(policy-lookup-cache | no-policy-lookup-cache);
```

Hierarchy Level

```
[edit security idp sensor-configuration global]
```

Description

Enable cache to accelerate IDP policy lookup which improves IDP performance.

Default

`policy-lookup-cache` is enabled by default.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

policy-map (Class of Service)

IN THIS SECTION

- Syntax | 13240
- Hierarchy Level | 13241
- Description | 13241
- Options | 13242

    exp outer-label code-point [alias | bits];
    ieee-802.1 outer code-point [alias | bits];
    ieee-802.1 outer-and-inner code-point [alias | bits];
    ieee-802.1ad outer code-point [alias | bits];
    ieee-802.1ad outer-and-inner code-point [alias | bits];
    user-attribute integer;
}
```

Hierarchy Level

```
[edit class-of-service]
```

Description

Define the packet-marking scheme (rewrite rules) for a customer. Traditionally, packet marking in Junos uses the forwarding class and loss priority determined from a behavior aggregate (BA) classifier or multifield classifier. This approach does not allow rewrite rules to be directly assigned for each customer because of the limited number of combinations of forwarding class and loss priority. `policy-map` enables you to define rewrite rules on a per-customer basis.

NOTE: To enable the policy map feature:

- On most devices, enable `enhanced-ip`, `enhanced-ethernet`, or `enhanced-mode` under `[edit chassis network-services]`.
- On PTX10002-36QDD routers, enable `policy-map-marking` on each egress logical interface that you want to do policy map marking. You enable `policy-map-marking` at the `[edit class-of-service interfaces interface-name unit unit-number]` hierarchy level.

NOTE: Policy maps have the following configuration restrictions:

- When configuring both `proto-ip` and `proto-mpls` options for `inet-precedence`, `inet6-precedence`, `dscp`, or `dscp-ipv6`, you must configure both options with the same code point or code point alias.
- You cannot configure `inet-precedence` and `dscp` in the same policy map.
- You cannot configure `inet6-precedence` and `dscp-ipv6` in the same policy map.
- In case of MPLS SWAP/PUSH operation, only the new labels are marked on all label-switching routers (LSRs), except the penultimate hop case where if it exposes the next label in the stack, then the exposed label is marked. Therefore, with the penultimate hop, the service label is changed.
- You cannot configure `ieee-802.1` and `ieee-802.1ad` in the same policy map.
- You cannot configure both `outer` and `outer-and-inner` options for `ieee-802.1` and `ieee-802.1ad` code points in the same policy map.

- For IEEE 802.1ad with the `outer-and-inner` option, the discard eligibility (DE) bit is marked only for the outer VLAN header. For the inner VLAN header, only the three CoS Bits are marked.

You assign the policy map to a customer through a firewall action on an ingress or egress firewall filter (where the match conditions identify the customer). Alternatively, you can also assign a policy map to an ingress interface or a routing instance. A policy map is executed on a packet just before it is queued, so it overrides any other packet-marking scheme that was previously applied to the packet.

Options

alias The predefined CoS code point alias on the device.

bits The bit pattern for the CoS code point.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R1.

`inet6-precedence` options added in Junos OS Release 24.2R1.

Refer to Feature Explorer for platform and release support information.

[edit logical-systems name tenants name routing-instances name routing-options rib],
[edit routing-instances name routing-options rib],
[edit routing-options rib],
[edit tenants name routing-instances name routing-options rib]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the

debug information, immediately disable tracing to minimize risk and restore normal system performance.

Create policy-based multipath route using a combination of segment routing traffic-engineered (SR-TE) LDP or RSVP routes and SR-TE IP routes. You can resolve BGP service routes over the mutlipath route, and apply export policies to steer traffic differently for different prefixes. The policy-based multipath feature is supported for both IP and IPv6 protocols.

Options

policy Import policy to create policy-based multipath.

> **NOTE**: This statement is supported only at the `[edit routing-option policy-multipath]` hierarchy level.

Any action commands configured in the policy, such as apply, is evaluated using the active route. For non-active routes, the policy is applied to check if the routes can participate in the multipath route or not. Multipath routes inherit all attributes of the active route. These attributes can be modified using the multipath policy configuration.

preserve-nexthop-hierarchy Enable expanded nh hierarchy support for policy-multipath routes for RIBs. For any inet[6].3 RIBs, the preserve-nexthop-hierarchy is enabled by default.

> **NOTE**: This statement is supported only at the `[edit routing-options rib <rib-name> policy-multipath]` hierarchy level.

The remaining statements are explained separately. See CLI Explorer.

- Release Information | 13249

Syntax

```
policy-oids [ oid ];
```

Hierarchy Level

```
[edit services ipsec-vpn ike policy policy-name certificate]
```

Description

Configure policy object identifiers (OIDs). This configuration is optional.

Options

oid Policy OID contained in a peer's certificate or certificate chain. Up to five policy OIDs can be configured. Each OID can be up to 63 bytes long.

> **NOTE**: You must ensure that at least one of the configured policy OIDs is included in a peer's certificate or certificate chain. Note that the **policy-oids** field in a peer's certificate is optional. If you configure policy OIDs in an IKE policy and the peer's certificate chain does not contain any policy OIDs, certificate validation for the peer fails.

Required Privilege Level

- Required Privilege Level | 13250
- Release Information | 13251

Syntax

```
policy-options {
    prefix-list uid {
        ip-addresses;
        dynamic-db;
    }
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name]
```

Description

Define a list of IPv4 or IPv6 address prefixes for use in a dynamic firewall filter or in an HTTP redirect configuration.

You can configure up to 85,325 prefixes in each prefix list. To configure more than 85,325 prefixes, configure multiple prefix lists and apply them to multiple firewall filter terms.

You can configure policy options in a dynamic client profile or a dynamic service profile.

Options

uid Unique identifier of the prefix list. You must assign a UID as the prefix list name.

ip-addresses List of IPv4 or IPv6 address prefixes, one IP address per line in the configuration.

dynamic-db Specify that the routing policy and policy objects reference policies configured in the dynamic database at the `[edit dynamic]` hierarchy level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

policy-rematch

IN THIS SECTION

- Syntax | 13256
- Hierarchy Level | 13256
- Description | 13256
- Options | 13256
- Required Privilege Level | 13256
- Release Information | 13257

Syntax

```
policy-rematch <extensive>;
```

Hierarchy Level

```
[edit security policies]
```

Description

Enable the device to reevaluate an active session when its associated security policy is modified. The session remains open if it still matches the policy that allowed the session initially.

The session is closed if its associated policy is renamed, deactivated, or deleted. However, you can use the `extensive` option to reevaluate an active session when its associated security policy is renamed, deactivated, or deleted.

The policy rematch feature is disabled by default.

Options

extensive When a policy is modified or deleted, extensive option checks if any suitable policy permit to keep these sessions alive. This check is done through a fully new policy lookup for the session to see if any policy can still permit it.

> **NOTE**: The `extensive` option does not apply to ALG data sessions or to policies that specify a source-identity, application-services, destination-address (drop-untranslated or drop-translated), firewall-authentication, or a tunnel.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5. Support for the `extensive` option added in Junos OS Release 15.1X49-D20.

```

Syntax (without terms)

The policy statement configuration can be used without terms. An example configuration is as below.

```
policy-statement policy-name from <match-condition> then <action>
```

Hierarchy Level

```
[edit dynamic-profiles profile-name policy-options],
[edit logical-systems logical-system-name policy-options],
[edit policy-options]
```

Description

Define a routing policy, including subroutine policies.

A *term* is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

Each term contains a set of match conditions and a set of actions:

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of `accept` or `reject` is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either `accept` or `reject`) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the `[edit policy-options]` hierarchy level by `policy-statement` *`policy-name`* in alphabetical order, enter the `show policy-options` configuration command.

The statements are explained separately.

Options

actions—(Optional) One or more actions to take if the conditions match. The actions are described in Configuring Flow Control Actions.

family *family-name*—(Optional) Specify an address family protocol. Specify inet for IPv4. Specify inet6 for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify iso. For IPv4 multicast VPN traffic, specify inet-mvpn. For IPv6 multicast VPN traffic, specify inet6-mvpn. For multicast-distribution-tree (MDT) IPv4 traffic, specify inet-mdt. For BGP route target VPN traffic, specify route-target. For traffic engineering, specify traffic-engineering.

> **NOTE**: When family is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the "family" on page 7186 statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

from—(Optional) Match a route based on its source address.

as-path-origins (as-list | as-list-group)—Compares the AS that originated the route. Evaluates if the right most AS number on the AS path belongs to the as-list or as-list-group specified in the as-path-origins configuration statement. In the case where the route has been aggregated, and the location of the originating AS contains an AS-set, the as-path-origins operator evaluates to true if any AS contained in the AS-set belongs to the as-list or as-list-group specified in the as-path-origins configuration statement.

as-path-neighbors (as-list | as-list-group)—Compares the neighbor AS in the AS path. Evaluates if the first AS number on the AS path matches the as-list or as-list-group specified in the as-path-neighbors configuration statement. If the neighboring AS location happens to be an AS-set, the as-path-neighbors operator evaluates to true if any AS contained in the AS-set belongs to the as-list or as-list-group specified in the as-path-neighbors configuration statement.

as-path-transits (as-list | as-list-group)—Compares any AS in the AS-Path. Evaluates when any AS belongs to the as-list or as-list-group specified in the as-path-transit configuration statement. In the case of AS-set, the as-path-transit operator compares all the ASes in the AS-set.

as-path-calc-length *count* (equal | orhigher | orlower)—(Optional) Specify a number from 0 through 1024 to filter routes based on the number of calculated autonomous systems (ASs) in the AS path.

> **NOTE**:
>
> - ASs in a sequence count as 1.

- AS sets count as 1.
- BGP confederation segments count as 0.

`as-path-unique-count` *`count`* `(equal | orhigher | orlower)`—(Optional) Specify a number from 0 through 1024 to filter routes based on the total number of unique non-BGP confederation autonomous systems (ASs) in the AS path.

NOTE: Duplicate AS numbers are ignored for the count.

`advertise-locator`—(Optional) Enable IS-IS to summarize and advertise locator prefixes.

Range: *0-255*

`aggregate-bandwidth [transitive | non-transitive]`—(Optional) Enable BGP to advertise aggregate outbound link bandwidth for load balancing. By default, the aggregate link-bandwidth community is transitive. You can choose to use the BGP link-bandwidth community as a non-transitive attribute.

`aggregate-bandwidth divide-equal`—(Optional) Enable equal division of total link-bandwidth by number of peers in the advertising group. If you modify the BGP group, the updated aggregate bandwidth is sent to all peers.

`dynamic-tunnel-attributes` *`dynamic-tunnel-attributes`*—(Optional) Choose a set of defined dynamic tunnel attributes for forwarding traffic over V4oV6 tunnels.

`match-conditions`—(Optional in `from` statement; required in `to` statement) One or more conditions to use to make a match. The qualifiers are described in Routing Policy Match Conditions.

`multipath-resolve` *`multipath-resolve`*–(Optional) Enable the use of all paths for resolution over the specified prefix.

`limit-bandwidth` *`limit-bandwidth`*—(Optional) Specify the limit for advertised aggregate outbound link bandwidth for load balancing.

- **Range:** 0 through 4,294,967,295 bytes

`no-entropy-label-capability`—(Optional) Disable the entropy label capability advertisement at egress or transit routes specified in the policy.

`neighbor`—(Optional) Specify a neighbor for route filtering.

`priority (high | medium | low)`—(Optional) Configure the priority for an IS-IS route to change the default order in which the routes are installed in the routing table, in the event of a network topology change.

`policy` *`subroutine-policy-name`*—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to

255 characters long. To include spaces in the name, enclose it in quotation marks (“ ”). Policy names cannot take the form `__.*-internal__`, as this form is reserved. For information about how to configure subroutines, see Understanding Policy Subroutines in Routing Policy Match Conditions.

policy-name—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (“ ”).

`prefix-list` *prefix-list-name*—Name of a list of IPv4 or IPv6 prefixes.

`prefix-list-filter` *prefix-list-name*—Name of a prefix list to evaluate using qualifiers; *match-type* is the type of match, and *actions* is the action to take if the prefixes match.

`programmed`—(Optional) Allow policy matches for routes injected by JET APIs.

`protocol` *protocol-name*—Name of the protocol used to control traffic engineering database import at the originating point. For example,

`protocol` *srv6* matches SRv6 routes. Note that SRv6 routes are added to the routing infrastructure by BGP. To view all SRv6 routes, run `show route protocol srv6`.

Starting in Junos OS Release 19.1R1, you can specify options to match label IS-IS and label OSPF routes using the `l-isis` and `l-ospf` options, respectively. The `isis` options matches all IS-IS routes, excluding labelled IS-IS routes. The `ospf` option matches all OSPF routes, including OSPFv2, OSPFv3 and labelled OSPF routes.

`resolution-map`—(Optional) Set resolution map modes. A given resolution-map can be shared across multiple policy-statements.

`route-filter` *destination-prefix match-type* <*actions*>—(Optional) List of routes on which to perform an immediate match; *destination-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see Configuring Route Lists), and *actions* is the action to take if the *destination-prefix* matches.

When `invert-match` *match-type* is configured, it will return `true` if the route doesn't pass any prefixes defined in the `route-filter-list`. When you add the `invert-match` *match-type*, you only need to provide a list of prefixes it *should not* match instead of a list of prefixes it should.

`source-address-filter` *source-prefix match-type* <*actions*>—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. *source-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see Configuring Route Lists), and *actions* is the action to take if the *source-prefix* matches.

`tag` *value*—(Optional) A numeric value that identifies a route. You can tag certain routes to prioritize them over other routes. In the event of a network topology change, Junos OS updates these routes in the routing table before updating other routes with lower priority. You can also tag some routes to identify and reject them based on your requirement.

`term` *`term-name`*—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (“ ”). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the `term` statement when defining match conditions and actions.

`to`—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

`then`—(Optional) Actions to take on matching routes. The actions are described in Configuring Flow Control Actions and Configuring Actions That Manipulate Route Characteristics.

`set-down-bit`—(Optional) Configure this option to aggregate leaked locator routes using routing policies.

`srv6` *`SID value`* - Enter the Segment Routing over IPv6 (SRv6) SID value. You use this configuration to define SID values for routes, which can also be SRv6 routes.

`validation-database-instance`—(Optional) Name to identify a validation-state with database name.`database-name <database-name>`—(Optional) Route Validation Database name to be looked at. `state (valid|invalid|unknown)`—(Optional) Name to identify a validation-state

policy-with-count

IN THIS SECTION

- Syntax | 13268
- Hierarchy Level | 13268
- Description | 13268
- Options | 13269
- Required Privilege Level | 13269
- Release Information | 13269

Syntax

```
policy-with-count {
    maximum maximum;
    reserved reserved;
}
```

Hierarchy Level

```
[edit system security-profile]
```

Description

Specify the number of security policies with a count that user logical system administrators and primary logical system administrators can configure for their logical systems if the security profile is bound to the logical systems.

The primary administrator:

- uses security profiles to provision logical systems with resources.
- binds security profiles to user logical systems and the primary logical system.

- can configure more than one security profile, specifying different amounts of resource allocations in various profiles.

Only the primary administrator can create security profiles and bind them to logical systems.

Options

maximum A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows, it can utilize resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems compete for global resources.

- **Range:** 0 through 1024

reserved A reserved quota that guarantees that the resource amount specified is always available to the logical system.

- **Default:** 0

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

Syntax

```
polling-interval seconds;
```

Hierarchy Level

```
[edit protocols sflow],
[edit protocols sflow interfaces interface-name]
```

Description

Configure the interval (in seconds) that the device waits between port statistics update messages. *Polling* refers to the device successively gathering various statistics for the network interfaces configured for sFlow monitoring and exporting the statistics to the configured sFlow collector.

Default

If no polling interval is configured for a particular interface, the device uses the global polling interval configured at the `[edit protocols sflow]` hierarchy level. If no global interval is configured, the device uses the default polling interval of 20 seconds.

Options

seconds—Number of seconds between successive samples of interface statistics. Specifying a value of 0 (zero) disables the polling.

- **Range:** 0 through 3600 seconds
- **Default:** 20 seconds

Required Privilege Level

Hierarchy Level

```
[edit system access-line]
```

Description

Configure adjustments to actual PON data rates as follows:

- Multiply the actual data rate by a percentage for only downstream rates or for both upstream an downstream rates
- Adjust the encapsulation overhead by adding to or subtracting from the total cell or frame bytes a specified number of bytes

The actual (unadjusted) downstream and upstream data rates, PON line type, and encapsulation mode are received from the access node by the ANCP agent in ANCP port messages, or by the PPPoE daemon from the PPPoE intermediate agent (PPPoE-IA) in PADI or PADR messages. The ANCP agent or PPPoE daemon subsequently adjusts rates and bytes based on the configuration.

If the PON-Access-Type TLV (0x92) is not received in either the ANCP Port Status message or PPPoE-IA tags, the default adjustment leaves the rates and bytes unchanged.

Adjustments are applied to all subscribers using access lines of the specific PON line type. Depending on the value, it may be reported to AAA, CoS, or both:

- Adjusted and unadjusted downstream and upstream rates are always reported to AAA in response to an AAA request.
- Adjusted and unadjusted downstream rates and overhead byte adjustments are reported to CoS, but only when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.
- Overhead byte adjustments are not reported to AAA.

AAA reports the adjusted values to the RADIUS server in the Access-Request and Accounting-Request messages through Juniper Networks VSAs 26-141, Downstream-Calculated-Qos-Rate Rate, and 26-142, Upstream-Calculated-Qos-Rate. A change in value triggers an immediate Interim-Accounting message to the RADIUS server if you have configured the "ancp-speed-change-immediate-update" on page 2436 statement.

The ANCP agent reports these values to the LAC in an L2TP network. The LAC passes the rates to the LNS in the following AVPs and messages:

- AVP 24, Tx Connect Speed (ICCN message)—For the initial total rate adjustment to ONT/ONU-Peak-Data-Rate-Downstream TLV (0x94).
- AVP 38, Rx Connect Speed (ICCN message)—For the initial total rate adjustments to ONT/ONU-Peak-Data-Rate-Upstream TLV (0x95).
- AVP 97, Connect Speed Update (CSUN message)—For subsequent changes to the initial rates reported in AVP 24 and AVP 38.

Options

gpon Sets attributes for GPON access lines.

other Sets attributes for access lines of type OTHER. This might used, for example, when an OLT uses a new PON type that is not yet formally supported by the Broadband Forum.

overhead-adjust ***percentage*** Adjusts the actual downstream rates for all subscribers on an access line or PON tree of the specified types by multiplying the rate by the specified percentage. This adjustment accounts for the Layer 1 overhead for the PON type. The rates are adjusted as follows:

- For the subscriber access line, the adjustment is made to the downstream rate reported in the ONT/ONU-Peak-Data-Rate-Downstream TLV (0x94). The adjusted rate is applied to the logical interface or the (child) interface set for the subscriber access line, as determined by the CoS adjustment control profile. This adjustment applies for FTTH connections.
- For the PON tree, the adjustment is made to the downstream rate reported in the PON-Tree-Maximum-Data-Rate-Downstream TLV (0x98). The adjusted rate is applied to the PON tree (parent) interface set, as determined by the CoS adjustment control profile. This adjustment applies for both FTTH and FTTB connections. For FTTB, this is the rate on the OLT to DPU-P access line.
- **Range:** 80 through 100 percent
- **Default:** 100 percent

overhead-bytes *bytes*

Adjusts the actual downstream cell overhead for all subscribers on the specified access line or PON tree by adding or subtracting the specified number of bytes. The adjustment accounts for the traffic encapsulation overhead. It shapes the logical interface or the (child) interface set for the subscriber access line or the PON tree (parent) interface set, as determined by the CoS adjustment control profile. The overhead is adjusted as follows:

- For the subscriber access line, the adjustment is made to the overhead reported in the ONT/ONU-Peak-Data-Rate-Downstream TLV (0x94). The adjusted overhead is applied to the logical interface or the (child) interface set for the subscriber access line, as determined by the CoS adjustment control profile. This adjustment applies for FTTH connections.
- For the PON tree, the adjustment is made to the overhead reported in the PON-Tree-Maximum-Data-Rate-Downstream TLV (0x98). The adjusted overhead is applied to the PON tree (parent) interface set, as determined by the CoS adjustment control profile. This adjustment applies for both FTTH and FTTB connections. For FTTB, this is the overhead on the OLT to DPU-P access line.
- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

twdm-pon

Sets attributes for TWDM-PON access lines.

total-adjust *percentage*

Adjusts the downstream and upstream data rates for all subscribers on an access line of the specified type by multiplying the rate by the specified percentage. This adjustment accounts for the total Layer 1 and encapsulation overhead for the PON type. The

adjustment is made to the ONT/ONU-Peak-Data-Rate-Downstream TLV (0x94) and the ONT/ONU-Maximum-Data-Rate-Upstream TLV (0x95). The adjustments apply to FTTH connections.

- **Range:** 1 through 100 percent
- **Default:** 100 percent

type *tlv-value* Sets attributes for access lines by specifying the unsigned integer value of the PON-Access-Type TLV (0x92) to reference the PON type. This option enables the `pon` statement to be used for PON access line types that might be introduced in the future.

- **Range:** 6 through 4294967295

wdm-pon Sets attributes for WDM-PON access lines.

xg-pon1 Sets attributes for XG-PON access lines.

xgs-pon Sets attributes for XGS-PON access lines.

}
```

Hierarchy Level

```
[edit access address-assignment]
[edit routing-instances routing-instances-name access address-assignment]
```

Description

Configure the name of an address-assignment pool.

NOTE: Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.

Options

pool-name Name assigned to the address-assignment pool.

active-drain Configure the DHCP local server to stop allocating addresses from this pool. When this is configured, the DHCP local server gracefully shifts clients from this address pool to an alternative pool for which active drain is not configured. When existing clients with an address from this pool submit a DHCPv4 request or DHCPv6 renew, they receive a NAK, forcing them to renegotiate. The server responds with a DHCPv4 offer or DHCPv6 advertise message with an address from a different pool.

family Configure the protocol family for the address-assignment pool.

The options for this statement are explained separately. Click the linked statement for details.

hold-down Configure an address-assignment pool that is currently in use to be unavailable for further address allocation. When a pool is in the hold-down state, the pool is no longer used to allocate IP addresses for subscribers. Current subscribers who previously obtained an address from the pool are not affected; they can continue to renew their leases. As each of these users disconnects, their address is not reallocated. The pool becomes inactive when all subscribers have disconnected and their addresses are returned to the pool.

link Designate a secondary address-assignment pool that is linked to the pool being configured. When the pool being configured has no addresses available for allocation, the secondary pool can be searched for a free address. You can configure a chain of linked pools, but you cannot directly link more than one pool to or from any other pool. Each linked pool in the chain serves as a backup pool for the pool immediately before it in the chain.

- **Values:** *pool-name*—Name assigned to the secondary address-assignment pool.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

Support at the [edit routing-instances *routing-instances-name* access address-assignment] hierarchy level at tenant system level introduced in Junos OS Release 20.2R1.

Configuring Pools of Addresses and Ports for Network Address Translation Overview

pool (Security Destination NAT)

IN THIS SECTION

- Syntax | 13290
- Hierarchy Level | 13290
- Description | 13291
- Options | 13291
- Required Privilege Level | 13291
- Release Information | 13291

Syntax

```
pool pool-name {
    address <ip-address> {
        (port port-number | to ip-address);
    }
    description text;
    routing-instance (routing-instance-name | default);
    session-retain;
}
```

Hierarchy Level

```
[edit security nat destination]
```

Description

Define a destination NAT pool to identify the pool uniquely.

Options

- *pool-name*—Name of the pool.
- description—Description of the pool.
- session-retain —To support destination FQDN NAT session continue to use existing IP from DNS resolution up to session lifetime. By default, the `session-retain` is disabled.

  When enabled, the retained sessions remain in the session table, and cleared only upon connection termination from clients, or timeout due to sessions being inactive, or when sessions are explicitly cleared by the user through CLI.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.6. The `description` option added in Junos OS Release 12.1.

The `session-retain` option added in Junos OS Release 23.1R1.

pool (Security Source NAT)

IN THIS SECTION

- Syntax | 13293
- Hierarchy Level | 13294
- Description | 13294
- Options | 13294
- Required Privilege Level | 13294
- Release Information | 13294

Syntax

```
pool pool-name {
    address ip-address {
         to ip-address;
    }
    burst-pool burst-pool-name;
    address-persistent subscriber ipv6-prefix-length prefix-length;
    address-pooling (paired | no-paired);
    address-shared;
    description text;
    host-address-base ip-address;
    overflow-pool (interface | pool-name);
    pool-utilization-alarm (clear-threshold value | raise-threshold value);
    port (no-translation | port-overloading-factor number | port-overloading-usage-alarm (raise-
threshold | clear-threshold) | preserve-range | enhanced-port-overloading-algorithm | range port-
low (to port-high));
    routing-instance routing-instance-name;
}
```

Hierarchy Level

```
[edit security nat source]
```

Description

Define a source NAT pool to identify the pool uniquely.

Options

pool-name	Name of the pool.
description	Description of the pool.
enhanced-port-overloading-algorithm	The hash algorithm uses destination IP and port to calculate the port overloading index.
preserve-range	Assign a port within the same range as the incoming port—either 0 through 1023 or 1024 through 65,535. You cannot configure the preserve range option with port no-translation and secure port block allocation.
port-overloading-usage-alarm (*raise-threshold* | *clear-threshold*)	Through the *raise-threshold* option, you can raise threshold for alarm on port usage per overload index value through 50 to 100. Through the *clear-threshold* option, you can clear threshold for alarm on port usage per overload index value through 40 to 100.
burst-pool	Burst mode allows you to use the ports beyond the allocated port blocks.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

Syntax

```
pool address/prefix-length {
    address-range {
        low address;
        high address;
    }
    exclude-address {
        address;
    }
}
```

Hierarchy Level

```
[edit system services dhcp]
```

Description

For J Series Services Routers and EX Series switches only. Configure a pool of IP addresses for DHCP clients on a subnet. When a client joins the network, the DHCP server dynamically allocates an IP address from this pool.

Options

`address-range`—Lowest and highest IP addresses in the pool that are available for dynamic address assignment. If no range is specified, the pool will use all available addresses within the subnet specified. (Broadcast addresses, interface addresses, and excluded addresses are not available.)

`exclude-address`—Addresses within the range that are not used for dynamic address assignment. You can exclude one or more addresses within the range.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

- Required Privilege Level | 13304
- Release Information | 13304

Syntax

```
pool pool-name <priority priority>;
```

Hierarchy Level

```
[edit interfaces br-pim/0/port dialer-options],
[edit interfaces umd0 dialer-options],
[edit interfaces dln unit logical-unit-number dialer-options],
[edit logical-systems logical-system-name interfaces dln unit logical-unit-number dialer-options]
```

Description

On J Series Services Routers, for logical and physical ISDN interfaces, specify the dial pool. The dial pool allows logical (dialer) and physical (`br-pim/0/port`) interfaces to be bound together dynamically on a per-call basis. On a dialer interface, `pool` directs the dialer interface which dial pool to use. On `br-pim/0/port` interface, `pool` defines the pool to which the interface belongs.

Options

pool-name—Pool identifier.

priority *priority*—(Physical br-*pim*/0/*port* interfaces only) Specify a priority value of 0 (lowest) to 255 (highest) for the interface within the pool.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

pool-default-port-range (Source NAT Next Gen Services)

IN THIS SECTION

- Syntax | 13304
- Hierarchy Level | 13305

- Release Information | 13305

Syntax

```
pool-default-port-range port-low to port-high;
```

Hierarchy Level

```
[edit services nat source]
```

Description

Configure a global default port range for NAT pools that use port translation. This port range is used when a NAT pool does not specify a port range and does not specify automatic port assignment.

Options

port-low	The lower end of the port range.
port-high	The upper end of the port range.

- **Range:** 1024 through 65,535

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

pool-default-port-range

IN THIS SECTION

- Syntax | 13306
- Hierarchy Level | 13306
- Description | 13306
- Options | 13306

Required Privilege Level | 13306
Release Information | 13307

Syntax

```
pool-default-port-range lower-port-range to upper-port-range;
```

Hierarchy Level

```
[edit security nat source]
```

Description

Set the global default single port range for source NAT pools with port translation. If the port range in source NAT pools is not specified, the configured default port range is used. If neither the port range in source NAT pools nor the default port range are configured, the default single port range is 1024 through 63,487.

To set the global twin port range for source NAT pools with port translation, use the `pool-default-twin-port-range` statement at the [edit security nat source] hierarchy. The twin port range is 63,488 through 65,535.

To set the single port range for a specific pool, use the `port range` *`port-low`* `(to` *`port-high`*`)` statement at the [edit security nat source pool] hierarchy level.

Options

- *`lower-port-range`*—Specify the lower limit of the port range.
- *`upper-port-range`*—Specify the upper limit of the port range.
- **Range:** 1024 through 63,487. To view pool information, use the **show security nat source pool** command.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

- Syntax | 13307
- Hierarchy Level | 13307
- Description | 13308
- Options | 13308
- Required Privilege Level | 13308
- Release Information | 13308

Syntax

```
pool-default-twin-port-range lower-port-range to upper-port-range;
```

Hierarchy Level

```
[edit security nat source]
```

Description

Specify the global default twin port range for all source pools. Two ports within range (63488, 65535) are allocated at a time for RTP/RTCP applications such as SIP, H.323, and RTSP for source pools with PAT.

The default twin port range is 2048. If you have an SRX5400, SRX5600, or SRX5800 device that supports a maximum of 1 million IP addresses, use this option to limit the twin port range and avoid exceeding the port capacity of 384 million.

To set the twin port range for a specific pool, use the `port range twin-port` *`port-low`* `(to` *`port-high`*`)` statement at the [edit security nat source pool] hierarchy level.

Options

- *`lower-twin-port-range`*—Specify the lower limit of the port range.
- *`upper-twin-port-range`*—Specify the upper limit of the port range.
- **Range:** 63,488 through 65,535.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

services dhcp-local-server],
[edit logical-systems logical-system-name system services dhcp-local-server],
[edit routing-instances routing-instance-name system services dhcp-local-server],
[edit system services dhcp-local-server]
```

Description

Configure the order in which the DHCP local server uses information in the DHCP client PDU to determine how to obtain an address for the client.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Default

DHCP local server uses the `ip-address-first` method to determine which address pool to use.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

pool-utilization-alarm (Security Source NAT Pool)

IN THIS SECTION

- Syntax | 13311
- Hierarchy Level | 13311
- Description | 13311
- Options | 13311
- Required Privilege Level | 13311
- Release Information | 13311

Syntax

```
pool-utilization-alarm (clear-threshold value | raise-threshold value);
```

Hierarchy Level

```
[edit security nat source pool pool-name]
```

Description

Define utilization alarm thresholds for a specific Network Address Translation (NAT) source pool. When pool utilization exceeds the upper (raise) threshold or falls below the lower (clear) threshold, an SNMP trap is triggered. Threshold settings that use this statement take precedence over thresholds that are set using the global `pool-utilization-alarm` statement in the `[security nat source]` hierarchy.

Options

clear-threshold *value*

Lower threshold at which an SNMP trap is triggered.

- **Range:** 40 through 100.

raise-threshold *value*

Upper threshold at which an SNMP trap is triggered.

- **Range:** 50 through 100.

NOTE: If you enter a value for `raise-threshold` but not for `clear-threshold`, `clear-threshold` is automatically set to 80 percent of `raise-threshold`.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

RELATED DOCUMENTATION

pool-utilization-alarm | 13313

pool-utilization-alarm (Source NAT Next Gen Services)

IN THIS SECTION

- Syntax | 13312
- Hierarchy Level | 13312
- Description | 13312
- Options | 13313
- Required Privilege Level | 13313
- Release Information | 13313

Syntax

```
pool-utilization-alarm {
    clear-threshold value;
    raise-threshold value;
}
```

Hierarchy Level

```
[edit services nat source pool nat-pool-name]
```

Description

Define the NAT pool utilization level that triggers SNMP traps and the pool utilization level that clears SNMP traps. For pools that use port-block allocation, the utilization is based on the number of ports that are used; for pools that do not use port-block allocation, the utilization is based on the number of addresses that are used.

If you do not configure `pool-utilization-alarm`, traps are not created.

Options

clear-threshold *value*

NAT pool utilization percentage that clears the trap.

- **Range:** 40 through 100
- **Default:** 0 (traps are not created)

raise-threshold *value*

NAT pool utilization percentage that triggers the trap.

- **Range:** 50 through 100
- **Default:** There is not default value. Traps are not raised if you do not configure a value.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

pool-utilization-alarm

IN THIS SECTION

- Syntax | 13314
- Hierarchy Level | 13314
- Description | 13314
- Options | 13314
- Required Privilege Level | 13314
- Release Information | 13314

Syntax

```
pool-utilization-alarm (clear-threshold value | raise-threshold value);
```

Hierarchy Level

```
[edit security nat source]
```

Description

Define the global pool utilization alarm thresholds for Network Address Translation (NAT) source IP address pools without Port Address Translation (PAT). When the pool utilization exceeds the upper (raise) threshold or falls below the lower (clear) threshold, an SNMP trap is triggered.

Options

clear-threshold *value*—Lower threshold at which an SNMP trap is triggered.

- **Range:** 40 through 100.

raise-threshold *value*—Upper threshold at which an SNMP trap is triggered.

- **Range:** 50 through 100.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

pop (Dynamic VLANs)

IN THIS SECTION

- Syntax | 13315
- Hierarchy Level | 13315
- Description | 13315
- Required Privilege Level | 13315
- Release Information | 13315

Syntax

```
pop;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number output-vlan-map]
```

Description

For dynamic VLAN interfaces, specify the VLAN rewrite operation to remove a VLAN tag from the top of the VLAN tag stack. The outer VLAN tag of the frame is removed.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

RELATED DOCUMENTATION

Syntax

```
pop3-profile profile-name;
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm utm-policy policy-name content-filtering]
```

Description

Configure a Content Security policy for the content filtering POP3 protocol and attach this policy to a security profile to implement it.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

pop

IN THIS SECTION

- Syntax | 13320
- Hierarchy Level | 13320
- Description | 13320
- Required Privilege Level | 13320

Release Information | 13320

Syntax

```
pop;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number input-vlan-map],
[edit interfaces interface-name unit logical-unit-number output-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
output-vlan-map]
```

Description

NOTE: On EX4300 switches, pop is not supported at the [edit interfaces *interface-name* unit *logical-unit-number* input-vlan-map] hierarchy level.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2, and IQ2-E interfaces; 10-Gigabit Ethernet LAN/WAN PIC; aggregated Ethernet interfaces using Gigabit Ethernet IQ interfaces; 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces, specify the VLAN rewrite operation to remove a VLAN tag from the top of the VLAN tag stack. The outer VLAN tag of the frame is removed.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

pop-all-labels

IN THIS SECTION

- Syntax | 13321
- Hierarchy Level | 13321
- Description | 13321
- Default | 13322
- Required Privilege Level | 13322
- Release Information | 13322

Syntax

```
pop-all-labels {
    required-depth number;
}
```

Hierarchy Level

```
[edit interfaces interface-name atm-options mpls],
[edit interfaces interface-name fastether-options mpls],
[edit interfaces interface-name gigether-options mpls],
[edit interfaces interface-name sonet-options mpls]
```

Description

For passive monitoring on ATM, SONET/SDH, Fast Ethernet, and Gigabit Ethernet interfaces only, removes up to two MPLS labels from incoming IP packets. For passive monitoring on T Series devices,

removes up to five MPLS labels from incoming IP packets. For passive monitoring on MX Series routers with MPCs, all labels are popped by default and the `required-depth` statement is ignored.

Except for MX Series routers with MPCs, this statement has no effect on IP packets with more than two MPLS labels, or IP packets with more than five MPLS labels on T Series devices. Packets with MPLS labels cannot be processed by the monitoring PIC; if packets with MPLS labels are forwarded to the monitoring PIC, they are discarded.

The remaining statement is explained separately. See CLI Explorer.

Default

If you omit this statement, the MPLS labels are not removed, and the packet is not processed by the monitoring PIC.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

- Required Privilege Level | 13341
- Release Information | 13341

Syntax

```
port port-number;
```

Hierarchy Level

```
[edit system services netconf ssh]
```

Description

Configure the TCP port used for NETCONF-over-SSH connections.

NOTE:

- The configured port accepts only NETCONF-over-SSH connections. Regular SSH session requests for this port are rejected.
- The default SSH port (22) continues to accept NETCONF sessions even with a configured NETCONF server port. To disable the SSH port from accepting NETCONF sessions, you can specify this in the login event script.

- We do not recommend configuring the default ports for FTP (21) and Telnet (23) services for configuring NETCONF-over-SSH connections.

Options

`port` *`port-number`*—Port number on which to enable incoming NETCONF connections over SSH.

- **Default:** 830 (as specified in RFC 4742, *Using the NETCONF Configuration Protocol over Secure Shell (SSH)*)
- **Range:** 1 through 65535

Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Configure an alternative TCP port number to be used for the outgoing connection with the cache server. For a given deployment, an RPKI cache server might listen on some other TCP port number. If so, configure the alternative port number with this statement.

Options

port-number TCP port number to be used for the outgoing connection to the cache server.

- Default: 2222

> **NOTE**: Note:
> Starting in Junos OS Releases 20.1R3, 20.2R3, 20.3R2, 20.4R2, 21.1R1, the default TCP port is 8282.

Required Privilege Level

routing—To view this statement in the configuration.

port (Packet Forwarding)

IN THIS SECTION

- Syntax | 13345
- Hierarchy Level | 13345
- Description | 13345
- Options | 13346
- Required Privilege Level | 13347
- Release Information | 13347

Syntax

```
port port-number {
    description text-description;
    interface interface-name {
        broadcast;
        description text-description;
        no-listen;
        server address <logical-system logical-system-name> <routing-instance routing-instance-name>;
    }
    server address <logical-system logical-system-name> <routing-instance routing-instance-name>;
}
```

Hierarchy Level

```
[edit forwarding-options helpers]
```

Description

Configure a port helper on the router or switch, which listens for LAN broadcast traffic on a custom UDP port number and forwards traffic to particular destination servers as unicast traffic.

To set up a port helper, configure the UDP port number and optionally an interface on which to listen for broadcast traffic, and the destination server address to receive that traffic, as shown in either of the following sample configurations:

```
user@ host# show forwarding-options
helpers {
    port 1200 {
        server 10.20.30.40;
        }
    }
```

```
user@ host# show forwarding-options
helpers {
    port 3000 {
        interface {
            fe-0/0/1.0 {
                server 192.0.2.2;
            }
        }
    }
    port 3001 {
        interface {
            fe-0/0/0.0 {
                server 192.0.2.2;
            }
        }
    }
}
```

Starting in Junos OS Release 17.2R1, you can configure forwarding traffic to multiple destination servers for a given port number by specifying multiple port configuration statements with the same port number and different server addresses.

You cannot configure port helpers for standard ports used by services such as BOOTP, DNS and TFTP; instead, use the `helpers` configuration statements specifically for forwarding packets for those protocols.

The remaining statements are explained separately. See CLI Explorer.

Options

port-number	UDP port number for listening.

- **Range:** 1 through 65535

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for multiple server instances for a given port introduced in Junos OS Release 17.2 for MX Series routers.

Support for multiple servers on a given port introduced in Junos OS Release 17.3R1 for EX9200 switches.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

port (Security Source NAT)

IN THIS SECTION

- Syntax | 13356
- Hierarchy Level | 13357
- Description | 13357
- Options | 13357
- Required Privilege Level | 13358
- Release Information | 13358

Syntax

```
port {
    block-allocation {
        active-block-timeout timeout-interval;
        block-size block-size;
        interim-logging-interval timeout-interval;
        last-block-recycle-timeout timeout-interval;
        log disable;
        maximum-blocks-per-host maximum-block-number;
    }
    deterministic {
        block-size block-size;
        host {
            address ip-address;
            address-name address-name ;
```

```
        }
    }
    no-translation;
    port-overloading-factor number;
    range {
        port-low <to port-high>;
        to port-high;
        twin-port port-low <to port-high>;
    }
}
```

Hierarchy Level

```
[edit security nat source pool pool-name]
```

Description

Specify the Port Address Translation (PAT) for a source pool.

Options

- `block-allocation`—Allocates a block of ports for translation, instead of allocating individual ports.
- `deterministic`—Maps an incoming (source) IP address and port to the specific destination address and port block, based on a predefined deterministic NAT algorithm.
- `no-translation`—Specifies that no PAT is required. This option cannot be configured with the `port-overloading-factor` or `range` options.
- `port-overloading-factor` *`number`*—Configures the port overloading capacity in source NAT. This option cannot be configured with the `no-translation` option.
- `range` *`port-low`* `<to` *`port-high`*`>`—Specifies the port number range attached to each address in the pool. This option cannot be configured with the `no-translation` option.
- `twin port`—Configures the twin port range for source NAT pools to avoid port overloading.

The remaining statements are explained separately.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2. Statement updated with `block-allocation`, `deterministic`, and **twin-port** options in Junos OS Release 12.1X47-D10. Statement updated with `interim-logging-interval` and `last-block-recycle-timeout` options in Junos OS Release 15.1X49-D60.

port (Security Web Filtering Server)

IN THIS SECTION

- Syntax | 13358
- Hierarchy Level | 13358

[edit security utm feature-profile web-filtering websense-redirect profile profile-name server]
[edit security utm feature-profile web-filtering juniper-enhanced profile profile-name server]
```

Description

Enter the port number for communicating with the server. (Default ports are 80, 8080, and 8081.)

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5 .

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

port (Services NAT)

IN THIS SECTION

- Syntax | 13359
- Hierarchy Level | 13360
- Description | 13360
- Options | 13360
- Required Privilege Level | 13361
- Release Information | 13361

Syntax

```
port {
    automatic (sequential | random-allocation);
    range low minimum-value high maximum-value random-allocation;
    preserve-parity;
    preserve-range;
    deterministic-port-block-allocation <block-size block-size> <include-boundary-addresses>;
```

```
    secured-port-block-allocation {
        active-block-timeout timeout-seconds;
        block-size block-size;
        max-blocks-per-user max-blocks;
    }
}
```

Hierarchy Level

```
[edit services nat pool nat-pool-name]
```

Description

Specify the NAT pool port or range. You can configure an automatically assigned port or specify a range with minimum and maximum values.

NOTE: Starting in Junos OS Release 14.2R1, the `sequential` option is introduced to enable you to configure sequential allocation of ports. The `sequential` and `random-allocation` options available with the `port automatic` statement at the `[edit services nat pool nat-pool-name]` hierarchy level are mutually exclusive. You can include the `sequential` option for sequential allocation and the `random-allocation` option for random delegation of ports. By default, sequential allocation of ports takes place if you include only the `port automatic` statement at the `[edit services nat pool nat-pool- name]` hierarchy level.

For releases earlier than Junos OS Release 14.2R1, configure automatic sequential port assignment by using the `auto` option at the `[edit services nat pool nat-pool-name port automatic]` hierarchy level.

If you upgrade a router running a Junos OS release earlier than Release 14.2R1 to Release 14.2 and if the router contains the `port automatic` statement defined without the `auto` option included with the configuration, the router validates the auto option present in the configuration for sequential allocation of ports.

Options

NOTE: Starting with Junos OS Release 15.1R1, the preserve-port and preserve-range functionalities are supported on MX Series routers with MS-MPCs and MS-MICs.

automatic Cause the port assignment type to be automatically performed by the router.

sequential Allocate ports in a sequential manner. With sequential allocation, the next available address in the NAT pool is selected only when all the ports available from an address are exhausted.

minimum-value Lower boundary for the port range.

maximum-value Upper boundary for the port range.

preserve-parity Allocate ports with same parity as the original port.

preserve-range Preserve privileged port range after translation.

random-allocation Allocate ports within a specified range randomly.

Other options are described separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

`port` statement introduced before Junos OS Release 7.4.

`random-allocation` statement introduced in Junos OS Release 9.3.

`secured-port-block-allocation` statement introduced in Junos OS Release 11.2.

`deterministic-port-block-allocation` statement introduced in Junos OS Release 12.1.

`sequential` statement introduced in Junos OS Release 14.2R1.

- Default | 13376
- Required Privilege Level | 13376
- Release Information | 13376

Syntax

```
port-error-disable {
    disable-timeout timeout ;
}
```

Hierarchy Level

```
[edit ethernet-switching-options]
```

Description

Disable rather than block an interface when enforcing MAC limiting, MAC move limiting, and rate-limiting configuration options for shutting down the interface, and allow the interface to recover automatically from the error condition after a specified period of time:

- If you have enabled MAC limiting with the `shutdown` option and you enable `port-error-disable`, the switch disables (rather than shuts down) the interface when the MAC address limit is reached.
- If you have enabled MAC move limiting with the `shutdown` option and you enable `port-error-disable`, the switch disables (rather than shuts down) the interface when the maximum number of moves to a new interface is reached.
- If you have enabled storm control with the `action-shutdown` option and you enable `port-error-disable`, the switch disables (rather than shuts down) the interface when applicable traffic exceeds the specified levels. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.

> **NOTE**: The `port-error-disable` configuration does not apply to pre-existing error conditions. It impacts only error conditions that are detected after `port-error-disable` has been enabled and committed. To clear a pre-existing error condition and restore the interface to service, use the operational command that appears in your CLI:
>
> - `clear ethernet-switching port-error`

The remaining statement is explained separately. See CLI Explorer.

Default

Not enabled.

Configuring MAC Move Limiting (non-ELS)

port-forwarding (Destination NAT Next Gen Services)

IN THIS SECTION

- Syntax | 13377
- Hierarchy Level | 13377
- Description | 13377
- Options | 13378
- Required Privilege Level | 13378

Syntax

```
port-forwarding map-name {
    destined-port port-id translated-port port-id;
}
```

Hierarchy Level

```
[edit services nat destination]
```

Description

Configure a port forwarding map, which translates the original destination port of a packet to a different port. This translation is a static, one-to-one mapping.

Port forwarding allows a packet to reach a host within a masqueraded, typically private, network, based on the port number on which the packet was received from the originating host. An example of this type of destination is the host of a public HTTP server within a private network.

Options

map-name	Name of the port forwarding map.
destined-port *port-id*	Original destination port number.
translated-port *port-id*	Port number to which the original port is mapped.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

port-forwarding

IN THIS SECTION

- Syntax | 13378
- Hierarchy Level | 13379
- Description | 13379
- Options | 13379
- Required Privilege Level | 13379
- Release Information | 13379

Syntax

```
port-forwarding map-name {
    destined-port;
    translated-port;
}
```

Hierarchy Level

```
[edit services nat]
```

Description

Specify the mapping for port forwarding.

The `port-forwarding` statement is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS. Starting in Junos OS Release 17.4R1, the `port-forwarding` statement is also supported on the MS-MPC and MS-MIC.

Options

map-name Identifier for the port forwarding map.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

- Options | 13381
- Required Privilege Level | 13382
- Release Information | 13382

Syntax

```
port-forwarding-mappings map-name;
```

Hierarchy Level

```
[edit services nat rule rule-name term term-name then]
```

Description

Specify the name of the mapping for port forwarding in a Network Address Translation rule.

The `port-forwarding-mappings` statement is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS. Port forwarding on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS supports only the `dnat-44` and `twice-napt-44` translation types in NAT rules, and supports only IPv4 networks. Starting in Junos OS Release 17.4R1, the `port-forwarding-mappings` statement is also supported on the MS-MPC and MS-MIC.

Options

map-name	Identifier for the port forwarding mapping.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

port-group-alias (satellite-policies)

IN THIS SECTION

- Syntax | 13382
- Hierarchy Level | 13383
- Description | 13383
- Default | 13383
- Options | 13383
- Required Privilege Level | 13383
- Release Information | 13384

Syntax

```
port-group-alias port-group-alias-name {
    pic pic-number {
        port [port-number | port-number-range | all];
```

```
    }
}
```

Hierarchy Level

```
[edit policy-options satellite-policies]
```

Description

Configure a port group alias for satellite policies in a Junos Fusion.

A port group alias is used to define the candidate uplink ports on satellite devices that use the satellite policy.

> **CAUTION**: The physically connected uplink ports on a satellite device must be defined as candidate uplink ports in the Junos Fusion configuration. If the uplink ports on a satellite device are not configured as candidate uplink ports, uplink failure detection cannot be enabled on the device, and a system log message is generated.

A port group alias is associated with a satellite policy using the `set uplink-port-group` *`uplink-port-group-name`* statement in the [`edit policy-options satellite-policies candidate-uplink-policy` *`policy-name`*] hierarchy.

Default

Each satellite device model has a set of default uplink ports (see *Overview of Uplink Failure Detection on a Junos Fusion*). You only need to assign an uplink port group to a satellite device if you do not want to use the default uplink ports.

Options

port-group-alias-name	The user-defined name of the port group alias.

The remaining statements are explained separately.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Syntax

```
port-id port-id-number;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name secure-channel
secure-channel-name id]
```

Description

Specify a port ID in a secure channel when enabling MACsec using static secure association key (SAK) security mode. The port IDs must match on a sending and receiving secure channel on each side of a link to enable MACsec.

Once the port numbers match, MACsec is enabled for all traffic on the connection.

You only use this configuration option when you are configuring MACsec using static SAK security mode. This option does not need to be specified when you are enabling MACsec using static connectivity association key (CAK) security mode.

Default

No port ID is specified.

Options

port-id-number	The port ID number.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

port_list

IN THIS SECTION

- Syntax | 13388
- Hierarchy Level | 13388
- Description | 13388
- Required Privilege Level | 13390
- Release Information | 13390

Syntax

```
port-list port-list-name
```

Hierarchy Level

```
[edit firewall port-list port-list-name]
```

Description

You create a `port-list` to conveniently group together multiple ports (source ports or destination ports) so that they can be referenced easily in firewall configurations as `port-list`, `source-port-list` and/or `destination-port-list` match conditions. You can create a port list and associate a port number with this port list by issuing the `set firewall port-list` *`port list name port number`* configuration statement.

After setting the port list, you can view the ports in the configured port-list with the `show firewall` command like in the following example.

```
master}[edit]
user@host# show firewall
port-list pl1 {
      100-200;
      40;
      400;
    }
```

In the following example, `show firewall` command shows the configured `port-list` applied as a match condition.

```
{master}[edit]
user@host# show firewall
family inet {
      filter f1 {
            term t1 {
                  from {
                        port-list {
```

```
                              pl1;
                        }
                  protocol tcp;
                        }
                  }
            }
      }
```

In the following example, the `show firewall` command shows the configured `port-list` applied as a match condition inside `source-port-list` to match source port(s) in the named port-list.

```
{master}[edit]
user@host# show firewall
family inet {
      filter f1 {
            term t1 {
                  from {
                        source-port-list {
                                    pl1;
                                    }
                         protocol tcp;
                        }
                      }
                  }
            }
```

In the following example, the `show firewall` command shows the configured `port-list` applied as a match condition inside `destination-port-list` to match destination port(s) in the named port-list.

```
{master}[edit]
user@host# show firewall
family inet {
filter f1 {
      term t1 {
            from {
                  destination-port-list {
                              pl1;
                  }
                  protocol udp;
```

```
                }
            }
        }
    }
```

Using port lists improves readability, reduces configuration errors, and makes it easier to update configurations, rather than having to find and update port match conditions in multiple firewall filter configurations.

port-mode

IN THIS SECTION

- Syntax | 13399
- Hierarchy Level | 13399
- Description | 13399
- Default | 13399
- Options | 13399
- Required Privilege Level | 13400
- Release Information | 13400

Syntax

```
port-mode (access | tagged-access | trunk);
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family ethernet-switching]
```

Description

> **NOTE**: This statement does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see "interface-mode" on page 9438. For ELS details, see Using the Enhanced Layer 2 Software CLI.

Configure whether an interface on the switch operates in access, tagged access, or trunk mode.

Default

All switch interfaces are in access mode.

Options

access—Have the interface operate in access mode. In this mode, the interface can be in a single VLAN only. Access interfaces typically connect to network devices, such as PCs, printers, IP telephones, and IP cameras.

tagged-access—Have the interface operate in tagged-access mode. In this mode, the interface can be in multiple VLANs. Tagged access interfaces typically connect to network devices, such as PCs, printers, IP telephones, and IP cameras.

trunk—Have the interface operate in trunk mode. In this mode, the interface can be in multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.

> **NOTE**: The number of VLANs supported per switch varies for each model. Use the configuration-mode command `set vlans id vlan-id ?` to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is

assigned an ID number when it is created. You can, however, exceed the recommended VLAN member maximum. To determine the maximum number of VLAN members allowed on a switch, multiply the VLAN maximum for the switch times 8 (vmember limit = vlan max * 8).

If a switch configuration exceeds the recommended VLAN member maximum, you see a warning message when you commit the configuration. If you ignore the warning and commit such a configuration, the configuration succeeds but you run the risk of crashing the Ethernet switching process (**eswd**) due to memory allocation failure.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

port-overloading (Security Source NAT Interface)

IN THIS SECTION

- Syntax | **13401**
- Hierarchy Level | **13401**
- Description | **13401**
- Options | **13401**
- Required Privilege Level | **13401**

Release Information | 13401

Syntax

```
port-overloading off
```

Hierarchy Level

```
[edit security nat source interface]
```

Description

Enable interface NAT with or without port overloading.

Options

off Specify off to disable interface port overloading.

> **NOTE**: The `port-overloading` option should not be used in conjunction with the `port-overloading-factor` option because they can override each other. For example, if `port-overloading` has been set to `off` to disable interface port overloading, and subsequently the `port-overloading-factor` is configured with any value greater than 1, the `port-overloading-factor` setting will override the `port-overloading` setting. (Configuring `port-overloading-factor 1` is equivalent to configuring `port-overloading off`.)

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

RELATED DOCUMENTATION

port-overloading-factor (Security Source NAT Interface) | 13402

port-overloading-factor (Security Source NAT Interface)

IN THIS SECTION

- Syntax | 13402
- Hierarchy Level | 13402
- Description | 13402
- Options | 13403
- Required Privilege Level | 13403
- Release Information | 13403

Syntax

```
port-overloading-factor number;
```

Hierarchy Level

```
[edit security nat source interface]
```

Description

Configure the port overloading capacity for the source NAT interface. If `port-overloading-factor` is set to *x*(1 up to the maximum port capacity), then x times the maximum port capacity is allocated for interface-based NAT.

NOTE: There is also a `port-overloading` option, but it is not supported for logical systems, and should not be used in conjunction with the `port-overloading-factor` option because the

statements can overwrite each other. For example, if `port-overloading` has been set to **off** to disable interface port overloading, and subsequently `port-overloading-factor` is configured with any value greater than 1, the `port-overloading-factor` setting will override the `port-overloading` setting. (Configuring **port-overloading-factor 1** is equivalent to configuring **port-overloading off**.)

Options

number A number ranging from 1 through the maximum port capacity.

For example, if `port-overloading-factor` is set to 2, and it is multiplied by a maximum port capacity of 63,486, the port overloading threshold is 126,972. If the configured `port-overloading-factor` setting exceeds the maximum port capacity of the interface, an error message is generated during the configuration commit.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

port-overloading-factor (Security Source NAT Pool)

IN THIS SECTION

- Syntax | **13404**
- Hierarchy Level | **13404**

- Description | 13404
- Options | 13404
- Required Privilege Level | 13404
- Release Information | 13405

Syntax

port-overloading-factor

Hierarchy Level

```
[edit security nat source pool source-pool-name port]
```

Description

Configures the port overloading capacity in source NAT. If the port-overloading-factor is set to *x*, each translated IP address will have *x* number of ports available.

> **NOTE**: The port-overloading-factor statement cannot be configured with port no-translation (source NAT pool without PAT).

Options

- **Range:** 2 through 32

For example, If you set `port-overloading-factor` to 2 for a source pool with two IP addresses, each with the single port range of 1024 through 2047, the ports are multiplied by 2, increasing the port capacity for each from 1024 to 2048. If the configured port-overloading-factor setting exceeds the maximum port capacity of the pool, an error message is generated during the configuration commit.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2

port-priority

IN THIS SECTION

- Syntax | 13405
- Hierarchy Level | 13405
- Description | 13405
- Options | 13405

Syntax

```
port-range port-range-low port-range-high;
```

Hierarchy Level

```
[edit chassis fpc fpc-id pic pic-id fibre-channel]
```

Description

Configure a contiguous block of ports as FC ports. You can configure the FC-capable ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5, and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47 to create blocks of native FC interfaces. You cannot individually configure a single port as a native FC interface. Within these port blocks, you cannot mix FC interfaces with Ethernet interfaces. All of the ports in a block must be either native FC interfaces or Ethernet interfaces.

You can configure:

- Six native FC interfaces by configuring either ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5, or ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47.
- Twelve native FC interfaces by configuring ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5 and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47.

- No native FC interfaces by leaving ports xe-0/0/0 through xe-0/0/5 and ports xe-0/0/42 through xe-0/0/47 in their default state as Ethernet interfaces.

Options

port-range-low—Lowest-numbered port in the block of native FC interfaces, either **0** or **42**.

port-range-high—Highest-numbered port in the block of native FC interfaces. The value is **5** if the ***port-range-low*** value is **0**. The value is **47** if the ***port-range-low*** value is **42**.

> **NOTE**: Only a complete block of ports, xe-0/0/0 through xe-0/0/5, xe-0/0/42 through xe0/0/47, or both, can be configured as FC ports.

Syntax

```
port-scan {
    threshold number;
}
```

Hierarchy Level

```
[edit security screen ids-option screen-name tcp]
```

```
[edit security screen ids-option screen-name udp]
```

Description

Prevent port scan attacks. A port scan attack occurs when an attacker sends packets with different port numbers to scan available services. The attack succeeds if a port responds. To prevent this attack, the

device internally logs the number of different ports scanned from a single remote source. For example, if a remote host scans 10 ports in 0.005 seconds (equivalent to 5000 microseconds, the default threshold setting), the device flags this behavior as a port scan attack, and rejects further packets from the remote source.

Options

`threshold` *`number`* —Number of microseconds during which the device accepts packets from the same remote source with up to 10 different port numbers. If the number of ports during the threshold period reaches 10 or more, the device rejects additional packets from the source.

- **Range:** 1000 through 1,000,000 microseconds
- **Default:** 5000 microseconds

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

- Hierarchy Level | 13427
- Description | 13427
- Options | 13428
- Required Privilege Level | 13428
- Release Information | 13428

Syntax

```
post-convergence-lfa <fate-sharing-protection fate-sharing-protection<node-protection <cost
cost> <srlg-protection>;
```

Hierarchy Level

```
[edit logical-systems name protocols ospf area interface interface-name ],
[edit logical-systems name routing-instances name protocols ospf area interface interface-name],
[edit protocols ospf area interface interface-name ],
[edit routing-instances name protocols ospf area interface interface-name]
```

Description

Configure the installation of backup-paths that follow the post-convergence paths corresponding to the failure of this interface.

Options

fate-sharing-protection Enable fate-sharing protection. A list of fate-sharing groups are configured on each point of local repair (PLR) with the links in each fate-sharing group identified by their respective IP addresses. The PLR associates a cost with each fate-sharing group. The fate-sharing-aware post-convergence path is computed by assuming that the cost of each link in the same fate-sharing group as the failed link has increased the cost associated with that group.

node-protection Enable node protection mode for topology-independent loop-free alternate (TI-LFA) routes for OSPF.

cost Enable a node-protecting post-convergence backup path to be computed for all primary next-hops using this interface. Configure the cost of all the links used for calculating the TI-LFA post-convergence failure path cost. If node protection is enabled without configuring a cost value, then the cost is set to the maximum cost or default value of 65535.

- **Default:** 65535
- **Range:** `1` through `65535`

srlg-protection Enable Shared Risk Link Group (SRLG) protection in an OSPFv2 network if you want OSPFv2 to choose a fast reroute path that does not include SRLG links in the topology-independent loop-free alternate (TI-LFA) backup paths. If you have configured fate-sharing-protection in addition to srlg-protection then both costs are added to the link metric to calculate the final TI-LFA backup path. These links have a higher metric cost and therefore TI-LFA backup computation enables OSPFv2 to avoid these links.

```

Description

Configure backup paths along post-convergence on this interface.

Options

fate-sharing-protection Enable fate-sharing protection. A list of fate-sharing groups are configured on each point of local repair (PLR) with the links in each fate-sharing group identified by their respective IP addresses. The PLR associates a cost with each fate-sharing group. The fate-sharing-aware post-convergence path is computed by assuming that the cost of each link in the same fate-sharing group as the failed link has increased the cost associated with that group.

srlg-protection Enable Shared Risk Link Group (SRLG) protection in an IS-IS network if you want IS-IS to choose a fast reroute path that does not include SRLG links in the topology-independent loop-free alternate (TI-LFA) backup paths. If you have configured fate-sharing-protection in addition to srlg-protection then both costs are added to the link metric to calculate the final TI-LFA backup path. These links have a higher metric cost and therefore TI-LFA backup computation enables IS-IS to avoid these links.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

Release Information

Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

Statement introduced in Junos OS Release 13.3.

Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

For BMP route monitoring, allows you to excludes routes that are non-eligible for the decision process (for example, protocol nexthop not resolved). This represents the view of the BGP routes after running the import policy. If the import policy has rejected the BGP route, the route does not exist in the post policy view.

> **NOTE**: If post-policy is configured the router applies the import policies on the routes received so that BMP can display the routes as follows:
>
> - If an import policy modifies any parameters in the route, the route is displayed by BMP with the new values.
> - If an import policy modifies the NH and the NH is unresolved by the local router, the route is displayed by BMP as reachable.
> - If an import policy rejects a route, it is displayed as unreachable in BMP update.
> - If a route is received with unreachable NH, but the import policy doesn't reject the route, then BMP displays the route as reachable.

Using post-policy with **exclude-non-eligible** causes an unreachable BMP update in the following:

- If an import policy modifies the NH and the NH is unresolved by the local router, the route is displayed by BMP as unreachable.
- if a route is received with a NH that is unreachable, and the import policy does not reject this route, it is displayed by BMP as unreachable.

> **NOTE**: If you have initially configured post-policy route monitoring, but later delete the initial configuration and configure pre-policy route monitoring, then the previously advertised post-policy routes are withdrawn. Conversely, if you have initially configured pre-policy route monitoring and later modify it to post-policy route monitoring, then the previously advertised pre-policy routes are withdrawn.

> **NOTE**: When `post-policy` is not configured, BMP post policy feature is turned off for all routes, regardless of whether their nexthops are reachable or resolved or not.

Options

exclude-non-eligible—Exclude routes that are non-eligible for the decision process.

    }
    replay-attacks {
         threshold value;
    }
    security-log-percent-full percentage;
}
```

Hierarchy Level

```
[edit security alarms]
```

Description

Configure alarms for potential violation.

Options

authentication Raise a security alarm when the device or switch detects a specified number of authentication failures (bad password attempts) before an alarm is raised.

cryptographic-self-test	Raise a security alarm when the device or switch detects a cryptographic self-test failure. Cryptographic self-tests are a set of preoperational tests that are performed after the device or switch is powered on. The self-tests run without operator intervention. No alarm is raised upon failure of a cryptographic self-test.
decryption-failures	Raise a security alarm after exceeding a specified number of decryption failures.
encryption-failures	Raise a security alarm after exceeding a specified number of encryption failures.
ike-phase1-failures	Raise a security alarm after exceeding a specified number of Internet Key Exchange (IKE) Phase 1 failures.
ike-phase2-failures	Raise a security alarm after exceeding a specified number of Internet Key Exchange (IKE) phase 2 failures.
key-generation-self-test	Raise a security alarm when the device or switch detects a key generation self-test failure. Key generation is the process of generating keys for cryptography. A key is used to encrypt and decrypt data. The self-tests run without operator intervention. No alarm is raised upon failure of a key generation self-test.
non-cryptographic-self-test	Raise a security alarm when the device or switch detects a noncryptographic self-test failure. The self-tests run without operator intervention. No alarm is raised upon failure of a noncryptographic self-test.
non-cryptographic-self-test	Raise a security alarm when the device or switch detects a noncryptographic self-test failure. The self-tests run without operator intervention. No alarm is raised upon failure of a noncryptographic self-test.
policy	Configure alarms for policy violation, based on source IP, destination IP, application, and policy rule.
replay-attacks	Raise a security alarm when the device detects a replay attack.
security-log-percent-full	Raise a security alarm when security log exceeds a specified percent of total capacity.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

power

IN THIS SECTION

- Syntax | 13439
- Hierarchy Level | 13439
- Description | 13440
- Default | 13440
- Options | 13441
- Required Privilege Level | 13441
- Release Information | 13441

Syntax

```
power (off | on);
```

Hierarchy Level

```
[edit chassis fpc slot-number]
[edit chassis fpc slot  pic],
[edit chassis lcc name fpc name  pic  slot],
[edit chassis member name fpc slot  pic],
[edit chassis fpc slot slc slc-id]
[edit chassis feb slot slot-number]
[edit chassis sib slot slot-number]
```

Description

Turn a Flexible PIC Concentrator (FPC), a Physical Interface Card (PIC) in the specified FPC, a sub line card (SLC), a Forwarding Engine Board (FEB), or a Switch Interface Board (SIB) on or off.

The `power (off | on)` command at the `edit chassis fpc slot-number` hierarchy configures the Flexible PIC Concentrator (FPC) to stay offline or to come online automatically.

The `edit chassis fpc slot-number pic pic-number power off` command turns off the power to the PIC in the specified FPC.

NOTE:

- The `power off` command is applicable only to the fixed-configuration MPC with six 40-Gigabit Ethernet ports and twenty-four 10-Gigabit Ethernet ports (MPC5E-40G10G). For other PICs, it is ignored with a syslog message.
- On PTX10004 routers that run Junos OS Evolved 22.4R1 or later, you can use the `power off` command to turn off the Switch Interface Board (SIB). On PTX10004 routers that run Junos OS Evolved releases earlier than 22.4R1, you must use the `request chassis sib slot slot_number offline` command.
- On an EX6200 switch, the power statement has no effect when you configure it for an uplink port FPC on the Switch Fabric and Routing Engine (SRE) module. If you configure the statement for those FPCs, the configuration will be committed, but a message that informs you that the configuration has no effect is logged in the system log. You cannot turn the power on or off for these FPCs.
- The PTX10003-80C and PTX10003-160C routers running Junos OS Evolved do not support the `set chassis fpc fpc-slot power on` command. Executing this command on an FPC which is offline could cause unintended reboots of the router.
- The `set chassis feb slot slot-number power (off | on)` command is supported on ACX7509 routers.

In Junos Node Slicing, issuing the command `set chassis fpc slot-number power off` on the BSYS (base system) powers off even those FPCs that are assigned to the Guest Network Functions (GNFs) in which unified in-service software upgrade (ISSU) is in progress. Learn more about Junos Node Slicing.

Default

on

Options

`off`—Take the FPC (or a PIC in the specified FPC), or SLC offline, and configure it to stay offline, as, for example, after a system reboot.

`on`—Bring the FPC (or a PIC in the specified FPC) online, and configure it to come online automatically, as, for example, after a system reboot.

`slc` *`slc-id`*—The ID of the SLC to be powered off.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

- Description | 13442
- Default | 13443
- Options | 13443
- Required Privilege Level | 13443
- Release Information | 13443

Syntax

```
power-budget-priority priority;
```

Hierarchy Level

```
[edit chassis fpc slot]
```

Description

Assign a power priority to the specified line card slot on an EX6200 or EX8200 switch.

NOTE: On an EX6200 switch, you cannot change the power priority of a slot containing a Switch Fabric and Routing Engine (SRE) module. Although the CLI allows you to set a different power priority for the slot, your change does not go into effect, and the power priority remains 0. A message is sent to the system log to inform you that changing the power priority of the slot is unsupported.

Default

All line card slots are initially assigned the lowest priority, with the exception of slot 4 and slot 5 on the EX6200 switch, which always are assigned a priority of 0.

Options

priority—Assigned power priority for the slot, with 0 being the highest priority:

- 0 through 9 for an EX6200 switch
- 0 through 7 for an EX8208 switch
- 0 through 15 for an EX8216 switch

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Syntax

```
power-mode-ipsec;
```

Hierarchy Level

```
[edit security flow (Security Flow)]
```

Description

Enable PowerMode IPsec. processing. PMI is a new mode of operation that provides IPsec performance improvements.

For SRX4100, SRX4200 devices running Junos OS Release 18.4R1, SRX4600 devices running Junos OS Release 20.4R1, and vSRX Virtual Firewall instances running Junos OS Release 18.3R1, you can enable or disable the PMI. Starting in Junos OS Release 21.1R1, you can enable or disable the PMI on MX-SPC3 services card.

If you use Junos OS Release 18.3R1, you must reboot the device for the configuration to take effect.

From Junos OS Release 18.4R1 and later, you don't need reboot the device after enabling or disabling this feature.

Packets cannot go through the PMI when firewall or advanced security services are combined with IPsec. Hence, PMI must not be used when firewall or advanced security services are combined with IPsec.

Syntax (QFX5110, QFX5120, QFX5200, and QFX5210)

```
ppm {
    no-delegate-processing;
    inline-processing-enable;
}
```

Hierarchy Level

```
[edit routing-options]
```

Description

Disable distributed periodic packet management (PPM) to the Packet Forwarding Engine (on routers), to access ports (on EX3200 and EX4200 switches, and QFX Series), or to line cards (on EX6200 and EX8200 switches).

After you disable PPM, PPM processing continues to run on the Routing Engine.

In Junos OS Release 8.2, PPM was moved from the Routing Engine to the Packet Forwarding Engine, access ports, or line cards. The `no-delegate-processing` statement disables the default behavior and restores the legacy behavior.

Default

Distributed PPM processing is enabled for all protocols that use PPM such as:

- Bidirectional Forwarding Detection (BFD)
- Connectivity Fault Management (CFM)
- Link Aggregation Control Protocol (LACP)
- Link Fault Management (LFM)
- Real-time Performance Monitoring (RPM)
- Spanning Tree Protocol (STP)
- Synchronous Ethernet (SYNCE)
- Virtual Router Redundancy Protocol (VRRP)

> **NOTE**: The protocols BFD and CFM are supported on SRX300, SRX320, SRX340, SRX345 and SRX1500 devices.
>
> The protocol LACP is supported on SRX5400, SRX 5600, and SRX5800 devices.

Options

`no-delegate-processing`	Disable PPM to the Packet Forwarding Engine, access ports, or line cards. Distributed PPM is enabled by default.
`redistribution-timer`	Ensures that link aggregation and spanning tree protocols work seamlessly on chassis or virtual chassis based devices during ISSU/NSSU, NSR and GRES. Recommended value is 120 seconds.
`inline-processing-enable`	Enable inline processing. Inline processing allows you to set BFD timers to less than one second. On platforms that support hardware-assisted inline BFD, use this option to enable it.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

`inline-processing-enable` option introduced in Junos OS Release 19.4R1.

    secondary-wins secondary-wins;
}
```

Hierarchy Level

```
[edit access group-profile profile-name]
```

Description

Configure PPP properties for a group profile.

Options

cell-overhead

Configure the session to use Asynchronous Transfer Mode (ATM)-aware egress shaping on the IQ2 PIC.

encapsulation-overhead

Configure the encapsulation overhead for class-of-service calculations.

- **Values:** *bytes*—The number of bytes used as encapsulation overhead for the session.

framed-pool

Configure the address pool.

- **Values:** *framed-pool*—References a configured address pool.

idle-timeout

Configure the idle timeout for a user. The router might consider a PPP session to be idle because of the following reasons:

- There is no ingress traffic on the PPP session.
- There is no egress traffic.
- There is neither ingress or egress traffic on the PPP session.

- There is no ingress or egress PPP control traffic. This is applicable only if keepalives are enabled.
- **Values:** *seconds*—Number of seconds a user can remain idle before the session is terminated.
- **Range:** 0 through 4,294,967,295 seconds
- **Default:** 0

interface-id *interface-id*

Configure the interface identifier.

- **Values:** *interface-id*—Identifier for the interface representing a Layer 2 Tunneling Protocol (L2TP) session configured at the `[edit interfaces interface-name unit local-unit-number dial-options]` hierarchy level. For more information about the interface ID, see Services Interface Naming Overview.

keepalive

Configure the keepalive interval for an L2TP tunnel.

- **Values:** *seconds*—Time period that must elapse before the Junos OS checks the status of the Point-to-Point Protocol (PPP) session by sending an echo request to the peer.

  For L2TP on MX Series routers, the minimum recommended interval is 30 seconds. A value of 0 disables generation of keepalive messages from the LNS.
- **Range:** 0 through 32,767 seconds
- **Default:** 30 seconds

primary-dns

Configure the primary Domain Name System (DNS) server.

- **Values:** *primary-dns*—An IPv4 address.

primary-wins

Configure the primary Windows Internet name server.

- **Values:** *primary-wins*—An IPv4 address.

secondary-dns

Configure the secondary DNS server.

- **Values:** *secondary-dns*—An IPv4 address.

secondary-wins

Configure the secondary Windows Internet name server.

- **Values:** *secondary-wins*—An IPv4 address.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

```
[edit dynamic-profiles profile-name interfaces $junos-interface-ifd-name unit $junos-interface-
unit],
[edit dynamic-profiles profile-name interfaces pp0 unit $junos-interface-unit]
```

Description

Configure PPP-specific interface properties in a dynamic profile.

NOTE: PPP options can also be configured in a group profile with the `ppp-options (L2TP)` statement. The following behavior determines the interaction between the PPP options configured in a group profile and the PPP options configured in a dynamic profile:

- When PPP options are configured only in the group profile, the group profile options are applied to the subscriber.
- When PPP options are configured in both a group profile and a dynamic profile, the dynamic profile configuration takes complete precedence over the group profile when the dynamic profile includes one or more of the PPP options that can be configured in the group profile. Complete precedence means that there is no merging of options between the profiles. The group profile is applied to the subscriber only when the dynamic profile does not include any PPP option available in the group profile.

Options

lcp-connection-update

Enable PPP to act on a Connection-Status-Message VSA (26–218) received by authd in either a RADIUS Access-Accept message or a CoA message. PPP conveys the contents of the VSA in an LCP Connection-Update-Request message to the remote peer, such as a home gateway. This action requires the following to be true:

- At least the first address family has been successfully negotiated and the session is active.
- The router LCP is in the Opened state.

Otherwise PPP takes no action on the VSA. If you do not enable the `lcp-connection-update` option, PPP processes the notification from authd, but takes no action.

- **Default:** Disabled

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

Support at the `[edit dynamic-profiles profile-name interfaces "$junos-interface-ifd-name" unit “$junos-interface-unit”]` hierarchy level introduced in Junos OS Release 12.2.

`lcp-connection-update` option added in Junos OS Release 20.2R1.

- Description | 13476
- Required Privilege Level | 13477
- Release Information | 13477

Syntax

```
ppp-options {
    aaa-options aaa-options-name;
    chap;
    ignore-magic-number-mismatch;
    initiate-ncp (ip | ipv6 | dual-stack-passive)
    ipcp-suggest-dns-option;
    mru;
    mtu;
    pap;
    peer-ip-address-optional;
}
```

Hierarchy Level

```
[edit access group-profile profile-name ppp]
```

Description

Configure PPP-specific properties in a group profile that applies to tunneled PPP subscribers at the LNS.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

NOTE: PPP options can also be configured for an inline service interface within a dynamic profile with the `ppp-options (Dynamic PPP)` statement. The following behavior determines the interaction between the PPP options configured in a group profile and the PPP options configured in a dynamic profile:

- When PPP options are configured only in the group profile, the group profile options are applied to the subscriber.
- When PPP options are configured in both the dynamic profile and the group profile, the group profile options are applied to the subscriber only when the dynamic profile PPP options do not include any of the following attributes: "aaa-options" on page 1780, "chap" on page 3501, "ipcp-suggest-dns-option" on page 9691, "mru" on page

11447, "mtu" on page 11480, "pap" on page 12671, and "peer-ip-address-optional" on page 12886. When any of these attributes is present, the dynamic profile is applied to the subscriber.

When PPP options are configured in both a group profile and a dynamic profile, the dynamic profile configuration takes complete precedence over the group profile when the dynamic profile includes one or more of the PPP options that can be configured in the group profile. Complete precedence means that there is no merging of options between the profiles. The group profile is applied to the subscriber only when the dynamic profile does not include any PPP option available in the group profile.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

`mtu` statement introduced in Junos OS Release 14.2

```

Hierarchy Level

```
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Description

On interfaces with PPP encapsulation, configure PPP-specific interface properties.

For ATM2 IQ interfaces only, you can configure CHAP on the logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- **atm-ppp-llc**—PPP over AAL5 LLC encapsulation.
- **atm-ppp-vc-mux**—PPP over AAL5 multiplex encapsulation.

> **BEST PRACTICE**: On inline service (si) interfaces for L2TP, only the **chap** and **pap** statements are typically used for subscriber management. We recommend that you leave the other statements subordinate to **ppp-options**—including those subordinate to **chap** and **pap**—at their default values.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

ppp-over-ether

IN THIS SECTION

- Syntax | 13480
- Hierarchy Level | 13480
- Description | 13480
- Required Privilege Level | 13480
- Release Information | 13480

Syntax

```
ppp-over-ether;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number encapsulation]
```

Description

This encapsulation is used for underlying interfaces of pp0 interfaces. This encapsulation is supported on Fast Ethernet interface, Gigabit Ethernet interface, and Redundant Ethernet interface. When Redundant Ethernet interface is used as underlying interface, an existing pppoe session can be continued in case of failover.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 11.2.

This encapsulation is supported for Redundant Ethernet interface in Junos OS Release 11.2.

ppp-subscriber-services

IN THIS SECTION

- Syntax | 13481
- Hierarchy Level | 13481
- Description | 13481
- Options | 13482
- Required Privilege Level | 13482
- Release Information | 13482

Syntax

```
ppp-subscriber-services (disable | enable);
```

Hierarchy Level

```
[edit chassis]
```

Description

Enable dynamic PPP subscriber services on non-PPPoE interfaces on certain PICs.

> **NOTE**: When you include this statement, the relevant PICs restart. This action disrupts subscribers already logged in through those PICs. You can confirm completion of the restart by issuing the **show chassis pic fpc-slot *slot-number* pic-slot *slot-number*** command.

Options

`disable`—Disable subscriber services.

`enable`—Enable subscriber services.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

Release Information

Statement introduced in Junos Evolved OS Release 23.4R1.

pppoe (System Processes)

IN THIS SECTION

Syntax | 13493

- Hierarchy Level | 13493
- Description | 13493
- Options | 13493
- Required Privilege Level | 13494
- Release Information | 13494

Syntax

```
pppoe {
    command binary-file-path;
    disable;
    failover (alternate-media | other-routing-engine);
}
```

Hierarchy Level

```
[edit system processes]
```

Description

Enable users to connect to a network of hosts over a bridge or access concentrator.

Options

- `command` *`binary-file-path`*—Path to the binary process.
- `disable`—Disable the Point-to-Point Protocol over Ethernet process.
- `failover`—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.
  - `alternate-media`—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.

- `other-routing-engine`—Instruct the secondary Routing Engine to take primary role if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

pppoe-options (SRX Series)

IN THIS SECTION

Syntax | 13496

- Hierarchy Level | 13496
- Description | 13496
- Options | 13496
- Required Privilege Level | 13497
- Release Information | 13497

Syntax

```
pppoe-options {
    access-concentrator name ;
    auto-reconnect seconds;
    (client | server);
    ignore-eol-tag;
    service-name name;
    underlying-interface interface-name;
}
```

Hierarchy Level

```
[edit interfaces pp0 unit logical-unit-number],
[edit logical-systems logical-system-name interfaces pp0 unit logical-unit-number]
```

Description

Configure PPP over Ethernet-specific interface properties.

Options

access-concentrator *name*

(SRX Series devices with Point-to-Point Protocol over Ethernet (PPPoE) interfaces) Configure the name of the access concentrator. If you configure a specific access concentrator name on the client and the same access concentrator name server is available, then a PPPoE session is established. If there is a mismatch between the access concentrator names of the client and the server, the PPPoE session gets closed.

auto-reconnect *seconds*	Configure the amount of time to wait before reconnecting after a session has terminated.
client	Configure the device to operate in the PPPoE client mode.
idle-timeout *seconds*	Configure the maximum time that a session can be idle.
ignore-eol-tag	Disable the `End-of-List` tag to process the tags after the `End-of-List` tag in a PPPoE Active Discovery Offer (PADO) packet.
service-name *name*	Configure the service to be requested from the PPP over Ethernet server; that is, the access concentrator. For example, you can use this statement to indicate an Internet service provider (ISP) name or a class of service.
server	Configure the device to operate in the PPPoE server mode.
underlying-interface *interface-name*	Configure the interface on which PPP over Ethernet is running.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 12.3X48 to include `ignore-eol-tag` statement.

[edit interfaces pp0 unit logical-unit-number],
[edit logical-systems logical-system-name interfaces pp0 unit logical-unit-number],
[edit interface ppp interface unit logical-unit-number ppp-max-payload ppp-max-payload]
```

Description

Configure PPP over Ethernet-specific interface properties.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

The maximum payload allowed on an Ethernet frame is 1500 bytes. For a PPPoE interface, the PPPoE header uses 6 bytes and the PPP protocol ID uses 2 bytes. This restricts the maximum MTU size on a PPPoE interface to 1492 bytes, which can cause frequent fragmentation and reassembly of larger PPP packets received over the PPPoE interface. To prevent frequent fragmentation and reassembly for PPP packets over Ethernet, you can configure the maximum transmission unit (MTU) and MRU sizes for PPP subscribers.

For PPPoE subscribers, the PPP MRU or PPP MTU size can be greater than 1492 bytes if the PPP-Max-Payload tag is received in the PPPoE Active Discovery Request (PADR) packets.

The PPP-Max-Payload option allows you to override the default behavior of the PPPoE client by providing a maximum size that the PPP payload can support in both sending and receiving directions. The PPPoE server might allow the negotiation of an MRU larger than 1492 octets and the ability to use an MTU larger than 1500 octets.

It is important to set an appropriate value for the MTU size of the physical interface before setting `ppp-max-payload`. The value of `mtu` must be greater than the value of `ppp-max-payload`.

To enable Jumbo frames refer Understanding Jumbo Frames Support for Ethernet Interfaces.

```
pppoe-tags {
    priority priority;
    algorithm algorithm;
}
```

Hierarchy Level

```
[edit class-of-service adjustment-control-profiles profile-name application]
```

Description

Configure the shaping rate adjustment controls for the Point-to-Point Protocol over Ethernet (PPPoE) Tags application.

Options

priority Priority of the Point to Point Protocol over Ethernet IA Tags application in the adjustment control profile.

- **Range:** 1 through 10; 1 being the highest priority.
- **Default:** 2

algorithm Rate adjustment algorithm used by the Point to Point Protocol over Ethernet (PPPoE) IA Tags application.

- Values:
  - adjust-never—Do not perform rate adjustments.
  - adjust-always—Adjust the shaping rate unconditionally.
  - adjust-less—Adjust the shaping rate if it is less than the configured value.
  - adjust-less-or equal—Adjust the shaping rate if it is less than or equal to the configured value.
  - adjust-greater—Adjust the shaping rate if it is greater than the configured value.
  - adjust-greater-or-equal—Adjust the shaping rate if it is greater than or equal to the configured value.
- **Default:** adjust-less

Required Privilege Level

pppoe-underlying-options (Dynamic VLAN Interface Sets)

IN THIS SECTION

- Syntax | 13502
- Hierarchy Level | 13502
- Description | 13502
- Required Privilege Level | 13503
- Release Information | 13503

Syntax

```
pppoe-underlying-options {
    max-sessions number;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-set $junos-interface-set-name]
```

Description

Configure PPPoE-specific interface properties in the dynamic profile that defines the agent circuit identifier (ACI) interface set. An ACI interface set is a logical collection of subscriber interfaces that originate at the same household or on the same access-loop port. Configuring PPPoE-specific interface properties for an ACI interface set enables you to apply these attributes to all subscribers on a per-household basis.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

NOTE: When you configure PPPoE-specific interface properties for an ACI interface set, only the `max-sessions` statement is currently supported.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

pps-limit (Hierarchical Policer)

IN THIS SECTION

- Syntax | 13505
- Hierarchy Level | 13505
- Description | 13505
- Options | 13506
- Required Privilege Level | 13506
- Release Information | 13506

Syntax

```
pps-limit pps;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall hierarchical-policer hierarchical-policer-name aggregate
if-exceeding],
[edit dynamic-profiles profile-name firewall hierarchical-policer hierarchical-policer-name premium
if-exceeding],
[edit No Link Title hierarchical-policer hierarchical-policer-name aggregate if-exceeding],
[edit No Link Title hierarchical-policer hierarchical-policer-name premium if-exceeding]
```

Description

Configure the maximum bandwidth in packets per second (pps) for premium or aggregate traffic in a hierarchical policer.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short periods and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

Options

pps—Specify the number of packets per second either as a decimal number or as a decimal number followed by the abbreviation `k` (1000), or `m` (1000000).

- **Range:** 2 through 24414062
- **Default:** None

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

Syntax

```
pps-limit pps;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall policer policer-name if-exceeding-pps],
[edit firewall policer policer-name if-exceeding-pps],
[edit logical-systems logical-system-name firewallpolicer policer-name if-exceeding-pps]
```

Description

For a single-rate two-color policer, configure the packets-per-second (pps) limit as a number of packets per second. Single-rate two-color policing uses the single token bucket algorithm to measure traffic-flow conformance to a two-color policer rate limit.

Traffic at the interface that conforms to the pps limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with `low` packet loss priority (PLP) and then passed through the interface.

Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

NOTE: This statement specifies the pps limit as an absolute number of packets per second. You cannot use the pps limit as a percentage of interface bandwidth.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allow more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short periods and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

Options

pps—Specify the number of packets per second either as a decimal number or as a decimal number followed by the abbreviation `k` (1000), or `m` (1000000).

- **Range:** 2 through 24414062

pptp

IN THIS SECTION

- Syntax | 13509
- Hierarchy Level | 13509
- Description | 13510
- Options | 13510
- Required Privilege Level | 13510
- Release Information | 13510

Syntax

```
pptp {
    disable;
    traceoptions {
        flag {
            all {
                extensive
            }
        }
    }
}
```

Hierarchy Level

```
[edit logical-systems name security alg],
[edit logical-systems name tenants name security alg],
[edit security alg],
[edit services alg],
[edit tenants name security alg]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure pptp to specify the Point-to-Point Tunneling Protocol (PPTP) ALG on the device. PPTP ALG is a TCP-based ALG.

Options

- `disable`—Disable the PPTP ALG. By default, the PPTP ALG is enabled.
- `traceoptions`—Configure PPTP ALG tracing options.
  - `flag`—Trace operation to perform.
    - `all`—Trace all events.
    - *`extensive`*—Display extensive amount of data.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

The `tenant` option is introduced in Junos OS Release 18.3R1.

prbs-test-start

IN THIS SECTION

- Syntax | 13512
- Description | 13512
- Options | 13513
- Required Privilege Level | 13514
- Release Information | 13514

Syntax

```
test interfaces  ifd-name prbs-test-start pattern-type type direction 0/1 flip 0/1
```

Description

You can check the physical link connectivity by issuing this command that starts collecting the Pseudo Random Binary Sequence (PRBS) statistics. The PRBS pattern generation and verification validates the

physical link connectivity in a routers. If the PRBS test passes with PRBS31 pattern type consistently, it indicates that the quality of signal received is good.

This command provides the PRBS test statistics while test is in progress. Use the `clear interfaces statistics` command to clear the collected statistics.

Use the `show interfaces interface-name prbs-stats` command to view the collected statistics.

> **NOTE**:
>
> - While running PRBS statistics, the link will be down.
> - The interface link status goes down when PRBS is enabled and the interface state is back to the original state when PRBS is disabled.
> - On MX10003 routers, the PRBS58 pattern is supported only on JNP-MIC1-MACSEC MIC.

Issue the "prbs-test-stop" on page 13515 command to stop collecting the PRBS statistics .

For the step-by-step procedure on how to collect and view the PRBS statistics, refer *Verifying Link and Transceivers using Pseudo Random Binary Sequence (PRBS) Test*.

Options

ifd-name—Name of the interface.

type—Specifies the pattern type, that is in the range from 7 to 58.

Following pattern types are supported:

Pattern Type	Pattern Name
7	PRBS7
9	PRBS9
11	PRBS11
15	PRBS15

(Continued)

Pattern Type	Pattern Name
23	PRBS23
31	PRBS31 **NOTE**: Recommended pattern to check the quality of the received link.
58	PRBS58

`direction`—Specifies to configure transmit or receive PRBS pattern.

`flip`—Specifies if the pattern bits needs to be flipped or not.

Required Privilege Level

pre-id-default-policy {
    then {
        log {
            session-init;
            session-close;
        }
        session-timeout {
            icmp seconds;
            icmp6 seconds;
            ospf seconds;
            others seconds;
            tcp seconds;
            udp seconds;
        }
    }
}
```

Hierarchy Level

```
[edit security policies]
```

Description

Configure pre-ID default policy settings.

Starting in Junos OS Release 23.4R1, the flow process is optimized to deny the traffic (without AppID) when all the potential policies (including the default policy) would deny the traffic.

The flow does not proceed to the Pre-ID default policy (pre-id-default-policy) but is instead denied by the default policy or by the topmost rule in the unified policy. The sessions matching Pre-Id default Policy are denied if there is no potential permit policy before performing application identification (AppID).

When the device receives the first packet of a traffic flow, it performs basic 5-tuple matching and checks the defined potential policies to determine how to treat the packet. If all potential policies have action as `deny`, and the default policy action is also set to `deny`, then the device denies the traffic and does not perform application identification.

If any policy has action as other than `deny` then the device performs DPI to identify the application.

The device checks for potential policies on both zone context and global context.

In the Junos OS Release prior to 23.4R1, the pre-ID default policy temporarily allows the session to get created so that DPI can get the packet and perform application identification (AppID).

> **CAUTION**: Configuring `session-init` logging for the `pre-id-default-policy` can generate a large amount of logs. Each session that enters the SRX that initially matches the `pre-id-default-policy` will generate an event. We recommend only using this option for troubleshooting purposes.

Options

then Specifies the policy action that has to be taken when the packet matches the criteria.

log Specifies the log details at session close time and session initialization time.

- Values:
  - session-init—Log at the beginning of a session
  - session-close—Log at the closure of a session

> **NOTE**: In recent versions of Junos OS, the factory-default configuration of an SRX includes the `session-close` knob. If not already present, we recommend that customers implement `session-close logging` within their `pre-id-default-policy`. This will ensure security logs are generated by the SRX if a flow is unable to leave the `pre-id-default-policy`. These events are generally a result of JDPI being unable to properly classify traffic, although they may also indicate potential attempts at evading the APPID engine.

session-timeout When you update a session, the session timeout is configured, which specifies the session timeout details in seconds.

- **Values:** icmp—Timeout value for ICMP sessions (seconds)
- **Range:** 4 through 86,400
- **Values:** icmp6—Timeout value for ICMP6 sessions (seconds)
- **Range:** 4 through 86,400
- **Values:** ospf—Timeout value for OSPF sessions (seconds)
- **Range:** 4 through 86,400
- **Values:** others—Timeout value for other sessions (seconds)
- **Range:** 4 through 86,400
- **Values:** tcp—Timeout value for TCP sessions (seconds)
- **Range:** 4 through 86,400
- **Values:** udp—Timeout value for UDP sessions (seconds)
- **Range:** 4 through 86,400

Required Privilege Level

security—To view this statement in the configuration.

input filter-name],
```

```
[edit dynamic-profiles profile-name interfaces pp0 unit $junos-interface-unit family  family filter
output filter-name]
```

Description

Apply a precedence to a dynamic filter. You can configure filter processing to occur in a particular order. You specify a precedence for input and output filters within a dynamic profile at the `[edit dynamic-profiles profile-name interfaces (interface-name | demux0) unit logical-unit-number family family]` hierarchy level.

The precedence range is from 0 through 250. Setting a lower precedence value for a filter gives it a higher precedence within the dynamic profile. A precedence of zero (the default) gives the filter the highest precedence. If no precedence is specified, the filter receives a precedence of zero (highest precedence). Filters with matching precedence (zero or otherwise) are applied in random order.

Options

precedence—Precedence value for the filter. The lower the precedence value, the higher the precedence.

- **Range:** 0 through 250
- **Default:** 0

Required Privilege Level

- Required Privilege Level | 13535
- Release Information | 13535

Syntax

```
precision-timers;
```

Hierarchy Level

```
[edit protocols bgp]
```

Description

NOTE: The `precision-timers` statement is not applicable to Junos OS Evolved.

Enable BGP sessions to send frequent keepalive messages with a hold time as short as 10 seconds.

NOTE: The hold time is three times the interval at which keepalive messages are sent, and the hold time is the maximum number of seconds allowed to elapse between successive keepalive messages that BGP receives from a peer. When establishing a BGP connection with the local routing device, a peer sends an open message, which contains a hold-time value. BGP on the local routing device uses the smaller of either the local hold-time value or the peer's hold-time value as the hold time for the BGP connection between the two peers.

The default hold-time is 90 seconds, meaning that the default frequency for keepalive messages is 30 seconds. More frequent keepalive messages and shorter hold times might be desirable in large-scale deployments with many active sessions (such as edge or large VPN deployments). To configure the hold time and the frequency of keepalive messages, include the `hold-time` statement at the `[edit protocols bgp]` hierarchy level. You can configure the hold time at a logical system, routing instance, global, group, or neighbor level. When you set a hold time value to less than 20 seconds, we recommend that you also configure the BGP `precision-timers` statement. The `precision-timers` statement ensures that if scheduler slip messages occur, the routing device continues to send keepalive messages. When the `precision-timers` statement is included, keepalive message generation is performed in a dedicated kernel thread, which helps to prevent BGP session flaps.

NOTE: Starting with Junos OS Release 15.2, you can register or unregister keepalives of BGP with the automated keepalive precision timer service of the kernel. This service ensures a reliable generation of keepalives for some configurable maximum period after a switchover of the routing engine from backup to primary until BGP is able to take over the keepalive generation.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

precision-timers-max-period

IN THIS SECTION

- Syntax | 13536
- Hierarchy Level | 13536
- Description | 13536
- Required Privilege Level | 13536
- Release Information | 13537

Syntax

```
precision-timers-max-period precision-timers-max-period;
```

Hierarchy Level

```
[edit routing-options nonstop-routing-options]
```

Description

Support of precision-timers in the kernel is a feature where the kernel takes over auto-generation of BGP keepalives right after the switchover from standby to primary event occurs. The kernel in the RE continues this auto-generation until the BGP protocol is able to take over the session or until a maximum period has elapsed since the switchover event occurred. The maximum period for which the kernel auto-generates keepalives on behalf of BGP after a switchover event from standby to primary ranges from 60 seconds to 1800 seconds. The default value is 600 seconds.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

predefined-attack-groups

IN THIS SECTION

predefined-variable-defaults (Dynamic Client Profiles)

IN THIS SECTION

- Syntax | 13540
- Hierarchy Level | 13540
- Description | 13540
- Options | 13541
- Required Privilege Level | 13542
- Release Information | 13542

Syntax

```
predefined-variable-defaults {
    cos-excess-rate <percent percentage> <proportion number>;
    cos-excess-rate-low <percent percentage> <proportion number>;
    cos-excess-rate-high <percent percentage> <proportion number>;
    cos-scheduler-bs <percent percentage> <temporal microseconds>;
    cos-scheduler-shaping-rate <percent percentage> <rate bps>;
    cos-scheduler-tx <percent percentage> <rate bps>;
    predefined-variable default-value;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name]
```

Description

Configure default values for the predefined variables that are configured in a dynamic client profile. These default values are used when RADIUS does not supply a value. Omit the predefined variable prefix, $junos-, when you configure a default. Most predefined variables support only a single default value; these predefined variables are not listed separately here. The listed predefined variables support default values for two attributes; for these you can specify the default value for either attribute or for both attributes.

> **NOTE**: Not all predefined variables support default values. For a list of predefined variables and options for which you can configure default values, see *Junos OS Predefined Variables That Correspond to RADIUS Attributes and VSAs*

Defining default values for these predefined variables enables you to determine whether to source values locally from the profile instead of only from RADIUS. This enables you to use RADIUS as a way to selectively override predefined variable values, instead of being the sole source of those values.

> **NOTE**: The `proportion` option provides greater granularity than the `percent` option, enabling you to specify the equivalent of a tenth of a percent. Configuring `proportion 121` applies a value equivalent to 12.1 percent, which you cannot achieve with the `percent` option.

NOTE: Do not use this statement in a dynamic service profile.

Options

cos-excess-rate percent *percentage*

Specify the percentage of excess bandwidth to share from all traffic.

- **Range:** 1 through 100

cos-excess-rate proportion *number*

Specify the proportion of excess bandwidth to share from all traffic.

- **Range:** 0 through 1000

cos-excess-rate-low percent *percentage*

Specify the percentage of excess bandwidth to share from low-priority traffic.

- **Range:** 1 through 100

cos-excess-rate-low proportion *number*

Specify the proportion of excess bandwidth to share from low-priority traffic.

- **Range:** 0 through 1000

cos-excess-rate-high percent *percentage*

Specify the percentage of excess bandwidth to share from high-priority traffic.

- **Range:** 1 through 100

cos-excess-rate-high proportion *number*

Specify the proportion of excess bandwidth to share from high-priority traffic.

- **Range:** 0 through 1000

cos-scheduler-bs percent *percentage*

Specify the buffer size as a percentage of the total buffer.

- **Range:** 0 through 100

cos-scheduler-bs temporal *microseconds*

Specify the temporal value that determines the buffer size. The temporal value multiplied by the logical interface speed determines the size.

- **Range:** 0 through 4294967295

cos-scheduler-shaping-rate percent *number*

Specify the shaping rate as a percentage of the available interface bandwidth.

- **Range:** 1 through 100

cos-scheduler-shaping-rate rate *bps*

Specify the shaping rate in bits per second.

- **Range:** 3200 through 160,000,000,000

cos-scheduler-tx percent *number*

Specify the transmit rate as a percentage of the total available bandwidth.

- **Range:** 0 through 100

cos-scheduler-tx rate *bps*

Specify the transmit rate in bits per second.

- **Range:** 3200 through 160,000,000,000

default-value—Default value that you want to assign to the predefined variable. Use this for predefined variables that support only a single value.

predefined-variable—Name of the Junos OS predefined variable to which you want to assign a default value. Do not include the `$junos-` prefix.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

Support for the $junos-interface-mtu predefined variable (`interface-mtu`) introduced in Junos OS Release 18.1R1 on MX Series.

preempt (Chassis Cluster)

IN THIS SECTION

- Syntax | 13543
- Hierarchy Level | 13543
- Description | 13543
- Options | 13544
- Required Privilege Level | 13544
- Release Information | 13544

Syntax

```
preempt {
    delay seconds;
    limit limit;
    period seconds;
}
```

Hierarchy Level

```
[edit chassis cluster redundancy-group group-number]
```

Description

Allow preemption of the primary system based on the priority within a redundancy group.

Configuring preemption for RG0 is not allowed and is blocked when committed.

By configuring the preemptive delay timer and failover limit, you can limit the flapping of the redundancy group state between the secondary and the primary in a preemptive failover.

By default, preemption is disabled.

Example: Consider the following scenario where you have configured a preemptive period as 300 seconds and preemptive limit as 50.

When the preemptive limit is configured as 50, the count starts at 0 and increments with a first preemptive failover; this process continues until the count reaches the configured preemptive limit, that is 50, before the preemptive period expires. When the preemptive limit (50) is exceeded, you must manually reset the preempt count to allow preemptive failovers to occur again.

When you have configured the preemptive period as 300 seconds, and if the time difference between the first preemptive failover and the current failover has already exceeded 300 seconds, and the preemptive limit (50) is not yet reached, then the preemptive period will be reset. After resetting, the last failover is considered as the first preemptive failover of the new preemptive period and the process starts all over again.

Options

delay Time to wait before the node in secondary state transitions to primary state in a preemptive failover.

- **Range:** 1 to 21,600 seconds
- **Default:** 1

limit Maximum number of preemptive failovers allowed in a configured preemptive period.

- **Range:** 1 to 50

period Time period during which the preemptive limit is applied.

- **Range:** 1 to 1400 seconds

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0. Support for `delay`, `limit`, and `period` options are added in Junos OS Release 17.4R1.

[edit logical-systems logical-system-name  interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
```

Description

In a Virtual Router Redundancy Protocol (VRRP) configuration, determine whether or not a backup router can preempt a primary router:

- `preempt`—Allow the primary router to be preempted.

  > **NOTE**: By default, a higher-priority backup router can preempt a lower-priority primary router.

- `no-preempt`—Prohibit the preemption of the primary router. When `no-preempt` is configured, the backup router cannot preempt the primary router even if the backup router has a higher priority.

The remaining statement is explained separately. See CLI Explorer.

Default

By default the `preempt` statement is enabled, and a higher-priority backup router preempts a lower-priority primary router even if the `preempt` statement is not explicitly configured.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

preference {
    least;
    non-revertive;
    value value;
}
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces name esi df-election-type],
[edit dynamic-profiles name logical-systems name interfaces name esi df-election-type],
[edit interfaces name esi df-election-type]
```

Description

Configure the preference-based election algorithm for the designated forwarder (DF) for an Ethernet segment among the multihoming provider edge (PE) devices in an Ethernet VPN (EVPN) network.

> **NOTE**: Configure all the candidate devices within the Ethernet segment with the same election algorithm. In the event of a mismatch between the locally configured DF election algorithm and the remote PE's DF election algorithm, all the PEs revert to the default DF election as specified in RFC 7432.

When configured, the device uses the *value* as an administrative preference value associated with the Ethernet segment identifier (ESI) you configure at the same ESI hierarchy level. The DF candidate devices exchange the preference value and the Don't Preempt (DP) bit in EVPN Type 4 routes using the DF election extended community.

When the candidate devices in the Ethernet segment receive the Type 4 route, they determine their DF preference order based on the configured preference value, the DP bit, and the IP address.

The preference-based DF election process uses the highest configured preference value by default. Configure the least `option` to enable DF election for the ESI based on the lowest configured preference value. You can also set the preferred preference level for the EVPN instance (EVI) using the `designated-forwarder-preference-highest` or `designated-forwarder-preference-least` statements at the [edit routing-instance routing-instance-name protocols "evpn" on page 6839] hierarchy. The configuration at the EVI level takes precedence over the ESI level. You can use the configurations at the EVI and ESI levels together to configure load balancing for the DF.

The `non-revertive` option prevents a higher priority PE from preempting the DF role from a lower priority PE after recovering from a failure, thus avoiding a service impact caused by an additional DF role change. However it does not prevent role changes due to administrative actions such as changing the DF preference `value`.

Options

least Enable the DF election for the ESI based on the lowest configured preference value.

non-revertive Don't allow DF Election preemption after a DF failure. This option does not prevent role changes due to administrative actions such as changing the DF preference `value`. The default mode of operation is revertive.

value The preference value for this DF election candidate device. If all of the DF candidate devices for the ESI have the same configured preference value they elect the DF based on the lowest IP address.

- **Default:** 32767

EVPN Multihoming Overview

preference (Interface-Level Preference for VPLS Multihoming for FEC 129)

IN THIS SECTION

- Syntax | 13560
- Hierarchy Level | 13560
- Description | 13560
- Options | 13560
- Required Privilege Level | 13560
- Release Information | 13560

Syntax

```
preference preference-value;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name protocols vpls multi-
homing site site-name interface interface-name],
[edit routing-instances instance-name protocols vpls multi-homing site site-name interface
interface-name]
```

Description

Specify a preference for the interface to become the designated forwarder (DF) for a multihomed VPLS site. This `preference` statement can be useful when you want the interface preference for a site to change dynamically so that the DF election can be influenced depending on the interface state. Among the list of interface preferences, Junos OS advertises the best preference as the VPLS site's preference value. For example, if the site has three interfaces configured with preference values 12, 10, and 9, respectively, 12 is advertised as the site preference. If that interface goes down, 10 is advertised as the site preference.

If you configure interface-level preference, you cannot configure site-level preference.

Options

preference-value

Preference value for the interface.

- **Range:** 1 through 65535

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Syntax

```
preference (high | low | medium);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-name],
[edit protocols router-advertisement interface interface-name]
```

Description

Specify the router preference that is communicated to IPv6 hosts through router advertisements. The `preference` value in the router advertisements enables IPv6 hosts to select a default router to reach a remote destination.

The `preference` can be configured when there are multiple devices that route to distinct sets of prefixes and where one of the devices would lead to considerably fewer redirects. You can indicate a lower

preference for a new device that is not completely configured yet, so that hosts do not adopt this new device as the default device and thus avoid traffic loss.

Options

You can specify different levels of preference depending on your requirements:

high Specify a high preference for a device.

low Specify a low preference for a device.

medium Specify a medium preference for a device. This is the default preference.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]
```

Description

Specify the preference for routes learned from BGP.

At the BGP global level, the preference statement sets the preference for routes learned from BGP. You can override this preference in a BGP group or peer preference statement.

At the group or peer level, the preference statement sets the preference for routes learned from the group or peer. Use this statement to override the preference set in the BGP global preference statement when you want to favor routes from one group or peer over those of another.

NOTE: Do not set `preference2` for BGP route-policy.

Options

preference—Preference to assign to routes learned from BGP or from the group or peer.

- **Range:** 0 through 4,294,967,295 (2^{32} – 1)
- **Default:** 170 for the primary preference

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name],
[edit protocols mpls static-label-switched-path lsp-name ingress]
```

Description

Preference for the route.

You can optionally configure multiple LSPs between the same pair of ingress and egress routers. This is useful for balancing the load among the LSPs because all LSPs, by default, have the same preference level. To prefer one LSP over another, set different preference levels for individual LSPs. The LSP with the lowest preference value is used. The default preference for LSPs is lower (more preferred) than all learned routes except direct interface routes.

Options

preference—Preference to assign to the route. A route with a lower preference value is preferred.

- **Range:** 1 through 255

- **Default:** 5 for static MPLS LSPs, 7 for RSVP MPLS LSPs, 9 for LDP MPLS LSPs

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

preference (Protocols RIP)

IN THIS SECTION

- Syntax | 13569
- Hierarchy Level | 13570
- Description | 13570
- Options | 13570
- Required Privilege Level | 13570
- Release Information | 13570

Syntax

```
preference preference;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rip group group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols rip
group group-name],
[edit protocols rip group group-name],
[edit routing-instances routing-instance-name protocols rip group group-name]
```

Description

Specify the preference of external routes learned by RIP as compared to those learned from other routing protocols.

By default, Junos OS assigns a preference of 100 to routes that originate from RIP. When Junos OS determines a route's preference to become the active route, the software selects the route with the lowest preference and installs this route into the forwarding table.

Options

preference—Preference value. A lower value indicates a more preferred route.

- **Range:** 0 through 4,294,967,295 ($2^{32} - 1$)
- **Default:** 100

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Route Preferences Overview

preference (Protocols RIPng)

IN THIS SECTION

- Syntax | 13571
- Hierarchy Level | 13571
- Description | 13571
- Options | 13572
- Required Privilege Level | 13572
- Release Information | 13572

Syntax

```
preference preference;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols ripng group group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
ripng group group-name],
[edit protocols ripng group group-name],
[edit routing-instances routing-instance-name protocols ripng group group-name]
```

Description

Specify the preference of external routes learned by RIPng as compared to those learned from other routing protocols.

By default, Junos OS assigns a preference of 100 to routes that originate from RIPng. When Junos OS determines that a route is to become the active route, the software selects the route with the lowest preference and installs this route into the forwarding table.

To modify the default RIPng preference value, include the `preference` statement.

Options

preference—Preference value. A lower value indicates a more preferred route.

- **Range:** 0 through 4,294,967,295 (2^{32} – 1)
- **Default:** 100

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for routing instances introduced in Junos OS Release 9.0.

preference (Routing Options)

IN THIS SECTION

- Syntax | 13572
- Hierarchy Level | 13573
- Description | 13573
- Options | 13573
- Required Privilege Level | 13574
- Release Information | 13574

Syntax

```
preference {
    metric-value;
```

```
    <type metric_type>
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options (aggregate | generate | static) (defaults | route)],

[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options rib routing-table-name (aggregate | generate | static) (defaults | route)],

[edit logical-systems logical-system-name routing-options (aggregate | generate | static)
(defaults | route)],
[edit logical-systems logical-system-name routing-options rib routing-table-name (aggregate |
generate | static) (defaults | route)],
[edit routing-instances routing-instance-name routing-options (aggregate | generate | static)
(defaults | route)],
[edit routing-instances routing-instance-name routing-options rib routing-table-name (aggregate |
generate | static) (defaults | route)],
[edit routing-options (aggregate | generate | static) (defaults | route)],
[edit routing-options rib routing-table-name (aggregate | generate | static) (defaults | route)]
```

Description

Preference value for a static, aggregate, or generated route. You also can specify a secondary preference value, as well as color values, which are even finer-grained preference values.

You can specify a primary route preference (by including the **preference** statement in the configuration), and a secondary preference that is used as a tiebreaker (by including the **preference2** statement). You can also mark route preferences with additional route tiebreaker information by specifying a color and a tiebreaker color (by including the **color** and **color2** statements in the configuration).

If the Junos OS routing table contains a dynamic route to a destination that has a better (lower) preference value than the static, aggregate, or generated route, the dynamic route is chosen as the active route and is installed in the forwarding table.

Options

metric_value—The metric value for an aggregate, a generated, or a static route to determine the best route among multiple routes to a destination

- **Range:** 0 through 4,294,967,295 (2^{32} – 1)
- **Default:** 5 (for static routes), 130 (for aggregate and generated routes)

type ***metric_type***—(Optional) External metric type for routes exported by OSPF. When routes are exported to OSPF, type 1 routes are advertised in type 1 externals, and routes of any other type are advertised in type 2 externals. Note that if a qualified-next-hop metric value is configured, this value overrides the route metric.

- **Range:** 1 through 16

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

preference (Site-Level Preference for VPLS Multihoming for FEC 129)

IN THIS SECTION

- Syntax | **13575**
- Hierarchy Level | **13575**
- Description | **13575**

- Default | 13575
- Options | 13575
- Required Privilege Level | 13576
- Release Information | 13576

Syntax

```
preference (preference-value | backup | primary);
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name protocols vpls multi-homing site site-name],
[edit routing-instances instance-name protocols vpls multi-homing site site-name]
```

Description

Influence the designated forwarder (DF) selection for a multihomed VPLS site. Configure the preference in terms of keywords `primary` and `backup`, or configure the preference value explicitly.

Default

If this statement is omitted, the default preference value for the site is 100.

Options

preference-value	Preference value for the DF. • **Range:** 1 through 65535
backup	Less likely to become the DF.
primary	Most likely to become the DF.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

preference (Subscriber Management)

IN THIS SECTION

- Syntax | 13576
- Hierarchy Level | 13577
- Description | 13577
- Options | 13577
- Required Privilege Level | 13577
- Release Information | 13577

Syntax

```
preference route-distance;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options
access route prefix],
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options
rib routing-table-name access route prefix],
[edit dynamic-profiles profile-name routing-options access route prefix]
```

Description

Dynamically configure the distance for an access route.

Options

route-distance—Either the specific distance you want to assign to the access route or either of the following distance variables:

- `$junos-framed-route-distance`—Distance of an IPv4 access route; the variable is dynamically replaced with the preference value (Subattribute 5) from the RADIUS Framed-Route attribute [22].
- `$junos-framed-route-ipv6-distance`—Distance of an IPv6 access route; the variable is dynamically replaced with the preference value (Subattribute 5) from the RADIUS Framed-IPv6-Route attribute [99].

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

Support at `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options access route prefix]` and `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options rib routing-table-name access route prefix]` hierarchy levels introduced in Junos OS Release 10.1.

preference (Tunnel Profile)

IN THIS SECTION

- Syntax | 13578
- Hierarchy Level | 13578
- Description | 13578
- Options | 13578
- Required Privilege Level | 13579
- Release Information | 13579

Syntax

```
preference number;
```

Hierarchy Level

```
[edit access tunnel-profile profile-name tunnel tunnel-id]
```

Description

Specify the preference for a tunnel. You can specify up to 8 levels of preference, and you can assign the same preference to a maximum of 31 tunnels. When you define multiple preferences for a destination, you increase the probability of a successful connection.

This value can be overridden by RADIUS attribute Tunnel-Preference [83].

Options

number—Number that indicates the order in which the router attempts to connect to the destination. Zero is the highest level of preference.

- **Range:** 0 through 2000
- **Default:** 2000

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

preferred

IN THIS SECTION

- Syntax | 13579
- Hierarchy Level | 13580
- Description | 13580
- Default | 13580
- Required Privilege Level | 13580
- Release Information | 13580

Syntax

```
preferred;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family address address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family  family address address]
```

Description

Configure this address to be the preferred address on the interface. If you configure more than one address on the same subnet, the preferred source address is chosen by default as the source address when you initiate frame transfers to destinations on the subnet.

NOTE: The `edit logical-systems` hierarchy is not available on QFabric systems.

Default

The lowest-numbered address on the subnet is the preferred address.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Syntax

```
preferred-ciphers (custom | medium | strong | weak);
```

Hierarchy Level

```
[edit services ssl proxy profile profile-name ]
[edit services ssl termination profile profile-name ]
[edit services ssl initiation profile profile-name]
```

Description

Select preferred ciphers. Preferred ciphers allow you to define an SSL cipher that can be used with acceptable key strength. Ciphers are divided in three categories depending on their key strength: strong, medium, or weak.

Custom ciphers allow you to define your own cipher list. If you do not want to use one of the three categories, you can select ciphers from each of the categories to form a custom cipher set. To configure custom ciphers, you must set `preferred-ciphers` to `custom`.

Options

- `custom`—Configure custom cipher suite and order of preference.

- `medium`—Use ciphers with key strength of 128 bits or greater.
- `strong`—Use ciphers with key strength of 168 bits or greater.
- `weak`—Use ciphers with key strength of 40 bits or greater.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10.

[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet6 dhcpv6-client prefix-delegating]
[edit tenants tenant-name interfaces interface-name unit logical-unit-number family inet6 dhcpv6-client prefix-delegating]
```

Description

Allows you to configure DHCPv6 client preferred prefix length. If preferred-prefix-length is configured, the DHCPv6 client checks the prefix length in the ADVERTISE packet and if the check fails, a sysolg is created.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30 and in Junos OS Release 15.1X49-D100.

The `logical-systems` and `tenants` options are introduced in Junos OS Release 18.4R1.

RELATED DOCUMENTATION

sub-prefix-length | 29785

preferred-source-address

IN THIS SECTION

Syntax | 13587

- Hierarchy Level | 13587
- Description | 13587
- Options | 13588
- Required Privilege Level | 13588
- Release Information | 13588

Syntax

```
preferred-source-address address;
```

Hierarchy Level

```
[edit dynamic-profiles interfaces interface-name unit logical-unit-number family family unnumbered-
address interface-name],
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family family]
```

Description

For unnumbered Ethernet interfaces configured with a loopback interface as the donor interface, specify one of the loopback interface's secondary addresses as the preferred source address for the unnumbered Ethernet interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. To configure the preferred source address dynamically, instead of using this statement, you must include the `$junos-preferred-source-address` predefined variable for IPv4 (family inet) addresses or the `$junos-preferred-source-ipv6-address` predefined variable for IPv6 (family inet6) addresses.

Configuration of a preferred source address for unnumbered Ethernet interfaces is supported for IPv4 and IPv6 address families.

NOTE: When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the `$junos-routing-instance` predefined variable, you must not configure a preferred source address, whether with the `$junos-preferred-source-address` predefined variable, the `$junos-preferred-source-ipv6-address` predefined variable, or the

preferred-source-address statement. Configuring the preferred source address in this circumstance causes a commit failure.

Options

address—Secondary IP address of the donor loopback interface. Alternatively, use the `$junos-preferred-source-address` or the `$junos-preferred-source-ipv6-address` predefined variable to dynamically apply a preferred source address to the unnumbered Ethernet interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Support for the `$junos-preferred-source-address` and `$junos-preferred-source-ipv6-address` predefined variables introduced in Junos OS Release 9.6.

Syntax

```
prefix {
    host-name;
    logical-system-name;
    routing-instance-name;
}
```

Hierarchy Level

For platforms with enhanced Layer 2 software (ELS):

```
[edit vlans forwarding-options dhcp-security option-82 circuit-id]
```

For platforms without ELS:

```
[edit ethernet-switching-options secure-access-port vlan (all | vlan-name) dhcp-option82 circuit-id],
[edit forwarding-options helpers bootp dhcp-option82 circuit-id],
[edit forwarding-options helpers bootp interface interface-name dhcp-option82 circuit-id]
```

For MX Series platforms:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security option-82 circuit-id]
```

Description

Configure an optional prefix for the circuit ID suboption in the DHCP option 82 information that is inserted by the switch or router into the packet header of a DHCP request before it forwards or relays the request to a DHCP server.

Default

If the `prefix` statement is not explicitly specified, no prefix is prepended to the circuit ID.

Options

host-name Add router host name to DHCP option 82 circuit ID.

logical-system-name Add logical system name to DHCP option-82 circuit ID.

This option is not used for the `prefix` statement at any of the above hierarchy levels.

routing-instance-name Add routing instance name to DHCP option-82 circuit ID.

This option is not used for the `prefix` statement occurring at the following hierarchy levels:

- [edit bridge-domains *bridge-domain-name* forwarding-options dhcp-security option-82circuit-id]
- Any of the hierarchy levels for the platforms without ELS

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Hierarchy level [edit vlans *vlan-name* forwarding-options dhcp-security option-82 circuit-id] introduced in Junos OS Release 13.2X50-D10. (See Using the Enhanced Layer 2 Software CLI for information about ELS.)

[edit forwarding-options dhcp-relay group group-name relay-option-82 (circuit-id | remote-id)],
[edit logical-systems logical-system-name ... forwarding-options dhcp-relay dhcpv6 (relay-agent-
interface-id | relay-agent-remote-id)],
[edit logical-systems logical-system-name ... forwarding-options dhcp-relay ... relay-option-82
(circuit-id | remote-id)],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay dhcpv6  (relay-agent-
interface-id | relay-agent-remote-id)],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ... relay-option-82
(circuit-id | remote-id)]
```

Description

Add a prefix to the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or to the DHCPv6 option 18 (Relay Agent Interface-ID) or option 37 (Relay Agent Remote-ID) information in DHCP packets that DHCP relay agent sends to a DHCP server. The prefix can consist of any combination of the hostname, logical system name, and routing instance name.

Options

prefix—Any of the following:

- `host-name`—Prepend the hostname of the router configured with the `host-name` statement at the `[edit system]` hierarchy level to the DHCP option information.
- `logical-system-name`—Prepend the name of the logical system to the option information.
- `routing-instance-name`—Prepend the name of the routing instance to the option information.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

Support at the `[edit ... dhcpv6]` hierarchy levels introduced in Junos OS Release 11.4.

Support at the `[edit ... relay-agent-remote-id]` and `[edit ... remote-id]` hierarchy levels introduced in Junos OS Release 14.1.

- Description | 13597
- Default | 13597
- Options | 13597

Required Privilege Level | 13598
Release Information | 13598

Syntax

```
prefix {
    host-name;
    logical-system-name;
    routing-instance-name;
    vlan-id;
    vlan-name;
}
```

Hierarchy Level

```
[edit vlans forwarding-options dhcp-security dhcpv6-options option-18]
[edit vlans forwarding-options dhcp-security dhcpv6-options option-37]
```

Description

Configure a prefix for DHCPv6 option 18 (Interface ID) or option 37 (Remote ID). When configured, the prefix is inserted into DHCPv6 packets during the DHCPv6 snooping process.

Default

If the `prefix` statement is not explicitly specified, no prefix is inserted in DHCPv6 packets.

Options

host-name	Add the host name of the switch to DHCPv6 options.
logical-system-name	Add the logical system name to the DHCPv6 options.
routing-instance-name	Add the routing instance name to the DHCPv6 options.

`vlan-id`	Add the VLAN ID to the DHCPv6 options.
`vlan-name`	Add the VLAN name to the DHCPv6 options.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53-D10.

[edit ethernet-switching-options secure-access-port vlan (all | vlan-name) dhcp-
option82                 remote-id],
[edit forwarding-options helpers bootp dhcp-option82 remote-id],
[edit forwarding-options helpers bootp interface interface-name dhcp-option82 remote-id]
```

Description

Configure an optional prefix for the remote ID suboption in the DHCP option 82 information that is inserted by the switch into the packet header of a DHCP request before it forwards or relays the request to a DHCP server.

Default

If **prefix** is not explicitly specified, no prefix is appended to the remote ID.

Options

hostname—Name of the host system (the switch) that is forwarding or relaying the DHCP request from the DHCP client to the DHCP server.

mac—MAC address of the host system (the switch) that is forwarding or relaying the DHCP request from the DHCP client to the DHCP server.

none—No prefix is applied to the remote ID.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

prefix (Security Static NAT)

IN THIS SECTION

- Syntax | 13603
- Hierarchy Level | 13603
- Description | 13603
- Options | 13604
- Required Privilege Level | 13604
- Release Information | 13604

Syntax

```
prefix {
    address-prefix;
    mapped-port lower-port-range to upper-port-range;
    routing-instance (routing-instance-name| default);
}
```

Hierarchy Level

```
[edit security nat static rule-set rule-set-name rule rule-name then static-nat]
```

Description

Specify a static IP address prefix.

> **NOTE**: If you use the *inet* option for translation of IPv6 to IPv4 addresses (and vice versa), you do not need to specify a prefix because the *inet* option automatically strips the first 96 most significant bits from the 128-bit IPv6 address.

Options

- *address-prefix*—Specify address prefix.
- mapped-port *lower-port-range* to *upper-port-range*—Specify a destination port or port range to allow static NAT to map ports.
- routing-instance —Specify routing instance type:
  - *routing-instance-name*—Use the user-defined static NAT routing instance to perform static NAT.
  - default—Use the default routing-instance.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.6.

multicast (routing-options) | **11523**

prefix-65-127-disable

IN THIS SECTION

- Syntax | **13606**
- Hierarchy Level | **13606**
- Description | **13606**
- Options | **13608**
- Required Privilege Level | **13608**
- Release Information | **13608**

Syntax

```
prefix-65-127-disable;
```

Hierarchy Level

```
[edit chassis forwarding-options lpm-profile]
```

Description

For the Unified Forwarding Table (UFT) feature, specify not to allocate any memory for IPv6 prefixes with lengths in the range /65 through /127 for longest-prefix-match (LPM) entries. Doing so increases the memory available for LPM entries for IPv4 unicast prefixes and IPv6 prefixes with lengths equal to or less than 64. The maximum default value for LPM entries is 16,000 IPv6 prefixes of all lengths.

In an environment where the switch is being used in the core of the network, for example, it might not need to store IPv6 prefixes with lengths in the range /65 through /127. IPv6 prefixes of this type are not typically used in the core.

NOTE: When using this statement, IPv6 prefixes within the range /65 through /127 will still appear in the routing table, but will *not* be installed in the forwarding table; therefore, matching traffic will be dropped. Note further that if a default route is configured, traffic will be forwarded, though it will be sent through the RE and rate-limited.

NOTE: On QFX5100 switches, when you configure this statement, the maximum number of LPM IPv6 entries with prefix lengths equal to or less than 64 increases to 128,000. On the QFX5200 switch, when you configure this statement, the maximum number of IPv6 entries with prefix lengths equal to or less 64 that are allocated in the LPM table increases to 98,0000.

NOTE: This statement is supported only with the `lpm-profile`. No other profile is supported.

The effects of this statement can be seen on a QFX5100 as follows:

```
[edit]
user@host# set chassis forwarding-options lpm-profile prefix-65-127-disable

[edit]
user@host# commit
configuration check succeeds

Syntax

```
prefix-attribute-flags [node-segment-flag | external-prefix-flag]
```

Hierarchy Level

```
[edit policy-options policy-statement <policy-name> then]
```

Description

When the prefix attribute flags CLI is configured, the originating router will include the prefix attributes sub TLV.

Options

Set when the prefix `node-segment-flag` identifies the advertising router,that is when the prefix is a host prefix advertising a globally reachable address typically associated with a loopback address.

Set if the prefix `external-prefix-flag` has been redistributed from another protocol. This includes the case where multiple IS-IS instances are configured and the source of the redistributed prefix is another IS-IS instance. The flag MUST be preserved when leaked between levels.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.4R1.

prefix-export-limit (Protocols IS-IS)

IN THIS SECTION

- Syntax | 13613

- Required Privilege Level | 13614
- Release Information | 13615

Syntax

```
prefix-export-limit number;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis level level-number],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis
level level-number],
[edit protocols isis level level-number],
[edit routing-instances routing-instance-name protocols isis level level-number]
```

Description

Configure a limit to the number of prefixes exported into IS-IS.

By default, there is no limit to the number of prefixes that can be exported into IS-IS. To configure a limit to the number of prefixes that can be exported into IS-IS, include the `prefix-export-limit` statement. The `prefix-export-limit` statement protects the rest of the network from a malicious policy by applying a threshold filter for exported routes.

The number of prefixes depends on the size of your network. Good design advice is to set it to double the total number of IS-IS Level 1 and Level 2 routing devices in your network.

If the number of prefixes exported into IS-IS exceeds the configured limit, the overload bit is set and the overload state is reached. When other routers detect that this bit is set, they do not use this routing device for transit traffic, but they do use it for packets destined to the overloaded routing device's directly connected networks and IP prefixes. The overload state can be cleared by using the `clear isis overload` command.

The `show isis overview` command displays the prefix export limit when it is configured.

You can prevent IS-IS from enterning the overload state even after the prefixes reach the configured limit, by using the `no-overload-on-prefix-export-limit` command.

Options

number—Prefix limit.

- **Range:** 0 through 4,294,967,295 (2^{32} – 1)
- **Default:** None

family (inet | inet6) (any | flow |  labeled-unicast | multicast | unicast)]
```

Description

Limit the number of prefixes received on a BGP peer session and a rate-limit logging when injected prefixes exceed a set limit.

This functionality is identical to the `accepted-prefix-limit` functionality except that it operates against received prefixes rather than accepted prefixes.

Options

`maximum` *`number`*

When you set the maximum number of prefixes, a message is logged when that number is exceeded.

- **Range:** 1 through 4,294,967,295 (2^{32} – 1)

`teardown` *`<percentage>`*

(Optional) If you include the `teardown` statement, the session is torn down when the maximum number of prefixes is reached. If you specify a percentage, messages are logged when the number of prefixes exceeds that percentage. After the session is torn down, it is reestablished in a short time unless you include the `idle-timeout` statement. Then the session can be kept down for a specified amount of time, or forever. If you specify `forever`, the session is reestablished only after you issue a `clear bgp neighbor` command.

If the `teardown` statement is not configured, a message is logged when the number of prefixes exceeds the value configured for the `maximum` option.

- **Range:** 1 through 100

`idle-timeout (forever |` *`timeout-in-minutes`*`)`

(Optional) If you include the `idle-timeout` statement, the session is torn down for a specified amount of time, or forever. If you specify a period of time, the session is allowed to reestablish after this timeout period. If you specify `forever`, the session is reestablished only after you intervene with a `clear bgp neighbor` command.

- **Range:** 1 through 2400

`drop-excess` *`<percentage>`*

(Optional) If you include the `drop-excess` *`<percentage>`* option, the excess routes are dropped when the maximum number of prefixes is reached. If you specify a percentage, the routes are logged when the number of prefixes exceeds that percentage value of the maximum number.

`hide-excess` *`<percentage>`*

(Optional) If you include the `hide-excess` *`<percentage>`* option, the excess routes are hidden when the maximum number of prefixes is reached. If you specify a percentage, the routes are logged when the number of prefixes exceeds that percentage value of the maximum number. If the percentage is modified, the routes are re-evaluated

automatically. If the active routes drop below the specified percentage, those routes are kept as hidden.

To recover the routes from the hidden state, run the following commands to refresh the routes and get a complete re-evaluation of the routes:

`clear bgp table <table-name>` and `clear bgp neighbor <neighbor address> soft-inbound`

NOTE: You can include either the `teardown <percentage>`, `drop-excess <percentage>`, or `hide-excess <percentage>` statement option one at a time.

Understanding Multiprotocol BGP

show bgp neighbor | 17887

prefix-list (Junos Telemetry Interface)

IN THIS SECTION

- Syntax | 13621
- Hierarchy Level | 13621
- Description | 13622
- Options | 13622
- Required Privilege Level | 13622
- Release Information | 13622

Syntax

```
prefix-list {
    table table-name {
        family {
            inet {
                prefix [ prefix ... ];
            }
            inet6 {
                prefix [ prefix ... ];
            }
        }
    }
}
```

Hierarchy Level

```
[edit system fib-streaming]
```

Description

Enable specific prefix addresses to be periodically streamed from the target (source) to a collector. Only interfaces with those prefixes and their corresponding next-hop and next-hop group containers are exported to the IP OpenConfig Abstract Forwarding Table (oc-aft) collector. Reducing the set of interfaces to only those with prefixes of interest decreases the overall CPU and resource usage on Routing Engines, FPCs, and MPCs.

Export data from your source (target) to a collector using the sensor **/network-instances/network-instance/afts/**. When using prefix-filter mode, we recommend you use streaming subscription mode at a sampling frequency of 5 minutes or more and that all collectors have the same sampling frequency. If you are using non-prefix-filter mode, we recommend you use ON_CHANGE subscription mode. You can also export data using User Datagram Protocol (UDP).

Options

table-name	A forwarding information base (FIB) table.
prefix	An IPv4 (`inet`) or IPv6 `inet6` address prefix.

Required Privilege Level

edit

Release Information

Statement introduced in Junos OS 24.2R1 for MX2020 routers.

Syntax

```
prefix-list-name prefix-list-name;
```

Hierarchy Level

```
[edit forwarding-options access-security router-advertisement-guard policy policy-name discard
(forwarding-options)],
[edit forwarding-options access-security router-advertisement-guard policy policy-name accept (Router
Advertisement Guard Policy) match-list]
```

Description

Configure a list of IPv6 address prefixes for an IPv6 Router Advertisement (RA) guard policy. The policy is used to validate the source IPv6 address prefix of an incoming RA message against the IPv6 address prefixes in this list. RA guard protects against rogue RA messages generated either maliciously or unintentionally by unauthorized or improperly configured routers connecting to the network segment. An RA guard policy is used to validate incoming RA messages on the basis of whether they match the conditions defined in the policy.

You can use a list of IPv6 address prefixes for validating RA messages as part of either an accept policy or a discard policy. Before you can include a list in an RA guard policy, you must configure the list name at the [`edit policy-options prefix-list`] hierarchy level. When RA guard is enabled by using an accept

policy, any RA messages that match the conditions defined in the policy are forwarded, and RA messages that do not match the conditions are dropped. When RA guard is enabled by using a discard policy, any RA messages that match the conditions are dropped, and RA messages that do not match the conditions are forwarded.

Options

prefix-list-name Configure a list of IPv6 address prefixes for an RA guard policy. The policy is used to validate the source of an incoming RA message by comparing the IPv6 address prefix of the RA message to the IPv6 address prefixes contained in the list.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

- Description | 13631
- Caveats | 13634
- Default | 13634
- Required Privilege Level | 13634
- Release Information | 13634

Syntax

```
prefix-scale-mode
```

Hierarchy Level

```
[edit firewall family <inet/inet6> filter <filter-name>]
```

Description

Allows you to configure significantly higher number of prefixes, of upto 225,000 prefixes per term, and in total up to 1 million prefixes (IPv4), 512,000 prefixes (IPv6 64-bit), 256,000 prefixes (IPv6 128-bit) as match conditions in an ingress firewall filter. Without this configuration, the scale is limited to a total of 128,000 prefixes by default. You can apply this configuration to a firewall filter that is bound to a physical interface or logical interface. Note that `prefix-scale-mode` is only applicable to upto 256 terms.

The following table enumerates supported firewall filter features for the `prefix-scale-mode` configuration command.

Table 114: Supported Firewall Filter Features for `prefix-scale-mode`

Firewall Filter Feature	Supported
Interface specific firewall filter	Yes
Incremental update	Yes
Filter chaining	No
Non-incremental update	Yes
Scale mode	Yes
Input-List	Yes
Split filters	Partly. Only the first split will be considered for processing at scale.
Filter on tunnel transport header (non-terminated)	Yes
Filter on tunnel payload header (non-terminated)	Yes
Filter on tunnel transport header (terminated)	No
Filter on tunnel payload header (terminated)	Yes
Two pass filters	Yes
Transient filters	Yes
Rollback on error	Yes

Table 114: Supported Firewall Filter Features for `prefix-scale-mode` *(Continued)*

Firewall Filter Feature	Supported
Loopback attachment	No
Egress filters	No

The following table enumerates the combinations of the allowed configurations for tunnel terminated traffic of L2 and L3 firewall filters. L2 firewall filters are applied at the physical interface and logical interface. L3 firewall filters are applied on VRFs and routing instances. In the following table, `prefix-scale-mode` filter refers to a firewall filter that has been applied the `prefix-scale-mode` configuration. Regular filter refers to a firewall filter that has not been applied the `prefix-scale-mode` configuration. Note that not all unsupported configurations is enforced by the CLI.

Table 115: Supported Configuration Combinations for Tunnel Terminated Traffic

L2 firewall filters	L3 firewall filters	Supported
Regular filter	Regular filter	Yes
`prefix-scale-mode` filter	Regular filter	Match on transport header not supported
`prefix-scale-mode` filter	Regular filter	Match on payload not supported
Regular filter	`prefix-scale-mode` filter	Match on transport header not supported
Regular filter	`prefix-scale-mode` filter	Match on payload not supported
`prefix-scale-mode` filter	`prefix-scale-mode` filter	Match on transport header not supported

Caveats

Not supported on egress, loopback, IRB, FFT, and L3 firewall filters. `prefix-scale-mode` is supported only on IPv4 and IPv6 firewall filters.

Default

128,000 prefixes

Required Privilege Level

interface—To view this statement in the configuration.

[edit policy-options policy-statement policy-name term term-name from],
[edit policy-options policy-statement polic-name term term-name then],
[edit protocols ospf source-packet-routing]
```

Description

Configure prefix segment attributes such as index and node segment. Prefix segment index is the index assigned to a specific prefix. This is used by all other remote routers in the network to index the prefix into respective segment routing global blocks (SRGB) to derive the segment identifier and to forward the traffic destined for the current prefix. Prefix segment index is provisioned through policy for each prefix along with the option to mark it as a node segment.

Indicate route which is evaluating against policy must have prefix-segment information associated with it. If route has prefix-segment information associated with it, policy action results in Policy Accept, if not, policy action is Policy Reject. Once policy action result in Policy Accept after evaluating from clause, action specified in the then clause is applied to the matching route.

algorithm *name*

Specify the prefix segment attributes for strict/flex algorithm.

- **Range:** 1 through 255

index *index*

Specify the prefix segment index

- **Range:** 0 through 1048575

node-segment

Set node segment flag for this prefix segment.

reuse-allocated-sid

Specify this option if a large number of prefixes need to be assigned SID value. You can reuse the allocated SID on the IGP route only if they are available during export of IGP routes.

`redistribute`

Enable prefix-sid redistribution between BGP and ISIS through policy configuration without specifying index under prefix-segment.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2.

Statement introduced under `[edit protocols ospf source-packet-routing]` hierarchy in Junos OS Release 19.1R1 for MX Series.

`reuse-allocated-sid` option introduced in Junos OS Release 20.4R1.

`redistribute` option introduced in Junos OS Release 22.2R1.

```

```
    }
}
```

Hierarchy Level

```
[edit security remote-access compliance]
```

Description

The statement defines Juniper Secure Connect remote-access prelogon compliance policies. You associate a single compliance rule object per remote-access connection profile. This means, a remote-access connection profile can have one associated compliance policy. The Juniper Secure Connect application sends details to the SRX Series Firewall. The device performs prelogon compliance checks. Based on the prelogon compliance rule match, action is taken to accept or reject a connection.

You can create multiple prelogon compliance policies and each policy can contain multiple term rules. The term rules are a set of individual rules containing match conditions and their actions based on the compliance parameters listed in the options below. You can associate a single compliance rule object per remote-access connection profile.

Evaluation Criteria

For every connection request, SRX Series Firewall processes each rule as follows –

1. SRX Series Firewall evaluates the term rules in the order they appear in the configuration.
2. If there is no match in the current term rule, it evaluates the next term rule.
3. Based on the match, it takes an action.
4. When there is no action specified, the default action for a match rule is `reject`.
5. When no further term rule is specified for an unmatched rule, the default action is `reject`
6. When no compliance rule is attached to the profile, the default action is `accept`.

Based on this evaluation criteria, the administrator defines rules.

Options

pre-logon Define pre-login compliance rule; specify the compliance rule *name*.

- Values:
  - Format: String beginning with a number or letter and consisting of letters, numbers, dashes and underscores.
  - Range: Supports up to 255 prelogon compliance rules.

term Define compliance rule term; specify the term rule *name*.

- Values:
  - Format: Must be a string beginning with a number or letter and consisting of letters, numbers, dashes and underscores.
  - Range—Supports up to 10 term rules per compliance rule.

action Specify the action based on the rule match.

- Values:
  - `accept`—To approve the request.
  - `reject`—To reject the request. This is the default action for an unmatched rule when no further term rule is specified.
  - Default: When no action is specified, the default action is `reject`.

match Specify rules to match.

platform Specify rule to match OS and Client information for the specified OS.

- Values:
  - `android`—Specify Android version and app-version.
  - `ios`—Specify iOS version and app-version.
  - `ipados`—Specify iPados version and app-version.
  - `macos`—Specify macOS version and app-version.
  - `windows`—Specify Windows OS version and app-version.

app-version Match remote access client version with the specified operational values.

- Values:
  - `equal`—Perform operation 'equal'.
  - `greater-than`—Perform operation 'greater-than'.
  - `greater-than-or-equal`—Perform operation 'greater-than-or-equal'.
  - `less-than`—Perform operation 'less-than'.
  - `less-than-or-equal`—Perform operation 'less-than-or-equal.

os-version Match operating system version with the specified operational values.

- Values:
  - `equal`—Perform operation 'equal'.
  - `greater-than`—Perform operation 'greater-than'.
  - `greater-than-or-equal`—Perform operation 'greater-than-or-equal'.
  - `less-than`—Perform operation 'less-than'.
  - `less-than-or-equal`—Perform operation 'less-than-or-equal.

version Specify version.

- Values:
  - `app-version` supports numeric and . (period) characters.
  - `os-version` supports alphanumeric and . (period) characters.
- Range:
  - `app-version` supports up to 16 entries per term rule.
  - `os-version` supports up to 16 entries per term rule.

deviceid Specify set of device IDs.

- Values:
  - Supports alphanumeric, +, /, and = characters.

This is a list of values.

- Range:
  - Supports up to 1024 entries per term.

hostnames

Specify set of host names.

- Values:
  - Supports alphanumeric, - and _ characters.

    This is a list of values.
- Range:
  - Supports up to 1024 entries per term rule.

ms-domain

Specify set of domain names.

- Values:
  - Supports alphanumeric, - and _ characters.

    This is a list of values.
- Range:
  - Supports up to 16 entries per term rule.

ms-workgroup

Specify set of work groups.

- Values:
  - Supports alphanumeric, - and _ characters.

    This is a list of values.
- Range:
  - Supports up to 16 entries per term rule.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

preprovisioned (MX Series Virtual Chassis)

IN THIS SECTION

- Syntax | **13652**
- Hierarchy Level | **13652**
- Description | **13652**

Required Privilege Level | 13652
Release Information | 13652

Syntax

```
preprovisioned;
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

Enable creation of a Virtual Chassis by means of a preprovisioned configuration.

To configure a Virtual Chassis consisting of MX Series routers, you must create a preprovisioned configuration on the primary router in the Virtual Chassis by specifying the serial number, member ID, and role for each router (member chassis) in the Virtual Chassis. When a new member router joins the Virtual Chassis, its serial number is compared against the values specified in the preprovisioned configuration. If the serial number of a joining router does not match any of the configured serial numbers, the software prevents that router from becoming a member of the Virtual Chassis.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

preserve-fpc-poweron-sequence

IN THIS SECTION

- Syntax | 13655
- Hierarchy Level | 13655
- Description | 13655
- Required Privilege Level | 13655
- Release Information | 13655

Syntax

```
preserve-fpc-poweron-sequence;
```

Hierarchy Level

```
[edit chassis]
```

Description

Preserve the sequence in which the line cards—specifically, MPCs on MX series routers—on a router or switch are powered on when the device is restarted. During a system reboot, the line cards are brought online in the sequence specified in the system log file **/var/log/fpc_poweron_seq.log**. When a line card goes offline, its entry is removed from the log file. You can use the `show chassis poweron sequencs` command to view the configured power-on sequence.

NOTE:

- If both `preserve-fpc-poweron-sequence` and `fru-poweron-sequence` statements are configured, then the power-on sequence specified in the `fru-poweron-sequence` statement takes precedence.
- If `preserve-fpc-poweron-sequence` is configured and `fru-poweron-sequence` not configured, then the line cards are powered on in the sequence preserved in the system log file **/var/log/ fpc_poweron_seq.log**.
- If neither of these statements is configured, then the line cards are powered on in the ascending order of their slot numbers. Line cards whose slot numbers are not specified in the log file are powered on in the ascending order of their slot numbers.

Required Privilege Level

chassis—To view this statement in the configuration.

chassis-control—To add this statement to the configuration.

Understanding How Dynamic Power Management Enables Better Utilization of Power

preserve-incoming-fragment-size

IN THIS SECTION

- Syntax | 13656
- Hierarchy Level | 13656
- Description | 13656
- Required Privilege Level | 13657
- Release Information | 13657

Syntax

```
preserve-incoming-fragment-size;
```

Hierarchy Level

```
[edit security flow] ]
```

Description

Enable the preserve incoming fragment size feature that allows the SRX Series Firewall to preserve the size of incoming fragments to be used in determining the best maximum transmission unit (MTU) size for the egress interface.

When data is sent from one host to another, it is transmitted as a series of packets. Performance is improved and network resources are conserved when packets of the largest size can transit the path from the source node to the destination node without being fragmented at any link in the datapath.

If application-layer services are configured on the SRX Series Firewall, packet fragments at the ingress interface must be reassembled before the services can be applied and the content inspected. These reassembled packet fragments must be broken down again before the data is transmitted out the egress interface.

When a packet must be fragmented into smaller packets to transit a link in the path because the packet is larger than the MTU size established for that link, each of the resulting fragments must contain packet header information, in addition to the payload, or data. The increased overhead can lower throughput and degrade network performance. Also, the packet fragments must be reassembled at the destination node, which consumes additional network resources.

By default, the SRX Series Firewall uses the MTU size configured for the egress interface to determine the size for the packet fragments it transmits. However, if you enable the preserve incoming fragment size feature, the SRX Series Firewall detects and saves the size of incoming packet fragments and takes that into account. To diminish the likelihood of packet fragmentation in the datapath, the SRX Series Firewall sets the egress interface MTU size to the smaller of two values: It identifies the maximum size of all incoming fragments and it compares that size to the existing MTU size of the egress interface. The SRX Series Firewall takes the smaller number and uses it for the egress interface MTU size.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D100.

- Release Information | 13659

Syntax

```
preserve-interface;
```

Hierarchy Level

```
[edit interfaces interface-name sonet-options aps]
```

Description

Provide link PIC replication, providing MLPPP link redundancy at the port level. This feature is supported with SONET APS and the following link PICs:

- Channelized OC3 IQ PIC
- Channelized OC12 IQ PIC
- Channelized STM1 IQ PIC

Link PIC replication provides the ability to add two sets of links, one from the active SONET PIC and the other from the standby SONET PIC, to the same bundle. If the active SONET PIC fails, links from the standby PIC are used without triggering link renegotiation. All the negotiated state is replicated from the active links to the standby links to prevent link renegotiation.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

preserve-nexthop-hierarchy (SRv6 TE)

IN THIS SECTION

- Syntax | 13659
- Hierarchy Level | 13659
- Description | 13660
- Options | 13660
- Required Privilege Level | 13660
- Release Information | 13660

Syntax

```
preserve-nexthop-hierarchy {
                  (sr-mpls | srv6);
}
```

Hierarchy Level

```
[edit protocols source-packet-routing]
```

Description

Enable preserve-nexthop hierarchy support for source packet routing. When you enable `preserve-nexthop-hierarchy`, SRv6 TE transport is populated correctly so that service resolution is performed properly. The `preserve-nexthop-hierarchy` statement at the `[edit protocols source-packet-routing]` hierarchy level is a prerequisite for configuring SR-TE SRv6 tunnels. However, if you enable the global configuration statement `set routing-options resolution preserve-nexthop-hierarchy`, then `preserve-nexthop-hierarchy` statement at the `[edit protocols source-packet-routing]` is not mandatory. Additionally, you have an option to enable the `preserve-nexthop-hierarchy` only for a certain data plane for transports populated by SR-TE. The following options when enabled disable the `preserve-nexthop-hierarchy` for that data plane.

Options

sr-mpls Disable preserve-nexthop-hierarchy for sr-mpls.

srv6 Disable preserve-nexthop-hierarchy for srv6.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.3R1.

```
primary;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family]
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family  family]
```

Description

Configure the primary interface for a device. By default, the multicast-capable interface with the lowest-index address is chosen as the primary interface. If there is no such interface, the point-to-point interface with the lowest-index address is chosen. Otherwise, any interface with an address can be picked. In practice, this means that, on the device, the **fxp0** or **em0** interface is picked by default. To configure a different interface to be the primary interface, you include this statement.

The *primary interface* for the router has the following characteristics:

- It is the interface through which the packets go out when you type a command such as ping 255.255.255.255—that is, a command that does not include an interface name (there is no interface ***type*-0/0/0.0** qualifier) and where the destination address does not imply any particular outgoing interface.
- It is the interface on which multicast applications running locally on the router, such as Session Announcement Protocol (SAP), perform group joins by default.
- It is the interface from which the default local address is derived for packets sourced out of an unnumbered interface if there are no non-127 addresses configured on the loopback interface, lo0.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Configuring Primary and Secondary LSPs

primary (Virtual Tunnel in Routing Instances)

IN THIS SECTION

- Syntax | 13672
- Hierarchy Level | 13672
- Description | 13672
- Default | 13673
- Required Privilege Level | 13673
- Release Information | 13673

Syntax

```
primary;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name interface vt-
fpc/pic/port.unit-number],
[edit routing-instances routing-instance-name interface vt-fpc/pic/port.unit-number]
```

Description

In a multiprotocol BGP (MBGP) multicast VPN (MVPN), configure the virtual tunnel (VT) interface to be used as the primary interface for multicast traffic.

Junos OS supports up to eight VT interfaces configured for multicast in a routing instance to provide redundancy for MBGP (next-generation) MVPNs. This support is for RSVP point-to-multipoint provider tunnels as well as multicast Label Distribution Protocol (MLDP) provider tunnels. This feature works for extranets as well.

This statement allows you to configure one of the VT interfaces to be the primary interface, which is always used if it is operational. If a VT interface is configured as the primary, it becomes the nexthop that is used for traffic coming in from the core on the label-switched path (LSP) into the routing instance.

When a VT interface is configured to be primary and the VT interface is used for both unicast and multicast traffic, only the multicast traffic is affected.

If no VT interface is configured to be the primary or if the primary VT interface is unusable, one of the usable configured VT interfaces is chosen to be the nexthop that is used for traffic coming in from the core on the LSP into the routing instance. If the VT interface in use goes down for any reason, another usable configured VT interface in the routing instance is chosen. When the VT interface in use changes, all multicast routes in the instance also switch their reverse-path forwarding (RPF) interface to the new VT interface to allow the traffic to be received.

To realize the full benefit of redundancy, we recommend that when you configure multiple VT interfaces, at least one of the VT interfaces be on a different Tunnel PIC from the other VT interfaces. However, Junos OS does not enforce this.

Default

If you omit this statement, Junos OS chooses a VT interface to be the active interface for multicast traffic.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

    address address;
    ca-profile ca-profile;
    client-id client-id;
    client-secret client-secret;
    interface interface-name;
    routing-instance routing-instance -name;
    source source-address;
}
```

Hierarchy Level

```
[edit services user-identification identity-management connection]
```

Description

Configure parameters that the SRX Series Firewall uses to connect to the Juniper Identity Management Service (JIMS) primary server and authenticate to it to obtain an access token. JIMS requires that the SRX Series Firewall use OAuth2 to authenticate to it before the SRX Series Firewall can query the JIMS server for user identity information. The SRX Series Firewall must provide the JIMS server with credentials, including a client ID and a client secret. If the client is authenticated-in this case the SRX Series Firewall—it is granted an access token. (See RFC 6749.) Both the client ID and the client secret must be consistent with the API client configured on the JIMS primary server.

In addition to configuring the client ID and the client secret, you configure the filename of the JIMS's ca-certificate. The certificate enables the SRX Series Firewall to verify the identity of JIMS and that it is trusted for the SSL connection.

If the deployment configuration consists of more than one JIMS server, a primary and secondary relationship is established. The SRX Series Firewall always attempts to connect to the primary server. When one or more queries to the primary server fails, the system falls back to the secondary server.

address- Configure the IP address for the primary Juniper Identity Management Service (JIMS) server. The SRX Series Firewall requires the server IP address to connect to the server to obtain an access code that allows it to query the server for user identity information. The IP address is configured as part of a collection of information which includes the SRX Series Firewall's client ID, client secret, and ca-certificate information.

The SRX Series Firewall sends a unique set of identification information to the primary server and the secondary server. The feature supports only IPV4 addresses.

client-id- Client ID that the SRX Series provides to the JIMS primary server as part of its authentication to it. The SRX Series Firewall must authenticate to the server to obtain an access token that allows the SRX Series Firewall to query the server for user identity information The client ID must be consistent with the API client configured on the JIMS primary server.

client-secret- Client secret that the SRX Series provides to the JIMS primary server as part of its authentication to it. The client secret must be consistent with the API client configured on the JIMS primary server.

WARNING: Before you use this feature, you must disable any other actively used options under the [edit services user-identification] hierarchy. You cannot commit this configuration if active directory authentication and the ClearPass query and webapi functions are configured and committed.

Options

address	IP address of the primary server.
ca-profile	CA profile name
client-id	Client ID for OAuth2 grant
client-secret	Client secret for OAuth2 grant

primary-data-record-fields

IN THIS SECTION

- Syntax | 13681
- Hierarchy Level | 13681
- Description | 13681
- Default | 13682
- Options | 13682
- Additional Information | 13683
- Required Privilege Level | 13684
- Release Information | 13684

Syntax

```
primary-data-record-fields {
   name;
}
```

Hierarchy Level

```
[edit services inline-monitoring template template-name]
```

Description

Configure which IPFIX information elements (IEs) to include in the primary data record, which is exported by the data path and contains the specific properties seen by the data path, either from the sampled packet or the packet notification header or context. With this statement, each inline-monitoring instance can export IPFIX packets using a different, customized data template, resulting in a custom set of IEs in the IPFIX packets for each instance. The fields are encoded using one or more Common Properties IDs. As per RFC 5473, the primary data record is exported using the IPFIX data template.

Default

datalink-frame-section—Datalink Frame Section (IE 315) is always included in the primary data record.

IEs 10, 14, 61, and 312 are included in the primary data record when the `export-by-asic` and the `primary-data-fields` statements are not configured.

For the PTX10002-36QDD router, to configure fields in the primary data record, use the `export-by-asic` statement instead. Fields configured using the `primary-data-record-fields` statement are ignored. The system reports IEs as listed in IE fields reported when you configure the export-by-asic statement on page 6977.

Options

name Configure which IPFIX information elements (IEs) to include in the primary data record. Per RFC 5102, the Common Properties ID (CPID) is an identifier of a set of common properties that is locally unique per observation domain and transport session.

- cpid-state-byte—(Junos OS Evolved only) CPID State Byte (IE 137)
- auxiliary_egnh_id—(Junos OS Evolved only) Auxiliary Egress Nexthop ID

- Release Information | 13687

Syntax

```
primary-interface interface-name;
```

Hierarchy Level

```
[edit interfaces asix aggregated-inline-services-options]
```

Description

Specify the primary (active) inline services member link in the asi bundle. You must also configure a secondary (backup) member link on a different MPC with the `secondary-interface` statement. The secondary member provides 1:1 redundancy for subscriber service sessions on the primary member link. The bandwidth configured at the `[edit chassis fpc slot pic number inline-services bandwidth]` hierarchy level must be the same for both member links.

Redundancy is not achievable if you configure the primary and secondary interface on the same MPC, because both member interfaces go down if the card goes down. Consequently, if you configure both interfaces on the same MPC, the subsequent configuration commit fails.

Options

interface-name	Name of an inline services physical interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

Syntax

```
primary-vlan vlan-name;
```

Hierarchy Level

```
[edit vlans vlan-name]
```

Description

For a private VLAN (PVLAN), configure the primary VLAN. The primary VLAN is always tagged.

- If the PVLAN is configured on a single switch, do not assign a tag to the community VLANs.
- If the PVLAN is configured to span multiple switches, you must assign tags to the community VLANs also.

For a community VLAN, configure the primary VLAN. The primary VLAN must be tagged, and the community VLAN must be untagged.

If you want to create a community VLAN, you must configure the primary VLAN to be private using the "pvlan" on page 14428 statement.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type **?** after **vlan** or **vlans** in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

 prioritization {
          high-priority-inline;
          policy [policy-stanza];
}
```

Hierarchy Level

```
[edit logical-systems logical -system-name protocols bgp multipath],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols bgp
multipath],
[edit routing-instances routing-instance-name protocols bgp multipath]
```

Description

Prioritization in multipath BGP involves selecting and load-sharing traffic across multiple equal-cost BGP paths, including both EBGP and IBGP routes. Prioritization can be used to prioritize critical routes in BGP multipath computations with low-, medium-, and high-priority queues. Doing so reduces multipath-calculation latency for operator-prioritized routes in overall route convergence during high load. You can manage delayed Forwarding Information Base (FIB) convergence that results from frequent routing changes.

Options

high-priority-inline Routes that have high priority, either from route prioritization, or overridden using multipath priority policy, will have their equal-cost multipath computed immediately rather than being subject queueing for service.

policy A policy block is used to override the multipath priority queue behavior without affecting the existing route prioritization. If the policy does not have an explicit terminating action, the system defaults to using the medium priority level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Syntax

```
priority (priority-level | $junos-cos-scheduler-priority);
```

Hierarchy Level

```
[edit dynamic-profiles profile-name class-of-service schedulers scheduler-name]
```

Description

Specify packet-scheduling priority value in a dynamic profile.

Options

priority-level—one of the following packet-scheduling priority values:

- `low`—Scheduler has low priority.
- `medium-low`—Scheduler has medium-low priority.
- `medium-high`—Scheduler has medium-high priority.
- `high`—Scheduler has high priority. Assigning high priority to a queue prevents the queue from being underserved.
- `strict-high`—Scheduler has strictly high priority. Configure a `high` priority queue with unlimited transmission bandwidth available to it. As long as it has traffic to send, the `strict-high` priority queue receives precedence over `low`, `medium-low`, and `medium-high` priority queues, but not `high` priority queues. You can configure `strict-high` priority on only one queue per interface.

`$junos-cos-scheduler-priority`—Junos predefined variable that is replaced with the packet-scheduling priority value obtained from the RADIUS server when a subscriber authenticates over the interface to which the dynamic profile is attached.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

The `$junos-cos-scheduler-priority` predefined variable introduced in Junos OS Release 9.4.

Description

Sets the global or interface-specific priority value associated with the switch FCF-MAC. CNAs use the priority value to determine the switch with which they will perform FIP FLOGI. The lower the value, the higher the priority. The switch advertises this value to the server ENodes on the FCoE network. A priority value set at the interface level overrides the global setting.

Options

priority —Value that determines the FCF an ENode selects to perform FIP FLOGI. The lower the priority number, the higher the priority of the FCF.

- **Range:** 0 through 255
- **Default:** 128

Required Privilege Level

storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

priority (Management Traffic)

IN THIS SECTION

- Syntax | 13711
- Hierarchy Level | 13711
- Description | 13711
- Required Privilege Level | 13712
- Release Information | 13712

Syntax

```
priority (low | medium | high)
```

Hierarchy Level

```
[edit system management-traffic protocol protocol-name
```

Description

You can prioritize the internal traffic between the Routing Engine and the Packet Forwarding Engine or other Routing Engine based on the packet classification. This enhancement increases the internal and management traffic performance and provides better packet processing. In addition, this enhancement can introduce more operational commands which provide easily interpretable outputs for debugging packet path issues in the Routing Engine.

Before Junos OS Release 22.4R1, all internal traffic is considered as high priority. Starting in Junos OS Release 22.4R1, the applications in Packet Forwarding Engine and peer Routing Engine can change priority of a traffic using DSCP marking. Different platforms can use this packet prioritization feature based on their deployment scenarios and needs.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 22.4R1.

[edit routing-instances instance-name protocols pim rp bidirectional address address],
[edit routing-instances routing-instance-name protocols pim rp local family (inet | inet6)]
```

Description

For PIM-SM, configure this routing device's priority for becoming an RP.

For bidirectional PIM, configure this RP address' priority for becoming an RP.

The bootstrap router uses this field when selecting the list of candidate rendezvous points to send in the bootstrap message. A smaller number increases the likelihood that the routing device or RP address becomes the RP. A priority value of 0 means that bootstrap router can override the group range being advertised by the candidate RP.

Options

number—Priority for becoming an RP. A lower value corresponds to a higher priority.

- **Range:** 0 through 255
- **Default:** 1

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for bidirectional RP addresses introduced in Junos OS Release 12.1.

priority (PoE)

IN THIS SECTION

- Syntax | 13717
- Hierarchy Level | 13717
- Description | 13717
- Default | 13718
- Options | 13718
- Required Privilege Level | 13718
- Release Information | 13718

Syntax

```
priority (high | low);
```

Hierarchy Level

```
[edit poe interface (all | interface-name)]
```

Description

Sets the priority of individual ports. When it is not possible to maintain power to all connected ports, lower-priority ports are powered off before higher priority ports. When a new device is connected on a higher-priority port, a lower-priority port will be powered off automatically if available power is insufficient to power on the higher-priority port. Note that for ports with the same priority configuration, ports on the left are given higher priority than the ports on the right.

Default

low

Options

value—high or low:

- `high`—Specify that this port is to be treated as high priority in terms of power allocation
- `low`—Specify that this port is to be treated as low priority in terms of power allocation.

Required Privilege Level

```

Description

Sets the priority for route installation. You can choose a relative priority of `high`, `low` , or `medium` to ensure that high priority IGP and LDP routes are updated in the FIB (forwarding table) before medium and low priority routes. Routes are placed in different priority queues according to the priority. Any routes that are not explicitly assigned a priority are treated as medium priority. Within the same priority level, routes will continue to be updated in lexicographic order.

Options

high—Set priority to high.

low—Set priority to low.

medium—Set priority to medium.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Syntax

```
priority (low | high);
```

Hierarchy Level

```
[edit poe interface (interface-name | all | all-extended)]
```

Description

Set the power priority for individual interfaces when there is insufficient power for all PoE interfaces. If the switch needs to shut down powered devices because PoE demand exceeds the PoE budget, low-priority devices are shut down before high-priority devices. Among interfaces that have the same assigned priority, priority is determined by port number, with lower-numbered ports having higher priority.

Default

`low`

Options

`high`—Specifies that this interface is to be treated as high-priority in terms of power allocation. If the switch needs to shut down powered devices because PoE demand exceeds the PoE budget, power is not shut down on this interface until it has been shut down on all the low-priority interfaces.

`low`—Specifies that this interface is to be treated as low-priority in terms of power allocation. If the switch needs to shut down powered devices because PoE demand exceeds the PoE budget, power is shut down on this interface before it is shut down on high-priority interfaces.

Required Privilege Level

[edit logical-systems logical-system-name  interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
```

Description

Configure a Virtual Router Redundancy Protocol (VRRP) device's priority for becoming the primary default device. The device with the highest priority within the group becomes the primary. VRRP is designed to eliminate the single point of failure inherent in the static default routed environment. VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP routers on a LAN. The VRRP router controlling the IP address(es) associated with a virtual router is called the Primary, and forwards packets sent to these IP addresses. The election process provides dynamic fail-over in the forwarding responsibility when the Primary become unavailable. Any of the virtual router's IP addresses on a LAN can then be used as the default first hop router by end-hosts. The advantage gained from using VRRP is a higher availability default path without requiring configuration of dynamic routing or router discovery protocols on every end-host.

Options

priority Device's priority for being elected to be the primary device in the VRRP group. A larger value indicates a higher priority for being elected.

- **Range:** 0 through 255
- **Default:** 100. If two or more devices have the highest priority in the VRRP group, the device with the VRRP interface that has the highest IP address becomes the primary, and the others serve as backups.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

priority (Redundant Power System)

IN THIS SECTION

Syntax | 13734

Hierarchy Level | 13734

- Description | 13734
- Required Privilege Level | 13735
- Release Information | 13735

Syntax

```
priority (0|1|2|3|4|5|6);
```

Hierarchy Level

```
[edit redundant-power-system member]
[edit redundant-power-system member member-number]
```

Description

Configure the backup of any switch connected to the Redundant Power System (RPS) using the CLI on each switch. The determines the order in which the RPS supplies backup power to the switches connected to the RPS. 6 is the highest priority and 1 is lowest. Zero means off or no RPS backup.

If the switch is not reconfigured from the CLI, the default priority is 1. In this case, priority is determined by connector location with the rightmost connector having the highest priority.

For switches that can only be used as standalone switches, this hierarchy level is used for configuration:

```
[edit redundant-power-system]
```

For switches that can be used either as standalone switches or configured in a Virtual Chassis, this hierarchy level is used for configuration:

```
[edit redundant-power-system member vc-member-number]
```

If two or more connections are assigned the same , then the power of each connection is determined based on its switch connector port location, with the rightmost port receiving power first.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Release Information

priority (Schedulers)

IN THIS SECTION

- Syntax | 13735
- Hierarchy Level | 13735
- Description | 13735
- Options | 13736
- Required Privilege Level | 13736
- Release Information | 13736
- Platform-Specific Behavior | 13737

Syntax

```
priority priority-level;
```

Hierarchy Level

```
[edit class-of-service schedulers scheduler-name]
```

Description

Specify the packet-scheduling priority value.

Options

NOTE: Available options can vary by platform and software release.

priority-level can be one of the following:

- `low`—Scheduler has low priority.
- `low-medium`—Scheduler has low-medium priority.
- `low-high`—Scheduler has low-high priority.
- `medium-low`—Scheduler has medium-low priority.
- `medium-high`—Scheduler has medium-high priority.
- `high`—Scheduler has high priority. Assigning high priority to a queue prevents the queue from being underserved.
- `strict-high`—Scheduler has strictly high priority. Configure a `high` priority queue with unlimited transmission bandwidth available to it. As long as it has traffic to send, the `strict-high` priority queue receives precedence over `low`, `medium-low`, and `medium-high` priority queues, but not `high` priority queues. You can configure `strict-high` priority on only one queue per interface.
- `low-latency`—Scheduler has low latency queuing (LLQ) priority. LLQ enables delay-sensitive data to have preferential treatment over other traffic. A queue configured as a low latency queue has the highest priority over any other priority queues, including `strict-high` queues.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`low-latency` support introduced for Junos OS Evolved Release 23.4R1.

`low-high` and `low-medium`support introduced for Junos OS Evolved Release 24.4R1.

Platform-Specific Behavior

Use Feature Explorer to confirm platform and release support for scheduling priority.

Use the following table to review platform-specific behavior for your platforms:

Platform	Platform-specific Behavior
ACX5048 and ACX5096 routers	• ACX5048 and ACX5096 routers support CIR among strict-priority queues. There is no implicit queue number-based priority among the strict-priority queues. • ACX5048 and ACX5096 routers support configuring drop profiles for loss-priority `low`, `medium-high`, and `high` for non-TCP protocols as well.
ACX7000	• ACX7000 routers support multiple queues with the same priority. • ACX7000 Series routers support all eight levels of priority for port scheduling and six levels for HCoS scheduling (all except `low-medium` and `low-high`). • ACX7000 Series routers do not guarantee round-robin distribution between queues of the same priority. • You can configure `trasmit-rate` only on low priority queues.
EX4400	On EX4400 switches, applying strict-high priority schedulers to queues 0 through 3 also applies strict-high priority to queues 8 through 11. Therefore, Juniper recommends applying strict-high priority schedulers only to queues 4 through 7.

(Continued)

Platform	Platform-specific Behavior
EX4600 and QFX5100	On QFX5100 and EX4600 switches, you can configure only one queue as a strict-high priority queue. We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. A shaping rate (shaper) sets the maximum amount of bandwidth a queue can consume. (Unlike using the transmit rate on a QFX10000 switch to limit traffic that receives strict-high priority treatment, traffic that exceeds the shaping rate is dropped, and is not treated as best-effort traffic that shares in excess bandwidth.) If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.
QFX10000	On QFX10000 switches, you can configure as many strict-high priority queues as you want. On QFX10000 switches, we strongly recommend that you apply a transmit rate to strict-high priority queues to prevent them from starving other queues. A transmit rate configured on a strict-high priority queue limits the amount of traffic that receives strict-high priority treatment to the amount or percentage set by the transmit rate.

Configuring Schedulers for Priority Scheduling

priority1

IN THIS SECTION

- Syntax | 13739
- Hierarchy Level | 13739
- Description | 13739
- Options | 13740
- Required Privilege Level | 13740
- Release Information | 13740

Syntax

```
priority1 priority1-value;
```

Hierarchy Level

```
[edit protocols ptp]
```

Description

Configure the priority as one of the following:

- In the timeReceiver, the priority value is set to select the best timeTransmitter clock. Note that in order to select a particular timeTransmitter clock, the priority value in the timeTransmitter clock's announce message must be equal to or lower than the configured *priority1-value*.
- In the timeTransmitter, the priority value is set to represent itself in the announce message to other timeReceiver clocks.
- In the boundary node, the timeReceiver uses this value to determine the best timeTransmitter clock, whereas the timeTransmitter uses this value from the announce message of the selected timeTransmitter clock.

Note that the lower value takes precedence.

Options

priority1-value—The priority value of the clock.

- **Range:** 0 through 255
- **Default:** 128

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

priority2

IN THIS SECTION

- Syntax | 13741
- Hierarchy Level | 13741
- Description | 13741
- Options | 13741
- Required Privilege Level | 13741
- Release Information | 13741

Syntax

```
priority2 priority2-value;
```

Hierarchy Level

```
[edit protocols ptp]
```

Description

Configure the `priority2` value. This value is used to differentiate and prioritize the timeTransmitter clocks to avoid confusion when the *`priority1-value`* is the same for different timeTransmitter clocks in a network.

Note that the lower value takes precedence.

Options

`priority2-value`—The priority value of the clock.

- **Range:** 0 through 255
- **Default:** 128

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Syntax

```
priority number;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group
group-id],
[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-
group group-id]
```

Description

Configure a switch's priority for becoming the primary default routing platform. The routing platform with the highest priority within the group becomes the primary.

Options

number—Routing platform's priority for being elected to be the primary router in the VRRP group. A larger value indicates a higher priority for being elected.

- **Range:** 1 through 255
- **Default:** 100 (for backup routers)

> **NOTE**: Priority 255 cannot be assigned to routed VLAN interfaces (RVIs).

Required Privilege Level

interface—To view this statement in the configuration.

[edit logical-systems logical-system-name  interfaces interface-name unit logical-unit-number
family inet6 address address vrrp-inet6-group group-id track interface interface-name]
```

Description

Configure a Virtual Router Redundancy Protocol (VRRP) router's priority cost for becoming the primary default router. The router with the highest priority within the group becomes the primary.

Options

priority—The value subtracted from the configured VRRP priority when the tracked interface or route is down to force a new primary router election. The sum of all the costs for all interfaces or routes that are tracked must be less than or equal to the configured priority of the VRRP group.

- **Range:** 1 through 254

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

priority-flow-control

IN THIS SECTION

- Syntax | 13745
- Hierarchy Level | 13745
- Description | 13745
- Options | 13746
- Required Privilege Level | 13746
- Release Information | 13746

Syntax

```
priority-flow-control {
    no-auto-negotiation;
}
```

Hierarchy Level

```
[edit protocols dcbx interface (all | interface-name)]
```

Description

Disable auto-negotiation of priority-based flow control (PFC) on one or more Ethernet interfaces.

DCBX controls the operational state of PFC on each interfaces where PFC is enabled by configuration. Auto-negotiation enables PFC on an interface only if the switch and the peer device connected to the switch both support PFC and have the same PFC configuration. DCBX exchanges PFC feature capability and provisioning information with the peer and enables PFC only if the peer is capable and provisioned

to support PFC. Disabling auto-negotiation on an interface forces the interface to use the PFC state (enabled or disabled) that is configured on the switch by the configuration and assignment of the congestion notification profile.

Options

`no-auto-negotiation`—Disable automatic negotiation of PFC.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Statement introduced in Junos OS Release 10.0.

priority-hold-time

IN THIS SECTION

- Syntax | 13748
- Hierarchy Level | 13748
- Description | 13749
- Options | 13749
- Required Privilege Level | 13749
- Release Information | 13749

Syntax

```
priority-hold-time seconds;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id track],
[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id track],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id track],
[edit logical-systems logical-system-name  interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id track]
```

Description

Configure a Virtual Router Redundancy Protocol (VRRP) router's priority hold time to define the minimum length of time that must elapse between dynamic priority changes. If the dynamic priority changes because of a tracking event, the priority hold timer begins running. If another tracking event or manual configuration change occurs while the timer is running, the new dynamic priority update is postponed until the timer expires.

> **NOTE**: When the track feature is configured, and if VRRP should pre-empt due to the tracking interface or route transition, any configured pre-empt hold time will be ignored. VRRP primary will pre-empt according to the configuration of the priority-hold time.

Options

seconds—Minimum length of time that must elapse between dynamic priority changes.

- **Range:** 0through 3600 seconds

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

priority-override (Event Policy)

IN THIS SECTION

- Syntax | 13750
- Hierarchy Level | 13750
- Description | 13750
- Required Privilege Level | 13750
- Release Information | 13751

Syntax

```
priority-override {
    facility facility-type;
    severity severity-level;
}
```

Hierarchy Level

```
[edit event-options policy policy-name then]
```

Description

Configure an event policy to override the default system log priority of the triggering event so that the system logs the event with a different facility type, severity level, or both. If you configure multiple event policies to override the priority of the same event, the event is logged based on the priority set by the last executed event policy to change it.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

[edit snmp v3 usm remote-engine engine-id user username privacy-aes128],
[edit snmp v3 usm remote-engine engine-id user username privacy-des]
```

Description

Configure a privacy key for the SNMPv3 user, if you know it. The encrypted version of a password is known as a key.

Options

privacy-key The encrypted version from the cleartext password. It is an alternative to entering a password.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

privacy-none

IN THIS SECTION

- Syntax | 13755
- Hierarchy Level | 13755

[edit snmp v3 usm remote-engine engine-id user username privacy-aes128],
[edit snmp v3 usm remote-engine engine-id user username privacy-des]
```

Description

Configure a privacy password for the SNMPv3 user.

Options

privacy-password—Password that a user enters. The password is then converted into a key that is used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

private-vlan

IN THIS SECTION

- Syntax | 13757
- Hierarchy Level | 13757
- Description | 13758
- Options | 13758
- Required Privilege Level | 13758
- Release Information | 13758

Syntax

```
private-vlan (isolated | community) vlan-id number;
```

Hierarchy Level

```
[edit vlans vlan-name]
```

Description

Configure a secondary VLAN (either an isolated VLAN or a community VLAN) within a private VLAN (PVLAN) and specify a VLAN ID for that secondary VLAN. This statement essentially converts a VLAN into a PVLAN, by carving out discrete subdomains (secondary VLANs) within the primary VLAN. You must specify a VLAN ID for each secondary PVLAN.

> **NOTE**: After you have configured the secondary VLAN, you must also configure its association with a specific primary VLAN. See "isolated-vlan" on page 9816 and "community-vlan" on page 4713 for additional information.

Options

- `isolated`—The VLAN specified by *vlan-name* is defined as an *isolated* VLAN and a VLAN-ID is assigned to it. An isolated VLAN receives packets only from the primary VLAN and forwards frames upstream to the primary VLAN. The VLAN name is optional. The VLAN ID is required.
- `community`—The VLAN specified by *vlan-name* is defined as community VLAN and a VLAN-ID is assigned to it. A *community* VLAN used to transport frames among members of a community, which is a subset of users within the VLAN, and to forward frames upstream to the primary VLAN. The VLAN name is optional. The VLAN ID is required.

Required Privilege Level

system—To view this statement in the configuration.

system–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53-D10.

proactive-arp-detection

IN THIS SECTION

- Syntax | 13759
- Hierarchy Level | 13759
- Description | 13759
- Default | 13759
- Required Privilege Level | 13760
- Release Information | 13760

Syntax

```
proactive-arp-detection;
```

Hierarchy Level

```
[edit system arp]
```

Description

Enable proactive ARP detection to check the reachability of connected devices (within an IP subnet range) on a specified interface. After enabling this statement, you can set the ARP configurations at the interface level by the setting the: `host-discovery` *`address-range`*, `ageing-time-out` *`seconds`*, and `discovery-time-interval` *`seconds`* options at the [edit interfaces *interface-name* family inet address *ip-address*] hierarchy level. Likewise, you can delete the ARP configuration settings by using the `delete interfaces` *`interface-name`* `unit` *`unit`* family inet address *ip-address* host-discovery *address-range* command.

Default

This configuration statement is disabled by default.

Required Privilege Level

admin

Release Information

probe (ICMP Router Discovery)

IN THIS SECTION

- Syntax | 13760
- Description | 13761
- Options | 13761
- Required Privilege Level | 13762
- Output Fields | 13762
- Sample Output | 13763
- Release Information | 13765

Syntax

```
probe <proxy-ip-address-or-hostname>
<by-address>
<by-index>
<by-name>
<by-remote-address>
<count>
<detail>
<inet>
<inet6>
<interface>
<interval>
<logical-system>
```

```
<routing-instance>
<source>
<tos>
<ttl>
<wait>
```

Description

Query the status of the probed interface.

Options

by-address	(Optional) Probe a local interface by address.
by-index	(Optional) Probe a local interface by index.
by-name	(Optional) Probe a local interface by name.
by-remote-address	(Optional) Probe a remote interface by remote address.
count	(Optional) Specify the number of probe requests or packets sent out. • **Range:** 1 through 255
detail	(Optional) Display details of the incoming interface of the received packet.
inet	(Optional) Force probe to IPv4 network family destination.
inet6	(Optional) Force probe to IPv6 network family destination.
interface *interface-name*	(Optional) Specify the source interface to send the probe requests.
interval *seconds*	(Optional) Specify the time interval between the probe requests. • **Default:** 1 second
logical-system *logical-system-name*	(Optional) Specify the name of the logical system used to send the probe requests.
routing-instance *routing-instance-name*	(Optional) Specify the routing instance for the probe attempt.
source *source-address*	(Optional) Specify the source IP address of the probing interface.

tos ***type-of-service***

(Optional) Specify the type-of-service (ToS) field in the IP header of the probe packets.

- **Range:** 0 through 255

ttl ***value***

(Optional) Specify the time-to-live (TTL) value for IPv4 packets and hop-limit value for IPv6 packets for the number of hops/devices to cross.

- **Range:** 0 through 255

wait ***seconds***

(Optional) Specify the maximum wait time in seconds after the final packet is sent. If this option is not specified, the default delay is 10 seconds.

- **Default:** 10 seconds

Required Privilege Level

system-To view this statement in the configuration.

Output Fields

Table 1 lists the output fields for the `probe` command. The output fields are listed in the appropriate order in which they appear.

Table 118: probe Output Fields

Field Name	Field Description	Level of Output
`icmp-seq`	ICMP sequence number of the proxy IP address.	All levels
`ttl`	Time to live value (maximum IPv6 hop-limit-value) of the packets sent—0 to 255.	none
`code`	ICMP code values where—0 indicates No Error, 1 indicates Malformed Query, 2 indicates No Such Interface, 3 indicates No Such Table Entry, and 4 indicates Multiple Interfaces Satisfy Query.	All levels
`state`	State values are—0 indicates Reserved, 1 indicates Incomplete, 2 indicates Reachable, 3 indicates Stale, 4 indicates Delay, 5 indicates Probe, and 6 indicates Failed.	All levels

Table 118: probe Output Fields *(Continued)*

Field Name	Field Description	Level of Output
active	Inactive/active state (0 indicates inactive state and 1 indicates active state) of the IPv4 or IPv6 address configured.	All levels
IPv4	Unconfigured/configured state (0 indicates unconfigured and 1 indicates configured state) of IPv4 address.	All levels
IPv6	Unconfigured/configured state (0 indicates unconfigured and 1 indicates configured state) of IPv6 address.	All levels
time	Time taken time taken to receive the reply after the request is transmitted in milliseconds (ms).	All levels
hlim	Hop limit to the destination.	detail

```

Description

Specify the packet and protocol contents of a probe.

Options

type—One of the following probe type values:

- `http-get`—(Not available at the `[edit services rpm bgp]` hierarchy level for Junos OS.) Sends a Hypertext Transfer Protocol (HTTP) get request to a target URL. For Junos OS Evolved, you must set the `offload-type` statement to `none` to configure this probe type.
- `http-metadata-get`—(Not available at the `[edit services rpm bgp]` hierarchy level for Junos OS.) Sends an HTTP get request for metadata to a target URL. For Junos OS Evolved, you must set the `offload-type` statement to `none` to configure this probe type.
- `icmp-ping`—Sends ICMP echo requests to a target address.
- `icmp-ping-timestamp`—Sends ICMP timestamp requests to a target address.
- `tcp-ping`—Sends TCP packets to a target. For Junos OS Evolved, you must set the `offload-type` statement to `none` to configure this probe type.
- `udp-ping`—(Junos OS only) Sends UDP packets to a target.
- `udp-ping-timestamp`—Sends UDP timestamp requests to a target address.

process (Memory)

IN THIS SECTION

- Syntax | 13778
- Hierarchy Level | 13779
- Description | 13779
- Options | 13779
- Required Privilege Level | 13779
- Release Information | 13779

Syntax

```
process {
    frequency (minutes | hours | days) value;
    minor-event {
        threshold process name memory-limit value ;
        action snmp-trap;
    }
    major-event {
        threshold process name memory-limit value ;
        action [snmp-trap | live-core | (terminate-process| terminate-process-force)];
    }
    critical-event {
        threshold process name memory-limit value ;
        action [snmp-trap | live-core | (terminate-process| terminate-process-force)];
    }
}
```

Hierarchy Level

```
[edit system monitor memory]
```

Description

Configure process level memory monitoring. you can specify user-configurable thresholds for monitoring the Virtual Memory Size (VSZ) of processes. Events are categorized based on severity, depending on the detected anomaly. The system classifies event severity as Minor, Major, or Critical.

The system uses an algorithm to identify the processes that are likely to exceed the specified thresholds, reducing false alarm triggers. The algorithm evaluates the memory conditions by comparing the free_count and cache_count against predefined target and user-configurable thresholds.

The remaining statements are explained separately.

Options

frequency Specify the frequency of system level memory monitoring. You can specify the frequency in days, hours or minutes. Possible values: 1 through 65535.

minor-event Indicates a non-critical event that, if left unchecked, may cause an interruption in service or degradation in performance but does not significantly affect the device.

major-event Indicates an event that, if left unchecked, may result in significant loss of service or interruption of traffic.

critical-event Indicates an event that, if left unchecked, may result in serious loss of service or interruption of traffic. In case a critical event is triggered, you can terminate the process but only if the device is running out of memory.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.1.

process-non-null-as-null-register

IN THIS SECTION

- Syntax | 13784
- Hierarchy Level | 13784
- Description | 13784
- Required Privilege Level | 13785
- Release Information | 13785

Syntax

```
process-non-null-as-null-register;
```

Hierarchy Level

```
[edit protocols pim rp local]
```

Description

When `process-non-null-as-null-register` is enabled on a PTX device serving as PIM Rendezvous Point (RP) for multicast traffic, it allows the device to treat non-null registers, such as may be sent from any first hop router (FHR), as null registers, and thus to form a register state with the device. This statement is required when RP is enabled on PTX devices running Junos OS Evolved.

NOTE: Currently supported PTX devices include PTX10003, PTX10004, PTX10008, PTX10016, and PTX10001-36MR.

More Information

In typical operation, for PIM any-source multicast (ASM), all *,G PIM joins travel hop-by-hop towards the RP, where they ultimately end. When the FHR receives its first traffic, it forms a register state with the RP in the network for the corresponding S,G. It does this by sending a PIM non-null register to form a multicast route with the downstream encapsulation interface. The RP decapsulates the non-null register and forms a multicast route with the upstream decapsulation device. In this way, multicast data traffic flows across the encapsulation/decapsulation tunnel interface, from the FHR to the RP, to all the downstream receivers until the RP has formed the S,G multicast tree in the direction of the source.

Without `process-non-null-as-null-register` enabled, for PIM ASM, PTX devices can only act as a PIM transit router or last hop router. These devices can receive a PIM join from downstream interfaces and propagate the joins towards the RP, or they can receive an IGMP/MLD join and propagate it towards a PIM RP, but they cannot act as a PIM RP itself. Nor can they form a register state machine with the PIM FHR in the network.

> **NOTE**: When you enable `process-non-null-as-null-register` on a PTX device, an initial drop in traffic is observed while the multicast tree is setup from the PIM RP to the FHR.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure which Junos OS processes are running on the router or switch.

CAUTION: Never disable any of the software processes unless instructed to do so by a customer support engineer.

Default

All processes are enabled by default.

Options

all-processes *option*	(Junos OS Evolved only) Apply a configured setting to all processes that support that setting.
(enable | disable)	(Optional) Enable or disable a specified process.
failover (alternate-media | other-routing-engine)	(Optional) For routers or switches with redundant Routing Engines only, switch to backup media if a process fails repeatedly. If a process fails four times within 30 seconds, the router or switch reboots from the alternate media or the other Routing Engine.

no-livecore-dump-on-crash

(Junos OS Evolved only) For related processes, do not collect a live core for the given process when its related process generates a core file. Starting in Junos OS Evolved Release 24.4R1, the system, by default, generates a live core for a process when its related process stops responding and generates a core file.

You can configure this statement for an individual process, or you can configure it under the `all-processes` hierarchy level to apply the setting to all processes that support this feature, which include:

- bfdd and bfddagent
- cfmd and cfmd-agent
- dot1xd and dot1xd-agent
- l2ald and l2ald-agent
- l2cpd and l2cpd-agent
- mcsnoopd and mcsnoopd-agent
- ppmd and ppmdagent
- routing and rpdagent

process-name

One of the valid process names. You can obtain a complete list of process names by using the CLI command completion feature. After specifying a process name, command completion also indicates any additional options for that process.

timeout *seconds*

(Optional) How often the system checks the watchdog timer, in seconds. If the watchdog timer has not been checked in the specified number of seconds, the system reloads. If you set the time value too low, it is possible for the system to reboot immediately after it loads.

- **Values:** 15, 60, or 180
- **Default:** 180 seconds (rounded up to 291 seconds by the Junos kernel)

traceoptions

Configure tracing options for the given process.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`no-livecore-dump-on-crash` option added in Junos OS Evolved Release 24.4R1.

product-model (Junos Fusion)

IN THIS SECTION

- Syntax | 13789
- Hierarchy Level | 13789
- Description | 13790
- Options | 13790
- Required Privilege Level | 13790
- Release Information | 13790

Syntax

```
product-model model-name;
```

Hierarchy Level

```
[edit policy-options satellite-policies candidate-uplink-port-policy policy-name term term-name
from],
[edit policy-options satellite-policies forwarding-policy policy-name term term-name from]
```

Description

Define the satellite device product models that will use the candidate uplink port policy defined in the `from` statement.

The other statements in the same `from` statement are applied to satellite devices that match the `product-model` *`model-name`* definition. Those configuration statements are not applied to satellite devices that do not match the definition.

Options

model-name Defines the satellite device product models that will use the candidate uplink port policy. It can be a complete device model name, to match that device model exactly. You can also use the wildcard character (*) in the match term to match zero or more of any character.

Some examples of using the wildcard character in the match term:

- To apply the satellite policy to all EX4300 switches in the satellite device role, enter `EX4300*` as the *model-name*.
- To apply the satellite policy to all QFX5100 switches in the satellite device role, enter `QFX5100*` as the *model-name*.
- To apply the satellite policy to QFX5100 switches with model names that start with QFX5100-96, enter `QFX5100-96*` as the *model-name*.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2R3.

[edit access]
```

Description

Create a profile containing a set of attributes that define device management access.

Options

name	Profile name
accounting	Specifies the accounting options

address-assignment

Specify the address assignment pool

authentication-order

Order in which authentication mechanisms are used

- Values:
  - ldap—Light weight directory access protocol
  - none—No authentication performed
  - password—Locally configured password in access profile
  - radius—Remote authentication dial-in user service
  - s6a—S6a authentication
  - securid—RSA secure ID authentication

charging-service-list

List of used 3gpp charging services

- Values:
  - ocs—Online charging service

client

Entity requesting access

client-name-filter

Restrictions on client names authenticated on this server

domain-name-server

Default DNS server's IPv4 address

domain-name-server-inet

DNS server's IPv4 address

domain-name-server-inet6

DNS server's IPv6 address

jsrc

Set of JSRC configurations

ldap-options

Light weight directory access protocol options

ldap-server

Light weight directory access protocol server

preauthentication-order

Order in which pre authentication mechanisms are used

- Values:
  - radius—Remote Authentication Dial-In User Service

radius

Set of RADIUS configurations

radius-options	RADIUS options
radius-server	RADIUS server configuration
session-limit-per-username	Maximum number of sessions allowed per username • **Range:** 1 through 16
session-options	Options for an authenticated client's session
subscriber	Locally authenticated subscriber configuration
wins-server	Default WINS server's IPv4 address

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

`inet6-pool` option is introduced in Junos OS Release 20.3R1.

`none` option is introduced in Junos OS Release 20.3R1.

profile (Application Firewall)

IN THIS SECTION

- Syntax | 13798
- Hierarchy Level | 13798
- Description | 13798
- Options | 13799
- Required Privilege Level | 13799
- Release Information | 13799

Syntax

```
profile profile-name {
    block-message {
        type {
            custom-redirect-url {
                content content;
            }
            custom-text {
                content content;
            }
        }
    }
}
```

Hierarchy Level

```
[edit security application-firewall]
```

Description

Define the profile of the response to be issued when an application firewall rule set blocks HTTP or HTTPS traffic with a `deny` or `reject` action.

Although drop and reject actions are logged, application firewall does not notify users when either action is taken. To provide an explanation for the action or to redirect the users to an informative webpage, you can use the `block-message` option with the reject or deny action in an application firewall rule.

You can customize the redirect action by including additional text on the splash screen or by specifying a URL to which the user is redirected. To customize the block message, define the `type` and `content` in a block message profile defined in the rule set.

Starting in Junos OS Release 18.2R1, the application firewall (AppFW) functionality is deprecated. As a part of this change, the `[edit security application-firewall]` hierarchy and all the configuration options under this hierarchy are deprecated— rather than immediately removed—to provide backward compatibility and an opportunity to bring your configuration into compliance with the new configuration.

        destination-port destination-port;
```

```
    }
}
```

Hierarchy Level

```
[edit services captive-portal-content-delivery]
```

Description

Configure the service profile for HTTP redirect services, also known as Captive Portal and Content Delivery (CPCD) services. The profile contains rules or rule sets that specify the details of the service. The CPCD service profile is included in a service set that applies the service to a service interface. This statement is supported only for static CPCD; it is not supported for converged services CPCD.

Options

cpcd-rule-sets *rule-set-name*	Specify a list of sets of service rules.
cpcd-rules *rule-name*	Specify a service rule.
dynamic	Indicate that the service is a dynamic, converged service.
http-redirect-options *url*	Redirect the packets to the specified URL. The URL must begin with `http://` or `https://`.
ipda-rewrite-options *destination*	Rewrite the destination for the packets to send them to a remote HTTP redirect server. • `destination-address` *address*—IP address of the remote HTTP redirect server. • `destination-port` *number*—(Optional) Port number for the remote HTTP redirect server. Requires the destination address to be specified as well.

Required Privilege Level

services—To view this statement in the configuration.

services–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Support for Next Gen Services introduced in Junos OS Release 19.3R2.

profile (HTTP Header Enrichment)

IN THIS SECTION

- Syntax | 13808
- Hierarchy Level | 13808
- Description | 13808
- Options | 13808
- Required Privilege Level | 13809
- Release Information | 13809

Syntax

```
profile profile-name {
    tag rule rule-name;
}
```

Hierarchy Level

```
[edit services hcm]
```

Description

Configure an HCM profile, which points to one or more tag rules that Junos OS uses to enrich HTTP headers with the appropriate tags. You can configure a maximum of 100 HCM profiles.

For subscriber traffic under static policy control, a tag rule is used if it is included in the HCM profile specified in a PCC rule that the traffic matches. For subscribers under dynamic policy control, a message from the PCRF identifies the configured HCM profile and tag rules to use for HTTP header enrichment.

Options

profile-name	Name of the HCM profile.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

        tls-profile tls-profile;
    }
    timeout timeout;
}
```

Hierarchy Level

```
[edit services]
```

Description

Configure the ICAP redirect profile.

The ICAP server profile allows the ICAP server to process request messages, response messages, fallback options, and so on, for the permitted traffic.

When you configure an ICAP redirect service on SRX Series Firewalls, you must configure the ICAP redirect profile. The ICAP redirect profile defines the settings for ICAP server to process request messages, response messages, fallback options incase of a timeout, connectivity issues, too many requests, or other conditions.

This profile is applied to a security policy as an application service when the traffic is permitted by the security policy.

Options

profile *name* ICAP redirect profile name.

fallback-option Fallback options to specify the actions the device applies if the ICAP server is unavailable.

http Redirect request and redirect response for HTTP traffic.

- Values:
  - redirect-request—Enable the redirect service on HTTP request
  - redirect-response—Enable the redirect service on HTTP response

timeout Server response timeout in milliseconds. Timeout is the interval after which the server is considered inactive if there is no response from the server. A new incoming requests can bypass inactive status server.

- **Default:** 500
- **Range:** 100 through 50000

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.1 R1.

ICAP Service Redirect

profile (Juniper Secure Connect)

IN THIS SECTION

- Syntax | 13812
- Hierarchy Level | 13812
- Description | 13812
- Options | 13813
- Required Privilege Level | 13814
- Release Information | 13814

Syntax

```
profile realm-name {
    access-profile access-profile;
    client-config client-config;
    compliance {
        pre-logon compliance-rule;
    }
    description description;
    ipsec-vpn ipsec-vpn;
    options {
        multi-access;
        user-domain user-domain;
    }
}
```

Hierarchy Level

```
[edit security remote-access]
```

Description

Configure remote user connection profiles for the Juniper Secure Connect clients.

The remote access profiles allow you to deploy connection settings for the remote users by pushing the configuration file on the client devices. You can create multiple profiles and set one of the profiles as the default profile.

> **NOTE**: Starting in Junos OS Release 23.1R1, we've hidden the `default-profile` option at the [`edit security remote-access`] hierarchy level. In releases before Junos OS Release 23.1R1, you use this option to specify one of the remote-access profiles as the default profile in Juniper Secure Connect. But with changes to the format of remote-access profile names, we no longer require the `default-profile` option.
>
> We've deprecated `default-profile` option—rather than immediately removing it—to provide backward compatibility and a chance to make your existing configuration conform to the changed configuration. You'll receive a warning message if you continue to use the `default-profile` option in your configuration. However existing deployments are not affected if you modify the current configuration. See default-profile (Juniper Secure Connect).

Each remote access profile includes a *realm-name* mapping to a URL either in *FQDN/RealmName* or *FQDN* format, authentication settings, VPN settings, and client configurations. You can create different remote access profiles for different names or functions.

Example—You can create a configuration profile for the engineering department, and another for the human resource department. You name the profile for engineering department and human resource department as *ra.example.com/engineering* and *ra.example.com/hr* respectively.

When a Juniper Secure connect remote user selects a connection profile such as *ra.example.com/engineering*, the SRX Series Firewall receives the configuration request and selects a remote-access profile with same name —that is—*ra.example.com/engineering* for pushing the configuration on client device.

Options

realm-name

Set realm-name as remote-access profile name. This is the profile identifier in FQDN/RealmName format.

Examples:

ra.example.com/hr, if FQDN is *ra.example.com* and Realm name is *hr*.

ra.example.com/engineering, if FQDN is *ra.example.com* and Realm name is *engineering*.

ra.example.com, if FQDN is *ra.example.com* and Realm name is empty.

Specify an IP address if you do not have an *FQDN* (*192.168.1.10/hr* or *192.168.1.10)*.

access-profile Select the access profile for authentication and accounting for clients.

client-config Select the client configuration object.

compliance Select pre-logon compliance rule object name.

description Text description of the remote access profile.

ipsec-vpn Select the IPsec VPN policy object used for IKE and IPsec proposals.

multi-access Set to allow an user to connect from multiple devices.

user-domain (Optional) Specify a VPN user domain alias name.

When you associate an IPsec VPN object with two different remote access profiles, you must use the same domain alias name in those remote access profiles. You must not configure different domain alias names for the different remote access profiles that use the same IPsec VPN object.

Required Privilege Level

security

Release Information

Statement introduced in Junos OS Release 20.3R1.

`compliance` option added in Junos OS Release 23.1R1.

Realms format changed to FQDN/RealmName or FQDN in Junos OS Release 23.1R1.

`user-domain` option added in Junos OS Release 24.4R1.

profile (LRF)

IN THIS SECTION

- Syntax | 13815
- Hierarchy Level | 13816
- Description | 13816
- Options | 13816
- Required Privilege Level | 13816
- Release Information | 13816

Syntax

```
profile profile-name {
    collector collector-name {
        destination {
            address collector-address;
            port collector-port-number;
        }
        source-address source-address;
    }
    http-log-multiple-transactions;
    policy-based-logging;
    rule lrf-rule-name {
        then {
            report {
                collector collector-name;
                template template-name;
                time-limit time-interval;
                volume-limit volume;
            }
        }
    }
    template template-name {
        format ipfix;
        template-tx-interval tx-time;
        template-type template-type;
```

```
        trigger-type (session-close | time | volume);
    }
    vendor-support ibm;
}
```

Hierarchy Level

```
[edit services lrf]
```

Description

Configure an LRF profile to specify a set of logging and reporting parameters, which includes data templates, collectors, and LRF rules.

For Junos OS Subscriber Aware, you can then assign an LRF profile to a subscriber by assigning the profile to the TDF service set associated with the subscriber's TDF domain.

For Junos OS Broadband Subscriber Management, you can then assign the LRF profile to the service set that is configured for application-aware policy control.

Options

profile-name

Name of the LRF profile.

- **Range:** Up to 63 characters.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

vendor-support option introduced in Junos OS Release 17.2.

Support for Next Gen Services introduced in Junos OS Release 19.3R1 on MX Series.

profile (Rule Sets)

IN THIS SECTION

- Syntax | 13817
- Hierarchy Level | 13817
- Description | 13817
- Options | 13818
- Required Privilege Level | 13818
- Release Information | 13818

Syntax

```
profile profile-name;
```

Hierarchy Level

```
[edit security application-firewall rule-sets rule-set-name]
```

Description

Specifies the profile of the block message to be used for any deny or reject action in the rule set that specifies the `block-message` option.

The block-message option enables you to provide an explanation for the action or to redirect the client to an informative webpage. You can configure the block-message in `set security application-firewall profile` hierarchy.

Options

profile-name—Name of the block-message profile to be used for this rule set.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

    timeout hours;
    u-tunnel-validated;
    ue-group group-name;
}
```

Hierarchy Level

```
[edit security gtp]
```

Description

Use the profile option to create a profile for the GPRS tunneling protocol (GTP) feature. This profile includes all subsequent configuration options.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs gtp]` hierarchy level is replaced by `[edit security gtp]`.

Options

- `apn-control`–You can specify APN control profile using APN string. APN string consists of Network Identifier (NI) and Operator Identifier (OI). You can specify APN in the below formats:

  - <NI>: for example internet, internet.public

  - <NI>.<OI>: for example internet.mnc005.mcc244.gprs, internet.public.mnc005.mcc244.gprs

  APN string configuration supports wild card "*" in place of OI. You can specify APN as <NI>."*" and configure the matching APN string. You don't need to specify the OI when you configure APN using wild card "*".

  You can also use this configuration to group all the APNs with the same rate limiting requirements and apply the group to the GTP profile.

- `end-user-address-validated`—During the GTP-U security check procedure, IPv4 and IPv6 addresses for user equipment is checked against the end-user address stored in the user tunnel. Once the GTP-U packet is determined to match the user equipment address, the packet data unit (PDU) is parsed to obtain the user equipment address. Use the end-user-address-validated function to validate the IP address. By default, the UE address check is disabled, it will not check the IP address of GTP-U payload.

- `gtp-in-gtp-denied`—To enable the security device to detect and drop a GTP packet that contains another GTP packet in its message body.

- `handover-on-roaming-intf`—To enable the security device to receive context and forward relocation messages, inspect the packets, and to set up PDP contexts on the device.

- `u-tunnel-validated`—To specify GTP-U tunnel validation. When u-tunnel-validated is enabled, the GTP ALG checks whether the tunnel endpoint identifier (TEID) in the GTP-U packet matches the user tunnel in the tunnel table. If the user tunnel is not found, then the GTP-U packet is dropped. By default, the check is disabled.

- `must-ie-v1`—To check the presence of IEs that should be contained in a GTPv1 message. The device checks the presence of Must-IEs of specific GTP messages and forwards the messages only if Must-IEs are present.

- `must-ie-v2`—To check the presence of IEs that should be contained in a GTPv2 message. The device checks the presence of Must-IEs of specific GTP messages and forwards the messages only if Must-IEs are present.
- `remove-ie-v1`—To remove IEs of specific types from all messages for GTPv1. This helps to remove all instances of specified IEs such as supporting IE, Grouped IE, Embedded IE, or embedded grouped IE.
- `remove-ie-v2`—To remove IEs of specific types from all messages for GTPv2. This helps to remove all instances of specified IEs such as supporting IE, Grouped IE, Embedded IE, or embedded grouped IE.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0. The `restart-path` option added in Junos OS Release 11.4. New GPRS tunneling protocol (GTP) message types added in Junos OS Release 11.4. Support for GTPv2 added in Junos OS Release 11.4. Statement modified in Junos OS Release 15.1X49-D40.The `must-ie-v1`, `must-ie-v2`, `remove-ie-v1`, and `remove-ie-v2` options added in Junos OS Release 20.2R1.

[edit security log]
```

Description

Configure the security log profile to define the policy related log format including fields selection and fields order for the log. You can apply the log profile to a policy to get the log in a predefined format. Configure the stream and the log server to send the logs to the destination before configuring the profile. You can specify the log profile only for the policy related logs. After configuring the policy category, configure the field-name from the options that are available for the policy log per category. After you have selected the field name, select the field-extra name from the available options. You can apply the profile on the policy related logs mentioned in the Table 119 on page 13845.

Table 119: You can apply log profile on below policy related logs and their categories.

Category	Policy related logs
SESSION	RT_FLOW_SESSION_CREATE RT_FLOW_SESSION_CLOSE RT_FLOW_SESSION_DENY RT_FLOW_SESSION_UPDATE
WEBFILTER	WEBFILTER_URL_BLOCKED WEBFILTER_URL_PERMITTED WEBFILTER_URL_REDIRECTED
ANTIVIRUS	AV_VIRUS_DETECTED_MT
CONTENT-FILTER	CONTENT_FILTERING_BLOCKED_MT
ANTISPAM	ANTISPAM_SPAM_DETECTED_MT
IDP	IDP_ATTACK_LOG_EVENT
SECINTEL	SECINTEL_ACTION_LOG
AAMW	AAMW_ACTION_LOG AAMW_IMAP_ACTION AAMW_SMTP_ACTION

Table 119: You can apply log profile on below policy related logs and their categories. ***(Continued)***

Category	Policy related logs
SSL-PROXY	SSL_PROXY_SSL_SESSION_DROP SSL_PROXY_SSL_SESSION_ALLOW
APPTRACK	APPTRACK_SESSION_VOL_UPDATE APPTRACK_SESSION_CREATE APPTRACK_SESSION_CLOSE

Default

Options

category Selects the category of events for the profile

stream-name Specify the destination to send the log. One log profile can point to multiple streams. Different log profiles can point to the same stream. You need to configure the stream mode for the logging before configuring stream-name.

template Select the template from the available options for the profile to get the log in a predefined format. You can apply the profile template on the policy related logs and categories mentioned in the Table 120 on page 13847.

Table 120: You can apply log profile templates on the below listed policy related logs and categories.

Required Privilege Level

Release Information

Configuration statement `profile` is added in Junos OS Release 21.1R1.

profile (Services Application Identification)

IN THIS SECTION

- Syntax | 13862
- Hierarchy Level | 13862
- Description | 13862
- Options | 13862
- Required Privilege Level | 13862

Release Information | 13862

Syntax

```
profile app-id-profile-name;
```

Hierarchy Level

```
[edit services application-identification]
```

Description

Configure an application identification profile. This profile is a placeholder profile with no configuration options, but it must be created to enable application identification functionality on the services plane.

Options

app-id-profile-name	Name of the application identification profile.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

RELATED DOCUMENTATION

Applying Services to Subscriber-Aware Traffic with a Service Set

profile (Services PCEF)

IN THIS SECTION

- Syntax | 13863
- Hierarchy Level | 13863
- Description | 13863
- Options | 13863
- Required Privilege Level | 13863
- Release Information | 13864

Syntax

```
profile pcef-profile-name;
```

Hierarchy Level

```
[edit services pcef]
```

Description

Configure a policy and charging enforcement function (PCEF) profile that is a placeholder profile with no configuration options. This profile must be created to enable PCEF functionality on the services plane. You apply this placeholder profile to the subscriber-aware service set.

Options

pcef-profile-name	Name of the PCEF profile.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

profile (Services Proxy)

IN THIS SECTION

- Syntax | 13864
- Hierarchy Level | 13865
- Description | 13865
- Options | 13865
- Required Privilege Level | 13865
- Release Information | 13865

Syntax

```
profile (Services Proxy) name {
        protocol {
            http {
                host host;
                password password;
                port port;
                username username;
            }
```

```
                }
            }
```

Hierarchy Level

```
[edit services proxy]
```

Description

Define proxy profiles that enable the system to route outbound HTTP or HTTPS traffic through a proxy server. This configuration is useful in environments where direct internet access is restricted or monitored, and proxy authentication is required.

Each proxy profile can include one or more protocol-specific configurations (e.g., HTTP), allowing for flexible and secure communication with external services.

Options

name Proxy profile name.

protocol Protocol type for the profile. Support is available for only HTTP connections. See protocol (Services Proxy).

Required Privilege Level

system

Release Information

Statement introduced in Junos OS Release 18.3R1.

}
```

Hierarchy Level

```
[edit services ssl proxy],
[edit logical-systems logical-system-name services ssl proxy]
```

Description

Specify the SSL server profile. An SSL proxy profile defines SSL behavior for the SRX Series Firewall.

The SSL proxy profile will be applied to the security policy as application services.

We have updated the limits for trusted CA certificates, server certificates, and URL categories in both SSL forward proxy and SSL reverse proxy configurations. These changes ensure compliance with the maximum configuration blob size limit of 56,986 bytes.

Changes in limit Size:

- Trusted CA certificate/Server certificates: Maximum limit—400 (reduced from 1024)
- URL categories: Maximum limit—800 (unchanged)

Configuration statements:

```
user@host# set services ssl proxy profile profile-name trusted-ca (all | [ca-profile] )
user@host# set services ssl proxy profile profile-name server-certificate
```

```
user@host# set services ssl proxy profile profile-name whitelist-url-categories [whitelist url
categories]
```

NOTE: In the reverse proxy configuration, ensure combined size of server certificates and URL categories does not exceed 56,986 bytes. If the combined size exceeds the limit, the following error message is displayed during commit:

```
ERROR: Maximum blob size (56986 bytes) exceeded...current blob size is 57014 bytes.
400 Server certs are taking 54400 bytes, and 27 URL categories are taking 1728 bytes.
```

This error provides a breakdown of memory usage, helping you adjust the configuration accordingly.

Options

profile-name Profile identifier.

actions Logging and traffic related actions.

custom-ciphers Custom cipher list.

- Values:
  - `ecdhe-rsa-with-3des-ede-cbc-sha`—ECDHE/RSA, 3DES EDE/CBC, SHA hash
  - `ecdhe-rsa-with-aes-128-cbc-sha`—ECDHE/RSA, 128-bit AES/CBC, SHA hash
  - `ecdhe-rsa-with-aes-128-cbc-sha256`—ECDHE/RSA, 128-bit AES/CBC, SHA256 hash
  - `ecdhe-rsa-with-aes-128-gcm-sha256`—ECDHE/RSA, 128-bit AES/GCM, SHA256 hash

disable-deferred-profile-selection

Disable the deferred profile selection mechanism. In the defered profile selection mechanism, the SSL proxy module defers SSL profile selection until the dynamic application is detected in a client hello message based on the Server Name Indication (SNI). After detecting dynamic application, SSL proxy module does a firewall rule lookup based on the identified application and selects an appropriate SSL proxy profile.

enable-flow-tracing

Enable flow tracing for the profile.

preferred-ciphers

Select preferred ciphers.

- Values:
  - `custom`—Configure custom cipher suite and order of preference.
  - `medium`—Use ciphers with key strength of 128-bits or greater.
  - `strong`—Use ciphers with key strength of 168-bits or greater.
  - `weak`—Use ciphers with key strength of 40-bits or greater.

root-ca	Root certificate for interdicting server certificates in proxy mode.
server-certificate	Local certificate identifier.
trusted-ca	List of trusted certificate authority profiles.
whitelist	Addresses exempted from SSL proxy.
whitelist-url-categories	URL categories exempted from SSL proxy.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10.

The `crl` statement is supported from 15.1X49-D30.

The `logical system` option is introduced in Junos OS Release 19.1R1.

}
```

Hierarchy Level

```
[edit services ssl initiation]
```

Description

Specify the name of the profile for SSL initiation support service.

SSL initiation is a process where the SRX Series Firewall acts as in SSL proxy client, initiates the SSL sessions with an SSL server. The SRX Series Firewall receives clear text from an HTTP client. It encrypts and transmits the data as ciphertext to the SSL server. On the reverse side, the SRX Series decrypts the ciphertext that it receives from the SSL server and sends the data to the client as clear text.

The profile contains the settings for the SSL-initiated connections. This includes the list of supported ciphers and their priority, the supported versions of SSL/TLS, and a few other options.

Options

actions

Specify the certification revocation checks and traffic related actions for configuring SSL initiation support service.

- **crl**

  Specify certificate revocation actions. The certificate revocation list (CRL) contains the list of digital certificates that have been canceled before their expiration date. When a participating device uses a digital certificate, it checks the certificate signature and validity. It also acquires the most recently issued CRL and checks that the certificate serial number is not on that CRL. By default, CRL verification is enabled on SSL profile.

- **ignore-hold-instruction-code**

  Ignore server authentication failure. By selecting this option, you can choose to ignore certificate validation, root CA expiration dates, and other such issues based on your requirements.

client-certificate

Local certificate. It is a certificate that client connects to server with. It is usually signed by a CA that the SRX Series Firewall trusts.

crypto-hardware-offload

Trusted Platform Module (TPM) mode. Configure tpm based SSL Initiation sessions.

custom-ciphers

Configure custom cipher for an SSL profile.

Custom ciphers allow you to define your own cipher list. If you do not want to use one of the three categories (strong, medium, or week) of preferred ciphers, you can select ciphers from each of the categories to form a custom cipher set.

To configure custom ciphers, you must set preferred-ciphers to custom. See "preferred-ciphers" on page 13581 for more details.

enable-flow-tracing	Enable flow tracing to enable debug tracing.
enable-session-cache	Enable SSL session cache. You can enable session caching to cache session information, such as the pre-master secret key and agreed-upon ciphers, for both the client and server.
ignore-server-auth-failure	Ignore server authentication completely. In this case, SSL forward proxy ignores errors encountered during the server certificate verification process (such as CA signature verification failure, self-signed certificates, and certificate expiry).
preferred-ciphers	Select preferred ciphers. Preferred ciphers allow you to define an SSL cipher that can be used with acceptable key strength. Ciphers are divided in three categories depending on their key strength: strong, medium, or weak.
protocol-version	Specify the accepted SSL protocol version. You can specify the SSL/TLS protocol version the security device uses to negotiate in SSL connections.
trusted-ca	List of trusted certificate authority profiles. SSL forward proxy uses trusted CA certificates for server authentication. Junos OS provides a default list of trusted CA certificates that you can easily load on to your system using a default command option.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10. The `protocol-version` statement is updated to include `tls11` and `tls12` from Junos OS Release 15.1X49-D30.

Configuring SSL Forward Proxy

profile (SSL Termination)

IN THIS SECTION

- Syntax | 13874
- Hierarchy Level | 13874
- Description | 13874
- Options | 13875
- Required Privilege Level | 13875
- Release Information | 13876

Syntax

```
profile name {
    custom-ciphers;
    enable-flow-tracing   enable-flow-tracing;
    enable-session-cache enable-session-cache;
    preferred-ciphers (custom | medium | strong | weak);
    protocol-version (all | ssl3 | tls1 | tls11 | tls12);
    server-certificate  server-certificate;
    trusted-ca  ;
}
```

Hierarchy Level

```
[edit services ssl termination]
```

Description

Specify the name of the profile for SSL termination support service.

Traffic from the client to SRX Series is encrypted and terminated at SRX Series, which then re-encrypts traffic to the back-end server.

SSL termination is a process where the SRX Series Firewall acts as an SSL proxy server, terminates the SSL session from the client. The SRX Series Firewall receives encrypted data from the HTTP client. It decrypts and transmits the data as unencrypted request to the other servers (HTTP server).

The profile contains the settings for the SSL-terminated connections. This includes the list of supported ciphers and their priority, the supported versions of SSL/TLS, and a few other options.

Options

custom-ciphers

Configure custom cipher for an SSL profile.

Custom ciphers allow you to define your own cipher list. If you do not want to use one of the three categories (strong, medium, or week) of preferred ciphers, you can select ciphers from each of the categories to form a custom cipher set.

To configure custom ciphers, you must set preferred-ciphers to custom. See "preferred-ciphers" on page 13581 for more details.

enable-flow-tracing

Enable flow tracing to enable debug tracing.

enable-session-cache

Enable SSL session cache. You can enable session caching to cache session information, such as the pre-master secret key and agreed-upon ciphers, for both the client and server.

preferred-ciphers

Select preferred ciphers. Preferred ciphers allow you to define an SSL cipher that can be used with acceptable key strength. Ciphers are divided in three categories depending on their key strength: strong, medium, or weak.

protocol-version

Specify the accepted SSL protocol version. You can specify the SSL/TLS protocol version the security device uses to negotiate in SSL connections.

server-certificate

Local certificate identifier. Server certificates are used to authenticate the identity of a server. A server is required to present a certificate as part of the initial connection setup. SSL proxy generates a new certificate by replacing the original issuer of the certificate with its own identity and signs this new certificate with its own public key (provided as a part of the proxy profile configuration).

trusted-ca

List of trusted certificate authority profiles. SSL forward proxy uses trusted CA certificates for server authentication. Junos OS provides a default list of trusted CA certificates that you can easily load on to your system using a default command option.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10. The `protocol-version` statement is updated to include `tls11` and `tls12` from Junos OS Release 15.1X49-D30.

Hierarchy Level

```
[edit access]
```

Description

Configure a subscriber access profile that includes subscriber access, L2TP, or PPP properties.

Options

profile-name—Name of the profile.

For CHAP, the name serves as the mapping between peer identifiers and CHAP secret keys. This entity is queried for the secret key whenever a CHAP challenge or response is received.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Hierarchy Level

```
[edit services network-monitoring]
```

Description

Configure a monitoring profile that can be used for health-checking a group of TLB servers.

Options

custom

Use custom probes for server health checking.

cmd *priority*

Use the specified command priority to send for a custom probe.

- **Values:** 1 or 2

default-real-service-status (down | up)

Assign a server status for when the probe times out. The **up** value is used when the server or the intermediate network nodes are only expected to send a negative response to a probe.

- **Default:** down

expect (ascii | binary) *receive-string*

Use the specified ascii or binary string as an expected probe response.

- **Range:** 1 through 512 characters

port *port*

Use the specified port for custom probes.

protocol (tcp | udp)

Use the selected protocol for custom probes.

real-service-action (down | up)

Assign a server status for when the expected response to the probe is received.

- **Default:** down

send (ascii | binary) *send-string*

Send the specified ascii or binary string as a probe.

- **Range:** 1 through 512 characters

failure-retries *number-of-retries*

Use the specified number of probes that are sent after which the real server is tagged as down.

- **Default:** 5

http

Use HTTP probes for server health checking.

host *hostname*

Use the specified hostname for HTTP probes for server health checks.

method (get | option)

Use the get or option HTTP method for server health checks.

port *http-port-number*

Use the specified port number for HTTP probes.

url *url* — Use the specified URL for HTTP probes. Maximum length is 128 bytes.

icmp — Use ICMP probes for server health checking.

probe-interval *interval* — Use the specified interval of time, in seconds, at which health check probes are sent.

- **Default:** 5

profile-name — Identifier for the network monitoring profile.

recovery-retries *number-of-recovery-retries* — Use the specified number of successful probe attempts after which the server is declared up.

- **Default:** 5

ssl-hello — Use a `Client Hello` for server health checks

port *port* — Use the specified port number for `Client Hello` server health checks.

ssl-version — SSL version.

- **Default:** 3

tcp — Use TCP probes for server health checks.

port *tcp-port-number* — Use the specified port number for TCP probes.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

```
[edit services url-filter]
```

Description

Define URL filter profile or DNS filter profile.

A URL filter profile is for filtering access to disallowed URLs. A URL filter profile includes a general database setting and templates. The template settings apply to specific interfaces or to access from specific source IP address prefixes, and override the database setting at the profile level.

A DNS filter profile is used to filter DNS requests for disallowed website domains. A DNS filter profile includes general DNS filtering settings and up to 32 templates. The template settings apply to DNS requests on specific interfaces or to DNS requests from specific source IP address prefixes, and override the corresponding settings at the profile level. You can configure up to eight DNS filter profiles.

NOTE: For URL filtering, use the `url-filter-template` option starting in Junos OS Release 18.3R1 and use the `template` option in Junos OS Releases before 18.3R1.

Options

profile-name	Name of the filter profile.
`url-filter-database` ***filename***	Specify the filename of the URL filter database. This option is mandatory.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2.

`dns-filter`, `dns-filter-templates`, `global-dns-stats-log-timer`, and `url-filter-template` options introduced in Junos OS Release 18.3R1.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

          (authentication-server [server-addresses] | authentication-server-name hostname);
    }
}
```

Hierarchy Level

```
[edit access]
```

Description

Configure an access profile that specifies authentication and accounting parameters. Authentication and accounting parameters run only if you specify the profile name. The access profile contains the entire authentication, authorization, and accounting (AAA) configuration that aids in handling AAA requests, including the authentication method and order, AAA server addresses, and AAA accounting.

Default

Not enabled.

Options

profile-name	Profile name of up to 32 characters.

The remaining statements are explained separately. See CLI Explorer.

NOTE: The `[edit access]` hierarchy is not available on QFabric systems.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

profile(dynamic-application)

IN THIS SECTION

- Syntax | 13892
- Hierarchy Level | 13893
- Description | 13893
- Options | 13893
- Required Privilege Level | 13894
- Release Information | 13894

Syntax

```
profile name {
    redirect-message {
        type {
            custom-text {
                content content;
            }
```

```
            redirect-url {
                content content;
            }
        }
    }
}
```

Hierarchy Level

```
[edit security dynamic-application]
```

Description

Define a profile to provide an explanation for the policy action or to redirect the client request to an informative webpage when a policy blocks HTTP or HTTPS traffic with a deny or reject action in a security policy.

Although drop and reject actions can be logged, the users might not be notified when either action is taken. To provide a reason for the action or to redirect the users to an informative webpage, use the `redirect-message` option at the `[edit security dynamic-application profile` *name*`]` hierarchy level to display a custom message.

Customize the redirect action by adding your text message on the splash screen or specify the URL to which the user is redirected. When the `redirect message` option is specified, a splash screen and message informs the client that the traffic has been blocked.

Starting in Junos OS Release 18.2R1, a redirect profile can be configured in a unified policy.

Options

name Name of the profile.

- Values:

  redirect-message Defines the profile of the notification sent to clients when HTTP or HTTPS traffic is blocked by a reject or deny action from an application firewall.

  type The message type displayed after a reject or deny action.

custom-text Text message in HTML added to the default text. If custom-text is specified, the splash screen displays both the default block message and the custom-defined block message.

The user is redirected when a reject or deny action is taken during one of the following HTTP methods: GET, POST, OPTIONS, HEAD, PUT, DELETE, TRACE, CONNECT, PROPFIND, PROPPATCH, LOCK, UNLOCK, COPY, MOVE, MKCOL, BCOPY, BDELETE, BCOPY, BMOVE, BPROPFIND, BPROPPATCH, POLL, SEARCH, SUBSCRIBE, and UNSUBSCRIBE. If the reject or deny action occurs during a different HTTP method, the traffic is silently dropped.

content Custom text added to the splash screen. Custom text is inserted below the default message. Add the characters **\n** to insert a line break in the displayed text.

redirect-url Custom URL redirection.

content The URL of the webpage to which the client is directed. When traffic is rejected or denied, the client is redirected to the specified webpage for further action. The URL can be hosted on either the SRX Series device or an external server.

Enter the redirect URL in quotation marks for an HTTP or HTTPS site, as shown in the following example:

```
"https://custom-redirect-url"
```

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

profile-type (Dynamic Service Profiles)

IN THIS SECTION

- Syntax | 13896
- Hierarchy Level | 13897
- Description | 13897
- Options | 13897
- Required Privilege Level | 13897
- Release Information | 13897

Syntax

```
profile-type remote-device-service;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name]
```

Description

Specify that the dynamic service profile containing this statement is not applied locally to the router. Instead, it is applied to an external device by means of the remote device services manager daemon (rdmd). It enables an external authority, such as PCRF to reference the dynamic service profile to provision or deprovision services (charging rules) on the remote device.

The content of the service is limited to a set of variables that are translated to NETCONF XML protocol remote procedure calls (RPCs) by a dictionary provisioned on the MX series router. The dictionary contains entries corresponding to different service profiles. Each entry contains the RPCs that correspond to the service variables and install the service on the remote device.

The `remote-device-service` type effectively separates the external authority from how and where a service is provisioned. The external authority simply references the profile name; if the service profile has this type, then the service is provisioned on a remote device. If the profile does not have this type, then the service is provisioned on the router.

Options

remote-device-service	Service profile type that causes the profile to be applied to an external device by means of the remote device services manager daemon (rdmd).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Syntax (QFX Series)

```
profile-type (aes67 | aes67-smpte | enterprise-profile | g.8275.2.enh | smpte)
```

Hierarchy Level

```
[edit protocols ptp]
```

Description

On the MX Series, configure the G.8275.1 or the enhanced G.8275.1 PTP profile for applications that require accurate phase and time synchronization. This profile supports the architecture defined in ITU-T G.8275 to enable the distribution of phase and time with full timing support and is based on the second version of PTP defined in IEEE 1588.

> **NOTE**: When the enhanced G.8275.1 PTP profile is configured on either MX240, MX480, MX960, MX2010, MX2020, or MX2008 with MPC2E-NG, MPC3E-NG, MPC5E, or MPC6E line cards with MICS (MIC-3D-20GE-SFP-E), and if PTPoIPv4 BC (Boundary-Clock) stream is configured on the MIC, then the PTPoIPv4 traffic that pass through the PIC gets time stamped one-way and sees a huge correction field update on the pass through traffic. This can cause PTP sync issues on the devices consuming this traffic.

On QFX Series switches that support the enterprise-profile feature, you can configure the enterprise profile, which supports IEEE 1588 PTPv2 transport over multicast IPv4. If you do not specify a profile, the IEEE 1588 default profile is enabled by default.

On QFX Series switches that support the G.8275.2 enhanced profile feature, you can configure the G.8275.2 enhanced profile, which supports telecom applications that require accurate phase and time synchronization for phase alignment and time of day synchronization over a wide area network. This profile supports PTP over IPv4 unicast, ordinary and boundary clocks, and unicast negotiation.

On QFX Series switches that support the media profile, you can configure the SMPTE, AES67, and the AES67+SMPTE profiles to support video applications for capture (for example, cameras), video edit, and playback to be used in professional broadcast environments. The standard allows multiple video sources to stay in synchronization across various equipment by providing time and frequency synchronization to all devices. This profile supports PTP over IPv4 multicast and ordinary and boundary clocks.

ACX 710 devices support G.8275.2 profile with node type T-BC-P (BC).

ACX5448, ACX5448-D, and ACX5448-M devices support ACX G.8275.2 enhanced profile. You can configure the G.8275.2 enhanced profile, which supports telecom applications that require accurate phase and time synchronization for phase alignment and time of day synchronization over a wide area network. This profile supports PTP over IPv4 and IPV6 unicast traffic.

ACX710, ACX2100, ACX2200, ACX7100-48L, and ACX7100-32C devices support G.8275.1 telecome profile. This profile supports the architecture defined in ITU-T G.8275 to enable the distribution of phase and time with full timing support. This profile requires all devices in the network to operate in combined or hybrid modes, which means that PTP and Synchronous Ethernet are enabled on all devices.

PTX10008 device supports G.8275.1 telecome profile. This profile supports the architecture defined in ITU-T G.8275 to enable the distribution of phase and time with full timing support. This profile requires all devices in the network to operate in combined or hybrid modes, which means that PTP and Synchronous Ethernet are enabled on all devices.

Options

aes67	(QFX Series only) Enable the AES67 PTP profile.
aes67-smpte	(QFX Series only) Enable the AES67+SMPTE PTP profile.
enterprise-profile	(QFX Series only) Enable the enterprise profile. The enterprise profile supports IEEE 1588 PTPv2 transport over multicast IPv4. When the enterprise profile is enabled, no other profiles can be enabled. Also, unicast negotiation is disabled when you enable the enterprise profile.
g.8275.1	(ACX710, ACX2100, ACX2200, ACX7100-48L, ACX7100-32C, MX Series, and PTX10008 only) Enable the G.8275.1 PTP profile.
g.8275.1.enh	(MX Series, PTX series) Enable the enhanced G.8275.1 PTP profile. This profile supports PTP over IPv4.
g.8275.2	(ACX710 only) Enable the G.8275.2 PTP profile.
g.8275.2.enh	(ACX5448, ACX5448-D, ACX5448-M, and QFX Series only) Enable the enhanced G.8275.2 PTP profile.

ieee-2008	(PTX Series) Enable the IEEE 2008 profile type (default).
ieee1588v2-custom	(PTX Series) Enable the IEEE1588v2 with Multicast.
smpte	(QFX Series only) Enable the SMPTE PTP profile.

Required Privilege Level

routing—To view this statement in the configuration.

    }
```

Hierarchy Level

```
[edit unified-edge pcef],
[edit services pcef]
```

Description

Set up the overall policy and charging enforcement function (PCEF) configuration that can be applied to subscribers.

NOTE: You can configure only one of the following statements in a PCEF profile: `aaa-policy-control`, `static-policy-control`, or `dynamic-policy-control`.

You can configure a maximum of 32 policy and charging control (PCC) rules in a PCEF profile. There is no limit to the number of PCC rulebases you can configure in a PCEF profile.

If you are using Junos OS Subscriber Aware, configure the PCEF profile at the `[edit unified-edge pcef]` hierarchy level. You then assign this profile to the subscriber's TDF domain or to the domain selection configuration.

If you are using Junos OS Broadband Subscriber Management, configure the PCEF profile at the `[edit services pcef]` hierarchy level. The `static-policy-control` option is applicable to PCC rule activation through a dynamic profile, and you assign the PCEF profile to the dynamic profile. Starting in Junos OS Release 18.2R1, the `dynamic-policy-control` option is also available and is applicable to direct rule activation by a policy and charging rules function (PCRF) server; you assign the PCEF profile to the access profile. The `aaa-policy-control` option is not applicable to subscriber management.

Options

profile-name

Name of the PCEF profile.

- **Range:** 1 through 63 characters.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

For Junos OS Subscriber Aware:

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

For Junos OS Broadband Subscriber Management:

services—To view this statement in the configuration.

services–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support at the `[edit services pcef]` hierarchy level introduced for Junos OS Broadband Subscriber Management in Junos OS Release 17.2 on MX Series.

profiles (RFC 2544 Benchmarking)

IN THIS SECTION

- Syntax | 13910
- Hierarchy Level | 13911
- Description | 13911
- Options | 13911
- Required Privilege Level | 13911
- Release Information | 13911

Syntax

```
profiles {
    test-profile profile-name {
        test-type (throughput | latency | frame-loss | back-back-frames);
        packet-size bytes;
        step-percent percent;
        bandwidth-kbps kpbs;
    }
}
```

Hierarchy Level

```
[edit services rpm rfc2544-benchmarking]
```

Description

Configure the test profile to specify attributes, such as the period for the test and the type of test to be performed, for the RFC 2544-based benchmarking test. The test profile is referenced in the test interface to perform a specific type of benchmarking test and compute statistics to describe the performance characteristics of a network interconnecting device.

Options

profiles Define the test profile for the RFC 2544-based benchmarking test to examine and analyze the performance characteristics of a network interconnecting device.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X53.

  flag name;
 }
}
```

Hierarchy Level

```
[edit logical-systems name routing-options],
[edit routing-options]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure the programmable routing protocol process (prpd). The prpd provides public APIs to program routing systems, making it possible for users to directly access the APIs to customize, create, and modify behavior of their network.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

`stats-aggregation-interval` and `stats-sampling-interval` statements introduced in Junos OS Evolved Release 22.2R1.

promiscuous-mode (Interfaces)

IN THIS SECTION

- Syntax | 13918
- Hierarchy Level | 13918
- Description | 13918
- Required Privilege Level | 13919
- Release Information | 13919

Syntax

```
promiscuous-mode;
```

Hierarchy Level

```
[edit interfaces interface-name ]
```

Description

Enable promiscuous mode on Layer 3 Ethernet interfaces. When promiscuous mode is enabled on an interface, all packets received on the interface are sent to the central point or Services Processing Unit regardless of the destination MAC address of the packet.

You can also enable promiscuous mode on chassis cluster redundant Ethernet interfaces and on aggregated Ethernet interfaces. If you enable promiscuous mode on a redundant Ethernet interface,

promiscuous mode is then enabled on any child physical interfaces. If you enable promiscuous mode on an aggregated Ethernet interface, promiscuous mode is then enabled on all member interfaces.

Required Privilege Level

`interface`—To view this statement in the configuration.

`interface-control`—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

RELATED DOCUMENTATION

promote

IN THIS SECTION

- Syntax | 13921
- Hierarchy Level | 13921
- Description | 13921
- Options | 13922

Required Privilege Level | 13922
Release Information | 13922

Syntax

Syntax for `promote gre-key`

```
promote gre-key;
```

Syntax for `promote dscp`

```
promote dscp;
```

Syntax for `promote traffic-class`

```
promote traffic-class;
```

Hierarchy Level

```
[edit firewall family family-name filter filter-name]
```

Description

Use the `promote gre-key` or `promote dscp` configuration statements to use `gre-key` or `dscp` match conditions in an inet firewall filter. Use the `promote traffic-class` configuration statement to use the `traffic-class` match condition in an inet6 firewall filter.

NOTE: When you apply any of these configuration statements, the entire filter is compiled in a way to optimize the performance of these match conditions for their respective firewall filters. As an example, when you configure `promote gre-key` and use `gre-key` in any of the terms in a filter, the entire filter is compiled in a way that optimizes performance of the filter for gre-key matching.

NOTE: All these configuration statements are supported on PTX Series routers only when network services is set to `enhanced-mode`. For more information, see `enhanced-mode` .

Options

The following are the options for the `promote` configuration command.

- `gre-key`
- `dscp`
- `traffic-class`

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F3 and 16.1R2.

- Options | 13928
- Required Privilege Level | 13928
- Release Information | 13929

Syntax

```
proposal proposal-name {
    authentication-algorithm (sha-256 | sha-384);
    authentication-method pre-shared-keys;
    description description;
    dh-group (group14 | group24);
    encryption-algorithm (aes-128-cbc | aes-192-cbc | aes-256-cbc);
    lifetime-seconds seconds;
}
```

Hierarchy Level

```
[edit security group-vpn member ike]
```

Description

Define an IKE proposal. You can configure one or more IKE proposals. Each proposal is a list of IKE attributes to protect the IKE connection between the IKE host and its peer.

Options

`proposal` *`proposal-name`*—Name of the IKE proposal. The proposal name can be up to 32 alphanumeric characters long.

`authentication-algorithm`—Configure the Internet Key Exchange (IKE) authentication algorithm. Hash algorithm that authenticates packet data. It can be one of the following algorithms:

- `sha-256`—Produces a 256-bit digest. This is the default value.
- `sha-384`—Produces a 384-bit digest.

`authentication-method` *`pre-shared-keys`*—Specify the method the device uses to authenticate the source of Internet Key Exchange (IKE) messages. The `pre-shared-keys` option refers to a preshared key, which is a secret key shared between the two peers, is used during authentication to identify the peers to each other. The same key must be configured for each peer. This is the default method.

`description` *`description`*—Specify descriptive text for an IKE proposal.

`dh-group`—Specify the IKE Diffie-Hellman group for key establishment.

- `group14`—2048-bit group. This is the default value.
- `group24`—2048-bit, 256 bit subgroup. Support for the `group24` option added in Junos OS Release 15.1X49-D30 for vSRX Virtual Firewall.

`encryption-algorithm`—Configure an encryption algorithm for an IKE proposal.

- `aes-128-cbc`—Advanced Encryption Standard (AES) 128-bit encryption algorithm.
- `aes-192-cbc`—AES 192-bit encryption algorithm.
- `aes-256-cbc`—AES 256-bit encryption algorithm.

`lifetime-seconds` *`seconds`*—Specify the lifetime (in seconds) of an IKE or IPsec security association (SA) for group VPN. When the SA expires, it is replaced by a new SA and security parameter index (SPI) or terminated.

- **Range:** 180 through 86,400 seconds
- **Default:** 3600 seconds

The device does not delete existing IPsec SAs when you update the `authentication-algorithm`, `authentication-method`, `dh-group`, and `encryption-algorithm` configuration in the IKE proposal.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

- `sha-384`—Produces a 384-bit digest.
- In Power Mode IPSec mode and in normal mode—
  - `sha1`—Produces a 160-bit digest.
  - `sha-512`—Produces a 512-bit digest.

The device deletes existing IPsec SAs when you update the `authentication-algorithm` configuration either in the IKE proposal or IPsec proposal.

authentication-method

Specify the method the device uses to authenticate the source of Internet Key Exchange (IKE) messages. The `pre-shared-keys` option refers to a preshared key, which is a key for encryption and decryption that both participants must have before beginning tunnel negotiations. The other options refer to types of digital signatures, which are certificates that confirm the identity of the certificate holder. The device deletes existing IPsec SAs when you update the `authentication-method` configuration in the IKE proposal.

- `certificates`—You can establish the IKEv2 and IPsec SA tunnels irrespective of the type of certificate used on initiator and responder. The `authentication-method certificates` option cannot be used with IKEv1.
- `digital-signature`—Specify digital signature as an authentication method for IKEv2. Note that you cannot use the option with IKEv1.
- `dsa-signatures`—Specify that the Digital Signature Algorithm (DSA) is used.
- `ecdsa-signatures-256`—Specify that the Elliptic Curve DSA (ECDSA) using the 256-bit elliptic curve secp256r1, as specified in the *Federal Information Processing Standard (FIPS) Digital Signature Standard (DSS) 186-3*, is used.
- `ecdsa-signatures-384`—Specify that the ECDSA using the 384-bit elliptic curve secp384r1, as specified in the *FIPS DSS 186-3*, is used.
- `pre-shared-keys`—Specify that a preshared key, which is a secret key shared between the two peers, is used during authentication to identify the peers to each other. The same key must be configured for each peer. This is the default method.

- `rsa-signatures`—Specify that a public key algorithm, which supports encryption and digital signatures, is used.
- `ecdsa-signatures-521`—Specify that the ECDSA using the 521-bit elliptic curve secp521r1 is used.

description *description*
Text the description of IKE proposal.

dh-group
Specify the IKE Diffie-Hellman group.

encryption-algorithm
Configure an encryption algorithm for an IKE proposal.

lifetime-seconds *seconds*
Specify the lifetime (in seconds) of an IKE security association (SA). When the SA expires, it is replaced by a new SA and security parameter index (SPI) or terminated.

- Range: 180 through 86,400 seconds
- Default: 28,800 seconds

signature-hash-algorithm
(Optional) Specify the digital signature hash algorithms for IKEv2. Note that you cannot use the option with IKEv1.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 8.5.

Support for `dh-group group 14` and `dsa-signatures` added in Junos OS Release 11.1.

Support for `sha-384`, `ecdsa-signatures-256`, `ecdsa-signatures-384`, `group19`, `group20`, and `group24` options added in Junos OS Release 12.1X45-D10.

Support for `ecdsa-signatures-256` and `ecdsa-signatures-384` options added in Junos OS Release 12.1X45-D10.

Support for `sha-512`, `group15`, `group16`, `group21`, and `ecdsa-signatures-521` options added in Junos OS Release 19.1R1 on SRX5000 line of devices with `junos-ike` package installed.

Support for authentication algorithm (SH1: hmac-sha1-96) added to vSRX Virtual Firewall in Junos OS Release 19.3R1 for Power Mode IPSec mode, along with the existing support in normal mode.

Support for `group15`, `group16`, and `group21` options added in Junos OS Release 20.3R1 on vSRX Virtual Firewall instances with `junos-ike` package installed.

Support for `group15`, `group16`, and `group21` options added in Junos OS Release 21.1R1 on vSRX Virtual Firewall 3.0 instances with `junos-ike` package installed.

Support for `certificates` option added in Junos OS Release 22.4R1 on MX240, MX480, and MX960 in USF mode, SRX1500, SRX4200, SRX4600, SRX5400, SRX5600, SRX5800, and vSRX 3.0 running the iked process.

Support for the `chacha20-poly1305` option added to SRX1600, SRX2300, SRX4300, SRX4600, SRX5400, SRX5600, SRX5800, and vSRX 3.0 in Junos OS Release 24.2R1.

Support for the `digital-signature` and `signature-hash-algorithm` options added in Junos OS Release 24.4R1.

We've deprecated support for `md5` and `sha1` in `authentication-algorithm`, `des-cbc` and `3des-cbc` in `encryption-algorithm`, and `group1`, `group2` and `group5` in `dh-group` starting in Junos OS Release 25.2R1.

```

Hierarchy Level

```
[edit security ipsec]
```

Description

Define an IPsec proposal. An IPsec proposal lists protocols and algorithms (security services) to be negotiated with the remote IPsec peer.

Options

proposal-name Name of the IPsec proposal.

authentication-algorithm Configure the IPsec authentication algorithm. Authentication algorithm is the hash algorithm that authenticates packet data. It can be one of six algorithms:

- Values:

  The hash algorithm to authenticate data can be one of the following:

  - `hmac-md5-96`—Produces a 128-bit digest.

- `hmac-sha-256-128`—Provides data origin authentication and integrity protection. This version of the hmac-sha-256 authenticator produces a 256-bit digest and specifies truncation to 128 bits.
- `hmac-sha1-96`—Hash algorithm that authenticates packet data. It produces a 160-bit digest. Only 96 bits are used for authentication.
- `hmac-sha-512`—Produces a 512-bit digest.
- `hmac-sha-384`—Produces a 384-bit digest.
- `hmac-sha-256-96`—HMAC-SHA-256-96 authentication algorithm (non-RFC compliant)

description

Text description of IPsec proposal

encryption-algorithm

Define encryption algorithm. The device deletes existing IPsec SAs when you update the `encryption-algorithm` configuration in the IPsec proposal.

- Values:
  - `3des-cbc`—Encryption algorithm with block size of 8 bytes (64 bits) and key size of 192 bits.
  - `aes-128-cbc`—Advanced Encryption Standard (AES) 128-bit encryption algorithm.
  - `aes-128-gcm`—AES Galois/Counter Mode (GCM) 128-bit encryption algorithm.

    For an IKE proposal, AES 128-bit authenticated encryption algorithm is supported with IKEv2 only. When this option is used, `aes-128-gcm` should be configured at the [`edit security ipsec proposal` *`proposal-name`*] hierarchy level, and the `authentication-algorithm` option should not be configured at the [`edit security ike proposal` *`proposal-name`*] hierarchy level.

    When `aes-128-gcm`, `aes-192-gcm`, or `aes-256-gcm` encryption algorithms are configured in the IPsec proposal, it is not mandatory to configure AES-GCM encryption algorithm in the corresponding IKE proposal.
  - `aes-192-cbc`—AES 192-bit encryption algorithm.
  - `aes-192-gcm`—AES GCM 192-bit encryption algorithm.
  - `aes-256-cbc`—AES 256-bit encryption algorithm.

- `aes-256-gcm`—AES GCM 256-bit encryption algorithm.

  For an IKE proposal, AES 256-bit authenticated encryption algorithm is supported with IKEv2 only. When this option is used, `aes-256-gcm` should be configured at the [`edit security ipsec proposal` *`proposal-name`*] hierarchy level, and the `authentication-algorithm` option should not be configured at the [`edit security ike proposal` *`proposal-name`*] hierarchy level.

- `chacha20-poly1305`—ChaCha20-Poly1305 authenticated encryption algorithm.

  You can use the algorithm for data path security with Encapsulating Security Payload (ESP) for IPsec VPN. You can configure the algorithm in:

  - PowerMode IPsec (PMI) mode on SRX1600, SRX2300, SRX4120, SRX4300, SRX4600, SRX5400, SRX5600, and SRX5800 Firewalls.
  - PMI and non-PMI modes on vSRX 3.0.

  You can use the algorithm for IPsec when the VPN monitoring feature is not configured at [`edit security ipsec vpn` *`vpn-name`* `vpn-monitor`].

  Note that you cannot use the algorithm on SRX1500 Firewalls.

- `des-cbc`—Encryption algorithm with block size of 8 bytes (64 bits) and key size 48 bits.

extended-sequence-number

Use the `extended-sequence-number` option to enable ESN support. ESN allows IPsec to use 64-bit sequence numbers for the sequence number. If ESN is not enabled, 32-bit sequence number will be used by default. Ensure ESN is not enabled when anti-replay is disabled.

lifetime-kilobytes

Specify the lifetime (in kilobytes) of an IPsec security association (SA). If this statement is not configured, the number of kilobytes used for the SA lifetime is unlimited.

- **Range:** 64000 through 4,294,967,294 kilobytes

lifetime-seconds

Lifetime in seconds.

- **Range:** 180 through 86400
- **Default:** 3600 seconds

protocol

Define the IPsec protocol for a manual or dynamic security association (SA).

- Values:
  - ah—Authentication header
  - esp—Encapsulated Security Payload header

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`extended-sequence-number` option introduced in Junos OS Release 19.4R1.

Starting in Junos OS Release 20.2R1, we’ve changed the help text description as `NOT RECOMMENDED` for the CLI options `hmac-md5-96`, `hmac-sha1-96`, `3des-cbc`, and `des-cbc` for devices running iked process with `junos-ike` package installed.

`hmac-sha-512` and `hmac-sha-384` options introduced in Junos OS Release 19.1R1 on SRX5000 line of devices with SRX5K-SPC3 card.

Support for `aes-128-gcm`, `aes-192-gcm`, and `aes-256-gcm` options added in Junos OS Release 15.1X49-D70 for vSRX Virtual Firewall.

Support for `aes-128-gcm`, `aes-192-gcm`, and `aes-256-gcm` options added in Junos OS Release 12.1X45-D10.

Support for the `hmac-sha-256-128` added to SRX5400, SRX5600, and SRX5800 devices in Junos OS Release 12.1X46-D20.

Support for the `lifetime-kilobytes` option with IPsec VPN running iked process added in Junos OS Release 23.4R1.

Support for the `chacha20-poly1305` option added to SRX1600, SRX2300, SRX4300, SRX4600, SRX5400, SRX5600, SRX5800, and vSRX 3.0 in Junos OS Release 24.2R1.

We've deprecated support for `hmac-md5-96` and `hmac-sha1-96` in `authentication-algorithm`, and `des-cbc` and `3des-cbc` in `encryption-algorithm` starting in Junos OS Release 25.2R1.

protect core

IN THIS SECTION

- Syntax | 13950
- Hierarchy Level | 13950
- Description | 13951
- Required Privilege Level | 13951
- Release Information | 13951

Syntax

```
protect core;
```

Hierarchy Level

```
[edit routing-instances routing-instance-name routing-options]
```

Description

In an MPLS VPN Core network, enable BGP Prefix-Independent Convergence (PIC) Edge to install a VPN route in the forwarding table for use as an alternate path when a provider edge (PE) router fails or connectivity to a PE router is lost. This alternate link is used until global convergence through the interior gateway protocol (IGP) occurs. Both OSPF with LDP or RSVP, and IS-IS with LDP or RSVP are supported.

For IPv6 networks, enable the BGP PIC edge feature by specifying the IPv6 routing table in the routing-instance. For example:

```
[edit routing-instances routing-instance-name routing-options]
user@host# set rib inet6.0 protect core
```

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Support in Layer 3 VPN routers is extended to BGP PIC with multiple routes in the global tables such as inet and inet6 unicast, and inet and inet6 labeled unicast in Junos OS Release 15.1.

Support for Resource Reservation Protocol (RSVP) introduced in Junos OS Release 16.1.

Support for protect core in EVPN-VXLAN introduced in Junos OS Release 22.4R1.

Support for protect core in EVPN E-LAN and EVPN E-Tree introduced in Junos OS Evolved Release 25.2R1.

}
```

Hierarchy Level

```
[edit protocols]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure Ethernet ring protection switching.

The statements are explained separately. All statements apply to MX Series routers. EX Series switches do not assign `node-id` and use `control-vlan` instead of `control-channel`.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

protection-revert-time

IN THIS SECTION

- Syntax | 13963
- Hierarchy Level | 13963
- Description | 13964
- Options | 13964
- Required Privilege Level | 13964
- Release Information | 13964

Syntax

```
protection-revert-time seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls interface interface-name static],
[edit protocols mpls interface interface-name static]
```

Description

Specify the amount of time (in seconds) that a static LSP must wait before traffic reverts from the bypass path to the original path.

If you have configured a value of 0 seconds for the `protection-revert-time` statement and traffic is switched to the bypass path, the traffic remains on that path indefinitely. It is never switched back to the original path unless the bypass path is down or you intervene.

Options

seconds—Time in seconds.

- **Range:** 0 through 65,535 seconds
- **Default:** 5 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

RELATED DOCUMENTATION

Application Identification Overview

protocol (Applications)

IN THIS SECTION

- Syntax | 13969
- Hierarchy Level | 13969
- Description | 13969
- Options | 13970
- Required Privilege Level | 13970
- Release Information | 13970

Syntax

```
protocol protocol-name;
```

Hierarchy Level

```
[edit applications application  application-name  ]
[edit applications application  application-name  term  term-name]
```

Description

Specify the networking protocol name or number.

The networking protocol type combines with **destination-port** to identify an application type. For example, to create an application for iSCSI, use the protocol **tcp** with the destination port number **3260**.

Options

protocol-name— Networking protocol name. The following text values are supported. For a complete list of possible numeric values, see RFC 1700, *Assigned Numbers (for the Internet Protocol Suite)*.

- `ah`—IP Security Authentication Header
- `egp`—Exterior gateway protocol
- `esp`—IPsec Encapsulating Security Payload
- `gre`—Generic routing encapsulation
- `icmp`—Internet Control Message Protocol
- `igmp`—Internet Group Management Protocol
- `ipip`—IP over IP
- `node`—Clear each session that uses the specified IP protocol on a specific node.
- `ospf`—Open Shortest Path First
- `pim`—Protocol Independent Multicast
- `rsvp`—Resource Reservation Protocol
- `sctp`—Stream Control Transmission Protocol
- `tcp`—Transmission Control Protocol
- `udp`—User Datagram Protocol

NOTE: Internet Protocol version 6 (IPv6) is not supported as a network protocol in application definitions.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 8.5.

protocol (Flow Descriptions)

IN THIS SECTION

- Syntax | 13978
- Hierarchy Level | 13978

- Description | 13978
- Default | 13978
- Options | 13978
- Required Privilege Level | 13979
- Release Information | 13979

Syntax

```
protocol number;
```

Hierarchy Level

```
[edit unified-edge pcef flow-description flow-identifier],
[edit services pcef flow-description flow-identifier]
```

Description

Specify a protocol type to identify the subscriber traffic that you want the service data flow (SDF) filter to detect. If you specify the `protocol` statement, you must specify a protocol number.

If you are using Junos OS Subscriber Aware, specify the protocol type at the `[edit unified-edge pcef flow-description flow-identifier]` hierarchy level.

If you are using Junos OS Broadband Subscriber Management, specify the protocol type at the `[edit services pcef flow-description flow-identifier]` hierarchy level.

Default

If you do not specify the `protocol` statement, the default is any protocol.

Options

number Number that specifies the IP protocol type.

- **Range:** 1 through 255

Required Privilege Level

For Junos OS Subscriber Aware:

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

For Junos OS Broadband Subscriber Management:

services—To view this statement in the configuration.

services–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support at the `[edit services pcef flow-description flow-identifier]` hierarchy level introduced for Junos OS Broadband Subscriber Management in Junos OS Release 17.2 on MX Series.

- Hierarchy Level | 13988
- Description | 13988
- Options | 13989
- Required Privilege Level | 13989
- Release Information | 13989

Syntax

```
protocol protocol-types;
```

Hierarchy Level

```
[edit class-of-service interfaces interface-name unit logical-unit-number rewrite-rules exp
rewrite-name],
[edit class-of-service interfaces interface-name unit logical-unit-number rewrite-rules dscp
rewrite-name],
[edit class-of-service interfaces interface-name unit logical-unit-number rewrite-rules dscp-
ipv6 rewrite-name],
[edit class-of-service interfaces interface-name unit logical-unit-number rewrite-rules inet-
precedence rewrite-name]
[edit class-of-service interfaces interface-name unit logical-unit-number rewrite-rules inet6-
precedence rewrite-name]
```

Description

Apply a rewrite rule to MPLS packets only, and write the CoS value to MPLS headers only; or apply a rewrite rule to MPLS and IPv4 or IPv6 packets, and write the CoS value to MPLS and IPv4 or IPv6 headers.

On segment routing LSPs, applying an EXP rewrite rule to the egress interface on the ingress (provider edge) router of a segment-routing network imposes the rewrite rule to all transport labels in the stack. As a result, you don't need to configure rewrite rules on every segment in the LSP.

By default, IP precedence rewrite rules alter the first three bits on the type-of-service (ToS) byte while leaving the last three bits unchanged. This default behavior applies to rewrite rules you configure for MPLS packets with IPv4 payloads on provider edge (PE) routers only. On transit routers (P), we do not alter the inner IPv4 headers and payloads while setting EXP bits in the outer MPLS header.

Options

`protocol-types` can be one of the following:

- `mpls-any`—Apply a rewrite rule to MPLS packets and write the CoS value to MPLS headers only.
- `mpls-inet-both`—Applies the CoS value to the MPLS and IPv4 headers of VPN packets on provider edge (PE) routers. On core routers, this option rewrites only the MPLS header and does not rewrite CoS bits in the inner IPv4 payload.
- `mpls-inet-both-non-vpn`—Applies the CoS value to the MPLS and IPv4 headers of non-VPN packets on provider edge (PE) routers. On core routers, this option rewrites only the MPLS header and does not rewrite CoS bits in the inner IPv4 payload.

> Junos OS Evolved supports only the `mpls-any` option. Devices running Junos OS Evolved do not support different rewrite rules for VPN and non-VPN traffic.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Option for `dscp` and `inet-prec` introduced in Junos OS Release 8.4.

    }
}
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type signature]
```

Description

Specify a protocol to match the header information for the signature attack.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3. Statement modified in Junos OS Release 12.3X48-D25 to add ICMPv6 protocol support.

protocol (Security Source NAT)

IN THIS SECTION

- Syntax | 14001
- Hierarchy Level | 14001
- Description | 14001
- Options | 14001
- Required Privilege Level | 14002
- Release Information | 14002

Syntax

```
protocol [protocol-name-or-number];
```

Hierarchy Level

```
[edit security nat source rule-set rule-set-name rule rule-name match]
```

Description

Specify an IP protocol to match the rule. You can configure multiple protocol names or protocol numbers.

Options

protocol-name-or-number—Name or number of the specific protocol.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.6.

protocol (Server MEP)

IN THIS SECTION

- Syntax | 14002
- Hierarchy Level | 14002
- Description | 14003
- Options | 14003
- Required Privilege Level | 14003
- Release Information | 14003

Syntax

```
protocol (l2circuit | l2vpn | ethernet) {
    interface interface-name;
}
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management]
```

Description

Configure the protocol as Layer 2 circuit, Layer 2 VPN, or Ethernet and associate the interface to the protocol that needs to be monitored for ETH-AIS.

Options

l2circuit	Configure the protocol for the server MEP as Layer 2 circuit.
l2vpn	Configure the protocol for the server MEP as Layer 2 VPN.
ethernet	Configure the protocol for the server MEP as Ethernet.
interface *interface-name*	The interface that is to be associated with the protocol that needs monitoring for ETH-AIS.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

Ethernet Alarm Indication

protocol (Subscriber Secure Policy)

IN THIS SECTION

Syntax | 14004

- Hierarchy Level | 14004
- Description | 14004
- Options | 14004
- Required Privilege Level | 14004
- Release Information | 14004

Syntax

```
protocol  protocol;
```

Hierarchy Level

```
[edit services radius-flow-tap policy policy-name inet drop-policy rule-name from],
[edit services radius-flow-tap policy policy-name  inet6 drop-policy rule-name from]
```

Description

Specify the match IP protocol type for the radius-flow-tap policy.

Options

protocol—Protocol for the IPv4 or IPv6 address for the radius-flow-tap policy.

Required Privilege Level

flow-tap—To view this statement in the configuration.

flow-tap-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

```

Hierarchy Level

```
[edit logical-systems name protocols layer2-control mac-rewrite interface interface-name],
[edit protocols layer2-control mac-rewrite interface interface-name]
```

Description

Configure the protocol to be tunneled on an interface using Layer 2 protocol tunneling (L2PT). To enable tunneling multiple protocols, include multiple `protocol` statements.

You can tunnel different protocols listed in the Options section on different types of devices. The Syntax and Release Information sections list the available options for the protocols that different devices can tunnel as of a particular Junos OS release (for devices that support L2PT).

When a service provider edge (PE) port configured for L2PT receives a control packet for a supported protocol, the device rewrites the multicast destination MAC address with the predefined multicast tunneling MAC address 01:00:0c:cd:cd:d0. The packet travels across the provider network transparently to the other end of the tunnel, and the destination device restores the original multicast destination MAC address to deliver the packet at its destination.

Options

`all`—Tunnel all supported Layer 2 control protocols.

`cdp`—Tunnel the Cisco Discovery Protocol (CDP).

`elmi`—Tunnel Ethernet Local Management Interface (E-LMI) packets.

`gvrp`—Tunnel Generic Attribute Registration Protocol (GARP) VLAN Registration Protocol (GVRP) packets.

`ieee8021x`—Tunnel IEEE 802.1X authentication packets.

`ieee8023ah`—Tunnel IEEE 802.3AH Operation, Administration, and Maintenance (OAM) link fault management (LFM) packets.

`lacp`—Tunnel Link Aggregation Control Protocol (LACP) packets.

`lldp`—Tunnel Link Layer Discovery Protocol (LLDP) packets.

`mmrp`—Tunnel Multiple MAC Registration Protocol (MMRP) packets.

`mvrp`—Tunnel Multiple VLAN Registration Protocol (MVRP) packets.

`pvstp`—Tunnel VLAN Spanning Tree Protocol (VSTP), Per-VLAN Spanning Tree (PVST), and Per-VLAN Spanning Tree Plus (PVST+) Protocol packets.

`stp`—Tunnel packets for all versions of Spanning-Tree Protocols.

`udld`—Tunnel Unidirectional Link Detection (UDLD) packets.

`vstp`—Tunnel VLAN Spanning Tree Protocol (VSTP) packets.

`vtp`—Tunnel VLAN Trunking Protocol (VTP) packets.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

Support for PVST/PVST+ introduced in Junos OS Release 13.3 for MX Series routers and EX9200 switches.

Support for E-LMI, IEEE 802.1X, MMRP, and UDLD introduced in Junos OS Release 17.3R1 for EX4300 switches.

Support for E-LMI, GVRP, IEEE 802.1x, IEEE 802.3AH, LACP, LLDP, MMRP, MVRP, and UDLD introduced in Junos OS Release 17.3R1 for EX9200 switches.

Support for E-LMI, IEEE 802.1X, MMRP, and UDLD introduced in Junos OS Release 18.2R1 for EX2300 and EX3400 switches.

`all` option added in Junos OS Release 22.3R1.

Description

Select family as protocol primary. In some customer use cases, CPE devices have reachability to multiple BNG routers for load sharing. The CPE's DHCP client broadcasts a DHCP protocol handshake to the reachable routers; more than one router may respond. In a DHCP dual-stack environment, the DHCPv4 and DHCPv6 protocol handshakes are independent of each other, meaning that each arm of the subscriber session could connect to a different router. You can avoid this situation by specify the primary protocol. For a given dual-stack subscriber, this configuration causes the rejection of any binding attempt from the secondary address family client when a binding is not currently active for the primary protocol family. If bindings are currently active for both arms when the primary protocol family binding is released or deleted, then the binding for the secondary address family is also torn down.

Options

inet INET family has protocol primary behavior.

inet6 INET6 family has protocol primary behavior.

```

Hierarchy Level

```
[edit services ssl termination profile profile-name]
[edit services ssl initiation profile profile-name]
```

Description

Specify the accepted SSL protocol version.

You can specify the SSL/TLS protocol version the SRX Series Firewall uses to negotiate in SSL connections.

Options

- `all`—Accept all versions of TLS. This is enabled by default.
- `TLS version 1.0`—Accept TLS version 1.0. It provides secure communication over networks by providing privacy and data integrity between communicating applications
- `TLS version 1.1`—Accept TLS version 1.1. This enhanced version of TLS provides protection against cipher-block chaining (CBC) attacks.
- `TLS version 1.2` —Accept TLS version 1.2. This enhanced version of TLS provides improved flexibility for negotiation of cryptographic algorithms.
- `TLS version 1.2 and lower` —Accept TLS version 1.2 and lower.
- `TLS version 1.3` —Accept TLS version 1.3. This enhanced version of TLS provides improved security and better performance.

Required Privilege Level

Description

Change default configurable control plane DDoS protection policer parameters for all packet types within a protocol group or for a particular packet type within a protocol group.

> **NOTE**: PTX10003 router doesn't support the `priority` option to change default priority values for aggregate or individual packet type policers.
> QFX10002-60C switches and PTX Series routers do not support the `bypass-aggregate` option.

> **NOTE**: Although the term bandwidth usually refers to bits per second (bps), this feature's `bandwidth` option represents a packets per second (pps) value, and the `burst` option represents number of packets in a burst. These options are explained separately.

Not all protocol groups and packet types listed in Table 121 on page 14025 or Table 122 on page 14034 are supported on all devices. Exceptions include:

- ACX Series routers support only the following protocol group options: `arp`, `bfd`, `bfdv6`, `bgp`, `dhcpv4v6`, `eoam`, `esmc`, `igmp`, `ipmcast-miss` (unknown multicast packets), `isis`, `lacp`, `ldp`, `lldp`, `ndpv6`, `oam-lfm`, `ospf`, `pim`, `pvstp`, `rip`, `rsvp`, `stp`, and `vrrp`.
- PTX10003 and PTX10008 routers do not support the following policer protocol group options: `all-fiber-channel-enode`, `bridge-control`, `diameter`, `garp-reply`, `l2pt`, `ptp`, `radius`, and `tacacs`.
- Other PTX Series routers do not support the following policer protocol group options: `all-fiber-channel-enode`, (however, `arp` protocol group is supported), `bridge-control`, `diameter`, `garp-reply`, `martian-address`, `proto-802-1x`, `ptp`, `pvstp`, `radius`, `stp`, and `tacacs`
- QFX10002-60C switches do not support the following policer protocol group options: `all-fiber-channel-enode`, (however, `arp` protocol group is supported), `bridge-control`, `diameter`, `garp-reply`, `martian-address`, `proto-802-1x`, `ptp`, `radius`, and `tacacs`
- QFX10002, QFX10008, and QFX10016 switches do not support the `ttl` protocol group option.

Options

aggregate Configure parameters for the policer that polices all control packets belonging to the specified protocol as a combined group. An aggregate policer exists for all protocol groups.

> **NOTE**: ACX Series routers support only the aggregate policer for the supported protocol groups.

packet-type Configure policer values for the specified individual control packet type within a protocol group. On some devices, you can configure the packet-type policers in the protocol groups listed in Table 121 on page 14025. For all other protocol groups not listed in Table 121 on page 14025, only aggregate policers are available.

Table 121 on page 14025 lists the protocol groups with packet-type policers available on some devices, and common values for default-configured parameters. Default values can differ among supporting devices and across different Junos OS releases; you can run the `show ddos-protection protocols` or `show ddos-protection protocols parameters` CLI command before modifying any configurable values to see the default policer values for all supported protocol groups and packet types. You can also include a specific protocol group and packet type (or aggregate) with those commands.

Each of the protocol groups in Table 121 on page 14025 also supports the aggregate policer. See Table 122 on page 14034 for the default aggregate policer values for all protocol groups.

Table 121: Packet Types Supported by Control Plane DDoS Protection on PTX Series Routers and QFX Series Switches

Protocol Group	Packet Type	Description	Default Bandwidth (pps)	Default Burst (number of packets)	Default Priority
`arp`	`arp-snoop` or `arp` **NOTE**: Starting in Junos OS Release 20.3R1 and several other maintenance releases on PTX and QFX Series switches, option name `arp-snoop` is renamed simply `arp`.	ARP traffic	10000	1024 or 2048	High
	`unclassified`	Unclassified ARP packets	500	1024	High
`bfd`	`bundle-bfd`	(PTX 10003 only) Link bundle BFD traffic	10000	10000	High
	`multihop-bfd`	Multihop BFD traffic	5000 or 10000	2048 or 10000	High
	`unclassified`	Unclassified BFD packets	10000	2048	High

Table 121: Packet Types Supported by Control Plane DDoS Protection on PTX Series Routers and QFX Series Switches *(Continued)*

Protocol Group	Packet Type	Description	Default Bandwidth (pps)	Default Burst (number of packets)	Default Priority
`dhcpv4` (PTX10003 and PTX10008 routers only; for rate-limiting at line card and RE levels)	`ack`	DHCPACK packets	500	500	Medium
	`bad-packets`	DHCPv4 packets with bad formats	0	0	Low
	`bootp`	DHCPBOOTP packets	300	300	Low
	`decline`	DHCPDECLINE packets	500	500	Low
	`discover`	DHCPDISCOVER packets	500	500	Low
	`force-renew`	DHCPFORCE RE-NEW packets	2000	2000	High
	`inform`	DHCPINFORM packets	500	500	Low
	`lease-active`	DHCPLEASE ACT-IVE packets	2000	2000	High
	`lease-query`	DHCPLEASE-QUERY packets	2000	2000	High

Table 121: Packet Types Supported by Control Plane DDoS Protection on PTX Series Routers and QFX Series Switches *(Continued)*

Protocol Group	Packet Type	Description	Default Bandwidth (pps)	Default Burst (number of packets)	Default Priority
	`lease-unassigned`	DHCPLEASE UN-ASSIGNED packets	2000	2000	High
	`lease-unknown`	DHCPLEASE UN-KNOWN packets	2000	2000	High
	`nak`	DHCPNAK packets	500	500	Low
	`no-message-type`	DHCP packets that are missing the message type	1000	1000	Low
	`offer`	DHCPOFFER packets	1000	1000	Low
	`rebind`	DHCPv4 REBIND packets	2000	2000	High
	`release`	DHCPRELEASE packets	2000	2000	High
	`renew`	DHCPRENEW packets	2000	2000	High

Table 121: Packet Types Supported by Control Plane DDoS Protection on PTX Series Routers and QFX Series Switches *(Continued)*

Protocol Group	Packet Type	Description	Default Bandwidth (pps)	Default Burst (number of packets)	Default Priority
	`request`	DHCPREQUEST packets	1000	1000	Medium
	`unclassified`	All unclassified DHCPv4 packets	300	150	Low
`dhcpv6` (PTX10003 and PTX10008 routers only; for rate-limiting at line card and RE levels)	`advertise`	DHCPv6 ADVERTISE packets	500	500	Low
	`confirm`	DHCPv6 CONFIRM packets	1000	1000	Medium
	`decline`	DHCPv6 DECLINE packets	1000	1000	Low
	`information-request`	DHCPv6 INFORMATION-REQUEST packets	1000	1000	Low
	`leasequery`	DHCPv6 LEASEQUERY packets	1000	1000	Low

Table 121: Packet Types Supported by Control Plane DDoS Protection on PTX Series Routers and QFX Series Switches *(Continued)*

Protocol Group	Packet Type	Description	Default Bandwidth (pps)	Default Burst (number of packets)	Default Priority
	`leasequery-data`	DHCPv6 LEASEQUERY - DATA packets	1000	1000	Low
	`leasequery-done`	LEASEQUERY - DONE packets	1000	1000	Low
	`leasequery-reply`	DHCPv6 LEASEQUERY - REPLY packets	1000	1000	Low
	`rebind`	DHCPv6 REBIND packets	2000	2000	Medium
	`reconfigure`	DHCPv6 RECONFIGURE packets	1000	1000	Low
	`relay-forward`	DHCPv6 RELAY-FORWARD packets	1000	1000	Low
	`relay-reply`	DHCPv6 RELAY-REPLY packets	1000	1000	Low

Table 121: Packet Types Supported by Control Plane DDoS Protection on PTX Series Routers and QFX Series Switches *(Continued)*

Protocol Group	Packet Type	Description	Default Bandwidth (pps)	Default Burst (number of packets)	Default Priority
	`release`	DHCPv6 RELEASE packets	2000	2000	High
	`renew`	DHCPv6 RENEW packets	2000	2000	Medium
	`reply`	DHCPv6 REPLY packets	1000	1000	Medium
	`request`	DHCPv6 REQUEST packets	1000	1000	Medium
	`solicit`	DHCPv6 SOLICIT packets	500	500	Low
	`unclassified`	All unclassified DHCPv6 packets	3000	3000	Low
`eoam`	`oam-cfm`	Ethernet OAM CFM traffic	1000	1024 or 2048	High
	`unclassified`	Unclassified Ethernet OAM traffic	100000	1024 or 2048	High

Table 121: Packet Types Supported by Control Plane DDoS Protection on PTX Series Routers and QFX Series Switches *(Continued)*

Protocol Group	Packet Type	Description	Default Bandwidth (pps)	Default Burst (number of packets)	Default Priority
`igmpv6`	`mld`	MLD traffic	1000 or 5000	1024 or 2048	High
	`unclassified`	Unclassified IGMPv6 packets	1000 or 90000	1024 or 2048	High
`ldp`	`ldp-hello` Some devices have an `ldp-hello` aggregate policer. Only the following devices support this packet type policer: • PTX10003 and PTX10008 routers • QFX10002, QFX10008, and QFX10016 switches	LDP HELLO traffic	1000	1024	High
	`unclassified`	LDP unclassified packets	1000	1024	High

Table 121: Packet Types Supported by Control Plane DDoS Protection on PTX Series Routers and QFX Series Switches *(Continued)*

Protocol Group	Packet Type	Description	Default Bandwidth (pps)	Default Burst (number of packets)	Default Priority
`mcast-snoop`	`igmp`	Control packets for IGMP snooping	500, 5000, or 20000	2048 or 5000	High
	`mld`	Control packets for MLD snooping	500, 2000, or 5000	2048	High
	`pim`	Control packets for PIM snooping	500, 2000, or 5000	2048	High
	`unclassified`	Unclassified multicast snooping control packets	500	2048	High
`radius`	`accounting`	RADIUS accounting packets	200	2048	High
	`authorization`	RADIUS authorization packets	200	2048	High
	`server`	RADIUS server traffic	200	2048	High

Table 121: Packet Types Supported by Control Plane DDoS Protection on PTX Series Routers and QFX Series Switches *(Continued)*

Protocol Group	Packet Type	Description	Default Bandwidth (pps)	Default Burst (number of packets)	Default Priority
	`unclassified`	Unclassified RADIUS traffic	200	2048	High
`tcc`	`ethernet-tcc`	TCC-encapsulated Ethernet traffic	100	100, 1024 or 2048	High
	`iso-tcc`	TCC-encapsulated ISO traffic	100	100, 1024 or 2048	High
	`unclassified`	Unclassified TCC-encapsulated traffic	100	1024 or 2048	High

protocol-group

Configure policer values for the specified protocol group. You can configure the aggregate policer for any of the following protocol groups listed in Table 122 on page 14034. The table shows the aggregate policer default-configured parameters for each protocol group. Default values can differ among supporting devices and across different Junos OS releases; you can run the `show ddos-protection protocols` or `show ddos-protection protocols parameters` CLI command before modifying any configurable values to see the default policer values for all supported protocol groups. You can also include a specific protocol group with or without the `aggregate` option with those commands to see the aggregate policer parameters.

The protocol groups in Table 122 on page 14034 also support any corresponding individual packet-type policers listed in Table 121 on page 14025.

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`all-fiber-channel-enode`	Fiber channel ENode traffic	10	1024 or 2048
`arp` or `arp-snoop` (Different platforms support an aggregate policer protocol group option for ARP traffic named either `arp` or `arp-snoop`.)	ARP traffic **NOTE**: On some platforms, the `arp` protocol group encompasses `arp-snoop` as a packet type. See Table 121 on page 14025. Starting in Junos OS Release 20.3R1 and other maintenance releases on PTX and QFX Series switches, the `arp-snoop` packet type option in the `arp` protocol group is renamed `arp`.	1000, 2000, or 10000	512, 1024, 2000, or 2048
`bfd`	Single-hop BFD traffic	1000, 6200, 10000, 20000, or 250000	512, 2048 or 20000
`bfdv6`	BFDv6 traffic	512, 3000, 10000, 20000, or 250000	512, 2048 or 20000
`bgp`	BGP traffic	1200, 1500, 3000, 5000, 10000, 20000, or 250000	512, 2048, 4096, or 20000

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches *(Continued)*

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`bridge-control`	Bridge Control traffic	10	2048
`dhcpv4` (PTX10003 and PTX10008 routers only)	Aggregate for all DHCPv4 traffic (priority Medium) **NOTE**: On PTX10003 and PTX10008 routers, use this option for rate-limiting at PFE line card and RE levels. Use aggregate option `dhcpv4v6` for rate-limiting at PFE chip level.	5000	5000
`dhcpv6` (PTX10003 and PTX10008 routers only)	Aggregate for all DHCPv6 traffic (priority Low) **NOTE**: On PTX10003 and PTX10008 routers, use this option for rate-limiting at PFE line card and RE levels. Use aggregate option `dhcpv4v6` for rate-limiting at PFE chip level.	5000	5000

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches *(Continued)*

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`dhcpv4v6`	DHCPv4 and DHCPv6 traffic (limits apply to combined traffic) **NOTE**: On PTX10003 and PTX10008 routers, use this aggregate option for rate-limiting at PFE chip level only (priority is Low). Use `dhcpv4` and `dhcpv6` protocol group and individual packet type options for rate-limiting at line card and RE levels.	600 or 5000	512, 2048 or 5000
`diameter`	Diameter and Gx-Plus traffic	200	2048
`dns`	DNS traffic	200	200 or 2048
`dtcp`	DTCP traffic	200	200 or 2048
`egpv6`	EGPv6 traffic	10	10 or 2048

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches *(Continued)*

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`eoam`	Ethernet OAM traffic **NOTE**: On PTX10003 and PTX10008 routers, the aggregate `eoam` protocol group option includes OAM-CFM packets (no `oam-cfm` individual packet type option).	1000, 6200, or 100000	102, 512, 2048, or 10000
`esmc`	ESMC traffic	200	512
`ethernet-tcc`	TCC-encapsulated Ethernet traffic **NOTE**: The `tcc` protocol group option encompasses this as a packet type option on some devices.	100	100 or 2048
`exception`	• MTU traffic • Multicast traffic • TTL traffic (QFX10002, QFX10008, and QFX10016 switches only)	100	2048

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches *(Continued)*

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`ftp`	FTP traffic	500 or 1500	1500 or 2048
`garp-reply`	Gratuitous ARP reply traffic	100	2048
`gre`	GRE traffic	500	500 or 2048
`icmp`	ICMP traffic	500, 1000, or 20000	500, 2048, or 20000
`igmp`	IGMPv4 and IGMPv6 traffic **NOTE**: Use this option on PTX Series and QFX10002-60C devices for IGMPv4 traffic only, and `igmpv6` option for IGMPv6 traffic. On PTX10003 and PTX10008 routers, this option encompasses aggregated IGMP and MLD traffic.	1000, 1600, 5000, or 90000	512, 2048 or 5000
`igmpv6`	IGMPv6 traffic	20000 or 90000	2048 or 5000
`ip-options`	IP traffic with IP packet header options	100	100 or 2048

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches *(Continued)*

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`ipmcast-miss` (ACX Series only)	Unknown IPv4 and IPv6 multicast packets	600	512
`isis`	IS-IS traffic	1000, 1200, 5000, or 20000	512, 2048, 4096, or 20000
`isis-data`	ISIS-Data traffic	5000, 8000, or 10000	4096 or 8000
`isis-hello`	ISIS-Hello traffic	1000, 5000, or 12000	4096 or 12000
`iso-tcc`	TCC-encapsulated ISO traffic **NOTE**: The `tcc` protocol group option encompasses this as a packet type option on some devices.	100	100 or 2048
`l2pt`	Layer 2 protocol tunneling traffic	500	2048
`l2tp`	Layer 2 tunneling protocol traffic	500	500 or 2048
`lacp`	LACP traffic	800, 1000, or 2000	512, 300, 2000, or 2048
`ldp`	LDP traffic	1200, 5000, 10000, or 20000	200, 512, 2048, or 20000

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches *(Continued)*

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`ldp-hello`	LDP hello packets **NOTE**: The following devices have an `ldp-hello` packet type policer and do not use this aggregate policer: • PTX10003 and PTX10008 routers • QFX10002, QFX10008, and QFX10016 switches	1000 or 5000	2048 or 5000
`lldp`	LLDP traffic	100, 800, or 2000	300, 512, 2000, or 2048
`lmp`	LMP traffic	100	100 or 2048
`martian-address`	Martian address	200	20
`mcast-snoop`	Control traffic for multicast snooping	5000, 20000, or 22000	2048, 6000, or 20000

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches *(Continued)*

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`mld`	MLD traffic **NOTE**: The `igmpv6` protocol group option encompasses this as a packet type option on some devices.	1000	2048
`msdp`	MSDP traffic	20000	20000
`multihop-bfd`	Multihop BFD traffic **NOTE**: The `bfd` protocol group option encompasses this as a packet type option on some devices.	1500	2048
`ndpv6`	NDPv6 traffic	100, 1000, or 2000	512, 1024, or 2000
`ntp`	NTP traffic	20000	20000

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches *(Continued)*

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`oam-cfm`	OAM CFM traffic **NOTE**: The `eoam` protocol group option encompasses this as a packet type option on some devices. On PTX10003 and PTX10008 routers, the aggregate `eoam` protocol group option includes OAM-CFM packets (no `oam-cfm` individual packet type option).	200	2048
`oam-lfm`	OAM LFM traffic	200, 800, 1000, or 20000	512, 1000, 2048, or 20000
`ospf`	OSPF traffic	1200, 5000, 10000, or 20000	200, 512, 2048, 4096, or 20000
`ospf-hello`	OSPF hello packets	1000, 1500, or 10000	2048, 4096, or 20000
overlay	Packets such as ARP and NDP coming over VxLAN tunnel with VxLAN header.	500	200
`pim` (ACX Series only)	PIM IPv4 and IPv6 packets	1600	512

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches *(Continued)*

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`pim-ctrl`	PIM control packets	1000 or 1500	200 or 2048
`pim-data`	PIM data	2000 or 3000	1024 or 2048
`proto-802-1x`	802.1X traffic	200	200 or 2048
`ptp`	PTP traffic	100	2048
`pvstp`	PVSTP traffic	800, 2000, or 20000	512, 2048, or 20000
`radius`	RADIUS traffic	200	2048
`reject`	Packets rejected by a next-hop forwarding decision	100, 200, or 2000	200, 2000, or 2048
`resolve`	Unclassified IPv4 and IPv6 resolve packets sent to the host because of a traffic request resolve action	100, 500, or 5000	100, 2048, or 5000
`rip`	RIP traffic	200, 1200, or 20000	200, 512, 2048, or 20000
`rsvp`	RSVP traffic	1200, 5000, 10000, or 20000	512, 2048, 10000, or 20000

Table 122: Protocol Groups Supported by Control Plane DDoS Protection on ACX Series Routers, PTX Series Routers, and QFX Series Switches *(Continued)*

Protocol Group	Description	Default Bandwidth (pps)	Default Burst (number of packets)
		The default bandwidth and burst values varies based on the platform type and underlying DDoS infra settings.	
`snmp`	SNMP traffic	1000 or 20000	1024, 2048, or 20000
`ssh`	SSH traffic	5000 or 20000	500, 2048, or 20000
`stp`	STP traffic	800 or 20000	512, 2048, or 20000
`tacacs`	TACACS+ traffic	200	2048
`tcc`	Transitional Cross-connect encapsulated traffic	100 or 200	200, 1024, or 2048
`telnet`	Telnet traffic	5000 or 20000	500, 2048, or 20000
`ttl`	Time to Live packets	100 or 2000	2048
`unclassified`	Traffic that cannot be classified into one of the other available protocol groups	100 or 10000	2048 or 10000
`vrrp`	VRRP traffic	512, 1000, 2000, or 20000	512, 1000, 2048, or 20000
`vxlan`	VXLAN Layer 2 and Layer 3 packets	300	10

Table 123: Protocol Groups Supported by Control Plane DDoS Protection on PTX Series Routers for Junos OS Evolved

Protocol Group	Description
`arp` or	Configure ARP traffic
`bfd`	Configure BFD traffic
`bfdv6`	BFDv6 traffic
`bgp`	Configure BGP traffic
`custom`	Configure CUSTOM traffic
`sample`	Configure Sampling traffic
`dhcpv4`	Configure DHCPv4 traffic
`dhcpv6`	Configure DHCPv6 traffic
`dhcpv4v6`	Configure DHCPv4/v6 traffic
`l2tp`	Configure L2TP traffic.
`ppp`	Configure PPP traffic.
`pppoe`	Configure PPPoE traffic.

Starting in Junos OS Evolved Release 23.1R1, on QFX5220, QFX5130, and QFX5700 Series devices, the default DDoS `localnh aggregate bandwidth` value is 1500 pps. Earlier to Junos OS Evolved Release 23.1R1, you can configure the bandwidth value using the [`set system ddos-protection protocols localnh aggregate bandwidth 1500 burst 200`] CLI command. This configuration enables you to prevent LAG interface down time during the heavy local IP traffic.

Starting in Junos OS Release 23.3R1, on QFX Series devices, we've added the `ip-option` protocol support at the [`edit ddos-protection protocols`] hierarchy level.

Starting in Junos OS Release 23.4R1, on QFX5000 Series and EX4000 Series devices, the address resolution protocol (ARP) packets over the virtual tunnel endpoints (VTEP) tunnel goes to the overlay ARP. You can check the ARP details using the `show ddos-protection protocols overlay arp` CLI command. We also introduce the `overlay` statement at the [`edit system ddos-protection protocols`] hierarchy level to control the VxLANDDOS packets.

Starting Junos OS Evolved release 23.4R1 supports, DVLAN (single and dual tag) for subscriber services scaling, performance on ACX7100-48L devices that includes:

- DHCP (IP-DEMUX lite) & PPPoE subscribers (IPv4, IPV6, and Dual stack) with CoS Lawful Intercept and filter support.
- DVLAN (Single and dual tag) with L2TP (LAC) DDOS policers configuration for BBE protocols. Individual BBE protocol and DDOS protocol group configuration is enabled.
- Support for protocol groups DHCPv6, L2TP, PPP, and PPPoE
- Only the aggregate DDOS protocol group `dhcpv4v6` is active.
- Subscriber scale qualification with Class of Support (CoS) for Layer 2 Tunneling Protocol (L2TP), L2TP access concentrator (LAC) subscriber interfaces for IPV4, IPV6 and dual stack.

  The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

Description

(MX Series routers with only MPCs or LC9600 or LC4800, T4000 Core Routers with only FPC5s, or EX9200 switches) Configure control plane DDoS protection policers for all supported packet types within a protocol group or for a particular supported packet type within a protocol group.

Starting in Junos OS Release 22.2R1, we’ve enabled support for following DDoS protocol statements for MX10008 devices also. In earlier releases, the MX10008 devices did not support these DDoS protocol statements.

- `Filter-action`
- `Virtual-chassis`
- `Ttl`
- `Redirect`
- `Re-services`
- `Re-services-v6`
- `Rejectv6`
- `L2pt`

- `Syslog`
- `Vxlan`

> **NOTE**: For the available control plane DDoS protection policer configuration options on PTX Series routers and QFX Series switches, which are different from the options described here, see protocols (DDoS) (ACX Series, PTX Series, and QFX Series).

> **NOTE**: Although the term bandwidth usually refers to bits per second (bps), this feature's `bandwidth` option represents a packets per second (pps) value, and the `burst` option represents number of packets in a burst. These options are explained separately.

Options

aggregate Configure the policer to monitor all control packets within the protocol group. You can configure an aggregate policer for any protocol group.

packet-type (Optional) Name of the control packet type to be policed. You can configure a specific policer for only the following packet types and protocol groups:

- `arp`—The following ARP packet types are available:
  - `aggregate`—Applies to the combination of all types of control packet traffic for this protocol group.

  On MX Series devices, prior to Junos OS Release 23.2R1, the ARP request and reply traffic had a single DDoS protocol. Starting in Junos OS Release 23.2R1, you can configure separate DDoS protocol packet-types, `bcast` and `ucast`, at the [`edit ddos-protection protocols arp`] hierarchy level for ARP request and reply traffic. The separate DDoS policers provide an improved packet rate limiting and priority handling for ARP traffic.

- `bgp`—The following BGP packet types are available:
  - `aggregate`—Applies to the combination of all types of control packet traffic for this protocol group.
- `bgpv6`—The following BGPv6 packet types are available:
  - `aggregate`—Applies to the combination of all types of control packet traffic for this protocol group.

- `dhcpv4`—The following packet types are available for DHCPv4 traffic:
  - `ack`—DHCPACK packets.
  - `bad-packets`—DHCPv4 packets with bad formats.
  - `bootp`—DHCPBOOTP packets.
  - `decline`—DHCPDECLINE packets.
  - `discover`—DHCPDISCOVER packets.
  - `force-renew`—DHCPFORCERENEW packets.
  - `inform`—DHCPINFORM packets.
  - `lease-active`—DHCPLEASEACTIVE packets.
  - `lease-query`—DHCPLEASEQUERYpackets.
  - `lease-unassigned`—DHCPLEASEUNASSIGNED packets.
  - `lease-unknown`—DHCPLEASEUNKNOWN packets.
  - `nak`—DHCPNAK packets.
  - `no-message-type`—DHCP packets that are missing the message type.
  - `offer`—DHCPOFFER packets.
  - `release`—DHCPRELEASE packets.
  - `renew`—DHCPRENEW packets.
  - `request`—DHCPREQUEST packets.
  - `unclassified`—All unclassified packets in the protocol group.
- `dhcpv6`—The following packet types are available for DHCPv6 traffic:
  - `advertise`—ADVERTISE packets.
  - `confirm`—CONFIRM packets.
  - `decline`—DECLINE packets.
  - `information-request`—INFORMATION-REQUEST packets.

    - `leasequery`—LEASEQUERY packets.
    - `leasequery-data`—LEASEQUERY-DATA packets.
    - `leasequery-done`—LEASEQUERY-DONE packets.
    - `leasequery-reply`—LEASEQUERY-REPLY packets.
    - `rebind`—REBIND packets.
    - `reconfigure`—RECONFIGURE packets.
    - `relay-forward`—RELAY-FORWARD packets.
    - `relay-reply`—RELAY-REPLY packets.
    - `release`—RELEASE packets.
    - `renew`—RENEW packets.
    - `reply`—REPLY packets.
    - `request`—REQUEST packets.
    - `solicit`—SOLICIT packets.
    - `unclassified`—All unclassified packets in the protocol group.
- `filter-action`—The following packet types are available for unclassified firewall filter action packets, sent to the host because of reject terms in firewall filters:
    - `filter-v4`—Unclassified IPv4 filter action packets.
    - `filter-v6`—Unclassified IPv6 filter action packets.
    - `other`—All other unclassified filter action packets that are not IPv4 or IPv6.
- `frame-relay`—The following packet types are available for Frame Relay traffic:
    - `frf15`—Multilink frame relay FRF.15 packets.
    - `frf16`—Multilink frame relay FRF.16 packets.
- `ip-fragments`—The following packet types are available for IP fragments:
    - `first-fragment`—First IP fragment.

    - `trail-fragment`—Last IP fragment.

- `ip-options`—The following packet types are available for IP option traffic:
    - `non-v4v6`—Options packets other than IPv4/v6.
    - `router-alert`—Router alert options packets.
    - `unclassified`—All unclassified packets in the protocol group.

- `l2tp`—The following packet types are available for L2TP LNS subscriber management network environments in Junos OS releases 13.3R5 and 14.1X50 (this option has been obsoleted by L2TP ERA in current Enhanced Subscriber Management environments):
    - `cdn`—Call-Disconnect-Notify message packets.
    - `hello`—Hello message packets.
    - `iccn`—Incoming-Call-Connected message packets.
    - `icrq`—Incoming-Call-Request message packets.
    - `scccn`—Start-Control-Connection-Connected message packets.
    - `sccrq`—Start-Control-Connection-Request message packets.
    - `stopccn`—Stop-Control-Connection-Notification message packets.
    - `unclassified`—All unclassified packets in the protocol group.

- `mcast-snoop`—Control traffic for multicast snooping.
    - `igmp`—Snooped IGMP traffic.
    - `mld`—Snooped MLD traffic.
    - `pim`—Snooped PIM control traffic.

- `mlp`—The following MLP packet types are available:
    - `aggregate`—Applies to the combination of all types of control packet traffic for this protocol group.
    - `add`—Add requests; internal MAC address learning request packets sent to the host.

    - `delete`—Delete requests; internal MAC address learning request packets sent to the host.
    - `lookup`—Lookup requests; internal MAC address learning request packets sent to the host.
    - `unclassified`—All unclassified packets in the protocol group.
    - `macpin-exception`—Exceptions to MAC address pinning (wherein dynamically learned MAC addresses are pinned to prevent looping caused by MAC moves from duplicate MAC detection).
- `ndpv6`—The following NDPv6 packet types are available, except where noted, starting in 14.1R8, 14.2R8, 15.1R5, 15.1F7, and 16.1R1:
    - `aggregate`—Applies to the combination of all types of control packet traffic for this protocol group.
    - `invalid-hop-limit`—(Starting in 16.1R2) Invalid hop limit packets. These messages might represent crafted packets in a malicious network-based packet flood.
    - `neighbor-advertisement`—Neighbor advertisement packets. These are messages used for duplicate address detection and to test reachability of neighbors. Neighbor advertisements are sent in response to neighbor solicitation messages.
    - `neighbor-solicitation`—Neighbor solicitation packets. These are messages used for duplicate address detection and to test reachability of neighbors.
    - `redirect`—Redirect packets.
    - `router-advertisement`—Router advertisement packets. These are messages sent to announce the presence of the router, advertise prefixes, assist in address configuration, and share other link information such as MTU size and hop limit. The IPv6 nodes on the link can use this information to configure themselves with an IPv6 address and routing information such as the default gateway.
    - `router-solicitation`—Router solicitation packets. These are messages sent by IPv6 nodes when they come online to solicit immediate router advertisements from the router.
- `ppp`—The following PPP packet types are available:
    - `authentication`—PPP authentication protocol packets.

    - `echo-rep`—LCP echo reply packets.
    - `echo-req`—LCP echo request packets.
    - `ipcp`—IP Control Protocol packets.
    - `ipv6cp`—IPv6 Control Protocol packets.
    - `isis`—IS-IS packets.
    - `lcp`—Link Control Protocol packets.
    - `mlppp-lcp`—MLPPP LCP packets.
    - `mplscp`—MPLS Control Protocol packets.
    - `unclassified`—All unclassified packets in the protocol group.
- `pppoe`—The following PPPoE packet types are available:
    - `padi`—PADI packets.
    - `padm`—PADM packets.
    - `padn`—PADN packets.
    - `pado`—PADO packets.
    - `padr`—PADR packets.
    - `pads`—PADS packets.
    - `padt`—PADT packets.
- `radius`—The following RADIUS packet types are available:
    - `accounting`—RADIUS accounting packets.
    - `authorization`—RADIUS authorization packets.
    - `server`—RADIUS server traffic.
    - `unclassified`—All unclassified packets in the protocol group.
- `re-services`—The following packet type is available for Routing Engine-based HTTP redirect IPv4 traffic:

    - `captive-portal`—Routing Engine-based captive portal content delivery packets.

- `re-services-v6`—The following packet type is available for Routing Engine-based HTTP redirect IPv6 traffic:
    - `captive-portal`—Routing Engine-based captive portal content delivery packets.

- `resolve`—The following packet types are available for unclassified resolve packets, which are sent to the host because of a traffic request resolve action:
    - `mcast-v4`—Unclassified IPv4 multicast resolve packets.
    - `mcast-v6`—Unclassified IPv6 multicast resolve packets.
    - `ucast-v4`—Unclassified IPv4 unicast resolve packets.
    - `ucast-v6`—Unclassified IPv6 unicast resolve packets.
    - `other`—All other unclassified resolve packets.

- `sample`—The following sample packet types are available:
    - `host`—Host packets.
    - `pfe`—Packet Forwarding Engine packets.
    - `syslog`—System log message packets.
    - `tap`—TAP packets.

- `tcp-flags`—The following TCP-flagged packet types are available:
    - `established`—TCP packets with ACK or RST flags set.
    - `initial`—TCP packets with SYN flag set and ACK flag not set.
    - `unclassified`—TCP packets with flags set any other way than the established and initial packets.

- `unclassified`—The following unclassified packet types are available:
    - `control-layer2`—Unclassified layer 2 control packets.
    - `control-v4`—Unclassified IPv4 control packets.
    - `control-v6`—Unclassified IPv6 control packets.

- `fw-host`—Unclassified send-to-host firewall packets.
- `host-route-v4`—Unclassified IPv4 routing protocol and host packets in traffic sent to the router local interface address.
- `host-route-v6`—Unclassified IPv6 routing protocol and host packets in traffic sent to the router local interface address.
- `other`—All unclassified packets that do not belong to another type.

- `virtual-chassis`—The following packet types are available for virtual chassis packets:
  - `control-low`—Low-priority control packets.
  - `control-high`—High-priority control packets.
  - `unclassified`—All unclassified packets in the protocol group.
  - `vc-packets`—All exception packets on the virtual chassis link.
  - `vc-ttl-errors`—Virtual chassis TTL error packets.

protocol-group

Name of the protocol group for which traffic is policed. You can configure a policer for any of the following protocol groups:

- `amtv4`—IPv4 AMT traffic.
- `amtv6`—IPv6 AMT traffic.
- `ancp`—ANCP traffic.
- `ancpv6`—ANCPv6 traffic.
- `arp`—ARP traffic.
- `atm`—ATM traffic.
- `bfd`—BFD traffic.
- `bfdv6`—BFDv6 traffic.
- `bgp`—BGP traffic.
- `bgpv6`—BGPv6 traffic.
- `control`—Control traffic.
- `demux-autosense`—Demux autosensing traffic.

- `dhcpv4`—DHCPv4 traffic.
- `dhcpv6`—DHCPv6 traffic.
- `diameter`—Diameter and Gx-Plus traffic.
- `dns`—DNS traffic.
- `dtcp`—DTCP traffic.
- `dynamic-vlan`—Dynamic VLAN exception traffic.
- `egpv6`—EGPv6 traffic.
- `eoam`—EOAM traffic.
- `esmc`—ESMC traffic.
- `fab-probe`—Fab out probe packets.
- `filter-action`—IPv4 and IPv6 firewall filter action packets sent to the host because of reject terms in firewall filters
- `frame-relay`—Frame relay traffic.
- `ftp`—FTP traffic.
- `ftpv6`—FTPv6 traffic.
- `gre`—GRE traffic.
- `gtp-path-mgmt`—GTP path management traffic.
- `icmp`—ICMP traffic.
- `igmp`—IGMP traffic
- `igmpv4v6`—IGMP v4/v6 traffic.
- `igmpv6`—IGMPv6 traffic.
- `inline-ka`—Inline service interfaces keepalive traffic.
- `inline-svcs`—Inline services traffic.
- `ip-fragments`—IP fragments traffic.
- `ip-options`–IP traffic with IP packet header options.

- `isis`—IS-IS traffic.
- `jfm`—JFM traffic.
- `l2pt`—Layer 2 protocol tunneling traffic.
- `lacp`—LACP traffic.
- `ldp`—LDP traffic.
- `ldpv6`—LDPv6 traffic.
- `lldp`—LLDP traffic.
- `lmp`—LMP traffic.
- `lmpv6`—LMPv6 traffic.
- `mac-host`—Layer 2 MAC send-to-host traffic.
- `mcast-snoop`—Control traffic for multicast snooping.
- `mlp`—MLP traffic.
- `msdp`—MSDP traffic.
- `msdpv6`—MSDPv6 traffic.
- `multicast-copy`—Host copy traffic due to multicast routing.
- `mvrp`—MVRP traffic.
- `ndpv6`—NDPv6 traffic.
- `ntp`—NTP traffic.
- `oam-lfm`—OAM-LFM traffic.
- `ospf`—OSPF traffic.

  Starting in Junos OS Release 23.2R1, the `ospf` protocol has two sub protocols: `ospf-hello` to classify the DDOS high priority OSPF traffic and `ospf-unclassified` to classify the DDOS low priority OSPF traffic.

- `ospfv3v6`—OSPFv3/IPv6 traffic.

Starting in Junos OS Release 23.2R1, the `ospfv3v6` protocol has two sub protocols: `ospfv3v6-hello` to classify the DDOS high priority OSPF traffic and `ospfv3v6-unclassified` to classify the DDOS low priority OSPF traffic.

- `pfcp`—Packet Forwarding Control Protocol (PFCP) traffic.
- `pfe-alive`—Packet Forwarding Engine keepalive traffic.
- `pim`—PIM traffic.
- `pimv6`—PIMv6 traffic.
- `pmvrp`—PMVRP traffic.
- `pos`—POS traffic.
- `ppp`—PPP traffic.
- `pppoe`—PPPoE traffic.
- `ptp`—PTP traffic.
- `pvstp`—PVSTP traffic.
- `radius`—RADIUS traffic.
- `re-services`—Captive portal content delivery IPv4 traffic for Routing Engine HTTP redirect.
- `re-services-v6`—Captive portal content delivery IPv6 traffic for Routing Engine HTTP redirect.
- `redirect`—Traffic that triggers ICMP redirects.
- `reject`—Packets rejected by a next-hop forwarding decision.
- `rejectv6`—V6 packets rejected by a next-hop forwarding decision.
- `resolve`—Unclassified IPv4 and IPv6 resolve packets sent to the host because of a traffic request resolve action.
- `rip`—RIP traffic.
- `ripv6`—RIPv6 traffic.
- `rsvp`—RSVP traffic.

Starting in Junos OS Release 23.2R1, the `rsvp` protocol has two sub protocols: `rsvp-hello` to classify the DDOS high priority RSVP traffic and `ospfv3v6-unclassified` to classify the DDOS low priority RSVP traffic.

- `rsvpv6`—RSVPv6 traffic.
- `services`–Service traffic.
- `snmp`—SNMP traffic.
- `snmpv6`—SNMPv6 traffic.
- `ssh`—SSH traffic.
- `sshv6`—SSHv6 traffic.
- `stp`—STP traffic.
- `syslog`—System log messages UDP traffic on port 6333 for the Routing Engine syslog server.
- `tacacs`—TACACS traffic.
- `tcp-flags`—Traffic with TCP flags.
- `telnet`—TELNET traffic.
- `telnetv6`—TELNETv6 traffic.
- `ttl`—TTL traffic.
- `tunnel-fragment`—Tunnel fragments traffic.
- `tunnel-ka`—Tunnel keepalive traffic.
- `unclassified`—Unclassified traffic.

  Starting in Junos OS Release 23.2R1, the `unclassified` protocol has two sub protocols: `host-route-tcp-v4` and `host-route-udp-v4` to classify the DDOS low priority TCP and UDP traffic.

- `virtual-chassis`—Virtual chassis traffic.
- `vrrp`—VRRP traffic.
- `vrrpv6`—VRRPv6 traffic.
- `vxlan`—VXLAN Layer 2 and Layer 3 traffic.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

Support for Enhanced Subscriber Management added in Junos OS Release 17.3R1.

```

Hierarchy Level

```
[edit dynamic-profiles profile-name]
```

Description

Enable Internet Group Management Protocol (IGMP) or Multicast Listener Discovery (MLD) Protocol on the router and configure interface-specific values on dynamic interfaces for each protocol.

PIM and MLD manage multicast groups by establishing, maintaining, and removing groups on a subnet. Multicast routing devices use these protocols to learn which groups have members on each of their attached physical networks. Enable IGMP for the router to receive IPv4 or IPv6 multicast traffic. Enable MLD for the router to receive IPv6 multicast traffic. MLD is needed only for IPv6 networks.

You can also use this statement to enable router advertisement for IPv6 Neighbor Discovery protocol and configure interface-specific values on dynamic interfaces.

You can configure these protocols in a dynamic client profile or a dynamic service profile.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Default

IGMP is disabled on the router. IGMP is automatically enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP).

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Support at the `[edit dynamic-profiles` *`profile-name`* `protocols mld]` and `[edit dynamic-profiles` *`profile-name`* `protocols router-advertisement]` hierarchy levels introduced in Junos OS Release 10.1.

}
```

Hierarchy Level

```
[edit fc-fabrics fc-fabric-name]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure global or interface-specific FC protocol options. Individual interface settings override global settings.

Overview of FIP

protocols (Security Zones Host Inbound Traffic)

IN THIS SECTION

- Syntax | 14068
- Hierarchy Level | 14068
- Description | 14068
- Options | 14069
- Required Privilege Level | 14070
- Release Information | 14070

Syntax

```
protocols {
    (protocol-name | all <protocol-name except>);
}
```

Hierarchy Level

```
[edit security zones security-zone zone-name host-inbound-traffic]
```

Description

Specify the types of protocol traffic that can reach the device for all interfaces in a zone. You can do this in one of several ways:

- You can enable traffic from each protocol individually.

- You can enable traffic from all protocols.
- You can enable traffic from all but some protocols.

Options

protocol-name Protocol for which traffic is allowed. The following protocols are supported:

- `all`—Enable traffic from all possible protocols available. Use the *except* option to disallow specific protocols.
- `bfd`—Enable incoming Bidirectional Forwarding Detection (BFD) protocol traffic.
- `bgp`—Enable incoming BGP traffic.
- `dvmrp`—Enable incoming Distance Vector Multicast Routing Protocol (DVMRP) traffic.
- `igmp`—Enable incoming Internet Group Management Protocol (IGMP) traffic.
- `ldp`—Enable incoming Label Distribution Protocol (LDP) traffic (UDP and TCP port 646).
- `msdp`—Enable incoming Multicast Source Discovery Protocol (MSDP) traffic.
- `nhrp`—Enable incoming Next Hop Resolution Protocol (NHRP) traffic.
- `ospf`—Enable incoming OSPF traffic.
- `ospf3`—Enable incoming OSPF version 3 traffic.
- `pgm`—Enable incoming Pragmatic General Multicast (PGM) protocol traffic (IP protocol number 113).
- `pim`—Enable incoming Protocol Independent Multicast (PIM) traffic.
- `rip`—Enable incoming RIP traffic.
- `ripng`—Enable incoming RIP next generation traffic.
- `router-discovery`—Enable incoming router discovery traffic.
- `rsvp`—Enable incoming Resource Reservation Protocol (RSVP) traffic (IP protocol number 46).
- `sap`— Enable incoming Session Announcement Protocol (SAP) traffic. SAP always listens on `224.2.127.254:9875`. New addresses and ports can be added dynamically. This information must be propagated to the Packet Forwarding Engine (PFE).
- `vrrp`—Enable incoming Virtual Router Redundancy Protocol (VRRP) traffic.

except (Optional) Disable specific incoming protocol traffic, but only when the *all* option has been defined . For example, to enable all but BGP and VRRP protocol traffic:

```
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust host-inbound-traffic protocols bgp except
set security zones security-zone trust host-inbound-traffic protocols vrrp except
```

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

[edit routing-instances routing-instance-name]
```

Description

Specify the protocol for a routing instance. You can configure multiple instances of many protocol types. Not all protocols are supported on the switches. See the switch CLI.

Options

bgp Specify BGP as the protocol for a routing instance.

isis Specify IS-IS as the protocol for a routing instance.

l2iw Specify Layer 2 interworking.

l2vpn Specify Layer 2 VPN as the protocol for a routing instance.

ldp Specify LDP as the protocol for a routing instance or for a virtual router instance.

mpls Specify MPLS as the protocol for a routing instance.

msdp Specify the Multicast Source Discovery Protocol (MSDP) for a routing instance.

mstp Specify the Multiple Spanning Tree Protocol (MSTP) for a virtual switch routing instance.

ospf Specify OSPF as the protocol for a routing instance.

ospf3 Specify OSPF version 3 (OSPFv3) as the protocol for a routing instance.

> **NOTE**: OSPFv3 supports the `no-forwarding`, `virtual-router`, and `vrf` routing instance types only.

pim Specify the Protocol Independent Multicast (PIM) protocol for a routing instance.

rip Specify RIP as the protocol for a routing instance.

ripng Specify RIP next generation (RIPng) as the protocol for a routing instance.

rstp Specify the Rapid Spanning Tree Protocol (RSTP) for a virtual switch routing instance.

rsvp Specify the RSVP for a routing instance.

vstp Specify the VLAN Spanning Tree Protocol (VSTP) for a virtual switch routing instance.

vpls Specify VPLS as the protocol for a routing instance.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for RIPng introduced in Junos OS Release 9.0.

`mpls` and `rsvp` options added in Junos OS Release 15.1.

Description

Configure virtual private LAN service (VPLS) flooding of unknown unicast, broadcast, and multicast traffic using point-to-multipoint LSPs. Also configure point-to-multipoint LSPs for MBGP MVPNs.

Starting in Junos OS Release 21.1R1, following provider tunnel types are supported on QFX10002, QFX10008, and QFX10016 Switches:

- Ingress Replication
- RSVP-TE P2MP LSP
- mLDP P2MP LSP

A point-to-multipoint (P2MP) is a MPLS LSP with a single source and multiple destinations. By taking advantage of MPLS packet replication capability of the network, point-to-multipoint LSPs avoid unnecessary packet replication at the ingress router. Packet replication takes place only when packets are forwarded to two or more different destinations requiring different network paths.

Following are some of the properties of point-to-multipoint LSPs:

- A P2MP LSP enables use of MPLS for point-to-multipoint data distribution. This functionality is similar to that provided by the IP multicast.
- The branch LSPs can be added and removed without disruption traffic.
- A node can be configured as both a transit and egress router for different LPSs of the same point-to-multipoint LSP.
- LSPs can be configured statically or dynamic or as a combination of both static and dynamic LSPs.

P2MP LSPs are used to carry the IP unicast and multicast traffic.

Following tunnel types are not supported on QFX10002, QFX10008, and QFX10016 Switches:

- PIM-SSM tree
- PIM-SM tree
- PIM-Bidir tree
- mLDP MP2MP LSP

Options

external-controller *pccd*

(Optional) Specifies that point-to-multipoint LSP and (S,G) for MVPN can be provided by an external controller.

This option enables an external controller to dynamically configure (S,G) and point-to-multipoint LSP for MVPN. This is for only selective types. When not configured for a particular MVPN routing-instance, the external controller is not allowed to configure (S,G) and map point-to-multipoint LSP to that (S,G).

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.
The `selective` statement and substatements added in Junos OS Release 8.5.

The `ingress-replication` statement and substatements added in Junos OS Release 10.4.

In Junos OS Release 17.3R1, the `mdt` hierarchy was moved from `provider-tunnel` to the `provider-tunnel family inet` and `provider-tunnel family inet6` hierarchies as part of an upgrade to add IPv6 support for default MDT in Rosen 7, and data MDT for Rosen 6 and Rosen 7. The `provider-tunnel mdt` hierarchy is now hidden for backward compatibility with existing scripts.

The `inter-as` statement and its substatements were added in Junos OS Release 19.1R1 to support next generation MVPN inter-AS option B.

`external-controller` option introduced in Junos OS Release 19.4R1 on all platforms.

- Release Information | 14362

Syntax

```
provisioning-order (gx-plus | jsrc | pcrf);
```

Hierarchy Level

```
[edit access profile profile-name]
```

Description

Configure AAA to use the specified application for subscriber service provisioning.

Options

gx-plus—Specify Gx-Plus as the application used to communicate with a PCRF server for subscriber service provisioning. Sets the Subscription-Id-Type Diameter AVP sub-attribute (450) to 4 (END_USER_PRIVATE) and sets the Subscription-Id-Data Diameter AVP sub-attribute (444) to `reserved`. Both of these sub-attributes are conveyed in the Diameter AVP Subscription-ID (443) by a CCR-I message.

`jsrc`—Specify JSRC as the application used to communicate with the SAE for subscriber service provisioning. JSRC is used in an SRC environment to request services from the SAE for an authenticated

subscriber. JSRC attempts to activate these services. If successful, JSRC returns an ACK message. If unsuccessful, the subscriber is denied access.

pcrf—Specify Policy Control and Charging Rules Function (PCRF) as the application used to request provisioning from the PCRF server over the Gx protocol. If you change this configuration, any existing subscriber sessions are unaffected.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

Support for Gx-Plus introduced in Junos OS Release 11.2.

`pcrf` option added in Junos OS Release 16.2.

snooping],
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name protocols vlan
vlan-id igmp-snooping]
```

Description

Configure proxy mode and options, including source address. All the queries generated by IGMP snooping are sent using 0.0.0.0 as the source address in order to avoid participating in IGMP querier election. Also, all reports generated by IGMP snooping are sent with 0.0.0.0 as the source address unless there is a configured source address to use.

Default

By default, IGMP snooping does not employ proxy mode.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family tcc],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family tcc]
```

Description

For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the IP address for which the TCC router is proxying. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only. Ethernet TCC is not supported on the T640 router.

Starting in Junos OS Release 20.1R1, aggregated ethernet interfaces supports VLAN TCC (Translational cross-connect) encapsulation on MX series platforms. See Configuring VLAN TCC Encapsulation for more details.

Options

`inet-address`—Configure the IP address of the neighbor to the TCC router.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
20.1R1	Starting in Junos OS Release 20.1R1, aggregated ethernet interfaces supports VLAN TCC (Translational cross-connect) encapsulation on MX series platforms.

Configuring TCC Encapsulation for Layer 2 VPNs and Layer 2 Circuits

proxy (Multicast VLAN Registration)

IN THIS SECTION

- Syntax | 14369
- Hierarchy Level | 14369
- Description | 14369
- Default | 14370
- Options | 14370
- Required Privilege Level | 14370
- Release Information | 14370

Syntax

```
proxy source-address ip-address;
```

Hierarchy Level

```
[edit protocols igmp-snooping vlan (all | vlan-name)]
```

Description

Specify that a VLAN operate in IGMP snooping proxy mode.

On EX Series switches that do not use the Enhanced Layer 2 Software (ELS) configuration style, this statement is used only to set proxy mode for multicast VLAN registration (MVR) on a VLAN acting as a data-forwarding source (an MVLAN).

On ELS EX Series switches, this statement is available to enable IGMP snooping proxy mode either with or without MVR configuration. When you configure this option for a VLAN without MVR, the switch acts as an IGMP proxy to the multicast router for ports in that VLAN. When you configure this option with MVR on an MVLAN, the switch acts as an IGMP proxy between the multicast router and hosts in any MVR receiver VLANs associated with the MVLAN. This mode is configured on the MVLAN only, not on MVR receiver VLANs.

> **NOTE**: ELS switches also support *MVR proxy mode*, which is configured on individual MVR receiver VLANs associated with an MVLAN rather than on an MVLAN (unlike IGMP snooping proxy mode). To enable MVR proxy mode on an MVR receiver VLAN on ELS switches, use the "mode" on page 11252 statement with the proxy option.
>
> See *Understanding Multicast VLAN Registration* for details on MVR modes.

Default

Disabled

Options

`source-address` *`ip-address`*—IP address of the source VLAN to act as proxy.

Required Privilege Level

routing—To view this statement in the configuration.

proxy (snmp)

IN THIS SECTION

- Syntax | 14374
- Hierarchy Level | 14375
- Description | 14375
- Options | 14375
- Required Privilege Level | 14376
- Release Information | 14376

Syntax

```
proxy proxy-name{
    device-name device-name;
    logical-system logical-system {
```

```
            routing-instance routing-instance;
        }
        routing-instance routing-instance;
        (version-v1 | version-v2c) {

            snmp-community community-name;

            no-default-comm-to-v3-config;
        }

        version-v3 {

            security-name security-name;

            context context-name;
        }
    }
```

Hierarchy Level

```
[edit snmp]
```

Description

Configure a device to act as a proxy SNMP agent, and specify a name for the proxy.

Options

context *context-name*	Specify the SNMPv3 context name as configured on the device specified at `edit snmp proxy proxy-name device-name device-name`. For more information about this statement, see "context" on page 4850.
device-name *device-name*	Specify the name of the device to be managed through the proxy SNMP agent.
no-default-comm-to-v3-config	(Optional) Specify whether you have to manually configure the statements at the `[edit snmp v3 snmp-community community-name]` and `[edit snmp v3 vacm]` hierarchy levels.

If this statement is not included in the configuration, the `[edit snmp v3 snmp-community community-name]` and `[edit snmp v3 vacm]` hierarchy level configurations are automatically initialized.

proxy-name Specify the name of the proxy.

security-name ***security-name*** Specify the SNMPv3 security name as configured on the device specified at `edit snmp proxy proxy-name device-name device-name`.

For more information about this statement, see "security-name" on page 17100.

snmp-community ***community-name*** Specify the name of the SNMP community. The community name you configure should match the `snmp-community` configuration on the device specified at `edit snmp proxy proxy-name device-name device-name`. For more information about this statement, see "snmp-community" on page 29160.

(version-v1 | version-v2c) Specify the SNMP version, and add the relevant configuration.

version-v3 Add the SNMPv3 configuration.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

proxy-arp

IN THIS SECTION

- Syntax | 14381
- Hierarchy Level | 14381
- Description | 14381
- Default | 14382
- Options | 14382
- Required Privilege Level | 14382
- Release Information | 14382

Syntax

```
proxy-arp (restricted | unrestricted);
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Description

For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request's target address.

NOTE: You must configure the IP address and the `inet` family for the interface when you enable proxy ARP.

Default

Proxy ARP is not enabled. The router or switch responds to an ARP request only if the destination IP address is its own.

Options

- `none`—The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.
- `restricted`—(Optional) The router or switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are in the same subnet. The router or switch must also have a route to the target IP address.
- `unrestricted`—(Optional) The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.
- **Default:** `unrestricted`

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`restricted` added in Junos OS Release 10.0 for EX Series switches.

proxy-generate

IN THIS SECTION

- Syntax | 14383
- Hierarchy Level | 14383
- Description | 14383
- Options | 14384
- Required Privilege Level | 14384
- Release Information | 14384

Syntax

```
proxy-generate <route-target-policy route-target-policy-name>;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols bgp group group-name family route-target],
[edit logical-systems logical-system-name protocols bgp group group-name neighbor address family
route-target],
[edit protocols bgp group group-name family route-target],
[edit protocols bgp group group-name neighbor address family route-target]
```

Description

Enable proxy BGP route target filtering (also known as proxy route target constrain, or proxy RTC). This feature is useful if you have a network environment where route target filtering is not widely deployed or fully supported. When configured for proxy BGP route target filtering, the device creates route target membership (RT membership) on behalf of its peers that do not have the route target filtering functionality. The device then distributes the RT membership advertisements from incoming BGP VPN routes to other devices in the network that need them.

Options

route-target-policy ***route-target-policy-name***

(Optional) Apply a routing policy that defines a subset of VPN routes to be used in your proxy BGP route target filter. The subset of VPN routes control which proxy BGP route targets are used to create the proxy BGP route target routes.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

proxy-mac

IN THIS SECTION

- Syntax | **14385**
- Hierarchy Level | **14385**
- Description | **14385**
- Options | **14385**
- Required Privilege Level | **14385**
- Release Information | **14386**

Syntax

```
proxy-mac {
    irb |proxy-mac-address;
}
```

Hierarchy Level

```
[edit routing-instances name protocols evpn],
[edit routing-instances name bridge-domains]
```

Description

Specifies the proxy MAC address.

When CE devices connect directly to gateway devices, configure the MAC proxy on the gateway devices with the `irb` option. Junos OS will use the virtual gateway MAC address or the MAC address of the IRB interface.

In a spine-and-leaf network where the routing is performed on the spine devices, configure the MAC proxy on the leaf devices to use the actual MAC address of the IRB interface.

Options

irb Reply with the manually configured virtual gateway, automatically derived virtual gateway, or IRB MAC address. The virtual gateway MAC address takes precedence over a IRB MAC address. If the MAC address of the IRB interface is not configured, Junos OS uses a MAC address derived from the physical interface.

proxy-mac-address Reply with the configured proxy MAC address for all requests. A configured proxy MAC address should correspond to the virtual or physical gateway MAC address that is deployed on centralized Layer 3 gateway IRB interfaces.

Required Privilege Level

routing

Release Information

Statement introduced in Junos OS Release 19.1R1.

RELATED DOCUMENTATION

ARP and NDP Request with a proxy MAC address

proxy-macip-advertisement

IN THIS SECTION

- Syntax | 14386
- Hierarchy Level | 14386
- Description | 14386
- Required Privilege Level | 14387
- Release Information | 14388

Syntax

```
proxy-macip-advertisement;
```

Hierarchy Level

```
[edit interfaces irb unit logical-unit-number ]
```

Description

Enable the proxy advertisement feature on a QFX Series switch that can function as a Layer 3 (L3) gateway. With this feature enabled, the L3 gateway advertises the MAC and IP routes (EVPN Type 2 MAC-IP routes) on behalf of Layer 2 (L2) Virtual Extensible LAN (VXLAN) gateways.

In an Ethernet VPN-VXLAN (EVPN-VXLAN) centrally-routed bridging (CRB) overlay, spine devices typically function as L3 VXLAN gateways, and leaf devices typically function as L2 gateways. In this overlay network, the L2 VXLAN gateways can advertise only the EVPN Type 2 MAC routes for the attached hosts. Because the L2 gateways are unable to resolve the MAC-IP bindings for the hosts, each of the L3 gateways rely on the Address Resolution Protocol (ARP) and the Neighbor Discovery Protocol (NDP) to discover and install the bindings.

For example, an L3 gateway receives a host MAC route advertisement from an L2 gateway, and ARP and NDP resolve the MAC-IP bindings. The L3 gateway in turn advertises the host MAC and IP routes along with the next hop, which is set to the L2 gateway to which the host is attached. Upon receiving this advertisement, L2 and 3 gateways in the topology install the MAC-IP bindings along with the associated next hops. Then when a gateway device receives a packet with a destination MAC that matches an address in its MAC table, the gateway does the following:

- Checks the next hop associated with the MAC address
- Forwards the packet directly to the L2 gateway to which the host is attached.

As a result, the packet doesn't need to be sent first to an L3 gateway that then forwards the packet to the L2 gateway.

Enable this feature in a CRB overlay fabric. With the `proxy-macip-advertisement` setting, the L3 gateway device manages learning and aging for the ARP and NDP entries. By default, the L3 gateway does not refresh the ARP and NDP entries. As a result, the MAC-IP bindings on the spine devices expire after a timeout interval. Upon receiving the next IPv4 or IPv6 packet after the MAC-IP entry expires, the spine devices tries to resolve the MAC-IP binding again using ARP (for IPv4 packets) or NDP (for IPv6 packets). The spine device might drop traffic until it records the new MAC-IP binding.

> **NOTE**: We support the `proxy-macip-advertisement` statement on Junos OS devices only. In an EVPN CRB overlay fabric with a mix of Junos OS and Junos OS Evolved spine devices, if you configure any Junos OS spine devices with the `proxy-macip-advertisement` statement, you must also configure the EVPN leaf devices with the `crb-proxy-mac` option at the `[edit protocols l2-learning]` hierarchy level. See "crb-proxy-mac" on page 4944 for details.

We recommend that you don't use this feature in an EVPN-VXLAN edge-routed bridging overlay (ERB) fabric with anycast IRB addresses. If you set this option in ERB fabrics, the device can have IP reachability issues because remote ARP entries are deleted when the entries age out. With anycast IRB addresses, ARP replies don’t reach the device that initiated the ARP request.

Description

Configure PTP on the device. PTP, also known as IEEE 1588v2, is a packet-based technology that enables the operator to deliver synchronization services on packet-based mobile backhaul networks. IEEE 1588 PTP (Version 2) clock synchronization standard is a highly precise protocol for time synchronization that synchronizes clocks in a distributed system.

The system clocks can be categorized based on the role of the node in the network. They are broadly categorized into ordinary clocks and boundary clocks. The timeTransmitter clock and the timeReceiver clock are known as ordinary clocks. The boundary clock can operate as either a timeTransmitter clock or a timeReceiver clock.

You can configure the timeTransmitter clock and the timeReceiver clock for Precision Time Protocol (PTP) to help synchronize clocks in a distributed system. The time synchronization is achieved through packets that are transmitted and received in a session between the timeTransmitter clock and the timeReceiver clock.

Starting in Junos OS Evolved Release 22.2R1, with PTP timing profiles, such as G.8275.1 and G.8275.2, the accepted clock attribute `priority2` value is 255 for T-TSC clock. Any value other than 255 is rejected by the T-TSC clocks.

Starting in Junos OS Evolved Release 23.2R1, to support PTP timing profiles, such as G.8275.1 and G.8275.2, you can configure timing performance and monitoring for passive ports and stateful interfaces.

Options

acquiring-state-announce-grandmaster

Use grandmaster data set for announce messages when in acquiring state.

afts

Enable assisted full timing support (AFTS) mode of operation. See, No Link Title.

clock-class-threshold <value>

The clock class threshold limit value for the upstream PTP timeTransmitter.

The system will consider the upstream PTP timeTransmitter as a backup source only if the timeTransmitter's clock class is less than or equal to the set threshold value. If this parameter is not configured, the value is set to default.

- Range: 1 through 255
- Default: 248

> **NOTE**: This option is available only on supported platforms.

clock-mode

Clock mode

- boundary—The clock mode of the node is a boundary clock where the clock acts as both timeTransmitter and timeReceiver.
- ordinary—The clock mode of the node is a system clock where the clock acts either as a timeTransmitter or as a timeReceiver. The ordinary option is not supported on ACX710 devices.

delay-comp

PTP delay compensation values.

disable-lag-revertive-switchover

Disable revertive switchover for LAG.

domain

PTP domain number. This option is applicable to G.8275.1 profile.

- 0 through 127.

e2e-transparent

Enable end-to-end IEEE1588 transparent clock functionality.

frequency-lock-threshold

Control the frequency offset in parts per billion (ppb) that the servo will lock with. Review "frequency-lock-threshold" on page 7936.

> **NOTE**: This option is available only on supported platforms.

holdover-in-spec-duration

In case, both GNSS and the PTP timing reference are lost or inactive, then the internal clock oscillator provides synchronization for the specified duration.

After the holdover time expires, the clock class transition happens based on the mode of the system (T-GM, APTS or AFTS). For example, in T-GM mode, when the holdover timer is set to 120 minutes, the system sends the clock class 7 for 120 minutes and thereafter clock class 160 is sent. Similarly, in T-BC-A mode, when the holdover timer is set to 120 minutes, the system sends the clock class 135 for 120 minutes and thereafter clock class 165 is sent.

> **NOTE**: This option is available only on supported platforms.

- Default: 240 (minutes)
- Range: 5 through 1440 (minutes)

holdover-time-error-budget

PTP clock holdover in specification time error budget in nano second (ns)

- Default: 400
- Range: 0 through 10000.

ipv4-dscp

IPv4 DiffServ code point (DSCP) value to be used for PTP packets

- 0 through 63.

ipv6-dscp

IPv6 DiffServ code point (DSCP) value to be used for PTP packets

- 0 through 63.

local-priority

Priority assigned to the local clock

- 1 through 255.

phase-adjust-threshold

Set the maximum phase offset that will be adjusted by the G.8275.2 enhanced servo in a phase-aligned state. Review "phase-adjust-threshold" on page 12981.

> **NOTE**: This option is available only on supported platforms.

phase-error-limit

Parameters for configuring a phase-error threshold. Review "phase-error-limit" on page 12982.

> **NOTE**: This option is available only on supported platforms.

phase-lock-threshold

Control the maximum phase offset with which G.8275.2 enhanced servo enters the phase-aligned state. Review "phase-lock-threshold" on page 12984.

> **NOTE**: This option is available only on supported platforms.

phy-timestamping

PHY timestamping feature.

priority1

Used in selecting best timeTransmitter clock

- 0 through 255.

priority2

Tie-breaker in selecting best timeTransmitter clock

- 0 through 255.

profile-type

PTP profile type

- aes67—Enable the AES67 PTP profile.
- aes67-smpte—Enable the AES67 and SMPTE ST-2059-2 PTP profile.
- enterprise-profile—Enable the enterprise profile. The enterprise profile supports IEEE 1588 PTPv2 transport over multicast IPv4. When the enterprise profile is enabled, no other profiles can be enabled. Also, unicast negotiation is disabled when you enable the enterprise profile.
- g.8275.1—Enable the G.8275.1 PTP profile.
- g.8275.1.enh—Enable the enhanced G.8275.1 PTP profile. This profile supports PTP over IPv4 and IPv6.
- g.8275.2—Enable the G.8275.2 PTP profile.
- g.8275.2.enh—Enable the enhanced G.8275.2 PTP profile.
- ieee-2008—Enable the IEEE 2008 profile type (default).
- ieee1588v2-custom—Enable the IEEE1588v2 with Multicast.
- smpte—Enable the SMPTE ST-2059-2 PTP Profile.

syntonized-e2e-transparent

Enable end-to-end syntonized IEEE1588 transparent clock functionality.

timescale

The timescale of the timeTransmitter.

- arbitrary—TimeTransmitter clock with arbitrary timescale.

unicast-negotiation Enable unicast negotiation.

utc-leap-seconds UTC leap seconds offset

- 0 through 255.

performance-monitor Configure performance-monitor PTP packet delay metrics

- passive-port – Enable PTP performance monitoring for passive ports
- delay-request-rate – Log mean interval between delay requests. Valid range is -4 to 4. This represents the packet rates as 2^(-4) that is (16 packets per second) to 2^4 (1 packets per 1 second). The default value is -4.

stateful interface Stateful parameters to set interfaces to PTP stateful role.

<interface name> – Interface name or port range. For example, et-0/0/4:0.0, et-0/0/4:1.0, et-2/0/4.0

- passive-port-monitor – Configure passive port monitoring.
- phase-threshold *<offset-threshold-value>* – Configure phase offset threshold value for raising alarm, relative to active timeReceiver port. Valid range is 20 to 100000000 nanoseconds.
- not-master – Configures port as timeReceiver or passive or listening port.
- measure-only – Configures port as passive or listening port.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing-To view this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 12.2R1

`frequency-lock-threshold`, `phase-adjust-threshold`, and `phase-lock-threshold` options introduced in Junos OS Release 23.4R1 for MX10008 routers.

`frequency-lock-threshold`, `phase-adjust-threshold`, and `phase-lock-threshold` options supported on ACX7100-32C, ACX7100-48L, and ACX7024 routers in Junos OS Evolved Release 24.2R1.

PTP profile-type options added to QFX5130-48C devices in Junos OS Evolved Release 24.2R1.

`apts` and `holdover-in-spec-duration` options introduced in Junos OS Evolved Release 24.2R2 for ACX7024.

`phase-error-limit` option introducted in Junos OS Release 25.4R1.

`clock-class-threshold <value>` option introduced in Junos OS Evolved Release 25.4R1.

`afts` option introduced in Junos OS Evolved Release 25.4R1 for ACX7348, ACX7332, and ACX7024.

purge-flow-timer (Protocols OpenFlow)

IN THIS SECTION

- Syntax | 14415
- Hierarchy Level | 14415
- Description | 14415
- Options | 14416
- Required Privilege Level | 14416
- Release Information | 14416

Syntax

```
purge-flow-timer seconds;
```

Hierarchy Level

```
[edit protocols openflow switch switch-name]
```

Description

For an OpenFlow virtual switch, specify the number of seconds after which an invalid OpenFlow flow entry is deleted from the flow table.

If you do not configure the `purge-flow-timer` statement, the device purges invalid flows from hardware, but indefinitely retains the corresponding flow entries in the flow table. If you configure the `purge-flow-timer` statement, the device purges invalid flows from hardware, and after the specified number of seconds, the device deletes the invalid flow entries from the flow table. Configuring a value of 0 causes the device to immediately delete invalid flow entries from the flow table.

> **NOTE**: By default, if you remove an active OpenFlow interface from an existing OpenFlow configuration, flow entries that match on this interface as the ingress interface and flow entries that include this interface in their action list (for OpenFlow v1.0) or flow instructions (for OpenFlow v1.3.1) are invalid and are automatically purged from the flow table and from the hardware regardless of whether you configure the `purge-flow-timer` statement.

Options

seconds Number of seconds after which an invalid flow entry is deleted from the flow table.

- **Range:** 0 through 300

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

purge-timeout (programmable-rpd)

IN THIS SECTION

- Syntax | **14417**
- Hierarchy Level | **14417**

- Description | 14417
- Options | 14417
- Required Privilege Level | 14418
- Release Information | 14418

Syntax

```
purge-timeout {
    never;
    timeout <seconds>;
}
```

Hierarchy Level

```
[edit routing-options programmable-rpd]
```

Description

Set the time, in seconds, after which a disconnected client times out. Upon disconnect, the client state remains available but no operations occur. If the disconnected client reconnects before the set time has elapsed, the states are restored on the router. If it does not, all client operations are reverted and the programmable routing protocol process (prpd) server notifies any other modules of the disconnect so they can purge any other client operations.

Options

never When this option is configured, the purge timeout is infinite for the BGP route service. Client-added routes never time out. The prpd-client-added routes are not deleted when the client disconnects and does not reconnect back. The routes are deleted only when the client explicitly deletes the routes. If routing is restarted, then the client-added routes are lost.

timeout *seconds* (Optional) After this time, in seconds, disconnected clients time out on the prpd server and the routes added by the client are purged.

- **Default:** 120
- **Range (Junos OS Releases 18.4R1 and later):** 1 through 604,800 (7 days)
- **Range (Before Junos OS Releases 18.4R1):** 1 through 1000

push-backup-to-master (Accounting Options)

IN THIS SECTION

- Syntax | 14424
- Hierarchy Level | 14424
- Description | 14424
- Required Privilege Level | 14425
- Release Information | 14425

Syntax

```
push-backup-to-master;
```

Hierarchy Level

[edit accounting-options file *filename*]

Description

Configure the router to save the accounting files from the new backup Routing Engine to the new primary Routing Engine when a change in primary role occurs. The files are saved to the **/var/log/pfedBackup** directory on the router. The primary Routing Engine includes these accounting files with its own current accounting files when it transfers the files from the backup directory to the archive site at the next transfer interval. Use this statement when the new backup Routing Engine is not able to connect to the archive site; for example, when site is not connected by means of an out-of-band interface or the path to the site is routed through a line card.

NOTE: The backup Routing Engine's files on the primary Routing Engine are sent at each interval even though the files remain the same. If this is more activity than you want, consider using the `backup-on-failure master-and-slave` statement instead.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Syntax

```
push-to-identity-management;
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication]
```

Description

Configure JIMS with SRX Series Firewall to push the authentication entries with a successful authentication state to the Juniper Identity Management Service server. Configure JIMS with SRX Series Firewall to view the JIMS status online. For more information, see Configuration of JIMS with SRX Series Firewall. You use the `push-to-identity-management` statement in conjunction with the query-api/user statement, which sets the path of the URL for querying user identities.

When the SRX Series Firewall does not have authentication information for a user based on the user's IP address, it can force the user to authenticate through captive portal to obtain the user ID information and authenticate the user. If a security policy that specifies firewall authentication is configured with the `push-to-identity-management` statement, the user information is pushed to the Juniper Identity Management Service server.

After you push the entry to the Juniper Identity Management Service server, you can use the batch query function to obtain authentication information for that user from the Juniper Identity Management Service server, including the groups that the user belongs to.

NOTE:

- For push-to-identity-management to successfully push the authentication entry to JIMS, you must configure JIMS and verify that JIMS status is online.
- The SRX Series Firewall does not update the authentication-entry time-out state to Juniper Identity Management Service.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D100.

- Description | 14432
- Default | 14432
- Options | 14432
- Required Privilege Level | 14432
- Release Information | 14432

Syntax

```
python-script-user username;
```

Hierarchy Level

```
[edit event-options event-script file filename],
[edit system scripts snmp file filename]
```

Description

Define the user under whose access privileges the local Python event script or Python SNMP script executes. If you do not associate a user with the script, then by default, Junos OS executes the script with the privileges of the *nix user and group `nobody`, which is the generic, unprivileged system account.

> **NOTE**: You cannot configure Python event scripts or Python SNMP scripts to execute with root access privileges.

> **NOTE**: Junos OS and Junos OS Evolved execute Python commit scripts and Python op scripts under the access privileges of the user who executes the command or operation that invokes the script.

Default

If you do not configure the `python-script-user` statement for a given Python script, the system executes the script under the access privileges of the *nix user and group `nobody`.

Options

username Username that is configured at the `[edit system login]` hierarchy level.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R3.

```

For Junos OS Release 17.4 and Later Releases

```
qos-adjust;
```

Hierarchy Level

```
[edit protocols ancp]
```

Description

Specify that the ANCP agent reports data rates for downstream traffic to CoS. When this statement is not configured, the ANCP agent does not report traffic rates to CoS.

For Junos OS Release 17.3 and earlier releases, configure the values by which the actual downstream data rates are adjusted. The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Starting in Junos OS Release 17.4, all of the previously supported subordinate statements are deprecated. The ANCP agent ignores them if they are present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustments with the `access-line` statement at the `[edit system]` hierarchy level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

Subordinate statements deprecated in Junos OS Release 17.4.

[edit routing-instances routing-instance-name routing-options static route destination-prefix],
[edit routing-options rib inet6.0 static route destination-prefix],
[edit routing-options static route destination-prefix]
```

Description

Configure a static route with multiple possible next hops, each of which can have its own preference value, IGP metric that is used when the route is exported into an IGP, and Bidirectional Forwarding Detection (BFD) settings. If multiple links are operational, the one with the most preferred next hop is used. The most preferred next hop is the one with the lowest preference value.

Options

address—IPv4, IPv6, or ISO network address of the next hop.

interface-name—Name of the interface on which to configure an independent metric or preference for a static route. To configure an unnumbered interface as the next-hop interface for a static route, specify **qualified-next-hop *interface-name***, where ***interface-name*** is the name of the IPv4 or IPv6 unnumbered interface.

> **NOTE**: For an Ethernet interface to be configured as the qualified next hop for a static route, it must be an unnumbered interface.

To configure an Ethernet interface as an unnumbered interface, configure the `unnumbered-address <interface-name>` statement at the `[edit interfaces <interface-name> unit <logical-unit-number> family <family-name>]` hierarchy level as described in *Configuring an Unnumbered Interface*.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit chassis synchronization source interfaces (external | interface interface-name)],
[edit chassis synchronization source interfaces (external-0/0 | external-1/0 | interface interface-name)]
```

Description

Configure the quality level for a timing source so that the router knows the best available source with which to synchronize. The quality level specifies the accuracy level of the clock and is transmitted across the network through Synchronization Status Messages (SSMs) over the Ethernet Synchronization Messaging Channel (ESMC), or through SSMs contained in SONET/SDH frames.

SONET SSM messages are either Generation 1 or Generation 2. Generation 1 is the first and most widely deployed SSM message set. Generation 2 is a newer version. Quality level options are available for both Generation 1 and Generation 2.

Options

prs—Primary reference source—Stratum 1

st2—Stratum 2

tnc—Transit node clock

st3e—Stratum 3E

st3—Stratum 3

smc—SONET minimum clock

st4—Stratum 4

quality-level

IN THIS SECTION

- Syntax | 14465
- Hierarchy Level | 14465
- Description | 14465

- Options | 14465
- Required Privilege Level | 14466
- Release Information | 14466

Syntax

```
quality-level (prc | prs |sec | smc | ssu-a | ssu-b | st2 | st3 | st3e | st4 | stu | tnc);
```

Hierarchy Level

```
[edit chassis synchronization source (bits | gps | interfaces interface-name)]
```

Description

For ACX Series routers operating with Synchronous Ethernet, configure the quality level (QL) for a timing source so that the router can know the best available source with which to synchronize. The QL specifies the expected accuracy level of the clock and is transmitted across the network through Synchronization Status Messages (SSMs) over the Ethernet Synchronization Message Channel (ESMC).

The quality level options are valid depending on the configured **network-option**; **option-1** or **option-2** at the [**edit chassis synchronization**] hierarchy level.

Both **option-1** and **option-2** SSM quality levels (QL) are supported:

- For **option-1**, QL must be configured for external clocks (**gps** or **bits**) whether or not QL is enabled.
- For **option-2**, the default QL for external clocks is QL_STU whether or not QL is enabled.

Options

prc—Timing quality of a primary reference clock (option-1 only).

prs—Clock traceable to a primary reference source (option-2 only).

sec—Timing quality of an SDH equipment clock (option-1 only).

smc— Clock traceable to a self-timed SONET (option-2 only).

ssu-a—Timing quality of a type I or IV client clock (option-1 only).

ssu-b—Timing quality of a type VI client clock (option-1 only).

st2—Clock traceable to Stratum 2 (option-2 only).

st3—Clock traceable to Stratum 3 (option-2 only).

st3e—Clock traceable to Stratum 3E (option-2 only).

st4—Clock traceable to Stratum 4 free-run (option-2 only).

stu—Clock traceable to an unknown quality (option-2 only).

tnc—Clock traceable to a transit node clock (option-2 only).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

quality-mode-enable (MX)

IN THIS SECTION

- Syntax | **14467**
- Hierarchy Level | **14467**

- Description | 14467
- Default | 14468
- Required Privilege Level | 14468
- Release Information | 14468

Syntax

```
quality-mode-enable;
```

Hierarchy Level

```
[edit chassis synchronization]
```

Description

Enable Synchronous Ethernet ESMC quality mode. The quality level parameter for a Synchronous Ethernet interface is optional when the `quality-mode-enable` and the `selection-mode received-quality` statements are included at the `[edit chassis synchronization]` hierarchy level.

The default quality level for a Synchronous Ethernet interface is based on the value of network option: The `option-1` statement, when set, selects the `sec` quality level; and the `option-2` statement, when set, selects the `st3` quality level.

Table 124 on page 14467 shows whether SSM quality level is supported for a given external interface signal type and framing. The default setting is disabled.

- **Table 124: SSM-Quality LevelSupport by Signal Type and Framing**

Signal Type	Framing	SSM Quality Level Supported
E1	G.704	yes
E1	G.704 no CRC4	no

Table 124: SSM-Quality LevelSupport by Signal Type and Framing *(Continued)*

Signal Type	Framing	SSM Quality Level Supported
T1	ESF	yes
T1	SF	no
2048 KHz	Not applicable	no

Default

By default, this statement is disabled.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2R4.

```

Description

Specify how long to wait to receive a response to a specific query message from a host.

Options

seconds—Time interval. This interval should be less than the host-query interval.

- **Range:** 1 through 1024
- **Default:** 10 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

- Hierarchy Level | **14491**
- Description | **14491**
- Options | **14491**
- Required Privilege Level | **14491**
- Release Information | **14491**

Syntax

```
queue queue-number class-name;
```

Hierarchy Level

```
[edit class-of-service forwarding-classes]
```

Description

Specify the output transmission queue to which to map all input from an associated forwarding class.

This statement enables you to configure up to eight forwarding classes with one-to-one mapping to output queues. If you want to configure up to 16 forwarding classes with multiple forwarding classes mapped to single output queues, include the `class` statement instead of the `queue` statement at the `[edit class-of-service forwarding-classes]` hierarchy level.

Options

class-name—Name of forwarding class.

queue-number—Output queue number.

- **Range:** 0 through 7.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

queue-num

IN THIS SECTION

- Syntax | 14494
- Hierarchy Level | 14495
- Description | 14495
- Options | 14496
- Required Privilege Level | 14496
- Release Information | 14496

Syntax

```
queue-num queue-number <no-loss>;
```

Hierarchy Level

```
[edit class-of-service forwarding-classes class class-name]
```

Description

Map a forwarding class to an output queue number. Optionally, configure the forwarding class as a lossless forwarding class. Each switch provides enough output queues so that you can map forwarding classes to queues on a one-to-one basis, so each forwarding class can have a dedicated output queue.

On switches that use different forwarding classes and output queues for unicast and multidestination (multicast, broadcast, destination lookup fail) traffic, the switch supports 12 forwarding classes and 12 output queues, eight of each for unicast traffic and four of each for multidestination traffic. You can map some or all of the eight unicast forwarding classes to a unicast queue (0 through 7) and some or all of the four multidestination forwarding classes to the a multidestination queue (8 through 11). You cannot map a forwarding class to more than one queue (each forwarding class maps to one and only one queue), but you can map multiple forwarding classes to one queue. The queue to which you map a forwarding class determines if the forwarding class is a unicast or multidestination forwarding class.

On switches that use the same forwarding classes and output queues for unicast and multidestination traffic, the switch supports eight forwarding classes and eight output queues. You can map some or all of the eight of the forwarding classes to queues (0 through 7). You cannot map a forwarding class to more than one queue (each forwarding class maps to one and only one queue), but you can map multiple forwarding classes to one queue.

You cannot configure weighted random early detection (WRED) packet drop on forwarding classes configured with the no-loss packet drop attribute. Do not associate a drop profile with lossless forwarding classes. Instead, use priority-based flow control (PFC) to prevent frame drop on lossless forwarding classes.

NOTE: If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

NOTE: On systems that do not use the ELS CLI, if you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless `fcoe` and `no-loss` forwarding classes. If you explicitly configure lossless forwarding classes, the traffic

mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

NOTE: On systems that do not use the ELS CLI, if you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the `fcoe` and `no-loss` forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the `no-loss` option. If you do not specify the `no-loss` option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if you explicitly configure the `fcoe` forwarding class and you do not include the `no-loss` option, the `fcoe` forwarding class is lossy, not lossless.

Options

queue-number—(Switches that use different output queues for unicast and multidestination traffic) Number of the CoS unicast queue (0 through 7) or the CoS multidestination queue (8 through 11).

queue-number—(Switches that use the same output queues for unicast and multidestination traffic) Number of the CoS queue (0 through 7).

`no-loss`—Optional packet drop attribute keyword to configure the forwarding class as lossless.

Required Privilege Level

interfaces—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

No-loss option introduced in Junos OS Release 12.3 for the QFX Series.

queue-statistics

IN THIS SECTION

- Syntax | 14497
- Hierarchy Level | 14497
- Description | 14497
- Default | 14498
- Options | 14498
- Required Privilege Level | 14498
- Release Information | 14499

Syntax

```
queue-statistics {
    file filename {
        files number-of-files;
        size size;
    }
    interval interval;
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Enable the logging of queue statistics in a local file. This statement does not enable queue statistics monitoring.

To enable queue monitoring, you must specify the `queue-statistics` configuration statement at the `[edit services analytics interfaces]` hierarchy level.

Default

This feature is disabled by default.

Options

interval *interval* Configure the polling interval in milliseconds.

> **NOTE**: You can configure the polling interval for queue statistics globally for all interfaces only. Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.

- Range:
  - Junos OS Release 13.2X50-D15—8 to 1000 milliseconds (8 milliseconds to 1 second)
  - Junos OS Release 13.2X51-D10 or later—10 to 1000 milliseconds (10 milliseconds to 1 second)

> **NOTE**: In Junos OS Release 13.2X51-D10 or later, if you configured an interval of less than 10 milliseconds, the following warning messages appear during the commit process: `Queue statistics polling interval can not be less than 10 milliseconds` and `Setting Queue statistics polling interval to 10 milliseconds`. These messages do not stop the commit operation, but the interval is automatically set to 10 milliseconds.

- Default:
  - Junos OS Release 13.2X50-D15—8 milliseconds
  - Junos OS Release 13.2X51-D10 or later—10 milliseconds

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Network Analytics Overview

queue-threshold

IN THIS SECTION

- Syntax | 14499
- Hierarchy Level | 14500
- Description | 14500
- Options | 14500
- Required Privilege Level | 14501
- Release Information | 14501

Syntax

```
queue-threshold {
    fabric-queue {
        priority priority {
            threshold threshold-percentage;
        }
    }
    wan-queue {
        priority priority {
            threshold threshold-percentage;
        }
    }
}
```

Hierarchy Level

```
[edit chassis fpc slot-number traffic-manager]
```

Description

Enable monitoring of fabric and WAN queues.

When the `fabric-queue` statement is configured, an SNMP trap is generated when the fabric queue depth exceeds the configured threshold value.

When `wan-queue` is configured, an SNMP trap is generated whenever the WAN queue depth exceeds the configured threshold value.

By default, monitoring of fabric queue and WAN queue is disabled.

Options

fabric-queue Configure threshold values to monitor fabric queue depth. An SNMP trap is generated when fabric queue depth exceeds the configured threshold value. When this option is configured, you can use the `show class-of-service fabric statistics detail` command or the `show pfe statistics traffic detail` command to display detailed statistics at the level of the Packet Forwarding Engine.

- `priority` *`priority`*—Specify the queue priority for fabric queues. The options are `high` and `low`. Traffic with `low` priority is sent after any queue that has a `high` priority. The priorities map to numeric priorities in the underlying hardware.
- `threshold` *`threshold-percentage`*—Configured threshold value for the priority level for fabric queues. An SNMP trap is generated when the actual queue utilization percentage exceeds the configured threshold value.

wan-queue Configure threshold values to monitor the WAN queue depth. An SNMP trap is generated when the WAN queue depth exceeds the configured value.

- `priority` *`priority`*—Specify the queue priority for WAN queues. The priority level can be `high`, `medium-high`, `medium-low`, and `low`.
- `threshold` *`threshold-percentage`*—Configured threshold value for the priority level for WAN queues. An SNMP trap is generated when the actual queue utilization percentage exceeds the configured threshold value.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

r2cp

IN THIS SECTION

- Syntax | **14537**
- Hierarchy Level | **14537**
- Description | **14537**
- Options | **14537**
- Required Privilege Level | **14537**

Release Information | 14537

Syntax

```
r2cp {
    command binary-file-path;
    disable;
}
```

Hierarchy Level

```
[edit system processes]
```

Description

Specify the Radio-to-Router Control Protocol (R2CP) used to exchange dynamic metric changes in the network that routers use to update the OSPF topologies.

Options

- `command` *`binary-file-path`*—Path to the binary process.
- `disable`—Disable the Radio-to-Router Control Protocol process.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

RELATED DOCUMENTATION

PPPoE-Based Radio-to-Router Protocols Overview

radio-router (Interfaces)

IN THIS SECTION

- Syntax | 14538
- Hierarchy Level | 14538
- Description | 14539
- Options | 14539
- Required Privilege Level | 14539
- Release Information | 14539

Syntax

```
radio-router {
    bandwidth number;
    credit {
        interval number;
    }
    data-rate number;
    latency number;
    quality number;
    resource number;
    threshold number;
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number]
```

Description

Point-to-Point Protocol over Ethernet (PPPoE)-based radio-to-router protocols include messages that define how an external system will provide the device with timely information about the quality of a link's connection. They also include a flow control mechanism to indicate how much data the device can forward. The device can then use the information provided in the PPPoE messages to dynamically adjust the interface speed of PPP links.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

`interface`—To view this statement in the configuration.

`interface-control`—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

Description

Configure the RADIUS parameters that the router uses for AAA authentication and accounting for subscribers.

Options

accounting-server

(MX Series only) Specify a list of the RADIUS accounting servers used for accounting for DHCP, L2TP, and PPP clients.

- **Values:** *ip-address*—IP version 4 (IPv4) address.

authentication-server

(SRX Series only) Specify a list of the RADIUS authentication servers used to authenticate DHCP, L2TP, and PPP clients. The servers in the list are also used as RADIUS dynamic-request servers, from which the router accepts and processes RADIUS disconnect requests, CoA requests, and dynamic service activations and deactivations.

- **Values:** *ip-address*—IPv4 address.

preauthentication-server

(MX Series only) Starting in Junos OS Release 13.3, specify the RADIUS preauthentication server, which is used for the LLID service.

> **NOTE**: You cannot configure this statement if the Calling-Station-ID attribute is excluded from RADIUS Access-Request messages by the `exclude` statement.

- **Values:** *ip-address*—IPv4 address.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

[edit logical-systems name tenants name security log stream],
```

```
[edit security log stream],
[edit tenants name security log stream]
```

Description

Configure RADIUS accounting for security events by specifying the RADIUS accounting server.

Options

- `ipaddr` — Specify the IP address of the RADIUS server for accounting messages. Use the `primary` and `backup` options in the hierarchy `edit security log stream radius idappr` to configure the primary and backup RADIUS servers for authentication event logging. These options provide redundancy in case the primary RADIUS server is unavailable, ensuring that authentication events can still be logged to the backup RADIUS server.

  RADIUS accounting supports all the eight streams and each stream can have both a primary and backup radius server.

  Both the primary and backup RADIUS server shares same secret key and port number. Without a primary RADIUS server, you cannot configure the backup RADIUS server.

  - `primary` — IP address of the primary RADIUS server. Configure the primary IP address to enable `radius` stream.

  - `backup` — IP address of the backup RADIUS server. You can configure one backup RADIUS server per stream for the primary RADIUS server. The backup server handles log delivery if the primary server goes down.

    The backup server is optional. Backup server becomes active only if message delivery fails to primary server.

    If the backup server becomes unavailable, disable the backup server to switch back to the primary server.

- `port`- Port number of the RADIUS server. Configure the port number that receives RADIUS accounting messages.

  - **Default**: 1813

- `secret`- Configure a secret key on the RADIUS server. This secret key is used to calculate the MD5 hash for verifying the message's validity on the receiver side. The maximum length of the secret key is 256 characters.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Configuring RADIUS System Accounting

radius-accounting

IN THIS SECTION

- Syntax | 14548
- Hierarchy Level | 14548
- Description | 14548
- Options | 14549
- Required Privilege Level | 14549
- Release Information | 14549

Syntax

```
radius-accounting {
   session-drop;
}
```

Hierarchy Level

```
[edit security nat source]
```

Description

Configure RADIUS accounting options for NAT.

NOTE: If you have configured both syslog and RADIUS server for the same stream, NAT PBA logs are sent to the RADIUS server and other logs are sent to the syslog server.

If you want to receive all logs (including NAT PBA and flow logs), you must use different streams for the RADIUS server and syslog server.

Options

session-drop Drop Source NAT sessions until RADIUS accounting succeeds.

When you enable the `session-drop` statement at the `[edit security nat source radius-accounting]` hierarchy, subscribers cannot use a port block until RADIUS logging succeeds for the port block. The device drops the subscriber's NAT PBA sessions until it receives a positive acknowledgement for the RADIUS log sent. The port block is released when the RADIUS logging timeout or a negative acknowledgement is received from the RADIUS accounting server.

When you disable this command, subscribers can continue using the allocated port block even if RADIUS logging fails for the port block.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 24.2R1.

radius-coa (Adjustment Control Profiles)

Syntax

```
radius-coa {
    priority priority;
    algorithm algorithm;
}
```

Hierarchy Level

```
[edit class-of-service adjustment-control-profiles profile-name application]
```

Description

Configure the shaping rate adjustment controls for the RADIUS CoA application.

Options

priority Priority of the RADIUS CoA application in the adjustment control profile.

- **Range:** 1 through 10; 1 being the highest priority.
- **Default:** 1

algorithm Rate adjustment algorithm used by the RADIUS CoA application.

- Values:
  - adjust-never—Do not perform rate adjustments.
  - adjust-always—Adjust the shaping rate unconditionally.
  - adjust-less—Adjust the shaping rate if it is less than the configured value.
  - adjust-less-or equal—Adjust the shaping rate if it is less than or equal to the configured value.
  - adjust-greater—Adjust the shaping rate if it is greater than the configured value.
  - adjust-greater-or-equal—Adjust the shaping rate if it is greater than or equal to the configured value.
- **Default:** adjust-always

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

[edit system services dhcp-local-server group group-name reconfigure trigger],
[edit system services dhcp-local-server dhcpv6 group group-name reconfigure trigger]
```

Description

Configure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces to be reconfigured when a RADIUS-initiated disconnect is received by the DHCP client or group of clients. A group configuration takes precedence over a DHCP local server configuration.

Default

The client is deleted when a RADIUS-initiated disconnect is received.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

Support at the `[edit ... dhcpv6 ...]` hierarchy levels introduced in Junos OS Release 10.4.

)
```

Hierarchy Level

```
[edit services]
```

Description

Configure the radius-flow-tap service for subscriber secure policy mirroring. Both RADIUS-initiated and Dynamic Tasking Control Protocol (DTCP)-initiated mirroring are supported.

Starting in Junos OS Release 17.3R1, the radius-flow-tap service can run concurrently on the same router with the FlowTapLite service. The FlowTapLite service is a version of the flow-tap service (`[edit services flow-tap]`) that is configured only on tunnel interfaces on MX Series routers.

In earlier releases, the radius-flow-tap and FlowTapLite services cannot run concurrently on an MX Series router, preventing you from running FlowTapLite monitoring and subscriber secure policy mirroring at the same time.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Options

extended-mirror-header
(Optional) (Junos OS Evolved) Includes packet direction field in the mirror header when the router sends the mirrored traffic to the mediation device. This field helps the mediation device to identify the traffic direction and apply rules defined by the law enforcement agency.

forwarding-class *class-name*
Specify the forwarding class that is applied to mirrored packets sent to a mediation device.

interfaces *interface-name*
Assign virtual tunnel interfaces to mirror the interfaces created by extensible subscriber services manager (ESSM)

If a currently used tunnel interface is deleted from the pool of interfaces, the active mirroring sessions are redistributed from the deleted interface to other tunnel interfaces in the pool. Also, when a new tunnel interface is added into the pool, the service adds the new interface to the list of interfaces available for new mirroring sessions or for existing sessions transferred from a failed interface.

logical-system *logical-system-name*
Specify the logical system that is used to send mirrored packets to a mediation device for subscriber secure policy traffic mirroring. When you specify a logical system, you must also specify a routing instance.

- **Default:** Logical system `default`

multicast-interception

Enables subscriber secure policy to mirror IPv4 multicast traffic sent to subscribers. It enables the mirroring of multicast traffic for all subscribers on the chassis.

Mirroring of multicast traffic is supported only for subscribers in the default logical system.

routing-instance *routing-instance-name*

Specify the routing instance that is used to send mirrored packets to a mediation device for subscriber secure policy traffic mirroring.

- **Default:** Routing instance `default`

snmp notify-targets *ip-address*

Specify the IP address for a target mediation device (trap target) to receive SNMPv3 encrypted trap notifications subscriber secure policy mirroring trap. Only these configured targets can receive the notifications. This is required for secure SNMPv3 notifications for subscriber secure policy mirroring. If you configure multiple targets, you must configure them one at a time.

source-ipv4-address *ipv4-address*

Specify the source IPv4 address used in the IP header that is prepended to mirrored packets sent to a mediation device.

Required Privilege Level

flow-tap—To view this statement in the configuration.

flow-tap-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

`logical-system` option added in Junos OS Release 15.1R3 for enhanced subscriber management.

`multicast-interception` option added in Junos OS Release 11.4.

`snmp notify-targets` option added in Junos OS Release 16.1R1.

`routing-instance` option added in Junos OS Release 15.1R3 for enhanced subscriber management.

`extended-mirror-header` option added in Junos OS Evolved Release 25.4R1.

radius-reachability {
 query-period seconds;
}
```

Hierarchy Level

```
[edit logical-systems name protocols dot1x authenticator],
[edit protocols dot1x authenticator]
```

Release Information

Statement introduced in Junos OS Release 21.4R1.

Description

Enable the RADIUS reachability feature to authenticate sessions that are in server fail state once the authentication server becomes reachable. The authenticator checks for reachability by triggering reauthentication for one of the authentications sessions that previously failed to reach the server.

When an authentication session fails because the server is not reachable, the session is placed in held state or in the server-fail VLAN, if it is configured. If RADIUS reachability is not enabled, these sessions will not reauthenticate until the reauthentication timer expires. The reauthentication interval is typically long, one hour by default, forcing the client to wait even after the server is reachable.

Options

query-period *seconds*

Query period interval.

- Default: 120 seconds.
- Range: 20 through 65535 seconds.

Required Privilege Level

routing

        source-addresssource-address;
        timeout seconds;
        tls {
            ca-profiles name;
    }
    }
```

Hierarchy Level

```
[edit system]
```

Description

Configure the RADIUS authentication server for subscriber access management, Layer 2 Tunnelling Protocol (L2TP), or Point-to-Point Protocol (PPP).

To configure multiple RADIUS servers, include multiple `radius-server` *`server-address`* statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

> **NOTE**: The accounting-port and source-address options are not available on QFabric systems.

Options

server-address	Specify the IPv4 or IPv6 address of the RADIUS authentication server.
accounting-port *port-number*	Configure the accounting port number on which to contact the RADIUS server. • **Range:** 1 through 65,335 • **Default:** 1813 (as specified in RFC 2866)

accounting-retry *number*

Configure the number of accounting retry attempts.

- **Range:** 0 through 100 attempts
- **Default:** 0

accounting-timeout *seconds*

Configure the accounting request timeout period.

- **Range:** 0 through 1000 seconds
- **Default:** 0

dynamic-request-port *number*

Configure the RADIUS client dynamic request port number

- **Range:** 1 through 65535
- **Default:** 3799

max-outstanding-requests *value*

Configure the maximum number of outstanding requests in flight to the server.

- **Range:** 0 through 2000 requests
- **Default:** 1000 requests

port *port-number*

Configure the port number on which to contact the RADIUS server.

- **Range:** 1 through 65,335
- **Default:** 1812 (as specified in RFC 2865)

preauthentication-port *number*

Configure the RADIUS server preauthentication-port number.

- **Range:** 1 through 65535

preauthentication-secret *secret*

Configure the shared secret with the RADIUS server; it can include spaces if the character string is enclosed in quotation marks. The secret used by the local device must match that used by the RADIUS server.

retry *value*

Configure the number of times that the device is allowed to try to contact a RADIUS authentication server.

- **Range:** 1 through 100
- **Default:** 3

routing-instance *routing-instance-name*

Configure the routing instance name for the management routing instance. In the case of configuring the non-default management instance, use the value

mgmt_junos. that is mgmt_junos. Configuring this option along with the management-instance statement enables authentication processes (for example, RADIUS and TACACS+) to use the non-default management routing instance for packet traffic.

> **NOTE**: You must also define the mgmt_junos routing instance under the [edit routing-instances] hierarchy level.

If you do not configure the mgmt_junos instance under the [edit routing-instances] hierarchy level and configure it only under tacplus-server or radius-server, the commit will fail.

secret *password*

(Required) Configure the password (shared secret) to use with the RADIUS server; it can include spaces if the character string is enclosed in quotation marks. The secret password used by the local device must match that used by the RADIUS server.

source-address *source-address*

Configure a valid IPv4 or IPv6 address configured on one of the device's interfaces.

timeout *seconds*

Configure the amount of time the local device waits to receive a response from a RADIUS server.

- **Range:** 1 through 1000 seconds
- **Default:** 3 seconds

tls

Configure RADIUS over the Transport Layer Security (TLS) protocol.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

routing-instance introduced in Junos OS Release 18.1R1.

```

Hierarchy Level

```
[edit access],
[edit access profile profile-name]
```

Description

Configure RADIUS for subscriber access management, Layer 2 Tunneling Protocol (L2TP), or Point-to-Point Protocol (PPP) authentication.

To configure multiple RADIUS servers, include multiple `radius-server` statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

Options

server-address IPv4 or IPv6 address of the RADIUS server.

accounting-port Configure the port number on which to contact the RADIUS accounting server.

> **NOTE**: Specifying the accounting port is optional, and port 1813 is the default. However, we recommend that you configure it in order to avoid confusion, as some RADIUS servers might refer to an older default.

- **Values:** *port-number*—Port number on which to contact the RADIUS accounting server. Most RADIUS servers use port 1813, as specified in RFC 2866.
- **Default:** 1813

accounting-retry Configure the number of times the device retransmits RADIUS accounting messages when no response is received from the server. When you do not configure this statement, the number of retry attempts is determined by the `retry` statement.

> **NOTE**: To successfully set a retry limit for the accounting servers different from the authentication servers, you must configure both the `accounting-retry` and `accounting-timeout` statements . If you configure only one of these statements, then the value you configure is ignored in favor of the values configured with the `retry` and `timeout` statements.

> **NOTE**: The maximum retry duration (the number of retries times the length of the timeout) cannot exceed 2700 seconds. An error message is displayed if you configure a longer duration.

- **Values:** *number*—Number of retry attempts.
- **Range:** 0 through 100
- **Default:** 0 (disabled)

accounting-timeout

Configure how long the local device waits to receive a response from a RADIUS accounting server before retransmitting the message. When you do not configure this statement, the length of the timeout is determined by the `timeout` statement.

> **NOTE**: To successfully set a timeout value for the accounting servers different from the authentication servers, you must configure both the `accounting-retry` and `accounting-timeout` statements . If you configure only one of these statements, then the value you configure is ignored in favor of the values configured with the `retry` and `timeout` statements.

> **NOTE**: The maximum retry duration (the number of retries times the length of the timeout) cannot exceed 2700 seconds. An error message is displayed if you configure a longer duration.

- **Values:** *seconds*—Duration of timeout period.
- **Range:** 0 through 1000 seconds
- **Default:** 0 (disabled)

dynamic-request-port

Specify the port that the router monitors for dynamic (CoA) requests from the specified RADIUS servers. You can configure a port globally or for a specific access profile.

You must either use the default port for all RADIUS servers or configure the same nondefault port for all RADIUS servers. This rule applies at both the global access and access profile levels.

> **NOTE**: Any other configuration results in a commit check failure. Multiple port numbers—that is, different port numbers for different servers—are not supported.

- **Values:** *port-number*—Number of the monitored port.
- **Default:** 3799 (as specified in RFC 5176)

max-outstanding-requests

Configure the maximum number of outstanding requests for this RADIUS server. An increase in this value is immediate while a decrease is more gradual if the current number of outstanding requests exceeds the new value.

- **Values:** *requests*—Maximum number of outstanding requests for this RADIUS server.
- **Range:** 0 through 2000 outstanding requests per server
- **Default:** 1000 outstanding requests per server

port

Configure the port number on which to contact the RADIUS server.

- **Values:** *port-number*—Port number on which to contact the RADIUS server.
- **Default:** 1812 (as specified in RFC 2865)

preauthentication-port

Configure the port number on which to contact the RADIUS server for logical line identification (LLID) preauthentication requests. If you do not configure a separate UDP port for preauthentication purposes, the same UDP port that you configure for authentication messages by including the `port port-number` statement is used.

- **Values:** *port-number*—Port number used for preauthentication requests to contact the RADIUS server.

preauthentication-secret

Configure the password to use with the RADIUS server for LLID preauthentication requests. If you do not configure a separate UDP password for

preauthentication purposes, the same password that you configure for authentication messages by including the `secret` *password* statement is used. The secret password used by the local router must match that used by the server.

- **Values:** *password*—Password to use. To include spaces enclose the character string in quotation marks.

retry

Specify the number of times that the device is allowed to attempt to contact a RADIUS authentication or accounting server. You can override the retry limit for accounting servers with the `accounting-retry` statement.

> **NOTE**: To successfully set a retry limit for the accounting servers different from the authentication servers, you must configure both the `accounting-retry` and `accounting-timeout` statements . If you configure only one of these statements, then the value you configure is ignored in favor of the values configured with the `retry` and `timeout` statements.

> **NOTE**: The maximum retry duration (the number of retries times the length of the timeout) cannot exceed 2700 seconds. An error message is displayed if you configure a longer duration.

- **Values:** *attempts*—Number of times that the router is allowed to attempt to contact a RADIUS server.
- **Range:** 1 through 100
- **Default:** 3

routing-instance

Configure the routing instance used to send RADIUS packets to the RADIUS server.

- **Values:** *routing-instance-name*—Routing instance name.

source-address

Configure a source address for each configured RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address. Support for IPv6 *source-address* was introduced in Junos OS Release 16.1.

- **Values:** *source-address*—Valid IPv4 or IPv6 address configured on one of the router or switch interfaces. On M Series routers only, the source address can be an IPv6 address and the UDP source port is 514.

timeout

Configure the amount of time that the local device waits to receive a response from RADIUS authentication and accounting servers. You can override the timeout value for accounting servers with the `accounting-timeout` statement.

> **NOTE**: To successfully set a timeout value for the accounting servers different from the authentication servers, you must configure both the `accounting-retry` and `accounting-timeout` statements . If you configure only one of these statements, then the value you configure is ignored in favor of the values configured with the `retry` and `timeout` statements.

> **NOTE**: The maximum retry duration (the number of retries times the length of the timeout) cannot exceed 2700 seconds. An error message is displayed if you configure a longer duration.

- **Values:** *seconds*—Amount of time to wait.
- **Range:** 1 through 1000 seconds
- **Default:** 3 seconds

```

Description

Configure RADIUS for 802.1x authentication using a fully-qualified domain name (FQDN). Use an FQDN if the server name can translate to more than one address. The FQDN resolves dynamically at regular intervals so there is no need to modify the configuration for address changes.

The FQDN is first resolved at the time of configuration commit, and then at fixed intervals based on the configured value for the `dns-query-interval` statement.

You can combine the FQDN configuration with the round-robin algorithm to achieve load distribution among the available servers. Configure the round-robin algorithm at the [`edit access profile profile-name radius options`] hierarchy level.

To configure a RADIUS server using a fixed IP address, use the `radius-server` statement.

Options

hostname Configure the FQDN to identify the RADIUS server. The *hostname* parameter supports only one FQDN. To configure more than one FQDN, use multiple `radius-server-name` statements.

dns-query-interval Configure the interval for resolving an FQDN as the server address. The FQDN is resolved dynamically at fixed intervals based on the configured value.

- **Values:** *minutes*—Interval of the FQDN resolution in minutes.
- **Range:** 10 through 1440
- **Default:** 60

}
```

Hierarchy Level

```
[edit access]
```

Description

Configure RADIUS over TLS, also known as RADSEC, to redirect regular RADIUS traffic to remote RADIUS servers connected over TLS. The TLS connection provides encryption, authentication, and data integrity for the exchange of RADIUS messages.

To configure RADIUS over TLS, you need to configure the RADSEC server as a destination for RADIUS traffic. Traffic that is destined for a RADIUS server can then be redirected to the RADSEC destination. RADSEC destinations are identified by a unique numeric ID. You can configure multiple RADSEC destinations with different parameters pointing to the same RADSEC server.

TLS relies on certificates and private-public key exchange pairs to secure the transmission of data between the RADSEC client and server. The RADSEC destination uses local certificates that are dynamically acquired from the Junos PKI infrastructure.

To enable RADSEC, you must specify the name of the local certificate. If a certificate is not available, or if the certificate was revoked, the RADSEC destination attempts to retrieve it every 300 seconds.

Default

RADSEC is not enabled by default.

Options

destination ***id-number***

Globally unique ID number for the RADSEC destination.

- **Range:** 1 through 65535

address ***ip-address***

Specify the IP address of the RADSEC server.

id-reuse-timeout ***seconds***

Configure the number of seconds after which the RADIUS ID field value can be reused.

- **Default:** 120 seconds
- **Range:** 60 to 3600 seconds

logical-system ***ls-name*** **routing-instance** ***ri-name***

Specify the logical system or the routing instance for transport.

Default: If you do not explicitly configure the logical system or routing instance, the default is used. You can specify the logical system, the routing instance, or both.

- No configuration specifies default:default.

- Configuring only the routing instance specifies default:*ri-name*.
- Configuring only the logical system specifies *ls-name*:default.
- Configuring both the logical system and the routing instance specifies *ls-name*:*ri-name*.

max-tx-buffers *number*

Configure the maximum number of packets buffered on transmission.

> **NOTE**: The buffer allocation should be able to accommodate the `max-outstanding-requests` for mapped RADIUS servers configured at the [`edit access radius-server`] hierarchy level.

- **Default:** 100
- **Range:** 32 to 3200

port *port-number*

(Optional) Configure the port number of the RADSEC server.

- **Default:** 2083
- **Range:** 1 through 65535

source-address *ip-address*

Configure the source IP address, which is the IP address of the RADSEC server. If the source address is not configured for dynamic requests, dynamic requests will be rejected.

tls-certificate *certificate-name*

Specify the name of the local certificate.

tls-force-ciphers [medium | low]

(Optional) Allow lower-grade ciphers than the default.

- Values:
  - low—Add medium and low grade ciphers.
  - medium—Add medium grade ciphers.
  -

> **NOTE**: The "tls-force-ciphers" option is not applicable. Strong cipher suites are always used by default.

tls-min-version [v1.1 | v1.2]

(Optional) Configure the TLS version to limit the lowest supported versions of TLS that are enabled for SSL connections.

- Values:
  - v1.1—Require TLS 1.1 and 1.2.
  - v1.2—Require TLS 1.2.
- **Default:** v1.2

tls-peer-name *name*

Certified name of the RADSEC server.

tls-timeout *seconds*

Specify a limit on TLS negotiation.

- **Default:** 5 seconds
- **Range:** 3 through 90 seconds

IN THIS SECTION

- Syntax | 14588
- Hierarchy Level | 14588
- Description | 14588
- Required Privilege Level | 14588
- Release Information | 14588

Syntax

```
raise-trap;
```

Hierarchy Level

```
[edit event-options policy policy-name then]
```

Description

Define an event policy that raises an SNMP trap in response to an event. If one or more of the listed events occur, the system log message for the event is converted into a trap. This enables an agent to notify a trap-based *network management system* (NMS) of significant events.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 8.1.

RELATED DOCUMENTATION

Overview of Using Event Policies to Raise SNMP Traps

Example: Raise an SNMP Trap in Response to an Event

random

IN THIS SECTION

- Syntax | 14589
- Hierarchy Level | 14589

- Description | 14589
- Default | 14589
- Required Privilege Level | 14590
- Release Information | 14590

Syntax

```
(random | least-fill | most-fill);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name]
```

Description

Configure the preferred path when several equal-cost candidate paths to a destination exist, and prefer the path with the highest available bandwidth (with the largest minimum available bandwidth ratio). The available bandwidth ratio of a link is the available bandwidth on a link divided by the maximum reservable bandwidth on the link.

- `least-fill`—Prefer the path with the most available bandwidth (with the largest available bandwidth ratio).
- `most-fill`—Prefer the path with the least available bandwidth (with the minimum available bandwidth ratio). The minimum available bandwidth ratio of a path is the smallest available bandwidth ratio belonging to any of the links in the path.
- `random`—Choose the path at random.

Default

`random`

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

range (Access)

IN THIS SECTION

- Syntax | 14590
- Hierarchy Level | 14591
- Description | 14591
- Options | 14591
- Required Privilege Level | 14591
- Release Information | 14591

Syntax

```
range range-name {
    high upper-limit;
    low lower-limit;
    prefix-length delegated-prefix-length;
}
```

Hierarchy Level

```
[edit access address-assignment pool pool-name family inet6]
[edit access address-assignment pool pool-name family inet]
```

Description

Configure an IP name range used within an address-assignment pool. For IPv4, you do not create a prefix-length.

Options

- *range-name*—Name of the range.
- `high` *upper-limit*—Upper limit of IPv6 address range.
- `low` *lower-limit*—Lower limit of IPv6 address range.
- `prefix-length` *delegated-prefix-length*—IPv6 delegated prefix length.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Release 10.4 of Junos OS.

RELATED DOCUMENTATION

Firewall User Authentication Overview

range (Address-Assignment Pools)

IN THIS SECTION

- Syntax | 14592
- Hierarchy Level | 14592
- Description | 14592
- Options | 14592
- Required Privilege Level | 14593
- Release Information | 14593

Syntax

```
range range-name {
    high upper-limit;
    low lower-limit;
    prefix-length prefix-length;
}
```

Hierarchy Level

```
[edit access address-assignment pool pool-name family (inet | inet6)]
```

Description

Configure a named range of IPv4 addresses or IPv6 prefixes, used within an address-assignment pool.

Options

`high` *`upper-limit`*—Upper limit of an address range or IPv6 prefix range.

`low` *`lower-limit`*—Lower limit of an address range or IPv6 prefix range.

`prefix-length` *`prefix-length`*—Assigned length of the IPv6 prefix.

range-name—Name assigned to the range of IPv4 addresses or IPv6 prefixes.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

IPv6 support introduced in Junos OS Release 10.0.

Address-Assignment Pools for Subscriber Management

range (Source NAT Next Gen Services)

IN THIS SECTION

- Syntax | 14593
- Hierarchy Level | 14594
- Description | 14594
- Options | 14594
- Required Privilege Level | 14594
- Release Information | 14594

Syntax

```
range {
    port-low to port-high;
```

```
    (random-allocation | round-robin);
}
```

Hierarchy Level

```
[edit services nat source pool nat-pool-name port]
```

Description

To configure a range of ports to assign to a pool, specify the low and high values for the port. If you do not configure automatic port assignment, you must configure a range of ports. This statement applies to source NAT with port translation, but not to deterministic NAT.

If you specify a range, ports are selected a round-robin fashion. If you specify a range of ports to assign, the automatic statement is ignored.

Options

port-low	Lowest port number.
port-high	Highest port number.
random-allocation	Randomly assigns a port from the range 1024 through 65535 for each port translation.
round-robin	First assigns port 1024, and uses the next higher port for each successive port assignment. Round robin allocation is the default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

rate (Forwarding Options)

IN THIS SECTION

- Syntax | 14602
- Hierarchy Level | 14602
- Description | 14602
- Options | 14603
- Required Privilege Level | 14603
- Release Information | 14603

Syntax

```
rate number;
```

Hierarchy Level

```
[edit forwarding-options analyzer analyzer-name input],
[edit forwarding-options port-mirroring input],
[edit forwarding-options sampling input],
[edit forwarding-options sampling instance instance-name input]
```

Description

Set the ratio of the number of packets to be sampled. For example, if you specify a rate of 10, every tenth packet (1 packet out of 10) is sampled.

Native analyzer sessions (that is, the `[edit forwarding-options analyzer analyzer-name input]` hierarchy level for MX Series routers) can be configured without specifying input parameters, which means that the instance uses default input values: rate = 1 and maximum-packet-length = 0.

NOTE: The recommended sampling rate for the MX150 is 1000 or greater. If you configure less than 1000, a warning is issued.

Options

number—Denominator of the ratio.

- **Range:** 1 through 16000000 (16M)

  For QFX Series switches, the maximum sampling rate for inline Junos Traffic Vision (J-Flow) is 65535.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the `[edit forwarding-options analyzer analyzer-name input]` hierarchy level for MX Series routers introduced in Junos OS Release 14.1.

rate-limit (Aggregated rate limit)

IN THIS SECTION

- Syntax | 14610
- Hierarchy Level | 14610
- Description | 14610
- Options | 14611
- Required Privilege Level | 14612
- Release Information | 14612

Syntax

```
rate-limit name {
    message {
        v0 msg-list-name;
        v1 msg-list-name;
        v2 msg-list-name;
    }
}
```

Hierarchy Level

```
[edit security gtp]
```

Description

Use the rate-limit function to configure the message that needs to be rate limited.

Use the message-list function to configure the list of messages for aggregated rate limiting. This helps to specify aggregated rate limit messages of various GTP versions. It is also used to customize aggregated rate limit for different GTP message-list profiles.

The configured message-list replaces the default messages. The configured *msg-list-name* should be a defined message-list.

If the message-lists are not configured, aggregated rate limit uses the default messages.

Table 125: Default aggregated rate limit messages for various GTP versions.

GTP version	Default aggregated rate limit messages
GTPv0	Echo Request
	Create PDP Request
	Create AA PDP Request
	Update PDP Request

Table 125: Default aggregated rate limit messages for various GTP versions. ***(Continued)***

rate-limit (Security GTP)

IN THIS SECTION

- Syntax | 14612
- Hierarchy Level | 14613
- Description | 14613
- Options | 14613
- Required Privilege Level | 14613
- Release Information | 14613

Syntax

```
rate-limit {
    alarm-threshold alarm-threshold;
    drop-threshold drop-threshold;
}
```

Hierarchy Level

```
[edit security gtp profile profile-name]
```

Description

Use the rate-limit option to limit the GTP messages per second. The default value of rate limit is 0, which means there is no limit. A drop threshold option and an alarm threshold option are added to the existing rate-limit configuration to reduce the duplicate drop logs for destination GSN. In one second, if number of certain messages received reaches the alarm threshold, one alarm log is generated. If number of certain messages received reaches the drop threshold, one packet drop log is generated while all other messages received within this second will be dropped.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs gtp profile profile-name]` hierarchy level is replaced by `[edit security gtp profile profile-name]`.

Options

alarm-threshold

Sets alarm threshold for rate-limit.

- **Range:** 1 through 80000

drop-threshold

Sets drop threshold for rate-limit.

- **Range:** 1 through 80000

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0. Support. Support for `alarm-threshold` option and `drop-threshold` option are added in Junos OS Release 20.4R1.

RELATED DOCUMENTATION

Understanding Path Rate Limiting for GTP Control Messages

Example: Limiting the Message Rate and Path Rate for GTP Control Messages

rate-limit (Security Log)

IN THIS SECTION

- Syntax | 14614
- Hierarchy Level | 14614
- Description | 14614
- Required Privilege Level | 14615
- Release Information | 14615

Syntax

```
rate-limit rate-limit;
```

Hierarchy Level

```
[edit security log stream stream-name]
[edit logical-systems name security log stream stream-name]
[edit tenants tenant-name security log stream stream-name]
```

Description

The Integrated Authentication and Enforcement feature sends threat and attack logs generated by the SRX Series Firewall security modules to the ClearPass Policy Manager (CPPM) to use in its security policy assessment.

The logs are sent in stream mode. To avoid overburdening the SRX Series Firewall and the log server, you can control the rate at which these logs are sent. By setting a rate-limit value, you can constrain the number of logs that are sent in 1 second. After the limit is reached, no more logs are sent.

Range: 1 through 65,535.

NOTE: For devices with multicore systems that use SPUs, each SPU is programmed with the configured-rate, which results in an aggregate-rate proportional to the number of SPUs.

```
SPU configured-rate = aggregate-rate/number-of-SPUs
```

Rate limiting on SRX5400, SRX5600, and SRX5800 devices is generally not as accurate as it is on SRX100, SRX210, SRX220, SRX240, SRX650, SRX1400, SRX1500, SRX3400, SRX3600, SRX4100, and SRX4200 devices, because the generation of logs is not entirely balanced between SPUs.

Required Privilege Level

1. security—To view this statement in the configuration.
2. security-control—To add this statement to the configuration.

```
[edit class-of-service application-traffic-control]
[edit logical-systems logical-system-name class-of-service application-traffic-control]
[edit tenants tenant-name class-of-service application-traffic-control]
```

Description

Share the available bandwidth and burst size of a device's PICs by defining rate limiter profiles and applying them in AppQoS rules.

Options

- *rate-limiter-name*—Name of the rate limiter. It is applied in AppQoS rules to share device resources based on quality-of-service requirements.

  The combination of rate limiting parameters, namely bandwidth- limit and burst-size-limit rate limit, make up the rate limiter profile. A maximum of 16 profiles are allowed per device. The same profile can be used by multiple rate limiters. For example, a profile with a bandwidth-limit of 200 Kbps and a burst-limit of 130,000 bytes, could be used in several rate limiters.

  A maximum of 1000 rate limiters can be created. Rate limiters are defined for the device, and are assigned in rules in a rule set. A single rate limiter can be used multiple times within the same rule set. However, the rate limiter cannot be used in another rule set.

- `bandwidth-limit` *value-in-Kbps*—Maximum number of kilobits to be transmitted per second for this rate limiter. Up to 2 GB of bandwidth can be provisioned among multiple rate limiters to share the resource proportionally.

- `burst-size-limit` *value-in-bytes*—Maximum number of bytes to be transferred in a single burst or time-slice. This limit ensures that a high-priority transmission does not keep a lower priority transmission from transmitting.

> **NOTE**: The number of `bandwidth-limit` and `burst-size-limit` combinations cannot exceed 16.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Support at the following hierarchy levels introduced in Junos OS Release 19.3R1: `[edit logical-systems` *logical-system-name* `class-of-service application-traffic-control]`, and `[edit tenants` *tenant-name* `class-of-service application-traffic-control]`.

rcp-count

IN THIS SECTION

- Syntax | 14620
- Hierarchy Level | 14620
- Description | 14620
- Options | 14621
- Required Privilege Level | 14621
- Release Information | 14621

Syntax

```
rcp-count number;
```

Hierarchy Level

```
[edit chassis nssu]
```

Description

(QFX5100 Virtual Chassis or Virtual Chassis Fabric [VCF] only) Optionally override the default algorithm that defines the number of parallel `rcp` sessions used for copying the new software image to member switches in a Virtual Chassis or VCF for nonstop software upgrade (NSSU).

You can upgrade the software running on all members of a Virtual Chassis or VCF using NSSU. At the beginning of the upgrade process, NSSU uses `rcp` to copy the new software from the primary switch to each of the member switches. Starting in Junos OS Release 14.1X53-D40, to minimize the time to copy the files to all members, NSSU uses parallel `rcp` sessions to copy the software to multiple members at the same time, rather than copying sequentially to each member in turn.

By default, the number of parallel `rcp` sessions that NSSU launches at a time follows an algorithm that optimizes the transfer time based on the total number of members in the Virtual Chassis or VCF, so that the new software is transferred to about half the members in parallel up to a maximum of 8 members at

one time. After the first set of parallel copy operations are complete, NSSU launches the next set of parallel copy operations, and so on as needed until all members are updated.

Although the default value is usually optimal, you can configure the `rcp-count` statement to set a specific value for the number of parallel copy sessions instead. For example, you might want to use a lower number of parallel sessions to avoid potential impact on Virtual Chassis or VCF forwarding activity during NSSU.

After copying the new software to all members using as many parallel `rcp` sessions as needed, the NSSU process continues by rebooting each member with the new software in sequence, starting with the member in the backup Routing Engine role.

> **NOTE**: If copying the new software to any member fails, NSSU terminates the upgrade process for the entire Virtual Chassis or VCF, logs the error condition, and initiates an error recovery measure to remove the new software from the members to which it was already transferred.

Options

number Number of parallel `rcp` sessions for NSSU to launch at a time, which overrides the default algorithm.
Allowable values are 0 through 8. Specifying a value of 0 suppresses parallel copy sessions; the new software is copied to each member sequentially.

     max-synacks-queued value;
    (tcp-error-logging | no-tcp-error-logging);
}
```

Hierarchy Level

```
[edit security idp sensor-configuration]
```

Description

Configure TCP reassembler for IDP sensor settings.

Options

max-flow-mem

Define the maximum TCP flow memory that the IDP sensor can handle.

- **Syntax:** *value*—Maximum TCP flow memory in kilobytes.
- **Range:** 64 through 4,294,967,295 kilobytes
- **Default:** 1024 kilobytes

max-synacks-queued

Define the maximum limit for queuing Syn/Ack packets with different SEQ numbers.

- **Syntax:** *value*—Maximum synchronization acknowledgements queued with different SEQ numbers.
- **Range:** 0 through 5

max-packet-mem-ratio

By default, values for IDP reassembler packet memory are established as percentages of all memory. In most cases, these default values are adequate.

If a deployment exhibits an excessive number of dropped TCP packets or retransmissions resulting in high IDP reassembly memory usage, use the `max-packet-mem-ratio` option to reset the percentage of available IDP memory for IDP reassembly packet memory. Acceptable values are between 5 percent and 40 percent.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2. Packet memory ratios added in Junos OS Release 12.1X44-D20.

            }
      }
}
```

Hierarchy Level

```
[edit chassis fabric event],
[edit chassis member name fabric event]
```

Description

Fabric reachability fault detection. Configure options that apply to detect fabric reachability fault conditions and trigger automatic fabric connectivity restoration.

Options

- `actions`— Reachability fault recovery actions. Depending on the reachability fault conditions, allow users to configure one or more recovery actions for the router to attempt automatic fabric connectivity restoration.
  - `fpc-restart-disable`— Turn off FPC restart recovery action.
  - `recovery failure (pfe-restart-disable)`— Configure PFE-offline to override the default action of disabling interfaces, if fabric connectivity cannot be restored.
- `degraded`— Degraded fabric configuration. Allow users to configure the error threshold percentage value. The percentage value can range from 1 to 99, and it represents the percentage of fabric degradation at which the recovery action is taken.
  - `apply-groups` *`group-name,`* — Inherit configuration data from these groups.
  - `+ apply-groups-except`— Do not inherit configuration data from these groups.
  - `error-threshold`— Fabric error threshold when PFE is degraded.
  - `degradation` *`percentage`*— Degradation percentage values from 1 to 99.

Syntax

```
reachable-time milliseconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-name],
[edit protocols router-advertisement interface interface-name]
```

Description

Set the length of time that a node considers a neighbor reachable until another reachability confirmation is received from that neighbor.

After receiving a reachability confirmation from a neighbor, a node considers that neighbor reachable for a certain amount of time without receiving another confirmation. This mechanism is used for neighbor unreachability detection, a mechanism for finding link failures to a target node.

Options

milliseconds—Reachability time limit.

- **Range:** 0 through 3,600,000 milliseconds
- **Default:** 0 milliseconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name routing-options static (defaults | route)],
```

```
[edit routing-options rib routing-table-name static (defaults | route)],
[edit routing-options static (defaults | route)]
```

Description

Configure whether static routes are eligible to be readvertised by routing protocols:

Default

Static routes are eligible to be readvertised (that is, exported from the routing table into dynamic routing protocols) if a policy to do so is configured. To mark an IPv4 static route as being ineligible for readvertisement, include the `no-readvertise` statement.

Options

readvertise Readvertise static routes. Include the `readvertise` statement when configuring an individual route in the **route** portion of the `static` statement to override a **no-readvertise** option specified in the **defaults** portion of the statement.

no-readvertise Mark a static route as being ineligible for readvertisement. Include the **no-readvertise** option when configuring the route.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

dual-stack-group name],
[edit system services dhcp-local-server],
[edit system services dhcp-local-server dhcpv6],
[edit system services dhcp-local-server dual-stack-group name]
```

Description

Enable DHCP client reauthentication, that is, trigger jdhcpd to request reauthentication from authd, which in turn reissues the RADIUS Access-Request for subscriber authentication. The purpose of the reauthentication is to change characteristics of the subscriber session, such as activating subscriber services or changing attributes. You can use reauthentication as an alternative to a RADIUS CoA request.

Starting in Junos OS Release 18.1R1, reauthentication can be triggered by discover and solicit messages in addition to the previously supported renew and rebind messages. The release also introduces reauthentication support for dual-stack, single-session subscribers.

You can specify that reauthentication occurs in response to all DHCP renew, rebind, discover, or solicit messages or only in response to discover and solicit messages that include a new (different) Agent Remote ID for the DHCP client.

You can use the Juniper Networks VSA, Reauthentication-On-Renew (26-206) as an alternative to the CLI configuration to enable reauthentication. The `reauthenticate` statement overrides the VSA when the VSA is present with a value of disable.

NOTE: Reauthentication for dual-stack, single-session subscribers requires that the `on-demand-address-allocation` statement is configured for the dual-stack group. This is true whether you enable reauthentication with the `reauthenticate` statement or the Reauthenticate-On-Renew VSA (26-206).

NOTE: You cannot configure both the `reauthenticate` statement and the remote-id-mismatch (DHCP Local Server and DHCP Relay Agent) statement at the global level, `[edit system services dhcp-local-server]`. However, DHCP precedence rules do permit you to configure both statements when they are at different levels. For example, you can configure `reauthenticate` at the global level and remote-id-mismatch (DHCP Local Server and DHCP Relay Agent) for DHCPv6 at the `[edit system services dhcp-local-server dhcpv6]` or for a specific group at the `[edit system services dhcp-local-server group name]` hierarchy level, and so on.

NOTE: Reauthentication does not support Extensible Services Subscriber Management (essmd) services. Activation or deactivation of any such service causes the request to fail.

Options

lease-renewal Reauthenticate when a renew, rebind, discover, or solicit message is received from the DHCP client. This re-authentication is an alternative to RADIUS Change of Authorization (CoA) to change subscriber session characteristics based on the actual data rate change without interrupting the subscriber service.

remote-id-mismatch Reauthenticate when a discover or solicit message is received from the DHCP client with a new value for the DHCP client's Agent Remote ID. The change in value corresponds to a change in subscriber service plan. The Agent Remote ID is conveyed in option 82, suboption 2 for DHCPv4 clients and in option 37 for DHCPv6 clients.

actual-data-rate-change Optical line terminal (OLT) adds `option 82` with `sub-option 9` with Broadband Forum (Vendor ID 3561). It contains the sub-attributes `Actual-Data-Rate-Upstream` and `Actual-Data-Down-Stream` encoded. The decoded upstream and downstream data send to RADIUS server as a part of authentication request. RADIUS server analyzes the data received. Based on the `Actual-Data-Rate-Upstream` and `Actual-Data-Down-Stream` values, the RADIUS server selects the service profile for the subscriber interface.

When the actual data rate changes, the DHCP server re-authenticates the subscriber service. This re-authentication is an alternative to RADIUS Change of Authorization (CoA) to change subscriber session characteristics based on the actual data rate change without interrupting the subscriber service.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.4R1.

Support at the `[edit ... system services dhcp-local-server dual-stack-group]` hierarchy level introduced in Junos OS Release 18.1R1.

`actual-data-rate-change` option introduced in Junos OS Release 21.4R1.

rebalance-subscriber-granularity (PS interface)

IN THIS SECTION

- Syntax | 14656
- Hierarchy Level | 14656
- Description | 14656
- Default | 14657
- Required Privilege Level | 14657
- Release Information | 14657

Syntax

```
rebalance-subscriber-granularity <subscriber-granularity-value>;
```

Hierarchy Level

```
[edit interfaces psnumber targeted-options]
```

Description

Rebalancing takes place when the member links have more subscribers than the configured value on the rebalance-subscriber-granularity option. Changing the value to a value less than the current active value does not force IFLs to be reassigned to a different pseudo IFL.

BEST PRACTICE: We recommend that you do not configure a low granularity value. A low value can have undesirable effects, such as the router running out of pseudo logical interfaces or an increase in the convergence time for rebalancing.

Leaving subscriber granularity at the default value of 500 subscribers is sufficient in most cases. Whenever more than one member link is active, targeted distribution places new subscribers on a link with fewer subscribers than other member links on the interface.

Default

The default subscriber granularity value is 500 subscribers.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.4R1.

restart],
[edit protocols bgp graceful-restart long-lived],
[edit protocols bgp group group-name graceful-restart long-lived],
[edit protocols bgp group group-name neighbor address graceful-restart long-lived]
```

Description

Enable the long-lived graceful restart mechanism for a BGP receiver or helper router to preserve BGP routing details for a longer period from a failed BGP peer. Long-lived graceful restart receiver or helper mode is enabled by default, unless ordinary graceful restart receiver or helper mode is disabled.

The `long-lived receiver enable` overrides a disable option inherited from a higher level in the configuration. When the LLGR receiver or helper mode is enabled or disabled, the session is reset. This behavior enables the new capability value to be sent to the neighbor.

Options

enable Enable long-lived BGP graceful restart for a receiver or helper router

disable Disable long-lived BGP graceful restart for a receiver or helper router

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

receiver

IN THIS SECTION

- Syntax | 14671
- Hierarchy Level | 14672
- Description | 14672
- Default | 14672
- Options | 14672
- Required Privilege Level | 14673
- Release Information | 14673

Syntax

```
receiver {
    install;
    mode (proxy | transparent);
    (source-list | source-vlans) vlan-list;
```

```
    translate;
}
```

Hierarchy Level

```
[edit protocols igmp-snooping vlan vlan-name data-forwarding],
[edit logical-systems name protocols igmp-snooping vlan vlan-name data-forwarding]
```

Description

Configure a VLAN as a multicast receiver VLAN of a multicast source VLAN (MVLAN) using the multicast VLAN registration (MVR) feature.

You must associate an MVR receiver VLAN with at least one data-forwarding source MVLAN. You can configure an MVR receiver VLAN with multiple source MVLANs using the `source-list` or `source-vlans` statement.

The remaining statements are explained separately.

> **NOTE**: The `mode`, `source-list`, and `translate` statements are only applicable to MVR configuration on EX Series switches that support the Enhanced Layer 2 Software (ELS) configuration style.
>
> The `source-vlans` statement is applicable only to EX Series switches that do not support ELS, and is equivalent to the ELS `source-list` statement.

See CLI Explorer.

Default

MVR not enabled

Options

install

Install forwarding table entries (also called bridging entries) on the MVR receiver VLAN when MVR is enabled. By default, MVR only installs bridging entries on the source MVLAN for a group address.

You cannot configure the `install` option for a data-forwarding receiver VLAN that is configured in proxy mode (see the MVR "mode" on page 11252 option). In MVR

transparent mode, by default, the device installs bridging entries only on the MVLAN for a multicast group, so upon receiving MVR receiver VLAN traffic for that group, the switch doesn't forward the traffic to receiver ports on the MVR receiver VLAN that sent the join message for that group. The traffic is only forwarded on the MVLAN to MVR receiver interfaces. Configure this option when in transparent mode to enable MVR receiver VLAN ports to receive traffic forwarded on the MVR receiver VLAN.

mode (proxy | transparent) (ELS devices only) Set proxy or transparent mode for an MVR receiver VLAN. This statement is explained separately. The mode is `transparent` by default.

source-list *vlan-list* (ELS devices only) Specify a list of multicast source VLANs (MVLANs) from which a multicast receiver VLAN receives multicast traffic when multicast VLAN registration (MVR) is configured. This option is available only on on-ELS devices. (Use the `source-vlans` option for the same function on non-ELS switches.)

source-vlans *vlan-list* (Non-ELS switches only) Specify a list of MVLANs for MVR operation from which the MVR receiver VLAN receives multicast traffic when multicast VLAN registration (MVR) is configured. Either all of these MVLANs must be in proxy mode or none of them can be in proxy mode (see "proxy" on page 14369). This option is available only on non-ELS switches. (Use the `source-list` option for the same function on ELS devices.)

translate (ELS devices only) Translate VLAN tags in multicast VLAN (MVLAN) packets from the MVLAN tag to the multicast receiver VLAN tag on an MVR receiver VLAN. Without this option, tagged traffic has the MVLAN ID by default.

We recommend you set this option for MVR receiver VLANs with trunk ports, so hosts on the trunk interfaces receive multicast traffic tagged with the expected VLAN ID (the MVR receiver VLAN ID).

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

Statement and `mode`, `source-list`, and `translate` options introduced in Junos OS Release 18.3R1 for EX4300 switches (ELS switches).

Statement and `mode`, `source-list`, and `translate` options added in Junos OS Release 18.4R1 for EX2300 and EX3400 switches (ELS switches).

reconnect-time

IN THIS SECTION

- Syntax | 14680
- Hierarchy Level | 14680
- Description | 14680
- Options | 14680
- Required Privilege Level | 14681
- Release Information | 14681

Syntax

```
reconnect-time seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp graceful-restart],
[edit protocols ldp graceful-restart],
[edit routing-instances routing-instance-name protocols ldp graceful-restart]
```

Description

Specify the length of time required to reestablish a Label Distribution Protocol (LDP) session after graceful restart.

Options

seconds—Time required for reconnection.

- **Range:** 30 through 300
- **Default:** 60 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

record (Origin Validation for BGP)

IN THIS SECTION

- Syntax | 14682
- Hierarchy Level | 14682
- Description | 14682
- Options | 14682
- Required Privilege Level | 14682
- Release Information | 14683

Syntax

```
record destination {
    maximum-length prefix-length {
        origin-autonomous-system as-number {
            validation-state (invalid | valid);
        }
    }
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name routing-options
validation static],
[edit logical-systems logical-system-name routing-options validation static],
[edit routing-instances instance-name routing-options validation static],
[edit routing-options validation static]
```

Description

Configure the network prefix for the route validation (RV) record.

An RV record matches any route whose prefix matches the RV prefix, whose prefix length does not exceed the "maximum-length" on page 10973 given in the RV record, and whose origin AS equals the "origin-autonomous-system" on page 12428 given in the RV record. RV records are received from the cache server using the protocol defined in Internet draft draft-ietf-sidr-rpki-rtr-19, *The RPKI/Router Protocol*, and can also be configured statically, as shown here.

Options

destination—Network prefix for the RV record.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

[edit protocols mpls],
```

```
[edit protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

Description

Specify whether an LSP should actively record the path by sending the record route object (RRO). The RRO is used to record the path that the LSP traverses. It includes the IP address and router/node ID of each RSVP node in the path. Recording the LSP path can be useful for diagnostics and also provides loop detection.

Default

Recording LSP path is enabled by default.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

recovery

IN THIS SECTION

- Syntax | **14689**
- Hierarchy Level | **14689**

- Description | 14689
- Options | 14689
- Required Privilege Level | 14690
- Release Information | 14690

Syntax

```
recovery {
    automatic;
    configuration-only;
    configuration-preference;
    no-automatic;
    on-upgrade;
}
```

Hierarchy Level

```
[edit system snapshot]
```

Description

Configure system snapshot recovery management options.

Options

automatic

This option automatically recovers the Junos volume when necessary.

When you issue the `request system snapshot` command, the configuration on the device is stored in the OAM volume along with the creation of the recovery snapshot.

configuration-only

This option allows you to create or update a recovery snapshot along with storing the configuration on the device.

When you configure this option, the following scenarios occur:

- If a recovery snapshot does not exist for the current Junos image, issuing the `request system snapshot` command create a recovery snapshot along with storing the configuration on the device.
- If a recovery snapshot exists for the current image and additional packages are added or removed, a new recovery snapshot is created. The configuration changes are stored along with the new snapshot on the device.
- If a recovery snapshot exists for the current image and no changes are made to the current image, only the configuration changes are stored to the existing recovery snapshot. No new recovery snapshot is created.

configuration-preference This option allows you to specify a preferred configuration when booting from the OAM volume.

no-automatic When you configure this option, the system does not recover the Junos volume automatically.

on-upgrade Update the recovery snapshot when the Junos release changes.

This option enables the system to automatically create a recovery snapshot when you load a different version of the Junos image on the device. The system generates a recovery snapshot with the new Junos image version and stores the configuration on the device.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 24.2R1.

recovery

IN THIS SECTION

- Syntax | 14691
- Hierarchy Level | 14691
- Description | 14691
- Options | 14691
- Required Privilege Level | 14692
- Release Information | 14692

Syntax

```
recovery {
    (auto | manual);
    timer timer-value;
}
```

Hierarchy Level

```
[edit interfaces interfaces-name link-degrade-monitor]
```

Description

Configure the mechanism to be used to recover a degraded link. The recovery options supported are auto and manual.

Options

auto Recover a degraded link automatically. Use this option with the media-based action when there are no Layer 2 or Layer 3 protocols configured on the interface. If this option is configured, the degraded link is monitored at user-configured intervals; and if the link quality

is found to have improved (if bit error rate hits the clear threshold), the link is automatically recovered. With this configuration, you must configure a timer value.

manual Recover a degraded link manually. Use this option with the media-based action configuration when Layer 2 and Layer 3 protocols are configured on the interface. If this option is configured, you need to use the `request interface link-degrade-recover` *`interface-name`* statement to recover the link.

> **NOTE**: The manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while autorecovery is in progress.

timer ***timer-value*** Specify the interval value (in seconds) after which autorecovery of the degraded link must be triggered. This option is applicable if you configure the autorecovery option. The interval period starts from the time the link is degraded. The default interval is 1800 seconds. The autorecovery attempt is repeated until the link is recovered or the link monitoring feature is disabled through configuration.

> **NOTE**: During autorecovery, you might notice link flaps at the remote end of the link.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

- Release Information | **14696**

Syntax

```
recovery-timeout seconds;
```

Hierarchy Level (EX Series and QFX Series)

```
[edit interfaces interface-name unit 0 family ethernet-switching]
```

Hierarchy Level (MX Series)

```
[edit interfaces interface-name unit 0 family bridge]
```

Description

Configure an interface to be temporarily disabled when MAC limiting, MAC move limiting, or rate-limiting is in effect with the action `shutdown`. This enables the affected interface to recover automatically from the error condition after the specified period of time:

- If you configure MAC limiting with the `shutdown` option and you enable `recovery-timeout`, the interface is temporarily disabled when the MAC address limit is reached. The interface will recover automatically after the number of seconds specified.
- If you enable MAC move limiting with the `shutdown` option and you enable `recovery-timeout`, the interface is temporarily disabled when the maximum number of MAC address moves is reached. The interface will recover automatically after the number of seconds specified.
- If you enable MAC move limiting with the `vlan-member-shutdown` option and you enable `recovery-timeout`, the interface is temporarily disabled when the maximum number of MAC address moves is reached. The interface will recover automatically after the number of seconds specified. If the recovery timeout is not configured, the interface will recover automatically after 180 seconds.
- If you enable storm control with the `action-shutdown` option and you enable `recovery-timeout`, the interface is temporarily disabled when applicable traffic exceeds the specified levels. Depending upon the configuration, applicable traffic can include broadcast, unknown unicast, and multicast traffic.

NOTE: The `recovery-timeout` configuration does not apply to preexisting error conditions. It impacts only error conditions that are detected after the `recovery-timeout` statement is

configured and committed. To clear a preexisting error condition and restore the interface to service, use the operational mode commands `clear ethernet-switching recovery-timeout` for EX Series and QFX Series and `clear bridge recovery-timeout` for MX Series routers.

Default

The interface does not automatically recover from an error condition.

NOTE: On EX9200 switches, if a MAC move limit is configured with the action `vlan-member-shutdown`, the interface automatically recovers from the disabled condition after 180 seconds by default.

Options

seconds Number of seconds that the interface remains in a disabled state due to a port error prior to automatic recovery.

- **Range:** 10 through 3600

Required Privilege Level

system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

recycle-bandwidth-profiles

IN THIS SECTION

- Syntax | 14697
- Hierarchy Level | 14697
- Description | 14698
- Options | 14698
- Required Privilege Level | 14698
- Release Information | 14699

Syntax

```
recycle-bandwidth-profiles profile name {
    evpn-irb percentage;
    fti-virtual-loop percentage;
    ingress-egress-mcast percentage;
    mcast-tunnel-services percentage;
    srv6 percentage;
    srv6-ext percentage;
    tunnel-services percentage;
    vrf-leak percentage;
}
```

Hierarchy Level

```
[edit system packet-forwarding-options]
```

Description

This statement allows you to enable and configure a recycle bandwidth profile. This profile holds the map of the recycle applications and the percentage of recycle bandwidth value assigned to each application within that profile.

There is no cap on the number of recycle bandwidth profiles.

Options

The table below indicates supported recycle applications for which you can reserve recycle bandwidth. This list is not exhaustive.

> **NOTE**: Because the values are in percentages, the cumulative recycle bandwidth should not exceed 100.

Application	Description
evpn-irb	Set bandwidth in percentage to be allocated for EVPN IRB interface replication.
fti-virtual-loop	Set bandwidth in percentage to be allocated for an FTI virtual loop. You must configure this option to support the FlowTapLite feature on ACX routers running Junos OS Evolved.
ingress-egress-mcast	Set bandwidth in percentage to be allocated for ingress-egress-multicast replication.
mcast-tunnel-services	Set bandwidth in percentage to be allocated for multicast tunnel services (mt interface).
srv6	Set bandwidth in percentage to be allocated for srv6 replication.
srv6-ext	Set bandwidth in percentage to be allocated for srv6-ext replication.
tunnel-services	Set bandwidth in percentage to be allocated for tunnel-services replication.
vrf-leak	Set bandwidth in percentage to be allocated for VRF leak replication.

red-buffer-occupancy

IN THIS SECTION

- Syntax | **14699**
- Hierarchy Level | **14700**
- Description | **14700**
- Options | **14700**
- Required Privilege Level | **14700**
- Release Information | **14701**

Syntax

```
red-buffer-occupancy {
    weighted-averaged [ instant-usage-weight-exponent exponent-value ];
}
```

Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number ],
[edit chassis lcc number fpc slot-number pic pic-number]
```

Description

Configure the IQ PIC to base random early detection (RED) queue management on a *simple moving average* buffer occupancy calculation. If you do not include this statement, the IQ PIC bases RED on an *instantaneous* buffer occupancy value. As an option, you can specify that the IQ PIC bases RED on a *weighted moving average* of buffer occupancy values.

If you configure this feature on a channelized OC12 intelligent queuing (IQ) PIC, the PIC reboots.

Options

`weighted-averaged`—Configure the IQ PIC to base RED processing on a simple moving average of instantaneous buffer occupancy values instead of an instantaneous buffer occupancy.

`instant-usage-weight-exponent` *`exponent-value`*—(Optional) Specify the integer to be used as the negative exponent of 2 to express a weight value. The PIC performs weighted RED (WRED) by based on a calculation of average buffer occupancy that applies the specified weight value to the instantaneous buffer occupancy and then factors the weighted value into the calculation of average buffer occupancy. Valid exponent range is from 1 through 31 (weight values from 2^{-1} through 2^{-31}). If you do not specify this option, the default exponent value is 0, which results in a weight value of $2^0 = 1$. With a weight value of 1, the calculation of weighted average buffer occupancy yields the same value as the simple average buffer occupancy.

> **NOTE**: You can specify an exponent value greater than 31, and the value displays in the output of `show` commands. However, the PIC replaces the out-of-range value with the *operational* value of 31, which results in a weight value of $2^{-31} = 1 / 2^{31} = 0.0000000004656612873077392578125$.

Required Privilege Level

interface—To view this statement in the configuration.

- Release Information | 14707

Syntax

```
redirect-traffic (all | unauthenticated);
```

Hierarchy Level

```
[edit services unified-access-control captive-portal policy]
```

Description

Specify to redirect traffic destined for protected sources to the IC Series device. You can choose to redirect all traffic or only unauthenticated traffic.

Options

- `all`—Redirect all traffic destined for the protected sources to the IC Series device. Specify this option if you want to redirect all traffic (IPsec or source IP) to the currently connected IC Series device or to an IP address or domain name that you specify in a redirect URL.
- `unauthenticated`—Redirect unauthenticated traffic destined for the protected sources to the IC Series device. Select this option if your deployment uses source IP only or a combination of source IP and IPsec. The Junos OS Enforcer redirects clear-text traffic from unauthenticated users to the currently connected IC Series device or to an IP address or domain name that you specify in a redirect URL.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

RELATED DOCUMENTATION

Firewall User Authentication Overview

redirect-url

IN THIS SECTION

- Syntax | 14707
- Hierarchy Level | 14707
- Description | 14708
- Required Privilege Level | 14708
- Release Information | 14708

Syntax

```
redirect-url url;
```

Hierarchy Level

```
[edit services unified-access-control captive-portal policy]
```

Description

Specify to redirect traffic destined for protected sources to a specified URL.

You can configure the following options in the redirect URL string:

- *%dest-url%*—Specifies the protected resource which the user is trying to access.
- *%enforcer-id%*—Specifies the ID assigned to the Junos OS Enforcer by the IC Series device.
- *%policy-id%*—Specifies the encrypted policy ID for the security policy that redirected the traffic.
- *%dest-ip%*—Specifies the IP address or hostname of the protected resource that the user is trying to access.
- *%ic-ip%*—Specifies the IP address or hostname of the IC Series device to which the Junos OS Enforcer is currently connected.

If you do not specify the redirect URL, the Junos OS Enforcer uses the following default configuration:

```
https://%ic-ip%/?target = %dest-url%  &enforcer = %enforcer-id%  &policy = %policy-id%  &dest-ip
= %dest-ip%
```

NOTE: The maximum size of a redirect payload is 1450 bytes. The size of the redirect URL is restricted to 1407 bytes (excluding a few HTTP headers). If a user accesses a destination URL that is larger than 1407 bytes, the Infranet Controller authenticates the payload, calculates the exact length of the redirect URL, and trims the destination URL so that it can fit into the redirect URL. The destination URL can be fewer than 1407 bytes based on what else is present in the redirect URL (for example, policy ID). The destination URL in the default redirect URL is trimmed so that the redirect packet payload size is limited to 1450 bytes. If the length of the payload is larger than 1450 bytes, the excess length is trimmed and the user is directed to the destination URL that has been resized to 1450 bytes.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

redistribute-all-traffic (Aggregated Multiservices)

IN THIS SECTION

- Syntax | 14710
- Hierarchy Level | 14711
- Description | 14711
- Required Privilege Level | 14711
- Release Information | 14711

Syntax

```
redistribute-all-traffic {
    enable-rejoin;
}
```

Hierarchy Level

```
[edit interfaces interface-name load-balancing-options member-failure-options]
```

Description

Enable the option to redistribute traffic of a failed active member to the other active members.

For many-to-one (N:1) high availability support for Network Address Translation (NAT), the traffic for the failed member is automatically redistributed to the other active members.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

Syntax

```
redundancy {
    failover {
        on-disk-failure;
        on-loss-of-keepalives;
    }
    graceful-switchover;
}
```

Hierarchy Level

```
[edit chassis]
```

Description

Enable redundant Routing Engines on a Virtual Chassis with two or more member switches or on a Virtual Chassis Fabric, on a standalone EX6200 or EX8200 switch with more than one Routing Engine.

The remaining statements are explained separately. See CLI Explorer.

Default

Redundancy is enabled for the Routing Engines.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

            }
        }
    }
    no-advertise-routes-on-backup;
    protocol {
        pseudo-wire;
        vrrp;
    }
}
```

Hierarchy Level

```
[edit system services subscriber-management]
```

Description

Enable M:N subscriber group redundancy. This global configuration applies to all subscribers in redundancy groups across the chassis.

For dual-stack subscribers, you must configure both virtual IPv4 and virtual IPv6 addresses on the interface.

Options

group *group-name* Name of the redundancy group.

hot-standby Specifies the backup BNG, which is ready to switchover the traffic from the primary BNG immediately without any disruption during primary BNG failure.

interface *interface-name*

Identify the interface name for the logical access interface for the subscriber redundancy group covered by M:N redundancy.

Configuring the interfaces inside the group is for logical grouping only. You can group all the interfaces to one interface-group or you can have single interface-group for each redundancy interfaces.

> **NOTE**: You must configure the names for all such interfaces on the chassis for all redundancy groups.
>
> For VRRP redundancy, only `ge` and `xe` interfaces are supported for the underlying physical interface. Ethernet connections can be untagged, single-tagged, or double-tagged.
>
> For pseudowire redundancy, only pseudowire interfaces are supported for the underlying physical interface.

> **NOTE**: You cannot configure an interface for redundancy if it already has active non-DHCP subscribers. If the interface has existing DHCP subscribers, then redundancy is enabled for those subscribers.

local-inet-address *v4-address*

(Pseudowires only) Local IP address for the associated pseudowire interface. This address must match one of the access-facing GE interface addresses. It is unique per redundancy group identified by the ps*x*.0 interface. The DHCP relay agent uses this address as the giaddr for DHCP messages sent to a DHCP server. For dynamic subscriber Interfaces, this address is the same as the preferred-source address (the unnumbered address derived from the access-facing GE interface).

local-inet6-address *v6-address*

(Pseudowires only) Local IPv6 address for the associated pseudowire interface. This address must match one of the access-facing GE interface addresses. It is unique per redundancy group identified by the ps*x*.0 interface. The DHCP relay agent uses this address as the linkaddr for DHCP messages sent to a DHCP server. For dynamic subscriber Interfaces, this address is the same as the preferred-source address (the unnumbered address derived from the access-facing GE interface).

no-advertise-routes-on-backup

(Optional) Suppress advertisement of subscriber access routes or framed routes at the backup BNG towards the core or install the routes in the forwarding table. The routes are added to the routing table when the primary BNG fails over to the backup BNG. This option applies to all subscribers that are covered by redundancy on the chassis and that log in after you configure the option. Existing subscribers are not affected.

> **BEST PRACTICE**: We recommend that you always configure `no-advertise-routes-on-backup` when you use the non-aggregated mode of address allocation. In this mode, the DHCP server uses a common pool for all redundant subscribers and possibly all non-redundant subscribers. This mode increases the routing services overhead due to the number of routes being advertised for all subscribers. It increases the size of the routing table on the core side and can increase core-side convergence if a DHCP relay agent fails. It also increases downstream traffic convergence. The `no-advertise-routes-on-backup` option reduces the number of routes advertised and the associated potential issues.

- **Default:** Advertise the access and framed routes to the backup BNG during subscriber login.

protocol

Specify a method for BNG M:N redundancy. You can configure both VRRP and pseudowires when the underlying access interfaces do not overlap between these methods.

- `pseudo-wire`—Use pseudowires for redundancy on pseudowire interfaces for L2VPN and Layer 2 circuit-based networks over IP/MPLS.
- `vrrp`—Use VRRP for redundancy on GE and XE interfaces.
- **Default:** `vrrp`

shared-key *string*

(Pseudowires only) Shared key that is used by the topology discovery process to identify a backup pseudowire interface on a peer BNG for a subscriber redundancy group. You configure the same shared-key on the local access interfaces on the primary and backup BNGs for a particular redundancy group. A topology discovery match is achieved when both the query and response messages include the pseudowire local access interface name, the same shared key, and the same transaction ID. You define the shared key as a string of up to 64 characters that you choose. You must not use the shared key for any other peer BNGs.

> **NOTE**: If the interface already has non-DHCP subscribers, the router rejects the configuration. The configuration is accepted for existing DHCP relay subscribers.

> **NOTE**: You cannot dynamically change a shared key after you have configured a key for a subscriber redundancy group (represented by the pseudowire interface). This means that if you change the value after committing it, the change has no effect. In order to have the change take effect, you must delete the entire redundancy group configuration and then add it back with the new key.

service-activation-on-failover Specifies the interface mode on backup BNG, which uses less resources to forward traffic instantly on traffic switchover with basic statistics.

standby-mode Specifies how to program the Packet Forwarding Engine with subscriber state when the interface is inactive.

virtual-inet-address *virtual-inet-address* (VRRP) IPv4 address for the virtual router. This address is used as the gateway address for all redundancy peers associated with a particular subscriber redundancy group. You must specify the same virtual IP address that you also configure on VRRP so that it can create the virtual router for redundancy.

virtual-inet6-address *virtual-inet6-address* (VRRP) IPv6 address for the virtual router. This address is used as the gateway address for all redundancy peers associated with a particular subscriber redundancy group. You must specify the same virtual IP address that you also configure on VRRP so that it can create the virtual router for redundancy.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.2R1.

`local-inet-address`, `local-inet6-address`, `pseudo-wire`, and `shared-key` options added in Junos OS Release 20.1R1.

`service-activation-on-failover` introduced in Junos OS Release 22.2R1.

}
```

Hierarchy Level

```
[edit chassis cluster]
```

Description

Define a redundancy group. Except for redundancy group 0, a redundancy group is a logical interface consisting of two physical Ethernet interfaces, one on each chassis. One interface is active, and the other is on standby. When the active interface fails, the standby interface becomes active. The logical interface is called a redundant Ethernet interface (reth).

Redundancy group 0 consists of the two Routing Engines in the chassis cluster and controls which Routing Engine is primary. You must define redundancy group 0 in the chassis cluster configuration.

Options

group-number Redundancy group identification number.

> **NOTE**: The maximum number of redundancy groups is equal to the number of redundant Ethernet interfaces that you configure.

- **Range:** 0 through 128

interface-monitor Specify a redundancy group interface to be monitored for failover and the relative weight of the interface.

ip-monitor Specify IP address of interface to be monitored for end-to-end connectivity.

gratuitous-arp-count Number of gratuitous ARPs to send on an active interface after failover

- **Range:** 1-16

hold-down-interval RG failover interval. RG0(300-1800) RG1+(0-1800) (seconds)

- **Range:** `0-1800`

node Identify each cluster node in a redundancy group and set its relative priority for primary role.

preempt Allow preemption of the primary system based on the priority within a redundancy group.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Syntax

```
redundancy-group-id redundancy-group-id-number;
```

Hierarchy Level

```
[edit chassis satellite-management redundancy-groups redundancy-group-name]
```

Description

Defines a redundancy group ID number for a redundancy group in a Junos Fusion using dual aggregation devices.

A Junos Fusion using dual aggregation devices must have one redundancy group that includes both aggregation devices and all satellite devices. The redundancy group must be configured individually on each aggregation device. The redundancy group name and redundancy group ID number must match on the redundancy group configuration on each aggregation device in the Junos Fusion.

Default

A redundancy group does not have a redundancy group ID number by default.

Options

redundancy-group-id-number The user-defined redundancy group ID number.

- **Range:** 1 through 255

redundancy-mode (MX and SRX Platforms)

IN THIS SECTION

- Syntax | 14739
- Hierarchy Level | 14739
- Description | 14739
- Options | 14740
- Required Privilege Level | 14740
- Release Information | 14740

Syntax

```
redundancy-mode (increased-bandwidth | redundant)
```

Hierarchy Level

```
[edit chassis fabric]
```

Description

Configure the active control boards to be in redundancy mode or increased fabric bandwidth mode.

In increased fabric bandwidth mode, which is the default behavior for MX Series routers with Switch Control Board (SCB), the maximum number of available fabric planes are used. The MX Series routers that contain the Enhanced SCB—SCBE—and the MPC3E, the control boards operate in redundancy fabric mode (all the FPCs use 4 fabric planes as active planes) by default.

In increased fabric bandwidth mode, which is the default mode on the SRX5600 and SRX5800 Services Gateways with the SRX5K-SCB4 Switch Control Board, six active planes (without any spare planes) are used. With the redundant fabric mode, the SRX5600 and SRX5800 Services Gateways use four active planes and two spare planes. See Redundant Fabric Mode.

Options

increased-bandwidth Enable increased fabric bandwidth mode for the control boards, which causes all the available fabric planes to be used.

redundant Enable redundancy mode for the control boards, which causes all the FPCs to use 4 fabric planes as active planes.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

Configuring AS or Multiservices PIC Redundancy

redundancy-options (Aggregated Multiservices)

IN THIS SECTION

- Syntax | 14744
- Hierarchy Level | 14744
- Description | 14744
- Options | 14745
- Required Privilege Level | 14745
- Release Information | 14745

Syntax

```
redundancy-options {
    primary mams-a/b/0;
    secondary mams-a/b/0;
}
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

Configure warm standby for an aggregated multiservices (AMS) interface. Specify a primary and a secondary (backup) member services interface for the AMS interface. The primary interface is the service interface that you want to back up, and it is the active interface unless it fails. The secondary interface is the backup interface, and does not handle any traffic unless the primary interface fails. You can use the same services interface as the backup in multiple warm standby AMS interfaces.

You cannot use both the `redundancy-options` and the `load-balancing-options` statements in the same AMS interface.

Options

primary mams-*a/b*/0	Name of the primary services interface, where *a* is the FPC slot number and *b* is the PIC slot number.
secondary mams-*a/b*/0	Name of the secondary (backup) services interface, where *a* is the FPC slot number and *b* is the PIC slot number.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

    replication-options (apply-groups | apply-groups-except | mtu | replication-threshold |
replication-threshold routing-instance )
}
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

Specify the primary and secondary (backup) adaptive services PIC interfaces.

Options

data-address *address*	Internal IP address of the local redundant PIC.
ipaddress *address*	Internal IP address of the remote redundant PIC.
instance-name	Name of the routing instance to apply to the HA synchronization traffic between the high availability pair.
seconds	Length of time that the flow remains active for replication. • **Default:** 180 seconds
apply-groups *apply-groups-except*	Specify the groups from which NOT to inherit the configuration.
apply-groups *redundancy-local*	Specify information for the local peer.
apply-groups *redundancy-peer*	Specify information for peer.
replication-options *apply-groups*	Specify groups from which to inherit the configuration.
replication-options *apply-groups-except*	Specify the groups from which NOT to inherit the configuration.
replication-options *mtu*	Specify the maximal packet size for the replicated data. • **Range:** 1500 through 8000 bytes
replication-options *replication-threshold*	Specify the duration for which flow should remain active for replication. • **Range:** 60 through 3600 seconds
replication-options *replication-threshold routing-instance*	Specify routing-instance for the HA traffic.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card (interfaces of type `vms-x/y/z`).

        }
    }
}
```

Hierarchy Level

```
[edit policy-options]
```

Description

Specify the actions to be taken for redundancy events. These include acquiring or releasing primary role and adding or deleting static routes.

Options

acquire-mastership	Switch from standby to primary role.
add-static-route *destination*	(Optional) Use the specified destination IP address and prefix for an added signal route.
broadcast-warning	(Optional) Switch status from Standby to Standby (Warned).
delete-static-route *destination*	(Optional) Use the specified destination IP address and prefix for a deleted signal route.
event-list	List of names of one or more monitored events that trigger the actions specified in this policy.
next-hop	Interface name for the next hop for an added signal route.
policy-name	Name of the redundancy policy.
receive	Use the added signal route as a receive route.
release-mastership	(Optional) Switch from primary to standby role.
release-mastership-force	(Optional) Force switch from primary to standby role.
routing-instance *routing-instance*	(Optional) Name of the vrf used for the added signal route.

Required Privilege Level

    redundancy-group number;
    source-address-filter mac-address;
    (source-filtering | no-source-filtering);
}
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

Configure Ethernet redundancy options for a chassis cluster.

In a chassis cluster setup, a redundant Ethernet interface is a pseudointerface that includes at minimum one physical interface from each node of the cluster.

A reth is a special type of interface that has the characteristics of aggregated Ethernet interface.

Options

flow-control Enable flow control.

link-speed Link speed of individual interface that joins the reth interface.

- Values:
  - `100m`—Links are 100 Mbps
  - `10g`—Links are 10 Gbps
  - `10m`—Links are 10 Mbps
  - `1g`—Links are 1Gbps

loopback Enable loopback.

minimum-links Minimum number of active links.

- **Default:** `1`
- **Range:** `1-8`

no-flow-control Do not enable flow control.

no-loopback Do not enable loopback.

no-source-filtering Do not enable source address filtering.

redundancy-group Redundancy group of this interface.

- **Range:** `1-128`

source-filtering Enable source address filtering.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Syntax

```
redundant-pseudo-interface-options {
    redundancy-group redundancy-group-number;
}
```

Hierarchy Level

```
[edit interfaces lo0]
```

Description

Configure the loopback pseudointerface in a redundancy group.

Redundancy groups are used to bundle interfaces into a group for failover purpose in a chassis cluster setup. You can configure a loopback interface as an alternative physical interface to reach the peer gateway. Loopback interfaces can be configured on any redundancy group.

For example: An Internet Key Exchange (IKE) gateway operating in chassis cluster, needs an external interface to communicate with a peer device. When an external interface (a reth interface or a standalone interface) is used for communication; the interface might go down when the physical interfaces are down. Instead, use loopback interfaces as an alternative to physical interfaces.

Options

redundancy-group-number Configure the redundancy group number.

- **Range:** 0 through 255

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

reference-bandwidth (Protocols IS-IS)

IN THIS SECTION

- Syntax | 14770
- Hierarchy Level | 14770
- Description | 14770
- Options | 14771
- Required Privilege Level | 14771
- Release Information | 14771

Syntax

```
reference-bandwidth reference-bandwidth;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]
```

Description

Optimize routing based on bandwidth by setting the reference bandwidth used in calculating the default interface cost.

All IS-IS interfaces have a cost, which is a routing metric that is used in the IS-IS link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics. When there are several equal-cost routes to a destination, traffic is distributed equally among them. Tweak the reference bandwidth to route traffic across the fastest interface.

The cost of a route is described by a single dimensionless metric that is determined using the following formula:

```
cost = reference-bandwidth/bandwidth
```

For example, if you set the reference bandwidth to 1 Gbps (that is, *reference-bandwidth* is set to 1,000,000,000), a 100-Mbps interface has a routing metric of 10.

All IS-IS interfaces have a cost, which is a routing metric that is used in the IS-IS link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics. By default, IS-IS has a metric of 10. Modify the configured reference bandwidth to increase the cost of an interface in order to avoid a slow route or you can modify the reference bandwidth value to decrease the cost of a preferred interface. A route that has a lower cost is selected over a high cost route. Note that fractional metric values are not allowed. Therefore, if you configure a reference bandwidth that is higher than the actual bandwidth, which results in a fractional metric value then IS-IS takes the metric value as 1 because fractional metric values are not allowed.

Options

reference-bandwidth—Reference bandwidth value in bits per second.

- **Range:** 9600 through 4,000,000,000,000 bps
- **Default:** None

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

reference-bandwidth (Protocols OSPF)

IN THIS SECTION

- Syntax | 14772
- Hierarchy Level | 14772
- Description | 14773
- Options | 14773
- Required Privilege Level | 14773
- Release Information | 14773

Syntax

```
reference-bandwidth reference-bandwidth;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols (ospf | ospf3)],
[edit logical-systems logical-system-name protocols ospf3 realm (ipv4-unicast | ipv4-multicast |
ipv6-multicast)],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
(ospf | ospf3)],
[edit logical-systems logical-system-name protocols ospf3 realm (ipv4-unicast | ipv4-multicast |
ipv6-multicast)],
[edit protocols (ospf | ospf3)],
[edit protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances routing-instance-name protocols (ospf | ospf3)],
[edit routing-instances routing-instance-name protocols ospf3 realm (ipv4-unicast | ipv4-
multicast | ipv6-multicast)]
```

Description

Set the reference bandwidth used in calculating the default interface cost. The cost is calculated using the following formula:

```
cost = ref-bandwidth/bandwidth
```

Options

reference-bandwidth—Reference bandwidth, in bits per second.

- **Range:** 9600 through 4,000,000,000,000 bits
- **Default:** 100 Mbps (100,000,000 bits)

> **NOTE**: The default behavior is to use the reference-bandwidth value to calculate the cost of OSPF interfaces. You can override this behavior for any OSPF interface by configuring a specific cost with the `metric` statement.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for the `realm` statement introduced in Junos OS Release 9.2.

Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.

RELATED DOCUMENTATION

reflect-etype

IN THIS SECTION

- Syntax | 14774
- Hierarchy Level (Junos OS) | 14774
- Hierarchy Level (Junos OS Evolved) | 14774
- Description | 14774
- Options | 14775
- Required Privilege Level | 14775
- Release Information | 14775

Syntax

```
reflect-etype ethertype-value;
```

Hierarchy Level (Junos OS)

```
[edit services rpm rfc2544-benchmarking tests test-name test-name]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rfc2544 tests test-name test-name]
```

Description

Specify the EtherType to be used for reflection of the test frames. EtherType is a two-octet field in an Ethernet frame that defines the protocol in the frame payload. This statement is valid only if you configure the test mode to be a reflector. If you do not configure this statement, all EtherTypes are reflected.

Options

ethertype-value

Identifier for the EtherType. The EtherType value appears in the Ethernet type field of the packet. It specifies the protocol being transported in the Ethernet frame. For instance, the EtherType for IPv4 is 0x0800. So, if you specify the value as 2048, IPv4 packets are reflected.

- **Range:** 1 through 65,535

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X53.

Statement introduced in Junos OS Evolved Release 22.4R1.

[edit services rpm rfc2544-benchmarking tests test-name test-name]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rfc2544 tests test-name test-name]
```

Description

Specify the reflection mode for the benchmarking test.

Options

mac-rewrite (Junos OS ACX Series routers only) Enable rewriting of the MAC address on the reflected frames. You configure which MAC addresses the software should use with the `source-mac-address` and `destination-mac-address` configuration statements.

mac-swap Swap the source and destination MAC addresses in the test frame. This is the default behavior.

> **NOTE**: In `bridge` families, when the service type is `ELAN`, MAC addresses are swapped by default on the reflected frames. When the service type is `ELINE` , MAC addresses are not swapped by default.

no-mac-swap Do not swap the source and destination MAC addresses in the test frame. The frame is returned to the originator without any modification to the MAC addresses.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X52.

Statement introduced in Junos OS Evolved Release 22.4R1.

reflective-relay

IN THIS SECTION

- Syntax | 14778
- Hierarchy Level | 14778
- Description | 14778
- Default | 14778
- Required Privilege Level | 14778
- Release Information | 14779

Syntax

```
reflective-relay;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family ethernet-switching]
```

Description

Configure a switch interface to return packets back to a device on the same interface that was used to deliver the packets.

Default

Switch interfaces are not configured for reflective relay.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

reflexive | revert | reverse

IN THIS SECTION

- Syntax | 14779
- Hierarchy Level | 14779
- Description | 14780
- Required Privilege Level | 14780
- Release Information | 14780

Syntax

```
reflexive; | revert; | reverse {
    application-profile profile-name;
    dscp (alias | bits);
    forwarding-class class-name;
    syslog;
}
```

Hierarchy Level

```
[edit services cos rule rule-name term term-name then]
```

Description

`reflexive`—Applies the CoS rule actions to flows in the reverse direction as well as to flows in the matching direction.

`revert`—Stores the DSCP and forwarding class of a packet that is received in the match direction of the rule and then applies that DSCP and forwarding class to packets that are received in the reverse direction of the same session.

`reverse`—Allows you to define CoS behavior for flows in the reverse direction.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.1.

`revert` option introduced in Junos OS Release 16.1R5 and 17.4R1.

refresh (Commit Scripts)

IN THIS SECTION

- Syntax | **14781**
- Hierarchy Level | **14781**
- Description | **14781**

Required Privilege Level | 14782
Release Information | 14782

Syntax

```
refresh;
```

Hierarchy Level

```
[edit system scripts commit],
[edit system scripts commit file filename]
```

Description

Overwrite the local copy of all enabled commit scripts or a single enabled commit script with the copy located at the source URL, as specified in the `source` statement at the same hierarchy level. If the `load-scripts-from-flash` statement is configured, the device refreshes the scripts on the flash drive instead of the hard disk.

The update operation occurs as soon as you issue the `set refresh` configuration mode command. Issuing the `set refresh` command does not add the `refresh` statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

Before you refresh a local script from an HTTPS server, you must first configure the `cert-file` statement for that script in supported releases. Specify the absolute path to the certificate (Root CA or self-signed) that the device will use to validate the server's certificate during the refresh operation.

NOTE: On the QFabric system, commit scripts are stored in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit/** directory on the Director device.

As of Junos OS Release 18.1R1, you can specify which routing instance the update is done through. To specify the routing instance to use for updating commit scripts, configure the routing instance in two places in the CLI:

```
user@host# set system routing-instances routing-instance-name description description
user@host# set system scripts commit file filename routing-instance routing-instance-name
```

If you enable the non-default management instance and use `mgmt_junos` for *routing-instance-name*, you can configure scripts to update using the dedicated management instance mgmt_junos.

Required Privilege Level

maintenance—To execute this statement in configuration mode.

Release Information

Statement introduced in Junos OS Release 7.4.

Before you refresh a local script from an HTTPS server, you must first configure the `cert-file` statement for that script in supported releases. Specify the absolute path to the certificate (Root CA or self-signed) that the device will use to validate the server's certificate during the refresh operation.

NOTE: This statement is not supported on the QFabric system.

As of Junos OS Release 18.1R1, you can specify which routing instance the update is done through. To specify the routing instance to use for updating snmp scripts, configure the routing instance in two places in the CLI:

```
user@host# set system routing-instances routing-instance-name description description
user@host# set system scripts snmp file filename routing-instance routing-instance-name
```

If you enable the non-default management instance and use `mgmt_junos` for *routing-instance-name*, you can configure scripts to update using the dedicated management instance mgmt_junos.

Options

url The source specified as an HTTPS URL, HTTP URL, FTP URL, or secure copy (scp)-style remote file specification.

Required Privilege Level

maintenance—To execute this statement in configuration mode.

Release Information

Statement introduced in Junos OS Release 15.1.

Syntax

```
refresh-rate packets packets seconds seconds;
```

Hierarchy Level

```
[edit services jflow-log template-profile template-profile-name]
```

Description

Specify the refresh rate for transmitting flow template records with version 9 and IPFIX templates for NAT events to the collector, in either packets or seconds.

Options

packets— Number of packets after which templates are sent to the collector.

- **Range:** 1 through 480,000
- **Default:** 4800

seconds—Number of seconds after which templates are sent to the collector

- **Range:** 10 through 600
- **Default:** 600

Required Privilege Level

- Syntax | 14804
- Hierarchy Level | 14804
- Description | 14805
- Options | 14805
- Required Privilege Level | 14805
- Release Information | 14805

Syntax

```
regex "value";
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name domains domain-name subscription-id use-class]
```

Description

Configure a regular expression to parse the Class attribute contents of the accounting request from the BNG, PGW, or GGSN.

Options

value Regular expression that parses the contents of the Class attribute.

For example, the following configuration generates " `000118191129ALICE:DRAV3:`" out of " `000118191129#000118191129#ALICE:DRAV3:#7168#nflat#ADSL##`":

```
[edit unified-edge gateways tdf TDF1 domains domain1 subscription-id ]

regex-additive-logic

IN THIS SECTION

- Syntax | 14806
- Hierarchy Level | 14806

- Description | 14806
- Default | 14806
- Required Privilege Level | 14806
- Release Information | 14807

Syntax

```
regex-additive-logic;
```

Hierarchy Level

```
[edit system]
```

Description

Enable additive logic (that is, deny by default / allow some as specified) to be used in regular expressions in the `allow-configuration-regexps` and `deny-configuration-regexps` statements at the `[edit system login class` *`class-name`*`]` hierarchy level.

When you enable additive logic, the `allow-configuration-regexps` statement takes precedence over the `deny-configuration-regexps` statement. Thus, if you configure the `regex-additive-logic` statement and the same configuration hierarchy is referenced in both the `allow-configuration-regexps` statement and the `deny-configuration-regexps` statement, then the configuration hierarchy is allowed. If you do not configure the `regex-additive-logic`, then the same hierarchy would be denied in this case because the `deny-configuration-regexps` statement takes precedence by default.

Default

By default, this statement is disabled; the `deny-configuration-regexps` statement takes precedence over the `allow-configuration-regexps` statement.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

Release Information

Statement introduced in Junos OS Release 9.3.

region

IN THIS SECTION

- Syntax | 14808
- Hierarchy Level | 14809
- Description | 14809
- Options | 14809
- Required Privilege Level | 14809
- Release Information | 14810

Syntax

```
region region-name{
    incoming;
```

```
    ingress-replication {
        create-new-ucast-tunnel;
        label-switched-path {
            llabel-switched-path-template (Multicast){
                (default-template | lsp-template-name);
            }
        }
    }
    ldp-p2mp;
    rsvp-te {
        label-switched-path-template (Multicast) {
            (default-template | lsp-template-name);
        }
        static-lsp static-lsp;
    }
}
```

Hierarchy Level

```
[edit protocols mvpn inter-region-template template template-name]
```

Description

Specify the regions based on the BGP peer groups. The regions support different tunnel types such as incoming, ingress replication, ldp-p2mp, or rsvp-te. The incoming tunnel indicates that the tunnel type across the area boundary router (ABR) is not changed. A template is used to define the tunnel type for each region.

Options

incoming Specify the tunnel type to be same across area boundary router (ABR).

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name protocols pim rp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim
rp],
[edit protocols pim rp],
[edit routing-instances routing-instance-name protocols pim rp]
```

Description

Configure a limit for the number of incoming (S,G) PIM registers.

> **NOTE**: The maximum limit settings that you configure with the `maximum` and the `family (inet | inet6) maximum` statements are mutually exclusive. For example, if you configure a global maximum PIM register message limit, you cannot configure a limit at the family level for IPv4 or IPv6. If you attempt to configure a limit at both the global level and the family level, the device will not accept the configuration.

Options

`family (inet | inet6)`—(Optional) Specify either IPv4 or IPv6 messages to be counted towards the configured register message limit.

- **Default:** Both IPv4 and IPv6 messages are counted towards the configured register message limit.

The remaining statements are described separately.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

[edit logical-systems logical-system-name protocols mvrp interface (all | interface-name)],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols mvrp
interface (all | interface-name)]
```

Description

Specifies the Multiple VLAN Registration Protocol (MVRP) registration mode for the interface if MVRP is enabled.

Default

`normal`—The interface or interfaces accept MVRP messages and participate in MVRP.

Options

forbidden—The interface or interfaces do not register and do not participate in MVRP.

normal—The interface or interfaces accept MVRP messages and participate in MVRP.

restricted—The interface or interfaces ignore all MVRP JOIN messages received for VLANs that are not statically configured for MVRP on the interface.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Syntax

```
reject {
    profile redirect-profile-name;
    ssl-proxy {
        profile-name ssl-proxy-profile-name;
    }
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then]
```

Description

Block the service at the firewall. The device drops the packet and sends a TCP reset (RST) segment to the source host for TCP traffic and an ICMP “destination unreachable, port unreachable” message (type 3, code 3) for UDP traffic. For types of traffic other than TCP and UDP, the device drops the packet without notifying the source host, which is also what occurs when the action is `deny`.

You can configure reject action with one of the following options for the dynamic-applications:

- profile - You can chose to provide a notification to the clients or redirect client request to an informative Web page when a policy blocks HTTP or HTTPS traffic with a deny or reject action. To apply a profile, you must define the redirect profile for the dynamic applications.
- ssl-proxy - You can apply a redirect SSL proxy profile when a policy blocks HTTPS traffic with a reject action. When you apply am SSL proxy profile, SSL proxy decrypts the traffic and application identification functionality identifies the application. Next, you can take action to redirect or drop the traffic as per the configuration.

Options

profile Profile for redirect HTTP/HTTPS traffic.

SSL-proxy SSL proxy profile for decrypt HTTPS traffic.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5. Starting in Junos OS Release 19.2, options *profile* and *ssl-proxy* are added.

reject-unauthorized-ipv6cp

IN THIS SECTION

- Syntax | 14817
- Hierarchy Level | 14818
- Description | 14818
- Default | 14818
- Required Privilege Level | 14818
- Release Information | 14818

Syntax

```
reject-unauthorized-ipv6cp;
```

Hierarchy Level

```
[edit protocols ppp-service]
```

Description

Configure the router to reject any IPv6 Control Protocol (IPv6CP) negotiation messages on dynamic interfaces when no appropriate IPv6 address or prefix has been received from AAA. IPv6CP negotiation attempts are also rejected when only a Framed-IPv6-Prefix attribute is received but router advertisement is not enabled in the dynamic profile.

NOTE: IPv6CP negotiation messages are not rejected for static interfaces.

Default

IPv6CP negotiation is allowed regardless of the presence of IPv6 attributes received from AAA.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

- Description | 14819
- Default | 14819
- Options | 14820
- Required Privilege Level | 14820
- Release Information | 14820

Syntax

```
rejoin-timeout rejoin-timeout;
```

Hierarchy Level

```
[edit interfaces interface-name load-balancing-options member-failure-options drop-member-
traffic]
```

Description

Configure the time by when failed members (members in the `DISCARD` state) should rejoin the aggregated Multiservices (AMS) interface automatically. All members that do not rejoin by the configured time are moved to the `INACTIVE` state and the traffic meant for each of the members is dropped.

If multiple members fail around the same time, then they are held in the `DISCARD` state using a single timer. When the timer expires, all the failed members move to `INACTIVE` state at the same time.

Default

If you do not configure a value, the default value of 120 seconds is used.

Options

rejoin-timeout—Time, in seconds, by which a failed member must rejoin.

- **Default:** 120 seconds

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

```

Description

Enable the DHCP relay agent information option which allows DHCP to forward information from clients on different VRF routing instances. The functionality is described in RFC 3046, *DHCP Relay Agent Information Option*. For the Junos OS implementation, the DHCP option number is 82, and the suboption ID is 1. The suboption length is the length required to contain an interface name in addition to the terminating null character. The overall option length is the suboption length plus 2 bytes (for the option header). The DHCP relay agent information option is only present on packets sent between the relay and the DHCP server.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.0.

Syntax

```
relay-agent-option-79;
```

Hierarchy Level

```
[edit forwarding-options dhcp-relay dhcpv6]
```

Description

Configure the DHCPv6 client link layer option (option 79) to include the source MAC address in DHCPv6 requests from clients before the messages are forwarded to a DHCPv6 server. In a dual-stack network environment in which devices act as both DHCPv4 and DHCPv6 clients, the client MAC address can be used to associate DHCPv4 and DHCPv6 messages with the same client interface. The client MAC address also provides network operators with additional information for event debugging and logging related to the client at the relay agent and the server.

You can configure `relay-agent-option-79` to enable DHCPv6 option 79 for a layer 3 DHCPv6 relay agent (LDRA). When DHCPv6 option 79 is enabled, the relay agent reads the source MAC address of DHCPv6 Solicit and DHCPv6 Request messages that it receives from a client. The relay agent encapsulates the Solicit and Request messages within a DHCPv6 Relay-Forward message, and inserts the client MAC address as option 79 in the Relay-Forward header before relaying the message to the server.

You can also configure DHCPv6 option 79 for a lightweight DHCPv6 relay agent (LDRA). An LDRA resides on the same IPv6 link as the DHCPv6 client and relay agent or server and acts as a layer 2 relay agent. To configure DHCPv6 option 79 for an LDRA, use the `option-79` statement.

Required Privilege Level

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
21.2R1	Starting with Junos OS Release 21.2R1, QFX Series switches support the `relay-agent-option-79` CLI statement in a stateless DHCPv6 relay configuration. You can configure stateless DHCPv6 relay using the `forward-only` CLI statement at the [`edit forwarding-options dhcp-relay dhcpv6`] hierarchy level.

options dhcp-relay group group-name],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay group group-name]
```

Description

Enable or disable the insertion of the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server.

To enable insertion of option 82 information in DHCP packets, you must specify at least one of the `circuit-id` or `remote-id` statements.

You can use the `relay-option-82` statement and its subordinate statements at the `[edit forwarding-options dhcp-relay]` hierarchy level to control insertion of option 82 information globally, or at the `[edit forwarding-options dhcp-relay group` *`group-name`*`]` hierarchy level to control insertion of option 82 information for a named group of interfaces.

To restore the default behavior (option 82 information is not inserted into DHCP packets), use the `delete relay-option-82` statement.

Starting in Junos OS Release 21.2R1, on QFX Series devices, we've introduced `link-selection` statement at the `edit forwarding-options dhcp-relay relay-option-82` hierarchy level, which allows DHCP relay to add suboption 5 to option 82. Suboption 5 allows DHCP proxy clients and relay agents to request an IP address for a specific subnet from a specific IP address range and scope. Earlier to this release, the DHCP relay drops packets during the renewal DHCP process as the DHCP Server uses the leaf's address as a destination to acknowledge DHCP renewal message.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

`link-selection` option added in Junos OS Release 21.2R1.

```
relay-option-vendor-specific {
    host-name;
    location;
}
```

Hierarchy Level

```
[edit forwarding-options dhcp-relay dhcpv6]
```

Description

Add vendor-specific information to the vendor-specific option (17) field of DHCPv6 control messages on server-facing interfaces. The vendor-specific information can be a hostname, a location (such as a unique connection identifier), or both. The hostname can be a string of characters such as **Juniper-AB-1**. The location should be specified as interface, VLAN ID, and if applicable, stacked VLAN ID. For example, **<ifd-name>:<vlan>** (ae0:100) or **<ifd-name>:<svlan> -<vlan>** (ae0:100-10).

Junos OS automatically adds the remaining vendor-specific information as per RFC 4243. The enterprise ID is 2636. The hostname is option-data 1, and the location is option-data 2. The DHCPv6 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.

This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query a single entity to track and troubleshoot subscriber IP information and network attachment points.

Required Privilege Level

```

Description

Configure DHCP relay server to use the configured loopback address as the source address in both the IP header and in DHCP messages relayed to the server.

In network configurations where a firewall on the broadband network gateway (BNG) is between the DHCP relay agent and the DHCP server, only the BNG loopback address passes through the BNG firewall. In that case, DHCP unicast packets do not pass through the firewall and are discarded. This configuration statement places the loopback address in IP headers and DHCP messages, which enables DHCP unicast packets to pass through the firewall to the DHCP server.

Options

interface-name Specify the loopback interface. The *interface-name* must be `lo0`.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

[edit protocols rsvp peer-interface peer-interface-name]
```

Description

Enable reliable message delivery on the interface.

To have both refresh reduction and reliable delivery, enable both the `aggregate` and `reliable` statements.

> **NOTE**: For Junos OS Release 16.1 running on MX Series or PTX Series routers, setting `no-reliable` on an interface automatically disables the fast reroute (FRR) scalability enhancements, including refresh reduction, for all label-switched paths (LSPs) traversing the interface.

Default

Starting in Junos OS Release 16.1R1, all refresh reduction extensions are enabled by default.

Prior to Junos OS Release 16.1R1, the `reliable` option is disabled by default.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

}
```

Hierarchy Level

```
[edit security host-vpn]
```

Description

Configure the identity details for authenticating the remote device during IKE negotiations.

Options

id *remote-id* Specify the remote IKE identity to use when authenticating the host-to-host VPN connection. The identity can be an IP address, a domain name, or an e-mail address. This identity matches the local identity.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 18.3R1.

remote

IN THIS SECTION

- Syntax | 14853
- Hierarchy Level | 14853
- Description | 14853
- Options | 14853
- Required Privilege Level | 14854
- Release Information | 14854

Syntax

```
remote (inet-address | mac-address) address;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family tcc],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family tcc]
```

Description

For Layer 2.5 VPNs employing an Ethernet interface as the TCC router, configure the location of the remote router. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only.

Options

`inet-address` *address*—The IP address of the remote site.

`mac-address` *address*—The MAC address of the remote site.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

        no-remote-trace;
    }
}
```

Hierarchy Level

```
[edit security]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure remote access settings.

You must configure the remote client settings on SRX Series Firewall to facilitate auto configuration for Juniper Secure Connect remote clients.

When a remote client downloads Juniper Secure Connect application, the application establishes an HTTPS connection with the security device. All authenticated clients fetch the configuration file from the security device and establish a VPN tunnel. This step eliminates the need for the remote clients to configure parameters for certificate identifier parameters, remote access client settings, and IKE and IPsec parameters on their device to establish a VPN connection.

Options

client-config Define Juniper Secure Connect remote client configuration parameters.

compliance Configure the compliance rules for the Juniper Secure Connect client's connection request

default-profile Configure default profile. On your security device, you must specify one of the remote-access profiles as the default profile.

> **NOTE**: Starting in Junos OS Release 23.1R1, we've hidden the `default-profile` option at the [`edit security remote-access`] hierarchy level. In releases before Junos OS Release 23.1R1, you use this option to specify one of the remote-access profiles as the default profile in Juniper Secure Connect. But with changes to the format of remote-access profile names, we no longer require the `default-profile` option.
>
> We've deprecated `default-profile` option—rather than immediately removing it—to provide backward compatibility and a chance to make your existing configuration conform to the changed configuration. You'll receive a warning message if you continue to use the `default-profile` option in your configuration. However existing deployments are not affected if you modify the current configuration. See default-profile (Juniper Secure Connect).

global-options Define global parameters for Juniper Secure Connect remote access configuration.

profile Configure remote user connection profiles for the Juniper Secure Connect clients.

traceoptions Configure remote access tracing operations for Juniper Secure Connect.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security

Release Information

Statement introduced in Junos OS Release 20.3R1.

Support for prelogon compliance rule is added in Junos OS Release 23.1R1.

Support for application bypass is added in Junos OS Release 23.1R1.

Usage of `default-profile` options is not allowed starting Junos OS Release 23.1R1.

remote-execution (Event Scripts)

IN THIS SECTION

- Syntax | 14868
- Hierarchy Level | 14868
- Description | 14868
- Options | 14869
- Required Privilege Level | 14869
- Release Information | 14869

Syntax

```
remote-execution {
    remote-hostname {
        passphrase user-password;
        username user-login;
    }
}
```

Hierarchy Level

```
[edit event-options event-script file filename]
```

Description

Configure connection information for a local or remote host, which the event script can use to connect to and execute RPCs on the device.

Remote execution details, which include the hostname, username, and passphrase for one or more hosts, enable an event script to invoke remote procedure calls on a host without encoding the connection information directly in the event script. When you include remote execution details in the configuration instead of in individual event scripts, it has the advantage of capturing the information in a single location and the passphrase is encrypted.

When an event policy invokes an event script, it passes any configured remote execution details to the script. An event script references the remote execution details in the argument list of the function used to create the connection to the remote host.

Options

passphrase ***user-password***	User's password for the host.
remote-hostname	Name of the host with which the event script will communicate.
username ***username***	User's login name for the host.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

RELATED DOCUMENTATION

Use RPCs and Operational Mode Commands in Event Scripts

Use Event and Remote Execution Details in Event Scripts

remote-id (DHCP Relay Agent)

IN THIS SECTION

- Syntax | 14872
- Hierarchy Level | 14873
- Description | 14873
- Required Privilege Level | 14875
- Release Information | 14875

Syntax

```
remote-id {
    include-irb-and-l2;
    keep-incoming-remote-id ;
    no-vlan-interface-name;
    prefix prefix;
    use-interface-description (logical | device);
    use-vlan-id;
}
```

Hierarchy Level

```
[edit forwarding-options dhcp-relay relay-option-82],
[edit forwarding-options dhcp-relay group group-name relay-option-82],
[edit logical-systems logical-system-name forwarding-options dhcp-relay ... relay-option-82],
[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-
options dhcp-relay ... relay-option-82],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ... relay-option-82]
```

Description

Specify the Agent Remote ID suboption (suboption 2) of the DHCP relay agent information option (option 82) to include in DHCP packets destined for a DHCP server. Optionally specify that the suboption includes a prefix, textual description, or VLAN tag.

> **NOTE**: For Layer 3 interfaces, when you configure relay-option-82 only, the Agent Remote ID is the default If no VLAN tags are configured, then the default is the logical interface device (IFL) name. For integrated routing and bridging (IRB) interfaces, the default is the Layer 2 IFL name and bridge domain name.
>
> The interface to bridge domain relationship may be implicit (the interface is mapped to the bridge domain by the system based on VLAN tag) or explicit (the interface is mapped to the bridge domain by configuring it in the bridge domain definition). For the explicit case, tagging might not be relevant for the mapping.

The format of the Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual LANs (VLANs), stacked VLANs (S-VLANs), or bridge domains is as follows:

```
(fe | ge)-fpc/pic/port.subunit
```

> **NOTE**: For remote systems, the *subunit* is required and is used to differentiate an interface.

The format of the Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces that use VLANs is as follows:

```
(fe | ge)-fpc/pic/port:vlan-id
```

The format of the Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs is as follows:

```
(fe | ge)-fpc/pic/port:svlan-id--vlan-id
```

In the case of an IRB interface, the format displays the Layer 2 interface instead of the IRB interface along with the bridge domain name. For IRB interfaces (or other pseudo devices) the default format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

  ```
  (fe | ge)-fpc/pic/port.subunit:bridge-domain-name
  ```

- IRB interfaces that use VLANs:

  ```
  (fe | ge)-fpc/pic/port.subunit:vlan-name
  ```

To include the IRB interface name with the Layer 2 interface name, configure the `include-irb-and-l2` statement. The format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

  ```
  (fe | ge)-fpc/pic/port:bridge-domain-name+irb.subunit
  ```

- IRB interfaces that use VLANs:

  ```
  (fe | ge)-fpc/pic/port:vlan-name+irb.subunit
  ```

To include only the IRB interface name without the Layer 2 interface and bridge domain or VLAN, configure the `no-vlan-interface-name` statement. The format is as follows:

```
irb.subunit
```

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
21.2R1	Starting with Junos OS Release 21.2R1, QFX Series switches support the `remote-id` CLI statement in a stateless DHCP relay configuration. You can configure stateless DHCP relay using the `forward-only` CLI statement at the [`edit forwarding-options dhcp-relay`] hierarchy level.

RELATED DOCUMENTATION

Using DHCP Relay Agent Option 82 Information

Configuring Option 82 Information

remote-id (MX Series)

IN THIS SECTION

- Syntax | 14876
- Hierarchy Level | 14876
- Description | 14876
- Default | 14876
- Required Privilege Level | 14876
- Release Information | 14876

Syntax

```
remote-id {
    host-name;
    use-interface-description (logical | device);
    use-string string;
}
```

Hierarchy Level

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security option-82]
```

Description

Insert the `remote-id` suboption of DHCP option 82 (also known as the DHCP relay agent information option) in DHCP request packet headers before forwarding or relaying requests to a DHCP server. This suboption provides a trusted identifier for the host system that has forwarded or relayed requests to the server.

The remaining statements are explained separately. See CLI Explorer.

Default

If the `remote-id` statement is not explicitly set, no remote ID value is inserted in the DHCP request packet header.

If the `remote-id` statement is explicitly set, but is not qualified by a keyword, the default value is the device MAC address.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

[edit services ipsec-vpn ikepolicy policy-name]
```

Description

Define the remote identification values to which the IKE policy applies.

Options

`any-remote-id`–Allow any remote address to connect. This option is supported only in dynamic configurations and cannot be configured with specific values.

`ipv4_addr [ values ]`—Define one or more IPv4 address identification values.

`ipv6_addr [ values ]`—Define one or more IPv6 address identification values.

`key_id [ values ]`—Define one or more key identification values.

`fqdn fqdn`—Fully-qualified domain name.

`distinguished-name container container-string-values |wildcard wildcard-string-values`—One or more distinguished name values.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`ipv6_addr` option added in Junos OS Release 7.6.

`any-remote-id` option added in Junos OS Release 8.2.

`distinguished-name container` *`container-string-values`* `|wildcard` *`wildcard-string-values`* option added in Junos OS Release 19.1.

RELATED DOCUMENTATION

Configuring IKE Policies

remote-id (VLAN Authentication Username)

IN THIS SECTION

- Syntax | **14880**
- Hierarchy Level | **14880**
- Description | **14880**
- Required Privilege Level | **14881**
- Release Information | **14881**

Syntax

```
remote-id;
```

Hierarchy Level

```
[edit interfaces interface-name auto-configure vlan-ranges authentication username-include]
```

Description

Include the agent remote identifier (ARI) in the username sent to RADIUS for authentication of the dynamic VLAN. The ARI is conveyed by the Access-Loop-Remote-ID TLV in an out-of-band ANCP Port Up message.

NOTE: This statement is not supported for stacked VLANs.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R4.

RELATED DOCUMENTATION

Configuring VLAN Interface Username Information for AAA Authentication

Layer 2 Wholesale with ANCP-Triggered VLANs Overview

remote-id

IN THIS SECTION

- Syntax | 14882
- Hierarchy Level | 14882
- Description | 14882
- Default | 14883
- Required Privilege Level | 14883
- Release Information | 14883

Syntax

```
remote-id {
    host-name host-name;
    mac (Option 82);
    prefix ( hostname | mac | none);
    use-interface-description (logical | device);
    use-string string;
}
```

Hierarchy Level

For platforms with Enhanced Level 2 Software (ELS):

```
[edit vlans vlan-name forwarding-options dhcp-security option-82]
```

For platforms without ELS:

```
[edit ethernet-switching-options secure-access-port vlan (all | vlan-name) dhcp-option82],
[edit forwarding-options helpers bootp dhcp-option82],
[edit forwarding-options helpers bootp interface interface-name dhcp-option82]
```

Description

Insert the `remote-id` suboption of DHCP option 82 (also known as the DHCP relay agent information option) in DHCP request packet headers before forwarding or relaying requests to a DHCP server. This suboption provides a trusted identifier for the host system that has forwarded or relayed requests to the server.

The remaining statements are explained separately, and their availability depends on the hierarchy level at which the `remote-id` suboption is specified, as follows:

- The statement `prefix`, is *not* supported at the `[edit vlans vlan-name forwarding-options dhcp-security option-82]` hierarchy level.
- The statement `host-name` is supported *only* at the `[edit vlans vlan-name forwarding-options dhcp-security option-82]` hierarchy level.

Default

If the `remote-id` statement is not explicitly set, no remote ID value is inserted in the DHCP request packet header.

If the `remote-id` statement is explicitly set, but is not qualified by a keyword, the following are true:

- At the `[edit vlans vlan-name forwarding-options dhcp-security]` hierarchy level, the default keyword value is *interface-name*.
- At all other hierarchy levels, the default value of the `remote-id` keyword is the MAC address of the switch.

> **NOTE**: When you configure `remote-id`, `circuit-id` is also enabled, even if you do not explicitly configure `circuit-id`.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Hierarchy level `[edit vlans vlan-name forwarding-options dhcp-security option-82]` introduced in Junos OS Release 13.2X50-D10. (See Using the Enhanced Layer 2 Software CLI for information about ELS.)

[edit system services dhcp-local-server dhcpv6],
[edit system services dhcp-local-server group group-name],
[edit system services dhcp-local-server dhcpv6 group group-name]
```

Description

Configure the DHCP local server or DHCP relay agent to detect a mismatch in the Agent Remote ID value to trigger a new connection request. Information about a subscriber's service plan is encoded in the Agent Remote ID, which is conveyed in option 82, suboption 2, for DHCPv4 clients and in option 37 for DHCPv6 clients. When a subscriber session is activated, the Agent Remote ID value for the

authorized service plan is stored in the session database. When you configure `remote-id-mismatch`, the DHCP local server and relay agent inspect incoming renew and rebind messages and compare the Agent Remote ID in the message against the initial value that DHCP stored in the database. When DHCP local server discovers a mismatch between the stored value and the value in the message, DHCP local server sends a NAK to the client and tears down the client binding. If the client is a DHCPv6 client, because DHCPv6 does not support an explicit NAK message, the local server sends a reply packet with lifetime set to 0 to signify a logical NAK.

When DHCP relay agent discovers the mismatch, it sends a NAK or logical NAK (for DHCPv6) to the DHCP client. The relay agent cannot tear down the binding itself, so it sends a release message to the local server, causing the local server to tear down the binding. For this to happen, you must configure the `send-release-on-delete` statement on the DHCP relay agent; otherwise it will not send the release message to the local server. In that case, the local server retains the client entry in the database until it times out or the IP address is used for a different binding.

> **NOTE**: `remote-id-mismatch` functionality overrides the default DHCP relay agent bind-on-request behavior. By default, when a stray DHCP request is received, that is, one for which there is an entry in the local server database but not in the relay agent database, a complete binding is automatically made with the relay agent and the local server.

The DHCP client initiates renegotiation when it receives the NAK. The changed Agent Remote ID value is conveyed as part of the request, enabling the new service plan to be submitted for authorization.

The `remote-id-mismatch` statement is typically used in an environment that uses local authorization instead of RADIUS authorization.

> **NOTE**: You cannot configure both the `remote-id-mismatch` statement and the `reauthenticate` statement at the global level, `[edit system services dhcp-local-server]`. However, DHCP precedence rules do permit you to configure both statements when they are at different levels. For example, you can configure `reauthenticate` at the global level and `remote-id-mismatch` for DHCPv6 at the `[edit system services dhcp-local-server dhcpv6]` hierarchy level or for a specific group at the `[edit system services dhcp-local-server group` *`name`*`]` hierarchy level, and so on.

Required Privilege Level

system—To view this statement in the configuration.

Configuring DHCP-Initiated Service Change Based on Remote ID

remote-identity

IN THIS SECTION

- Syntax | 14886
- Hierarchy Level | 14887
- Description | 14887
- Options | 14887
- Usage | 14887
- Required Privilege Level | 14888
- Release Information | 14888

Syntax

```
remote-identity {
    distinguished-name {
        container container-string;
        wildcard wildcard-string;
    }
    hostname hostname;
    inet ip-address;
    inet6 ipv6-address;
    key-id;
    user-at-hostname e-mail-address;
}
```

Hierarchy Level

```
[edit security ike gateway gateway-name]
[edit system ntp server server-name nts]
```

Description

Specify the remote IKE identity to exchange with the destination peer to establish communication. If you do not configure a remote-identity, the device uses the IPv4 or IPv6 address corresponding to the remote endpoint by default.

For Network Address Translation Traversal (NAT-T), both remote identity and local identity must be configured. You can use the NTS 'remote-identity' configuration to verify server identity.

Options

- `distinguished-name`—Specify identity as the distinguished name (DN) from the certificate. If there is more than one certificate on the device, use the `security ike gateway` *`gateway-name`* `policy` *`policy-name`* `certificate local-certificate` *`certificate-id`*.

  Optional container and wildcard strings can be specified:

  - `container` *`container-string`*—Specify a string for the container.
  - `wildcard` *`wildcard-string`*—Specify a string for the wildcard.
- `hostname` *`hostname`*—Specify identity as a fully qualified domain name (FQDN).
- `inet` *`ip-address`*—Specify identity as an IPv4 address.
- `inet6` *`ipv6-address`*—Specify identity as an IPv6 address.
- `key-id` *`string-key-id`*—Specify the key ID in ASCII sring.
- `user-at-hostname` *`e-mail-address`*—Specify identity as an e-mail address.

Usage

The command option `hostname` is the FQDN of the server. This hostname must match the FQDN of server in the `Subject Alternative Name` field of the local certificate.

For example:

```
set system ntp server 10.10.10.10 nts remote-identity hostname junos.example.net
```

You can use the optional parameter `distinguished-name`, to verify the distinguished name (DN) in the server certificate. You can specify the DN and values in either container string or wildcard string format. If we use container option, the order of the fields in DN and their values must exactly match with the fields in the server certificate. If we use wildcard option, the order of the fields in the DN is not considered.

For example,

```
set system ntp server 10.10.10.10 nts remote-identity distinguished-name container
                ou=eng, o=example
```

Required Privilege Level

Syntax

```
(remote-loop-enable | no-remote-loop-enable);
```

Hierarchy Level

```
[edit interfaces interface-name otn-options odu-delay-management]
```

Description

Enable the remote interface to loop back the delay measurement pattern to the local interface. Delay is measured by transmitting a known pattern (delay measurement pattern) in a selected bit of the delay measurement (DM) field and measuring the number of frames that are missed when the delay measurement pattern is received at the transmitting end (local interface).

NOTE: Do not enable remote loopback on both ends (local and remote). If you enable remote loopback on both interfaces, the delay measurement pattern is looped back continuously between the two interfaces.

Default

Delay measurement is disabled by default.

Options

remote-loop-enable Enables loopback of the delay measurement pattern at the remote interface.

no-remote-loop-enable Disables loopback of the delay measurement pattern at the remote interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

remote-traffic-selector

IN THIS SECTION

- Syntax | 14907
- Hierarchy Level | 14908
- Description | 14908
- Options | 14908
- Required Privilege Level | 14908
- Release Information | 14908

Syntax

```
remote-traffic-selector {
    (ipv4-prefix ipv4-prefix | ipv6-prefix ipv6-prefix);
    port port;
    protocol protocol;
}
```

Hierarchy Level

```
[edit security host-vpn connections connection-name children child-name]
```

Description

Configure the remote IPsec traffic to be protected by the child security association. A traffic selector is a traffic filter that defines and identifies the traffic flow permitted between two systems (a specified pair of local and remote addresses) that have IPsec protection.

Options

(ipv4-prefix *ipv4-prefix* | ipv6-prefix *ipv6-prefix*)	Specify traffic to be protected by the child security association using either IPv4 or IPv6 with a prefix. The prefix allows for specifying more general traffic.
port *port*	Specify the port to protect by number or name. For example, port 21 and port ftp refer to the same port.
protocol *protocol*	Specify the protocol to protect by number or name. For example, protocol 6 and protocol tcp refer to the same protocol.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 18.3R1.

remote-vtep-list

IN THIS SECTION

Syntax | 14909

- Hierarchy Level | 14909
- Description | 14909
- Required Privilege Level | 14910
- Release Information | 14910

Syntax

```
remote-vtep-list [remote-vtep-loopback-address ... ];
```

Hierarchy Level

```
[edit routing-instances name],
[edit switch-options]
```

Description

Configure static remote VXLAN tunnel endpoints (VTEPs). This statement configures VTEPs at the global level in a Layer 2 (L2) VXLAN gateway device. Specify one or more loopback addresses of the remote VTEPs.

You don't configure EVPN as part of a static VXLAN configuration. However, on platforms that support EVPN-VXLAN and static VXLAN, you can configure EVPN-VXLAN and static VXLAN on the same device if the two configurations use different sets of remote peer VTEPs.

On some platforms, you can use this statement with the `static-remote-vtep-list` statement to also configure remote VTEPs at the VLAN or bridge domain level. When you use the `static-remote-vtep-list` option, you must configure the `remote-vtep-list` statement to specify the remote VTEPs at the global level as follows:

- In an L2 routing instance of type `virtual-switch` at the `[edit routing-instances name]` hierarchy level.
- In the default switch instance at the `[edit switch-options]` hierarchy level.

Then configure the `static-remote-vtep-list` statement at the VLAN or bridge domain level in the same L2 routing instance or the default switch instance at the following hierarchy levels:

- In a `virtual-switch` L2 routing instance:

- VLAN level: `[edit routing-instances name vlans name vxlan]`
- Bridge domain level: `[edit routing-instances name bridge-domains name vxlan]`

- In the default switch instance:
  - VLAN level: `[edit vlans name vxlan]`
  - Bridge domain level: `[edit bridge-domains name vxlan]`

> **NOTE**: On the PTX10000 line of routers that run Junos OS Evolved, we support static VXLANs as follows:
>
> - Only in routing instances of type `virtual-switch`.
> - At the global and VLAN levels.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Releases 14.1R3 and 14.2R1.

Syntax

```
remotely-controlled;
```

Hierarchy Level

```
[edit services nat pool nat-pool-name pgcp]
```

Description

Configure the addresses and ports in a NAT pool to be remotely controlled by the gateway controller.

Options

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

remove-ie

IN THIS SECTION

- Syntax | 14912
- Hierarchy Level | 14912
- Description | 14912
- Options | 14913
- Required Privilege Level | 14913
- Release Information | 14913

Syntax

```
remove-ie {
    version v1 {
        number ie-number;
        release name;
    }
}
```

Hierarchy Level

```
[edit security gtp profile profile-name]
```

Description

Use the remove-ie option to enable the security device to detect and remove 3G-specific attributes from the GPRS tunneling protocol (GTP) packet header when the packet passes into a 2G network. It allows you to retain interoperability when roaming between 2G and 3G networks.

From Junos OS Release 20.4R1 onwards, the [edit security gprs gtp profile *profile-name*] hierarchy level is replaced by [edit security gtp profile *profile-name*].

Options

- `version v1`—To specify GTP version 1.
- `number` —To specify the user-configured IE number. IE removal by IE number supports all IEs, ranging from 1 to 255.
- `release` —To Specify release number. Available options are:
  - Release R6—To specify R6 IE removal.
  - Release R7—To specify R7 IE removal.
  - Release R8—To specify R8 IE removal.
  - Release R9—To specify R9 IE removal.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols bgp],
[edit routing-instances routing-instance-name protocols bgp group group-name],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]
```

Description

When advertising AS paths to remote systems, have the local system strip private AS numbers from the AS path. The numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. If the AS path contains the AS number of the external BGP (EBGP) neighbor, BGP does not remove the private AS number.

> **NOTE**: As of Junos OS 10.0R2 and higher, if there is a need to send prefixes to an EBGP peer that has an AS number that matches an AS number in the AS path, consider using the `as-override` statement instead of the `remove-private` statement.

The operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.

Junos OS recognizes the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document.

The set of reserved AS numbers is in the range from 64,512 through 65,535. The 32-bit private ASN scope is in the range from 4,200,000,000 through 4,294,967,294.

Options

all Remove all private AS numbers from the original path. Do not stop the process of removing private AS numbers, even if a public AS number is encountered.

nearest When you use the `all` and `replace` options, choose the last (right-most) public AS number encountered in the original AS path for the replacement value, as the AS path is processed from left to right. If no public AS number is encountered, the default replacement value is used. (See the `replace` option for information about the default replacement value.)

replace When you use the `all` option, instead of a removing private AS numbers, perform a replace operation. The default replacement value for the private AS number is the local AS number at the BGP group level for the BGP peer. If you are unsure about the replacement value, check the local AS value displayed in the output of the `show bgp group` *`group-name`* command.

no-peer-loop-check Peer loop check is removed. By default, the `remove-private` statement has a peer loop check restriction. If a private AS in the AS path has the same value as the configured `peer-as` for the neighbor, `remove-private` does not remove or replace this private AS number. This restriction provides peer-as loop protection. However, you can remove this restriction using the `no-peer-loop-check` option.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`no-peer-loop-check` option added in Junos OS Release 15.1.

- Options | 14922
- Required Privilege Level | 14923
- Release Information | 14923

Syntax

```
replace pattern pattern1 with pattern2 <upto n>
```

Description

Replace identifiers or values in a configuration.

Options

pattern1 Text string or regular expression that defines the identifiers or values you want to match.

pattern2 Text string or regular expression that replaces the identifiers and values located with *pattern1*. Juniper Networks uses standard UNIX-style regular expression syntax (as defined in POSIX 1003.2). If the regular expression contains spaces, operators, or wildcard characters, enclose the expression in quotation marks. Greedy qualifiers (match as much as possible) are supported. Lazy qualifiers (match as little as possible) are not.

upto *n* Number of objects replaced. The value of *n* controls the total number of objects that are replaced in the configuration (not the total number of times the pattern occurs). Objects at the same hierarchy level (siblings) are replaced first. Multiple occurrences of a pattern within a given object are considered a single replacement. If you do not specify an upto option, all identifiers and values in the configuration that match *pattern1* are replaced.

Required Privilege Level

configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

Syntax

```
replay-protect {
    replay-window-size number-of-packets;
}
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name]
```

Description

Enable replay protection for MACsec.

A replay window size specified using the "replay-window-size" on page 14931 *number-of-packets* statement must be specified to enable replay protection.

When replay protection is enabled, the receiving interface checks the ID number of all packets that have traversed the MACsec-secured link. If a packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving interface. For instance, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window. Replay protection is especially useful for fighting man-in-the-middle attacks.

A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network. Replay protection should not be enabled in cases where packets are expected to arrive out of order. You can require that all packets arrive in order by setting the replay window size to 0.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

replicator

IN THIS SECTION

- Syntax | **14934**
- Hierarchy Level | **14934**
- Description | **14934**
- Options | **14934**
- Required Privilege Level | **14935**
- Release Information | **14935**

Syntax

```
replicator {
    inet ip;
    vxlan-encapsulation-source-ip (assisted-replicator-ip | ingress-replication-ip | retain-
incoming-source-ip);
}
```

Hierarchy Level

```
[edit logical-systems name routing-instances name protocols evpn assisted-replication],
[edit routing-instances name protocols evpn assisted-replication],
[edit protocols evpn assisted-replication]
```

Description

Configure a device in an EVPN network into the assisted replication (AR) replicator role.

AR helps to optimize broadcast, unknown unicast, and multicast (BUM) traffic in EVPN networks. To enable AR, you configure devices in the EVPN network to operate as AR replicator and AR leaf devices.

AR replicator devices take on BUM traffic replication and forwarding tasks for AR leaf devices. When an AR leaf device receives BUM traffic, instead of always performing ingress replication itself to the EVPN core, it forwards the traffic on an AR tunnel to an AR replicator device that can better handle the replication load. The AR replicator device then replicates and forwards the traffic to other overlay tunnels. You configure a loopback interface IP address on each AR replicator device for the AR tunnel.

You can configure multiple AR replicator devices in an EVPN network, and AR leaf devices load-balance among the available AR replicator devices.

Options

inet *ip-address*

(Required) IPv4 address for the AR tunnel to the AR replicator.

This must be a loopback interface configured on the AR replicator device that is part of the EVPN instance.

vxlan-encapsulation-source-ip

(Mandatory for EVPN-VXLAN networks with QFX Series AR devices) Specify the type of VXLAN encapsulation source IP address to include in replicated and forwarded traffic.

- Values:
  - `ingress-replication-ip`—(Mandatory for EVPN-VXLAN networks with QFX Series AR devices) Use the ingress replication IP address.

    > **NOTE**: When configuring AR in EVPN-VXLAN networks with QFX Series devices as AR replicators and AR leaf devices, the `vxlan-encapsulation-source-ip` statement must be set to `ingress-replication-ip`.
    >
    > The `ingress-replication-ip` option supports AR on AR replicator devices that are not capable of retaining the source IP address of the originating AR leaf device (sent on the AR overlay tunnel) when replicating the traffic onto other overlay tunnels. In that case, AR must operate in *extended AR mode* (see *Extended AR Mode for Multihomed Ethernet Segments*).You must explicitly set this option to override the default factory configuration setting, `retain-incoming-source-ip`, which is not supported in this case.
    >
    > AR is currently only supported in EVPN-VXLAN network with QFX Series AR devices operating in extended AR mode.

  (Not currently used) The following `vxlan-encapsulation-source-ip` options are reserved for future AR compatibility among AR replicators with different capabilities:

  - `assisted-replicator-ip`—Use the AR replicator IP address.
  - `retain-incoming-source-ip`—(Default) Retain the VXLAN encapsulation source IP address of the incoming packet.

The remaining statements are explained separately. See CLI Explorer.

Description

Set security log report settings.

On-box reporting offers a comprehensive reporting facility where your security management team can spot a security event when it occurs, immediately access and review pertinent details about the event, and quickly decide appropriate remedial action.

The on-box reporting feature is enabled by default on a SRX Series Firewall with Junos OS Release 15.1X49-D100 or later.

If you are upgrading your SRX Series Firewall from a Junos OS Release prior to Junos OS 15.1X49-D100, then on-box reporting feature is disabled by default. You need to run the `set security log report` command to enable the on-box reporting feature on the device.

Options

report	Enable log report.
logs-per-table	Log number for each table.
idp	Log number of idp.

- **Range:** For SRX300, SRX320, SRX340, SRX345, SRX550, SRX550M, and vSRX Virtual Firewall: 40000 through 80000
- **Default:** 40000
- **Range:** For SRX1500, SRX4100, and SRX4200: 500000 through 1000000
- **Default:** 500000
- **Range:** For SRX4600: 1333333 through 2666666
- **Default:** 1333333

ipsec-vpn Log number of IPsec-VPN.

- **Range:** For SRX300, SRX320, SRX340, SRX345, SRX550, SRX550M, and vSRX Virtual Firewall: 26666 through 26666
- **Default:** 26666
- **Range:** For SRX1500, SRX4100, and SRX4200: 333333 through 333333
- **Default:** 333333
- **Range:** For SRX4600: 666666 through 666666
- **Default:** 666666

screen Log number of screen.

- **Range:** For SRX300, SRX320, SRX340, SRX345, SRX550, SRX550M, and vSRX Virtual Firewall: 40000 through 80000

- **Default:** 500000
- **Range:** For SRX4600: 1333333 through 2666666
- **Default:** 1333333

session-all Log number of session.

- **Range:** For SRX300, SRX320, SRX340, SRX345, SRX550, SRX550M, and vSRX Virtual Firewall: 80000 through 800000

- **Default:** 80000
- **Range:** For SRX1500: 533333 through 5333333
- **Default:** 533333
- **Range:** For SRX4100 and SRX4200: 666666 through 6666666
- **Default:** 666666
- **Range:** For SRX4600: 1000000 through 10000000
- **Default:** 1000000

sky

Log number of SKY.

- **Range:** For SRX300, SRX320, SRX340, SRX345, SRX550, SRX550M, and vSRX Virtual Firewall: 40000 through 80000
- **Default:** 40000
- **Range:** For SRX1500, SRX4100, and SRX4200: 500000 through 1000000
- **Default:** 500000
- **Range:** For SRX4600: 1333333 through 2666666
- **Default:** 1333333

Content Security

Log number of Content Security.

- **Range:** For SRX300, SRX320, SRX340, SRX345, SRX550, SRX550M, and vSRX Virtual Firewall: 40000 through 80000
- **Default:** 40000
- **Range:** For SRX1500, SRX4100, and SRX4200: 500000 through 1000000
- **Default:** 500000
- **Range:** For SRX4600: 1333333 through 2666666
- **Default:** 1333333

table-lifetime

Table lifetime days.

- **Default:** 90
- **Range:** 0 through 365

table-mode Report table mode.

- `dense`- Enable table dense mode.
  - **Default:** `dense` mode is enabled by default from Junos OS Release 23.2R1 onwards.

    > **NOTE**: Before upgrading from Junos OS Release 22.4 or earlier to Junos OS Release 23.2 or later, you must remove the `set security log report table-mode dense` configuration.

- `disable-dense`- Disable table dense mode.

Required Privilege Level

The remaining statements are explained separately. See CLI Explorer.

Release Information

Statement introduced in Junos OS Release 15.1X49-D100

The [edit `logical-systems` *name* security "log" on page 10435] and [edit `tenants` *tenant-name* security "log" on page 10435] hierarchy levels introduced in Junos OS Release 19.1R1.

`table-mode` option added in Junos OS Release 19.4R1.

RELATED DOCUMENTATION

log (Security) | **10435**

report-ingress-shaping-rate (Dynamic CoS Interfaces)

IN THIS SECTION

Syntax | **14943**
Hierarchy Level | **14943**

- Description | 14943
- Options | 14943
- Required Privilege Level | 14944
- Release Information | 14944

Syntax

```
report-ingress-shaping-rate bps;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name class-of-service interfaces interface-name unit logical-unit-number]
```

Description

Report the ingress shaping rate in bits per second that is used as the receive speed (Rx) for the LAC to send to the LNS. The ingress shaping rate is used when the method for deriving the connect speed is configured as `service-profile` with the `tx-connect-speed` statement at the `[edit services l2tp]` hierarchy level.

> **NOTE**: This statement is supported only when the `effective shaping-rate` statement is included at the `[edit chassis]` hierarchy level. If it is not, the subscriber login fails and a system log message is generated. There is no commit check failure because a commit check cannot be performed at run time.

Options

bps Ingress shaping rate in bits per second.

- **Range:** 1000 through 6,400,000,000,000 (6.4Tbps)

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

report-local-rule (PCRF Partition)

IN THIS SECTION

- Syntax | 14946
- Hierarchy Level | 14946
- Description | 14946

Required Privilege Level | 14947
Release Information | 14947

Syntax

```
report-local-rule;
```

Hierarchy Level

```
[edit access pcrf partition partition-name]
```

Description

Configure the Policy and Charging Rule Function (PCRF) partition to send local report downstream messages by default. If you configure this statement, this generates the same result as if you enabled the Resource-Allocation-Notification message trigger with the local rule definition.

The following example shows predefined rule installation commands, including the Resource-Allocation-Notification command, for Credit Control Answer (CCA-GX) and Reauthorization Request (RAR-GX) messages between the PCRF and Gx:

```
{ Charging-Rule-Install
  { Charging-Rule-Name:            “fixed-cos” }
  { Charging-Rule-Definition:
    { Charging-Rule-Name:        “firewall” }
    { Service-Identifier:         10 }
    { Rating-Group:            292 }
    { Juniper-Param-V4-Input-Filter:    “my_input_filter” }
    { Juniper-Param-V4-Output-Filter:    “my_output_filter” }
  }
  [ Resource-Allocation-Notification: ENABLE_NOTIFICATION(0) ]
 }
```

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

RELATED DOCUMENTATION

report-resource-allocation (PCRF Partition)

IN THIS SECTION

- Syntax | 14947
- Hierarchy Level | 14948
- Description | 14948
- Required Privilege Level | 14948
- Release Information | 14949

Syntax

```
report-resource-allocation;
```

Hierarchy Level

```
[edit access pcrf partition partition-name]
```

Description

Configure the Policy and Charging Rule Function (PCRF) partition to generate reports for resource allocation failures by default. If you configure this statement, this generates the same result as if you enabled the Resource-Allocation-Notification message trigger with every rule received from the PCRF.

The following example shows predefined rule installation commands, including the Resource-Allocation-Notification command, for Credit Control Answer (CCA-GX) and Reauthorization Request (RAR-GX) messages between the PCRF and Gx:

```
{ Charging-Rule-Install
  { Charging-Rule-Name:            “fixed-cos” }
  { Charging-Rule-Definition:
    { Charging-Rule-Name:        “firewall” }
    { Service-Identifier:         10 }
    { Rating-Group:            292 }
    { Juniper-Param-V4-Input-Filter:    “my_input_filter” }
    { Juniper-Param-V4-Output-Filter:    “my_output_filter” }
  }
  [ Resource-Allocation-Notification: ENABLE_NOTIFICATION(0) ]
 }
```

NOTE: Some PCRFs may be unable to generate a Resource-Allocation-Notification AVP. As a result, the `report-resource-allocation` statement provides generated reports by default.

For login and update interactions between the PCRF and the Online Charging System (OCS), the OCS sends applicable reports to the PCRF using a CCR-GX-U message. If the service-dynamic-profile instantiation fails, and the Resource-Allocation-Notification (ENABLE_NOTIFICATION) is set for the charging rule, then the OCS sends a report. The router acknowledges the subscriber activation, allows subscriber traffic to flow, and continues to repeat the process.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

report-skip

IN THIS SECTION

- Syntax | 14949
- Hierarchy Level | 14950
- Description | 14950
- Required Privilege Level | 14950
- Release Information | 14950

Syntax

```
report-skip
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name],
[edit security policies global policy policy-name],
[edit security policies stateful-firewall-rule [name] policy [name]],
[edit security policies explicit-proxy profile [name] policy [name] report-skip],
[edit logical-systems logical-system-name security policies from-zone zone-name to-zone zone-name
policy policy-name],
[edit logical-systems logical-system-name security policies global policy policy-name],
[edit tenants tenant-name security policies from-zone zone-name policy policy-name],
[edit tenants tenant-name security policies global policy policy-name]
```

Description

You can configure this command to skip policy reports for a policy.

Adding the policy to the policy allowlist excludes the policy from any policy analysis and excluded it from appearing in any future report.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.1R1.

RELATED DOCUMENTATION

show security policy-report | 26040

report-successful-resource-allocation (PCRF Partition)

IN THIS SECTION

- Syntax | 14951
- Hierarchy Level | 14951
- Description | 14951
- Required Privilege Level | 14952
- Release Information | 14952

Syntax

```
report-successful-resource-allocation;
```

Hierarchy Level

```
[edit access pcrf partition partition-name]
```

Description

Configure the Policy and Charging Rule Function (PCRF) partition to generate reports for both resource allocation successes and failures by default. If you configure this statement, this generates the same result as if you enabled the Successful-Resource-Allocation-Notification message trigger with every CCA-GX-I, CCA-GX-U, and RAR-GX-A message.

The following example shows a predefined event trigger command for CCA-GX and RAR-GX messages between the PCRF and Gx:

```
{ Event-Trigger: SUCCESSFUL_RESOURCE_ALLOCATION(22) }
```

If the SUCCESSFUL_RESOURCE_ALLOCATION (22) trigger value exists in the downstream data, the Broadband Policy and Charging Enforcement Function (PCEF) reports successful installations of rules marked with Resource-Allocation-Notification AVP in the Charging-Rule-Install AVP.

> **NOTE**: Some PCRFs may be unable to generate this event trigger. As a result, the `report-successful-resource-allocation` statement provides generated reports by default.

For login and update interactions between the PCRF and the Online Charging System (OCS), the OCS sends applicable reports to the PCRF using a CCR-GX-U message. If the service-dynamic-profile instantiation succeeds, and the Resource-Allocation-Notification (ENABLE_NOTIFICATION) is set for the charging rule, and the SUCCESSFUL_RESOURCE_ALLOCATION event trigger is set in the request, then the OCS sends a report.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

report-zero-oif-gw-on-discard

IN THIS SECTION

- Syntax | 14953
- Hierarchy Level | 14953
- Description | 14953

- Default | 14954
- Required Privilege Level | 14954
- Release Information | 14954

Syntax

```
report-zero-oif-gw-on-discard;
```

Hierarchy Level

```
[edit chassis fpc slot-number inline-services]
```

Description

(MX Series only) For inline active flow monitoring, for only the flow records for rejected, discarded, and policed flows, set the flow record value to 0 (zero) for the IPFIX information elements `ipNextHopIPv6Address` (Element ID 62), `egressInterface` (Element ID 14), and `ipNextHopIPv4Address` (Element ID 15). If the `report-zero-oif-gw-on-discard` statement is not configured, the flow records display the available information for these elements, which is the default behavior for not only rejected, discarded, or policed flows, but also for all other flows. The available information for these elements is the result of a route lookup in the forwarding table, and is reported in the OIF/GW fields in the export flow record.

> **NOTE**: This statement does not apply to flows that are policed and sampled by the Packet Forwarding Engine for egress interfaces. After you configure the `report-zero-oif-gw-on-discard` statement, each sampled packet updates the forwarding action of that flow in the flow record. That is, the last sampled packet of the flow just before export determines the forwarding action of that flow. For example, in the case of a rate-limiting policer, the forwarding action taken on a flow is not deterministic. The flow is treated either as forwarded or as policed based on the forwarding action of the last sampled packet of that flow.

You configure this statement to help you track what traffic is being dropped.

Default

The flow records display the available information for the information elements `ipNextHopIPv6Address` (Element ID 62), `egressInterface` (Element ID 14), and `ipNextHopIPv4Address` (Element ID 15).

Required Privilege Level

Release Information

Statement introduced in Junos OS Release 15.1F7.

req-option

request access-security router-advertisement-guard-block

IN THIS SECTION

- Syntax | 14960
- Description | 14960
- Options | 14961
- Required Privilege Level | 14961
- Output Fields | 14961
- Release Information | 14961

Syntax

```
request access-security router-advertisement-guard-block interface (interface-name)
```

Description

Initiate the blocking state on an interface or range of interfaces for stateful IPv6 Router Advertisement (RA) guard. Stateful RA guard learns about legitimate senders of RA messages and stores this information in order to validate senders of subsequent RA messages. For example, an interface that is in the learning state and receives RA messages that are not sent from valid IPv6 routers will dynamically transition to the blocking state. While the interface is in blocking state, all RA messages received on that interface are dropped.

You can override the dynamic state transitions by requesting the blocking state on an interface. If you issue the request for the blocking state on an interface, the interface will remain in forwarding state until either the learning or forwarding state is requested on that interface.

Options

`interface` *`interface-name`*	Initiate the blocking state on the specified interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Output Fields

This command produces no output.

```
request access-security router-advertisement-guard-learn interface (interface-name) duration
seconds (forward | block)
```

Description

Request the learning state on an interface or range of interfaces for stateful IPv6 Router Advertisement (RA) guard. Stateful RA guard learns about legitimate senders of RA messages and stores this information in order to validate senders of subsequent RA messages. For example, an interface that is in the learning state and receives RA messages sent from legitimate sources dynamically transitions to the forwarding state after the learning period ends. While the interface is in forwarding state, all RA messages received on that interface that can be validated against the configured policy are forwarded.

Before you can request learning on an interface, you must enable RA guard at the [`edit forwarding-options access-security router-advertisement-guard`] hierarchy level and configure the `stateful` option. When you enable stateful RA guard, the default state is `Off`. An interface in the `Off` state operates as if RA guard is not available. The learning state can be initiated only by configuring the `request access-security router-advertisement-guard-learn` command.

When you request the learning state, you must configure the duration of the learning period in seconds. This is the amount of time the interface will remain in the learning state before it transitions to another state. RA messages that are received during the learning period can be either forwarded or blocked. Configure the `forward` option to forward RA messages during the learning period, or configure the `block` option to block RA messages during the learning period.

Options

interface *interface-name*	Initiate the learning state on the specified interface.
duration *seconds*	Configure the duration of the learning state in seconds. When the learning period ends, the state dynamically transitions to either the forwarding state or the blocking state.
forward	Configure the interface to forward RA messages received during the learning period.
block	Configure the interface to block RA messages received during the learning period.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Output Fields

This command produces no output.

Release Information

Command introduced in Junos OS Release 15.1X53-D55.

Syntax

```
request ancp oam interface
(interface-name | interface-set set-name)
```

```
<count count>
<timeout duration>
```

Description

Trigger the access node to run a loopback test on the local loop between the access node and the customer premises equipment. You must specify either an ANCP interface or an ANCP interface set. The access node responds to the NAS with the results of the test.

Options

interface-name	Name of the ANCP interface on whose local loop the loopback test is run.
interface-set *set-name*	Name of the ANCP interface set on whose local loop the loopback test is run.
count *count*	(Optional) Number of times a loopback message is sent on the local loop. Range: `1` through `32`. Default: `1`.
timeout *duration*	(Optional) Period of time in seconds that the NAS waits for a response to the OAM request. Range: `0` through `255`. Default: `5`.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request, including the result of the test, the response code, and the response string returned with the OAM response in the event of failure, an error code is displayed.

Sample Output

request ancp oam interface

```
user@host> request ancp oam interface ge-1/0/4.12 count 5 timeout 40
request succeeded
```

Syntax

```
request ancp oam neighbor
(ip-address ip-address | system-name neighbor-name)
subscriber identifier-string
<count count>
<timeout duration>
```

Description

Trigger the access node to run a loopback test on the local loop between the access node and the customer premises equipment. You must specify both the access node and the subscriber. The access node responds to the NAS with the results of the test.

Options

ip-address *ip-address*	IP address that specifies the access node on whose local loop the loopback test is run.
system-name *neighbor-name*	System name that specifies the access node on whose local loop the loopback test is run.
subscriber *identifier-string*	Access identifier that specifies the subscriber on whose local loop the loopback test is run.
count *count*	(Optional) Number of times a loopback message is sent on the local loop. Range: `1` through `32`. Default: `1`.
timeout *duration*	(Optional) Period of time in seconds that the NAS waits for a response to the OAM request. Range: `0` through `255`. Default: `5`.

ANCP Monitoring and Management

request ancp oam port-down

IN THIS SECTION

- Syntax | 14970
- Description | 14971
- Options | 14971
- Required Privilege Level | 14971
- Output Fields | 14971
- Sample Output | 14972
- Release Information | 14972

Syntax

```
request ancp oam port-down
(neighbor ip-address | subscriber-interface physical-interface-name)
circuit-id aci remote-id ari outer-vlan-id vlan-id
```

Description

Simulate an ANCP Port Down message on the specified access loop for troubleshooting or to mitigate an abnormal condition. Triggers removal of the corresponding out-of-band triggered, autosensed dynamic VLAN session for which no ANCP-sourced information exists. You must specify an ACI, an ARI, and an outer VLAN tag. This command is overridden by a genuine ANCP Port-Up message, meaning that you cannot use this command to initiate a Port Down condition when the access node has already reported a Port Up condition.

Options

aci	ANCP Access-Loop-Circuit-ID TLV that corresponds to a subscriber interface on the access node; used to identify the access node from which the message is simulated.
ari	ANCP Access-Loop-Remote-ID TLV that identifies the subscriber associated with an interface on the access node; used to identify the access node from which the message is simulated.
ip-address	IP address that specifies the access node from which the message is simulated.
physical-interface-name	Name of the access-facing subscriber interface that specifies the access node on whose local loop the loopback test is run.
vlan-id	ANCP Access-Aggregation-Circuit-ID-Binary TLV, the outer VLAN tag inserted by the access node on upstream traffic; used to identify the access node from which the message is simulated.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided no feedback on the status of your request. You can enter the `show ancp neighbor detail`, `show subscribers client-type vlan-oob detail`, and the `show subscribers summary` commands before and after initiating the Port Down message to verify the operation.

Sample Output

request ancp oam port-down neighbor circuit-id remote-id outer-vlan-id

```
user@host> request ancp oam port-down neighbor 192.168.25.31 circuit-id line-aci-1 remote-id
line-ari-1 outer-vlan-id 126
```

request app-engine cleanup

IN THIS SECTION

- Syntax | 14975
- Description | 14975
- Options | 14975
- Required Privilege Level | 14975
- Output Fields | 14975
- Sample Output | 14976
- Release Information | 14976

Syntax

```
request app-engine cleanup
<compute-cluster compute-cluster-name>
<compute-cluster compute-cluster-name compute-node compute-node-name>
```

Description

Cleans up temporary files on the Junos V App Engine or the host OS of QFX Series switches. This command deletes all files from the directories where temporary files are normally stored, such as /var/tmp and /var/log.

Be sure to collect any temporary files and logs you want to save before running this command.

Options

- `compute-cluster` *`compute-cluster-name`* `compute-node` *`compute-node-name`*—Name of the compute cluster and name of the compute node. On QFX Series switches, the default names of the compute cluster and compute node are default-cluster and default-node, which applies to the host OS.

Required Privilege Level

view

Output Fields

For a description of the output fields, see Table 127 on page 14975. Output fields are listed in the approximate order in which they appear.

Table 127: request app-engine cleanup Output Fields

Field Name	Field Description
`Compute Cluster`	Name of compute cluster.
`Compute Node`	Name of compute node.
`Cleanup`	Lists the directories that were cleaned up.

Sample Output

request app-engine cleanup (QFX 5100 Switches)

```
user@host> request app-engine cleanup
user@host> request app-engine cleanup
Compute cluster: default-cluster

  Compute node: default-node

   Cleanup (/var/tmp)
   =======
```

Release Information

Command introduced in Junos OS Release 13.1X51-D10.

RELATED DOCUMENTATION

request app-engine file-copy (crash | log) from-jhost to-vjunos

IN THIS SECTION

- Syntax | 14977
- Description | 14977
- Options | 14977
- Additional Information | 14978
- Required Privilege Level | 14978

- Output Fields | **14978**
- Sample Output | **14978**
- Release Information | **14978**

Syntax

```
request app-engine file-copy (crash | log)
from-jhost host-os-filename
to-vjunos vjunos-filename
```

Description

In Junos OS environments with a host OS, copies core files (`crash` option) or system log files (`log` option) from the host OS to a Junos OS filename.

- `crash` option—Core files are copied from the directory where the host OS normally stores core files. For example, when the host OS is Linux, the source directory is **/var/crash**. The `show app-engine crash` command displays the list of core files available to copy from the host OS source directory.
- `log` option—Log files are copied from the directory where the host OS normally stores system log files. For example, when the host OS is Linux, the source directory is **/var/log**. The `show app-engine logs` command displays the list of system log files available to copy from the host OS source directory.

Either the `crash` or `log` option is required. When the destination Junos OS path for the `to-vjunos` argument is a directory, the destination filename is the source filename by default. To rename the file at the destination, specify a full path that includes a destination filename in the path with the `to-vjunos` argument.

Options

- `from-jhost` *host-os-filename*—Source filename to copy from the host OS.
- `to-vjunos` *vjunos-filename*—Junos OS destination path (with or without a filename) to which the file is copied. If this path is a directory, the source filename is used as the destination filename by default.

Additional Information

This command does not apply to accessing files on guest virtual machines (VMs) on QFX Series devices that support guest VMs.

Required Privilege Level

view

Output Fields

This command produces no output. To see the results of the copy operation, you can run Junos OS commands for viewing files, such as `file list` with the destination directory, `show system core-dumps`, or `show log`.

Sample Output

request app-engine file-copy crash

```
user@host> request app-engine file-copy crash from-jhost
localhost.dcfpe.6449.1454328456.core.tgz to-junos /var/tmp

user@host> show system core-dumps

- Syntax (EX Series) | 14982
- Syntax (QFX Series) | 14982
- Syntax (PTX Series) | 14983
- Description | 14983
- Options | 14983
- Required Privilege Level | 14984
- Output Fields | 14984
- Sample Output | 14984
- Release Information | 14986

Syntax (EX Series)

```
request chassis beacon
<fpc slot-number (off | on)>
<fpc slot-number (off | on) timer minutes>
<fpc slot-number pic-slot slot-number port port-number (off | on)>
<fpc slot-number pic-slot slot-number port port-number (off | on) timer minutes>
```

Syntax (QFX Series)

This is the general syntax for the QFX Series of switches. The exact syntax and options are different depending on the specific model of QFX switch and Junos OS release.

```
request chassis beacon
<all (off | on)>
<fpc slot-number (off | on)>
<interconnect-device name (cb slot-number | fpc slot-number | (off | on)>
<node-device name (off | on)>
```

Syntax (PTX Series)

```
request chassis beacon
<all (off | on)>
<fpc slot-number (off | on)>
<interconnect-device name (cb slot-number | fpc slot-number | (off | on)>
<node-device name (off | on)>
```

NOTE: `request chasis beacon` is not supported on the PTX10001-36MR.

Description

(QFX Series switches only) Enable or disable the beacon LED on a QFX Series device.

(EX Series switches only) Supports the following for one or all network port status LEDs on a specified FPC:

- Enable the beacon for:
  - 5 minutes (default)
  - A specified number of minutes (1 through 120)
- Disable the beacon:
  - Instantly
  - After a specified number of minutes (1 through 120) is over

NOTE: To turn the beacon on or off on a Virtual Chassis, you must issue the `request chassis beacon` command on the primary switch in the Virtual Chassis. Also, when specifying the FPC slot number, you must use the target Virtual Chassis member number.

Options

all Turn the beacon LED either **on** or **off** on all QFabric system Interconnect and Node devices.

cb *slot-number*	Turn the beacon LED either **on** or **off** on the Control Board of the QFX3008-I Interconnect device.
fpc *slot-number*	Turn all beacon LEDs on the specified FPC either **on** or **off**.
fpc *slot-number* **pic-slot** *slot-number* **port** *port-number*	Turn the beacon LED for the specified port either **on** or **off**.
interconnect-device *name*	Turn the beacon LED either **on** or **off** on the Interconnect device.
node-device *name*	Turn the beacon LED either **on** or **off** on the Node device.
off	Turn the specified beacon LEDs **off**.
on	Turn the specified beacon LEDs **on**.
timer *minutes*	Turn the beacon LEDs **on** for the specified number of minutes or **off** after the specified number of minutes elapses. • **Range:** 1 through 120

```

Usage

When `request chassis cb slot 1 offline`, is configured before the node is made offline, the following error `Error: CB offline is not allowed, when the node is online state. Try to offline the node using "request node offline` *node* is displayed.

Platform-Specific request chassis cb Behavior

Use Feature Explorer to confirm platform, and release support for specific features.

Use the following table to review platform-specific behaviors for your platform:

Table 128:

Platform	Difference

Junos OS Evolved device with dual Routing and Control Boards (RCBs)	After initiating a node halt, you must wait 1 minute before doing Control Board (CB) offline. This delay ensures system stability. If you try to offline a CB within this period, the system displays the following error message:
	
	`request chassis cb slot 1 offline`
	`Error: CB offline is not allowed now, Try after sometime`

Release Information

Command introduced before Junos OS Release 7.4.

- Additional Information | 14997
- Required Privilege Level | 14997
- Output Fields | 14997
- Sample Output | 14997
- Release Information | 14997

Syntax

```
request chassis clock master switch
```

Description

(PTX Series Packet Transport Routers only) Control which Centralized Clock Generator (CCG) is the primary.

Options

This command has no options.

Additional Information

By default, the CCG in slot 0 (CCG0) is the primary and the CCG in slot 1 (CCG1) is the backup. If you use this command to change the primary, and then restart the chassis software for any reason, the primary reverts to the default setting. To change the default primary CCG, include the `ccg` statement at the [**edit chassis redundancy**] hierarchy level in the configuration. For more information, see the Junos OS Administration Library.

The configurations on the two CCGs do not have to be the same, and they are not automatically synchronized. If you configure both CCGs as primaries, when the chassis software restarts for any reason, the CCG in slot 0 becomes the primary and the one in slot 1 becomes the backup.

The switchover from the primary CCG to the backup CCG is immediate.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis clock primary switch

```
user@host> request chassis clock master switch
CCG master switch initiated, use “show chassis environment ccg” to verify
```

Release Information

Command introduced in Junos OS Release 12.1.

request chassis cluster failover node

IN THIS SECTION

- Syntax | 15000
- Description | 15000
- Options | 15000
- Required Privilege Level | 15000
- Output Fields | 15000
- Sample Output | 15000
- Release Information | 15001

Syntax

```
request chassis cluster failover node          node-number
redundancy-group          group-number
```

Description

For chassis cluster configurations, initiate manual failover in a redundancy group from one node to the other, which becomes the primary node, and automatically reset the priority of the group to 255. The failover stays in effect until the new primary node becomes unavailable, the threshold of the redundancy group reaches 0, or you use the `request chassis cluster failover reset` command.

After a manual failover, you must use the `request chassis cluster failover reset` command before initiating another failover.

Options

- `node` *`node-number`*—Number of the chassis cluster node to which the redundancy group fails over.
- **Range:** 0 through 1
- `redundancy-group` *`group-number`*—Number of the redundancy group on which to initiate manual failover. Redundancy group 0 is a special group consisting of the two Routing Engines in the chassis cluster.

  Range: 0 through 255

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis cluster failover node

```
user@host> request chassis cluster failover node 0 redundancy-group 1
Initiated manual failover for redundancy group 1
```

Release Information

Command introduced in Junos OS Release 9.0.

Upgrading a Chassis Cluster Using In-Service Software Upgrade

request chassis device-mode satellite

IN THIS SECTION

- Syntax | 15006
- Description | 15006
- Options | 15007
- Required Privilege Level | 15007
- Sample Output | 15007
- Release Information | 15007

Syntax

```
request chassis device-mode satellite package-name
```

Description

Manually install satellite software onto a switch before interconnecting the switch as a satellite device into a Junos Fusion.

There are other methods of installing satellite software onto a satellite device, and each Junos Fusion has individual requirements for manually installing satellite software. See *Configuring Junos Fusion Provider Edge* or Configuring or Expanding a Junos Fusion Enterprise before manually installing satellite software.

This command is entered from a standalone device before it is configured into a satellite device in a Junos Fusion.

Options

package-name	The URL to the satellite software package.

Required Privilege Level

system-control

Sample Output

request chassis device-mode satellite /var/tmp/satellite-3.0R1.1-signed.tgz

```
user@satellite-device> request chassis device-mode satellite /var/tmp/satellite-3.0R1.1-
signed.tgz
```

Release Information

Command introduced in Junos OS Release 14.1X53-D16.

request chassis device-mode

IN THIS SECTION

- Syntax | 15008
- Description | 15008
- Options | 15008
- Required Privilege Level | 15009
- Output Fields | 15009

Sample Output | 15009
Release Information | 15010

Syntax

```
request chassis device-mode (interconnect-device | node-device | standalone)
```

Description

Select the operating mode for the device, which acts either as a device within a QFabric system or as a standalone switch.

NOTE:

- Issue the `request chassis device-mode` command only when your management station is connected directly to the device over a console port connection.
- Changing the device mode erases all configuration data on the device. When you convert a device to a different device mode, we recommend that you back up your device configuration to an external location before issuing the `request chassis device-mode` command.

Options

interconnect-device Set the device to operate as an Interconnect device within a QFabric system. To complete the Interconnect device mode conversion process, you must connect the device to the QFabric system management control plane and reboot the device.

node-device Set the device to operate as a Node device within a QFabric system. To complete the Node device mode conversion process, you must connect the device to the QFabric system management control plane and reboot the device.

standalone Set the device to operate as a standalone switch. If the device starts in Node device or Interconnect device mode, you must reboot the device to return to standalone mode. Standalone mode is the factory default setting.

Required Privilege Level

admin

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis device-mode interconnect-device (Starting in Node Device or Standalone Mode)

```
user@switch> request chassis device-mode interconnect-device
Device mode set to 'interconnect-device' mode.
Please reboot the system to complete the process.
```

request chassis device-mode node-device (Starting in Interconnect Device or Standalone Mode)

```
user@switch> request chassis device-mode node-device
Device mode set to 'node-device' mode.
Please reboot the system to complete the process.
```

request chassis device-mode standalone (Starting in Interconnect Device or Node Device Mode)

```
user@switch> request chassis device-mode standalone
Device mode set to 'standalone' mode.
Please reboot the system to complete the process.
```

request chassis device-mode standalone (Starting in Standalone Mode)

```
user@switch> request chassis device-mode standalone
Device mode set to 'standalone' mode.
No reboot required.
```

Release Information

Command introduced in Junos OS Release 11.2.

interconnect-device option introduced in Junos OS Release 13.1 for the QFX Series.

IN THIS SECTION

- Syntax | **15011**
- Description | **15011**
- Options | **15011**
- Required Privilege Level | **15011**
- Output Fields | **15011**
- Sample Output | **15011**
- Release Information | **15012**

Syntax

```
request chassis fabric fpc interconnect-device interconnect-device-name slot slot-number
(offline | online)
```

Description

(QFabric systems only) Set the Interconnect device Flexible PIC Concentrator (FPC) offline or online for the QFabric system. When the FPC is offline, traffic is redirected to other FPCs and is not lost while you remove or install an FPC. After issuing this command, you must issue the `request chassis fpc` command.

Options

interconnect-device *interconnect-device-name*	Set the Interconnect device containing the FPC you want to bring either offline or online.
slot *slot-number*	Set the specific FPC slot on the Interconnect device.
offline	Set the Interconnect device FPC to offline for removal.
online	Set the Interconnect device FPC to online after installation.

Required Privilege Level

admin

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis fabric fpc online

```
user@qfabric> request chassis fabric fpc interconnect-device IC-YW3781 offline slot 15
Graceful offline of the fabric card has been initiated. Please wait 20 seconds before offlining
or removing the card.
```

request chassis fabric fpc offline

```
user@qfabric> request chassis fabric fpc interconnect-device IC-YW3781 online slot 15
Bring the FPC online by issuing the "request chassis fpc online" command.
```

Release Information

Command introduced in Junos OS Release 11.3.

RELATED DOCUMENTATION

- request chassis fpc

request chassis fabric pfe

IN THIS SECTION

- Syntax | 15012
- Description | 15012
- Options | 15013
- Required Privilege Level | 15013
- Release Information | 15013

Syntax

```
request chassis fabric pfe pfe-number fpc fpc-number offline
```

Description

Make a specified fabric of the packet forwarding engine (PFE) offline.

This command makes only the specified PFE of the FPC offline and rest of the PFEs of the FPC are not affected. If a PFE of an FPC is affected because of fabric path wedge errors, the affected PFE is disabled and the associated fabric goes offline as part of fabric hardening actions. The output of the `show chassis fabric fpcs` and `show chassis fabric plane` commands show a new state for the PFE as `Fabric Disabled`.

Fabric stream wedge occurs when the ASIC of the FPC is in the stuck state, and the ingress PFE fails to send traffic to the destination PFE. You can use the request `chassis fabric pfe` *`pfe-number`* `fpc` *`fpc-number`* `offline` command to make any PFE offline.

> **NOTE**: This statement does not have an option to bring the PFE back online. You must restart the FPC to bring the PFE back online.

Options

pfe-number [0–3]

fpc-number [0–11] or [0–5] or [0–19] or [0–2], depending on the type of the chassis.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Command introduced in Junos OS Release 17.2.

request chassis fabric plane

IN THIS SECTION

- Syntax | 15014
- Description | 15014
- Options | 15015
- Required Privilege Level | 15015
- Output Fields | 15015
- Sample Output | 15015
- Release Information | 15017

Syntax

```
request chassis fabric plane plane-number  (offline | online)
```

Description

(M120 and MX Series routers and EX8200 switches only) Control the operation of the specified fabric plane.

On an MX480 or MX240 series router, you can configure the active control board for redundancy mode or increased bandwidth mode. When running in increased bandwidth mode, MX series routers with Trio chips and the MPC3E will use all eight active fabric planes.

To take both plane 0 and plane 1 offline on a MX480 and MX240 series routers with one or more MPC4E MICs installed, a X86 Media Service Blade, and/or 100G PFE, and where redundancy-mode is configured for "increased-bandwidth", Juniper recommends taking plane 1 offline before plane 0. Likewise, when the router is configured for increased-bandwidth mode, taking fabric planes 0, 2, 4, and 6 offline can cause the chassis to run in a reduced fabric bandwidth mode. Plane 7 may remain in a "spare" state (as seen in the "show chassis fabric summary" command output) until plane 3 is taken offline and then brought back up.

Options

offline Take the fabric plane offline. Use the `request chassis fabric plane` *`plane-number`* `offline` command to clear a FAULT state on a fabric plane. To bring the fabric plane back online, use the `request chassis fabric plane` *`plane-number`* `online` command.

online Bring the fabric plane online.

plane *plane-number* Fabric plane number.

- For the M120 router, replace *plane-number* with a value from 0 through 3.
- For the MX480 and MX240 routers, replace *plane-number* with a value from 0 through 7.
- For the MX2020, MX2010, and MX2008 routers, replace *plane-number* with a value from 0 through 7.
- For the MX960, MX10004, and MX10008 routers, replace *plane-number* with a value from 0 through 11.
- For the EX8208 switch, replace *plane-number* with a value from 0 through 11.
- For the EX8216 switch, replace *plane-number* with a value from 0 through 7.

Required Privilege Level

request chassis feb

IN THIS SECTION

- Syntax | 15017
- Syntax (ACX7509 Router) | 15018
- Description | 15018
- Options | 15018
- Required Privilege Level | 15018
- Output Fields | 15018
- Sample Output | 15019
- Release Information | 15020

Syntax

```
request chassis feb slot slot-number (offline | online | restart)
```

Syntax (ACX7509 Router)

```
request chassis feb slot slot-number (offline | online | restart) <force>
```

Description

Offline, online, restart the specified FEB. Upon restart, the FEB goes offline and online within the stipulated time. FEB traffic is forwarded before power off. Traffic is recovered after FEB is online.

On ACX7509 routers, when a primary FEB is made offline or restarted, the switchover to backup FEB does not take place. This results in traffic loss as none of the FEB is forwarding the traffic. If you make the primary FEB offline or restart it, a traffic loss warning message is displayed and the request is rejected. You can use the `force` option to forcefully offline or restart the primary FEB.

Options

slot *slot-number*	FEB slot number. Replace ***slot-number*** with the FEB slot number value of your platform.
offline	Bring the specified FEB offline.
online	Bring the specified FEB online.
restart	Restart the specified FEB.
force	Force execute the offline/restart command. Only available for ACX7509 routers.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis feb (ACX1000 Router)

```
user@host> request chassis feb slot 0 restart
FEB will be restarted NOW.
```

request chassis feb (ACX7509 Router) (Primary FEB)

NOTE: Slot 1 is the primary FEB for the example commands provided below.

```
user@host> request chassis feb restart slot 1
warning: RCB and FEB work in the paired slot mode. FEB 1 offline/restart will result in traffic
loss and does not cause a switchover. Please re-try after initiating a mastership switchover
using 'request chassis routing-engine master switch' CLI. If offline/restart is still intended,
use 'force' option in addition to this CLI.
```

```
user@host> request chassis feb offline slot 1
warning: RCB and FEB work in the paired slot mode. FEB 1 offline/restart will result in traffic
loss and does not cause a switchover. Please re-try after initiating a mastership switchover
using 'request chassis routing-engine master switch' CLI. If offline/restart is still intended,
use 'force' option in addition to this CLI.
```

If offline/restart is still intended for primary FEB, use `force` option in addition to the command. For example:

```
user@host> request chassis feb offline slot 1 force
Offline initiated, use "show chassis feb" to verify
```

request chassis feb (QFX5700 Switch)

```
user@host> request chassis feb slot 0 online
Online initiated, use "show chassis feb" to verify
```

Release Information

Command introduced in Junos OS Release 8.0.

Command support introduced for ACX7509 devices in Junos OS Evolved Release 21.4R1.

Warning message introduced for ACX7509 devices in Junos OS Evolved Release 23.2R2.

request chassis fpc optical-module firmware-upgrade

IN THIS SECTION

Syntax | 15024

- Description | 15024
- Options | 15024
- Required Privilege Level | 15024
- Output Fields | 15024
- Sample Output | 15025
- Release Information | 15025

Syntax

```
request chassis fpc optical-module firmware-upgrade fpc-slot fpc-slot
```

Description

Upgrade the firmware of the integrated photonic line card (IPLC) module installed in the Flexible PIC Concentrator (FPC) or PIC slot.

Options

fpc-slot Slot number of the FPC or PIC in which the IPLC module resides.

Required Privilege Level

maintenance

Output Fields

When you enter the command, you are provided feedback on the status of your request.

Sample Output

request chassis fpc optical-module firmware-upgrade

```
user@host> request chassis fpc optical-module firmware-upgrade fpc-slot 4
```

```
IPLC 2 upgrade finished
```

Release Information

Statement introduced in Junos OS Release 15.1F6 and 17.1R1.

request chassis fpc slc

IN THIS SECTION

- Syntax | 15026
- Description | 15026
- Options | 15026
- Required Privilege Level | 15026
- Release Information | 15026

Syntax

```
request chassis fpc fpc-slot slc slc-id (offline | restart | online)
```

Description

(Applies to the base system or BSYS). Start, stop or restart the sub line cards (SLCs).

> **NOTE**: On BSYS, entering the `request chassis fpc fpc-slot offline/restart/online` command initiates the offline/online/restart process of all the SLCs (sub line cards) of the selected line card (FPC). On GNF, entering the `request chassis fpc fpc-slot offline/restart/online` command initiates the offline/online/restart process of only those SLCs that are assigned to the selected GNF.

Options

fpc-slot Specify the line card slot.

slc-id Specify the SLC you want to take offline, bring online or restart.

Required Privilege Level

< slot slot-number
<tag>
```

Description

(MX Series, QFabric systems, EX Series switches, and PTX Series Devices only) Control the operation of the Flexible PIC Concentrator (FPC). An error message is displayed when restart, offline, or online is configured using `request chassis fpc slot` command on an FPC with empty slot.

Control the operation of the Flexible PIC Concentrator (FPC).

NOTE: The SRX5K-SPC-2-10-40 (SPC1), SRX5K-SPC-4-15-320 (SPC2), and SRX5K-SPC3 does not support the `request chassis fpc` command.

NOTE:

- Starting with Junos OS Release 12.3, it is possible that FPCs brought offline by using the `request chassis fpc slot` *`fpc-slot`* `offline` operational-mode CLI command can come online during a configuration commit or power-supply replacement procedure. As an alternative, use the `set fpc` *`fpc-slot`* `power off` configuration-mode command at the `[edit chassis]` hierarchy level to ensure that the FPCs remain offline.
- Starting in Junos OS Evolved Release 19.1R1, PTX10003-80C and PTX10003-160C devices do not support the `request chassis fpc slot` *`<slot-number>`* `online` command. The only way to bring up an FPC (MPC) that is offline is by rebooting the chassis. So,

starting in Junos OS Evolved Release 21.1R1, when you take an FPC offline by using the `request chassis fpc slot <slot-number> offline` command, the screen displays the following message.

```
Warning : FPC <slot> cannot be made online using a CLI command. You need to perform router
reboot using "request system reboot" to online the FPC <slot>. Do you wish to continue ?
[yes,no] (no).
```

Starting in Junos OS Evolved Release 22.4R1, when you perform FPC restart by using the `request chassis fpc slot <slot-number> offline` command, the screen displays the following message.

On Junos OS Evolved, an FPC does not restart when you enter a commit command that configures an element of that FPC.

NOTE: In releases earlier than Junos OS Release 15.1F3 and Junos OS Release 16.1, offline FPCs in the PTX5000 router might be powered on by the router during a reboot, or when triggered by other power management events on the router, such as when you take another FPC offline.

Starting with Junos OS Release 15.1F3 and Junos OS Release 16.1, offline FPCs do not come online during reboots or other power management events. To bring such an FPC online:

1. Delete the `fpc fpc-slot power off` statement from the `[edit chassis]` hierarchy level, if that statement is configured, and commit the configuration.
2. Either issue the `request chassis fpc online slot fpc-slot` operational-mode CLI command or press and hold the FPC **ONLINE/OFFLINE** button for about 5 seconds until the green **OK** LED next to the button lights steadily.

NOTE: If a CLI-based firmware upgrade is in progress, the specified FPC does not restart. Starting with Junos OS Release 15.1, the following message is displayed when this occurs:

```
user@host> request chassis fpc slot 0 restart
FPC 0 Firmware update in progress. Wait!!!
```

NOTE: The command `request chassis fpc (offline | online) slot slot-number` is not supported on PTX1000 router. Whereas, `request chassis fpc restart slot slot-number` is supported on PTX1000 router.

NOTE: On EX9204, EX9208, EX9214, and EX9253 switches, when a line card is brought online, if the aggregate interface is initialized before the child interface is marked as part of the aggregate interface, there might be a loss of traffic from the aggregate interface for up to 30 seconds and the CPU usage of the line card installed on the switch might go up to 100%.

Options

node

Change Flexible PIC Concentrator status of specific node.

offline

Take the FPC offline.

online

Bring the FPC online.

interconnect-device *name*

(QFabric systems only) Bring the FPC on the QFX3008-I Interconnect device either offline or online:

- (QFabric System) On a QFabric system, specify the name of the QFX3008-I Interconnect device containing the FPC you want to bring either offline or online.

restart

Restart the FPC.

force

Restart an unresponsive FPC on PTX platforms. The `<force>` option can be used before or after the `<(offline | online | restart)>` options

slot *slot-number*

The following options can be configured for FPC slots:

- offline —Take the FPC slot offline.
- online — Bring the FPC slot online.
- restart — Restart the FPC slot.

FPC slot number:

- MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the (DPC slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the DPC slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the DPC slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX2020 router—0 through 19.
- MX2010 router—0 through 9.
- MX2008 router—0 through 9.
- MX10004 router—0 through 3.

  MX10008 router—0 through 7.

  MX10016 router—0 through 15.
- Other routers—0 through 7.
- QFabric System—Replace *slot-number* with a value from 0 through 2.
- EX Series switches:
  - EX4200 switches in a Virtual Chassis configuration—Replace *slot-number* with a value from 0 through 9.
  - EX6210 switches—Replace *slot-number* with a value from 0 through 9.

    NOTE: These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.
  - EX8208 switches—Replace *slot-number* with a value from 0 through 7.
  - EX8216 switches—Replace *slot-number* with a value from 0 through 15.

- EX9204 switches—Replace *slot-number* with a value from 0 through 2.
- EX9208 switches—Replace *slot-number* with a value from 0 through 5.
- EX9214 switches—Replace *slot-number* with a value from 0 through 11.

- PTX5000 Packet Transport Router—Replace *slot-number* with a value from 0 through 7.

tag This option is used for upgrading the latest firmware for components Mezz, I2CS, CPLD or Boot CPLD on the FPC.

pfe-instance *pfe-number* PFE instance number for the FPC slot. For PTX10008 device, it is 0 through 4. The following options can be configured for PFEs:

- offline —Take the PFE instance on the FPC offline.
- online — Bring the PFE instance on the FPC online.
- restart — Restart the PFE instance on the FPC.

pfe *pfe-id* (PTX10002-36QDD routers only) PFE number for the FPC slot. Range: 0 through 3. The following options can be configured for PFEs:

- offline —Take the PFE instance on the FPC offline.
- online — Bring the PFE instance on the FPC online.
- restart — Restart the PFE instance on the FPC.

all-members (MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

local (MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

member *member-id* (MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

Required Privilege Level

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis fpc (SRX Series)

```
user@host> request chassis fpc online slot 0
FPC 0 already online
```

request chassis fpc

```
user@host> request chassis fpc online slot 0

Online initiated, use "show chassis fpc" to verify
```

request chassis fpc (MX Series Routers with Media Services Blade [MSB])

```
user@host> request chassis fpc slot 0
Possible completions:
  offline              Take FPC offline
  online               Bring FPC online
  restart              Restart FPC
```

request chassis fpc (MX2020 Router)

```
user@host> request chassis fpc online slot 2
Online initiated, use "show chassis fpc" to verify
```

request chassis fpc (MX2010 Router)

```
user@host> request chassis fpc offline slot 5
Offline initiated, use "show chassis fpc" to verify
```

request chassis fpc (MX2008 Router)

```
user@host> request chassis fpc online slot 5
Online initiated, use "show chassis fpc" to verify
```

request chassis fpc (MX10003, MX10004, and MX10008)

```
user@host> request chassis fpc online slot 1
Online initiated, use "show chassis fpc" to verify
```

request chassis fpc (MX204 Router)

```
user@host> request chassis fpc online slot 0
Online initiated, use "show chassis fpc" to verify
```

request chassis fpc (PTX10008 Router)

```
user@host> request chassis fpc online slot 1
Online initiated, use "show chassis fpc" to verify
```

```
user@host> request chassis fpc slot 0 pfe-instance 0 ?
Possible completions:
  offline              Take FPC offline
  online               Bring FPC online
  restart              Restart FPC
```

request chassis fpc (EX9200 Switch)

```
user@host> request chassis fpc slot 0
Possible completions:
  offline              Take FPC offline
  online               Bring FPC online
  restart              Restart FPC
```

request chassis fpc (EX9251 Switch)

```
user@switch> request chassis fpc online slot
0
Online initiated, use "show chassis fpc" to verify
```

request chassis fpc (EX9253 Switch)

```
user@switch> request chassis online fpc slot
0
Online initiated, use "show chassis fpc" to verify
```

request chassis fpc (PTX10002-36QDD)

```
user@host> request chassis fpc slot 0 pfe 0 offline
Warning: pfe 1 will also be offlined. Do you wish to continue? [yes,no]
```

NOTE: On a PTX10002-36QDD router, you must commit command for both PFEs.

request chassis fpc (ACX7509, ACX7332, and ACX7348 Routers)

```
user@host> request chassis fpc slot 1 offline

Offline initiated, use "show chassis fpc" to verify
```

```
user@host> request chassis fpc slot 1 online

Online initiated, use "show chassis fpc" to verify
```

```
user@host> request chassis fpc slot 1 restart
Fpc 1 restart initiated!
```

Release Information

Command introduced before Junos OS Release 7.4.

Command support added to MX10004 device in Junos OS Release 22.3R1.

Command introduced on SRX Series Firewalls in Junos OS Release 17.2.

Hardware Upgrade for SRX5000-Line SPC3 in a Multinode High Availability Setup

request chassis internal-ssh

IN THIS SECTION

- Syntax | 15044
- Description | 15044
- Options | 15044
- Required Privilege Level | 15044

Sample Output | 15045
Release Information | 15048

Syntax

```
request chassis internal-ssh (prepare-setup | clear-setup)
```

Description

(EX Series and QFX Series switches only) Configure the SSH keys for transferring configuration data in a Virtual Chassis between the primary member and the other members. The command creates public SSH keys for all Virtual Chassis members and copies the keys to all members in a full mesh manner. The command also updates the known hosts file in each member with the host keys of other members in the Virtual Chassis .

This command is a prerequisite to enabling the `system commit config-sync-with-scp` configuration statement. This command is a prerequisite for configuration synchronization in a FIPS Virtual Chassis.

You can execute this command only on the primary Virtual Chassis member and as a root user.

Options

`prepare-setup` Create and copy the SSH keys for all members, and update the known hosts file.

`clear-setup` Delete the SSH keys and entries in the known hosts file from all Virtual Chassis members.

If you execute this option after you've enabled the `config-sync-with-scp` statement, the command will automatically trigger the `prepare-setup` option after clearing the keys.

Required Privilege Level

`root`

Sample Output

request chassis internal-ssh prepare-setup

```
root@host> request chassis internal-ssh prepare-setup

request chassis mic

IN THIS SECTION

- Syntax | 15050
- Description | 15050
- Options | 15050
- Required Privilege Level | 15051
- Output Fields | 15051
- Sample Output | 15051
- Platform-Specific `request chassis mic` Behavior | 15052
- Release Information | 15053

Syntax

```
request chassis mic (offline | online) fpc-slot slot-number mic-slot slot-number
```

Description

(MX Series routers only) Control the operation of the Modular Interface Cards (MICs) installed on a Modular Port Concentrator (MPC).

NOTE: On MX960 routers, if the MIC is not functioning correctly, you should take the MPC offline, replace it with a new MPC, and reinstall the MIC. On MX104 routers, the `request chassis mic` command is not supported on FPC slot 2 and MIC slot 0.

Options

offline	Take the MIC offline.
online	Bring the MIC online.
fpc-slot *slot-number*	FPC slot number where the MIC is installed:

- ACX4000 router—Replace ***fpc-slot*** with the value `0` or `1`.
- MX80 router—Replace ***fpc-slot*** with the value **1**. This command is not supported on FPC slot 0.
- MX240 router—Replace ***fpc-slot*** with a value from **0** through **2**.
- MX480 router—Replace ***fpc-slot*** with a value from **0** through **5**.
- MX960 router—Replace ***fpc-slot*** with a value from **0** through **11**.
- MX2020 router—Replace ***fpc-slot*** with a value from **0** through **19**.
- MX2010 router—Replace ***fpc-slot*** with a value from **0** through **9**.
- MX2008 router—Replace ***fpc-slot*** with a value from **0** through **9**.

mic-slot ***slot-number*** MIC slot number.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis mic (MX Routers with Media Services Blade [MSB])

```
user@host> request chassis mic fpc-slot 1 mic-slot 0
Possible completions:
  offline              Take MIC offline
  online               Bring MIC online
```

request chassis mic offline (MX304 Router)

```
user@host > request chassis mic mic-slot 0 fpc-slot 0 offline
fpc 0 mic 0 offline initiated, use "show chassis fpc mic-status" to verify
```

A 120-second delay is required between consecutive requests. If a command is issued within this period, the request fails with an error message. For example:

```
user@host > request chassis mic mic-slot 0 fpc-slot 0 offline
FPC0 MIC0 throttling too frequent offline and online requests, please try after 73 seconds
```

request chassis mic online (MX304 Router)

```
user@host > request chassis mic mic-slot 0 fpc-slot 0 online
fpc 0 mic 0 online initiated, use "show chassis fpc mic-status" to verify
```

request chassis mic online (MX2010 Router)

```
user@host> request chassis mic online fpc-slot 1 mic-slot
0
FPC 1, MIC 0 is already online
```

request chassis mic online (MX2008 Router)

```
user@host>request chassis mic online fpc-slot 0 mic-slot
0
FPC 0 is not online
```

Platform-Specific `request chassis mic` Behavior

Use Feature Explorer to confirm platform, and release support for specific features.

Use the following table to review platform-specific behaviors for your platform:

Table 129:

Platform	Difference
MX304 devices	Once the `request chassis mic` command is executed, you need to verify the MIC status using the `show chassis fpc mic-status` command before any further action. If you try to begin another MIC online/offline process during MIC online/offline progress, the system will display the `MIC <slot> is in transition, try again.` error message. A 120-second delay is required between consecutive requests. If a command is issued within this period, The request fails with the error message: `FPC <fpc-slot-number> MIC <mic-slot-number> throttling too frequent offline and online requests, please try after <number of seconds> seconds.` The command option `request chassis mic fpc-slot <> mic-slot <> <offline | online>` is supported for MX304-LMIC-OIR-PFE on MX304.

Release Information

Command introduced in Junos OS Release 10.1.

Command introduced in Junos OS Release 24.4R1 for MX304 devices.

Syntax

```
request chassis optics fpc-slot fpc-slot-number reactivate
```

Description

(MX240, MX480, and MX960 routers) Control the status of the optical transceiver.

Options

fpc-slot *fpc-slot-number* Slot number of the line card that houses the optical transceiver.

- MX240 router—Replace *fpc-slot-number* with a value from 0 through 2.
- MX480 router—Replace *fpc-slot-number* with a value from 0 through 5.
- MX960 router—Replace *fpc-slot-number* with a value from 0 through 11.

reactivate Reactivate the optical transceiver.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis optics (MX480 router)

```
user@host> request chassis optics fpc-slot 5
reactivate
Enable FPC 5 non-nebs optics.
```

request chassis optics (MX10003 router)

```
user@host>request chassis optics fpc-slot 1 reactivate
Enable FPC 1 non-nebs optics.
```

request chassis optics (EX9251 swich)

```
user@switch>request chassis optics fpc-slot 0 reactivate
Enable FPC 0 non-nebs optics.
```

request chassis optics (EX9253 swich)

```
user@switch>request chassis optics fpc-slot 1 reactivate
Enable FPC 1 non-nebs optics.
```

<member member-id>
```

Syntax (TX Matrix and TX Matrix Plus Routers)

```
request chassis pic (offline | online) fpc-slot slot-number pic-slot slot-number
<lcc number>
```

Description

Control the operation of the PIC.

NOTE: Starting with Junos OS Release 12.3, it is possible that PICs brought offline by using the `request chassis fpc slot` *`fpc-slot`* `pic` *`pic-slot`* `offline` operational mode command can come online during a configuration commit or power-supply replacement procedure. (See the following note about difference in behavior on Junos OS Evolved.) As an alternative, use the `set fpc` *`fpc-slot`* `pic` *`pic-slot`* `power off` configuration mode command at the `[edit chassis]` hierarchy level to ensure that PICs remain offline.

NOTE: On Junos OS Evolved, a PIC does not restart when you enter a `commit` command that configures an element of that PIC.

NOTE: The `request chassis pic (offline | online) fpc-slot` *`slot number`* `pic-slot` *`slot-number`* command is not supported for built-in PICs on MX Series routers.

To view a list of built-in PICs on the router or switch chassis, use the `show chassis hardware` command.

NOTE: This command is not supported on MX960 and MX2020 routers with MPC5EQ.

NOTE: T1600 routers and TX Matrix Plus routers with 100-Gigabit Ethernet PICs require two adjacent PIC slots, 0 and 1, for each PIC. Therefore, only `online` and `offline` command options to PIC slot 0 are allowed. Use of the `online` and `offline` command options for PIC slot 1 with the described router and PIC combination is not allowed.

NOTE: In T Series routers, when the PIC state is set from `offline` to `online` or vice-versa before the processing is complete for the previous command, you are provided feedback on the status of your request. The following sample messages are displayed if you try to set a PIC `offline` or `online`:

```
user@switch> request chassis pic fpc-slot 1
pic-slot 0 online
fpc 1 pic 0 online initiated, use "show chassis fpc pic-status" to verify
user@switch> request chassis pic fpc-slot 1
pic-slot 0 online
FPC 1 PIC 0 already transitioning to online
```

When the same PIC is set to a different state while the transition is in progress, you are provided feedback on the status of your request.

```
user@switch> request chassis pic fpc-slot 1
pic-slot 0 offline
FPC 1, PIC 0 already transitioning to online.  Please retry later.
```

NOTE: If a CLI-based firmware upgrade is in progress, it prevents the specified PIC from restarting. Starting in Junos OS Release 15.1, the following message is displayed:

```
user@host> request chassis pic fpc-slot 0 pic-slot
1 offline
PIC's Firmware update in progress. Wait!!!
```

Options

offline Take the PIC offline.

online Bring the PIC online.

fpc-slot *slot-number* Flexible PIC Concentrator (FPC) slot number. Replace *slot-number* with a value appropriate for your router or switch:

- ACX4000 routers—1 or 2.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—0.
  - EX4200 switches in a Virtual Chassis configuration—0 through 9 (switch's member ID).
  - EX8208 switches—0 through 7 (line card).
  - EX8216 switches—0 through 15 (line card).
- M5, M7i, M10, and M10i routers—0 or 1.
- M20 routers—0 through 3.
- M40 and M40e routers—0 through 7.
- M120 routers—0 through 5.
- M160 routers—0 through 7.
- M320 routers—0 through 7.
- MX 5, MX10, and MX40 routers—0 or 1.
- MX80 routers—0 or 1.
- MX240 routers—0 through 2
- MX480 routers—0 through 5
- MX2020 routers—0 through 19.
- MX2010 routers—0 through 9.
- MX960 routers—0 through 11.
- MX10003 routers—0 or 1.
- MX204 routers—0.
- PTX5000 routers—0 or 1.

- T Series routers—0 through 7.
- TX Matrix and TX Matrix Plus routers only—On a TX Matrix router, if you specify the number of the T640 router by using the `lcc` *`number`* option (the recommended method), replace *`slot-number`* with a value from 0 through 7. Otherwise, replace *`slot-number`* with a value from 0 through 31.

  Likewise, on a TX Matrix Plus router, if you specify the *`number`* of the T1600 or T4000 router by using the lcc number option (the recommended method), replace *`slot-number`* with a value from 0 through 7. Otherwise, for the FPC slot number, replace *`slot-number`* with a value from 0 through 31. On a TX Matrix Plus router with 3D SIBs to assign the FPC slot number, replace *slot-number* with a value from `0` through `63`. For example, the following commands have the same result:

  ```
  user@host> request chassis pic fpc-slot 1 lcc 1 pic-slot 0 offline
  user@host> request chassis pic fpc-slot 9 pic-slot 0 offline
  ```

- QFX5100 standalone switches—0.

lcc *number*

(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

member *member-id*

(MX Series routers only) (Optional) Change the PIC status on the specified member of the Virtual Chassis configuration. Replace *member-id* with the value that is assigned to the specified member.

offline

Take the PIC offline.

online

Bring the PIC online.

pic-slot *slot-number*

PIC slot number.

- EX3200 and EX4200 switches—0 for built-in network interfaces and 1 for interfaces on uplink modules.
- EX8208 and EX8216 switches—0.
- M Series routers—0, 1, 2, or 3
- MX960 router—***slot-number*** corresponds to the slot number of the Packet Forwarding Engine.
- MX204 router—0 or 1.
- PTX5000 routers—0 or 1.
- T320 router—0 or 1.
- T640 router—0, 1, 2, or 3.
- T1600 router —0, 1, 2, or 3.
- T4000 router—0, 1, 2, or 3.
- QFX5100 standalone switches—0, 1, or 2. PIC 0 is used for all interfaces that are not configured on expansion modules, and PIC 1 and PIC 2 are used for interfaces configured on expansion modules.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis pic

```
user@host> request chassis pic pic-slot
0 online fpc-slot 0
FPC 0, PIC 0 is already online
```

request chassis pic online member (MX Series Routers)

```
user@host> request chassis pic online member
1 fpc-slot 11 pic-slot 3
fpc 11 pic 3 online initiated
```

request chassis pic offline member (MX Series Routers)

```
user@host> request chassis pic offline member
1 fpc-slot 11 pic-slot 3
fpc 11 pic 3 offline initiated
```

request chassis pic (MX10003 Router)

```
user@host> request chassis pic online pic-slot
1 fpc-slot 0
FPC 0 is not online
```

request chassis pic online member (PTX10008 Router)

```
user@host> request chassis pic online pic-slot
1 fpc-slot 0
FPC 0, PIC 1 is empty
```

Release Information

Command introduced before Junos OS Release 7.4.

Option `member` introduced in Junos OS Release 14.2 for MX Series routers.

show chassis pic | 19502

request chassis pic-mode

IN THIS SECTION

- Syntax | 15064
- Description | 15064
- Options | 15065
- Required Privilege Level | 15065
- Sample Output | 15065
- Release Information | 15066

Syntax

```
request chassis pic-mode (intraconnect | virtual-chassis)
<all-members>
<local>
<member member-id>
```

Description

Set the PIC mode on an EX4500 switch. The PIC mode command determines whether the module that is plugged into the EX4500 switch operates as an intraconnect module or a Virtual Chassis module.

NOTE: Operating an EX4500 switch without the intraconnect module or the Virtual Chassis module is not supported.

NOTE: If you use the EX4500 switch as a standalone switch without changing the PIC mode setting to `intraconnect`, you will not be able to achieve 960 Gbps data rate throughput. Some of the bandwidth is reserved for the dedicated Virtual Chassis ports (VCPs).

The PIC mode must be set to `virtual-chassis` if the EX4500 switch is cabled into a Virtual Chassis using the dedicated VCPs on the Virtual Chassis module. This is the setting in the default factory configuration. The `intraconnect` PIC mode is not supported by the default factory configuration.

If you want to use the EX4500 switch as a standalone switch, you must take several steps to reset the PIC mode as `intraconnect`. You cannot reset the PIC mode `intraconnect` simply by issuing the `request chassis pic-mode intraconnect` command. See *Resetting the EX4500 Switch to Run as a Standalone Switch (CLI Procedure)*.

Use the "show chassis pic-mode" on page 19541 command to verify the current PIC mode setting.

The PIC mode setting is maintained through reboots even though it is set in operational mode.

You do not need to enter this command to use the Virtual Chassis module on an EX4550 switch.

Options

intraconnect	Set the PIC mode to intraconnect.
virtual-chassis	Set the PIC mode to Virtual Chassis.
all-members	(Optional) Set the PIC mode for all members of the Virtual Chassis configuration. This is the default option.
local	(Optional) Set the PIC mode on the member switch where the command is issued.
member *member-id*	(Optional) Set the PIC mode on the specified member of the Virtual Chassis configuration.

Required Privilege Level

view

Sample Output

request chassis pic-mode virtual-chassis

```
user@switch> request chassis pic-mode virtual-chassis
```

request chassis pic-mode intraconnect

```
user@switch> request chassis pic-mode intraconnect

fpc0:
```

```
-----------------------------------------------------------------------------------------------
virtual-chassis (mode unchanged; intraconnect mode not supported on factory-default config)
```

Release Information

Command introduced in Junos OS Release 11.1.

request chassis port-led

IN THIS SECTION

- Syntax | 15066
- Description | 15067
- Options | 15067
- Required Privilege Level | 15068
- Output Fields | 15068
- Sample Output | 15068
- Release Information | 15070

Syntax

request chassis port-led (start | stop) fpc-slot *fpc-slot-number* pic-slot *pic-slot-number* port (*port-number*| all-10g | all-25g | all-40g | all-50g | all-100g | all-400g | all-port) duration *duration*

Description

Enable remote port identification of the Modular Interface Card (MIC) or PIC by making the LED of the appropriate active port blink for a duration of time. You can also make the LEDs of all active ports, specific active ports, and specific port types blink. For instance, on MX480 routers with MPC7E-MRATE, you can make the LED of all active ports that support port speeds of 100 Gbps blink. Enabling remote port identification provides cabling assistance and reduces cabling mistakes.

> **NOTE**: You can stop a LED from blinking before the end of duration. After the LED stops blinking, it resumes its normal operation of indicating current link status of the port.

Options

start
Start blinking of the LEDs of the specified ports.

stop
Stop the LEDs of the specified ports from blinking.

fpc-slot *fpc-slot-number*
(MX Series routers) Modular Port Concentrator (MPC) slot number. Replace *fpc-slot-number* with a value appropriate for your router:

- MX240 routers—0 through 2.
- MX480 routers—0 through 5.
- MX960 routers—0 through 11.
- MX2010 routers—0 through 9.
- MX2020 routers—0 through 19.
- MX10003 routers—0 through 1.
- MX10008 routers—0 through 6.

pic-slot *pic-slot-number*
(MX Series routers) MIC slot number. Replace *pic-slot-number* with a value from 0 through 3. For MX10008 routers with JNP10K-LC2101 and JNP10K-LC9600 MPC only, replace *pic-slot-number* with a value from 0 through 5.

port *port-number*
Port number. Replace *port-number* with a value appropriate for your MPC or line card:

- MIC-MRATE—0 through 11.
- MX10003 MPC—0 through 5 for PIC 0 and 0 through 11 for PIC1

- MX10K-LC2101 and MX10K-LC9600 MPC—0 through 3 per PIC. MX10K-LC2101 and MX10K-LC9600 supports 6 built-in PICs and each PIC supports 4 ports.

all-10g Active ports that support port speed of 10 Gbps.

all-25g Active ports that support port speed of 25 Gbps.

all-40g Active ports that support port speed of 40 Gbps.

all-50g Active ports that support port speed of 50 Gbps.

all-100g Active ports that support port speed of 100 Gbps.

all-400g Active ports that support port speed of 400 Gbps.

all-ports All active ports.

duration *duration* Duration, in seconds, to perform LED blinking. Replace *duration* with a value from 0 through 65,535. The default duration is 5 minutes (300 seconds).

Required Privilege Level

view

Output Fields

When you enter this command, you are asked to verify the LED status based on your request.

Sample Output

request chassis port-led (MX2020 Routers with MPC8E)

```
user@host> request chassis port-led start fpc-slot
3 pic-slot 0 port all-10g duration 5
Command sent to FPC_3. Check physically about LED status on the PIC_0 ports.
```

request chassis port-led (MX480 Routers with MPC7E-MRATE)

```
user@host> request chassis port-led start fpc-slot
3 pic-slot 0 port 2 duration 5
Command sent to FPC_3. Check physically about LED status on the PIC_0 ports.
```

request chassis port-led (MX10003 Router)

```
user@host> request chassis port-led start fpc-slot
1 pic-slot 1 port 0 duration 5
Command sent to FPC_1. Check physically about LED status on the PIC_1 ports.
```

request chassis port-led (MX10003 Router for all active 100GE ports)

```
user@host> request chassis port-led start fpc-slot
1 pic-slot 1 port all-100g duration 5
Command sent to FPC_1. Check physically about LED status on the PIC_1 ports.
```

request chassis port-led (MX10003 Router for all active 40GE ports)

```
user@host> request chassis port-led start fpc-slot
0 pic-slot 1 port all-40g duration 5
Command sent to FPC_0. Check physically about LED status on the PIC_1 ports.
```

request chassis port-led (MX10003 Router for all the active ports in a PIC)

```
user@host> request chassis port-led start fpc-slot
0 pic-slot 0 port all-ports duration 5
Command sent to FPC_0. Check physically about LED status on the PIC_0 ports.
```

request chassis port-led (MX204 Router for all the active ports in a PIC)

```
user@host> request chassis port-led start fpc-slot
0 pic-slot 0 port all-ports duration 5
Command sent to FPC_0. Check physically about LED status on the PIC_0 ports.
```

request chassis port-led (EX9251 Switch)

```
user@switch> request chassis port-led start
fpc-slot 0 pic-slot 0 port all-ports duration 5
Command sent to FPC_0. Check physically about LED status on the PIC_0 ports.
```

request chassis port-led (MX10008 Router with MX10K-LC2101 and MX10K-LC9600)

```
user@host>request chassis port-led start fpc-slot
0 pic-slot 2 all-ports duration 15
Command sent to FPC_0. Check physically about LED status on the PIC_2 ports.
```

request chassis port-led (ACX Series)

```
user@host>request chassis port-led start fpc-slot 0 pic-slot 0 port 20 duration 1
Command sent to FPC-0. Check the LEDs status on the PIC-0 ports.
```

```
user@host>request chassis port-led stop fpc-slot 0 pic-slot 0 port 20
Command sent to FPC-0. Check the LEDs status on the PIC-0 ports.
```

Syntax

```
request chassis primary-ha-control-port-transition <fpc FPC slot number | from-fpc-to-scb | from-
scb-to-fpc>
```

Description

With this command, you can disable the *FPC slot number* HA port 0 on local node, and then enable the SCB0 HA control port on local node or disable the SCB0 HA control port on local node, and then enable the *FPC slot number* HA port 0 on local node.

This command is used during single control link online transition and it can be carried out in cluster mode on SRX5K series devices.

Options

fpc	Specify the FPC slot number. **Range:** 0 through 23
from-fpc-to-scb	Transition from FPC to SCB.
from-scb-to-fpc	Transition from SCB to FPC.

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis primary-ha-control-port-transition

```
user@host> request chassis primary-ha-control-port-transition from-fpc-to-scb fpc 0
```

```
fpc 0 HA control port 0 disabled & scb 0 HA control port enabled
```

```
user@host> request chassis primary-ha-control-port-transition from-scb-to-fpc fpc 0
```

```
scb 0 HA control port disabled & fpc 0 HA control port 0 enabled
```

Release Information

Command introduced in Junos OS Release 21.4R1.

- Description | 15073
- Options | 15073
- Required Privilege Level | 15073
- Output Fields | 15074
- Sample Output | 15074
- Release Information | 15074

Syntax

```
request chassis redundancy feb slot slot-number (switch-to-backup | revert-from-backup)
```

Description

(M120 routers only) Control the operation of the specified Forwarding Engine Board (FEB) in a redundancy group.

Options

slot-number	FEB slot number. Replace ***slot-number*** with a value from **0** through **5**.
switch-to-backup	Initiate a switchover from the specified active FEB to the backup FEB for the redundancy group.
revert-from-backup	Initiate a revert to the specified FEB following a switchover from the backup FEB for a redundancy group.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis redundancy feb slot 2 switch-to-backup

```
user@host> request chassis redundancy feb slot 2 switch-to-backup
Switch initiated, use “show chassis redundancy febs” to verify
```

request chassis redundancy feb slot 3 revert-from-backup

```
user@host> request chassis redundancy feb slot 3 revert-from-backup
Revert initiated, use “show chassis redundancy febs” to verify
```

Release Information

Command introduced in Junos OS Release 8.2.

request chassis routing-engine hard-disk-test

IN THIS SECTION

- Syntax | 15075
- Description | 15075

- Required Privilege Level | 15075
- Output Fields | 15075
- Sample Output | 15078
- Release Information | 15082

Syntax

```
request chassis routing-engine hard-disk-test
```

Description

Run a Hard Disk Drive (HDD) memory and diagnostics monitoring test for an XRE200 External Routing Engine. The test provides output that is helpful in monitoring the status of the hard disk memory on the XRE200 External Routing Engine.

Required Privilege Level

system-control

Output Fields

Table 130 on page 15075 lists the output fields for the `request chassis routing-engine hard-disk-test` command. Output fields are listed in the approximate order in which they appear.

Table 130: request chassis routing-engine hard-disk-test Output Fields

Field Name	Field Description
RAID device path	The device path to the RAID. This output is generally only useful for customer support personnel.
Firmware Version	The firmware version of the RAID. This output is generally only useful for customer support personnel.

Table 130: request chassis routing-engine hard-disk-test Output Fields *(Continued)*

Field Name	Field Description
RAID controller s/n	The serial number of the RAID controller. This output is generally only useful for customer support personnel.
RAID Chip ID	The RAID chip identification number. This output is generally only useful for customer support personnel.
RAID policy	The RAID policy status. SAFE is the only RAID policy used by an XRE200 External Routing Engine. This output is generally only useful for customer support personnel.
Drive0 model	The model number of the HDD module in HDD slot 0. This output is generally only useful for customer support personnel.
Drive1 model	The model number of the HDD module in HDD slot 1. This output is generally only useful for customer support personnel.
Drive0 s/n	The serial number of the HDD module in HDD slot 0. This output is generally only useful for customer support personnel.
Drive1 s/n	The serial number of the HDD module in HDD slot 1. This output is generally only useful for customer support personnel.
Drive0 capacity	The memory capacity of the HDD module in HDD slot 0, in gigabytes.
Drive1 capacity	The memory capacity of the HDD module in HDD slot 1, in gigabytes.

Table 130: request chassis routing-engine hard-disk-test Output Fields *(Continued)*

Field Name	Field Description
Drive0 (RAID STATUS)	The RAID status of the HDD module in HDD slot 0. Outputs include: • **On-line**—The HDD module is online. • **Off-line**—The HDD module is offline. If the status is **Off-line**, verify that the HDD module is securely seated in its slot. If the HDD module is securely seated and you cannot identify the reason for this status, contact Juniper Networks customer support (JTAC). • **Unknown**—HDD module RAID status is unknown. If the status is **Unknown**, wait a few minutes then retry the test. If the status remains **Unknown** after the second test, contact Juniper Networks customer support (JTAC).
Drive1 (RAID STATUS)	The RAID status of the HDD module in HDD slot 1. Outputs include: • **On-line**—HDD module is online. • **Off-line**—HDD module is offline. If the status is **Off-line**, verify that the HDD module is securely seated in its slot. If the HDD module is securely seated and you cannot identify the reason for this status, contact Juniper Networks customer support (JTAC). • **Unknown**—HDD module RAID status is unknown. If the status is **Unknown**, wait a few minutes then retry the test. If the status remains **Unknown** after the second test, contact Juniper Networks customer support (JTAC).
Number of partitions	The number of RAID memory partitions.
Size of Partitions	The size of each partition, in gigabytes.

Table 130: request chassis routing-engine hard-disk-test Output Fields *(Continued)*

Field Name	Field Description
RAID Status	The RAID status. Outputs include: • **Healthy**—RAID is healthy. • **Degraded**—RAID has detected a problem with at least one HDD module. If **Degraded** appears in the RAID Status field, contact customer support. • **Unknown**—RAID status is unknown. If the status is **Unknown**, wait a few minutes then retry the test. If the status remains **Unknown** after the second test, contact Juniper Networks customer support (JTAC). • **Rebuilding**—The RAID is rebuilding. The output includes a drive number and a percentage complete indication. The RAID rebuilding process can take up to 40 minutes. Wait several minutes after the process has finished and then retry the test. • **Verifying**—The RAID is rebuilt and being verified by the system. The output includes a drive number and a percentage complete indication. The RAID verification process can take up to 40 minutes. Wait several minutes after the process has finished and then retry the test.

Description

For routers or switches with multiple Routing Engines, control which Routing Engine is the primary.

NOTE: Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to “Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset,” do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating “Command terminated. Not ready for primary role switch, try after n seconds” when this command is re-entered before 240 seconds have elapsed on EX Series switches.

> **NOTE**: On a QFabric system, to avoid traffic loss on the network Node group, switch primary role of the routing engine to the backup routing engine, and then reboot.

Options

acquire (Not available for Junos OS Evolved) Attempt to become the primary Routing Engine.

release (Not available for Junos OS Evolved) Request that the other Routing Engine become the primary.

switch Toggle primary role between Routing Engines.

> **NOTE**: The `acquire` option should be used with caution because acquiring a Routing Engine may result in a corrupted database. If possible, use the `switch` option instead.

The `acquire`, `release`, and `switch` options have the following suboptions:

all-members (MX Series routers only) (Optional) Control Routing Engine primary role on the Routing Engines in all member routers of the Virtual Chassis configuration.

check (ACX7509, MX Series, QFabric systems, and PTX5000 routers only) (Optional) Available with the `switch`, `release`, and `acquire` options. Check graceful switchover status of the standby Routing Engine before toggling primary role between Routing Engines (RE). Check if the RE is ready for a switchover.

> **NOTE**: Starting in Junos OS Release 25.2R1, MX Series devices will also check for ongoing commits, and display a message if a commit is in progress.

force (PTX Series devices only) Force the Routing Engine primary role change regardless of graceful switchover readiness.

interconnect-device *name* (QFabric systems only) (Optional) Control Routing Engine primary role on the Routing Engines on an Interconnect device.

local (MX Series routers only) (Optional) Control Routing Engine primary role on the Routing Engines in the local Virtual Chassis member.

member ***member-id***	(MX Series routers only) (Optional) Control Routing Engine primary role on the Routing Engines of the specified member in the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.
no-confirm	(Optional) Do not request confirmation for the switch.
node-group ***name***	(QFabric systems only) (Optional) Control Routing Engine primary role on the Routing Engines on a Node group.

Additional Information

Always use the `show system switchover` command on the backup Routing Engine to determine if the backup is ready to take over as the primary Routing Engine.

By default, the Routing Engine in slot 0 (`RE0`) is the primary and the Routing Engine in slot 1 (`RE1`) is the backup. To change the default primary Routing Engine, include the `routing-engine` statement at the [`edit chassis redundancy`] hierarchy level in the configuration.

To have the backup Routing Engine become the primary Routing Engine, use the `request chassis routing-engine master switch` command. If you use this command to change the primary and then restart the chassis software for any reason, the primary reverts to the default setting.

> **NOTE**: Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis routing-engine primary acquire

```
user@host> request chassis routing-engine master acquire
```

```
warning: Traffic will be interrupted while the PFE is re-initialized

warning: The other routing engine's file system could be corrupted

Reset other routing engine and become master ? [yes,no] (no)
```

request chassis routing-engine primary switch

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between Routing Engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The other Routing Engine becomes the master.
```

Switch primary role back to the local Routing Engine:

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between routing engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The local routing engine becomes the master.
```

request chassis routing-engine master switch (Junos OS Evolved)

```
user@host> request chassis routing-engine master switch
Resolving mastership...
Complete. The other Routing Engine becomes the master.
```

Switching back to primary router:

```
user@host> request chassis routing-engine master switch
Resolving mastership...
Complete. The local Routing Engine becomes the master.
```

If you did not switch back and tried to enter configuration mode, you would get the following error message:

```
user@host> configure
error: unknown command: configure
Configuration is allowed only from the master Routing Engine.
```

request chassis routing-engine master switch (ACX7348)

```
user@host> request chassis routing-engine master switch
Toggle mastership between routing engines ? [yes,no] (no) yes

Resolving mastership...
Mastership will switchover within 45 secs
Please check mastership status using 'show chassis routing-engine'
```

request chassis routing-engine primary switch check (ACX7509, M Series, and MX Series Devices)

```
warning: Standby Routing Engine is not ready for graceful switchover.
{master}[edit]

user@host> request chassis routing-engine master switch check
Platform specific components not ready for switchover
```

Output when system is ready for graceful switchover.

```
user@host> request chassis routing-engine master switch check
Switchover Ready
```

You can similarly check the backup Routing Engine for the switchover readiness.

request chassis routing-engine master switch check (DRAM Size Mismatch Between Primary and Standby)

```
user@host> request chassis routing-engine master switch check
error: Standby mirror connection is not up:RE DRAM Size Mismatch

{master}
```

To check switchover readiness, use the `show system switchover` command before changing the mastership. Please note that the switchover is denied until 360 seconds have passed from the previous switchover.

request chassis routing-engine master switch check (Disabled Backup Routing Engine)

```
user@host> request chassis routing-engine master switch check
Backup RE disabled
```

request chassis routing-engine master switch no-confirm (Disabled Backup Routing Engine)

```
user@host> request chassis routing-engine master switch no-confirm
Backup RE disabled
```

Release Information

Command introduced before Junos OS Release 7.4.

`all-chassis` option introduced in Junos OS Release 8.0.

Command support introduced in Junos OS Evolved Release 22.1 for ACX7509 devices.

`force` option introduced in Junos OS Evolved Release 25.4 for PTX Series devices.

request chassis satellite beacon

IN THIS SECTION

- Syntax | 15090
- Description | 15090
- Options | 15090
- Required Privilege Level | 15091
- Sample Output | 15091
- Release Information | 15091

Syntax

```
request chassis satellite beacon
    <(off | on)>
    <fpc-slot slot-id (off | on)>
    <range range (off | on)>
```

Description

This command is used to enable or disable the beacon LED on satellite devices in a Junos Fusion.

To display the status and colors of the beacon LEDs of the satellite devices in a Junos Fusion, use the `show chassis led satellite` command.

Options

off Turn the beacon LED `off`.

on Turn the beacon LED `on`.

range *range* Enable or disable the beacon LED in a range of FPC slot identifiers. For example, you can specify FPC slot identifiers 101, 102, and 103 by entering a range of 101-103.

fpc-slot *slot-id* Enable or disable beacon LED for the satellite device using the specified FPC slot identifier in the Junos Fusion. The *slot-id* is the FPC slot ID number.

Required Privilege Level

maintenance

Sample Output

request chassis satellite beacon fpc-slot 136 on

```
user@aggregation-device> request chassis satellite beacon fpc-slot 136 on
```

request chassis satellite beacon range 101-103 off

```
user@aggregation-device> request chassis satellite beacon range 101-103 off
```

Release Information

Command introduced in Junos OS Release 14.2R3.

request chassis satellite disable

IN THIS SECTION

- Syntax | 15092
- Description | 15092

- Options | 15092
- Required Privilege Level | 15093
- Sample Output | 15093
- Sample Output | 15093
- Release Information | 15093

Syntax

```
request chassis satellite disable
    <device-alias alias-name>
    <fpc-slot fpc-slot>
```

Description

Disable the specified satellite device from the Junos Fusion.

When a satellite device is disabled from a Junos Fusion, all extended ports are immediately placed in the down state. The satellite device cannot send or receive traffic for the Junos Fusion until it is reenabled.

This command is useful whenever you need to disable a satellite device from a Junos Fusion, such as for troubleshooting scenarios. If you are removing a satellite device from a Junos Fusion to use the device elsewhere on the network, use the "request chassis satellite install" on page 15097 command to install Junos OS onto your satellite device before removing it from the Junos Fusion. See Removing a Satellite Device from a Junos Fusion.

You can reenable a satellite device that was disabled using this command using the "request chassis satellite enable" on page 15093 command.

Options

device-alias ***alias-name***	Disable the satellite device with the specified alias name from the Junos Fusion.
fpc ***fpc-slot***	Disable the satellite device with the specified FPC slot identifier from the Junos Fusion.

Required Privilege Level

system-control

Sample Output

request chassis satellite disable device-alias satellite-01

```
user@aggregation-device> request chassis satellite disable device-alias satellite-01
```

Sample Output

request chassis satellite disable fpc-slot 101

```
user@aggregation-device> request chassis satellite disable fpc-slot 101
```

Release Information

Command introduced in Junos OS Release 14.2R3.

- Sample Output | 15095
- Release Information | 15095

Syntax

```
request chassis satellite enable
    <device-alias alias-name>
    <fpc-slot fpc-slot>
```

Description

Enable the specified device as a satellite device in a Junos Fusion.

This command is typically not used in any standard Junos Fusion initial configuration procedure. This command is typically needed in cases where the satellite device or cascade port has been disabled and needs to be re-enabled.

Options

device-alias ***alias-name***	Enable the satellite device with the specified alias name in the Junos Fusion.
fpc ***fpc-slot***	Enable the device with the specified FPC slot ID as a satellite device in the Junos Fusion.

Required Privilege Level

system-control

Sample Output

request chassis satellite enable device-alias satellite-01

```
user@aggregation-device> request chassis satellite enable device-alias satellite-01
```

Sample Output

request chassis satellite enable fpc-slot 101

```
user@aggregation-device> request chassis satellite enable fpc-slot 101
```

Release Information

- Syntax | 15096
- Description | 15096
- Options | 15096
- Required Privilege Level | 15096
- Sample Output | 15097
- Release Information | 15097

Syntax

```
request chassis satellite file-copy [remote | local] <source-URL> <destination-URL>
```

Description

Copy a file between a satellite device and an aggregation device in a Junos Fusion.

Options

local Indicate that the file-copy from satellite-device has been initiated by a local user.

remote Indicate that the file-copy from satellite-device has been initiated by a remote user.

source-URL Specify the URL of the file that is copied.

If no device is specified as the *source-URL*, the file is copied from the aggregation device.

To specify a satellite device in the *source-URL*, enter **sd*slot-id-number*** at the beginning of the *source-URL*. For example, enter **sd101:/var/tmp/filename.txt** to specify that filename.txt in the /var/tmp directory on the satellite device using FPC slot ID number 101 is the *source-URL*.

destination-URL Specify the destination URL where the file is copied into.

If no device is specified as the *destination-URL*, the file is copied into the aggregation device.

To specify a satellite device in the *destination-URL*, enter **sd*slot-id-number*** at the beginning of the *destination-URL*. For example, enter **sd101:/var/tmp/** to specify the /var/tmp directory on the satellite device using FPC slot ID number 101 as the *source-URL*.

Required Privilege Level

system-control

Sample Output

request chassis satellite file-copy

```
root@aggregation-device> request chassis satellite file-copy local /var/tmp/file_name
sd101:/var/tmp/
```

request chassis satellite install

IN THIS SECTION

- Syntax | 15097
- Description | 15098
- Options | 15098
- Required Privilege Level | 15099
- Sample Output | 15099
- Release Information | 15099

Syntax

```
request chassis satellite install package-name
    [fpc-slot fpc-slot | device-alias device-alias]
```

```
<no-confirm>
```

Description

Install a version of Junos OS software onto a satellite device in a Junos Fusion.

Any device operating as a satellite device in a Junos Fusion is running satellite software. A device running satellite software cannot operate as a standalone network device until it is running a version of Junos OS software.

You would typically enter this command to install Junos OS onto a satellite device before removing the satellite device from a Junos Fusion. Installing the Junos OS software onto the satellite device before removing it from the Junos Fusion allows you to more easily install the device elsewhere in your network.

If you are using the automatic satellite conversion feature to convert devices into satellite devices in your Junos Fusion, remove the FPC slot ID to the satellite device from the automatic satellite conversion configuration before using this command to install the Junos OS software. You can update the automatic satellite conversion feature using the `set chassis satellite-management auto-satellite-conversion satellite *slot-id*` configuration statement.

You must install a PXE version of compatible Junos OS to convert the satellite device running satellite software to a standalone device running Junos OS software on QFX5100 switches acting as satellite devices. The PXE version of Junos OS is the software that includes **pxe** in the Junos OS package name when it is downloaded from the Software Center—for example, the PXE image for Junos OS Release 14.1X53-D16 is named **install-media-pxe-qfx-5-14.1X53-D16.2.tgz**.

For Junos Fusion systems running Junos OS Release 17.2R1 and later, you must install a signed PXE version of Junos OS to convert the satellite device running satellite software to a standalone device running Junos OS software. The signed PXE Junos OS package name uses the format **install-media-pxe-qfx-5-*version*-domestic-signed.tgz**.

The device uses a factory-default configuration after the Junos OS installation is complete. No Junos OS configuration is modified and the previous Junos OS configuration is not restored after the Junos OS software installation.

Options

package-name	Specify the URL to the Junos OS image to install onto the satellite device.
fpc *fpc-slot*	Install the Junos OS software onto the satellite device with the specified FPC slot ID in the Junos Fusion.

device-alias ***device-alias***	Install the Junos OS software onto the satellite device with the alias name in the Junos Fusion.
no-confirm	(Optional) Install the Junos OS software onto the satellite device immediately without further confirmation prompting.

Required Privilege Level

system-control

Sample Output

request chassis satellite install /var/tmp/jinstall-ex-4300-14.1X53-D16.1-domestic-signed.tgz fpc-slot 101 (EX4300 switch as satellite device)

```
user@aggregation-device> request chassis satellite install /var/tmp/jinstall-ex-4300-14.1X53-
D16.1-domestic-signed.tgz fpc-slot 101
Response from device:
    Conversion Started
```

request chassis satellite install /var/tmp/install-media-pxe-qfx-5-14.1X53-D16.2.tgz fpc-slot 102 (QFX5100 switch as satellite device)

```
user@aggregation-device> request chassis satellite install /var/tmp/install-media-pxe-
qfx-5-14.1X53-D16.2.tgz fpc-slot 102
Response from device:
    Conversion Started
```

- Description | 15100
- Options | 15100
- Required Privilege Level | 15101
- Sample Output | 15101
- Release Information | 15101

Syntax

```
request chassis satellite interface interface-name
    device-mode satellite
```

Description

Change the device mode for a device.

This command is used to change a device into a satellite device for a Junos Fusion. After interconnecting a device to an aggregation device in a Junos Fusion, enter this command from the aggregation device to begin the manual satellite device conversion procedure.

Other configuration steps, such as configuring the cascade port and creating a satellite software upgrade group, must be completed before this command can be used to convert a device into a satellite device. See *Configuring Junos Fusion Provider Edge* or Configuring or Expanding a Junos Fusion Enterprise.

Options

interface-name Specify the name of the cascade port interface on the aggregation device that connects to the device that will be converted into a satellite device.

Required Privilege Level

system-control

Sample Output

request chassis satellite interface xe-0/0/1 device-mode satellite

```
user@aggregation-device> request chassis satellite interface xe-0/0/1 device-mode satellite
```

Release Information

    <interface-name interface-name>
```

Description

Log in to the satellite device from the aggregation device.

This command is typically used to log in to the satellite device by expert users for debugging purposes. You can perform all configuration and administration tasks in a Junos Fusion from the aggregation device.

Options

fpc *fpc-slot*	Log in to the satellite device with the specified FPC slot ID.
interface-name *interface-name*	Log in to the satellite device connected to the specified interface. The *interface-name* is the cascade port on the aggregation device.

Required Privilege Level

system-control

Sample Output

request chassis satellite login fpc-slot 101

```
user@aggregation-device> request chassis satellite login fpc-slot 101

- Additional Information | 15113
- Required Privilege Level | 15114
- Output Fields | 15114
- Sample Output | 15114
- Release Information | 15114

Syntax

```
request chassis sfm master switch
 <no-confirm>
```

Description

(M40e and M160 routers only) Control which Switching and Forwarding Module (SFM) is primary.

Options

no-confirm (Optional) Do not display a switch warning or query.

Additional Information

By default, the SFM in slot 0 (SFM0) is the primary and the SFM in slot 1 (SFM1) is the backup. If you use this command to change the primary, and then restart the chassis software for any reason, the primary reverts to the default setting. To change the default primary SFM, include the `sfm` statement at the `[edit chassis redundancy]` hierarchy level in the configuration. For more information, see the Junos OS Administration Library for Routing Devices.

All installed SFMs are always working together to forward packets. If an SFM fails, the other SFMs take over and traffic continues to flow uninterrupted.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis sfm primary switch

```
user@host> request chassis sfm master switch
warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between system forwarding module? [yes,no] (no) yes

Switch initiated, use “show chassis sfm” to verify
```

request chassis sfm primary switch no-confirm

```
user@host> request chassis sfm master switch no-confirm
Switch initiated, use “show chassis sfm” to verify
```

Release Information

Command introduced before Junos OS Release 7.4.

request chassis sib

IN THIS SECTION

- Syntax | **15117**

- Description | 15117
- Options | 15117
- Required Privilege Level | 15118
- Output Fields | 15118
- Sample Output | 15118
- Release Information | 15118

Syntax

```
request chassis sib (offline | online) slot slot-number
```

Description

Control the operation of the specified Switch Interface Board (SIB).

Options

f13 *slot-number*

Control the operation of F13 SIBs. Replace *slot-number* with a value `0`, `1`, `3`, `4`, `6`, `7`, `8`, `9`, `11`, or `12`.

offline

Take the SIB offline.

> **NOTE**: In PTX Series (PTX3000 and PTX5000) and T Series (T640 and T1600) Routers with active PFE interfaces, when the last SIB is taken offline, a message displays that if no SIB is brought online within 10 seconds, the system will take action to address the fabric null route condition. Taking all SIBs offline in these PTX Series or T Series Routers with active PFE interfaces results in null route condition, and the software takes action to rectify this condition if it persists for more than 10 seconds. If these routers do not have active PFE interfaces, taking all SIBs offline does not result in null route condition, and the message is not displayed when the last active SIB is taken offline. For details on null route condition, see *Fabric Resiliency and Degradation*.

online

Bring the SIB online.

slot *slot-number*

SIB slot number. For the T320 router, replace *slot-number* with a value from 0 through 2. For the T640 router, TX Matrix router, and T1600 router in a routing matrix, replace *slot-number* with a value from 0 through 4.

Required Privilege Level

Offline initiated, use "show chassis sibs" to verify
```

request chassis sib (PTX10008 with JNP10008-SF5 SIB)

```
user@host> request chassis sib slot 5 online
Request failed since Fru is incompatible with other slots!
```

On a PTX10008 device with JNP10008-SF5 SIB, if you to try to online another SIB, the `show chassis sibs` command displays `Request failed since Fru is incompatible with other slots!` in the output.

Release Information

Command introduced before Junos OS Release 7.4.

`f13` and `f2s` options for the TX Matrix Plus router introduced in Junos OS Release 9.6.

- Release Information | 15122

Syntax

```
request chassis spmb restart slot slot-number
```

Syntax (MX2020, MX2010, and 2008 Routers)

```
request chassis spmb restart slot slot-number
<all-members>
```

```
<local>
<member member-id>
```

Syntax (TX Matrix Router)

```
request chassis spmb restart (lcc number | scc) slot slot-number
```

Syntax (TX Matrix Plus Router)

```
request chassis spmb restart (lcc number | sfc number) slot slot-number
```

Description

Restart the specified Switch Processor Mezzanine Board (SPMB) on the Control Board (CB).

Options

all-members (MX2010, MX2020, and MX2008 routers only) (Optional) Restart the SPMB on the CB in all members of the Virtual Chassis configuration.

lcc *number* (TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local (MX2010, MX2020, and MX2008 routers only) (Optional) Restart the SPMB on the CB in the local Virtual Chassis member.

member *member-id*	(MX2010, MX2020, and MX2008 routers only) (Optional) Restart the SPMB on the CB in the specified member of the Virtual Chassis. Replace *member-id* with the value 0 or 1.
scc	(TX Matrix routers only) TX Matrix router (switch-card chassis) in the routing matrix.
sfc *number*	(TX Matrix Plus routers only) The switch-fabric chassis number of the TX Matrix Plus router. Replace the *number* variable with a value 0.
slot *slot-number*	The SPMB slot number. Replace *slot-number* with 0 or 1.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis spmb restart

```
user@host> request chassis spmb restart slot
0
```

request chassis spmb restart (MX2010 Router)

```
user@host> request chassis spmb restart slot 0
Restart initiated, use "show chassis spmb" to verify
```

request chassis spmb restart (MX2008 Router)

```
user@host>request chassis spmb restart slot 0
Restart initiated, use "show chassis spmb" to verify
```

Release Information

Command introduced before Junos OS Release 7.4.

`sfc` option for the TX Matrix Plus router introduced in Junos OS Release 9.6.

`all-members`, `local`, and `member` *`member-id`* options introduced in Junos OS Release 15.1 for MX2020 and MX2010 routers.

request chassis ssb master switch

IN THIS SECTION

- Syntax | 15122
- Description | 15123
- Options | 15123
- Additional Information | 15123
- Required Privilege Level | 15123
- Output Fields | 15123
- Sample Output | 15123
- Release Information | 15124

Syntax

```
request chassis ssb master switch
<no-confirm>
```

Description

(M20 router only) Control which System and Switch Board (SSB) is primary.

Options

no-confirm (Optional) Do not request confirmation for the switch.

Additional Information

By default, the SSB in slot 0 (SSB0) is the primary and the SSB in slot 1 (SSB1) is the backup. If you use this command to change the primary, and then restart the chassis software for any reason, the primary reverts to the default setting. To change the default primary SSB, include the `ssb` statement at the [**edit chassis redundancy**] hierarchy level in the configuration. For more information, see the Junos OS Administration Library for Routing Devices.

The configurations on the two SSBs do not have to be the same, and they are not automatically synchronized. If you configure both SSBs as primaries, when the chassis software restarts for any reason, the SSB in slot 0 becomes the primary and the one in slot 1 becomes the backup.

The switchover from the primary SSB to the backup SSB is immediate. The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. The interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis ssb primary switch

```
user@host> request chassis ssb master switch
warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between system switch boards ? [yes,no] (no) yes
```

```
Switch initiated, use “show chassis ssb” to verify
```

request chassis ssb primary switch no-confirm

```
user@host> request chassis ssb master switch no-confirm
Switch initiated, use “show chassis ssb” to verify
```

Release Information

Command introduced before Junos OS Release 7.4.

Syntax

```
request chassis synchronization mode (free-run | holdover | auto-select)
```

Description

(MX5-T, MX10-T, MX40-T, MX80, MX80-T, MX240, MX480, and MX960 routers only) Change the chassis synchronization source used for Synchronous Ethernet configuration.

Options

freerun	Change chassis synchronization to free-run mode.
holdover	Change chassis synchronization to holdover mode.
auto-select	Change chassis synchronization to auto-select mode.

Required Privilege Level

maintenance

Output Fields

When you enter this command, the current status of your request is displayed.

- **Not configured**—Indicates that the source is not configured.
- **Present**—Indicates that the source is configured and present.
- **Qualified**—Indicates that the source is being used for synchronization.

Sample Output

request chassis synchronization mode freerun

```
user@host> request chassis synchronization mode freerun
mode is freerun, status: qualified
```

Sample Output

request chassis synchronization mode holdover

```
user@host> request chassis synchronization mode holdover
mode is holdover, status: qualified
```

Sample Output

request chassis synchronization mode auto-select

```
user@host> request chassis synchronization mode auto-select
mode is auto-select, status: qualified
```

Release Information

Command introduced in Junos OS Release 11.2R4.

request chassis synchronization switch (external-a | external-b)
```

Syntax (PTX Series)

```
request chassis synchronization switch (bits-a | bits-b | fpc-slot-number | gps-0 | gps-1 )
```

Description

(M320, M40e, M120, T320, T640, and T1600 routers and PTX Packet Transport Routers only) Change the external clock source used for chassis synchronization.

Options

external-a (Routing matrix only) Change the synchronization source to external source A.

external-b (Routing matrix only) Change the synchronization source to external source B.

bits-a (PTX Series only) Change the synchronization source to the BITS external source A.

bits-b (PTX Series only) Change the synchronization source to the BITS external source B.

fpc-*slot-number* (PTX Series only) Change the synchronization source to an FPC in the slot specified. For the PTX5000 Packet Transport Router, replace *slot-number* with a value from 0 through 7.

gps-0-10mhz (PTX Series only) Change the synchronization source to the 10 MHz GPS source on CCG port 0.

gps-0-5mhz (PTX Series only) Change the synchronization source to the 5 MHz GPS source on CCG port 0.

gps-1-10mhz (PTX Series only) Change the synchronization source to the 10 MHz GPS source on CCG port 1.

gps-1-5mhz (PTX Series only) Change the synchronization source to the 5 MHz GPS source on CCG port 1.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request. **Not configured** indicates that the source is not configured. **Present** indicates that the source is configured and present. **Qualified** indicates that the source is being used for synchronization.

Sample Output

request chassis synchronization switch (M Series, T Series)

```
user@host> request chassis synchronization switch external-a
switching to external-a, status: qualified
```

request chassis synchronization switch (PTX Series)

```
user@host> request chassis synchronization switch fpc-2
switching to fpc-2, status: qualified
```

Release Information

Configuring Clock Synchronization Interface on MX Series Routers

Supported Time Synchronization Standard

request chassis system-mode

IN THIS SECTION

- Syntax | 15129
- Description | 15129
- Options | 15130
- Required Privilege Level | 15130
- Sample Output | 15130
- Release Information | 15130

Syntax

```
request chassis system-mode
<mode-2x100G>
<default-mode>
```

Description

Set the operating mode of the ports to 100-Gigabit Ethernet mode on an EX4300-48MP switch. The `request chassis system-mode` command sets the ports to 100-Gigabit Ethernet mode by overriding the `set chassis fpc` *`fpc-slot`* `pic` *`pic-slot`* `port` *`port-number`* `speed` *`speed value`* command. This command restarts the DC

packet forwarding engine (DCPFE), disables the virtual chassis ports (VCP) and brings up both ports of the uplink module to operate at 100Gbps speed. Use the `show chassis system-mode` command to verify configured system mode and the `request chassis system-mode default-mode` command to return to the default operating mode.

Options

mode-2x100G PIC mode configuration is 2x100Gbps. This will restart PFE and disable VCP ports.

default-mode Default-mode is the oversubscribed mode. This will restart PFE.

Required Privilege Level

view

Sample Output

request chassis system-mode

```
user@switch> request chassis system-mode mode-2x100G (mode - 2x100G on EX4300-48MP)
System-mode has changed. This will restart PFE and disable VCP ports.
```

request chassis system-mode (EX4300-48MP)

```
user@switch> request chassis system-mode default-mode
System-mode has changed. This will restart PFE.
```

Release Information

Command introduced in Junos OS Release 19.3R1.

request dhcpv6 client renew | 15154

request dhcp relay bulk-leasequery

IN THIS SECTION

Syntax | 15148

- Description | 15148
- Options | 15148
- Required Privilege Level | 15149
- Output Fields | 15149
- Sample Output | 15150
- Release Information | 15150

Syntax

```
request dhcp relay bulk-leasequery
<all-configured-ip>
<client-id | ipv4-address | mac-address>
<relay-id relay-id>
<remote-id remote-id>
<server-address server-address | server-group group-name>
<logical-system logical-system-name>
<routing-instance routing-instance-name>
```

Description

Initiate a bulk leasequery operation to update the binding information for multiple subscribers by requesting that the DHCPv4 relay agent send the bulk leasequery message to the configured DHCPv4 servers. The DHCP bulk leasequery feature must be configured on the DHCPv4 relay agent. If you do not specify a `server-address` or `server-group`, then the query is sent to all DHCPv4 servers known to the relay agent.

Options

NOTE: By default, the bulk leasequery operation uses the relay ID of the DHCPv4 relay agent if you do not explicitly specify any of the following options: *client-id*, *ipv4-address*, *mac-address*, *relay-id*, or *remote-id*.

all-configured-ip Update binding information for all IP addresses configured in the local server. The information is returned regardless of whether the IP addresses are part of a

	currently active binding and regardless of remote Id or relay ID. This enables the relay agent to update its database with all address changes that occurred after some point in time.
client-id	Update binding information for clients identified by the specified DHCPv4 client option (option 61).
ipv4-address	Update binding information for the most recent client that was assigned that IP address.
logical-system *logical-system-name*	Specify an optional logical system for the DHCP server being queried. The default logical system is used by default.
mac-address	Update binding information for the most recent client that has that MAC address.
relay-id *relay-id*	Update binding information for all currently active leases assigned to the client that has the specified Relay Agent Identifier suboption (suboption 12) of the DHCP relay agent information option (option 82). Suboption 12 uniquely identifies a relay agent within an administrative domain, which consists of all DHCP servers and relay agents that communicate with each other.
remote-id *remote-id*	Update binding information for all currently active leases assigned to clients that use that Agent Remote ID (suboption 2) of the DHCP relay agent information option (option 82).
routing-instance *routing-instance-name*	Specify an optional routing instance for the DHCP server being queried. The default routing instance is used by default.
server-address *server-address*	Specify the address of a DHCP local server to query.
server-group *group-name*	Specify the name of a group of DHCP local servers to query.

Required Privilege Level

view

Output Fields

When you enter this command, DHCP relay agent initiates the bulk leasequery operation.

Sample Output

request dhcp relay bulk-leasequery

```
user@host> request dhcp relay bulk-leasequery 4/1224 server-address 192.168.10.10
```

Release Information

Command introduced in Junos OS Release 16.1.

`all-configured-ip`, `relay-id`, and `remote-id` options added in Junos OS Release 19.1R1.

Syntax

```
request dhcp relay leasequery (client-id | ipv4-address | mac-address)
gateway-address giaddr;
```

```
<server-address address | server-group group-name>
<logical-system logical-system-name>
<routing-instance routing-instance-name>
```

Description

Initiate a leasequery operation to update the binding information for a specific subscriber by requesting that DHCPv4 relay agent send the leasequery message to the configured DHCP servers. The DHCP leasequery feature must be configured on the DHCPv4 relay agent. If you do not specify a `server-address` or `server-group`, then the query is sent to all DHCPv4 servers known to the relay agent.

Options

NOTE: You must configure at least one of *client-id*, *ipv4-address*, or *mac-address*.

client-id	Use the DHCPv4 client identifier option (option 61) to identify the client whose binding information is requested.
gateway-address *giaddr*	Gateway address of the relay agent making the request; the value in the giaddr field of the DHCP packet. You must always specify a gateway address in your request.
ipv4-address	Use the IPv4 address to identify the client whose binding information is requested.
logical-system *logical-system-name*	Specify an optional logical system for the DHCP servers being queried. The default logical system is used by default.
mac-address	Use the MAC address to identify the client whose binding information is requested.
routing-instance *routing-instance-name*	Specify an optional routing instance for the DHCPv4 servers being queried. The default routing instance is used by default.
server-address *server-address*	Specify the IP address of the DHCPv4 local server to query.
server-group *group-name*	Specify the name of a group of DHCPv4 local servers to query.

Required Privilege Level

DHCP Leasequery Methods

request dhcp server reconfigure

IN THIS SECTION

- Syntax | 15153
- Description | 15153
- Options | 15153
- Required Privilege Level | 15154
- Output Fields | 15154
- Sample Output | 15154
- Release Information | 15154

Syntax

```
request dhcp server reconfigure (all | address | interface interface-name | logical-system logical-system-name | routing-instance routing-instance-name)
```

Description

Initiate reconfiguration processing for the specified DHCP clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the `clear dhcp server binding` command.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a forcerenew message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the forcerenew message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the `clear-on-abort` statement to configure the client to be cleared when reconfiguration fails.

Options

all — Initiate reconfiguration for all DHCP clients.

address — Initiate reconfiguration for DHCP client with the specified IP address or MAC address.

interface *interface-name* — Initiate reconfiguration for all DHCP clients on this logical interface (clients whose initial login requests were received over the specified interface).

> **NOTE**: You cannot use the `interface interface-name` option with the `request dhcp server reconfigure` command for DHCP passive clients (clients that are added as a result of DHCP snooped packets). For passive clients, the interface is not guaranteed to be the next-hop interface to the client, as is the case for active clients.

logical-system *logical-system-name* — Initiate reconfiguration for all DHCP clients on the specified logical system.

routing-instance — Initiate reconfiguration reconfigured for all DHCP clients in the specified routing instance.

Syntax

```
request dhcpv6 server reconfigure (all | address | client-id | interface interface-name | logical-system
logical-system-name | routing-instance routing-instance-name | session-id)
```

Description

Initiate reconfiguration processing for the specified DHCPv6 clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the `clear dhcpv6 server binding` command.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfigure state and the local server sends a reconfigure message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the reconfigure message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the `clear-on-abort` statement to configure the client to be cleared when reconfiguration fails.

Options

all	Initiate reconfiguration for all DHCPv6 clients.
address	Initiate reconfiguration for DHCPv6 client with the specified IPv6 address.
client-id	Initiate reconfiguration for DHCPv6 client with the specified client ID.
interface ***interface-name***	Initiate reconfiguration for all DHCPv6 clients on this logical interface (clients whose initial login requests were received over the specified interface).
logical-system ***logical-system-name***	Initiate reconfiguration for all DHCPv6 clients on the specified logical system.
routing-instance ***routing-instance-name***	Initiate reconfiguration reconfigured for all DHCPv6 clients in the specified routing instance.
session-id	Initiate reconfiguration for DHCPv6 client with the specified session ID.

request diagnostics tdr

IN THIS SECTION

- Syntax | 15162
- Description | 15163
- Options | 15163
- Required Privilege Level | 15163
- Output Fields | 15163
- Sample Output | 15164
- Release Information | 15164

Syntax

```
request diagnostics tdr (abort | start) interface interface-name
```

Description

Start a time domain reflectometry (TDR) diagnostic test on the specified interface. This test characterizes and locates faults on twisted-pair Ethernet cables. For example, it can detect a broken twisted pair and provide the approximate distance to the break. It can also detect polarity swaps, pair swaps, and excessive skew.

The TDR test is supported on the following switches and interfaces:

- EX2200, EX3200, EX3300, and EX4200 switches—RJ45 network interfaces. The TDR test is not supported on management interfaces and SFP interfaces.
- EX6200 and EX8200 switches—RJ45 interfaces on line cards.

> **NOTE**:
>
> - Run the TDR test when the interface traffic under test is nil.
> - TDR is a cable diagnostic feature that must be triggered only when a link is down.

You view the results of the TDR test with the `show diagnostics tdr` command.

Options

abort	Stop the TDR test currently in progress on the specified interface. No results are reported, and previous results, if any, are cleared.
interface-name	The name of the interface.
start	Start a TDR test on the specified interface.

Required Privilege Level

maintenance

Output Fields

Table 131 on page 15164 lists the output fields for the `request diagnostics tdr` command. Output fields are listed in the approximate order in which they appear.

Table 131: request diagnostics tdr Output Fields

Field Name	Field Description
Test Status	Information about the status of the TDR test request: • **Admin Down *interface-name***—The interface is administratively down. The TDR test cannot run on interfaces that are administratively down. • **Interface *interface-name* not found**—The interface does not exist. • **Test successfully executed *interface-name***—The test has successfully started on the interface. You can view the test results with the `show diagnostics tdr` command. • **VCT not supported on *interface-name***—The TDR test is not supported on the interface.

Sample Output

request diagnostics tdr start interface ge-0/0/19

```
user@switch> request diagnostics tdr start interface ge-0/0/19

Interface TDR detail:
Test status                     : Test successfully executed  ge-0/0/19
```

Syntax

```
request evpn validate-maintenance-mode-pre-checks
erb-leaf
```

Description

Use the `request evpn validate-maintenance-mode-pre-checks erb-leaf` command and its companion `show evpn maintenance-mode-status` command to ensure the device configuration and state meets the prerequisites for EVPN maintenance mode. These commands can be ran before, during, or after configuring maintenance mode, and should be executed after any configuration changes to incorporate those changes into the re-validation process.

The `request evpn validate-maintenance-mode-pre-checks erb-leaf` command initiates the same validation checks as the `set protocols evpn maintenance-mode erb-leaf action-type (validate-only|validate-and-set)` configuration. However it does not display validation results; instead, use the `show evpn maintenance-mode-status` command to view those results.

Options

erb-leaf Validate pre-checks for EVPN ERB style of deployment for leaf node

```
user@qfabric request fabric administration power-off interconnect-device IC-12345 fpc 13
STEP 1 of 6 (Acquiring lock):
Acquiring lock to perform this operation
Acquired lock to perform this operation
STEP 2 of 6 (Performing pre-checks):
interconnect-device IC-12345 is online
STEP 3 of 6 (Gracefully offlining the interconnect linecard):
Gracefully offlining the fpc
fpc is successfully offlined
STEP 4 of 6 (Waiting for convergence):
```

```
Waiting for convergence(this will take few minutes)
request fabric administration power-off interconnect-device IC-12345
Convergence complete
STEP 5 of 6 (Powering-off the interconnect linecard):
Now, powering-off the fpc on the interconnect-device
Powered-off the fpc on the interconnect-device
STEP 6 of 6 (Releasing lock):
Releasing the lock
```

Release Information

Command introduced in Junos OS Release 14.1X53-D15.

request fabric administration power-off interconnect-device

IN THIS SECTION

- Syntax | 15173
- Description | 15173
- Options | 15173
- Additional Information | 15173
- Required Privilege Level | 15173
- Output Fields | 15173
- Sample Output | 15173
- Release Information | 15174

Syntax

```
request fabric administration power-off interconnect--device (serial-id | alias-name)
```

Description

In QFX3000-G QFabric systems, you can use this command to power off QFX3008-I Interconnect devices.

This command systematically takes the device offline and gracefully shuts down the device while preserving system state information. A message appears on the console or console log, confirming that the operating system has stopped on the device.

Options

serial-id | alias-name	Provide the serial ID or alias name of the device.

Additional Information

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request fabric administration power-off interconnect-device

```
user@qfabric request fabric administration power-off interconnect-device IC-12345
STEP 1 of 7 (Acquiring lock):
Acquiring lock to perform this operation
Acquired lock to perform this operation
STEP 2 of 7 (Performing pre-checks):
interconnect-device IC-12345 is online
```

```
STEP 3 of 7 (Gracefully offlining the interconnect):
Disabling fabric protocol on interconnect-device
Disabled fabric protocol on interconnect-device
STEP 4 of 7 (Waiting for convergence):
Waiting for convergence(this will take few minutes)
Convergence complete
STEP 5 of 7 (Powering-off the interconnect):
Now, powering-off the interconnect-device (this may take some time)
Powered-off the interconnect-device
STEP 6 of 7 (Updating inventory):
Removing the interconnect-device - IC-A0004 from inventory
interconnect-device - IC-12345 is removed from inventory
STEP 7 of 7 (Releasing lock):
Releasing the lock
```

Release Information

Command introduced in Junos OS Release 14.1X53-D15.

- Additional Information | 15175
- Required Privilege Level | 15175
- Output Fields | 15175

Sample Output | 15176
Release Information | 15176

Syntax

```
request fabric administration power-off node-device (serial-id | alias-name)
```

Description

In QFX3000-G QFabric systems, you can use this command to power off QFX3500, QFX3600, QFX5100-48S, QFX5100-48T, and QFX5100-24Q devices in server Node groups, redundant server Node groups, and network Node groups. In QFX3000-M QFabric systems, you can use this command to power off QFX5100-24Q Interconnect devices and QFX3600-I Interconnect devices.

This command systematically takes the device offline and gracefully shuts down the device while preserving system state information. A message appears on the console or console log, confirming that the operating system has stopped on the device.

Options

serial-id | alias-name	Provide the serial ID or alias name of the device.

Additional Information

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request fabric administration power-off node-device

```
user@qfabric request fabric administration power-off node-device ED1234
STEP 1 of 8 (Acquiring lock):
Acquiring lock to perform this operation
Acquired lock to perform this operation
STEP 2 of 8 (Performing pre-checks):
node-device ED1491 is online
STEP 3 of 8 (Mastership switch-over):
node-device ED1491 is Server Node-group
STEP 4 of 8 (Gracefully offlining the node-device):
node-device is being offlined
node-device is successfully offlined
STEP 5 of 8 (Waiting for convergence):
Waiting for convergence(this will take few minutes)
Convergence complete
STEP 6 of 8 (Powering-off the node-device):
Now, powering-off the node-device
Powered-off the node-device
STEP 7 of 8 (Updating inventory):
Removing the node-device - ED1491 from inventory
node-device - ED1491 is removed from inventory
STEP 8 of 8 (Releasing lock):
Releasing the lock
```

Release Information

Command introduced in Junos OS Release 14.1X53-D15.

request fabric administration remove

IN THIS SECTION

- Syntax | 15177
- Description | 15177
- Options | 15178
- Required Privilege Level | 15178
- Sample Output | 15178
- Sample Output | 15178
- Release Information | 15178

Syntax

```
request fabric administration remove (interconnect-device interconnect-device-name | node-device
node-device-name)
```

Description

(QFabric systems only) Remove a disconnected Interconnect or Node device from the QFabric system inventory so that it does not appear in the output of the `show fabric administration inventory` command.

NOTE:

- You cannot remove any devices that appear in the `Connected` state in the output of the `show fabric administration inventory` command.
- For Node devices, you can only remove a device if it belongs to an autogenerated server Node group that contains a single Node device. Node devices contained within redundant server Node groups or network Node groups cannot be removed directly. To remove a Node device that is part of a group, delete the device from the Node group configuration first before attempting to remove the device from the inventory.

Options

interconnect-device ***interconnect-device-name***	Remove a disconnected Interconnect device from the QFabric system inventory.
node-device ***node-device-name***	Remove a disconnected Node device from the QFabric system inventory.

Required Privilege Level

admin

Sample Output

request fabric administration remove interconnect-device

```
user@qfabric> request fabric administration remove interconnect-device IC1
Device successfully removed
```

Sample Output

request fabric administration remove node-device

```
user@qfabric> request fabric administration remove node-device node5
Device successfully removed
```

Release Information

Command introduced in Junos OS Release 11.3.

Syntax

```
request fabric administration system mac-pool add mac-base starting-mac-address count number-of-mac-address
```

Description

(QFabric systems only) Add a MAC address pool to expand the initial set of MAC addresses assigned to the QFabric system.

Options

mac-base *starting-mac-address*	Set the starting MAC address for a pool of addresses assigned to the QFabric system.
count *number-of-mac-address*	Set the total number of MAC addresses in the specified address pool assigned to the QFabric system.

Required Privilege Level

admin

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request fabric administration system mac-pool add mac-base starting-mac-address count

```
user@switch> request fabric administration system mac-pool add mac-base 02:00:00:11:22:00 count
10
```

Release Information

Command introduced in Junos OS Release 11.3.

- Sample Output | 15181
- Release Information | 15182

Syntax

```
request fabric administration system mac-pool delete mac-base starting-mac-address
```

Description

(QFabric systems only) Delete a range of MAC addresses assigned manually to the QFabric system.

> **NOTE**: You cannot delete the MAC address range assigned during the initial setup of the QFabric system. Also, you cannot delete a MAC address range if the MAC address block is still in use.

Options

mac-base ***starting-mac-address***	Specify the starting MAC address for a pool of addresses you wish to remove from the QFabric system.

Additional Information

After you issue the `request fabric administration system mac-pool delete` command, issue the "show fabric administration system mac-pool" on page 20817 command to verify that the MAC address range has been deleted.

Required Privilege Level

request fibre-channel proxy load-rebalance

IN THIS SECTION

- Syntax | 15182
- Description | 15183
- Options | 15183
- Additional Information | 15183
- Required Privilege Level | 15183
- Output Fields | 15183
- Sample Output | 15184
- Release Information | 15184

Syntax

```
request fibre-channel proxy load-rebalance
<dry-run>
fabric <fabric-name>
<brief | detail>
```

Description

Rebalance the link load on one or more FCoE-FC gateway proxy fabrics (local Fibre Channel fabrics on the gateway) on demand. Load rebalancing is a disruptive action that forces some or all sessions (depending on the configured load-balancing algorithm) to log out and then log in again. When sessions log in again, they are placed on NP_Port interfaces so that the link loads are balanced.

Link load rebalancing occurs 10 seconds after you run the rebalancing command, unless another rebalancing trigger occurs before the 10 seconds elapse. If another rebalancing event occurs before the 10-second timer elapses, the timer is extended. Rebalancing occurs a maximum of 30 seconds after you run the rebalancing command, regardless of whether more rebalancing events occur.

You can also perform a *dry run* to see a list of sessions that might be affected (logged out) if you request a load rebalance. A dry run does not rebalance the link loads; it only lists the sessions that might be affected if you rebalance.

Options

dry-run	(Optional) Simulates performing link load rebalancing and displays a list of sessions that might be affected if you rebalance the link loads.
fabric ***fabric-name***	Name of the fabric on which you want to rebalance the link loads. If you do not specify a fabric name with the fabric keyword, all fabrics on the FCoE-FC gateway rebalance their link loads.
brief | detail	(Optional) Display the specified level of output.

Additional Information

Requesting link load rebalancing is a one-time, on-demand operation. You must explicitly request load rebalancing every time you want to rebalance the link loads. Alternatively, you can configure automated load rebalancing if you want the NP_Port links to be rebalanced automatically whenever a load-rebalancing trigger occurs.

Required Privilege Level

maintenance

Output Fields

Table 132 on page 15184 lists the output fields for the `request fibre-channel proxy load-rebalance dry-run` command. Output fields are listed in the approximate order in which they appear.

Table 132: request fibre-channel proxy load-rebalance dry-run Output Fields

Field Name	Field Description
Fabric	Name of the fabric.
Fabric-id	Fabric ID number.
F-Port	FCoE VLAN interface (VF_Port interface to the FCoE network).
FCID	VN_Port Fibre Channel identifier provided by the Fibre Channel over Ethernet Forwarder (FCoE forwarder) or the Fibre Channel switch.
Port-WWN	Unique worldwide name (WWN) of the VN_Port.
NP-Port	Name of the native Fibre Channel interface.

Sample Output

request fibre-channel proxy load-rebalance dry-run fabric fc_fabric_100

```
user@host> request fibre-channel proxy load-rebalance dry-run fabric fc_fabric_100
Fabric: fc_fabric_100, Fabric-id: 100
F-Port                        FCID     Port-WWN                NP-Port
vlan.100                      0x8a013a 02:01:00:64:00:00:00:2a fc-0/0/1.0
vlan.100                      0x8a013c 02:01:00:64:00:00:00:2b fc-0/0/1.0
vlan.100                      0x8a0146 02:01:00:64:00:00:00:2e fc-0/0/1.0
vlan.100                      0x8a014c 02:01:00:64:00:00:00:2f fc-0/0/1.0
```

Release Information

Command introduced in Junos OS Release 12.3.

request flight-recorder set high-cpu

IN THIS SECTION

- Syntax | 15185
- Description | 15185
- Options | 15186
- Required Privilege Level | 15187
- Output Fields | 15187
- Sample Output | 15187
- Release Information | 15188

Syntax

```
request flight-recorder set high-cpu
<disable>
<backoff-duration seconds>
<collect-core>
<cpu-threshold percentage>
<logical-system>
<num-snapshots number>
<polling-frequency frequency>
```

Description

Enable flight recorder tool to collect snapshots of historical data on when the CPU utilization for the routing protocol process on a device was high and what processes caused the high utilization. The detection of high CPU usage enables faster resolution of issues.

The recorded snapshots and core files are saved as log files in a folder under the **/var/log/flight_recorder/** directory. The log files are listed in the order of time stamp saved. The folder format is `Flr_MONTH_DD_YYYY_HH:MM:SS`; for example, `Flr_May_09_2018_02:20:50`. Each log file in the directory includes the following information:

- Output from the `show task accounting detail` command (after enabling and waiting for 10 seconds).
- Output from the `show task jobs` command.
- Running core data stored in a separate core log file, if enabled.

Options

none

Enable flight recorder tool to collect snapshots of data used for detecting high CPU utilization. The recorded snapshots and core files are saved as log files in a folder under the **/var/log/flight_recorder/**.

disable

Disable flight recorder tool that has been enabled using the `request flight-recorder set high-cpu` command.

- **Default:** Disabled.

backoff-duration *seconds*

(Optional) Specify the time interval in seconds between two snapshots of data.

- **Default:** 100 seconds.
- **Range:** 10 through 1000.

collect-core

(Optional) Perform snapshot collection of the running core with every snapshot of data taken.

When the `collect-core` option is enabled, the data snapshots are stored in a separate core log file in a folder under the **/var/log/flight_recorder/** directory. The folder format is `Flr_MONTH_DD_YYYY_HH:MM:SS`; for example, `Flr_May_09_2018_02:20:50`.

- **Default:** Disabled.

cpu-threshold *percentage*

(Optional) Specify the maximum value of CPU utilization in percentage, beyond which the collection of data is triggered.

- **Default:** 80
- **Range:** 1 through 400.

logical-system

(Optional) Enable data collection on logical systems.

- **Default:** Disabled.

num-snapshots *number*

(Optional) Specify the number of snapshots of data to be collected before quitting the collection process.

- **Default:** 0
- **Range:** 1 through 20

polling-frequency *seconds*

(Optional) Specify the time in seconds for polling for high CPU utilization.

- **Default:** 10 seconds.
- **Range:** 5 through 100.

Required Privilege Level

root

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request flight-recorder set high-cpu (Enable flight-recorder)

```
user@host> request flight-recorder set high-cpu cpu-threshold 10 polling-frequency 5 backoff-
duration 10 collect-core num-snapshots 1
Please wait....Starting flight-recorder process.
```

request flight-recorder set high-cpu disable (When flight-recorder is enabled)

```
user@host> request flight-recorder set high-cpu disable
Disabling Done
```

request flight-recorder set high-cpu disable (When flight-recorder is disabled)

```
user@host> request flight-recorder set high-cpu disable
Flight Recorder is not running!
```

Release Information

Command introduced in Junos OS Release 18.2R1.

request interface (revert | switchover) (Adaptive Services)

IN THIS SECTION

- Syntax | 15191
- Description | 15192
- Options | 15192
- Required Privilege Level | 15192
- Output Fields | 15192
- Sample Output | 15192
- Release Information | 15193

Syntax

```
request interface (revert | switchover) (rsp number | rlsq number)
```

Description

(M Series and T Series routers only) Manually revert to the primary adaptive services interface or link services IQ interface, or to switch from the primary to the secondary interface.

> **NOTE**: All **rlsq** switchover or revert operations are allowed from the **rlsq***number* level only and not for individual channelized interfaces (**rlsq***number.unit*).

On an aggregated Ethernet interface with link protection enabled, use the **request interface (revert | switchover)** (Aggregated Ethernet Link Protection) operational command to manually revert egress traffic from the designated backup link to the designated primary link, or to manually switch egress traffic from the primary link to the backup link. For information about this command, see "request interface (revert | switchover) (Aggregated Ethernet Link Protection)" on page 15193.

Options

(revert | switchover)	The **revert** keyword restores active processing to the primary adaptive services (sp) or link services IQ (lsq) interface. The **switchover** keyword transfers active processing to the secondary (backup) interface.
rsp*number*	Redundant adaptive services interface name.
rlsq*number*	Redundant link services IQ interface name.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request interface revert

```
user@host> request interface revert rlsq0
request succeeded
```

request interface switchover

```
user@host> request interface switchover rlsq0
error: rlsq0: already on secondary
```

Release Information

Command introduced before Junos OS Release 7.4.

Support for **rlsq** interfaces added in Junos OS Release 7.6.

request interface (revert | switchover) (Aggregated Ethernet Link Protection)

IN THIS SECTION

- Syntax | 15193
- Description | 15193
- Options | 15194
- Required Privilege Level | 15194
- Output Fields | 15194
- Sample Output | 15194
- Release Information | 15195

Syntax

```
request interface (revert | switchover) aex
```

Description

Manually revert egress traffic from the designated backup link to the designated primary link of an aggregated Ethernet interface for which link protection is enabled, or manually switch egress traffic from

the primary link to the backup link. This traffic includes transit traffic and local traffic originated on the router itself.

> **NOTE**: When link protection is enabled on an aggregated Ethernet interface, if the primary link fails, the router automatically routes egress traffic to the backup link. However, the router does not automatically route egress traffic back to the primary link when the primary link is subsequently reestablished. Instead, you manually control when to have traffic diverted back to the primary link by issuing the **request interface (revert | switchover)** (Aggregated Ethernet Link Protection) operational command and specifying the **revert** keyword.

On M Series and T Series routers, use the **request interface (revert | switchover)** (Adaptive Services) operational command to manually revert to the primary adaptive services interface or link services interface, or to switch from the primary to the secondary interface. For information about this command, see "request interface (revert | switchover) (Adaptive Services)" on page 15191.

Options

revert	Restores egress traffic processing to the primary link.
switchover	Transfers egress traffic processing to the secondary (backup) link.
ae*x*	Aggregated Ethernet logical interface number: 0 through 15.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request interface revert

```
user@host >request interface revert ae1
```

Release Information

Command introduced in Junos OS Release 8.3.

request interface (revert | switchover) (Aggregated Inline Service Interfaces)

IN THIS SECTION

- Syntax | 15195
- Description | 15195
- Options | 15196
- Required Privilege Level | 15196
- Output Fields | 15196
- Sample Output | 15196
- Sample Output | 15196
- Release Information | 15197

Syntax

```
request interface (revert | switchover) bundle-name
```

Description

Manually revert L2TP data traffic from the designated backup link to the designated primary link of an aggregated inline service interface bundle interface for which 1:1 redundancy is configured, or manually switch data traffic from the primary link to the backup link.

NOTE: When 1:1 redundancy protection is configured for an aggregated inline service interface, if the primary link fails, the router automatically routes data traffic destined for the L2TP session on that link to the backup link. However, the router does not

automatically route data traffic back to the primary link when the primary link is subsequently reestablished. Instead, you manually divert traffic back to the primary link by issuing the `request interface revert` operational command.

Options

revert	Restore data traffic for the LNS session to the primary link.
switchover	Transfer data traffic for the LNS session to the secondary (backup) link.
bundle-name	Name of the aggregated inline service interface bundle.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request interface switchover

```
user@host >request interface switchover asi0
error: requesting cmd SWITCH when primary is not active
```

Sample Output

request interface revert

```
user@host >request interface revert asi0
request succeeded
```

Release Information

Command introduced in Junos OS Release 16.2.

request interface bounce

IN THIS SECTION

- Syntax with poe | 15197
- Syntax with remote-only | 15197
- Description | 15197
- Options | 15198
- Additional Information | 15198
- Required Privilege Level | 15198
- Output Fields | 15198
- Sample Outputs | 15199
- Release Information | 15200

Syntax with poe

```
request interface bounce interface_name poe interval seconds
```

Syntax with remote-only

```
request interface bounce interface_name remote-only interval seconds
```

Description

You can shut down the interface for a given time interval. The interface powers up at the end of the configured time.

Options

poe

An optional parameter that bounces the poe port. The time interval range is from 1 to 60 seconds. An example of the syntax with poe is shown:

```
request interface bounce interface_name poe interval seconds
```

> **NOTE**: You can only bounce poe on ports that have been configured for poe.

remote-only

An optional parameter that bounces only the remote end of the interface while keeping the local end operational. This is useful for troubleshooting remote connectivity issues without affecting the local interface state.

> **NOTE**: remote-only is only applicable to interface bounce and cannot be used with poe for port bounce.

interface *interface-name*

Name of the interface to shut down for the given time interval.

interval *seconds*

The interface shut down for the configured time interval. The time interval range is from 1 to 30 seconds.

Additional Information

- The default time interval is 0 seconds.
- In Junos OS the `poe bounce` command is supported only on Gigabit Ethernet and Multi rate Gigabit Ethernet.
- In Junos OS Evolved the `poe bounce` command is supported only on Ethernet interface.

Required Privilege Level

View

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Outputs

request interface bounce

```
user@host> request interface bounce et-0/0/0 interval 20
```

```
Bounce operation on interface et-0/0/0 started with interval 20 secs.
```

request interface bounce with remote-only

```
user@host> request interface bounce remote-only et-0/0/0 interval 20
```

```
Bounce operation on remote end of interface et-0/0/0 started with interval 20 secs.
```

poe port bounce with interval

```
user@host> request interface bounce poe mge-0/0/29 interval 30
```

```
PoE bounce request received for mge-0/0/29 with interval 30s.
```

poe port bounce without interval

```
user@host> request interface bounce poe mge-0/0/29
```

```
PoE bounce request received for mge-0/0/29 with interval 0s.
```

See Sample outputs for information on what the output looks like when poe bounce is enabled and when poe bounce is disabled.

Release Information

Starting in 24.2 R1 release, we've introduced the `poe` optional parameter. This statement was originally introduced in Junos OS release and Junos OS Evolved release 23.4R1.

request interface link-degrade-recover

IN THIS SECTION

- Syntax | 15200
- Description | 15200
- Options | 15201
- Required Privilege Level | 15201
- Output Fields | 15201
- Sample Output | 15201
- Release Information | 15203

Syntax

```
request interface link-degrade-recover interfaces-name
```

Description

Manually recover a degraded physical link. Manual recovery is used when the interface has any Layer 2 and Layer 3 protocols that prevents autorecovery. This command is applicable only if you have configured the manual link recovery option on the interface.

NOTE: Manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while auto-recovery is in progress.

Options

interfaces-name	Name of the interface.

Required Privilege Level

View

Output Fields

When you enter this command, Junos OS displays the status of your request.

Sample Output

Manual recovery

```
user@host>run request interface link-degrade-recover xe-9/1/11
FPC 9 PIC 1 PORT 11 Link        Degrade Recovery Started
```

Interface status when link degrade is enabled

request interface load-balancing revert (Aggregated Multiservices)

IN THIS SECTION

- Syntax | **15204**
- Description | **15204**
- Options | **15205**
- Required Privilege Level | **15205**
- Output Fields | **15205**
- Sample Output | **15205**
- Release Information | **15205**

Syntax

```
request interface load-balancing revert interface-name
```

Description

Revert the aggregated multiservices member interface (mams-) from the inactive state to the active or backup state based on the configuration and the operational state of the aggregated multiservices interface.

Options

interface-name Name of the member interface. The member interface format is mams-*a*/*b*/0, where *a* is the FPC slot number and *b* is the PIC slot number.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request interface load-balancing revert

```
user@host> request interface load-balancing revert mams-4/0/0
request succeeded
```

Release Information

Statement introduced in Junos OS Release 17.1.

request interface load-balancing switchover (Aggregated Multiservices)

IN THIS SECTION

Syntax | 15206

- Description | 15206
- Options | 15206
- Required Privilege Level | 15207
- Output Fields | 15207
- Sample Output | 15207
- Release Information | 15207

Syntax

```
request interface load-balancing switchover interface-name
<force>
```

Description

Switch the active member interface to the backup state.

In the case of mobile control plane redundancy, the behavior depends on the replication state of the member interface:

- If the sync state is `in-sync`, then the active member is rebooted and the backup member becomes the new active member.
- If the sync-state is `in-progress`, then the `force` option must be used to force the switchover.

> **CAUTION**: In this case, there is a risk of losing subscriber information because the synchronization has not yet been completed.

Options

interface-name	Name of the member interface. The member interface format is mams-*a*/*b*/0, where *a* is the FPC slot number and *b* is the PIC slot number.
force	(Optional) Force the switchover from the active member to the backup member.

Required Privilege Level

request interface mc-ae switchover (Multichassis Link Aggregation)

IN THIS SECTION

- Syntax | 15208
- Description | 15208
- Options | 15208
- Required Privilege Level | 15208
- Output Fields | 15208

- Sample Output | 15209
- Sample Output | 15209
- Release Information | 15209

Syntax

```
request interface mc-ae switchover
<immediate> mcae-id mcae-id;
mcae-id mcae-id;
```

Description

Manually revert egress traffic from the active node to the designated preferred node of a multichassis aggregated Ethernet interface. You can use this command to manually switch over traffic to the preferred node when the `switchover-mode` statement for the multichassis aggregated Ethernet interface is configured as `non-revertive` at the [`edit interfaces ae`*X* `mc-ae`] hierarchy level.

NOTE: To run this command successfully, the `status-control` statement should be configured as `active` at the [`edit interfaces ae`*X* `mc-ae`] hierarchy level.

Options

`immediate` (Optional) Trigger immediate switchover to the preferred node. If this option is not configured, Junos OS waits for the timer configured using the `revert-time` statement at the [`edit interfaces ae`*X* `mc-ae`] hierarchy level to expire before it triggers the switchover.

`mcae-id` *`mcae-id`* Triggers switchover for the specified mc-ae interface.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request interface mc-ae switchover immediate mcae-id

```
user@host >request interface mc-ae switchover immediate mcae-id 2
MCAE: Switchover Done
```

Sample Output

request interface mc-ae switchover mcae-id

```
user@host >request interface mc-ae switchover mcae-id 2
Switchover In Progress: Please check after 1 minutes,
Use “show interfaces mc-ae revertive-info” to check for the status
```

Release Information

Command introduced in Junos OS Release 13.3.
