX Series routers.

path (Protocols MPLS)

IN THIS SECTION

- Syntax | 12752
- Hierarchy Level | 12753
- Description | 12753
- Options | 12753
- Required Privilege Level | 12754
- Release Information | 12754

Syntax

```
path path-name {
    abstract-hop-name (abstract | loose | loose-link | strict);
```

```
    (address | hostname) <strict | loose>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

Description

Create a named path and optionally specify the sequence of explicit routers that form the path.

You must include this statement when configuring explicit LSPs.

Options

`abstract-hop-name`—Name of the predefined abstract hop. The abstract hop can be used in combination with real IP next hops. An abstract hop is traversed by traversing the member nodes. This traversal can be done by either links that satisfy the logical combination of defined constituent attributes, or by any kind of link. This choice is controlled by the use of abstract hop qualifiers – abstract, loose, loose-link, and strict.

`abstract`—Indicate that the next hop configured in the `path` statement is an abstract hop..

`loose-link`—Indicate that the next hop in the `path` statement is a loose-link abstract hop. This means that the LSP cannot traverse other routers before reaching this router. In other words, the abstract hop of type loose-link is processed only if any of the viable routers is reached in constraint through a link of associated abstract hop membership.

`loose`—Indicate that the next hop in the `path` statement is a loose abstract hop. The path can traverse any real nodes that do not have abstract hop membership, before reaching a node with abstract hop membership, which is a feasible starting point for processing the next abstract hop.

`strict`—Indicate that the next hop in the `path` statement is a strict abstract hop. After the last processed hop in the constraint list, the path can traverse any real nodes that do not have abstract hop membership, before reaching a node with abstract hop membership, which is a feasible starting point for processing the next abstract hop.

address—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is `loose`. As an option, you can include the ingress and egress routers in the path. Specify the addresses in order, starting with the

ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.

- **Default:** If you do not specify any routers explicitly, no routing limitations are imposed on the LSP.

hostname—See *address*.

- **Default:** If you do not specify any routers explicitly, no routing limitations are imposed on the LSP.

`loose`—(Optional) Indicate that the next address in the `path` statement is a loose link. This means that the LSP can traverse through other routers before reaching this router.

- **Default:** `strict`

path-name—Name that identifies the sequence of nodes that form an LSP. The name can contain up to 32 characters and can include letters, digits, periods, and hyphens. To include other characters or use a longer name, enclose the name in quotation marks. The name must be unique within the ingress router.

`strict`—(Optional) Indicate that the LSP must go to the next address specified in the `path` statement without traversing other nodes. This is the default.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`abstract-hop-name` option introduced in Junos OS Release 17.1 for all platforms.

Syntax

```
path address <strict | loose>;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection bypass bypass-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name]
```

Description

Configure an explicit path (a sequence of strict or loose routes) to control where and how a bypass LSP is established. If multiple bypasses are configured, they all will use the same explicit path.

Default

No path is configured. CSPF automatically calculates the path the bypass LSP takes.

Options

address—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is `loose`. As an option, you can include the ingress and egress routers in the path. Specify the addresses in order, starting with the ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.

- **Default:** If you do not specify any routers explicitly, no routing limitations are imposed on the bypass LSP.

`loose`—(Optional) The next address in the `path` statement is loose. The LSP can traverse other routers before reaching this router.

- **Default:** `strict`

`strict`—(Optional) The LSP must go to the next address specified in the `path` statement without traversing other nodes. This is the default.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Syntax

```
path destination {
    <address | hostname> <strict | loose>
}
```

Hierarchy Level

```
[edit protocols mpls]
```

Description

Configure path protection on your MPLS network.

Options

destination —Name of a label switched path (LSP). In addition to specifying the name of the configured LSP, you can include some other designation such as **primary-path**.

address —(Optional) IP address of each transit switch (or the IP address of the loopback interface on the switch) in the LSP. If you want to control exactly which switches are selected for the LSP, specify the address or hostname of each transit switch. Specify the addresses in order, starting with the first provider (transit) switch, and continuing sequentially along the path until reaching the egress provider edge switch.

- **Default:** If you do not specify the addresses or hostnames of any switches, the LSP is calculated by the switch.

hostname —(Optional) See ***address*** .

- **Default:** If you do not specify the addresses or hostnames of any switches, the LSP is calculated by the switch.

loose—(Optional) Indicates that the next address in the `path` statement is a loose link. This means that the LSP can traverse through other switches before reaching this switch.

- **Default: strict**

strict—(Optional) Indicates that the LSP must go to the next address specified in the `path` statement without traversing other switches. This is the default.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

path-selection

IN THIS SECTION

- Syntax | 12770
- Hierarchy Level | 12770
- Description | 12770
- Default | 12770

- Options | 12771
- Required Privilege Level | 12772
- Release Information | 12772

Syntax

```
path-selection {
    (always-compare-med | cisco-non-deterministic | external-router-id);
    as-path-ignore;
     l2vpn-use-bgp-rules;
    med-plus-igp {
        igp-multiplier number;
        med-multiplier number;
    }
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols bgp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols bgp],
[edit protocols bgp],
[edit routing-instances routing-instance-name protocols bgp]
```

Description

Configure BGP path selection.

Default

If the `path-selection` statement is not included in the configuration, only the multiple exit discriminators (MEDs) of routes that have the same peer ASs are compared.

Options

always-compare-med

Always compare MEDs whether or not the peer ASs of the compared routes are the same.

> **NOTE**: We recommend that you configure the `always-compare-med` option.

as-path-ignore

In the best-path algorithm, skip the step that compares the autonomous system (AS) path lengths. By default, the best-path algorithm evaluates the length of the AS paths and prefers the route with the shortest AS path length.

> **NOTE**: Starting with Junos OS Release 14.1R8, 14.2R7, 15.1R4, 15.1F6, and 16.1R1, the **as-path-ignore** option is supported for routing instances.

cisco-non-deterministic

Emulate the Cisco IOS default behavior. This mode evaluates routes in the order that they are received and does not group them according to their neighboring AS. With `cisco-non-deterministic` mode, the active path is always first. All inactive, but eligible, paths follow the active path and are maintained in the order in which they were received, with the most recent path first. Ineligible paths remain at the end of the list.

As an example, suppose you have three path advertisements for the 192.168.1.0 /24 route:

- Path 1—learned through EBGP; AS Path of 65010; MED of 200
- Path 2—learned through IBGP; AS Path of 65020; MED of 150; IGP cost of 5
- Path 3—learned through IBGP; AS Path of 65010; MED of 100; IGP cost of 10

These advertisements are received in quick succession, within a second, in the order listed. Path 3 is received most recently, so the routing device compares it against path 2, the next most recent advertisement. The cost to the IBGP peer is better for path 2, so the routing device eliminates path 3 from contention. When comparing paths 1 and 2, the routing device prefers path 1 because it is received from an EBGP peer. This allows the routing device to install path 1 as the active path for the route.

> **NOTE**: We do not recommend using this configuration option in your network. It is provided solely for interoperability to allow all routing devices in the network to make consistent route selections.

external-router-id Compare the router ID between external BGP paths to determine the active path.

igp-multiplier *number* The multiplier value for the IGP cost to a next-hop address. This option is useful for making the MED and IGP cost comparable.

- **Range:** 1 through 1000
- **Default:** 1

l2vpn-use-bgp-rules Enable routers to use both the BGP path selection algorithm and the designated forwarder path selection algorithm when selecting the preferred path to each destination in a Layer 2 VPN or VPLS routing instance. The BGP path selection algorithm is used by all of the Provider routers participating in the routing instance. The designated forwarder path selection algorithm is used by the PE router participating in the routing instance.

- **Default:** By default, the designated forwarder path selection algorithm is used to select the best path to reach each destination within Layer 2 VPN and VPLS routing instances.

med-multiplier *number* The multiplier value for the MED calculation. This option is useful for making the MED and IGP cost comparable.

- **Range:** 1 through 1000
- **Default:** 1

med-plus-igp Add the IGP cost to the indirect next-hop destination to the MED before comparing MED values for path selection. This statement only affects best-path selection. It does not affect the advertised MED.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`med-plus-igp` option introduced in Junos OS Release 8.1.

`as-path-ignore` and `l2vpn-use-bgp-rules` options introduced in Junos OS Release 10.2.

pattern (Class Attribute)

IN THIS SECTION

- Syntax | 12775
- Hierarchy Level | 12775
- Description | 12775
- Options | 12775
- Required Privilege Level | 12775
- Release Information | 12775

Syntax

```
pattern “pattern”;
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name domains domain-name subscription-id use-class]
```

Description

Configure characters to insert between the resulting regular expression groups that are generated from parsing the Class attribute contents of the accounting request from the BNG, PGW, or GGSN. Regular expression groups are identified with **\n** for a group number.

Options

pattern Characters to insert between regular expression groups. A regular expression group number “n” is identified as **\n**.

For example, the following configuration generates `" 000118191129|ALICE:DRAV3:"` out of `" 000118191129#000118191129#ALICE:DRAV3:#7168#nflat#ADSL##"`:

```
[edit unified-edge gateways tdf TDF1 domains domain1 subscription-id]
user@host# set use-class regex "[^#]*#\([^#]*\)\#\([^#]*\)"
user@host# set use-class pattern "\1|\2"
```

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

RELATED DOCUMENTATION

Configuring a Set of IP-Based TDF Subscriber Properties with a TDF Domain

pattern (Security IDP)

IN THIS SECTION

- Syntax | 12776
- Hierarchy Level | 12776
- Description | 12776
- Options | 12776
- Required Privilege Level | 12777
- Release Information | 12777

Syntax

```
pattern signature-pattern;
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type signature]
```

Description

Specify the pattern IDP should match. You construct the attack pattern just as you would when creating a new signature attack object.

Options

signature-pattern—Specify the signature pattern.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

pattern

IN THIS SECTION

- Syntax | 12777
- Hierarchy Level | 12777
- Description | 12777
- Options | 12778
- Required Privilege Level | 12778
- Release Information | 12778

Syntax

```
pattern dfa-pattern;
```

Hierarchy Level

```
[edit services application-identification nested-application name signature name member name]
```

Description

Define an attack pattern to be detected.

Options

dfa-pattern Pattern of attack to match. Deterministic Finite Automata (DFA) is a powerful pattern matching engine.

Required Privilege Level

system—To view this statement in the configuration.

system control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

RELATED DOCUMENTATION

Application Identification for Nested Applications

pattern-pcre (Security IDP)

IN THIS SECTION

- Syntax | 12779
- Hierarchy Level | 12779
- Description | 12779
- Options | 12779
- Required Privilege Level | 12779
- Release Information | 12779

Syntax

```
pattern-pcre  signature-pattern-pcre;
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type signature]
```

Description

Specify the pattern in standard PCRE format. You construct the attack pattern in PCRE format just as you would when creating a new signature attack object. This is an optional field. The pattern field is unused under this configuration.

Options

signature-pattern-pcre —Specify the signature pattern in standard PCRE format.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1x49-D40.

pattern-update (Security Antivirus)

IN THIS SECTION

- Syntax | 12780
- Hierarchy Level | 12780

- Description | 12780
- Required Privilege Level | 12781
- Release Information | 12781

Syntax

```
pattern-update {
    email-notify {
        admin-email email-address;
        custom-message message;
        custom-message-subject message-subject;
    }
    interval value;
    no-autoupdate;
    proxy-profile proxy profile name;
    routing-instance name;
    start-time start-time;
    url url;
}
```

Hierarchy Level

```
[edit security utm feature-profile anti-virus juniper-express-engine]
[edit security utm feature-profile anti-virus kaspersky-lab-engine]
[edit security utm default-configuration anti-virus avira-engine]
```

Description

Updates to the pattern file are added as new viruses are discovered. You can configure the security device to regularly update the pattern file automatically, or you can update the file manually.

Starting in Junos OS Release 23.1R1, we've deprecated the `pattern-update` statement at the [`edit security utm feature-profile anti-virus sophos-engine`] and [`edit security utm default-configuration anti-virus sophos-engine`] hierarchy levels.

Required Privilege Level

security— To view this statement in the configuration.

security-control— To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

The `proxy-profile` option is introduced under the `security utm feature-profile anti-virus sophos-engine` hierarchy level in Junos OS Release 18.3R1.

Support for Avira engine added in Junos OS Release 18.4R1.

pause-computation-during-churn

IN THIS SECTION

- Syntax | 12781
- Hierarchy Level | 12781
- Description | 12782
- Required Privilege Level | 12782
- Release Information | 12782

Syntax

```
pause-computation-during-churn;
```

Hierarchy Level

```
[edit fabric protocols bgp multipath],
[edit logical-systems name protocols bgp multipath],
```

```
[edit logical-systems name routing-instances name protocols bgp multipath],
[edit logical-systems name tenants name routing-instances name protocols bgp multipath],
[edit protocols bgp multipath],
[edit routing-instances name protocols bgp multipath],
[edit tenants name routing-instances name protocols bgp multipath]
```

Description

Defer multipath computation for all families during a BGP peering churn. In a very large-scale network, there is a temporary spike in multipath computation during BGP peering, which takes a toll on the Packet Forwarding Engine resources. You can pause the multipath computation and resume after the peering churn settles down. Note that if there is no BGP peering churn, then multipath computation is not paused.

Required Privilege Level

routing

Release Information

Statement introduced in Junos OS Release 20.3R1.

payload

IN THIS SECTION

- Syntax | 12783
- Hierarchy Level | 12783
- Description | 12783
- Options | 12783
- Required Privilege Level | 12783
- Release Information | 12783

Syntax

```
payload {
    ip {
        layer-3;
        layer-4;
    }
}
```

Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number hash-key family multiservice]
```

Description

(MX Series 5G Universal Routing Platforms only) Include payload data in a hash key for the **multiservice** protocol family when configuring PIC-level symmetrical load balancing on an 802.3ad Link Aggregation Group.

Options

ip—Include IPv4 payload data in the hash key. This option has the following suboptions:

- **layer-3**—Include Layer 3 IP information in the hash key.
- **layer-4**—Include Layer 4 IP information in the hash key.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

RELATED DOCUMENTATION

pba-interim-logging-interval

IN THIS SECTION

- Syntax | 12784
- Hierarchy Level | 12784
- Description | 12784
- Options | 12785
- Required Privilege Level | 12785
- Release Information | 12785

Syntax

```
pba-interim-logging-interval seconds
```

Hierarchy Level

```
[edit interfaces interface-name services-options]
```

Description

Port block allocation (PBA) generates one syslog entry per set of ports allocated to a subscriber. These logs are UDP based and can be lost in the network,especially for long running flows. Interim logging resends the above logs at a configured interval for all active blocks that have traffic on at least one block. For the MS-MIC and MS-MPC, log messages are generated for sessions which have a port in a block, even if the block has no traffic.

Options

seconds Interval, in seconds, for re-sending of session logs

- **Default:** 0—This indicates that interim logging is not used.
- **Range:** 1800 to 86,400seconds.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

pbb-service-options

IN THIS SECTION

Syntax | 12787

- Hierarchy Level | 12787
- Description | 12787
- Options | 12787
- Required Privilege Level | 12788
- Release Information | 12788

Syntax

```
pbb-service-options {
    default-isid isid-number;
    isid isid-number  vlan-id-list [ vlan-ids ];
    mac-address mac-address;
    source-bmac <mac-address>
}
```

Hierarchy Level

```
[edit routing-instances routing-instance-name service-groups service-group-name]
```

Description

For IEEE 802.1ah provider backbone bridge (PBB) configurations, configure PBB service options for the customer routing instance (I-component) service group.

NOTE: The `mac-address` statement is not supported for PBB-EVPN.

The remaining statements are explained separately. See CLI Explorer.

Options

service-group-name—Name of a service group.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in JUNOS Release 10.0.

pcc-action-profile (PCC Rules)

IN THIS SECTION

- Syntax | 12788
- Hierarchy Level | 12789
- Description | 12789
- Options | 12789
- Required Privilege Level | 12789
- Release Information | 12789

Syntax

```
pcc-action-profile profile-name;
```

Hierarchy Level

```
[edit unified-edge pcef pcc-rules rules-name then],
[edit services pcef pcc-rules rules-name then]
```

Description

Specify the name of the action profile to include in a policy and charging control (PCC) rule configuration. The action profile defines the treatment to be applied to specific service data flows or to packets associated with specific applications.

If you are using Junos OS Subscriber Aware, specify the name of the action profile at the `[edit unified-edge pcef pcc-rules rules-name then]` hierarchy level.

If you are using Junos OS Broadband Subscriber Management, specify the name of the action profile at the `[edit services pcef pcc-rules rules-name then]` hierarchy level.

Options

profile-name Name of the PCC action profile that the PCC rule references. The referenced action profile must be configured.

- **Range:** 1 through 63 characters.

Required Privilege Level

For Junos OS Subscriber Aware:

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

For Junos OS Broadband Subscriber Management:

services—To view this statement in the configuration.

services–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support at the [edit services pcef pcc-rules *rules-name* then] hierarchy level introduced for Junos OS Broadband Subscriber Management in Junos OS Release 17.2 on MX Series.

Support for Next Gen Services for Junos OS Broadband Subscriber Management introduced in Junos OS Release 19.3R2 on MX Series.

    output-service-set-name service-set-name;
    profile-name pcef-profile-name;
}
```

Hierarchy Level

```
[edit access profile profile-name session-options]
```

Description

Specify the PCEF profile that contains the policy and charging control (PCC) rules that a PCRF can directly activate for a subscriber, and specify the input and output service sets that process the PCC rules. You can optionally specify service filters for the service sets. PCC rules specify the policies to

apply to traffic based on the application being used by the subscriber or the Layer 3 and Layer 4 service data flow information.

Options

input-service-filter-name *filter-name*	(Optional) Input IPv4 service filter name. The service filter identifies conditions for which you want to skip application-aware policy control.
input-service-set-name *service-set-name*	Input IPv4 service-set name. Use a service set that is enabled for application-aware policy control.
ipv6-input-service-filter-name *filter-name*	(Optional) Input IPv6 service filter name. The service filter identifies conditions for which you want to skip application-aware policy control.
ipv6-input-service-set-name *service-set-name*	Input IPv6 service set name. Use a service set that is enabled for application-aware policy control.
ipv6-output-service-filter-name *filter-name*	(Optional) Output IPv6 service filter name. The service filter identifies conditions for which you want to skip application-aware policy control.
ipv6-output-service-set-name *service-set-name*	Output IPv6 service set name. Use a service set that is enabled for application-aware policy control.
output-service-filter-name *filter-name*	(Optional) Output IPv4 service filter name. The service filter identifies conditions for which you want to skip application-aware policy control.
output-service-set-name *service-set-name*	Output IPv4 service-set name. Use a service set that is enabled for application-aware policy control.
profile-name *pcef-profile-name*	PCEF profile name. The PCEF profile contains PCC rules or PCC rulesets that the PCRF can directly activate. The PCEF profile must be configured under `dynamic-policy-control` at the `[edit services pcef profiles profile-name]` hierarchy level.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

pcc-rules (PCEF)

IN THIS SECTION

- Syntax | **12803**
- Hierarchy Level | **12804**
- Description | **12804**
- Options | **12804**
- Required Privilege Level | **12804**
- Release Information | **12804**

Syntax

```
pcc-rules rule-name {
    from {
        <application-groups [application-group-name]>;
        <applications [application-name]>;
        flows ([flow-identifier | any)];
    }
    then {
        pcc-action-profile  profile-name;
    }
}
```

Hierarchy Level

```
[edit unified-edge pcef],
[edit services pcef]
```

Description

Configure the PCC rules. A PCC rule identifies the subscriber IP packets that are associated with a service data flow (SDF) or application and defines the treatment to be applied to the packets.

If you are using Junos OS Subscriber Aware, configure the PCC rule at the `[edit unified-edge pcef]` hierarchy level.

If you are using Junos OS Broadband Subscriber Management, configure the PCC rule at the `[edit services pcef]` hierarchy level.

Options

rule-name Name of the PCC rule.

- **Range:** 1 through 63 characters.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

For Junos OS Subscriber Aware:

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

For Junos OS Broadband Subscriber Management:

services—To view this statement in the configuration.

services–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support at the [edit services pcef] hierarchy level introduced for Junos OS Broadband Subscriber Management in Junos OS Release 17.2 on MX Series.

Support for Next Gen Services for Junos OS Broadband Subscriber Management introduced in Junos OS Release 19.3R2 on MX Series.

pcc-time-of-day-profiles

IN THIS SECTION

- Syntax | 12805
- Hierarchy Level | 12806
- Description | 12806
- Options | 12806
- Required Privilege Level | 12806
- Release Information | 12806

Syntax

```
pcc-time-of-day-profiles profile-name {
    rule-activation-time {
        <day-of-week | day-of-month month>;
        <hour:min>;
    }
    rule-deactivation-time {
        <day-of-week | day-of-month month>;
        <hour:min>;
```

```
    }
}
```

Hierarchy Level

```
[edit unified-edge pcef]
```

Description

Configure a PCC time-of-day profile to specify the time of day, day of the week, or day of the month to activate and deactivate a PCC rule or rulebase. A PCC time-of-day profile is applied to a PCC rule or PCC rulebase within a static PCEF profile. If a time zone is configured on the router, the time-of-day settings apply to the configured time zone.

Options

profile-name Name of the PCC time-of-day profile.

- **Range:** 1 through 63 characters.

The remaining statements are explained separately.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

```

Hierarchy Level

```
[edit protocols pcep]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure per-Path Computation Element (PCE) parameters.

Options

pce-id	IP address of the PCE.
authentication-key *key*	(Optional) Authentication password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (“ ”). It is recommended to define and bind an authentication key for securing a PCEP session, as opposed to binding an authentication keychain.
authentication-key-chain *key-chain*	(Optional) Authentication keychain password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (“ ”).
local-address *ip-address*	(Optional) IP address of the local end of the PCEP session, the PCC.
lsp-retry-delegation	(Optional) Enable retry LSP delegation process.
lsp-retry-delegation-timer	(Optional) Specify the amount of time (in seconds) that the Path Computation Client (PCC) must wait before retrying delegation of Path Computation Element (PCE)-initiated LSPs in case of delegation failure or re-delegation.

- **Default:** 3600 seconds
- **Range:** 0 through 4294967294 seconds

max-sid-depth (Optional) Specify the maximum value for service identifier (SID) depth.

- **Default:** 5
- **Range:** 1 through 5

p2mp-lsp-init-capability (Optional) Capability to provision point-to-multipoint RSVP-TE LSPs by a PCE. By default, this capability is not supported on a PCC, and should be explicitly configured to enable PCE-initated point-to-multipoint LSPs.

p2mp-lsp-report-capability (Optional) Capability to report point-to-multipoint RSVP-TE LSPs to a PCE. By default, this capability is not supported on a PCC, and should be explicitly configured to enable reporting of point-to-multipoint LSPs to a PCE.

p2mp-lsp-update-capability (Optional) Capability to update point-to-multipoint RSVP-TE LSP parameters by a PCE. By default, this capability is not supported on a PCC, and should be explicitly configured to enable updating of PCE-initated point-to-multipoint LSPs.

pce_traffic_steering (Optional) Configure the flow specification capability (also called traffic steering functionality) for enabling the mapping of PCE-initiated point-to-multipoint LSPs to an MVPN routing-instance.

spring-capability (Optional) Enable SPRING-based provisioning for the PCE.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

Support for PTX Series added in Junos OS Release 14.2.

Support for QFX Series switches added in Junos OS Release 16.1R3.

Support for ACX Series added in Junos OS Release 17.1R1.

`lsp-cleanup-timer`, `lsp-provisioning`, `max-unknown-requests`, `request-timer`, and `request-priority` options introduced in Junos OS Release 13.3.

`authentication-key` *`key`*, `authentication-key-chain` *`key-chain`*, and `p2mp-lsp-report-capability` options introduced in Junos OS Release 16.1.

`max-sid-depth` and `spring-capability` options introduced in Junos OS Release 17.2.

`p2mp-lsp-init-capability` and `p2mp-lsp-update-capability` options introduced in Junos OS Release 18.3R1 on all platforms.

`pce_traffic_steering` option introduced in Junos OS Release 19.4R1 on all platforms.

- Release Information | 12815

Syntax

```
pce-type {
    active stateful;
}
```

Hierarchy Level

```
[edit protocols pcep pce pce-id]
```

Description

Configure the path computation element (PCE) type:

- active—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegated control over their LSPs to the PCE.
- stateful—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update the LSP state. A PCC maintains synchronization with the PCE.

Required Privilege Level

pcef (Dynamic Profiles)

IN THIS SECTION

- Syntax | 12815
- Hierarchy Level | 12816
- Description | 12816
- Options | 12816
- Required Privilege Level | 12816
- Release Information | 12816

Syntax

```
pcef pcef-profile-name {
    activate rule-name | activate-all;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number service]
```

Description

Assign a policy and charging enforcement function (PCEF profile) to the dynamic profile. The PCEF profile specifies a set of PCC rules and rulebases to assign to a subscriber for application-aware policy control, and assigns a precedence value to each predefined rule. Also specify which of the PCC rules to activate for the dynamic profile.

Options

activate *rule-name* Name of the PCC rule to activate or the predefined dynamic interface variable `$junos-pcef-rule`. To specify more than one rules, include this line multiple times.

activate-all Activates all of the PCC rules.

pcef-profile-name Name of the PCEF profile or the predefined dynamic interface variable `$junos-pcef-profile`.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2.

Description

Configure the Policy and Charging Rules Function (PCRF) global attributes, rules, parameters, and partition to authorize and provision subscribers. PCRF is a centralized policy decision point that deploys business policy and charging rules to allocate broadband network resources and manages flow-based charges for subscribers and services. PCRF pushes the rules down to the Policy and Charging Enforcement Function (PCEF) using the 3GPP Gx protocol and online policy interface.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

peak-burst-size (QFX)

IN THIS SECTION

- Syntax | 12836
- Hierarchy Level | 12836
- Description | 12836
- Options | 12836
- Required Privilege Level | 12837
- Release Information | 12837

Syntax

```
peak-burst-size bytes;
```

Hierarchy Level

```
[edit firewall three-color-policer policer-name two-rate]
```

Description

Configure the maximum number of bytes allowed for incoming packets to burst above the peak information rate (PIR) and still be marked with medium-high packet loss priority (yellow). Packets that exceed the peak burst size (PBS) are marked with high packet loss priority (red).

NOTE: When you include the `peak-burst-size` statement in the configuration, you must also include the **committed-burst-size** and `peak-information-rate` statements at the same hierarchy level.

Options

bytes—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

- **Range:** 1500 bytes through 100,000,000,000 bytes (100 GB)

Required Privilege Level

Configuring Two-Color and Three-Color Policers to Control Traffic Rates

Overview of Policers

peak-burst-size

IN THIS SECTION

- Syntax | 12837
- Hierarchy Level | 12838
- Description | 12838
- Options | 12838
- Required Privilege Level | 12838
- Release Information | 12839

Syntax

```
peak-burst-size bytes;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall three-color-policer name two-rate],
[edit firewall three-color-policer policer-name two-rate]
```

Description

For a two-rate three-color policer, configure the peak burst size (PBS) as a number of bytes. The PBS defines the maximum number of bytes of unused peak bandwidth capacity that can be accumulated. The accumulated bandwidth allows for moderate periods of bursting traffic that exceeds the peak information rate (PIR) and the committed burst size (CBS).

> **NOTE**: When you include the `peak-burst-size` statement in the configuration, you must also include the `committed-burst-size` and `peak-information-rate` statements at the same hierarchy level.

Two-rate three-color policers use a *dual-rate dual token bucket algorithm* to measure traffic against two rate limits.

- A traffic flow is categorized green if it conforms to both the committed information rate (CIR) and the CBS-bounded accumulation of available committed bandwidth capacity.
- A traffic flow is categorized yellow if exceeds the CIR and CBS but conforms to the PIR. Packets in a yellow flow are marked with `medium-high` packet loss priority (PLP) and then passed through the interface.
- A traffic flow is categorized red if exceeds the PIR and the PBS-bounded accumulation of available peak bandwidth capacity. Packets in a red traffic flow are marked with `high` PLP and then either passed through the interface or optionally discarded.

Options

bytes—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

- **Range:** 1500 through 100,000,000,000 bytes

peak-information-rate bps;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall three-color-policer name two-rate],
[edit firewall three-color-policer policer-name two-rate]
```

Description

For a two-rate three-color policer, configure the peak information rate (PIR) as a number of bits per second. The PIR is the maximum rate for traffic arriving at or departing from the interface under peak line conditions. Traffic that exceeds the committed information rate (CIR) and the committed burst size (CBS) is metered to the PIR.

> **NOTE**: When you include the `peak-information-rate` statement in the configuration, you must also include the `committed-information-rate` and `peak-burst-size` statements at the same hierarchy level.

Two-rate three-color policers use a *dual-rate dual token bucket algorithm* to measure traffic against two rate limits.

- A traffic flow is categorized green if it conforms to both the CIR and the CBS-bounded accumulation of available committed bandwidth capacity.
- A traffic flow is categorized yellow if exceeds the CIR and CBS but conforms to the PIR. Packets in a yellow flow are marked with `medium-high` packet loss priority (PLP) and then passed through the interface.
- A traffic flow is categorized red if exceeds the PIR and the PBS-bounded accumulation of available peak bandwidth capacity. Packets in a red traffic flow are marked with `high` PLP and then either passed through the interface or optionally discarded.

Options

bps—Number of bits per second. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

Range:

- - 1500 through 100,000,000,000 bps on EX, M, and T Series routers
  - 1500 through 18,446,744,073,709,551,615 bps on Mx Series routers

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define an MSDP peering relationship. An MSDP routing device must know which routing devices are its peers. You define the peer relationships explicitly by configuring the neighboring routing devices that are the MSDP peers of the local routing device. After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. To configure multiple MSDP peers, include multiple `peer` statements.

By default, the peer's options are identical to the global or group-level MSDP options. To override the global or group-level options, include peer-specific options within the "peer (Protocols MSDP)" on page 12855 statement.

At least one peer must be configured for MSDP to function. You must configure ***address*** and **local-address**.

Options

address—Name of the MSDP peer.

peer

IN THIS SECTION

- Syntax | 12859
- Hierarchy Level | 12859
- Description | 12859
- Options | 12859
- Required Privilege Level | 12860
- Release Information | 12860

Syntax

```
peer a.b.c.d {
    interface interface-name;
}
```

Hierarchy Level

```
[edit interfaces interface-name multi-chassis-protection]
```

Description

For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, use the `multi-chassis-protection` statement under the physical interface level to reduce the configuration at the logical interface level. If the interchassis control protocol connection (ICCP) is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer active-active node specified by the `peer` statement. You must also specify the peer's physical interface.

Options

a.b.c.d Specify the IP address of the peer.

interface *interface-name* Specify the peer's physical interface: interface *interface-name-fpc/pic/port*

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Syntax

```
peer-active;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name protocols vpls multi-
homing],
[edit logical-systems logical-system-name routing-instances instance-name protocols vpls multi-
homing site site-name],
[edit routing-instances instance-name protocols vpls multi-homing],
[edit routing-instances instance-name protocols vpls multi-homing site site-name]
```

Description

Keep customer edge (CE) interfaces in the up state when all BGP peers go down.

> **NOTE**: In the VPLS documentation, the word *router* in terms such as *PE router* is used to refer to any device that provides routing functions.

Consider a scenario in which two provider edge (PE) routers are sharing two multihomed sites under one routing instance, with two CE devices, CE1 and CE2.

Figure 2: Two Provider Edge Topology

If the BGP peering session drops between Router PE1 and Router PE2, each one would consider itself to be the designated forwarder (DF) for Device CE1 and Device CE2. This creates a loop through the two CE devices, in which traffic loops from one CE device to the other then back to the first.

Junos OS overcomes this scenario by dropping all multihomed CE interface traffic on all multihoming PE routers when the BGP session drops between the PE routers. This functionality is enabled by default for all sites in a routing instance.

The `peer-active` statement disables the default functionality, so that PE routers keep their multihomed CE interfaces in the up state, even though the BGP peering session is down.

If you configure this statement in the `multi-homing` hierarchy, the default functionality is disabled for all sites. If you configure this statement for a site, the default functionality is disabled only for that particular site.

Default

If you omit this statement, Junos OS drops all multihomed CE interface traffic on all multihoming PE routers when the BGP session drops between the PE routers.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

[edit routing-instances routing-instance-name protocols bgp],
[edit routing-instances routing-instance-name protocols bgp group group-name],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]
```

Description

Specify the neighbor (peer) autonomous system (AS) number.

For EBGP, the peer is in another AS, so the AS number you specify in the `peer-as` statement must be different from the local router's AS number, which you specify in the `autonomous-system` statement. For IBGP, the peer is in the same AS, so the two AS numbers that you specify in the **autonomous-system** and `peer-as` statements must be the same.

The AS numeric range in plain-number format has been extended in Junos OS Release 9.1 to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of the Junos OS support 2-byte AS numbers.

In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order*

value in decimal>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

With the introduction of 4-byte AS numbers, you might have a combination of routers that support 4-byte AS numbers and 2-byte AS numbers. For more information about what happens when establishing BGP peer relationships between 4-byte and 2-byte capable routers, see the following topics:

- *Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview*.

Options

autonomous-system—AS number.

- **Range:** 1 through 4,294,967,295 (2^{32} – 1) in plain-number format for 4-byte AS numbers
- **Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)
- **Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte AS numbers

Required Privilege Level

routing—To view this statement in the configuration.

- Syntax | 12868
- Hierarchy Level | 12869
- Description | 12869
- Options | 12869
- Required Privilege Level | 12869
- Release Information | 12869

Syntax

```
peer-certificate-type (pkcs7 | x509-signature);
```

Hierarchy Level

```
[edit services ipsec-vpn ike policy policy-name]
```

Description

(MX Series routers only) Specify a preferred type of certificate (PKCS7 or X509). By default, X509 encoding format is used. With the flexibility to configure the encoding format in which certificate requests are sent to the peer, you can determine the type of certificate to be used depending on the type supported by the peer. For example, if the peer does not support PKCS7, certificate authentication cannot occur unless you configure the same type on MX Series routers as the initiator or sender.

Options

- `pkcs7`—Public-Key Cryptography Standard #7.
- `x509-signature`—X509 is an ITU-T standard for public key infrastructure.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

```
[edit dynamic-profiles profile-name interfaces pp0 unit $junos-interface-unit ppp-options],
[edit interfaces interface-name pp0 unit unit-number ppp-options],
[edit access group-profile profile-name ppp ppp-options]
```

Description

Enable the Internet Protocol Control Protocol (IPCP) negotiation to succeed even though the peer does not include the IP address option in an IPCP configuration request for static and dynamic, and terminated and tunneled, Point-to-Point Protocol over Ethernet (PPPoE) subscribers. By default, this statement is disabled.

If the client's provisioned IP address on the customer premises equipment (CPE):

- Matches the Framed-Route RADIUS attribute, then you must configure the access route at the `[edit dynamic-profiles routing-options]` hierarchy level.
- Matches the Framed-IP-Address RADIUS attribute, then no access route configuration is required.

> **NOTE**: You must assign an IP address by configuring the Framed-IP-Address RADIUS attribute or the Framed-Pool RADIUS attribute, or by allocating an IP address from the local address pool without a RADIUS-specified pool name, with an *optional* Framed-Route RADIUS attribute returned from the RADIUS Server.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

peer-subnet (Easy EVPN LAG Configuration)

IN THIS SECTION

- Syntax | 12892
- Hierarchy Level | 12892
- Description | 12892
- Options | 12893
- Required Privilege Level | 12894
- Release Information | 12894

Syntax

```
peer-subnet {
    inet inet-address;
    inet6 inet6-address;
    interface-name [interface-name ... ];
}
```

Hierarchy Level

```
[edit services evpn device-attribute peer-to-peer]
```

Description

Specify interface parameters for the peer-to-peer connections between Ethernet VPN (EVPN) fabric provider edge (PE) devices as part of a generated EVPN fabric configuration.

You use the statements in the `[edit services evpn]` hierarchy level to simplify configuring an EVPN fabric with Ethernet segment identifier (ESI) link aggregation groups (LAGs) in the topology. The feature you enable with statements in this hierarchy is an easy EVPN LAG configuration feature, also called EZ-LAG.

You only need to configure a few statements to provide the parameters required for an EVPN core fabric with multihomed or single-homed customer edge (CE) devices (or end server devices). When you commit the `[edit services evpn]` configuration statements, the device uses a commit script to generate the corresponding standard EVPN fabric configuration statements.

The statements at the `[edit services evpn device-attribute peer-to-peer peer-subnet]` hierarchy level provide the interface names and subnet addresses for the interfaces that connect the peer PE devices in the fabric. The commit script uses these parameters to generate the required statements to configure the aggregated Ethernet interfaces and underlay peering in the EVPN fabric.

You must provide an `inet` or an `inet6` subnet address (or both) for the aggregated Ethernet interface links between the peer PE devices.

For configuration simplicity, you configure the same subnet address on both peer PE devices. By default, the commit script derives a different interface address on each peer PE device based on that device's peer ID, as follows:

- If the peer ID is 1, the commit script uses the subnet address provided.
- Otherwise, the commit script uses the subnet address + 1 (adds 1 to the low order segment of the subnet range).

For example, if you specify *inet-address* as 10.0.1.0/31:

- Peer ID 1 peer-to-peer link address = 10.0.1.0
- Peer ID 2 peer-to-peer link address = 10.0.1.1

> **NOTE**: The commit process doesn't do a commit check to enforce setting the same subnet address across both devices. As a result, we strongly recommend that you make sure when you configure this `subnet-address` statement, you use the same base value on both peer PE devices. That way the default address derivation works as expected for the peer-to-peer interface addresses on each peer PE device.

Options

inet *inet-address*

The IPv4 subnet address for the interfaces or aggregated Ethernet interfaces that connect the PE device to a peer PE device. You should configure the same subnet address for this option on both peer PE devices.

inet6 ***inet6-address***	The IPv6 subnet address for the interfaces or aggregated Ethernet interfaces that connect the PE device to a peer PE device. You should configure the same subnet address for this option on both peer PE devices.
(Required) interface-name [*interface-name* ...]	The interface or interfaces that connect the PE device to a peer PE device.

See CLI Explorer for more on other related statements.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Syntax

```
peer-to-peer {
  overlay-connectivity {
    ibgp;
   }
  peer-subnet {
    inet inet-address;
    inet6 inet6-address;
    interface-name [ interface-name ... ];
  }
  underlay-connectivity {
    ospf;
  }
}
```

Hierarchy Level

```
[edit services evpn device-attribute]
```

Description

Specify parameters for the peer-to-peer interface connections between Ethernet VPN (EVPN) fabric provider edge (PE) devices as part of a generated EVPN fabric configuration.

You use the statements in the `[edit services evpn]` hierarchy level to simplify configuring an EVPN fabric with Ethernet segment identifier (ESI) link aggregation groups (LAGs) in the topology. The feature you enable with statements in this hierarchy is an easy EVPN LAG configuration feature, also called EZ-LAG.

You only need to configure a few statements to provide the parameters required for an EVPN core fabric with multihomed or single-homed customer edge (CE) devices (or end server devices). When you commit the `[edit services evpn]` configuration statements, the device uses a commit script to generate the corresponding standard EVPN fabric configuration statements.

The statements at the `[edit services evpn device-attribute peer-to-peer]` hierarchy level provide parameters to:

- Specify the required interface names and subnet addresses for the connections between peer PE devices.
- Customize the underlay and overlay peering in the generated configuration.

Options

overlay-connectivity

Use the specified protocol for the EVPN fabric overlay peering instead of EBGP, which is the default overlay protocol the `[edit services evpn]` commit script configures.

Available options:

- `ibgp`—Use IBGP for the overlay peering in the generated configuration.

underlay-connectivity

Use the specified protocol for the EVPN fabric underlay peering instead of EBGP, which is the default underlay protocol the `[edit services evpn]` commit script configures.

Available options:

- `ospf`—Use OSPF for the underlay peering in the generated configuration.

peg-df-election

IN THIS SECTION

- Syntax | 12902
- Hierarchy Level | 12903
- Description | 12903
- Options | 12903
- Required Privilege Level | 12904
- Release Information | 12904

Syntax

```
peg-df-election {
    delay-time seconds;
    mod;
    preference {
      use-least;
      value value;
```

```
    }
}
```

Hierarchy Level

```
[edit protocols evpn oism pim-evpn-gateway],
[edit routing-instances name protocols evpn oism pim-evpn-gateway]
```

Description

Use one of the available PIM EVPN gateway (PEG) designated forwarder (DF) election methods with optimized intersubnet multicast (OISM) for a Layer 3 (L3) virtual routing and forwarding (VRF) instance or for the default L3 routing instance on an EVPN fabric device.

Otherwise, if you don't enable PEG DF election, by default the OISM border devices you configure as PEG devices use native PIM DF election.

> **NOTE**: When PEG devices use PEG DF election, they don't use the PIM protocol (they don't exchange PIM protocol packets) within the data center. As a result, we recommend you have external L3 redundancy on the PEG devices.

See Feature Explorer for the devices that support this statement in the default L3 routing instance (at the `[edit protocols evpn oism pim-evpn-gateway]` hierarchy level).

All peer PEG devices must use the same DF election mechanism. As a result, if you enable PEG DF election, configure the same DF election method symmetrically on all peer PEG devices. If the configured PEG DF election methods don't match, the peer PEG devices all fall back to using the default mod-based PEG DF election method. If you enable PEG DF election on only some of the peer PEG devices, all of the devices fall back to using PIM-based DF election.

Options

delay-time *seconds*

Time to wait (in seconds) before applying the selected method to elect a PEG DF.

- **Range:** 1 through 1800

mod

Use mod-based PEG DF election. This method is the default if you enable PEG DF election but don't specify this option or the `preference` option.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

per-esi

IN THIS SECTION

- Syntax | 12913
- Hierarchy Level | 12913
- Description | 12914
- Options | 12914
- Required Privilege Level | 12915
- Release Information | 12915

Syntax

```
per-esi {
    lacp-oos-on-ndf;
}
```

Hierarchy Level

```
[edit interfaces name esi df-election-granularity]
```

Description

Ensure that all the member links in an aggregated Ethernet (AE) interface between a multihomed customer edge (CE) device and its multihoming peer provider edge (PE) devices take the same designated forwarder (DF) election role per Ethernet segment (ES). The behavior with this option is called port-based DF election with EVPN multihoming.

You can't configure this statement and the `df-election-granularity per-esi-vlan` statement at the same time. If you configure one of these statements when the other is already set, the CLI replaces the existing setting with the new one.

With active-standby multihoming, if the CE device has an AE interface that shares member links with both the active and standby peer PE devices, you must include the `lacp-oos-on-ndf` option with this statement. By default, the multihomed CE device load balances traffic toward the peer PE devices among all the AE links on the ES. The `lacp-oos-on-ndf` option ensures that the member link to the PE device that isn't the DF (the non-DF) remains in LACP Waiting state so the device only sends traffic on the link to the DF PE device. Otherwise, if the CE device sends part of the traffic to the non-DF, the non-DF doesn't forward it and the network loses some traffic.

> **NOTE**: You cannot enable the `sync-reset` statement at the `[edit interfaces` *`name`* `aggregated-ether-options lacp]` level when you have the `lacp-oos-on-ndf` statement enabled.

Options

lacp-oos-on-ndf

In an EVPN single-active configuration, the PE device that is the non-DF will send LACP out-of-sync packets to the multihomed CE device. As a result, LACP goes down on the CE device, and the CE device does not send traffic on the links connected to the non-DF.

If the connection between a CE device and the DF PE device fails, the DF election process selects a new DF. If the connection between the CE device and a non-DF PE device fails, the current DF assignment remains the same.

This option only applies to single-active multihoming where the CE device has an AE interface with member links to multiple peer PE devices associated with an ESI. The CLI doesn't allow you to configure this option if:

- You configure an ES with active-active (all-active) multihoming.
- The interface is not an AE interface.
- You didn't enable LACP on the AE interface.

Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

```
[edit interfaces interface-name esi df-election-granularity],
[edit interfaces interface-name unit logical-unit-number esi df-election-granularity]
```

Description

Enable the designated forwarder (DF) election granularity to support Ethernet segment ID (ESI) at the EVPN instance (EVI) level.

You can configure multiple access interfaces to support ESI at the EVI level between a multihomed customer edge (CE) device and its multihoming provider edge (PE) peer. When you configure the access interfaces in the same EVI with the same ESI and the `per-evi` statement, these interfaces will share the same designated forwarder (DF) election role. They will transition to the backup designated forwarder (BDF) role only if all the access interfaces within the EVI fail. This configuration avoids traffic disruptions caused by role changes due to a single interface failure in the EVI.

To enable the ESI at the EVI level support:

- Configure a unique ESI at the EVI level.
  - [edit routing-instances *routing-instance-name* protocols "evpn" on page 6839 esi]
- Configure the access logical interfaces (IFLs) with the same ESI value as the EVI.
  - [edit interfaces *interface-name* unit *logical-unit-number* "esi" on page 6742]

  > **NOTE**: Different IFLs under different physical interfaces (IFDs) can have the same ESI configured, but they must be part of the same bridge domain.

- Configure the IFLs with the "df-election-granularity" on page 5825 option `per-evi`.
- Configure the IFLs with the `esi single-active` option.

- Configure the IFLs with the "df-election-type" on page 5827 option `mod`.

> **NOTE**: If you configure the the `df-election-granularity per-evi` option, you must also configure the "df-election-type" on page 5827 `mod` option without configuring a `df-election-type preference` option to prevent an error when committing the configuration.

The following shows snippets from a sample configuration:

```
user@MX960> show configuration interfaces

- Hierarchy Level | 12920
- Description | 12920
- Options | 12920
- Required Privilege Level | 12921
- Release Information | 12921

Syntax

```
per-flow;
```

Hierarchy Level

```
[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful]
```

Description

Enable the mechanism to perform an even, effective distribution of traffic flows across member links of an aggregated Ethernet interface (ae) bundle on MX Series routers with MPCs, except MPC3Es and MPC4Es. When multiple flows are transmitted out of an ae interface, the flows must be distributed across the different member links evenly to enable an effective and optimal load-balancing behavior. To obtain a streamlined and robust method of load-balancing, the member link of the aggregated Ethernet interface bundle that is selected each time for load balancing plays a significant part.

Options

per-flow Enable the stateful load-distribution mechanism per traffic flow on an aggregated Ethernet interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2R1.

group-name family inet labeled-unicast],
[edit routing-instances instance-name protocols bgp family inet labeled-unicast],
[edit routing-instances instance-name protocols bgp group group-name family inet labeled-unicast]
```

Description

Allocate a unique label for each prefix. The `per-prefix-label` statement helps minimize packet loss in most deployments.

Although allocating a label for each prefix is not generally ideal for scaling, it is assumed that a small number of labels are used for BGP labeled-unicast. When labeled BGP is used to set up transport label-switched paths (LSPs), the common case is that each prefix has a unique next hop. Thus, the use of per-prefix labels does not have an adverse scaling impact. On the contrary, the use of per-prefix labels reduces churn in the network when multipath load balancing is enabled for IPv4 labeled-unicast, and a subset of the paths are withdrawn for some reason.

The advantage of per-prefix labeling is that the advertised upstream label is more stable during network changes. That is, if the downstream label changes, the advertised upstream label remains the same under most scenarios. This way, the upstream router is isolated from the downstream network change, and the overall network is more stable. The greater stability of the advertised upstream label helps to reduce traffic loss during many different network change scenarios.

Default

By default, label allocation is per next-hop router.

```

Description

Typically, in the BGP FlowSpec filter, an individual counter was added for each FlowSpec term configured. As part of optimization to FlowSpec, starting from Junos OS Evolved Release 21.1R1 this behavior is changed, and counter action is not added by default. We now support a higher scale of flows in BGP FlowSpec filter. You can achieve this by reducing the number of terms in the BGP FlowSpec filter using the filter optimization techniques without affecting the functionality. The `per-route-accounting` is not configured by default. To create room for term compression, the default per-term counters are disabled. However, to enable per-term counter a new CLI command, per-route-accounting has been introduced under the existing `[edit routing-options-flow]` hierarchy level.

The new algorithm used for term compression does not need branching.

Algorithm for Term Compression

Consider the current term and the next term, if these two terms are capable of being merged (see "Term merging conditions" section), merge these two terms.

If the two terms are merged, use the merged term as the current term and repeat this process.

If the two terms cannot be merged, use the consecutive next term as the current term and repeat this process.

Term merging conditions: Case 1

1. Both the terms have same set of actions.
2. Both the terms have same type and same number of match conditions.
3. If there are 'n' match conditions, at least 'n-1' match conditions must have identical values.
4. In a term, maximum 1 match can have non-identical values. And the values of this match from the second term can be merged with the corresponding values in the first term.
5. The second term will be eliminated if it is merged.

Example

```
Term t1 and t2 differ only by protocol values
Term t1 {
      from {
            source-address 10.10.10.1/32
            source-port 40
            protocol udp
            }
      then accept
      }
Term t2 {
      from {
            source-address 10.10.10.1/32
            source-port 40
            protocol tcp
            }
      then accept
      }
Term t1 after merging: protocol values got merged, term t2 is eliminated:
Term t1 {
      from {
            source-address 10.10.10.1/32
            source-port 40
            protocol udp tcp
```

```
            }
      then accept
}
```

Term merging conditions: Case 2

1. For every match in first term there should be a corresponding match of same type in second term.
2. All the match conditions in the first term have values which are identical to or superset of the values present in the corresponding match in the second term.
3. The match conditions present in first term fully covers the corresponding matches in the second term. Hence the second term will not get hit. So, that leads to:
   a. The second term can have additional match conditions of different type.
   b. The action present in second term need not match with that of first term.
4. If the above conditions are satisfied, then the second term will be eliminated.

Example

```
Term t1 has match conditions values are superset/identical to that of term t2
Term t1 {
      from {
            source-address {                  <<<<<<<<<<<<< Super set of term2's match condition
values
                  10.10.10.1/32
                  10.10.10.2/32
                  }
            source-port 40-50              <<<<<<<<<<<<< Super set of term2's match condition
values
            protocol tcp udp                 <<<<<<<<<<<<< Super set of term2's match condition
values
            }
      then discard
}
Term t2 {
      from {
            source-address 10.10.10.1/32
            source-port 40
            protocol udp
            destination-port 50              <<<<<<<<<< Term2 can have additional match
```

```
conditions
            }
      then accept                                <<<<<<<<<<< Actions may differ
}
```

```
In this case, term t2 will be eliminated. There is no match values merge in this case.
As a result:
Term t1 {
      from {
            source-address {
                  10.10.10.1/32
                  10.10.10.2/32
                  }
            source-port 40-50
            protocol tcp udp
      }
then discard
}
```

per-unit-scheduler

IN THIS SECTION

- Syntax | 12933
- Hierarchy Level | 12933
- Description | 12933
- Required Privilege Level | 12934
- Release Information | 12934

Syntax

```
per-unit-scheduler;
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

Enable the association of scheduler maps or traffic control profiles with logical interfaces.

CAUTION: Turning on per-unit scheduling causes the interface to reinitialize, which means all logical interfaces (units) on the interface are deleted and recreated.

When including the `per-unit-scheduler` statement, you must also include the `vlan-tagging` statement or the `flexible-vlan-tagging` statement (to apply scheduling to VLANs) or the `encapsulation frame-relay` statement (to apply scheduling to DLCIs) at the `[edit interfaces interface-name]` hierarchy level.

NOTE: To enable per-unit scheduling on MX80 and MX104 routers, configure the `per-unit-scheduler` statement at each member physical interface level of a particular aggregated Ethernet interface as well as at that aggregated Ethernet interface level. On

other routing platforms, it is enough if you include this statement at the aggregated Ethernet interface level.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Configuring Ethernet Frame Delay Measurement Sessions

periodic (Chassis)

IN THIS SECTION

- Syntax | 12946
- Hierarchy Level | 12946
- Description | 12946
- Options | 12946
- Required Privilege Level | 12947

Release Information | 12947

Syntax

```
periodic {
    ch-power-check-interval seconds;
    no-sib-asic-stats;
    one-sib-per-check;
    re-check-interval seconds;
    slow-fpc-check;
    yield-cpu;
}
```

Hierarchy Level

```
[edit chassis]
```

Description

Chassisd periodic options

Options

ch-power-check-interval

Chassis power check interval, 0=default (seconds)

- **Default:** 0
- **Range:** 0 through 60

no-sib-asic-stats

Disable asic statis for all SIBs in periodic

one-sib-per-check

Check one SIB per periodic

re-check-interval

Chassis RE check interval, 0=default (seconds)

- **Default:** 0
- **Range:** 0 through 60

slow-fpc-check Slow FPC check in periodic

yield-cpu Yield cpu in FRU periodic

Required Privilege Level

[none specified]

Release Information

Statement introduced in Junos OS Release 16.2R1.

periodic (Interfaces)

IN THIS SECTION

- Syntax | 12947
- Hierarchy Level | 12948
- Description | 12948
- Options | 12948
- Required Privilege Level | 12948
- Release Information | 12948

Syntax

```
periodic (fast | slow);
```

Hierarchy Level

```
[edit interfaces interface-name redundant-ether-options lacp]
```

Description

For redundant Ethernet interfaces in a chassis cluster only, configure the interval at which the interfaces on the remote side of the link transmit link aggregation control protocol data units (PDUs) by configuring the `periodic` statement on the interfaces on the local side. It is the configuration on the local side that specifies the behavior of the remote side. That is, the remote side transmits link aggregation control PDUs at the specified interval.

Options

- `fast`—Transmit link aggregation control PDUs every second.
- `slow`—Transmit link aggregation control PDUs every 30 seconds.
- **Default:** `fast`

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

periodic-traceroute

IN THIS SECTION

- Syntax | 12951
- Hierarchy Level | 12951
- Description | 12951
- Options | 12951
- Required Privilege Level | 12952
- Release Information | 12952

Syntax

```
periodic-traceroute {
    disable;
    exp exp-value;
    fanout fanout-value;
    frequency minutes;
    paths number-of-paths;
    retries retry-attempts;
    source address;
    ttl ttl-value;
    wait seconds;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp oam],
[edit logical-systems logical-system-name protocols ldp oam fec fec-address],
[edit protocols ldp oam],
[edit protocols ldp oam fec fec-address]
```

Description

Enable tracing of forwarding equivalence classes (FECs) for LDP LSPs.

Options

`disable`—(Optional) Disable tracing for a specific FEC. This option is available at the `[edit protocols ldp oam fec fec-address periodic-traceroute]` and `[edit logical-systems logical-system-name protocols ldp oam fec fec-address periodic-traceroute]` hierarchy levels only.

`exp exp-value`—(Optional) Specify the class of service to use when sending probes.

- **Default:** 7
- **Range:** 0 through 7

`fanout fanout-value`—(Optional) Specify the maximum number of next hops to search per node.

- **Default:** 16

- **Range:** 1 though 16

`frequency` *`minutes`*—(Optional) Specify the interval between traceroute attempts.

- **Default:** 60 minutes
- **Range:** 15 through 120 minutes

`paths` *`number-of-paths`*—(Optional) Specify the maximum number of paths to search.

- **Default:** 3
- **Range:** 1 through 255

`retries` *`retry-attempts`*—(Optional) Specify the number of attempts to send a probe to a specific node before giving up.

- **Default:** 3
- **Range:** 1 through 9

`source` *`address`*—(Optional) Specify the IPv4 source address to use when sending probes.

`ttl` *`value`*—(Optional) Specify the maximum time-to-live value. Nodes that are beyond this value are not traced.

- **Default:** 64
- **Range:** 1 through 255

`wait` *`seconds`*—(Optional) Specify the wait interval before resending a probe packet.

- **Default:** 10 seconds
- **Range:** 5 though 15 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.
Support added at the `[edit protocols ldp oam]` and `[edit logical-systems` *`logical-system-name`* `protocols ldp oam]` hierarchy levels in Junos OS Release 9.0.

permit (Security Persistent NAT)

IN THIS SECTION

- Syntax | 12953
- Hierarchy Level | 12953
- Description | 12953
- Options | 12953
- Required Privilege Level | 12954
- Release Information | 12954

Syntax

```
permit ( any-remote-host | target-host | target-host-port );
```

Hierarchy Level

```
[edit security nat source rule-set ruleset rule rule then source-nat interface persistent-nat]
[edit security nat source rule-set ruleset rule rule then source-nat pool persistent-nat]
```

Description

Configure persistent NAT mappings.

Options

- `any-remote-host`—All requests from a specific internal IP address and port are mapped to the same reflexive transport address. (The reflexive transport address is the public IP address and port created

by the NAT device closest to the STUN server.) Any external host can send a packet to the internal host by sending the packet to the reflexive transport address.

- `target-host`—All requests from a specific internal IP address and port are mapped to the same reflexive transport address. An external host can send a packet to an internal host by sending the packet to the reflexive transport address. The internal host must have previously sent a packet to the external host's IP address.
- `target-host-port`—All requests from a specific internal IP address and port are mapped to the same reflexive transport address. An external host can send a packet to an internal host by sending the packet to the reflexive transport address. The internal host must have previously sent a packet to the external host's IP address and port.

> **NOTE**: The target-host-port configuration is not supported for NAT64 when configured with IPv6 address.

Required Privilege Level

`security`—To view this statement in the configuration.

`security-control`—To add this statement to the configuration

Release Information

Statement introduced in Junos OS Release 9.6. Support.

        pair-policy pair-policy;
    }
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then]
```

Description

Specify the policy action to perform when packets match the defined criteria.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5. Support for the `tcp-options` added in Junos OS Release 10.4. Support for the `services-offload` option added in Junos OS Release 11.4. Support for the `ssl-termination-profile` and `web-redirect-to-https` options added in Junos OS Release 12.1X44-D10. Support for the `user-firewall` option added in Junos OS Release 12.1X45-D10. Support for the `advanced-connection-tracking` option is added in Junos OS Release 20.2R1.

You can configure the `advanced-connection-tracking` option under `[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit]` to mandate that traffic matching given policy do a lookup in the *to-zone*'s connection track mapping table using the new session's key information. If there is no match, a new connection is not created.

- Syntax (PTX10000 Series) | 12968
- Hierarchy Level | 12968
- Description | 12968
- Options | 12969
- Required Privilege Level | 12969
- Release Information | 12969

Syntax (PTX10000 Series)

```
pfc-account {
     name;
    pfc-priority pfc-priority;
    xoff xoff;
    xon xon;
}
```

Hierarchy Level

```
[edit class-of-service congestion-notification-profile name input]
```

Description

Define a PFC account for a congestion notification profile (CNP).

Options

name PFC account name

pfc-priority PFC priorities (set of priorities)

- **Range:** 0 through 7

xoff (Optional) Specifies account threshold for pause in microseconds of source port speed. When the XOFF threshold is reached, a PFC pause frame is generated with the `pfc-priority` defined here. Think of XOFF as a virtual buffer that can hold packets for the defined length of time.

- **Range:** Varies by platform
- **Default:**5000

xon (Optional) Specifies account threshold for resume in microseconds of source port speed. When the congestion is mitigated and the buffer size comes under the XON threshold, a resume frame is generated and sent upstream to restart the data traffic. The minimum value for XON must be at least 50 percent of XOFF. We recommend that if you configure XOFF that you also configure XON.

- **Range:** Varies by platform
- **Default:**3750

Required Privilege Level

[none specified]

Release Information

Statement introduced in Junos OS Evolved Release 20.4R1.

pfc-priority

IN THIS SECTION

- Syntax | 12970
- Hierarchy Level | 12970
- Description | 12970
- Options | 12971
- Required Privilege Level | 12971
- Release Information | 12971

Syntax

```
pfc-priority pfc-priority;
```

Hierarchy Level

```
[edit class-of-service forwarding-classes class class-name]
```

Description

Explicitly map a forwarding class to a priority-based flow control (PFC) priority value.

To support lossless behavior for untagged traffic across Layer 3 connections to Layer 2 subnetworks, you can configure PFC to be invoked based on a configured 6-bit Distributed Services code point (DSCP) value in the Layer 3 IP header, rather than an IEEE 802.1p code point in a VLAN header at Layer 2. However, because PFC sends Layer 2 pause frames specifying a PFC priority on which to notify the peer about congestion, this statement defines the PFC priority to use in pause frames when PFC is triggered by a configured DSCP value.

DSCP-based PFC is used to support Remote Direct Memory Access (RDMA) over converged Ethernet version 2 (RoCEv2).

To enable DSCP-based PFC:

- Use this statement to map a lossless forwarding class to a PFC priority value to use in the PFC pause frames.
- Use the `[edit class-of-service congestion-notification-profile name input] dscp` statement to define an input congestion notification profile to enable PFC on traffic specified by a desired DSCP value.
- Use the `[edit class-of-service classifiers] dscp` statement to set up a DSCP classifier for the desired DSCP value and forwarding class mapped to a PFC priority above.

Options

pfc-priority—3-bit PFC priority value in decimal form (0-7).

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.4R1.

Syntax

```
pfe pfe-instance power (off | on);
```

Hierarchy Level

```
[edit chassis fpc slot-number]
```

Description

Configure a Packet Forwarding Engine (PFE) to remain powered off when an FPC comes online or power off or power on a PFE during runtime. Click here to see the platforms supporting `pfe` configuration options.

Default

`on`

Options

pfe *pfe-id* The ID of the Packet Forwarding Engine to be powered off.

> **NOTE**:
>
> - Powering off a supported PFE using this configuration command triggers an automatic FPC restart on an MX series router.
> - For the MPC10E-15C-MRATE line card, only the Packet Forwarding Engine 2 is applicable.

power (off | on) Power off or on the selected Packet Forwarding Engine.

- **Default:** on

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.1R1.

Description

Configure options for the Packet Forwarding Engine (PFE). Click here to see the platforms supporting `pfe` configuration options.

Options

pfe-instance* or *pfe-id

PFE identifier or PFE number that represents the PFE ASIC ID ranges from 0-4 for PTX10004 and 0-7 for PTX10008 devices.

PFE identifier or PFE number that represents the PFE ASIC ID. The value is 0 for ACX7024, and ACX7024X devices.

PFE identifier or PFE number that represents the PFE ASIC ID. The value is 0 for ACX7100-48L and ACX7100-32C devices.

PFE identifier or PFE number that represents the PFE ASIC ID. The value is 0 or 1 for ACX7509 devices.

PFE identifier or PFE number that represents the PFE ASIC ID. The value is 0 for ACX7348 and ACX7332 devices.

power

Power PFEs on or off. See "pfe power off" on page 12971 for more details.

temp-perf-throttle-disable

Disable temperature based PFE performance throttling. By default, the system detects overheat condition at individual PFE level and gradually reduces the performance of the affected PFE. This results in reduction of power consumption, heat dissipation, PFE operating temperature, and prevents line card shutdown.

- **Default**

  By default, automatic performance throttling is enabled.

temp-volt-reduction-disable Disable temperature based PFE voltage reduction. By default, the system detects the ASIC temperature at individual PFE level that reaches the safe operating limit and dynamically manages the voltage of the DC-DC converters. This results in reduction of power consumption.

- **Default**

  By default, temperature voltage reduction is enabled.

tunnel-services Tunnel services configuration

Syntax

```
pgcp-service {
    command binary-file-path;
    disable;
    failover (alternate-media | other-routing-engine);
}
```

Hierarchy Level

```
[edit system processes]
```

Description

Specify the Packet Gateway Control Protocol (PGCP) that is required for the border gateway function (BGF) feature.

Options

- `command` *`binary-file-path`*—Path to the binary process.
- `disable`—Disable the Packet Gateway Control Protocol (PGCP) process.
- `failover`—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.
  - `alternate-media`—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.
  - `other-routing-engine`—Instruct the secondary Routing Engine to take primary role if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, the device reboots from the secondary Routing Engine.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

phase-adjust-threshold

IN THIS SECTION

- Syntax | 12981
- Hierarchy Level | 12981
- Description | 12981
- Options | 12981
- Required Privilege Level | 12982
- Release Information | 12982

Syntax

```
phase-adjust-threshold phase-offset
```

Hierarchy Level

```
[edit protocols ptp]
```

Description

The phase adjust threshold option is the maximum phase offset that will be adjusted by the G.8275.2 enhanced servo in a phase-aligned state. A higher phase adjust threshold permits a clock to tolerate phase offset changes because of higher network packet delay variation (PDV). This option can be used for PTP applications which do not demand the strict requirements that are typically needed in the case of telecom applications.

Options

phase-offset The maximum phase offset value in nanoseconds (ns).

- Range: 1100 ns through 100000 ns
- Default: 1100 ns

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.4R1 for MX10008.

Supported on ACX7100-32C, ACX7100-48L, and ACX7024 in Junos OS Evolved Release 24.2R1.

phase-lock-threshold

IN THIS SECTION

- Syntax | 12984
- Hierarchy Level | 12984
- Description | 12984
- Options | 12984
- Required Privilege Level | 12985
- Release Information | 12985

Syntax

```
phase-lock-threshold phase-offset
```

Hierarchy Level

```
[edit protocols ptp]
```

Description

The phase lock threshold option controls the maximum phase offset with which G.8275.2 enhanced servo enters the phase-aligned state. Phase locking with a higher phase lock threshold leads to the servo and time receiver getting into the phase-aligned state quickly. This higher offset is subsequently adjusted in the phase-aligned state. This option can be used for PTP applications which do not demand the strict requirements that are typically needed in the case of telecom applications.

Options

phase-offset The maximum phase offset value in nanoseconds (ns).

- Range: 100 ns through 1000 ns
- Default: 200 ns

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.4R1 for MX10008.

Supported on ACX7100-32C, ACX7100-48L, and ACX7024 in Junos OS Evolved Release 24.2R1.

phy-timestamping

IN THIS SECTION

- Syntax | 12986
- Hierarchy Level | 12986
- Description | 12986
- Required Privilege Level | 12986
- Release Information | 12986

Syntax

```
phy-timestamping
```

Hierarchy Level

```
[edit protocols ptp]
```

Description

Configure timestamping of the IEEE 1588 event packets at the physical layer. Timestamping the packet at the physical layer, also known as PHY timestamping, eliminates the noise or the packet delay variation (PDV) that is introduced by the Packet Forwarding Engine.

By default PHY timestamping is disabled.

On Junos EVO platforms, PHY timestamping is enabled by default and the `phy-timestamping` configuration option is unavailable.

NOTE: MX104 routers and the MPC5E and MPC6E line cards do not support PHY timestamping in WAN PHY mode. If the interface framing is changed from LAN PHY mode to WAN PHY mode or WAN PHY mode to LAN PHY mode on MX104, MPC5E, or MPC6E, you must reboot the MX104 router or the MPC5E and MPC6E line cards. For PHY timestamping to work for MX104 routers and the MPC5E and MPC6E line cards, the packet forwarding engine must come up in LAN PHY mode after a reboot.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1R1.

Precision Time Protocol Overview

physical-interface (DDoS Flow Detection)

IN THIS SECTION

- Syntax | 12987
- Hierarchy Level | 12987
- Description | 12987
- Options | 12988
- Required Privilege Level | 12989
- Release Information | 12989

Syntax

```
physical-interface  (flow-bandwidth | flow-control-mode | flow-detection-mode)
```

Hierarchy Level

```
[edit system ddos-protection protocols protocol-group packet-type flow-level-bandwidth],
[edit system ddos-protection protocols protocol-group packet-type flow-level-control],
[edit system ddos-protection protocols protocol-group packet-type flow-level-detection]
```

Description

(MX Series routers with only MPCs, T4000 Core Routers with only FPC5s, or EX9200 switches) Configure flow bandwidth, flow control mode, or flow detection mode at the physical interface flow aggregation level for the packet type.

Options

flow-bandwidth—Bandwidth for the flow at the physical interface level. Available only at the `[edit system ddos-protection protocols` *protocol-group packet-type* `flow-level-bandwidth]` hierarchy level.

- **Default:** 20,000 packets per second
- **Range:** 1 through 50,000 packets per second

flow-control-mode—Mode for how traffic in the detected flow is controlled at the physical interface level. Available only at the `[edit system ddos-protection protocols` *protocol-group packet-type* `flow-level-control]` hierarchy level.

> **NOTE**: The configuration at this level overrides the global configuration using the `flow-level-control` statement at the `[edit system ddos-protection global]` hierarchy level.

- `drop`—Drop all traffic in flow.
- `keep`—Keep all traffic in flow.
- `police`—Police the traffic to within its allowed bandwidth.
- **Default:** `drop`

flow-detection-mode—Mode for how flow detection operates at the physical interface level when a policer has been violated. Available only at the `[edit system ddos-protection protocols` *protocol-group packet-type* `flow-level-detection]` hierarchy level.

> **NOTE**: The configuration at this level overrides the global configuration using the `flow-detection-mode` statement at the `[edit system ddos-protection global]` hierarchy level.

- `automatic`—Search flows at the physical interface level only when a DDoS policer is being violated and only when the policer violation is not discovered at the finer aggregation levels, logical interface or subscriber. Flows at the physical interface level are subsequently not searched again until a subsequent violation occurs that cannot be found at the subscriber or logical interface levels.
- `off`—Disable flow detection at the physical interface level so that flows are never searched at this level.
- `on`—Search flows at the physical interface level, even when no DDoS protection policer is currently being violated. Monitoring continues at this level regardless of whether a suspect flow is identified at this level.
- **Default:** `automatic`

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

Support for Enhanced Subscriber Management added in Junos OS Release 17.3R1.

physical-interface-filter

IN THIS SECTION

- Syntax | 12989
- Hierarchy Level | 12990
- Description | 12990
- Required Privilege Level | 12991
- Release Information | 12991

Syntax

```
physical-interface-filter;
```

Hierarchy Level

```
[edit firewall family family-name filter filter-name],
[edit logical-systems logical-system-name firewall family family-name filter filter-name],
[edit routing-instances routing-instance-name firewall family family-name filter filter-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name firewall family
family-name filter filter-name]
```

Description

Configure a physical interface filter. Use this statement to reference a physical interface policer for the specified protocol family.

For PTX series routers running Junos OS Release 18.3R1 or later, you can use this command to configure separate firewall filters for different family address types (IPv4 and IPv6) that share the same interface, and configure the same policer as an action for the filter.

To use the aggregate policer, configure the firewall policer you want as `physical-interface-policer`. In addition, at the `firewall family family-name filter filter-name` hierarchy level where you will reference the policer, make the policer a `physical-interface-filter` firewall filter action. This creates a unique instance of the filter on the physical interface.

The sample configuration shows the settings and relationship between them.

```
firewall {
    policer Shared_Policer {
      physical-interface-policer;
        if-exceeding {
            bandwidth-limit 100m;
            burst-size-limit 500k;
        }
        then {
            discard;
        }
    }
}
```

```
firewall {
    filter Filter_Name {
        physical-interface-filter;
```

```
        term term_name {
            then {
                policer Shared_Policer;
                count cinet;
            }
        }
    }
}
```

```
family inet {
    filter filter_name {
       physical-interface-filter;
        term term_name {
            then {
                policer Shared_Policer;
                count cinet;
            }
        }
    }
}
```

policer policer-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name firewall three-
color-policer policer-name]
```

Description

Configure an aggregate policer for a physical interface.

A physical interface policer can be a two-color or three-color policer. When you apply physical interface policer, to different protocol families on the same logical interface, the protocol families share the same policer instance. This means that rate limiting is performed in aggregate for the protocol families for

which the policer is applied. This feature enables you to use a single policer instance to perform aggregate policing for different protocol families on the same physical interface. If you want a policer instance to be associated with a protocol family, the corresponding physical interface filter needs to be applied to that protocol family. The policer is not automatically applied to all protocol families configured on the physical interface.

In contrast, with logical interface policers there are multiple separate policer instances.

Syntax

```
pic pic-number {
    fte {
        (port port-number | port-range port-range-low port-range-high);
    }
    xe {
        (port port-number | port-range port-range-low port-range-high);
    }
}
```

Hierarchy Level

```
[edit chassis interconnect-device name fpc slot]
```

Description

(QFX3600 Node device only) Configure port types on QFX3600 Node devices.

CAUTION: The Packet Forwarding Engine on the QFX3600 Node device is restarted when you commit the port type configuration changes. As a result, you might experience packet loss on the Node device.

Options

pic *pic-number*	Number of the physical interface card (PIC) on which you want to configure port types. Specify **0** to configure *xe* (10-Gigabit Ethernet) type ports. Specify **1** to configure *fte* (40-gigabit data plane uplink) type ports.
fte	Configure a specific port or a range of ports to operate as 40-gigabit data plane uplink ports.
xe	Configure a specific port or a range of ports to operate as four 10-Gigabit Ethernet ports.
port-number	Port number on which you want to configure the port type. Valid values are 0 through 7 if the port type is `fte`, and 2 through 15 if the port type is `xe`.
port-range-low	Lowest-numbered port in the range of ports. The lowest possible value is 0 if the port type is `fte`. The lowest possible value is 2 if the port type is `xe`.
port-range-high	Highest-numbered port in the range of ports. The highest possible value is 7 if the port type is `fte`. The highest possible value is 15 if the port type is `xe`.

NOTE:

- By default, ports Q0 through Q3 operate as fte type ports, and ports Q4 through Q15 operate as xe type ports.
- Only ports Q0 through Q7 can be configured as fte type ports.
- Only ports Q2 through Q15 can be configured as xe type ports.

NOTE: When you delete the port type configuration for an individual port or a block of ports, the ports return to operating in their default port type.

Description

(QFX3500, QFX3600, and QFX5100 standalone switches running Enhanced Layer 2 Software only)—Configure a specific port or a range of ports to operate as 10-Gigabit Ethernet ports or 40-Gigabit Ethernet ports.

Enable the specified port on the Physical Interface Card (PIC) to perform in the specified operating mode.

Options

pic ***pic-number***	(QFX3500 standalone switch only) Number of the physical interface card (PIC) on which you want to configure port types. Specify **1** to configure 10-Gigabit Ethernet or 40-Gigabit Ethernet type ports. (QFX3600 standalone switch only) Number of the physical interface card (PIC) on which you want to configure port types. Specify **0** to configure 10-Gigabit Ethernet or 40-Gigabit Ethernet type ports.
port ***physical-port-number***	Port number on which you want to configure the port type.
port-range*port-range-low*	Lowest-numbered port in the range of ports.
port-range*port-range-high*	Highest-numbered port in the range of ports.
channel-speed (*speed* **|disable-auto-speed-detection)**	Configure *10g* for 10-Gigabit Ethernet type ports, and configure disable-auto-speed-detection) to disable auto-channelization.

> **NOTE**: This statement is not supported on the OCX Series.

- On a QFX3500 switch, specify **0** if the port type is `fiber-channel`, and **2** if the port type is `xle`.
- On a QFX3600 switch, specify **0** if the port type is `xe`, and **1** if the port type is `xle`.
- On a QFX5100 switch, specify **0** if the port type is `xe`, and **1** if the port type is `xle` and `fte`.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Options `xe` and `xle` introduced in Junos OS 12.2X50-D20 for the QFX Series.

Option `channel-speed` introduced in Junos OS Release 13.2 for the QFX Series.

- Hierarchy Level | 13009
- Description | 13009
- Options | 13009
- Required Privilege Level | 13010
- Release Information | 13010

Syntax

```
pic-boot-timeout (240 | 300);
```

Hierarchy Level

```
[edit interfaces interface-name multiservice-options]
```

Description

Set the service PIC boot timeout value to 240 or 300 seconds for every services PIC on the MX Series router if you are configuring more than 24 members in an aggregated multiservices (AMS) interface. We recommend setting the boot timeout value to 240. Starting with Junos OS Release 16.2, an AMS interface can have up to 32 member interfaces. In Junos OS Release 16.1 and earlier, an AMS interface can have a maximum of 24 member interfaces.

If you do not set the timeout value to 240 or 300 and you configure an AMS interface with more than 24 members, the default value of 180 causes some of the service PICs to go offline.

Options

240 Service PIC boot timeout is set to 240 seconds.

300 Service PIC boot timeout is set to 300 seconds.

- **Default:** 180

Required Privilege Level

pic-mode (MX Series)

IN THIS SECTION

- Syntax | 13015
- Hierarchy Level | 13015
- Description | 13015

- Options | 13016
- Required Privilege Level | 13017
- Release Information | 13017

Syntax

```
pic-mode pic-speed;
```

Hierarchy Level

```
[edit chassis fpc slot pic pic-number ]
```

Description

Configure the operating speed of all ports on the MPC7E-MRATE MPC, MIC-MRATE MIC, MX10003 MPC, and MX204 routers.

(MX240, MX480, MX960, MX2010, and MX2020 routers with MPC7E-MRATE) To configure 100 Gbps, 10 Gbps, and 40 Gbps speed on all supported ports, specify `100G`, `10G`, or `40G`, respectively, as the speed for the specified PIC. All the six ports of PIC 0 and PIC 1 of an MPC7E-MRATE MPC support 10-Gbps and 40-Gbps speeds. However, only ports 2 and 5 of PIC 0 and PIC 1 support 100-Gbps speed. Therefore, if you configure `100G` as the operating speed of a PIC, the PIC is rebooted and the ports 0, 1, 3, and 4 are disabled.

(MX2010 and MX2020 routers with MIC-MRATE on MPC8E and MPC9E) To configure the port speed at MIC level or on all supported ports, specify `100G`, `10G`, or `40G`, respectively, as the speed for the MIC-MRATE MIC on MPC8E and MPC9E. All the twelve ports of MIC-MRATE MIC support 10 Gbps and 40 Gbps speeds. When you configure the port speed as 100 Gbps at the PIC level for MPC8E, you can configure only 4 ports of the 12 MIC-MRATE ports on MPC8E to operate at 100 Gbps port speed. The other ports are disabled. Therefore, if you configure `100G` as the operating speed for ports 0, 1, 6, and 7, the other ports are disabled on MPC8E. Similarly, when you configure the port speed as 100 Gbps at the PIC level you can configure only 8 ports of the 12 MIC-MRATE ports on MPC9E with 100 Gbps port speed. Therefore, if you configure `100G` as the operating speed for ports 0, 1, 2, 3, 6,7, 8, and 9, the other ports can support only 40 Gbps or 10 Gbps. However, enabling port speed of 40 Gbps or 10 Gbps at the PIC level, enables all ports and sets the desired port speed on all ports.

(MX10003 routers with MX10003 MPC) To configure 100 Gbps, 10 Gbps, and 40 Gbps speed on all supported ports, specify 100G, 10G, or 40G, respectively, as the speed for the specified PIC. All the six ports of the fixed port PIC support 10-Gbps and 40-Gbps speeds. All the 12 ports of the Multi-rate MIC support 100-Gbps, 10-Gbps and 40-Gbps speeds. To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the `pic-mode` statement and specify the port speed. For more information see MX10003 MPC (Multi-Rate) and Supported Active Physical Ports on MX10003 MPC to Prevent Oversubscription.

(MX204 routers) To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the `pic-mode` statement and specify the port speed. The MX204 has four rate-selectable ports (referred to a PIC 0 ports) that can be configured as 100-Gigabit Ethernet ports or 40-Gigabit Ethernet port, or each port can be configured as four 10-Gigabit Ethernet ports (by using a breakout cable). The MX204 also has eight 10-Gigabit Ethernet ports (referred to as PIC 1 ports).

(MX240, MX480, MX960, MX2010, and MX2020 routers with 10x10GE SFPP and 10x1GE SFP MIC on MPC2E-NG and MPC3E-NG) 10x10GE SFPP and 10x1GE SFP MICs consist of 10 ports that support 10-Gbps and 1-Gbps speeds with PTP and MACsec capabilities. To configure all ports to operate at the same speed, configure rate selectability at the PIC level by using the `pic-mode` statement and specifying the port speed, in which case you cannot configure the speed of individual ports.

> **NOTE**: When you insert the 10x10GE SFPP or 10x1GE SFP MIC into slot 0 of the MPC and run the show commands, it appears under PIC 0. But when you insert the MIC into slot 1 of MPC, it appears under PIC 2 even though only one logical PIC is mapped. This indexing is made to accommodate other MICs that have two logical PICs mapped and prevent physical interface (IFD) name collisions.

The MX204 router does not support heterogeneous mode. That is, in PIC mode if 40-Gbps or 100-Gbps speed is configured on PIC 0, then the "number-of-ports" on page 12224 on PIC 1 must be configured to 0 only. For more information, see MX204 Router Overview.

Use the port-checker tool to check whether the combination of ports you want to use is valid or not.

Options

pic-speed—Operating speed of the interfaces configured on the ports of an MPC7E-MRATE MPC.

`100G`—Supported ports operate at 100 Gbps speed.

`40G`—Supported ports operate at 40 Gbps speed.

`10G`—Supported ports operate at 10 Gbps speed.

`1G`—Supported ports operate at 1 Gbps speed.

- **Default:** `10G`

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

- Release Information | 13018

Syntax

```
pic-mode  mode;
```

Hierarchy Level

```
[edit chassis fpc slot pic pic-number sfpplus]
```

Description

Configure the operating mode for the specified port on the SFP+ uplink module on an EX3200 or EX4200 switch.

On a switch using the SFP+ or SFP+ MACSec uplink module, the `pic-mode` setting defines the speeds of the SFP+ interfaces. When the PIC mode is set to `10g` on the SFP+ or SFP+ MACSec uplink module, uplink ports 0 and 2 support MACSec at 10-Gbps speeds while ports 1 and 3 cannot be used to send any traffic. When the PIC mode is set to `1g`, all four SFP+ ports on the uplink module support MACSec at 1-Gbps speeds.

Options

mode—Operating mode of the SFP+ uplink module:

- **1G**—1-gigabit operating mode
- **10G**—10-gigabit operating mode

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

```
[edit logical-systems logical-system-name protocols],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols],
[edit protocols],
[edit routing-instances routing-instance-name protocols]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable PIM on the routing device.

The remaining statements are explained separately. See CLI Explorer.

Default

PIM is disabled on the routing device.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

family statement introduced in Junos OS Release 9.6.

pim-evpn-gateway

IN THIS SECTION

- Syntax | 13028
- Hierarchy Level | 13029
- Description | 13029
- Options | 13029
- Required Privilege Level | 13029
- Release Information | 13030

Syntax

```
pim-evpn-gateway {
    external-irb irb-interface-name;
    peg-df-election {
      delay-time seconds;
      mod;
      preference {
        use-least;
        value value;
      }
    }
}
```

Hierarchy Level

```
[edit protocols evpn oism],
[edit routing-instances name protocols evpn oism]
```

Description

Configure a border leaf device to act as a PIM EVPN gateway (PEG) for optimized intersubnet multicast (OISM).

The PEG device connects an EVPN fabric to an external PIM domain to route multicast traffic:

- From external sources to receivers in the EVPN fabric.
- From sources in the EVPN fabric to external receivers.

You set this option in the Layer 3 virtual routing and forwarding (VRF) routing instances or in the default L3 routing instance on the EVPN fabric devices.

See Feature Explorer for the devices that support this statement in the default L3 routing instance (at the `[edit protocols evpn oism]` hierarchy level).

Options

`external-irb` *`irb-interface-name`*

Specify an IRB interface the device uses in PEG mode to route multicast traffic to and from the external PIM domain.

Include this option on OISM border leaf devices that use the M-VLAN IRB method for external multicast. You don't configure this option for the classic L3 interface method or the non-EVPN IRB method for external multicast.

See *Supported Methods for Multicast Data Transfer to or from an External PIM Domain* for a list of the methods you can use with OISM on a PEG device to connect the EVPN fabric to external multicast sources and receivers.

The remaining statements are explained separately. See CLI Explorer for all options.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.2R1 and Junos OS Evolved Release 22.1R1.

Support in the default L3 routing instance introduced in Junos OS Evolved Release 25.4R1.

Syntax

```
pim-snooping {
    no-dr-flood;
        traceoptions{
            file [filename  files | no-word-readable | size | word-readable];
            flag [all | general | hello | join | normal | packets | policy | prune | route |
state | task | timer];
        }
    vlan<vlan-id>{
        no-dr-flood;
```

```
    }
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name instance-type vpls
protocols],
[edit logical-systems logical-system-name routing-instances instance-name protocols],
[edit routing-instances instance-name protocols]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

PIM snooping snoops PIM hello and join/prune packets on each interface to find interested multicast receivers and then populates the multicast forwarding tree with the information. PIM snooping is configured on PE routers connected using pseudowires and ensures that no new PIM packets are generated in the VPLS (with the exception of PIM messages sent through LDP on pseudowires). PIM snooping differs from PIM proxying in that PIM snooping floods both the PIM hello and join/prune packets in the VPLS, whereas PIM proxying only floods hello packets.

Default

PIM snooping is disabled on the device.

Options

no-dr-flood Disable default flooding of multicast data on the PIM-designated router port.

traceoptions Configure tracing options for PIM snooping.

vlan *<vlan-id>* Configure PIM snooping parameters for a VLAN.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

PIM Snooping for VPLS

pim-ssm (Provider Tunnel)

IN THIS SECTION

- Syntax | 13032
- Hierarchy Level | 13033
- Description | 13033
- Required Privilege Level | 13033
- Release Information | 13033

Syntax

```
pim-ssm {
    group-address (Routing Instances) address;
    tunnel-source address;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name provider-
tunnel family inet | inet6],
[edit routing-instances routing-instance-name provider-tunnel family inet | inet6]
```

Description

Configure the PIM source-specific multicast (SSM) provider tunnel. Use `family inet6 pim-ssm` for Rosen 7 running on IPv6 . For Rosen 7 on IPv4, use `family inet pim-ssm`. The customer data-MDT can be configured on IPv4 or IPv6, but not both (the provider space always runs on IPv4). Enable Rosen IPv4 before enabling Rosen IPv6.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

In Junos OS Release 17.3R1, the `pim-ssm` hierarchy was moved from `provider-tunnel` to the `provider-tunnel family inet` and `provider-tunnel family inet6` hierarchies as part of an upgrade to add IPv6 support for default multicast distribution tree (MDT) in Rosen 7, and data MDT for Rosen 6 and Rosen 7.

RELATED DOCUMENTATION

Example: Configuring Source-Specific Multicast for Draft-Rosen Multicast VPNs

pim-ssm (Selective Tunnel)

IN THIS SECTION

Syntax | 13034

- Hierarchy Level | 13034
- Description | 13034

tunnel selective wildcard-group-inet6 wildcard-source],
[edit routing-instances routing-instance-name provider-tunnel selective group group-address
source source-address],
[edit routing-instances routing-instance-name provider-tunnel selective group group-address
wildcard-source],
[edit routing-instances routing-instance-name provider-tunnel selective wildcard-group-inet
wildcard-source],
[edit routing-instances routing-instance-name provider-tunnel selective wildcard-group-inet6
wildcard-source]
```

Description

Establish the multicast group address range to use for creating MBGP MVPN source-specific multicast selective PMSI tunnels.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

pim-to-igmp-proxy

IN THIS SECTION

- Syntax | 13035
- Hierarchy Level | 13035
- Description | 13036
- Required Privilege Level | 13036
- Release Information | 13036

Syntax

```
pim-to-igmp-proxy {
    upstream-interface [ interface-names ];
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options multicast],
[edit routing-options multicast]
```

Description

Use the **pim-to-igmp-proxy** statement to have Internet Group Management Protocol (IGMP) forward IPv4 multicast traffic across Protocol Independent Multicast (PIM) sparse mode domains.

Configure the rendezvous point (RP) routing device that resides between a customer edge-facing PIM domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding IGMP report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device.

On the IGMP upstream interface(s) used to send proxied PIM traffic, set the IP address so it is the lowest IP on the network to ensure that the proxying router is always the IGMP querier.

Note too that you should not enable PIM on the IGMP upstream interface(s).

The `pim-to-igmp-proxy` statement is not supported for routing instances configured with multicast VPNs.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

RELATED DOCUMENTATION

Configuring PIM-to-IGMP Message Translation

pim-to-mld-proxy

IN THIS SECTION

- Syntax | **13037**
- Hierarchy Level | **13037**
- Description | **13037**

- Required Privilege Level | 13037
- Release Information | 13038

Syntax

```
pim-to-mld-proxy {
    upstream-interface [ interface-names ];
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options multicast],
[edit logical-systems logical-system-name routing-options multicast],
[edit routing-instances routing-instance-name routing-options multicast],
[edit routing-options multicast]
```

Description

Configure the rendezvous point (RP) routing device that resides between a customer edge–facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Multicast Listener Discovery (MLD) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the `pim-to-mld-proxy` statement enables you to use MLD to forward IPv6 multicast traffic across the PIM sparse mode domains.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

ping clns

IN THIS SECTION

- Syntax | 13038
- Description | 13039
- Options | 13039
- Required Privilege Level | 13040
- Output Fields | 13040
- Sample Output | 13040
- Release Information | 13041

Syntax

```
ping clns host
<brief>
<count requests>
<detail>
<do-not-fragment>
<interval seconds>
<logical-system logical-system-name>
<no-resolve>
<pattern string>
<rapid>
<routing-instance routing-instance-name>
<size bytes>
```

```
<source source-address>
<ttl value>
<verbose>
<wait seconds>
```

Description

Check the reachability of a remote Connectionless Network Service (CLNS) node. Enter **Ctrl+c** to interrupt a `ping clns` command.

Options

host	IP address or hostname of the remote system to ping.
brief	(Optional) Display brief information.
count ***requests***	(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default is an unlimited number of requests.
detail	(Optional) Include in the output the interface on which the ping reply was received.
do-not-fragment	(Optional) Set the do-not-fragment (DF) bit in the IP header of the ping packets.
interval ***seconds***	(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.
logical-system ***logical-system-name***	(Optional) Run the command from the specified logical system.
no-resolve	(Optional) Do not attempt to determine the hostname that corresponds to the IP address.
pattern ***string***	(Optional) Specify a hexadecimal fill pattern to include in the ping packet.
rapid	(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of request, include the count option.
routing-instance ***routing-instance-name***	(Optional) Name of the routing instance for the ping attempt.

size *bytes*	(Optional) Size of ping request packets. The range of values, in bytes, is 0 through 65,468. The default value is 56, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.
source *source-address*	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.
ttl *value*	(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is 0 through 255.
verbose	(Optional) Display detailed output.
wait *seconds*	(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is 10 seconds. If this option is used without the count option, a default count of 5 packets is used.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

Sample Output

ping clns

```
user@host> ping clns 47.0005.9000.f800.0000.0108.0001.1921.6812.4058.00
PING 47.0005.9000.f800.0000.0108.0001.1921.6812.4058.00
(47.0005.9000.f800.0000.0108.0001.1921.6812.4058.00): 55 data bytes
64 bytes from 47.0005.9000.f800.0000.0108.0001.1921.6812.4058.00: seq=0 ttl=30 time=15.051 ms
64 bytes from 47.0005.9000.f800.0000.0108.0001.1921.6812.4058.00: seq=1 ttl=30 time=10.370 ms
64 bytes from 47.0005.9000.f800.0000.0108.0001.1921.6812.4058.00: seq=2 ttl=30 time=10.367 ms
--- ping statistics ---
```

```
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 10.367/11.929/15.051/2.207 ms
```

Release Information

Command introduced before Junos OS Release 7.4.

- Sample Output | 13043
- Release Information | 13043

Syntax

```
ping fabric multicast-flow source-fmep-id source-fmep-id fma-name fma-name flow-spec-name flow-
specification-name
<verbose>
```

Description

Send a fabric multicast ping command to the multicast group destination fabric maintenance endpoints (FMEPs) configured in the flow specification. Send a single PDU with a timeout after 1 second.

Options

flow-spec-name ***flow-specification-name***	Name of the flow specification that defines the protocol parameters (unicast or multicast) for the fabric ping operation.
fma-name ***fma-name***	Name of the FMA.
source-fmep-id ***source-fmep-id***	FMEP ID that is the source of the fabric ping operation.
verbose	(Optional) Detailed version of the output display.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Output Fields

Table 109 on page 13042 lists the output fields for the `ping fabric-multicast-flow` command. Output fields are listed in the approximate order in which they appear.

Table 109: ping fabric multicast-flow Output Fields

Field Name	Field Description
`Using fabric flow-specification`	Name of the flow specification.
`Ethernet frame-size`	Ethernet frame size in bytes.
`Source-IP`	MAC address of the source FMEP interface.
`Destination-IP`	MAC address of the destination FMEP interface.
`Protocol`	IP protocol.
`received response from fmep-id`	FMEP ID from which responses are received.

Sample Output

ping fabric multicast-flow

```
user@host> ping fabric multicast-flow source-fmep-id 3 fma-name fma1 flow-spec-name fspec2
verbose

Using fabric flow-specification: fspec2
 Ethernet frame-size: 256
 Source-IP: 87.238.205.21
 Destination-IP: 225.0.0.1 IP
 Protocol: 17
 received response from fmep-id 32775...
 received response from fmep-id 32794...
 received response from fmep-id 32795...
 sent 1 requests, received 3 responses
```

Release Information

Command introduced in Junos OS Release 12.2.

Syntax

```
ping fabric unicast-flow fma-name fma-name source-fmep-id source-fmep-id dest-fmep-id flow-spec-name flow-specification-name
<count count>
<forced-fte-interface fte-interface>
<verbose>
```

Description

Send a unicast fabric ping command to the destination fabric maintenance endpoints (FMEPs) specified.

Options

count *count*	(Optional) Number of fabric ping PDUs to send. The maximum PDU count is 5. The default PDU count is 1.
dest-fmep-id *destination-fmep-id*	ID of the destination FMEP of the fabric ping operation.
flow-spec-name *flow-specification-name*	Name of the flow specification that defines the protocol parameters (unicast or multicast) for the fabric ping operation.

fma-name *fma-name*	Name of the FMA.
forced-fte-interface *fte-interface*	(Optional) Forces the fabric ping operation to use the specified FTE interface to inject the PDU into the fabric instead of using the internal forwarding path lookup table to determine the FTE interface.
source-fmep-id *source-fmep-id*	ID of the FMEP that is the source of the fabric ping operation.
verbose	(Optional) Detailed version of the output display.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Output Fields

Table 110 on page 13045 lists the output fields for the `ping fabric-unicast-flow` command. Output fields are listed in the approximate order in which they appear.

Table 110: ping fabric unicast-flow Output Fields

Field Name	Field Description
`Fabric flow ping between source` *`source-fmep-name`* `destination` *`destination-fmep-name`*	Path of the unicast-flow ping between the source and detination FMEPs.
`Using fabric flow-specification`	Name of the flow specification.
`Ethernet frame-size`	Ethernet frame size in bytes.
`Source-MAC`	MAC address of the source FMEP interface.
`Destination-MAC`	MAC address of the destination FMEP interface.
`Ethertype`	EtherType protocol.

Table 110: ping fabric unicast-flow Output Fields *(Continued)*

Field Name	Field Description
received response from fmep-id	ID of the FMEP sending the response.

Sample Output

ping fabric unicast-flow

```
user@host> ping fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2 flow-spec-name
fspec1 verbose

Configuring Flow Specifications

fabric (OAM) | **7056**

ping fabric multicast-flow | **13041**

traceroute fabric unicast-flow | **31076**

ping mpls bgp

IN THIS SECTION

- Syntax | **13048**
- Description | **13048**
- Options | **13048**
- Additional Information | **13049**
- Required Privilege Level | **13050**

- Output Fields | 13050
- Sample Output | 13050
- Release Information | 13050

Syntax

```
ping mpls bgp fec
<bottom-label-ttl>
<count count>
<destination address>
<detail>
<exp forwarding-class>
<instance routing-instance-name>
<logical-system (all | logical-system-name)>
<size bytes>
<source source-address>
<sweep>
```

Description

Check the operability of MPLS BGP-signaled label-switched path (LSP) connections. Press Ctrl+c to interrupt a `ping mpls bgp` command.

NOTE: The `ping mpls bgp` *fec* command only supports single paths.

Options

bottom-label-ttl (Optional) Time-to-live (TTL) value for the bottom label in the label stack. The range of values is 1 through 255. The default value is **255**.

count *count* (Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination ***address***	(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.
detail	(Optional) Display detailed information about the echo requests sent and received.
exp ***forwarding-class***	(Optional) Value of the forwarding class for the MPLS ping packets.
fec	Ping a BGP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.
instance ***routing-instance-name***	(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.
logical-system (all | ***logical-system-name*****)**	(Optional) Perform this operation on all logical systems or on the specified logical system.
size ***bytes***	(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.
source ***source-address***	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).
stitched-protocol	(Optional) Used for BGP to LDP stitched LSPs to specify the stitching protocol on an intermediate node. In the context of a `ping mpls bgp` command only LDP is supported as the stitched protocol.
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

If the LSP changes, the label and interface information displayed when you issued the `ping` command continues to be used. You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only BGP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping

request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

> **NOTE**: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (**!**) indicates that an echo reply was received. A period (**.**) indicates that an echo reply was not received within the timeout period. An **x** indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately. To display the error codes, use the **detail** option (for example, **ping mpls bgp 10.255.245.222 detail**).

Sample Output

ping mpls bgp fec count

```
user@host> ping mpls bgp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received, 70% packet loss 4
packets received with error status, not counted as received.
```

Release Information

Command introduced in Junos OS Release 11.1.

ping mpls l2circuit

IN THIS SECTION

- Syntax | 13051
- Description | 13051
- Options | 13052
- Additional Information | 13053
- Required Privilege Level | 13053
- Output Fields | 13053
- Sample Output | 13054
- Release Information | 13054

Syntax

```
ping mpls  l2circuit (interface interface-name | virtual-circuit virtual-circuit-id
neighbor address)
<count count>
<destination address>
<detail>
<exp forwarding-class>
<logical-system (all | logical-system-name)>
reply-mode (application-level-control-channel | ip-udp | no-reply)
<size bytes>
<source source-address>
<sweep>
<v1>
```

Description

Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a `ping mpls l2circuit` command.

NOTE: This command is not supported on EX4500 and EX4550 switches.

Options

count *count*

(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`.

destination *address*

(Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.

detail

(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*

(Optional) Value of the forwarding class for the MPLS ping packets.

interface *interface-name*

Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.

logical-system (all | *logical-system-name***)**

(Optional) Perform this operation on all logical systems or on the specified logical system.

reply-mode

(Optional) Reply mode for the ping request. This option has the following suboptions:

application-level-control-channel	Reply using an application level control channel.
ip-udp	Reply using an IPv4 or IPv6 UDP packet.
no-reply	Do not reply to the ping request.

NOTE: The `reply-mode` option and its suboptions `application-level-control-channel`, `ip-udp`, and `no-reply` are also available in Junos OS Release 10.2R4 and 10.3R2.

size *bytes*

(Optional) Size of the label-switched path (LSP) ping request packet (`96` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes.

	If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.
source ***source-address***	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).
v1	(Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV).
virtual-circuit ***virtual-circuit-id*** **neighbor** ***address***	Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

Additional Information

You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls l2circuit interface

```
user@host> ping mpls l2circuit interface so-1/0/0.1
Request for seq 1, to interface 69, labels <100000, 100208>, packet size 100
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

ping mpls l2circuit virtual-circuit detail

```
user@host> ping mpls l2circuit virtual-circuit 200 neighbor 10.255.245.122/32 detail
Request for seq 1, to interface 68, labels <100048, 100128>, packet size 100

Reply for seq 1, return code: Egress-ok time: 0.539 ms
```

ping mpls l2circuit interface <interface-name> reply-mode

```
user@host> ping mpls l2circuit interface lt-1/2/0.21 reply-mode application-level-control-channel
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

Release Information

Command introduced before Junos OS Release 7.4.

The `size` and `sweep` options were introduced in Junos OS Release 9.6.

The `reply-mode` option and its suboptions are introduced in Junos OS Release 10.4R1.

ping mpls l2vpn

IN THIS SECTION

- Syntax | 13055

<logical-system (all | logical-system-name)>
reply-mode (application-level-control-channel | ip-udp | no-reply)
<size bytes>
<source source-address>
<sweep>
```

Description

Check the operability of MPLS Layer 2 virtual private network (VPN) connections. Type Ctrl+c to interrupt a `ping mpls l2vpn` command.

Options

bottom-label-ttl
(Optional) Display the time-to-live value for the bottom label in the label stack.

count *count*
(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through 1,000,000. The default value is `5`.

destination *address*
(Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.

detail
(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*
(Optional) Value of the forwarding class for the MPLS ping packets.

instance *instance-name* **local-site-id** *local-site-id-number* **remote-site-id** *remote-site-id-number*
Ping a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the ingress and egress provider edge (PE) routers or switches.

interface *interface-name*
Ping an interface configured for the Layer 2 VPN on the egress PE router or switch.

logical-system (all | *logical-system-name***)**
(Optional) Perform this operation on all logical systems or on the specified logical system.

reply-mode
(Optional) Reply mode for the ping request. This option has the following suboptions:

- **application-level-control-channel** — Reply using an application level control channel.
- **ip-udp** — Reply using an IPv4 or IPv6 UDP packet.
- **no-reply** — Do not reply to the ping request.

The `reply-mode` option and its suboptions `application-level-control-channel`, `ip-udp`, and `no-reply` are also available in Junos OS Release 10.2R4 and 10.3R2.

size *bytes*
(Optional) Size of the label-switched path (LSP) ping request packet (`96` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes.

	If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.
source *source-address*	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code these packets are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls l2vpn instance

```
user@host> ping mpls l2vpn instance vpn1 remote-site-id 1 local-site-id 2
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss

```

Release Information

Command introduced before Junos OS Release 7.4.

The `size` and `sweep` options were introduced in Junos OS Release 9.6.

The `reply-mode` option and its suboptions are introduced in Junos OS Release 10.4R1.

ping mpls l3vpn

IN THIS SECTION

- Syntax | 13059
- Description | 13059
- Options | 13060
- Additional Information | 13060
- Required Privilege Level | 13061
- Output Fields | 13061
- Sample Output | 13061
- Release Information | 13062

Syntax

```
ping mpls l3vpn prefix prefix-name
<l3vpn-name>
<bottom-label-ttl>
<count count>
<destination address>
<detail>
<exp forwarding-class>
<logical-system (all | logical-system-name)>
<size bytes>
<source source-address>
<sweep>
```

Description

Check the operability of a MPLS Layer 3 virtual private network (VPN) connection. Type Ctrl+c to interrupt a `ping mpls l3vpn` command.

Options

bottom-label-ttl	(Optional) Display the time-to-live value for the bottom label in the label stack.
count *count*	(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`.
destination *address*	(Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.
detail	(Optional) Display detailed information about the echo requests sent and received.
exp *forwarding-class*	(Optional) Value of the forwarding class for the MPLS ping packets.
l3vpn-name	(Optional) Layer 3 VPN name.
logical-system (all | *logical-system-name***)**	(Optional) Perform this operation on all logical systems or on the specified logical system.
prefix *prefix-name*	Ping to test whether a prefix is present in a provider edge (PE) router's or switch's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix. This option does not test the connection between a PE router or switch and a customer edge (CE) router or switch.
size *bytes*	(Optional) Size of the label-switched path (LSP) ping request packet (`96` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.
source *source-address*	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

If the Layer 3 VPN traffic transits a route reflector within the network, the `ping mpls l3vpn` command does not work.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code these packets are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls l3vpn

```
user@host> ping mpls l3vpn vpn1 prefix 10.255.245.122/32
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

```

Release Information

Command introduced before Junos OS Release 7.4.

The `size` and `sweep` options were introduced in Junos OS Release 9.6.

ping mpls ldp

IN THIS SECTION

- Syntax | 13062
- Description | 13063
- Options | 13063
- Additional Information | 13064
- Required Privilege Level | 13064
- Output Fields | 13065
- Sample Output | 13065
- Release Information | 13065

Syntax

```
ping mpls ldp fec
<count count>
<destination address>
<detail>
<exp forwarding-class>
<instance routing-instance-name>
<logical-system (all | logical-system-name)>
<p2mp root-addr ip-address lsp-id identifier>
<size bytes>
```

```
<source source-address>
<stitched-protocol>
<sweep>
```

Description

Check the operability of MPLS LDP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a `ping mpls` command.

Options

count *count*
(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`.

destination *address*
(Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.

detail
(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*
(Optional) Value of the forwarding class for the MPLS ping packets.

fec
Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

instance *routing-instance-name*
(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

logical-system (all | *logical-system-name***)**
(Optional) Perform this operation on all logical systems or on the specified logical system.

p2mp root-addr *ip-address* **lsp-id** *identifier*
(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.

size *bytes*
(Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

source ***source-address***	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
stitched-protocol	(Optional) Used for LDP to BGP stitched LSPs to specify the stitching protocol on an intermediate node. In the context of a `ping mpls ldp` command specify the stitching protocol as BGP, ISIS, or OSPF based on the configuration.
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

If the LSP changes, the label and interface information displayed when you issued the `ping` command continues to be used. You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the `ping mpls ldp` command by specifying a new time in seconds using the `lsp-ping-interval` statement at the `[edit protocols ldp oam]` hierarchy level. For more information, see the MPLS Applications User Guide.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

NOTE: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls ldp fec count

```
user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received, 70% packet loss 4
packets received with error status, not counted as received.
```

ping mpls ldp p2mp root-addr lsp-id

```
user@host>ping mpls ldp p2mp root-addr 10.1.1.1/32 lsp-id 1 count 1

instance option introduced in Junos OS Release 10.0.

p2mp, root-address, and lsp-id options introduced in Junos OS Release 11.2.

ping mpls lsp-end-point

IN THIS SECTION

- Syntax | 13066
- Description | 13066
- Options | 13067
- Additional Information | 13067
- Required Privilege Level | 13068
- Output Fields | 13068
- Sample Output | 13068
- Release Information | 13069

Syntax

```
ping mpls lsp-end-point prefix-name
<count count>
<destination address>
<detail>
<exp forwarding-class>
<instance routing-instance-name>
<logical-system (all | logical-system-name)>
<size bytes>
<source source-address>
<sweep>
```

Description

Check the operability of MPLS label-switched path (LSP) endpoint connections. Type Ctrl+c to interrupt a `ping mpls` command.

Options

count *count*	(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`.
destination *address*	(Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.
detail	(Optional) Display detailed information about the echo requests sent and received.
exp *forwarding-class*	(Optional) Value of the forwarding class for the MPLS ping packets.
instance *routing-instance-name*	(Optional) Ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP connection.
logical-system (all | *logical-system-name***)**	(Optional) Perform this operation on all logical systems or on the specified logical system.
prefix-name	LDP forwarding equivalence class (FEC) prefix or RSVP LSP endpoint address.
size *bytes*	(Optional) Size of the LSP ping request packet. If the endpoint is LDP-based, the minimum size of the packet is `88` bytes. If the endpoint is RSVP-based, the minimum size of the packet is `100` bytes. The maximum size in either case is `65468` bytes.
source *source-address*	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

If the LSP changes, the label and interface information displayed when you issued the `ping` command continues to be used. You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping

request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

> **NOTE**: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

Release Information

Command introduced before Junos OS Release 7.4.

The `size` and `sweep` options were introduced in Junos OS Release 9.6.

The `instance` option was introduced in Junos OS Release 10.0.

ping mpls rsvp

IN THIS SECTION

- Syntax | 13069
- Description | 13070
- Options | 13070
- Additional Information | 13071
- Required Privilege Level | 13072
- Output Fields | 13072
- Sample Output | 13072
- Release Information | 13076

Syntax

```
ping mpls rsvp
<lsp-name>
<count count>
<destination address>
<detail>
<dynamic-bypass>
<egress egress-address>
<exp forwarding-class>
```

```
<interface interface-name>
<logical-system (all | logical-system-name)>
<manual-bypass>
<multipoint>
<size bytes>
<source source-address>
<standby standby-path-name>
<sweep>
```

Description

Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a `ping mpls` command.

Options

count *count*

(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`.

destination *address*

(Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.

detail

(Optional) Display detailed information about the echo requests sent and received.

> **NOTE**: When using the `detail` option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.
>
> In practice, it is difficult to synchronize the system times of independent Juniper Networks routers with sufficient accuracy to provide a meaningful time value for the `detail` option (even when synchronized using NTP).

dynamic-bypass

(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

egress *egress-address*

(Optional) Only the specified egress router or switch responds to the ping request.

exp ***forwarding-class***	(Optional) Value of the forwarding class for the MPLS ping packets.
interface	(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the `manual-bypass` option.
logical-system (all | *logical-system-name*)	(Optional) Perform this operation on all logical systems or on the specified logical system.
lsp-name	Ping an RSVP-signaled LSP using an LSP name.
manual-bypass	(Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the `interface` option.
multipoint	(Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the `egress` option to ping a specific egress router or switch participating in a point-to-multipoint LSP.
size ***bytes***	(Optional) Size of the LSP ping request packet (`100` through `65468` bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum.
source ***source-address***	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.
standby ***standby-path-name***	(Optional) Name of the standby path.
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

If the LSP changes, the label and interface information displayed when you issued the `ping` command continues to be used. You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping

request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

> **NOTE**: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

```

```
<p2mp root-addr ip-address lsp-id identifier>
<size bytes>
<source source-address>
<stitched-protocol>
<sweep>
```

Description

Check the operability of MPLS segment routing label-switched path (LSP) connections added by ISIS protocol. Type Ctrl+c to interrupt a `ping mpls segment routing isis` command.

Options

algorithm *algorithm-id* — (Optional) Specify the flexible algorithm identifier. The range of values is `0` through `255`. The default value is `0` which means no algorithm is configured. The *algorithm-id* in conjunction with the prefix is used to distinguish labelled SR paths.

count *count* — (Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`.

destination *address* — (Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.

detail — (Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class* — (Optional) Value of the forwarding class for the MPLS ping packets.

fec — Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

instance *routing-instance-name* — (Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

logical-system (all | *logical-system-name***)** — (Optional) Perform this operation on all logical systems or on the specified logical system.

p2mp root-addr *ip-address* **lsp-id** *identifier* — (Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.

size ***bytes***	(Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.
source ***source-address***	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
stitched-protocol	(Optional) Protocol stitched on intermediate node.
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls segment-routing spring-te

IN THIS SECTION

- Syntax | 13084
- Description | 13084
- Options | 13084
- Additional Information | 13087
- Required Privilege Level | 13088
- Output Fields | 13088
- Sample Output | 13089
- Release Information | 13092

Syntax

```
ping mpls segment-routing spring-te
<egress-ip (active | color |  count | detail | exp | instance | logical-system | secondary |
segment-list | size | skip-fec-validation  | source | sweep | tunnel-source) >
<label-stack ( detail | egress | labels | logical-system | nexthop-address | nexthop-interface )
>
<source-routing-path ( active | color | count | detail | egress-ip | exp | instance | logical-
system | secondary | segment-list | size | skip-fec-validation | source | sweep | tunnel-source>
```

Description

Check the operability of MPLS segment routing label-switched path (LSP) connections added by segment routing traffic-engineered (SPRING-TE) protocol. Type Ctrl+c to interrupt a `ping mpls segment routing spring-te` command.

Options

egress-ip Specify to ping to or install IP address to use when sending probes.

- **active** Specify to use the forwarding path or nexthops from the RIB table.

color	Specify the color identifier for the tunnel end-point. • **Range:** 1 through 4294967295
count *count*	(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. • **Range:** 1 through 1000000 • **Default:** 5
detail	(Optional) Display detailed output.
exp *exp*	(Optional) Specify the class of service to use when sending probes. • **Range:** 0 through 7
instance *routing-instance-name*	(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.
`logical-system` *`logical-system-name`*	(Optional) Specify the name of the logical system.
`secondary`	Specify to use configured secondary segment list for the given segment routing path.
`segment-list`	Specify the segment list to use when sending probes.
size *bytes*	(Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.
`skip-fec-validation`	Specify to skip forwarding equivalence class (FEC) validation or use NIL FEC.
source *source-address*	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).
tunnel-source	Specify the source protocol used to create tunnel.

label-stack

Specify label stack for ping packets. This option works only if you do a minimum configuration of `source-packet-routing` at the `[edit protocols]` hierarchy level.

detail
(Optional) Display detailed output.

egress
Specify the egress IP address.

labels
Specify the labels in label stack.

- **Range:** 16 through 1048575

logical-system *logical-system-name*
(Optional) Specify the name of the logical system.

nexthop-address *address*
Specify the nexthop IP address for the ping packet.

nexthop-interface *interface*
Specify the outgoing interface for the ping packet.

source-routing-path

Specify ping source path routing to use when sending probes.

active
Specify to use the forwarding path or nexthops from the RIB table.

color
Specify the color identifier for the tunnel end-point.

- **Range:** 1 through 4294967295

count *count*
(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent.

- **Range:** 1 through 1000000
- **Default:** 5

detail
(Optional) Display detailed output.

egress-ip

exp *exp*
(Optional) Specify the class of service to use when sending probes.

- **Range:** 0 through 7

instance *routing-instance-name*
(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

logical-system *logical-system-name*
(Optional) Specify the name of the logical system.

`secondary`	Specify to use configured secondary segment list for the given segment routing path.
`segment-list`	Specify the segment list to use when sending probes.
size *bytes*	(Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.
`skip-fec-validation`	Specify to skip forwarding equivalence class (FEC) validation or use NIL FEC.
source *source-address*	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).
tunnel-source	Specify the source protocol used to create tunnel.

Additional Information

NOTE: With `segment-list` option, valid `tunnel-source` (source protocol used to create tunnel) is only static.

NOTE: `segment-list` option is not present when `tunnel-source` is BGP SR-TE since BGP SR-TE does not have named segment list.

NOTE: With `source-routing-path` name, valid `tunnel-source` are PCEP and static.

NOTE: With `tunnel-source` as PCEP, `secondary` option is not valid as PCEP always sends one primary LSP.

NOTE: FEC validation is performed for `ping mpls segment-routing spring-te` by default.

NOTE: FEC validation is supported when segment-routing traffic-engineering (SR-TE) tunnel has IGP labels (OSPF and IS-IS) only. For all the other labels (for example, static, LDP, RSVP, etc.), you can use `skip-fec-validation` option.

NOTE: For a combination of `egress-ip` and `color` options, valid `tunnel-source` are static and BGP SR-TE.

NOTE: `ping mpls segment-routing spring-te` command with `label-stack` option is supported in operational mode only. It is not supported in configuration mode.

NOTE: Parallel SID, binding SID, LDP over SR-TE is not supported.

NOTE: `ping mpls segment-routing spring-te` command with `label-stack` option adds explicit null label at the bottom of the label stack for interoperability. You can include NIL FEC for label “0” or “router alert label” per OAM standard.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls segment-routing spring-te

Release Information

Command introduced in Junos OS Release 20.2R1.

ping mpls segment routing static egress-ip

IN THIS SECTION

- Syntax | 13093
- Description | 13093
- Options | 13093
- Additional Information | 13096
- Required Privilege Level | 13096
- Output Fields | 13096
- Sample Output | 13096
- Release Information | 13097

Syntax

```
ping mpls segment-routing static egress-ip
<egress-ip (fec | count | destination | detail | exp | instance | logical-system | size | source
| sweep) >
```

```
ping mpls segment-routing spring-te label-stack
<label-stack (count | destination | detail | egress | exp | labels | logical-system | nexthop-
address | nexthop-interface | size | source | sweep) >
```

Description

Use `ping mpls segment-routing static` to check the MPLS segment routing label-switched path (LSP) connections on the prpd programmed static routes. Type Ctrl+c to interrupt a `ping mpls segment-routing static` command.

Options

egress-ip Specify to ping PRPD-programmed labelled switched paths (LSP).

<fec>	Specify to use the IP prefix/length of forwarding equivalence class.
count *count*	(Optional) Specify number of ping requests to send. If `count` is not specified, five ping requests are sent. • **Range:** 1 through 1000000 • **Default:** 5
destination*destination*	(Optional) Specify IP address of destination for echo request.
detail	(Optional) Display detailed output.
exp *exp*	(Optional) Specify the class of service to use when sending probes. • **Range:** 0 through 7
instance *routing-instance-name*	(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.
`logical-system` *`logical-system-name`*	(Optional) Specify the name of the logical system.
size *bytes*	(Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message displays reminding you of the 88-byte minimum.
source *source-address*	(Optional) IP address of the echo request (outgoing interface). This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).

`label-stack` Specify label stack for ping packets.

count *count*	(Optional) Specify number of ping requests to send. If `count` is not specified, five ping requests are sent.

	• **Range:** 1 through 1000000 • **Default:** 5
destination*destination*	(Optional) Specify IP address of destination for echo request.
detail	(Optional) Display detailed output.
egress	(Optional) Specify the egress IP address.
exp	(Optional) Specify the forwarding class entry. • **Range:**0 through 7
labels	Specify the labels in label stack. • **Range:** 16 through 1048575
logical-system *logical-system-name*	(Optional) Specify the name of the logical system.
nexthop-address *address*	Specify the nexthop IP address for the ping packet.
nexthop-interface *interface*	Specify the outgoing interface for the ping packet.
size *bytes*	(Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.
source *source-address*	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

NOTE: NIL FEC validation is supported. The FEC validation for SWAN ping and traceroute command is not supported.

NOTE: SWAN ping command takes label-stack, nexthop-address, and nexthop-interface as input will work only if all the three inputs are given by user in the label-stack command.

NOTE: `ping mpls segment-routing spring-te` command with `label-stack`, nexthop-address and nexthop-interface as input will have vendor private tlv in mpls echo request only if egress-ip is provided by user.

Required Privilege Level

Network

Output Fields

When you enter `ping mpls segment-routing static` command, you can see the feedback on the status of your request. An exclamation point (!) indicates that an echo reply. A period (.) indicates that an echo reply is not received within the timeout period. An `x` indicates that an echo reply with an error code. Packets with error codes are not counted in the received packets count. They are accounted separately.

Sample Output

ping mpls segment-routing static ?

```
user@host> ping mpls segment-routing static ?
Possible completions:
  egress-ip                  To install IP address to use when sending probes
```

ping mpls segment-routing static egress-ip

```
user@router>ping mpls segment-routing static egress-ip ::100.100.100.4
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

ping mpls segment-routing spring-te (label-stack)

```
user@host>ping mpls segment-routing spring-te label-stack labels 600040 nexthop-address 21.1.2.2
nexthop-interface ge-0/0/2.0
Warning: License key missing; requires 'sr' license
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

Release Information

Command introduced in Junos OS Release 22.4R1.

ping overlay

IN THIS SECTION

- Syntax | 13098
- Description | 13098
- Options | 13098
- Required Privilege Level | 13100
- Output Fields | 13101
- Sample Output | 13102
- Release Information | 13103

Syntax

```
ping overlay
<tunnel-type>
vni vni
tunnel-src ip-source-address
tunnel-dst ip-destination-address
<mac mac-address>
<count requests>
<ttl value>
<hash source-udp-port>
<hash-source-mac source-mac-address>
<hash-destination-mac destination-mac-address>
<hash-source-address source-IP-address>
<hash-destination-address destination-IP-address>
<hash-vlan vlan-id>
<hash-input-interface input-interface>
<hash-protocol protocol-id>
<hash-source-port source-layer4-port>
<hash-destination-port destination-layer4-port>
```

Description

Verify the presence of the Virtual Extensible LAN (VXLAN) tunnel endpoints (VTEPs), which can originate and terminate VXLAN tunnels, and service connectivity within the context of the overlay VXLAN segment. Use `ping overlay` as a fault detection tool to determine failure within an overlay VXLAN tunnel. Type **Ctrl+c** to interrupt a `ping overlay` command.

NOTE: The `ping overlay` command is not supported for IPv6.

NOTE: The `ping overlay` command is not supported when there are multiple virtual-switch routing instances.

Options

tunnel-type (Optional) Specify the overlay tunnel type used in a virtualized environment such as: VXLAN, Network Virtualization using Generic Routing Encapsulation (NVGRE),

MPLS over User Datagram Protocol (UDP), and MPLS over General Routing Encapsulation (GRE) tunnels.

> **NOTE**: Only VXLAN overlay tunnel types are supported.

vni *vni*

Specify the VNI of the VXLAN overlay segment.

tunnel-src *ip-source-address*

Specify the IP address of the source entity at the end of the tunnel, such as the source VTEP.

tunnel-dst *ip-destination-address*

Specify the IP address of the destination entity at the end of the tunnel, such as a remote VTEP.

mac *mac-address*

(Optional) Include the physical or hardware address on the end host system you are trying to reach.

count *requests*

(Optional) Number of ping requests to send.

For QFX and EX9200 switches, the range of values is **1** through **65,535**. The default value is **10**.

For MX Series routers, the range of values is **1** through **2,000,000,000**. The default value is **5**.

ttl *value*

(Optional) Time-to-live (TTL) value to include in the ping request.

For QFX and EX9200 switches, the range of values is **1** through **255**. The default value is **255**.

For MX Series routers, the range of values is **0** through **255**. The default value is **255**.

hash *source-udp-port*

(Optional) Specify the UDP source port. The range of values is **1** through **65,535**. Usage of this parameter will override all other hash-* parameters used to calculate the UDP source port.

hash-source-mac *source-mac-address*

(Optional) Specify the MAC address of the source end host system.

> **NOTE**: The hash parameters provide values that correspond to a particular data flow that the `ping overlay` command debugs. Based on the values that you specify, the system calculates a VXLAN UDP header source port hash, which is included in the VXLAN UDP header of the overlay ping and traceroute packets. Including

the calculated hash in the VXLAN header enables the overlay ping and traceroute packets to emulate data packets in the flow that you are troubleshooting.

When using the hash parameters, we recommend that you specify a value for each parameter. The exception to this guideline is the hash-vlan parameter, which you do not have to use if the source endpoint is not a member of a VLAN. This practice ensures that the overlay ping and traceroute processes are successful and that the output for each command is accurate. If you do not specify a value for one or more of the hash parameters, the system sends an OAM request that might include incorrect hash values and generates a warning message.

Hash computation supports TCP and UDP protocols only.

hash-destination-mac *destination-mac-address*	(Optional) Specify the MAC address of the destination end host system.
hash-source-address *source-IP-address*	(Optional) Specify the IP address of the source end host system.
hash-destination-address *destination-IP-address*	(Optional) Specify the IP address of the destination end host system.
hash-vlan *vlan-id*	(Optional, QFX switches only) Specify the VLAN ID of the end host system.
hash-input-interface *input-interface*	(Optional, QFX switches only) Specify the ingress interface of the flow on the Juniper Networks device.
hash-protocol *protocol-id*	(Optional) Specify the TCP/UDP IP protocol ID. The range of values is **1** through **255**.
hash-source-port *source-layer4-port*	(Optional) Specify the Layer 4 source port. The range of values is **1** through **65,535**.
hash-destination-port *destination-layer4-port*	(Optional) Specify the Layer 4 destination port. The range of values is **1** through **65,535**.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (**!**) indicates that an echo reply was received. A period (**.**) indicates that an echo reply was not received within the timeout period. An **x** indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

Table 111 on page 13101 lists the output fields for the `ping overlay` command. Output fields are listed in the approximate order in which they appear.

Table 111: ping overlay Output Fields

Field Name	Field Description
vni	The VNI of the VXLAN overlay segment.
tunnel src ip	The IP address of the source end of the tunnel.
tunnel dst ip	The IP address of the destination end of the tunnel.
mac address	The physical or hardware address on the end host system you are trying to reach.
count	Number of ping requests sent.
ttl	TTL value for maximum number of pings.
hash-parameters	The hash parameters provide the input-interface, source MAC address, destination MAC address, source IP address, destination IP address, and the VLAN of the two end hosts within an overlay segment. Hash parameters enable platform-specific hash computation to use as the source port in the outer UDP header.
Request/Response for seq *x* to/from *address* at *timestamp*	Number of ping request and response counts for determining overlay segments in tunnel.

Sample Output

run ping overlay

```
user@host> ping overlay tunnel-type vxlan vni 100 tunnel-src 192.0.2.10 tunnel-dst 192.0.2.20
mac 00:00:5E:00:53:cc count 5 hash-source-mac 00:00:5E:00:53:aa hash-destination-mac

ping srv6 spring-te micro-sids-stack

IN THIS SECTION

- Syntax | 13104
- Description | 13104
- Options | 13105
- Required Privilege Level | 13105
- Release Information | 13105

Syntax

```
ping srv6 spring-te micro-sids-stack usids ipv6addr nexthop-interface nexthop-interface nexthop-
address ipv6addr
<count>
<source ipv6addr>
<detail>
<size>
<ttl>
<instance instance>
<pattern pattern>
<tos>
<interval>
<sweep>
<logical-system>
```

Description

Sends ICMP Echo Requests (ping) along a Segment Routing over IPv6 (SRv6) path defined by a user-configured micro Segment ID (uSID) stack. This allows reachability testing for SRv6 micro segment paths using SPRING-TE.

Use this command to validate that each micro-segment in the SRv6 stack is reachable and programmed correctly on the target node. This is useful for verifying path consistency and isolating faults in SPRING-TE SRv6 deployments.

Options

count	(Optional) Number of ping requests to send.
source	(Optional) Source address of echo request.
detail	(Optional) Display detailed output.
size	(Optional) Size of request packets.
ttl	(Optional) IPv6 hop-limit value.
instance	(Optional) Routing-instance name.
pattern	(Optional) Hexadecimal fill pattern.
tos	(Optional) IPv6 type-of-service value.
interval	(Optional) Delay between ping requests.
sweep	(Optional) Incremental ping to find MTU.
logical-system	(Optional) Name of logical system.
usids	Ordered list of micro Segment Identifiers (uSIDs) that represent the segment stack - [usid0 ... usidn(top)].
nexthop-interface	Outgoing interface to reach the specified next-hop.
nexthop-address	Specifies the next-hop IPv6 address for the path.

Required Privilege Level

network

Release Information

Command introduced in Junos OS Release 23.4R1.

Description

Check the reachability of a Segment Routing with IPv6 data plane (SRv6) network.

Options

host	IPv6 loopback address or SRv6 Segment Identifier (SID) of the remote system to ping.
count ***requests***	(Optional) Number of ping requests to send. The range of values is 1 through 1,000,000. The default value is 5.
detail	(Optional) Include in the output the interface on which the ping reply was received.
instance ***routing-instance-name***	(Optional) Name of the routing instance for the ping attempt.
interval ***seconds***	(Optional) How often to send ping requests. The range of values, in seconds, is 0 through 2,147,483,647.
logical-system ***logical-system-name***	(Optional) Run the command from the specified logical system.
nexthop-address ***IPv6-address***	Nexthop IPv6 address of the outgoing interface.
nexthop-interface ***interface-name***	Interface name of the outgoing interface.
pattern ***hex-string***	(Optional) Specify a hexadecimal fill pattern to include in the ping packet.
sids ***value***	Specify the SRv6 SIDs in the SRv6 stack. Add a set of values.

size *bytes*	(Optional) Size of ping request packets. The range of values, in bytes, is 0 through 65,468.
source *source-address*	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.
sweep	(Optional) Automatically determine the size of the maximum transmission unit (MTU).
tos *type-of-service*	Type-of-Service (TOS) value to include in the ping request (IPv6). The range of values is 0 through 255.
ttl *value*	(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is 0 through 255.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

Sample Output

ping srv6 is-is

```
user@host> ping srv6 isis 6000::1 count 3
!!!
--- lsping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
```

Release Information

Command introduced in Junos OS Release 21.2.

ping vpls instance

IN THIS SECTION

- Syntax | 13111
- Description | 13111
- Options | 13112
- Required Privilege Level | 13112
- Output Fields | 13112
- Sample Output | 13113
- Release Information | 13113

Syntax

```
ping vpls instance instance-name destination-mac address source-ip address
<bd-name name>
<control-plane-response>
<count number>
<detail>
<learning-vlan-id number>
<logical-system logical-system-name>
```

Description

Check the operability of virtual private LAN service (VPLS) connections. Type Ctrl+c to interrupt a `ping vpls instance` command.

When you issue a `ping vpls instance` command, a chassis MAC address is drawn from the ingress PE router's pool of MAC addresses and used to create the VPLS ping packet. The ping packet is then forwarded to the egress PE router. When the egress PE router receives the ping packet, it learns the MAC address from the VPLS ping packet. The MAC address is added to the egress PE router's MAC table.

The `ping vpls instance` command relies on the LSP ping and trace infrastructure defined in RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures* and further enhancements defined

in Internet draft draft-stokes-vkompella-ppvpn-hvpls-oam-02, *Testing Hierarchical Virtual Private LAN Services*.

Options

Feature support is determined by the platform and release that you are using. Use Feature Explorer to determine if a feature is supported on your platform.

instance *instance-name*	Specify the name of the VPLS routing instance.
destination-mac *address*	Specify a destination MAC address for the ping echo requests.
source ip *address*	IP address of the outgoing interface.
bd-name *name*	(Optional) Name of the bridge domain.
control-plane-response	(Optional) Request VPLS OAM responses using the control plane.
count *number*	(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is **1** through **1,000,000**. The default value is **5**.
detail	(Optional) Display detailed information about the echo requests sent and received.
learning-vlan-id *number*	(Optional) Specify a learning VLAN identifier for the ping echo requests. The range of values is **0** through **4094**.
logical-system *logical-system-name*	(Optional) Specify a logical system name for the ping echo requests.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (**!**) indicates that an echo reply was received. A period (**.**) indicates that an echo reply was not received within the timeout period. An **x** indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

Sample Output

ping vpls instance

```
user@host> ping vpls instance red destination-mac 00:89:67:1a:23:6f source-ip 10.255.17.138
! -> sample-router:red:ge-4/1/1.0

```

Description

Check host reachability and network connectivity. The `ping` command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

Options

host	IP address or hostname of the remote system to ping.
bypass-routing	(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.
ce-ip *destination-ip-address* **instance** *routing-instance-name* **source-ip** *source-ip-address*	(MX Series routers with MPC and MIC interfaces only) (Optional) Check the connectivity information of customer edge (CE) devices, such as reachability, attachment points, and MAC addresses, from a provider edge (PE) device in a virtual private LAN service (VPLS), hierarchical VPLS (H-VPLS), and Ethernet VPN (EVPN) network. The `ce-ip` option is based on the LSP ping infrastructure, where the `ping` utility is extended to use the CE device IP address as the target host and the PE device loopback address as the source for a specific VPLS or EVPN routing instance.
destination-ip-address	IPv4 address of the CE device to ping.
instance *routing-instance-name*	Name of the VPLS or EVPN routing instance. The command output displays the connectivity information of the CE device based on the configured routing instance type.
source-ip *source-ip-address*	Loopback address of the PE device.
count *requests*	(Optional) Number of ping requests to send. The range of values is `1` through `2,000,000,000`. The default value is an unlimited number of requests.
detail	(Optional) This option is not supported for Junos OS Evolved Release 18.3R1. Include in the output the interface on which the ping reply was received.
do-not-fragment	(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For Junos OS Evolved Release 18.3R1, IPv6 `ping` does not have `do-not-fragment` support. The `ping` command is identified as IPv6 Ping when destination is IPv6 address or `inet6` option is used. For Junos OS IPv6 packets, this option disables fragmentation.

> **NOTE**: In Junos OS Release 11.1 and later, when issuing the `ping` command for an IPv6 route with the `do-not-fragment` option, the

maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

inet	(Optional) Ping Packet Forwarding Engine IPv4 routes.
inet6	(Optional) Ping Packet Forwarding Engine IPv6 routes.
interface *source-interface*	(Optional) Interface to use to send the ping requests.
interval *seconds*	(Optional) How often to send ping requests. The range of values, in seconds, is `1` through infinity. The default value is `1`.
logical-system *logical-system-name*	(Optional) Name of logical system from which to send the ping requests. Alternatively, enter the `set cli logical-system` *`logical-system-name`* command and then run the `ping` command. To return to the main router or switch, enter the `clear cli logical-system` command.
tenant *tenant-name*	(Optional) Name of tenant system from which to send the ping requests.
loose-source *value*	(Optional) Intermediate loose source route entry (IPv4). Open a set of values.
mac-address *mac-address*	(Optional) Ping the physical or hardware address of the remote system you are trying to reach.
no-resolve	(Optional) Do not attempt to determine the hostname that corresponds to the IP address.
pattern *string*	(Optional) Specify a hexadecimal fill pattern to include in the ping packet.
rapid	(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the `count` option.
record-route	(Optional) Record and report the packet's path (IPv4).
routing-instance *routing-instance-name*	(Optional) Name of the routing instance for the ping attempt. For Junos OS Evolved, the `routing-instance` option supports only `mgmt_junos`.

size *bytes*
(Optional) Size of ping request packets. The range of values, in bytes, is `0` through `65,468`. The default value is `56`, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source *source-address*
(Optional) IP address to be set in source ip address field of outgoing echo request. If this option is not specified, the outgoing interface IP is selected as source ip , lo0 otherwise.

strict
(Optional) Use the strict source route option (IPv4).

strict-source *value*
(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

tos *type-of-service*
(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is `0` through `255`.

If the device configuration includes the `dscp-code-point` *`value`* statement at the `[edit class-of-service host-outbound-traffic]` hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the `dscp-code-point` configuration statement instead of the value you specify in this command option.

ttl *value*
(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is `0` through `255`.

verbose
(Optional) Display detailed output.

vpls *instance-name*
(Optional) Ping the instance to which this VPLS belongs.

wait *seconds*
(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is `10` seconds. If this option is used without the count option, a default count of `5` packets is used.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply

was not received within the timeout period. An `x` indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

When pinging a nonexistant route, the display output of `ping` command does not print the number of packets sent or received or the packet loss.

Sample Output

ping ce-ip *destination-ip-address* instance *routing-instance-name* source-ip *source-ip-address* (EVPN)

```
user@host> ping ce-ip 10.0.0.4 instance foo source-ip 127.0.0.1

Release Information

Command introduced before Junos OS Release 7.4.

`ce-ip` option introduced in Junos OS Release 17.3 for MX Series routers with MPC and MIC interfaces.

The following options are deprecated for Junos OS Evolved Release 18.3R1: `detail`, `logical-system`, `loose-source`, `mac-address`, `strict`, `strict-source`, and `vpls`.

The command `tenant` option is introduced in Junos OS Release 19.2R1 for SRX Series.

Syntax

```
ping-death;
```

Hierarchy Level

```
[edit services screen ids-option screen-name icmp]
```

Description

Identify and drop oversized and irregular ICMP packets, which protects against the ping of death attack. In the ping of death attack, the attacker sends the target ping packets whose IP datagram length (ip_len) exceeds the maximum legal length (65,535 bytes) for IP packets, and the packets are fragmented. When the target attempts to reassemble the IP packets, a buffer overflow might occur, resulting in system crashing, freezing, and restarting.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

Syntax

```
ping-death;
```

Hierarchy Level

```
[edit security screen ids-option          screen-name        icmp]
```

Description

Configure the device to detect and reject oversized and irregular ICMP packets. Although the TCP/IP specification requires a specific packet size, many ping implementations allow larger packet sizes. Larger packets can trigger a range of adverse system reactions, including crashing, freezing, and restarting.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

}
```

Hierarchy Level

```
[edit security]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the

debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure an IPsec profile and related options to request digital certificates. The Public Key Infrastructure (PKI) provides an infrastructure for digital certificate management.

You can use 'trusted-ca' option to specify ca-profiles that are trusted by the NTS clients. You can specify a trusted ca-group (defined under PKI) or ca-profile by name. This configuration is optional and if it is not specified then, NTP trusts all loaded ca-profiles for NTS. Only client can configure trusted-ca options.

Options

auto-re-enrollment Configure the automatic reenrollment of a local end-entity (EE) certificate.

ca-profile *ca-profile-name* Configure certificate authority (CA) profile.

default-trusted-ca-certs Configure automatic download of default trusted CA certificates.

traceoptions Configure public key infrastructure (PKI) tracing options.

trusted-ca-group *trusted-ca-group-name* Configure trusted certificate authority group.

ca-profiles Name of the CA profiles. You can configure maximum of 20 CA profiles.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 8.5.

`default-trusted-ca-certs` option is added in Junos OS Release 23.2R1.

interface (all | interface-name)],
[edit protocols mvrp interface (all | interface-name)],
[edit routing-instances routing-instance-name protocols mvrp interface (all | interface-name)]
```

Description

(Optional) For Multiple VLAN Registration Protocol (MVRP) configurations, configure an interface to be recognized as a point-to-point connection. If specified, a point-to-point subset of the MRP state machine is used to provide a simpler and more efficient method to accelerate convergence on the network. Point-to-point must be enabled after enabling MVRP for the interface to be recognized as a point-to-point connection.

Default

MVRP is disabled by default.

point-to-point is disabled by default.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

[edit interfaces interface-name unit unit-number],
[edit interfaces interface-name unit unit-number family family],
[edit logical-systems logical-system-name interfaces interface-name unit unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit unit-number
family family]
```

Description

Apply a single-rate two-color policer—except for a physical interface policer—to Layer 3 input or output traffic at a logical interface.

- To rate-limit all traffic types, regardless of the protocol family, you can apply a logical interface policer at the logical unit level of a supported interface.
- To rate-limit traffic of a specific protocol family, you can apply a basic two-color policer, a bandwidth policer, or a logical interface policer at the protocol family level of a supported interface.

NOTE: You cannot apply a physical interface policer as part of the interface configuration. You can apply a physical interface policer by referencing the policer from a physical interface filter term.

Options

`input` *policer-name*—Name of one policer to evaluate packets received on the interface.

`output` *policer-name*—Name of one policer to evaluate packets transmitted on the interface.

Required Privilege Level

interface—To view this statement in the configuration.

    }
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall],
[edit firewall],
[edit logical-systems logical-system-name firewall]
```

Description

Configure policer rate limits and actions. When included at the `[edit firewall]` hierarchy level, the `policer` statement creates a template, and you do not have to configure a policer individually for every firewall filter or interface. To activate a policer, you must include the `policer-action` modifier in the `then` statement in a firewall filter term or on an interface.

You can configure the policer in static firewall filters or dynamic firewall filters in a dynamic client profile or a dynamic service profile.

Except for EX8200 switches, each policer that you configure includes an implicit counter. To obtain term-specific packet counts, configure a policer for each term in the filter that requires policing. For EX8200 switches, configure a policer and associate it with a global management counter using the "counter" on page 4927 option.

Options

policer-action One or more actions to take:

- `discard`—Discard traffic that exceeds the rate limits.
- `forwarding-class` *`class-name`*—Specify the particular forwarding class.
- `loss-priority`—Set the packet loss priority (PLP) to `low`, `medium-low`, `medium-high`, or `high`.

policer-name Name that identifies the policer. The name can contain letters, numbers, and hyphens (-), and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (“ ”). Policer names cannot begin with an underscore in the form `__.*`.

then Actions to take on matching packets.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

```
[edit interfaces interface-name unit logical-unit-number family (ccc | inet | tcc)],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family (ccc | inet | tcc)]
```

Description

Use policing to control the amount of traffic flowing over the interfaces servicing a Layer 2 VPN.

Options

`input` *`policer-template-name`*—Name of one policer to evaluate when packets are received on the interface.

`output` *`policer-template-name`*—Name of one policer to evaluate when packets are transmitted on the interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

policer (MAC)

IN THIS SECTION

- Syntax | 13154
- Hierarchy Level | 13155
- Description | 13155
- Options | 13155
- Required Privilege Level | 13155
- Release Information | 13155

Syntax

```
policer {
    input cos-policer-name;
    output cos-policer-name;
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number accept-source-mac mac-address mac-address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
accept-source-mac mac-address mac-address]
```

Description

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, configure MAC policing.

NOTE: On MX Series routers with Gigabit Ethernet or Fast Ethernet PICs, the following considerations apply:

- Interface counters do not count the 7-byte preamble and 1-byte frame delimiter in Ethernet frames.
- In MAC statistics, the frame size includes MAC header and CRC before any VLAN rewrite/imposition rules are applied.
- In traffic statistics, the frame size encompasses the L2 header without CRC after any VLAN rewrite/imposition rule.

Options

`input` *`cos-policer-name`*—Name of one policer to specify the premium bandwidth and aggregate bandwidth.

`output` *`cos-policer-name`*—Name of one policer to specify the premium bandwidth and aggregate bandwidth.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Configuring Gigabit Ethernet Policers

policer

IN THIS SECTION

- Syntax | 13156
- Hierarchy Level | 13156
- Description | 13157
- Options | 13157
- Required Privilege Level | 13157
- Release Information | 13157

Syntax

```
policer policer-name {
    filter-specific;
    if-exceeding {
        bandwidth-limit bps;
        burst-size-limit bytes;
    }
    then {
        policer-action;
    }
}
```

Hierarchy Level

```
[edit firewall]
```

Description

Configure policer rate limits and actions. To activate a policer, you must include the **policer** action modifier in the `then` statement in a firewall filter term.

Each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or across filters—the policer's implicit counter is used to count packets that are policed in all of these terms. If you want to obtain separate packet counts for each term, use these approaches:

- Configure a unique policer for each term.
- Configure only one policer, but use a unique, explicit counter in each term.

Options

policer-name—Name that identifies the policer. The name can contain letters, numbers, hyphens (-), and can be up to 64 characters long.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

policer-charge

IN THIS SECTION

- Syntax | 13158
- Hierarchy Level | 13158
- Description | 13158
- Default | 13159
- Required Privilege Level | 13159
- Release Information | 13160

Syntax

```
policer-charge
```

Hierarchy Level

```
[edit firewall family firewall filter family filter filter name term term name then]
```

Description

Hierarchical policers support policing of premium and non-premium traffic. The former is policed by a premium policer and the latter by an aggregate policer. Premium traffic is subject to expedited forwarding. Non-premium traffic is subject to non-expedited forwarding. Out of the aggregate bandwidth available to both types of traffic, a user-selectable bandwidth can be assigned to premium traffic. Assuming the aggregate traffic is 10 Mbps, and assured bandwidth for premium traffic is 5 mbps, the following scenarios are possible:

- When premium traffic is present, then premium traffic gets an assured bandwidth of 5 mbps. Remaining bandwidth is available to non-premium traffic.
- When premium traffic is absent, non-premium traffic can use upto 10 Mbps.
- When premium traffic is present, and non-premium traffic is absent, then premium traffic gets an assured bandwith of not more than 5 Mpbs.

The `policer-charge` firewall filter action enables this type of hierarchical policing on supported platforms. The following configuration is representative of a typical firewall filter configuration with the `policer-charge` action. Here, the `policer-charge` substracts the available credits, and makes it available to the aggregate policer. As an example, if aggregate bandwidth is 10 Mpbs, and assured premium bandwidth is 5 Mbps, and premium traffic is consuming 3 Mbps, then `policer-charge` substracts 3 Mbps from 10 Mbps. The remaining bandwith, 7 Mpbs, is made available to the aggregate policer.

```
set firewall family inet filter f1 term t1 from Premium traffic
set firewall family inet filter f1 term t1 then policer premium
set firewall family inet filter f1 term t1 then next term
set firewall family inet filter f1 term t2 from Premium traffic
set firewall family inet filter f1 term t2 then policer-charge aggregate
set firewall family inet filter f1 term t2 then accept
set firewall family inet filter f1 term t3 then policer aggregate
set firewall family inet filter f1 term t3 then accept
```

NOTE: All the terms need to be configured in same order.

The term that has the `policer-charge` and the preceding term that has the next term action, must have same match conditions.

All the policers, be it premium or aggregate, must be of same type.

The premium and aggregate policers must have discard actions.

The aggregate bandwidth should always be higher than the premium bandwidth.

Policer overhead adjustment is supported.

Policer accuracy - To support higher policer accuracy, a new packet size is added, which enables higher policer support. Policer rate configurable is also increased to 14.4 tbps. Policer accuracy is provided as close as possible to configured rate.

Default

`policer-charge` *aggregate policer*

Required Privilege Level

firewall—To view this statement in the configuration.

firewall -control—To add this statement to the configuration.

Release Information

policer-drop-probability-low

IN THIS SECTION

- Syntax | 13160
- Hierarchy Level | 13160
- Description | 13160
- Required Privilege Level | 13161
- Release Information | 13161

Syntax

```
policer-drop-probability-low;
```

Hierarchy Level

```
[edit chassis]
```

Description

Reduces the possibility that policers configured on the router might drop packets. For some Juniper Networks routers, policers can mark packets as out-of-specification in accordance with TCP. By default, these policers begin to randomly drop packets when the current credit exceeds the credit limit. In the context of TCP, this random drop mechanism helps to smooth the flow of traffic. The `policer-drop-probability-low` statement causes the policers to operate as strict rate limiters and to ignore the standard TCP behavior.

The `policer-drop-probability-low` statement is applicable to the following routing platforms:

- M7i
- M10i
- M120
- M320
- MX Series

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

policer-overhead

IN THIS SECTION

- Syntax | 13162
- Hierarchy Level | 13162
- Description | 13162
- Options | 13162
- Required Privilege Level | 13162
- Release Information | 13163

Syntax

```
policer-overhead {
    egress bytes;
    ingress bytes;
    policer-overhead-value;
}
```

Hierarchy Level

```
[edit interfaces interface-name unit number]
```

Description

Policer overhead adjustment for the logical interface. The adjustment can be made to ingress policers, egress policers, or both.

> **NOTE**: The policer overhead adjustment only works on the "logical-interface-policer" on page 10491.

Options

egress

Optional. Egress overhead adjustment in bytes.

- **Range:** -64 through 64

ingress

Optional. Ingress overhead adjustment in bytes.

- **Range:** -64 through 64

policer-overhead-value

Policer overhead adjustment to be made in both ingress and egress directions.

- **Range:** -64 through 64

Required Privilege Level

interface

Release Information

Statement introduced in Junos OS Release 18.2R1.

policer-overhead-adjustment

IN THIS SECTION

- Syntax | 13163
- Hierarchy Level | 13163
- Description | 13164
- Options | 13164
- Required Privilege Level | 13164
- Release Information | 13164

Syntax

```
interfaces interface-name
    unit unit-number
policer-overhead <ingress | egress> <adjustment in-bytes>
policer-overhead <adjustment in-bytes>
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number]
```

Description

Add the configured number of bytes to the length of a packet entering the interface or leaving the interface. The policer overhead adjustment at per IFL or direction granularity is in the range of -64 bytes to +64 bytes.

> **NOTE**: If you configure the `policer-overhead` adjustment statement without the ingress or egress option and only with values in the supported range, it is considered for both ingress and egress.
>
> For example: set interfaces xe-1/0/1 policer-overhead <*value*>

Options

`adjustment-in-bytes`—Policer overhead bytes to be accounted in ingress and egress. Number of bytes used to adjust the length of a packet used for policing purposes entering an interface and leaving an interface.

- **Range:** -64 to +64 bytes

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration

Release Information

Statement introduced in Junos OS Release 16.1.

Hierarchy Level

```
[edit security]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure a network security policies with IPv6 addresses only if flow support for IPv6 traffic is enabled on the device.

Options

default-policy Configure a default action when no user-defined policy match.

- Values:

- deny-all—Deny all traffic if no policy match
- permit-all—Permit all traffic if no policy match

policy-rematch Re-evaluate the policy when changed.

- Values:
  - extensive—Perform policy extensive rematch

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Support for the `services-offload` option added in Junos OS Release 11.4.

Support for the `source-identitiy` option added in Junos OS Release 12.1.

Support for the `description` option added in Junos OS Release 12.1.

Support for the `ssl-termination-profile` and `web-redirect-to-https` options are added starting from Junos OS Release 12.1X44-D10 and Junos OS Release 15.1X49-D40.

Support for the `user-firewall` option added in Junos OS Release 12.1X45-D10.

Support for the `domain` option, and for the `from-zone` and `to-zone` global policy match options, added in Junos OS Release 12.1X47-D10.

Support for the `initial-tcp-mss` and `reverse-tcp-mss` options added in Junos OS Release 12.3X48-D20. Support for the `extensive` option for `policy-rematch` added in Junos OS Release 15.1X49-D20.

Starting in Junos OS Release 18.2R1, an IDP policy is available within unified security policy. The IDP policy access is simplified and made available under the unified policy as one of the policy. When an IDP policy is available within a unified security policy, configuring source or destination address, source and destination-except, from and to zone, or application is not required, because the match happens in the security policy itself.

Starting in Junos OS Release 18.3R1, when an SRX Series Firewall is configured with a unified policies, you can configure multiple IDP policies and set one of those policies as the default IDP policy. If multiple

IDP policies are configured for a session and when policy conflict occurs, the device applies the default IDP policy for that session and thus resolves any policy conflicts.

> **NOTE**: If you have configured two or more IDP policies in a unified security policy, then you must configure the default IDP policy.

[edit logical-systems name tenants name security advance-policy-based-routing from-zone],
[edit tenants name security advance-policy-based-routing from-zone]
```

Description

Configure advanced policy-based routing (APBR) policies.

You can create APBR policies for a security zone and apply advanced policy-based routing (APBR) profiles on the traffic that matches the policy.

In the APBR policy, you can define source addresses, destination addresses, and applications as match conditions; and after a successful match, the configured APBR profile is applied as an application services for the session.

The routing instance associated with APBR profile includes a static route and next hop configured. The matching traffic arriving at the trust zone is forwarded to a specific device or interface as specified by the next-hop IP address.

> **NOTE**: When using specific address or address set in the APBR policy rule, we recommend to use the global address book. Because, zone specific rules might not be applicable for destination address, as the destination zone is not known at time of policy evaluation.

Options

policy *policy-name* Specify the name of the APBR policy.

description Specify descriptive text for the APBR policy.

match Specify an APBR policy match-criteria.

- **source-address** Define the source address as the matching criteria.
- **destination-address** Define the destination address as the matching criteria.

application	Name of the predefined or custom application or application set used as match criteria.
destination-address-excluded	Exclude destination addresses.
source-address-excluded	Exclude source addresses.
source-identity	Specify users and roles to be used as the match criteria.

scheduler-name *scheduler-name*

Specify the name of the scheduler to associate with APBR policy.

Schedulers allow you to activate a policy for a specified duration. To define a scheduler for a APBR policy, you must first create a scheduler and then refer the scheduler in your policy configuration.

When a scheduler times out, the associated policy is deactivated. All sessions associated with the policy are subsequently timed out only if policy-rematch is used.

then

Specify the policy action to be performed when packets match the defined criteria.

application-services

Enable application services within a security policy. the following application services is supported:

- advance-policy-based-routing-profile *apbr-profile-name*—Specify the advanced policy-based routing (APBR) profile.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

generate) (defaults | route)],
[edit routing-options (aggregate | generate) (defaults | route)],
[edit routing-options rib routing-table-name (aggregate | generate) (defaults | route)]
```

Description

Associate a routing policy when configuring an aggregate or generated route's destination prefix in the **routes** part of the **aggregate** or `generate` statement. This provides the equivalent of an import routing policy filter for the destination prefix. That is, each potential contributor to an aggregate route, along with any aggregate options, is passed through the policy filter. The policy then can accept or reject the route as a contributor to the aggregate route.

If the contributor is accepted, the policy can modify the default preferences. The contributor with the numerically smallest prefix becomes the most preferred, or *primary*, contributor. A rejected contributor still can contribute to a less specific aggregate route. If you do not specify a policy filter, all candidate routes contribute to an aggregate route.

The following algorithm is used to compare two generated contributing routes in order to determine which one is the primary or preferred contributor:

1. Compare the protocol's **preference** of the contributing routes. The lower the preference, the better the route. This is similar to the comparison that is done while determining the best route for the routing table.

2. Compare the protocol's **preference2** of the contributing routes. The lower **preference2** value is better. If only one route has **preference2**, then this route is preferred.

3. The preference values are the same. Proceed with a numerical comparison of the prefixes' values.

   a. The primary contributor is the numerically smallest prefix value.

   b. If the two prefixes are numerically equal, the primary contributor is the route that has the smallest prefix length value.

At this point, the two routes are the same. The primary contributor does not change. An additional next hop is available for the existing primary contributor.

A rejected contributor still can contribute to less specific generated route. If you do not specify a policy filter, all candidate routes contribute to a generated route.

Options

policy-name—Name of a routing policy.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

    }
}
```

Hierarchy Level

```
[edit event-options]
```

Description

Define an event policy to be processed by the eventd process. If you configure a policy, the `events` and `then` statements are mandatory.

You can configure multiple policies to be processed for an event. The policies are executed in the order in which they appear in the configuration. If you configure more than one policy for an event, and if one of the policies is configured to ignore the event, no policies that follow the policy with the `ignore` statement are executed.

Default

If you do not configure a policy for an event, no actions are taken upon receipt of the event, which is recorded in the system log.

Options

policy-name	Name of an event policy.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

Configuring IPsec Policies

policy (Multicast-Only Fast Reroute)

IN THIS SECTION

- Syntax | 13195
- Hierarchy Level | 13195
- Description | 13196
- Required Privilege Level | 13197
- Release Information | 13197

Syntax

```
policy policy-name;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options multicast stream-protection],
[edit logical-systems logical-system-name routing-options multicast stream-protection],
```

```
[edit routing-instances routing-instance-name routing-options multicast stream-protection],
[edit routing-options multicast stream-protection]
```

Description

When you configure multicast-only fast reroute (MoFRR), apply a routing policy that filters for a restricted set of multicast streams to be affected by your MoFRR configuration. You can apply filters that are based on source or group addresses.

For example:

```
routing-options {
    multicast {
        stream-protection {
            policy mofrr-select;
        }
    }
}
policy-statement mofrr-select {
    term A {
        from {
            source-address-filter 225.1.1.1/32 exact;
        }
        then {
            accept;
        }
    }
    term B {
        from {
            source-address-filter 226.0.0.0/8 orlonger;
        }
        then {
            accept;
        }
    }
    term C {
        from {
            source-address-filter 227.1.1.0/24 orlonger;
            source-address-filter 227.4.1.0/24 orlonger;
            source-address-filter 227.16.1.0/24 orlonger;
        }
        then {
```

```
            accept;
        }
    }
    term D {
        from {
            source-address-filter 227.1.1.1/32 exact;
        }
        then {
            reject; #MoFRR disabled
        }
    }
    term E {
        from {
            route-filter 227.1.1.0/24 orlonger;
        }
        then accept;
    }
    ...
}
```

Required Privilege Level

[edit logical-systems name routing-instances name protocols pim rp rpf-vector],
[edit protocols pim rp rpf-vector],
[edit routing-instances name protocols pim rp rpf-vector]
```

Description

Create a filter policy. The configured device checks the policy configuration to determine whether or not to apply "rpf-vector" on page 16609 to (S,G).

RPF Vector Policy Example

This example policy shows Source and Group, using Source, using Group.

```
policy-statement pim-rpf-vector-example {
        term A {
```

```
            from {
               source-address-filter <filter A>;
            }
            then {
               accept;
            }
        }
        term B {
            from {
               source-address-filter <filter A>;
               route-filter <filter D>;
            }
            then {
               p2mp-lsp-root {
                   address root address;
               }
               accept;
            }
        }
        term C {
            from {
               route-filter <filter D>;
            }
            then {
               accept;
            }
        }
        ...
    }
```

RPF Vector Policy Configuration statements

This example policy using Source, Group.

```
set protocols pim rpf-vector policy rpf-vector-policy
set policy-options policy-statement rpf-vector-policy term 1 from route-filter 232.0.0.1/32 exact
set policy-options policy-statement rpf-vector-policy term 1 from source-address-filter
22.1.1.2/32 exact
set policy-options policy-statement rpf-vector-policy term 1 then p2mp-lsp-root address 200.1.1.2
set policy-options policy-statement rpf-vector-policy term 1 then accept
```

RPF Vector Policy Configuration statements

This example policy using Group, Source wildcard.

```
set protocols pim rpf-vector policy rpf-vector-policy
set policy-options policy-statement rpf-vector-policy term 1 from source-address-filter
22.1.1.2/32 exact
set policy-options policy-statement rpf-vector-policy term 1 from route-filter 0.0.0.0/0 longer
set policy-options policy-statement rpf-vector-policy term 1 then p2mp-lsp-root address 200.1.1.2
set policy-options policy-statement rpf-vector-policy term 1 then accept
```

policy (Protocols Multipoint LDP)

IN THIS SECTION

- Syntax | 13201
- Hierarchy Level | 13201
- Description | 13201
- Options | 13201
- Required Privilege Level | 13201
- Release Information | 13201

Syntax

```
policy policy-name;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols pim mldp-inband-signalling],
[edit protocols pim mldp-inband-signalling]
```

Description

Multipoint LDP (M-LDP) in-band signaling enables you to carry multicast traffic across an existing IP/MPLS backbone, while avoiding the use of PIM in the provider core.

On the egress nodes of the point-to-multipoint LSP, specify an M-LDP join translation filter policy where PIM messages are translated into M-LDP FEC bindings. The policy statement is needed when internal BGP (IBGP) is not available in the core site or to override IBGP-based LSP root detection.

The filter policy is configured at the `[edit policy-options]` hierarchy level. The policy generally specifies one or more source-address filters and the point-to-multipoint LDP root IP address using the `p2mp-lsp-root` policy action.

Options

policy-name—Name of a policy configured at the `[edit policy-options]` hierarchy level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

- Description | 13204
- Options | 13204

Required Privilege Level | 13205
Release Information | 13205

Syntax

```
policy policy-name {
    description description;
    mode2 (aggressive | main);
    pre-shared-key (ascii-text key | hexadecimal key);
    proposals proposal-name;
}
```

Hierarchy Level

```
[edit security group-vpn member ike]
[edit security group-vpn server ike]
```

Description

Configure an IKE policy. An IKE policy defines a combination of security parameters (IKE proposals) to be used during IKE negotiation. It defines a peer address, the preshared key for the given peer, and the proposals needed for that connection. During the IKE negotiation, IKE looks for an IKE policy that is the same on both peers. The peer that initiates the negotiation sends all its policies to the remote peer, and the remote peer tries to find a match.

Options

policy *policy-name*	Name of the IKE policy. The policy name can be up to 32 alphanumeric characters long.
description *description*	Specify descriptive text for an IKE policy.
mode	Define the mode used for Internet Key Exchange (IKE) Phase 1 negotiations.

pre-shared-key Define a preshared key for an IKE policy. Preshared keys are used to secure the Phase 1 SAs between the root-server and the sub-servers and between the sub-servers and the group members. Ensure that the preshared keys used are strong keys. On the sub-servers, the preshared key configured for the IKEpolicy RootSrv must match the preshared key configured on the root-server, and the preshared key configured for the IKE policy GMs must match the preshared key configured on the group members.

proposals *proposal-name* Specify up to four Phase 1 proposals for an IKE policy. If you include multiple proposals, use the same Diffie-Hellman group in all of the proposals.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

gcm-256);
    proposals proposal-name;
    reauth-frequency number;
}
```

Hierarchy Level

```
[edit security ike]
```

Description

IKE policies define a combination of security parameters (IKE proposals) to be used during IKE negotiation, including peer address, the preshared key for the given peer, and the proposals needed for that connection. During the IKE negotiation, IKE looks for an IKE policy that is the same on both peers. The peer that initiates the negotiation sends all its policies to the remote peer, and the remote peer tries to find a match.

IKE proposals in the `policy` statement are evaluated in list order, from top to bottom, so when creating the policy, specify the highest priority proposal first, followed by the next highest priority, and so on.

Options

policy-name—Name of the IKE policy. The policy name can be up to 32 alphanumeric characters long.

blocklist *blocklist-name*—Specify the name of the corresponding remote peer's IKE identity blocklist. The blocklist is used for blocking IKE-IDs during IKE SA negotiation authentication phase.

certificate—Specify usage of a digital certificate to authenticate the virtual private network (VPN) initiator and recipient. For more information, See certificate.

description *description*—Specify the description of IKE policy.

mode—Define the mode used for Internet Key Exchange (IKE) Phase 1 negotiations. Use aggressive mode only when you need to initiate an IKE key exchange without ID protection, as when a peer unit has a dynamically assigned IP address. IKEv2 protocol does not negotiate using mode configuration. The device deletes existing IKE and IPsec SAs when you update the mode configuration in the IKE policy.

- aggressive—Aggressive mode.
- main—Main mode. Main mode is the recommended key-exchange method because it conceals the identities of the parties during the key exchange.

  Configuring mode main for group VPN servers or members is not supported when the remote gateway has a dynamic address and the authentication method is pre-shared-keys.

pre-shared-key—Define a preshared key for an IKE policy. The device deletes existing IKE and IPsec SAs when you update the pre-shared-key configuration in the IKE policy.

- ascii-text *key*—Specify a string of 1 to 255 ASCII text characters for the key. To include the special characters ( ) [ ] ! & ? | enclose either the entire key string or the special character in quotation marks; for example "str)ng" or str")"ng. Other use of quotation marks within the string is not allowed. With des-cbc encryption, the key contains 8 ASCII characters. With 3des-cbc encryption, the key contains 24 ASCII characters.
- hexadecimal *key*—Specify a string of 1 to 255 hexadecimal characters for the key. Characters must be hexadecimal digits 0 through 9, or letters a through f or A through F. With des-cbc encryption, the key contains 16 hexadecimal characters. With 3des-cbc encryption, the key contains 48 hexadecimal characters.

seeded-pre-shared-key—Define a seeded preshared key in ASCII or hexadecimal format for an IKE policy. The seeded-pre-shared-key is a master key that is used to generate the pre-shared-key for the peers. Thus each peer will have different pre-shared-key. The advantage of this option is that each peer connection to gateway will have different pre-shared key, so if one of the peer's pre-shared-key is compromised, then the other peers are not impacted.

The peer preshared keys are generated using the master key configured as seeded-pre-shared-key and shared across the peers. To view the peer's pre-shared-key, execute the show security ike pre-shared-key

command, share and configure the displayed pre-shared key in peer's device as pre-shared-key (in ASCII format). Master key is only configured in the gateway device and not shared to any peer.

You can retrieve the peer preshared key using the `show security ike pre-shared-key user-id` *`peer ike-id`* `master-key` *`master key`* or `show security ike pre-shared-key user-id` *`peer ike-id`* `gateway` *`gateway name`* command.

- `ascii-text` *`key`*—Configure a string of 1 to 255 ASCII text characters for the key. To include the special characters `( ) [ ] ! & ? |` enclose either the entire key string or the special character in quotation marks; for example "`str)ng`" or `str")"ng`. Other use of quotation marks within the string is not allowed.

- `hexadecimal` *`key`*—Specify a string of 1 to 255 hexadecimal characters for the key. Characters must be hexadecimal digits `0` through `9`, or letters `a` through `f` or `A` through `F`.

`proposal-set`—Specify a set of default Internet Key Exchange (IKE) proposals.

`proposals` *`proposal-name`*—Specify up to four Phase 1 proposals for an IKE policy. If you include multiple proposals, use the same Diffie-Hellman group in all of the proposals.

`reauth-frequency` *`number`*—Configure the reauthentication frequency to trigger a new IKEv2 reauthentication. Reauthentication creates a new IKE SA, creates new child SAs within the IKE SA, and then deletes the old IKE SA. This option is disabled by default. umber of IKE rekeys that occurs before reauthentication occurs. If `reauth-frequency` is `1`, reauthentication occurs every time there is an IKE rekey. If `reauth-frequency` is `2`, reauthentication occurs at every other IKE rekey. If `reauth-frequency` is `3`, reauthentication occurs at every third IKE rekey.

- **Default:** 0 (disable)

- **Range:** 0-100

- Syntax | 13211
- Hierarchy Level | 13211

- Description | 13211
- Options | 13211
- Required Privilege Level | 13211
- Release Information | 13212

Syntax

```
policy ipsec-policy-name {
    description description;
        perfect-forward-secrecy {
        keys (group1 | group 14 | group2 | group 5);
    }
    proposals [ proposal-names ];
}
```

Hierarchy Level

```
[edit security ipsec]
```

Description

Define an IPsec policy.

Options

ipsec-policy-name—Specify an IPsec policy name.

The remaining statements are explained separately.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring the IPsec Policy for an ES PIC

policy (Security IPsec)

IN THIS SECTION

- Syntax | 13212
- Hierarchy Level | 13213
- Description | 13213
- Options | 13213
- Required Privilege Level | 13215
- Release Information | 13215

Syntax

```
policy policy-name {
    description description;
    perfect-forward-secrecy keys (group1 | group14 | group19 | group2 | group20 | group24 |
group5 | group15 | group16 | group21);
    proposal-set (basic | compatible | prime-128 | prime-256 | standard | suiteb-gcm-128 |
suiteb-gcm-256);
    proposals proposal-name;
}
```

Hierarchy Level

```
[edit security ipsec]
```

Description

Define an IPsec policy. An IPsec policy defines a combination of security parameters (IPsec proposals) used during IPsec negotiation. It defines Perfect Forward Secrecy (PFS) and the proposals needed for the connection.

Options

name Name of the IPsec policy.

description Enter descriptive text for an IPsec policy.

perfect-forward-secrecy keys Specify Perfect Forward Secrecy (PFS) as the method that the device uses to generate the encryption key. PFS generates each new encryption key independently from the previous key. The device deletes existing IPsec SAs when you update the `perfect-forward-secrecy` configuration in the IPsec policy.

- Values:
  - `group1`—768-bit Modular Exponential (MODP) algorithm.
  - `group2`—1024-bit MODP algorithm.
  - `group5`—1536-bit MODP algorithm.
  - `group14`—2048-bit MODP group.
  - `group15`—3072-bit MODP algorithm.
  - `group16`—4096-bit MODP algorithm.
  - `group19`—256-bit random Elliptic Curve Groups modulo a Prime (ECP groups) algorithm.
  - `group20`—384-bit random ECP groups algorithm.
  - `group21`—521-bit random ECP groups algorithm.
  - `group24`—2048-bit MODP Group with 256-bit prime order subgroup.

proposal-set Define a set of default IPsec proposals.

- Values:
  - basic—IPsec basic proposal set. esp-des-sha and esp-des-md5.
    - Encapsulating Security Payload (ESP) protocol
    - Encryption algorithm—DES-CBC encryption algorithm
    - Authentication algorithm—SHA1 or MD5 authentication algorithm
  - compatible—IPsec compatible proposal set. esp-3des-sha, esp-3des-md5, esp-des-sha, and esp-des-md5.
    - ESP protocol
    - Encryption algorithm—3DES-CBC or DES-CBC encryption algorithm
    - Authentication algorithm—SHA1 or MD5 authentication algorithm
  - `prime-128`—Provides the following proposal set:
    - Encapsulating Security Payload (ESP) protocol
    - Encryption algorithm—Advanced Encryption Standard Galois/Counter mode (AES-GCM)128-bit
    - Authentication algorithm—None (AES-GCM provides both encryption and authentication)

    This option is not supported on Group VPNv2.
  - `prime-256`—Provides the following proposal set:
    - ESP protocol
    - Encryption algorithm—AES-GCM 256-bit
    - Authentication algorithm—None (AES-GCM provides both encryption and authentication)

    This option is not supported on Group VPNv2.
  - `standard`—esp-3des-sha and esp-aes128-sha

- ESP protocol
- Encryption algorithm—3DES-CBC or AES-CBC 128-bit encryption algorithm
- Authentication algorithm—SHA1 authentication algorithm

- `suiteb-gcm-128`—Provides the following proposal set:
  - ESP protocol
  - Encryption algorithm—AES-GCM 128-bit
  - Authentication algorithm—None (AES-GCM provides both encryption and authentication)

  This option is not supported on Group VPNv2.

- `suiteb-gcm-256`—Provides the following proposal set:
  - ESP protocol
  - Encryption algorithm—AES-GCM 256-bit
  - Authentication algorithm—None (AES-GCM provides both encryption and authentication)

  This option is not supported on Group VPNv2.

proposals ***proposal-name***

Specify up to four Phase 2 proposals for an IPsec policy. If you include multiple proposals, use the same Diffie-Hellman group in all of the proposals.

Proposals are evaluated in the order they appear on the list, from top down, so specify the highest priority first, followed by the next highest priority, and so on.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 8.5.

Support for group 14 is added in Junos OS Release 11.1.

Support for `group14` options added in Junos OS Release 11.1.

Support for `group19`, `group20`, and `group24` options added in Junos OS Release 12.1X45-D10.

`group15`, `group16`, and `group21` options introduced in Junos OS Release 19.1R1 on SR5000 line of devices with `junos-ike` package installed.

Support for `suiteb-gcm-128` and `suiteb-gcm-256` options added in Junos OS Release 12.1X45-D10. Support for `prime-128` and `prime-256` options added in Junos OS Release 15.1X49-D40.

Starting in Junos OS Release 20.2R1, we've changed the help text description as `NOT RECOMMENDED` for the CLI options `group1`, `group2`, and `group5` for devices running IKED with `junos-ike` package installed.

Support for `group15`, `group16`, and `group21` options added in Junos OS Release 20.3R1 on vSRX Virtual Firewall instances with `junos-ike` package installed.

Support for `group15`, `group16`, and `group21` options added in Junos OS Release 21.1R1 on vSRX Virtual Firewall 3.0 instances with `junos-ike` package installed.

}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name]
```

Description

Define a security policy.

Options

policy-name Name of the security policy.

description Descriptive text about the security policy.

Range: 1 through 900 characters

The descriptive text should not include characters “<”, “>”, “&”, or “\n”.
The upper limit of the description text range is related to character encoding, and is therefore dynamic. However, if you configure the descriptive text length beyond 900 characters, the configuration might fail to take effect.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5. The `services-offload` option added in Junos OS Release 11.4. Statement updated with the `source-identity` option and the `description` option added in Junos OS Release 12.1. Support for the `user-firewall` option added in Junos OS Release 12.1X45-D10. Support for the `initial-tcp-mss` and `reverse-tcp-mss` options added in Junos OS Release 12.3X48-D20.

The `junos-twamp` application is introduced in Junos OS Release 18.2R1.

```

```
            dscp (alias | bits);
            forwarding-class class-name;
        }
    }
}
```

Hierarchy Level

```
[edit services cos rule rule-name]
```

Description

Configure a policy in a services CoS rule. The policy specifies Differentiated Services (DiffServ) code point (DSCP) marking and forwarding-class assignment for packets that are processed by a service set. The policy identifies the matching conditions for packet source and destination addresses and for packet applications, and the actions to take on those packets. A CoS rule can include multiple policies.

The service set that the CoS rule is assigned to must include at least one stateful firewall rule or NAT rule, or CoS does not work. Only stateful firewall and NAT rules can be used with CoS rules in a service set.

Options

policy-name	Name of the policy.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

policy (System Security Profile)

IN THIS SECTION

- Syntax | 13230
- Hierarchy Level | 13230
- Description | 13230
- Options | 13231
- Required Privilege Level | 13231
- Release Information | 13231

Syntax

```
policy {
    maximum maximum;
    reserved reserved;
}
```

Hierarchy Level

```
[edit system security-profile]
```

Description

Specify the number of security policies that user logical system administrators and primary logical system administrators can configure for their logical systems if the security profile is bound to the logical systems.

The primary administrator:

- uses security profiles to provision logical systems with resources.
- binds security profiles to user logical systems and the primary logical system.

- can configure more than one security profile, specifying different amounts of resource allocations in various profiles.

Only the primary administrator can create security profiles and bind them to logical systems.

Options

maximum A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows, it can utilize resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems compete for global resources.

- **Range:** 0 through 80000

reserved A reserved quota that guarantees that the resource amount specified is always available to the logical system.

- **Default:** 0

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

- Release Information | 13233

Syntax

```
policy policy-name {
    accept (Router Advertisement Guard Policy) {
        match-list {
            match-criteria {
                (match-all | match-any);
            }
            prefix-list-name prefix-list-name;
            source-ip-address-list address-list-name;
            source-mac-address-list address-list-name;
        }
        match-option {
            hop-limit {
                (maximum | minimum) value;
            }
            managed-config-flag;
            other-config-flag;
            router-preference (high | low | medium);
        }
    }
    discard (forwarding-options) {
        prefix-list-name prefix-list-name;
        source-ip-address-list address-list-name;
        source-mac-address-list address-list-name;
```

```
    }
}
```

Hierarchy Level

```
[edit forwarding-options access-security router-advertisement-guard],
[edit forwarding-options access-security router-advertisement-guard interface interface-name],
[edit forwarding-options access-security router-advertisement-guard vlans (vlan-name| all)]
```

Description

Configure the policy for an IPv6 Router Advertisement (RA) guard. RA guard protects against rogue RA messages generated either maliciously or unintentionally by unauthorized or improperly configured routers connecting to the network segment. An RA guard policy is used to validate incoming RA messages based on whether they match the conditions defined in the policy.

RA guard compares the information contained in attributes of RA messages to the information contained in the policy. You must configure the policy before you can enable RA guard. You can configure either an accept policy or a discard policy and enable it on an interface or on a VLAN. When RA guard is enabled by using an accept policy, any RA messages that match the conditions defined in the policy are forwarded, and RA messages that do not match the conditions are dropped. When RA guard is enabled by using a discard policy, any RA messages that match the conditions defined in the policy are dropped, and RA messages that do not match the conditions are forwarded.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X53-D55.

policy-based-logging (LRF Profile)

IN THIS SECTION

- Syntax | 13234
- Hierarchy Level | 13234
- Description | 13234
- Required Privilege Level | 13234
- Release Information | 13234

Syntax

```
policy-based-logging;
```

Hierarchy Level

```
[edit services lrf profile profile-name]
```

Description

Configure policy-based logging, which causes the LRF rules to be activated by PCC rules.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support for Next Gen Services introduced in Junos OS Release 19.3R1 on MX Series.

policy-db-size

IN THIS SECTION

- Syntax | 13235
- Hierarchy Level | 13235
- Description | 13235
- Options | 13236
- Required Privilege Level | 13236
- Release Information | 13236

Syntax

```
policy-db-size size;
```

Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-
provider]
```

Description

Configure the size of the policy database. When this setting is changed, the PIC reboots.

> **NOTE**: At least one data core must be configured to configure the size of the policy database.

Options

size—Size of the policy database, in megabytes (MB). The size of the forwarding database and the size of the policy database together must be smaller than the size of the object cache.

- **Range:** 0 through 1279 MB

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

policy-decision-statistics-profile

IN THIS SECTION

- Syntax | 13237
- Hierarchy Level | 13237
- Description | 13237
- Options | 13237

Required Privilege Level | 13238
Release Information | 13238

Syntax

```
policy-decision-statistics-profile profile-name {
    aacl-fields {
        field-name;
    }
    file filename;
    files file-number;
    size bytes;
}
```

Hierarchy Level

```
[edit accounting-options],
[edit services service-set service-set-name]
```

Description

Create a policy decision statistics profile, which configures the files to which statistics records are exported and the format that is exported.

Options

`file` *`filename`*—Use the specified file to receive the accounting-data output. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

`files` *`number`*—(Optional) Use the specified maximum number of accounting files.

- **Range:** 2 through 1000 files
- **Default:** 2 files

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

profile-name—Name of the policy decision statistics profile.

size *size*—(Optional) Use the specified maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

- **Syntax:** *x*k to specify KB, *x*m to specify MB, or *x*g to specify GB
- **Range:** 10,240 through 1,073,741,824 or the maximum file size supported on your system

If you specify a maximum file size, you also must specify a maximum number of trace files with the files option.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.
