}
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type]
```

Description

IDP uses stateful signatures to detect attacks. Stateful signatures are more specific than regular signatures. With stateful signatures, IDP can look for the specific protocol or service used to perpetrate the attack.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

Release Information

Statement introduced in Junos OS Release 9.3.

Signature Hash Algorithm (Security IKE)

IN THIS SECTION

- Syntax | 29047
- Hierarchy Level | 29047
- Description | 29047
- Options | 29047
- Required Privilege Level | 29047
- Release Information | 29047

Syntax

```
signature-hash-algorithm (sha1 | sha256 | sha384 | sha512);
```

Hierarchy Level

```
[edit security ike proposal proposal-name]
```

Description

Defines the digital signature hash algorithms that must match with the received signature hash algorithms in the hierarchical order for IKEv2. If your device doesn't find a match, negotiation with the IKE peer fails. This configuration ensures that the peers negotiate a specific set of signature hash algorithms. Note that you cannot use the configuration statement with IKEv1.

If not configured, the default value is all the supported hash algorithms.

Options

sha1 Select SHA-1 signature hash algorithm.

sha256 Select SHA 256-bit signature hash algorithm.

sha384 Select SHA 384-bit signature hash algorithm.

sha512 Select SHA 512-bit signature hash algorithm.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 24.4R1.

- Hierarchy Level | 29050
- Description | 29050
- Options | 29050
- Required Privilege Level | 29050
- Release Information | 29051

Syntax

```
signature name {
    member name {
        context context;
        direction (any | client-to-server | server-to-client);
        pattern pattern;
    }
    port-range [ port-range ... ];
}
```

Hierarchy Level

```
[edit services application-identification application application-name over protocol-type]
```

Description

Application signature for pattern matching. A unique application signature identifier. Must be a unique name with a maximum length of 63 characters.

You need to define an application signature to match the pattern by defining a unique application signature identifier, application signature member identifier, connection direction of the packets, and set the context to be matched. You also need to specify port range for TCP or UDP.

Options

member Member name for a custom application signature. Custom signatures can contain multiple members that define attributes for an application. (The supported member name range is m01 through m15.)

port-range Port range. This option is applicable for TCP-based or UDP-based applications only.

The remaining statements are explained separately. See CLI Explorer.

Syntax

```
signature-method-all-ports
```

Hierarchy Level

```
[edit services application-identification]
```

Description

Run signature matching on all traffic in application-identification. This is called the signature-match mode.

In the default mode, or fast-port-match mode, all traffic destined to well-known ports (up to 1024) immediately returns the final port match. However, the device runs signature matching for all traffic destined for port 80,

simple-filter

IN THIS SECTION

- Syntax | 29055
- Hierarchy Level | 29056
- Description | 29056
- Options | 29056
- Required Privilege Level | 29056
- Release Information | 29057

Syntax

```
simple-filter filter-name {
    term term-name {
        from {
            match-conditions;
        }
        then {
            forwarding-class class-name;
            loss-priority (high | low | medium);
        }
    }
}
```

Hierarchy Level

```
[edit firewall family inet],
[edit logical-systems logical-system-name firewall family inet]
```

Description

Configure simple filters.

Options

filter-name	Name that identifies the simple filter. The name must be a non-reserved string of not more than 64 characters. No special characters are restricted. To include spaces in the name, enclose them in quotation marks (“ ”).
from	Match packet fields to values. If the `from` option is not included, all packets are considered to match and the actions and action modifiers in the `then` statement are taken.
match-conditions	One or more conditions to use to make a match.
term *term-name*	Define a simple-filter term. The name that identifies the term can contain letters, numbers, and hyphens (-), and can be up to 255 characters long. To include spaces in the name, enclose them in quotation marks (“ ”).
then	Actions to take on matching packets. If the `then` option is not included and a packet matches all the conditions in the `from` statement, the packet is accepted.

NOTE: Only `forwarding-class` and `loss-priority` are valid actions in a simple filter configuration.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

- Hierarchy Level | 29060
- Description | 29060
- Required Privilege Level | 29061
- Release Information | 29061

Syntax

```
single-rate {
    (color-aware | color-blind);
    committed-information-rate bps;
    committed-burst-size bytes;
    excess-burst-size bytes;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall three-color-policer name],
[edit firewall three-color-policer policer-name],
[edit logical-systems logical-system-name firewall three-color-policer policer-name]
```

Description

Configure a single-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), and excess burst size (EBS).

Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the EBS are assigned medium-high loss priority (yellow). Packets that exceed the EBS are assigned high loss priority (red).

Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Logical systems support introduced in Junos OS Release 9.3.

Support at the `[edit dynamic-profiles ... three-color-policer name]` hierarchy level introduced in Junos OS Release 11.4.

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure sip to specify the Session Initiation Protocol (SIP) ALG on the device. Session Initiation Protocol (SIP) is a signaling protocol for initiating, modifying, and terminating multimedia sessions over the internet. By default, the SIP ALG is disabled for SRX5600 and SRX5800 devices. Use the CLI command `delete security alg` *`alg-name`* `disable` to enable the SIP ALG. IPv6 is supported on the SIP ALG along with Network Address Translation Protocol Translation (NAT-PT) mode and NAT64 address translation. The type of the destination-ip-address is changed from IPv4 address to IP prefix to support all kinds of IP addresses, and correspondingly a prefix is supported to allow multiple IP addresses.

Options

`disable`—Disable the SIP ALG. Use the `set security alg` *`alg-name`* `disable` CLI command to disable the SIP ALG.

`distribution-ip`—Configure IPv4 or IPv6 distribution IP addresses. You can configure up to 20 IP addresses.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

The `distribution-ip` option introduced in Junos OS Release 18.1R1 for SRX5400, SRX5600, and SRX5800 devices.

The `tenant` option is introduced in Junos OS Release 18.3R1.

Understanding the SIP ALG

sip (Services CoS Next Gen Services)

IN THIS SECTION

- Syntax | 29066
- Hierarchy Level | 29066
- Description | 29066
- Options | 29067
- Required Privilege Level | 29067
- Release Information | 29067

Syntax

```
sip {
    data {
        dscp (alias | bits);
        forwarding-class class-name;
    }
}
```

Hierarchy Level

```
[edit services cos application-profile profile-name]
```

Description

Configure CoS actions for SIP traffic in an application profile. The application profile can then be used in CoS rule actions.

Options

dscp (*alias* | *bits*) Either a code point alias or a DSCP bit value to apply to the SIP packets.

forwarding-class *class-name* Forwarding class name to apply to the SIP packets. The choices are:

- assured-forwarding
- best-effort
- expedited-forwarding
- network-control

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

RELATED DOCUMENTATION

Class of Service for Services PICs (Next Gen Services)

sip

IN THIS SECTION

- Syntax | 29068
- Hierarchy Level | 29068
- Description | 29068
- Default | 29068
- Required Privilege Level | 29068

Release Information | 29069

Syntax

```
sip {
    video {
        dscp (alias | bits);
        forwarding-class class-name;
    }
    voice {
        dscp (alias | bits);
        forwarding-class class-name;
    }
}
```

Hierarchy Level

```
[edit services cos application-profile profile-name]
```

Description

Set the appropriate **dscp** and **forwarding-class** value for SIP traffic.

Default

By default, the system will not alter the DSCP or forwarding class for SIP traffic.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

- Required Privilege Level | 29070
- Release Information | 29070

Syntax

```
sip-call-hold-timeout seconds;
```

Hierarchy Level

```
[edit applications application application-name]
```

Description

Timeout period for SIP calls placed on hold, in seconds.

Options

seconds—Length of time the application holds a SIP call open before it times out.

- **Default:** 7200 seconds
- **Range:** 0 through 36,000 seconds (10 hours)

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

site (Layer 2 VPNs and Circuits)

IN THIS SECTION

- Syntax | 29075
- Hierarchy Level | 29075
- Description | 29075
- Options | 29075
- Required Privilege Level | 29076
- Release Information | 29076

Syntax

```
site site-name {
    hot-standby;
    site-identifier identifier;
    site-preference preference-value {
        backup;
        primary;
    }
    interface interface-name {
        description text;
        remote-site-id remote-site-ID;
    }
    static incoming-label label;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
l2vpn],
[edit routing-instances routing-instance-name protocols l2vpn]
```

Description

Specify the site name, site identifier, and interfaces connecting to the site. Allows you to configure a remote site ID for remote sites.

Options

hot-standby
Turn on the protector behavior for the site. This keeps backup pseudowire in continuous standby mode and ready for traffic forwarding.

site-identifier *identifier*
Numerical identifier for the site used as a default reference for the remote site ID.

site-name
Name of the site.

static incoming-label
Specifies a label for an incoming VPN.

- Range: 16 through 983,615

> **NOTE**: Configure the label size in increments of 2.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`hot-standby` option introduced in Junos OS Release 14.2 for MX Series routers.

    }
    peer-active;
    preference (preference-value | backup | primary);
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name protocols vpls multi-homing],
[edit routing-instances instance-name protocols vpls multi-homing]
```

Description

For VPLS autodiscovery (FEC 129), specify the parameters for a VPLS site that is multihomed to two or more provider edge (PE) routers.

> **NOTE**: In the VPLS documentation, the word *router* in terms such as *PE router* is used to refer to any device that provides routing functions.

Options

site-name—Name of the site.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

site-preference

IN THIS SECTION

- Syntax | 29083
- Hierarchy Level | 29083
- Description | 29083
- Options | 29083
- Required Privilege Level | 29083
- Release Information | 29084

Syntax

```
site-preference preference-value {
    backup;
    primary;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
l2vpn site site-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols vpls
site site-name],
[edit routing-instances routing-instance-name protocols l2vpn site site-name],
[edit routing-instances routing-instance-name protocols vpls site site-name]
```

Description

Specify the preference value advertised for a particular Layer 2 VPN or VPLS site. The site preference value is encoded in the BGP local preference attribute. When a PE router receives multiple advertisements with the same VE identifier, the advertisement with the highest local preference value is preferred. You can use this statement to enable multihoming for Layer 2 VPNs and VPLS.

Options

preference-value—Specify the preference value advertised for a Layer 2 VPN or VPLS site.

- **Range:** 1 through 65,535

backup—Set the preference value to 1.

primary—Set the preference value to 65,535.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

- Syntax | 29086
- Hierarchy Level | 29086
- Description | 29086
- Options | 29086

Required Privilege Level | 29087
Release Information | 29087

Syntax

```
site-reputation-action {
    harmful   (block | log-and-permit | permit | quarantine);
    fairly-safe   (block | log-and-permit | permit | quarantine);
    moderately-safe  (block | log-and-permit | permit | quarantine);
    suspicious  (block | log-and-permit | permit | quarantine);
    very-safe   (block | log-and-permit | permit | quarantine);
}
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile web-filtering juniper-enhanced profile profile-name category
category-name]
```

Description

Specify the action to be taken depending on the site reputation returned for all types of URLs whether it is categorized or uncategorized.

> **NOTE**: Starting with Junos OS Release 17.4R1, the reputation base scores are configurable. Users can apply global reputation values, provided by the Websense ThreatSeeker Cloud (TSC). For the non-category URLs, the global reputation value is used to perform filtering,

Options

fairly-safe Permit, log-and-permit, block, or quarantine a request if a site-reputation of 70 through 79 is returned.

harmful Permit, log-and-permit, block, or quarantine a request if a site-reputation of zero through 59 is returned.

moderately-safe Permit, log-and-permit, block, or quarantine a request if a site-reputation of 80 through 89 is returned.

suspicious Permit, log-and-permit, block, or quarantine a request if a site-reputation of 60 through 69 is returned.

very-safe Permit, log-and-permit, block, or quarantine a request if a site-reputation of 90 through 100 is returned.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

size (Interface)

IN THIS SECTION

- Syntax | 29088
- Hierarchy Level | 29088

- Required Privilege Level | 29088
- Release Information | 29088

Syntax

```
size bytes;
```

Hierarchy Level

```
[edit accounting-options file filename]
```

Description

Specify attributes of an accounting-data log file.

Options

bytes—Maximum size of each log file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a log file (for example, `profilelog`) reaches its maximum size, it is renamed `profilelog.0`, then `profilelog.1`, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. If you do not specify a size, the file is closed, archived, and renamed when the time specified for the transfer interval is exceeded.

- **Syntax:** *x* to specify bytes, *x*k to specify KB, *x*m to specify MB, *x*g to specify GB
- **Range:** 256 KB through 1 GB

Required Privilege Level

interface—To view this statement in the configuration.

skew-timer-disable

IN THIS SECTION

- Syntax | 29100
- Hierarchy Level | 29100
- Description | 29100
- Default | 29100
- Required Privilege Level | 29101
- Release Information | 29101

Syntax

```
skew-timer-disable;
```

Hierarchy Level

```
[edit protocols vrrp]
```

Description

Disable the skew timer, thereby reducing the time required to transition from the backup state to the primary state.

NOTE: The `skew-timer-disable` statement is used when there is only one primary router and one backup router in the network.

Default

By default, the skew timer is enabled for all the VRRP groups.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

[edit services rpm rfc2544-benchmarking tests test-name test-name]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rfc2544 tests test-name test-name]
```

Description

Disable the Address Resolution Protocol (ARP) test iteration for IPv4 or inet services during a benchmarking test. This parameter is valid only for an `inet` family. An ARP test iteration is a 3-second iteration that is run for all `inet` tests. The results of this iteration are disregarded in the test result calculations. The ARP test iteration is performed by sending test frames for 3 seconds to ensure that all devices on the path to the destination add ARP entries in the cache of the corresponding devices. This parameter is not applicable for CCC and bridge families.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

skip-multicast-router-port-sync-nlri

IN THIS SECTION

- Syntax | 29103
- Hierarchy Level | 29103
- Description | 29103
- Required Privilege Level | 29103
- Release Information | 29104

Syntax

```
skip-multicast-router-port-sync-nlri;
```

Hierarchy Level

```
[edit protocols evpn]
```

Description

Turn off automatically synchronizing the multicast router (mrouter) interface status for an Ethernet segment identifier (ESI) on multihoming peer border leaf (BL) devices in an EVPN-VXLAN bridged overlay network.

Some platforms support mrouter port synchronization by default, so you don't need to manually configure the `multicast-router-interface` setting on the multihoming peer BL devices. The mrouter port synchronization ensures that multicast traffic reaches external receivers when a non-designated forwarder (NDF) BL peer receives IGMP or MLD queries from the external PIM domain.

Use this option to disable that default behavior on supported devices, if you want to explicitly configure the mrouter ports on the BL devices.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement and automatic synchronization introduced in Junos OS Evolved Releases 25.4R1 and 25.2X100D10.

- Options | 29110
- Required Privilege Level | 29111
- Release Information | 29111

Syntax

```
sla-options {
    dynamic-load-balancer;
    log (disabled | syslog);
    max-passive-probe-limit {
        interval refresh-interval;
        number-of-probes probes;
    }
}
```

Hierarchy Level

```
[edit security advance-policy-based-routing]
```

Description

Specify global SLA options for Application Quality of Experience (AppQoE).

Options

dynamic-load-balancer

Enable the session-based load balancing functionality. When you enable session-based load balancing option, the application traffic distribution depends on the `weight` value that you configure at the [`edit security advance-policy-based-routing interface interface-name`] hierarchy level.

Load balancing is disabled by default.

log

Choose the logging mechanism for AppQoE. The log type configuration by default uses `syslog` to support application-level logging. You need to configure the log type as `disabled` to turn off the AppQoE logging.

disabled Disable logging.

syslog Enable logging.

- **Default:** syslog

max-passive-probe-limit

Set maximum passive probe limits.

interval Interval within which to send passive probes (in ms).

- **Default:** 500
- **Range:** 500 through 1000

number-of-probes Number of passive probes to be sent.

- **Default:** 5000
- **Range:** 10 through 5000

Required Privilege Level

```

Hierarchy Level

```
[edit security advance-policy-based-routing]
```

Description

Configure an SLA rule.

An SLA rule includes all information required to measure the SLA and to identify whether any SLA violation has occurred or not. It contains the complete probe profiles, time interval which the profiles need to be sent, preferred SLA configuration, and so on.

When you configure an APBR rule, you must associate the corresponding SLA rule for the application.

The presence of SLA rule in the APBR configuration triggers the AppQoE functionality; If there are no SLA profiles available, APBR operates without AppQoE.

Options

active-probe-params ***probe-params-name***
Name of the active probe parameter. Associate the active probe parameter with the SLA rule.

affinity
Define link type affinity. For strict affinity, AppQoE ensures that the selected path is always from the preferred tag. For the default affinity (loose), if there is no SLA meeting link in the preferred tag, AppQoE selects a link outside the preferred tag that meets the SLA requirements.

- **Default:** loose

  If the link-type affinity is not configured as strict, then an overlay link with the highest SLA score is selected. If there are no links meeting the SLA requirements and belonging to the preferred link type available, then AppQoE selects a link outside of the preferred link type that meets the SLA requirements. However, path selection mechanism continues to check for a preferred link meeting the SLA requirements. Once the preferred link type meeting the SLA requirement is available, then the application traffic is switched back to that link.

link-type-affinity (strict)
(optional) Configure the link-type affinity as strict for the preferred link type. For strict affinity, AppQoE ensures that the path selected is always of the preferred link type. When the default affinity (loose) is configured and if there are no SLA meeting links belonging to the preferred link type available, then AppQoE selects a link outside the preferred link type that meets the SLA requirements.

Following table provides details on AppQoE pat selection mechanism based on affinity type.

Table 1891: Enhanced AppQoE Path Selection

Affinity Type	SLA Metrics Type	Link Selection Preference		
		If there is a preferred tag	If there are multiple preferred tags	If there is no preferred tag
Strict	With SLA metrics	AppQoE selects the links with the preferred tag.	AppQoE selects the link with highest path score. If there are multiple links with same path score, then the link selection happens as per the priority.	To configure affinity as strict, the user need to configure a preferred tag.
Strict	Without SLA metrics	AppQoE selects the links with the preferred tag.	AppQoE selects the link based on the priority.	To configure affinity as strict, the user need to configure a preferred tag.

Table 1891: Enhanced AppQoE Path Selection *(Continued)*

Affinity Type	SLA Metrics Type	Link Selection Preference		
		If there is a preferred tag	If there are multiple preferred tags	If there is no preferred tag
Loose	With SLA metrics	AppQoE selects the links with the preferred tag.	AppQoE selects the link with highest path score. If there are multiple links with same path score, then the link selection happens as per the priority.	AppQoE selects the link outside the preferred tag with best path score. The link selection switches back to preferred link when a link with a preferred tag is available. If there are multiple links with same the preferred tag after switchback, AppQoE selects the preferred link with highest path score. If there are multiple links with same path score, then the link selection happens as per the priority.

Table 1891: Enhanced AppQoE Path Selection *(Continued)*

Affinity Type	SLA Metrics Type	Link Selection Preference		
		If there is a preferred tag	If there are multiple preferred tags	If there is no preferred tag
Loose	Without SLA metrics	AppQoE selects the links with the preferred tag.	AppQoE selects the link based on the priority.	AppQoE selects non preferred link with highest priority. If there are multiple non preferred links with similar priority, then the link selection happens randomly.

Prior to Junos OS Release 21.2R1, during traffic flow, switching from a link with a lower priority value that meets the SLA requirements to a link with a higher priority is not supported when the link with higher priority meets the SLA requirements.

When a currently selected link and the highest priority link are part of a indirect next-hop table (belonging to a different routing instance), the application traffic does not switch to the highest priority link. It switches to the highest priority link only when the SLA manager is triggered. The SLA manager is triggered for the following reasons:

- When no path for application traffic is selected,
- SLA is violated partially
- A non-preferred link is available as best path
- A non-highest priority link is available as the best path
- Change in next-hop ID
- Configuration changes
- Current best path link is down
- SLA violation is detected

metrics-profile *profile-name*

Metric profile name. The SLA rule contains metric profiles that provide the acceptable threshold. If the violation goes beyond the threshold, an alternate path is identified and then traffic is rerouted.

passive-probe-params

Passive probe parameter name. Passive probes are installed on links within the network, and they monitor all the traffic that flows through those links.. This option is not supported for SaaS applications.

preferred-link-type (IP | MPLS | Any)

Select an MPLS or Internet link as the preferred path. If you do not select `IP` or `MPLS`, the preferred link type `Any` is selected when the link-type affinity is configured as loose (default link type affinity). Configuring the link type as `Any` when the link-type affinity is configured as `strict` is not supported.

- **Default:** Any

preferred-tag

Define a custom tag such as ISP1, ISP2, WAN1, IP, MPLS, and so on as per the requirement. The security device does not support the preferred tag as `Any` when you configure affinity as `strict`.

The preferred tag is case sensitive. For example, the security device considers the prefered tag `IP` and `ip` as different tags.

- **Default:** `any`

Custom Link Tag

SLA link preference for security device interfaces support custom link tags. If there are multiple links that meet SLA, you can set link preference by configuring the `preferred-tag` and `affinity` options at the [`edit security advance-policy-based-routing sla-rule` *`sla-rule-name`* `link-preferences`] hierarchy level.

Application Traffic Switch to the Higher Priority Link of the Preferred Tags

During the traffic flow, AppQoE allows the application traffic to switch from a lower priority link to a higher priority link that meets SLA requirements.

Non-SLA metrics Based Deployments

We support AppQoE for application-based traffic or non-application based traffic even when the SLA metrics are not available.

Overlay Interface Attribute Preference

In case of conflicting attributes within an overlay or between an overlay and corresponding underlay interfaces, the highest level overlay link attributes take

precedence. Link attribute `gr` interface take precedence over corresponding `st` interface and `st` interface takes precedence over `ge` or `xe` underlay interfaces.

sla-export-factor *value*

Set interval to report passive probe report metrics at the application level.

Example: When you configure the `sla-export-factor` as 5, passive probe results are exported once at the end of the 5th, 10th, and 15th probe interval. You can use a passive probe report to report any data that remains unreported in the probe interval at the end of a session.

With application-level summarization, each probe candidate session must send data to central location where the metrics are aggregated. The data thus aggregated is sent out once the configured SLA export factor is met.

- **Range:** 5 through 1000
- **Default:** 500

switch-idle-time *period*

Path switch idle time in seconds. This is the period during which no subsequent switching of application traffic path occurs until the switch idle time expires. This idle time starts when application traffic switches the path.

- **Range:** 5 through 300 seconds

type Define SLA rule type.

saas Select SLA rule type sa Software as a Service (SaaS).

To perform AppQoE for SaaS application, you must define an SLA rule as SaaS and use policy-based APBR profile. You must specify SaaS destination server URL in address book configuration.

To configure AppQoE for SaaS applications:

1. Define the SLA rule type as SaaS (`set security advance-policy-based-routing sla-rule sla1 type saas`).
2. Include SaaS server details in the address book (`set security address-book global address` *`address-book`* `dns-name` *`saas-server-url`* `ipv4-only`).
3. Attach the SLA rule to the policy-based APBR profile.

violation-count *number*

Indicates the number of violations that must occur in a sampling-period for a given session before a link is marked as having violated the SLA.

- **Range:** 1 through 32 seconds
- **Default:** 5

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1.

The options `preferred-link-type` and `link-type-affinity` are introduced in Junos OS Release 18.4R1.

The options `sla-export-factor` and `violation-count` are moved to [edit security advance-policy-based-routing sla-rule] hierarchy in Junos OS Release 19.2R1.

The options `preferred-tag` and `affinity` are introduced in Junos OS Release 21.2R1.

           }
           twamp {
               connection name;
               test test-name;
           }
        }
        preference preference;
        tag tag;
    }
 }
```

Hierarchy Level

```
[edit routing-options]
```

Description

(Junos OS Evolved only) You configure this configuration statement when you want to install static routes only if they meet the criteria of a given service level agreement (SLA). You configure an RPM or TWAMP test instance with the criteria for the SLA at either the `[edit services monitoring rpm]` or the `[edit services monitoring twamp]` hierarchy levels. You then configure this statement to couple the SLA-tracked

static route with the configured RPM or TWAMP test instance. The system then installs or removes the static routes according to the results of the given RPM or TWAMP test. When installed, these routes are automatically given a preference of 1, and so are preferred over static routes that may already exist with the same prefix. You use the command `show route sla-tracking` to see the results of the tests.

If the test result is "success," then all SLA-tracked static routes that match the probe owner (RPM), connection name (TWAMP), and the test name of the successful test are added to the routing table and are considered to be in an active state. If the test result is "failure," then all SLA-tracked static routes that match the probe owner (RPM), connection name (TWAMP), and test name of the failed test are placed into an inactive state.

Static route tracking supports both IPv4 and IPv6 routes. SLA-tracked static routes are configured individually; wildcards, ranges, and regular expressions are not supported.

Default

See individual options for any defaults.

Options

metric *metric*

(Optional) Set the route metric for the destination prefix. The route with the lowest metric is active in the routing table.

- **Default:** 1
- **Range:** 1 through 16.

next-hop *next-hop*

(Required) Configure a next-hop address. Must be an IPv4 or IPv6 address. You can configure up to 16 multiple paths (next-hops) for any given SLA-tracked static route.

preference *preference*

(Optional) Set the route preference value for the destination prefix. The route with the lowest preference value is active in the routing table. Qualified next hops are not supported with SLA-tracked static routes. Hence, the setting of the `preference`, `metric`, and `tag` options apply only to the SLA-tracked static route and not to the related next hops.

- **Default:** 1

route *destination-prefix*

(Required) Configure an SLA-tracked static route. Must be an IPv4 or IPv6 destination prefix. The maximum allowed number of SLA-tracked routes is 10000.

rpm owner *name* **test** *test-name*

Associate the path for an SLA-tracked static route with a particular RPM owner and test. You must also configure an RPM test owner and test name using the `owner` statement at the `[edit services monitoring rpm]` hierarchy level.

twamp connection ***name*** **test** ***test-name***	Associate the path for an SLA-tracked static route with a particular TWAMP connection and test. You must also configure a TWAMP control connection and test session using the `control-connection` statement at the `[edit services monitoring twamp client]` hierarchy level.
tag ***tag***	(Optional) Set the route tag value for the destination prefix. The route with the lowest tag value is active in the routing table. • **Default:** 0

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Support introduced in Junos OS Evolved Release 24.4R1.

slaac-snooping

IN THIS SECTION

            duration seconds;
        }
    }
    link-local {
        expiry interval seconds;
    }
    vlans (vlan-name | all);
}
```

Hierarchy Level

```
[edit forwarding-options access-security]
```

Description

Configure IPv6 stateless address auto-configuration (SLAAC) snooping. SLAAC enables an IPv6 client to generate its own addresses using a combination of locally-available information and information advertised by routers through Neighbor Discovery Protocol (NDP). NDP messages are unsecured, which makes SLAAC susceptible to attacks that involve the spoofing (or forging) of link-layer addresses. IPv6 clients using SLAAC for dynamic address assignment are validated against the SLAAC snooping binding table before being allowed access to the network.

SLAAC snooping is similar to DHCP snooping, in that it snoops packets to build a table of IP-MAC address bindings. SLAAC snooping extracts address information from DAD packets exchanged during the SLAAC process to build the SLAAC snooping table. The address bindings in this table are used to inspect and validate NDP/IP packets sent by IPv6 clients using SLAAC.

NOTE: You must configure SLAAC snooping to allow IPv6 clients using SLAAC access to the network.

The remaining statements are explained separately. See CLI Explorer.

Options

`link-local expiry interval` *`seconds`*

Configure the expiration period for a link-local address learned by SLAAC. When the lease for the address expires, the snooping device sends a DAD message with the client address as the target. If the client is still reachable, the lease is renewed.

- **Default:** 86400 seconds
- **Range:** 60 to 86400 seconds

`vlans (`*`vlan-name`*` | all)`

Configure SLAAC snooping on a specific VLAN or on all VLANs.

Required Privilege Level

Description

Configure the timeReceiver with parameters.

> **NOTE**: Multicast mode is not supported on the QFX Series, ACX5448, ACX5448-D, and ACX5448-M devices.

Options

announce-interval

Configure the logarithmic mean interval for the announce messages to be sent by the timeTransmitter.

- **Range:** 0 through 3 seconds
- **Default:** 1

announce-timeout	Specify the number of announce messages a timeReceiver must miss before an announce-timeout is declared. • **Range:** 2 through 10 seconds • **Default:**
delay-request	Configure the logarithmic mean interval in seconds between the delay request messages sent by the timeReceiver to the timeTransmitter. Specify the grant duration value for the announce messages. • **Range:** 60 through 7200 seconds • **Default:** 300 seconds
frequency-only	Configure frequency synchronization.
hybrid	Configure the timing and synchronization feature to operate in Sync-E assisted PTP mode of operation.
interface *<interface-name>*	Interface on which to respond to upstream PTP timeTransmitter, or aggregated Ethernet ID. For example, interface ae0.0.
unicast-mode	Configure the timeReceiver in unicast mode.
clock-source	Configure the IP address of the timeTransmitter.
multicast-mode	Configure multicast transmission of PTP packets between the timeTransmitter node and the timeReceiver node.
transport 802.3	Configure Ethernet as the encapsulation type for transport of PTP packets.
sync-interval	Configure the logarithmic mean interval for sync interval messages to be sent by the timeTransmitter.
unicast-mode	Configure the timeTransmitter in unicast mode.
clock-client	Configure the IP address of the timeReceiver
transport	Configure the encapsulation type for PTP packet transport.
timeTransmitter-asymmetry *<timeTransmitter-asymmetry-value>*	Configure asymmetry for timeTransmitter link of the aggregated Ethernet bundle. (MX10004 Device)

secondary-asymmetry *<secondary-asymmetry-value>*	Configure asymmetry for secondary link of the aggregated Ethernet bundle. (MX10004 Device)
primary *<primary-interface>*	Configure primary interface name for the aggregated Ethernet bundle. (MX10004 Device)
secondary *<secondary-interface>*	Configure primary interface name for the aggregated Ethernet bundle. (MX10004 Device)
local-ip-address	Configure the IP address of the interface acting as the timeReceiver or the timeTransmitter.
local-priority	Configure a clock's local priority to be used as a tie-breaker in the dataset comparison algorithm, if all other attributes of the datasets being compared are equal.
max-announce-interval	Configure the maximum log mean interval between announce messages.
max-delay-response-interval	Configure the maximum log mean interval between delay-response messages.
max-sync-interval	Configure the maximum log mean interval between synchronization messages.
min-announce-interval	Configure the minimum log mean interval between announce messages.
min-delay-response-interval	Configure the minimum log mean interval between delay-response messages.
min-sync-interval	Configure the minimum log mean interval between synchronization messages.

slice (CoS Interfaces)

IN THIS SECTION

- Syntax | 29132
- Hierarchy Level | 29132
- Description | 29133
- Options | 29133
- Required Privilege Level | 29133
- Release Information | 29134

Syntax

```
slice name {
 output-traffic-control-profile profile-name;
}
```

Hierarchy Level

```
[edit class-of-service interfaces],
[edit dynamic-profiles name class-of-service interfaces]
```

Description

Assign output traffic control profiles to slices to provide hierarchical CoS for slices.

At the core of the slice per-hop behavior (PHB) in the data plane is the hierarchical class of service (CoS) queuing. In the network slicing architecture, each slice has a designated queue set consisting of queues corresponding to traditional behavioral aggregate (BA) classifiers. Similar to hierarchical queuing for logical interfaces, you can define hierarchical CoS (HCoS) for transport slices. You can configure up to three levels of HCoS for transport slices:

- Physical or aggregated Ethernet interface (Level 1)
- Individual slices (Level 2)
- Eight queues per slice (Level 3)

NOTE:

- You cannot configure hierarchical CoS for both slices and logical interfaces on the same physical or aggregated Ethernet interface.
- You cannot configure hierarchical CoS for slices on a device if the device also has "policy map" on page 13240 configured.
- You must define the slice name at [`edit services network-slicing`].
- You must enable `enhanced-ip` at [`edit chassis network-services`].
- You must enable `hierarchical-scheduler` at [`edit interfaces` *`interface-name`*].

Options

name	Name of the network slice
output-traffic-control-profile	Name of the traffic control profile

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 22.3R1 for MX Series routers.

smart-check

IN THIS SECTION

- Syntax | 29139
- Hierarchy Level | 29139
- Description | 29139

- Options | 29139
- Required Privilege Level | 29140
- Release Information | 29140

Syntax

```
smart-check {
    ssd-series ssd-series-name {
        id id-num {
            id-threshold id-threshold-value;
            id-value (norm | raw);
            id-flag (high | low);
        }
    }
}
```

Hierarchy Level

```
[edit chassis routing-engine disk]
```

Description

Configure the device to perform health monitoring on the Routing Engine disk and raise alarm when an error occurs. You can specify threshold value for each smart attribute of the solid-state drive (SSD). The device raises an alarm when the threshold is breached. You can view the alarms by using the command `show chassis alarms`.

Options

disk	Configure health check parameters for the SSD.
ssd-series *ssd-series-name*	Specify the SSD series name.

id *id-num*

Specify the ID of the SSD smart attribute for which you are configuring the health check. You can view the smart attributes and their IDs of an SSD by using the command `show vmhost hard-disk-test status disk /dev/sda`.

- **Range:** 1 - 255

id-threshold

Specify the SSD smart attribute threshold, breaching which will result in the device logging a health event or raising an alarm.

id-value

Choose the attribute value type from the following options:

- norm—Use this option to instruct the device to consider normalized value for the specified smart attribute.
- raw—Use this option to instruct the device to consider raw value for the specified smart attribute.

id-flag

Choose the attribute value flag from the following options:

- high—The software considers the threshold to be breached if the value is greater than smart threshold.
- low—The software considers the threshold to be breached if the value is less than smart threshold.

smart-check

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Managing Errors

smart-optimize-timer

IN THIS SECTION

- Syntax | 29141
- Hierarchy Level | 29141
- Description | 29141
- Default | 29142
- Options | 29142
- Required Privilege Level | 29142
- Release Information | 29142

Syntax

```
smart-optimize-timer seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

Description

Enable the smart optimization timer. When you enable the smart optimization timer on a router, the Junos OS operates on the assumption that the original LSP path is preferable to any alternate or secondary path. When you enable the smart optimization timer and an LSP fails and its traffic is switched to an alternate path, the smart optimization timer starts and waits 3 minutes (this time is configurable). After 3 minutes have passed, the LSP is switched back to the original path. If the original path fails again and the LSP is switched to an alternate path again, the router waits 1 hour before attempting to switch the LSP back to its original path.

NOTE: This feature is not applicable for LSPs for which `no-cspf` is configured.

If you want to disable the smart optimizer, you can set it to zero. The `smart-optimize-timer` value in seconds indicates the time before which the LSP is switched back to its primary path in case the primary path becomes available. Otherwise, the time to wait is controlled by the `optimize-timer` , which is usually set to a high value. Some ISPs have the `optimize-timer` set to once a day. Sometimes after the smart optimizer causes the LSP to be placed back on its primary path, the primary path goes down again within 60 minutes. When this happens, the `smart-optimize-timer` is disabled automatically, and the `optimize-timer` (regular path optimization) goes into effect. This is to protect against a flapping link being used.

Default

The smart optimization timer is enabled by default.

Options

seconds—(Optional) Specify the number of seconds to wait before switching an LSP back to its original path. If you do not specify the number of seconds, the default value is used.

- **Range:** 0 through 65,535 seconds
- **Default:** 180 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

smg-service (Enhanced Subscriber Management)

IN THIS SECTION

- Syntax | 29143
- Hierarchy Level | 29143
- Description | 29143
- Required Privilege Level | 29144
- Release Information | 29144

Syntax

```
smg-service {
    failover other-routing-engine;
    traceoptions {
        file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
        flag flag <disable>;
        level level;
        no-remote-trace
    }
}
```

Hierarchy Level

```
[edit system processes]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the

debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure system services, including tracing operations and Routing Engine failover, for the main enhanced subscriber management session management process, `smg-service`.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

snapshot

IN THIS SECTION

- Syntax | 29148
- Hierarchy Level | 29148
- Description | 29149
- Options | 29149
- Required Privilege Level | 29149
- Release Information | 29149

Syntax

```
snapshot {
   configuration;
   no-configuration;
   recovery {
      automatic;
      configuration-only;
      configuration-preference;
      no-automatic;
      on-upgrade;
   }
}
```

Hierarchy Level

```
[edit system]
```

Description

Configure system snapshot options. The `configuration` and `no-configuration` options are used for creating non-recovery snapshots and `recovery` is used for recovery snapshot.

This statement provides flexibility and control over the snapshot process.

Options

configuration Save configuration in snapshot. When you configure the `configuration` option and issue the `request system snapshot` command, it stores the configuration files as part of the non-recovery snapshot.

no-configuration When you configure the `no-configuration` option and issue the `request system snapshot` command, it does not store the configuration files in the non-recovery snapshot.

recovery This option is used for system snapshot recovery management. This option allows you to create recovery snapshots for the purpose of system recovery.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

System-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 24.2R1.

        }
    }
    view view-name {
        oid object-identifier (include | exclude);
    }
}
}
```

Options

`notify` *`name`* is the name assigned to the notification. Each notify entry name must be unique.

`tag` *`tag-name`* defines the target addresses that are sent this notification. The notification is sent to all target addresses that have this tag in their tag list. The *`tag-name`* is not included in the notification.

`type inform` is the type of notification.

`target-address` *`target-address-name`* identifies the target address. The target address defines a management application's address and parameters that are used to respond to informs.

`timeout` *`seconds`* is the number of seconds to wait for an acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted. The default timeout is `15` seconds.

`retry-count` *`number`* is the maximum number of times an inform is transmitted if no acknowledgment is received. The default is `3`. If no acknowledgment is received after the inform is transmitted the maximum number of times, the inform message is discarded.

`message-processing-model` defines which version of SNMP to use when SNMP notifications are generated. Informs require a `v3` message processing model.

`security-model` defines the security model to use when SNMP notifications are generated. Informs require a `usm` security model.

`security-level` specifies whether the inform is authenticated and encrypted before it is sent. For the `usm` security model, the security level must be one of the following:

- `authentication`—Provides authentication but no encryption.
- `privacy`—Provides authentication and encryption.

`security-name` identifies the username that is used when generating the inform.

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure SNMP.

SNMP modules cannot have the slash (/) character or the @ character in the name.

snmp-options

IN THIS SECTION

- Syntax | 29162
- Hierarchy Level | 29162
- Description | 29162
- Options | 29163
- Required Privilege Level | 29163
- Release Information | 29163

Syntax

```
snmp-options {
      backward-traps-only-from-established;
      emit-inet-address-length-in-oid;
}
```

Hierarchy Level

```
[edit protocols bgp]
```

Description

Configure the SNMP options and customize the behavior of BGP-related MIBs. By default, SNMP generates traps when a session moves from a higher state to a lower state. For example, from `Active` to `Idle` or from `Established` to `Idle`. This can result in many uninteresting traps, especially when there are a large number of unconfigured BGP sessions that toggle continuously between`Active` and `Idle` state. Set the `backward-traps-only-from-established` option to eliminate the uninteresting traps, and receive backward trap notifications only when transitioning away from the `Established` state. This can substantially reduce the number of traps sent.

Options

backward-traps-only-from-established Limit the generation of traps for backward transitions to session states that are moving from `Established` state only.

emit-inet-address-length-in-oid Emit Length in OID for InetAddress MIB type.

This option ensures that SNMP objects related to BGP include the length of internet addresses in their Object Identifier (OID), helping network monitoring tools interpret data correctly and comply with standards for accurate reporting.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

snmp-trap-thresholds

IN THIS SECTION

- Syntax | 29165
- Hierarchy Level | 29165
- Description | 29165
- Options | 29165
- Required Privilege Level | 29167
- Release Information | 29167

Syntax

```
snmp-trap-thresholds {
    flows high high-threshold | low low-threshold;
    nat-address-port high high-threshold | low low-threshold;
    }
}
```

Hierarchy Level

```
[edit services service-set service-set-name]
```

Description

Configures SNMP flow thresholds for all flows for a service set or flows for all NAT pools configured for a service set..

Options

The remaining options are described separately.

`flows high` *`high-threshold`*—Configure the upper limit for all flows on the service set. The limit is expressed as a percentage of `max-flows` configured for the service set. When the number of active flows exceeds this limit, an SNMP trap is set.

- **Default:** 90 percent of `max-flows`

`flows low` *`low-threshold`*—Configure the lower limit for all flows on the service set . The limit is expressed as a percentage of `max-flows` configured for the service set. When the number of active flows falls below this limit, an SNMP trap is set.

- **Default:** 70 percent of `max-flows`

`nat-address-port high` *`high-threshold`*—Configure the upper limit for flows for all NAT pools on the service set. The limit is expressed as a percentage of `max-flows` configured for the service set. When the number of active flows exceeds this limit, an SNMP trap is set.

- **Default:** 90 percent of `max-flows`

`nat-address-port low` *`low-threshold`*—Configure the lower limit for flows. The limit is expressed as a percentage of `max-flows` configured for the service set. When the number of active flows falls below this limit, an SNMP trap is set.

- **Default:** 80 percent of `max-flows`

NOTE: SNMP traps that are generated when you modify the threshold value for flows of NAT address pools in a service set (by using the `snmp-trap-thresholds nat-address-port (high` *`high-threshold`* `| low` *`low-threshold`*) statement) are not effective in the PIC. Only the initial threshold value that is set is effective on the PIC and subsequent changes to the threshold value are not reflected on the PIC. As a workaround, for the configuration changes under the `[edit services nat pool` *`nat-pool-name`*`]` hierarchy level, you must deactivate and activate the relevant service-set to enable the updated configuration to become effective. Otherwise, you must reboot the PIC for the updated threshold value of to take effect.

NOTE: Until Junos OS Release 14.1, when the NAT pool utilization exceeded the high threshold value configured, an SNMP trap was sent. However, a similar SNMP trap was not triggered when the NAT pool utilization fell below the configured lower limit or threshold. Because NMS systems are being used to monitor and set alarm for threshold values, the absence of an SNMP trap when the low threshold value was reached caused NMS to retain an active alarm in the alarms list. As a result, starting with Release 14.2R1, an SNMP trap is generated when the NAT pool utilization reaches the lower threshold, thereby causing the alarm in NMS to be reset.

snoop-pseudowires

IN THIS SECTION

- Syntax | 29168
- Hierarchy Level | 29169
- Description | 29169
- Required Privilege Level | 29169
- Release Information | 29169

Syntax

```
snoop-pseudowires;
```

Hierarchy Level

```
[edit routing-instances routing-instance-name igmp-snooping-options],
[edit logical-systems logical-system -name routing-instances routing-instance-nameigmp-snooping-
options]
```

Description

The default IGMP snooping implementation for a VPLS instance adds each pseudowire interface to its **oif** list. It includes traffic from the ingress PE that is sent to egress PE even if there is no interest. The `snoop-pseudowires` option prevents multicast traffic from traversing the pseudowire (to egress PEs) unless there are IGMP receivers for the traffic. In other words, multicast traffic is forwarded only to VPLS core interfaces that are router interfaces, or that are IGMP receivers. In addition to the benefit of sending traffic to only interested PEs, `snoop-pseudowires` also optimizes a common path between PE-P routers wherever possible (so if two PEs connect via the same P router, only one copy of packet is sent; the packet would be replicated only on P routers for which the path is divergent).

NOTE: Note that this option can only be enabled when `instance-type` is *vpls*. The `snoop-pseudowires` option cannot be enabled if `use-p2mp-lsp` is enabled for `igmp-snooping-options`.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

soft-gre

IN THIS SECTION

- Syntax | 29177
- Hierarchy Level | 29177
- Description | 29177
- Options | 29177
- Required Privilege Level | 29178
- Release Information | 29178

Syntax

```
soft-gre group-name {
    destination-networks [prefix];
    dynamic-profile profile-name;
    tunnel {
        tunnel-name {
            remote-address mdu-ip-address;
        }
    }
    service-interface psn;
    source-address wag-ip-address;
    <tunnel-idle-timeout seconds>;
}
```

Hierarchy Level

```
[edit services]
```

Description

Configure the conditions for enabling dynamic-bridged generic routing encapsulation (GRE) tunnel creation on the MX Series router Wi-Fi access gateway (WAG). You can configure the tunnel conditions for both IPv4 and IPv6 networks. The IP addresses for `source-address`, `destination-networks`, and `remote-address` specified in a given soft-GRE group must belong to the same address family. Therefore, you need to use two different Soft-GRE groups to configure both GRE over IPv4 and GRE over IPv6 dynamic or static tunnels.

Options

destination-networks [*prefix*]	Use the specified IP subnets from which soft-GRE connection requests from the customer can be processed.
group-name	Name of the dynamic GRE tunnel group.
dynamic-profile *profile-name*	Name of the dynamic profile that creates the tunnel.

> **NOTE**: To support VLAN autosensing on a GRE tunnel, you must also specify the `auto-configure` options at the `[edit dynamic-profile` *`profile-name`* `interfaces unit]` hierarchy level. These options include a reference to the dynamic profile that creates VLANs.

tunnel ***tunnel-name***

Define static soft GRE tunnels for static subscribers. The `remote-address` is the GRE tunnel endpoint associated with the subscriber, typically the Multi-Dwelling Unit (MDU). Multiple tunnels are supported, each with a unique tunnel name and a unique remote address.

service-interface ps*n*

Use the specified pseudowire subscriber interface device (IFD) on which the tunnels are built.

source-address ***wag-ip-address***

Use the specified source IP address of the GRE tunnels for the WAG. This is the IP address on which incoming GRE traffic must be received by the MX Series router.

tunnel-idle-timeout ***seconds***

(Optional) Use the specified number of seconds that a GRE tunnel remains up after the last subscriber session on the tunnel has ended. If set to 0, then no idle timeout is set, and the tunnel remains up for an unlimited period of time.

- **Range:** 0 through 65535
- **Default:** 120

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2R1.

The option `tunnel` added in Junos OS Release 25.2R1.

Statement support for IPv6 soft-GRE tunnels introduced in Junos OS Release 25.4R1.

softwire-name (Next Gen Services)

IN THIS SECTION

- Syntax | **29187**
- Hierarchy Level | **29188**
- Description | **29188**
- Options | **29188**
- Required Privilege Level | **29188**
- Release Information | **29188**

Syntax

```
softwire-name v6rd-softwire-concentrator {
    ipv4-prefix ipv4-prefix;
    mtu-v4 number-of-bytes;
    softwire-concentrator address;
    softwire-type v6rd;
    v6rd-prefix v6rd-prefix
}
```

Hierarchy Level

```
[edit services softwires]
```

Description

Configure a 6rd softwire concentrator. A 6rd softwire allows an IPv6 end user to send traffic over an IPv4 network to reach an IPv6 network. The softwire concentrator decapsulates IPv6 packets that were encapsulated in IPv4 packets by a software initiator at the customer edge WAN, and forwards the packets for IPv6 routing.

Options

ipv4-prefix ***ipv4-prefix***
IPv4 prefix of the customer edge (CE) network.

mtu-v4 ***number-of-bytes***
The size, in bytes, of the maximum transmission unit for IPv6 packets encapsulated in IPv4. Compute this as the maximum expected IPv4 packet size plus 20. Packets that are larger than the configured value are dropped.

- **Range:** 576 through 9192

softwire-concentrator ***address***
IPv4 address of a softwire concentrator. This is an IPv4 address independent of any interface and on a different prefix.

softwire-name ***v6rd-softwire-concentrator***
Name of the softwire concentrator.

softwire-type v6rd
Sets softwire concentrator type to 6rd.

v6rd-prefix ***v6rd-prefix***
IPv6 prefix for the 6rd domain.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

Syntax

```
softwire-name name {
    mtu-v6 mtu-v6;
    post-fragmentation(off | on);
    power-mode-disable;
    pre-fragmentation(clear-df-bit | off | on);
    services-offload-off;
    softwire-concentrator softwire-concentrator;
    softwire-type(IPv4-in-IPv6);
}
```

Hierarchy Level

```
[edit security softwires],
[edit security softwires softwire-types]
```

Description

Configure softwire object.

Options

mtu-v6

MTU for the softwire tunnel.

- **Range:** 1280 through 9192

post-fragmentation

Post fragmentation options for the softwire tunnel.

- off—Disable post-fragmentation for the softwire tunnel.
- on—Enable post-fragmentation for the softwire tunnel.

power-mode-disable

Power mode disabled for the softwire tunnel.

pre-fragmentation

IP fragmentation options for the softwire tunnel.

- clear-df-bit—Clear df bit of inner v4 packet.
- off—Disable pre-fragmentation for the softwire tunnel.
- on—Enable pre-fragmentation for the softwire tunnel.

services-offload-off

Disable services offload at softwire concentrator level.

softwire-concentrator

Concentrator address

softwire-type

Softwire-type

IPv4-in-IPv6—Ipv4-in-IPv6

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 24.2R1.

softwire-options

IN THIS SECTION

- Syntax | 29191
- Hierarchy Level | 29191
- Description | 29191
- Options | 29191
- Required Privilege Level | 29192
- Release Information | 29192

Syntax

```
softwire-options {
    dslite-ipv6-prefix-length dslite-ipv6-prefix-length ;
}
```

Hierarchy Level

```
[edit services service-set service-set-name]
```

Description

Specify the IPv6 prefix length associated with a subscriber's basic broadband bridging device that is subject to a limited number of sessions.

This feature is supported on MX Series routers equipped with MS-DPCs. Starting in Junos OS Release 18.2R1, this option is also supported on MS-MPCs and MS-MICs.

Options

dslite-ipv6-prefix-length Subnet prefix representing the size of the subnet subject to session limitation.

- **Values:** 56, 64, 96, 128
- **Default:** 0—no limitation.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

Support added in Junos OS 20.2R1 for Next Gen Services on MX240, MX480, and MX960 routers.

        v6rd-prefix ipv6-prefix;
        mtu-v4 mtu-v4;
    }
}
```

Hierarchy Level

```
[edit services softwires]
```

Description

Configure ds-lite, 6rd and MAP-E softwire objects.

Options

The following options are available for each type of softwire:

ds-lite	Specify options for DS-Lite softwites.
v6rd	Specify options for v6rd softwites.
map-e	Specify options for map-e softwires.
auto-update-mtu	This option is not currently supported.
copy-dscp	Copy DSCP information to IPv4 headers during decapsulation.
flow-limit	—Maximum number of IPv4 flows per softwire.
ipv4-prefix	IPv4 prefix of the customer edge (CE) network
mtu-v4	Maximum transmission unit (MTU), in bytes (576 through 9192), for IPv6 packets encapsulated into IPv4. If the final length is greater than the configured value, the IPv4 packet is dropped. This option is mandatory except for DS-Lite softwires since it depends on other network parameters under administrator control.
mtu-v6	Maximum transmission unit when encapsulating IPv4 packets into IPv6. If the final length is greater than the MTU, the IPv6 packet is fragmented. This option is mandatory since it depends on other network parameters under administrator control.
session-limit-per-prefix	Maximum number of sessions per B4 subnet prefix.
softwire-concentrator	Specify the IP address of the softwire concentrator.
softwire-type	Sets softwire concentrator type to 6rd. • **Values:** v6rd
v6rd-prefix	IPv6 prefix for the 6rd domain.

For map-e softwires:

Options for MAP-E rules:

name

Name of the MAP-E softwire domain name.

br-address

Specify the Border Relay (BR) device unicast IPv6 address as the softwire concentrator IPV6 address.

version

3(Optional) Configure version number to distinguish between currently supported version of the Internet draft draft-ietf-softwire-map-03 (expires on July 28, 2013), *Mapping of Address and Port with Encapsulation (MAP)* and the latest available version.

rule

Specify the name of Map-E the rule.

v4-reassembly | v6-reassembly

(Optional) Enable IPv4 and IPv6 reassembly for MAP-E.

disable-auto-route

Disable auto-routes and enable static routes to facilitate ECMP load balancing.

> **NOTE**: When you enable the `disable-auto-route` option, you must configure static routes.

ipv4-prefix

Configure rule for IPv4 prefix of the MAP-E domain.

ipv6-prefix

Configure rule for IPv6 prefix of the MAP-E domain.

ea-bits-length

Configure rule for Embedded Address (EA) length for the MAP-E domain.

- **Range:** 0 through 48

psid-length

Configure Port Set ID (PSID) length value for the MAP-E domain.

> **NOTE**:
>
> - If the sum of `v4-prefix-len` and `ea-bits-len` is less than 32, then the `psid-len` must be equal to the difference between 32 and the sum total of `v4-prefix-len` and `ea-bits-len`.

- **Range:** 0 through 16

psid-offset

(Optional) Configure PSID offset value for the MAP-E domain.

- **Default:** 4
- **Range:** 0 through 16

mtu-v6 (Optional) Specify the Maximum transmission unit (MTU) for the MAP-E softwire tunnel.

- **Default:** 9192
- **Range:** 1280 through 9192

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.2 for Next Gen Services on MX240, MX480 and MX960.

- Hierarchy Level | 29211
- Description | 29211
- Options | 29212
- Required Privilege Level | 29212
- Release Information | 29212

Syntax

```
source url;
```

Hierarchy Level

```
[edit system scripts commit file filename]
```

Description

Specify the location of the master source file for a commit script. When you issue the `set refresh` configuration mode command at the same hierarchy level, the local copy of the script is overwritten by the version stored at the specified URL. If the `load-scripts-from-flash` statement is configured, the device refreshes the scripts on the flash drive instead of the hard disk.

NOTE: On the QFabric system, commit scripts are stored in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit/** directory on the Director device.

Options

url The source specified as an HTTPS URL, HTTP URL, FTP URL, or scp-style remote file specification.

If you specify an HTTPS URL, you must also configure the `cert-file` statement at the same hierarchy level. Specify the path to the certificate (Root CA or self-signed) that the device will use to validate the server's certificate when you refresh the script.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 7.4.

source (Multicast VLAN Registration)

IN THIS SECTION

- Syntax | 29223
- Hierarchy Level | 29223
- Description | 29224
- Default | 29224
- Options | 29224
- Required Privilege Level | 29224
- Release Information | 29224

Syntax

```
source {
    groups group-prefix;
}
```

Hierarchy Level

```
[edit protocols igmp-snooping vlan  vlan-name data-forwarding]
```

Description

Configure a VLAN to be a multicast source VLAN (MVLAN), and specify the IP address range of the multicast source groups.

To configure a data-forwarding VLAN as an MVLAN, you also configure one or more multicast receiver VLANs (MVR receiver VLANs) with hosts that might be interested in receiving traffic on the MVLAN for the specified multicast groups. You can configure a VLAN as either an MVLAN or MVR receiver VLAN, but not both at the same time.

> **NOTE**: On EX4300 and EX4300 multigigabit switches, you can configure up to 10 MVLANs, and up to a total of 4K MVR receiver VLANs and MVLANs together. On EX2300 and EX3400, you can configure up to 5 MVLANs and the remaining configurable VLANs can be MVR receiver VLANs.

The remaining statement is explained separately. See CLI Explorer.

Default

Disabled

Options

groups *group-prefix* — IP address range of the source groups. Each MVLAN must have exactly one `groups` statement. If there are multiple MVLANs on the switch, their group ranges must be unique.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

tunnel family intet | inet6mdt threshold group group-address],
[edit routing-instances routing-instance-name protocols pim mdt threshold group group-address],
[edit routing-instances routing-instance-name provider-tunnel family intet | inet6mdt threshold
group group-address]
```

Description

Establish a threshold to trigger the automatic creation of a data MDT for the specified unicast address or prefix of the source of multicast information.

Options

source-address—Explicit unicast address of the multicast source.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4. In Junos OS Release 17.3R1, the `mdt` hierarchy was moved from `provider-tunnel` to the `provider-tunnel family inet` and `provider-tunnel family inet6` hierarchies as part of an upgrade to add IPv6 support for default MDT in Rosen 7, and data MDT for Rosen 6 and Rosen 7. The `provider-tunnel mdt` hierarchy is now hidden for backward compatibility with existing scripts.

            zone [zone-name];
        }
    }
}
```

Hierarchy Level

```
[edit security nat source pool pool-name port]
```

Description

Configure source NAT, which allows you to configure the following:

- Translate source IP address or addresses to the egress interface's IP address.
- Translate a range of source IP addresses to another range of IP addresses. This mapping is dynamic and without PAT.
- Translate a range of source IP addresses to another range of IP addresses. This mapping is dynamic and with PAT.
- Translate a range of source IP addresses to another range of IP addresses. This mapping is one-to-one, static, and without PAT.

Options

enhanced-port-overloading-algorithm	The hash algorithm uses destination IP and port to calculate the port overloading index.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Statement modified in Junos OS Release 9.6. The `description` option added in Junos OS Release 12.1. Statement modified in Junos OS Release 12.1X45-D10. Statement modified in Junos OS Release 12.1X47-D10. Statement modified in Junos OS Release 12.3X48-D10. Statement modified in Junos OS Release 15.1X49-D60. The `enhanced-port-overloading-algorithm` option added in Junos OS Release 22.4R1.

source (SNMP Scripts)

IN THIS SECTION

- Syntax | 29240
- Hierarchy Level | 29240
- Description | 29240
- Options | 29240
- Required Privilege Level | 29240
- Release Information | 29240

Syntax

```
source url;
```

Hierarchy Level

```
[edit system scripts snmp file filename]
```

Description

Specify the location of the master source file for an SNMP script. When you issue the `set refresh` configuration mode command at the same hierarchy level, the local copy of the script is overwritten by the version stored at the specified URL. If the `load-scripts-from-flash` statement is configured, the device refreshes the scripts on the flash drive instead of the hard drive.

Options

url The source specified as an HTTPS URL, HTTP URL, FTP URL, or scp-style remote file specification.

If you specify an HTTPS URL, you must also configure the `cert-file` statement at the same hierarchy level. Specify the path to the certificate (Root CA or self-signed) that the device will use to validate the server's certificate when you refresh the script.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

RELATED DOCUMENTATION

- Hierarchy Level | 29243
- Description | 29243
- Options | 29243
- Required Privilege Level | 29244
- Release Information | 29244

Syntax

```
source interfaces (external | interface-name)
    hold-off-time time;
    priority number;
    quality-level (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3 | st3e | st4 | stu | tnc);
    request (force-switch | lockout);
    wait-to-restore minutes;
```

```
    aggregated-ether aggregated-ether-group-name;
}
```

Hierarchy Level

```
[edit chassis synchronization]
```

Description

Configure the clock source that is used by the clock selection process on an interface.

- (SCB only) Specify the timeTransmitter clock source as the external-a interface and the secondary clock source as the external-b interface. The clock source is chosen using the clock selection process.
- (SCBE only) Specify the external interface to select the external clock source.
- (SCBE2 only) Specify the external-0/0 interface or the external-1/0 interface to select the external clock source.

Options

time Amount of time in milliseconds that a signal is held before being passed to the clock selection process.

Range: 300–1800 milliseconds

Default: 1000 milliseconds

number Set the priority level of the clock source.

Range: 1 through 5

`prc`—Primary reference clock

`prs` —Primary reference source—Stratum 1

`sec`—SDH equipment clock

`smc`—SONET minimum clock

`ssu-a`—Synchronization supply unit A

`ssu-b`—Synchronization supply unit B

st2—Stratum 2

st3—Stratum 3

st3e—Stratum 3E

st4—Stratum 4

force-switch Force switching to a clock source, provided the clock source is enabled and not locked out. Only one configured source may be force-switched.

lockout Clock source is not considered by the selection process. Lockout may be configured for any source.

minutes Set the time for the port signal to be up before the port is opened to receive and transmit ESMC messages.

Range: 0 through 12 minutes

Default: 5 minutes

aggregated-ether-group-name aggregated ethernet group name

Required Privilege Level

interface—To view this statement in the configuration.

```
source-address address;
```

Hierarchy Level

```
[edit security utm default-configuration web-filtering juniper-enhanced server]
[edit security utm default-configuration web-filtering websense-redirect server]
[edit security utm default-configuration anti-virus sophos-engine server]
[edit security utm feature-profile web-filtering websense-redirect profile profile-name server]
```

Description

You can configure source address for Enhanced Web Filtering (EWF) cloud service, websense redirect policy service, antivirus scan service, and antispam scan service. Configuring a source address for these Content Security services enhance the network disaster recovery. Since the antivirus and antispam scan services shares the same Domain Name Service (DNS) to forward the scan request, they share the same source address configuration under Sophos antivirus engine server.

The source address configuration is optional. If you do not configure the source address, the Content Security find the route and get the source address.

Options

address	Source address.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.1R1.

Statement introduced in Junos OS Release 19.3R2.

source-address (Next Gen Services Service-Set Remote System Logging)

IN THIS SECTION

- Syntax | 29261
- Hierarchy Level | 29262
- Description | 29262
- Required Privilege Level | 29262
- Release Information | 29262

Syntax

```
source-address address;
```

Hierarchy Level

```
edit services service-set name syslog
```

Description

Specify the IP address of the source for Next Gen Services system log messages.

BEST PRACTICE: The syslog source address can be any arbitrary IP address. It does not have to be an IP address that is assigned to the device. Rather, this IP address is used on the syslog collector to identify the syslog source. The best practice is to configure the source address as the IP address of the interface that the traffic is sent out on.

Required Privilege Level

system

```

Description

Specify the source IP address used for probes. If the source IP address is not one of the router's or switch's assigned addresses, the packet uses the outgoing interface's address as its source. Prior to Junos OS Evolved Release 23.1R1, only IPv4 addresses are supported for Junos OS Evolved.

The following addresses cannot be used for the source IP address used for probes:

- 0.0.0.0
- 127.0.0.0/8 (loopback)
- 224.0.0.0/4 (multicast)
- 255.255.255.255 (broadcast)
- ::/128
- ::1/128 (loopback)
- fc00::/7 (unique-local)
- 2001:db8::/32 (documentation prefix)
- 2002::/16 (6to4)
- 5f00::/8 (6bone)
- 2001:10::/28 (ORCHID)
- 2001::/32 (Teredo)
- ::/0 (default route)
- ff00::/8 (multicast)
- :ffff:0:0/96 (IPv4-mapped addresses)

Options

address—Valid IP address. You cannot configure this statement if the address configured for the `target` statement is an IPv6 link-local address.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.3 for EX Series switches.

Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport routers.

Statement introduced in Junos OS Evolved Release 20.1R1.

Support for IPv6 addresses added in Junos OS Evolved 23.1R1.

source-address (SNMP)

IN THIS SECTION

- Syntax | 29285
- Hierarchy Level | 29285
- Description | 29285
- Options | 29285
- Required Privilege Level | 29286
- Release Information | 29286

Syntax

```
source-address address;
```

Hierarchy Level

```
[edit snmp trap-options]
```

Description

Set the source address of every SNMP trap packet sent by this router to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.

Options

address—Source address of SNMP traps. You can configure the source address of trap packets two ways: `lo0` or a valid IPv4 address configured on one of the router interfaces. The value `lo0` indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface `lo0`.

- **Default:** Disabled. (The source address is the address of the outgoing interface.)

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

source-address (SRC Software)

IN THIS SECTION

source-address (System Logging)

IN THIS SECTION

- Syntax | 29289
- Hierarchy Level | 29289

- Description | 29289
- Options | 29289
- Required Privilege Level | 29289
- Release Information | 29290

Syntax

```
source-address source-address <routing-instance routing-instance-name>;
```

Hierarchy Level

```
[edit system syslog]
```

Description

Specify a source address to record in system log messages that are directed to a remote machine.

Options

source-address—A valid IP address configured on one of the device interfaces. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all `host hostname` statements at the `[edit system syslog]` hierarchy level, but not for messages directed to the other Routing Engine.

`routing-instance routing-instance-name`—(Optional) The routing instance name in which the source address is defined.

- **Default:** The primary address of the interface

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

source-address (TWAMP)

IN THIS SECTION

- Syntax | 29290
- Hierarchy Level | 29290
- Description | 29290
- Default | 29291
- Options | 29291
- Required Privilege Level | 29291
- Release Information | 29292

Syntax

```
source-address address;
```

Hierarchy Level

```
[edit services rpm twamp client control-connection connection-name test-session session-name
```

Description

Specify the source IP address used for probes. If the source IP address is not one of the router's or switch's assigned addresses, the packet uses the outgoing interface's address as its source.

The following IPv4 addresses cannot be used as the source IP address used for probes:

- 0.0.0.0

- 127.0.0.0/8 (loopback)
- 224.0.0.0/4 (multicast)
- 255.255.255.255 (broadcast)

The following IPv6 addresses cannot be used as the source IP address used for probes:

- ::/128
- ::1/128 (loopback)
- fc00::/7 (unique-local)
- 2001:db8::/32 (documentation prefix)
- 2002::/16 (6to4)
- 5f00::/8 (6bone)
- 2001:10::/28 (ORCHID)
- 2001::/32 (Teredo)
- ::/0 (default route)
- ff00::/8 (multicast)
- :ffff:0:0/96 (IPv4-mapped addresses)

Default

The source address is selected based on the available default route.

Options

address Valid IPv4 or IPv6 address. You can only specify an IPv6 address as the source address if the source address corresponds to a TWAMP Light IPv6 link-local target address.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.4R1.

source-address

IN THIS SECTION

- Syntax | 29292
- Hierarchy Level | 29292
- Description | 29292
- Required Privilege Level | 29293
- Release Information | 29293

Syntax

```
source-address ip-address;
```

Hierarchy Level

```
[edit firewall family family-name filter filter-name term term-name from],
[edit firewall family family-name filter filter-name term term-name from ip-version ip-version]
```

Description

IP source address field, which is the address of the source node sending the packet. You cannot specify the `source-address` and `address` match conditions in the same term.

For IPv4, the source-address field is 32 bits in length. The filter description syntax supports either a mask value that can be noncontiguous, such as 10.0.0.10/255.0.0.255, or prefix notation such as 10.0.0.0/8. Simple filters do not support noncontiguous mask values.

For IPv6, the source-address field is 128 bits in length. The filter description syntax supports the text representations for IPv6 addresses that are described in RFC 2373, *IP Version 6 Addressing Architecture*.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1R1.

source-address-filter (Interfaces)

IN THIS SECTION

Syntax | 29295

- Hierarchy Level | 29295
- Description | 29295
- Options | 29295
- Required Privilege Level | 29296
- Release Information | 29296

Syntax

```
source-address-filter mac-address;
```

Hierarchy Level

```
[edit interfaces interface-name redundant-ether-options]
```

Description

For redundant Ethernet interfaces, specify the MAC addresses from which the interface can receive packets. For this statement to have any effect, you must include the `source-filtering` statement in the configuration to enable source address filtering.

Be sure to update the MAC address if the remote Ethernet card is replaced. Replacing the interface card changes the MAC address. Otherwise, the interface cannot receive packets from the new card.

NOTE:

- Software based MAC limiting is supported on SRX300, SRX320, and SRX340 devices.

  A maximum of 32 devices are supported per device.

Options

mac-address —MAC address filter. You can specify the MAC address as six hexadecimal bytes in one of the following formats: *nn:nn:nn:nn:nn:nn* (for example, `00:11:22:33:44:55`) or *nnnn:nnnn:nnnn* (for example, `0011.2233.4455`). You can configure up to 64 source addresses. To specify more than one address, include multiple *mac-address* options in the `source-address-filter` statement.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

RELATED DOCUMENTATION

Understanding Ethernet Interfaces

source-address-filter

IN THIS SECTION

- Syntax | 29296
- Hierarchy Level | 29297
- Description | 29297
- Options | 29297
- Required Privilege Level | 29297
- Release Information | 29297

Syntax

```
source-address-filter {
    mac-address;
}
```

Hierarchy Level

```
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]
```

Description

For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), specify the MAC addresses from which the interface can receive packets. For this statement to have any effect, you must include the `source-filtering` statement in the configuration to enable source address filtering.

Options

mac-address—MAC address filter. You can specify the MAC address as *nn*:*nn*:*nn*:*nn*:*nn*:*nn* or *nnnn*.*nnnn*.*nnnn*, where *n* is a decimal digit. To specify more than one address, include multiple *mac-address* options in the `source-address-filter` statement.

If you enable the VRRP on a Fast Ethernet or Gigabit Ethernet interface, as described in VRRP and VRRP for IPv6 Overview, and if you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the `source-address-filter` statement. MAC addresses ranging from `00:00:5e:00:01:00` through `00:00:5e:00:01:ff` are reserved for VRRP, as defined in RFC 3768, *Virtual Router Redundancy Protocol*. When you configure the VRRP group, the group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

On untagged Gigabit Ethernet interfaces, you should not configure the `source-address-filter` statement and the `accept-source-mac` statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the `source-address-filter` statement and the `accept-source-mac` statement with an identical MAC address specified in both filters.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

source-address-filter-list (Create List)

```
source-address-filter-list source-address-filter-list-name;
```

Hierarchy Level

```
[edit logical-systems logical-system-name policy-options],
[edit policy-options]
```

source-address-filter-list (Use list)

```
source-address-filter-list source-address-filter-list-name;
```

Hierarchy Level

```
[edit logical-systems logical-system-name policy-statement policy-statement-name term term-name
from],
[edit policy-options policy-statement policy-statement-name term term-name from]
```

Description

The source address filter list is a user configured list of individual source address filters, typically used to match an incoming route address to unicast source addresses in Multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments, that you create at the `[edit policy-options]` hierarchy level. Each item in the list consists of a complete source address filter statement, made up of a source-prefix address, a match-type, and an optional action.

For example:

```
[edit]
user@router# show policy-options source-address-filter-list saf-test-list
203.0.113.0/26 exact;
192.0.2.0/24 longer accept;
198.51.100.8/29 exact reject;
```

Once configured, `source-address-filter-list` is used by referencing its *`source-address-filter-list-name`* in a `policy-statement` at the `[edit policy-options policy-statement` *`policy-statement-name`* `term` *`term-name`* `from]` hierarchy level. Source address filter lists can be used in conjunction with other `source-address-filter` statements.

For example:

```
[edit]
user@router# show policy-options policy-statement test-saf-list-statement
from {
source-address-filter 198.51.100.16/29 exact accept;
source-address-filter-list saf-test-list;
}
then reject;
```

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement first introduced in Junos OS Release 16.1 on M Series, MX Series, and T Series.

source-address-giaddr

IN THIS SECTION

- Syntax | 29300
- Hierarchy Level | 29300

Syntax

```
source-address-giaddr;
```

Hierarchy Level

```
[edit forwarding-options helpers bootp],
[edit forwarding-options helpers bootp interface interface-name]
```

Description

Configure the gateway IP address (giaddr) as the source IP address of the switch for relayed DHCP packets when the switch is used as the DHCP relay agent.

When this statement is entered in the [**edit forwarding-options helpers bootp**] hierarchy, the gateway IP address is configured as the source IP address of the switch for relayed DHCP packets exiting all interfaces on the switch.

When this statement is entered in the [**edit forwarding-options helpers bootp interface** *interface-name*] hierarchy, the gateway IP address is configured as the source IP address of the switch for relayed DHCP packets exiting the specified interface of the switch.

In Junos OS Release 10.1 for EX Series switches and later releases, the IP address of the interface that the DHCP packet exits on the switch acting as a DHCP relay agent is used as the source IP address for relayed DHCP packets by default.

In Junos OS Releases 9.6 and 10.0 for EX Series switches, the gateway IP address of the switch is always used as the source IP address for relayed DHCP packets when the switch is used as the DHCP relay agent.

In Junos OS Releases 9.3 through 9.5 for EX Series switches, the IP address of the interface that the DHCP packet exits on the switch acting as a DHCP relay agent is always used as the source IP address for relayed DHCP packets.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

Configuring the Control Source

source-attachment-identifier (Protocols VPWS)

IN THIS SECTION

- Syntax | 29315
- Hierarchy Level | 29315
- Description | 29315
- Options | 29315
- Required Privilege Level | 29315
- Release Information | 29316

Syntax

```
source-attachment-identifier identifier;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
l2vpn site site-name],
[edit routing-instances routing-instance-name protocols l2vpn site site-name]
```

Description

For FEC 129, specify the VPWS source attachment identifier. The point-to-point nature of VPWS requires that you specify the source access individual identifier (SAII) and the target access individual identifier (TAII). This SAII-TAII pair defines a unique pseudowire between two PE devices.

Auto-discovery routes are used by BGP to allow auto-discovery of remote source access individual identifiers (SAIIs) (the sources of the point-to-point pseudowires). One auto-discovery route is advertised for each source attachment identifier (SAI) in the instance or mesh group.

The SAII is specified with the `source-attachment-identifier` statement within the FEC 129 VPWS routing instance. You configure the source attachment identifier and the interfaces to associate with that source attachment identifier. Under each interface, you can configure the TAII with the `target-attachment-identifier` statement. If the configured target identifier matches a source identifier advertised by a remote PE device by way of a BGP auto-discovery message, the pseudowire between that source-target pair is signaled. If there is no match between an advertised source identifier and the configured target identifier, the pseudowire is not established.

Options

identifier—The numerical identifier for the Layer 2 VPN site.

- **Range:** 1 through 4,292,967,295

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

source-based-forwarding

IN THIS SECTION

- Syntax | **29316**
- Hierarchy Level | **29316**
- Description | **29317**
- Required Privilege Level | **29320**
- Release Information | **29320**

Syntax

```
source-based-forwarding next-hop next-table forwarding table name
```

Hierarchy Level

```
[edit policy-options policy-statement policy name term term name then]
```

Description

Source based forwarding is used to provide value added services where paths through the network are selected based on the packet's source address. In some deployments, the destination node of the packet, identified by the protocol next hop, stays the same, but the path through the network may vary.

In some deployments, the destination of the packet changes too. In this scenario, separate forwarding tables are used for traffic forwarding, and traffic is steered into these tables based on the packet's source address.

PTX routers provide a mechanism to conditionally route a packet with a specific source IP address via a specific forwarding table. When a packet arrives at the router interface, the source IP address information is retrieved from the packet, and a source lookup is performed in the forwarding table using the packet's source IP address. If a match is found in the forwarding table, the matching route in the forwarding table has the details on which forwarding table to lookup the destination IP address for this packet. Subsequently, the destination IP address and next-hop is used from the designated forwarding table to forward the packet.

This type of conditional traffic steering is done only after initial configuration. You initially configure policy options and within the policy options, under a policy statement, for a match criteria, specify the forwarding table for this route, from where the destination IP address and next-hop is retrieved to forward the packet. In the following example, a packet with BGP community *c1* is matched in the *from* clause, and the matching packet's forwarding table specified in the *then* clause.

```
policy-options {

policy-statement p1 {

    term t1 {

        from community c1;

        then {

            source-based-forwarding {

                next-hop {
                             next-table foo.inet.0;
                        }

            }
```

```
        }

    }

}

}
```

You then include the policy in a forwarding table export policy.

```
routing-options {
 forwarding-table {
 export pl;
 }
}
```

You have to enable the interface to do a source lookup when the packet arrives at the interface - you use the `source-lookup` configuration statement to enable the interface to do a source lookup. You can enable `source-lookup` per interface, per routing protocol family, for INET or INET6. You cannot use `source-lookup` along with Source Class Usage (SCU). In the following example, `source-lookup` is enabled for an interface at the `[edit interfaces]` hierarchy of the CLI.

```
et-0/0/1 {
 unit 0 {
 family inet {
 source-lookup;
             }
      }
}
```

NOTE:

- Only the table prefixes - inet.0, inet6.0 and instance tables (including L3vVPN prefixes) are supported.

- The `source-lookup` configuration statement cannot be used alongside source-class-usage configuration statement (`set interfaces` *`interface name`* `unit` *`unit number`* `family` *`routing protocol family source-class-usage`*). But because `souce-lookup` is enabled per family for INET or INET 6, there can be a situation where INET has `source-lookup` enabled and INET6 has source-class-usage enabled - this use case is supported.

- After configuring the policy, issue `show policy` *`policy name`* to display the configured policy, like in the following example.

```
{master}[edit]
host@router# run show policy p1
Policy p1: [RESOLVED]
 Term unnamed:
   from
       route filter:
             10.0.0.8/32 orlonger
    then
       source-based-forwarding
              next-hop next-table: VRF1.inet.0
```

- You can use the `show route extensive` command to display whether a source-lookup for the route is being performed. In the following output, the `Opaque Data` field displays Source Based Forwarding details.

```
{master}[edit]
root@R11_re0# run show route 10.0.0.8/32 extensive
inet.0: 15 destinations, 15 routes (15 active, 0 holddown, 0 hidden)

source-bmac

IN THIS SECTION

- Syntax | 29321
- Hierarchy Level | 29321
- Description | 29321

- Options | 29321
- Required Privilege Level | 29322
- Release Information | 29322

Syntax

```
source-bmac <mac-address> <length> [auto];
```

Hierarchy Level

```
[edit interfaces interface-name unit unit esi],
[edit routing-instances routing-instance-name service-groups service-group-name pbb-service-
options ]
```

Description

Set a shared source Provider Backbone Bridging (PBB) MAC (B-MAC) address for all service identifiers (ISIDs) under a specified routing instance. If a source B-MAC address is derived automatically from the aggregated Ethernet system ID, you must specify the `auto` keyword.

For PBB-Ethernet VPN (EVPN) functionality, one service group (a group of ISIDs) can correspond to a single-homed, single-Active, or Active-Active scenario. You cannot mix and match service groups. For a shared B-MAC model, you configure one source B-MAC per service group using the `routing-instances` *`routing-instance-name`* `service-groups` *`service-group-name`* `pbb-service-options` hierarchy.

To specify a source B-MAC per ISID, use the `routing-instances` *`routing-instance-name`* `service-groups` *`service-group-name`* `pbb-service-options isid` *`isid-name`* hierarchy. If you do not specify the source B-MAC per ISID, then the B-MAC inherits from the B-MAC configuration located under the `pbb-service-options` setting.

The support of the `source-bmac` statement at the `[edit interfaces` *`interface-name`* `unit` *`unit`* `esi]` hierarchy level allows configuring of the Ethernet Segment Identifier (ESI) and source B-MAC address per logical interface, in addition to the existing support for physical devices.

Options

Length Length of the B-MAC address.

- **Default:** 48B

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

Support at the `[edit interfaces interface-name unit unit esi]` hierarchy level introduced in Junos OS Release 18.1R1.

source-checking;
```

Hierarchy Level

```
[edit forwarding-options family inet6]
```

Description

(MX Series 5G Universal Routing Platforms Only) Discard IPv6 packets when the source address type is unspecified, loopback, multicast, or link-local unicast.

RFC 4291, *IP Version 6 Addressing Architecture*, refers to four address types that require special treatment when they are used as source addresses. The four address types are:

- Unspecified--The IPv6 unspecified address is 0:0:0:0:0:0:0:0, which can be notated as ::/128.
- Loopack--The IPv6 loopback address is 0:0:0:0:0:0:0:1, which can be notated as ::1/128.
- Multicast--IPv6 multicast addresses use the prefix FF00::/8.
- Link-Local--IPv6 link-local addresses have the prefix FE80::/10.

The loopback and multicast addresses must never be used as a source address in IPv6 packets. The unspecified and link-local addresses can be used as source addresses but routers must never forward packets that have these addresses as source addresses. Typically, packets that contain unspecified or link-local addresses as source addresses are delivered to the local host. If the destination is not the local host, then the packet must not be forwarded. Configuring this statement filters or discards IPv6 packets of these four address types.

Required Privilege Level

Syntax

```
source-end-user-profile device-identity-profile-name;
```

Hierarchy Level

```
[edit security policies from-zone from-zone to-zone to-zone policy policy-name match]
```

Description

The `source-end-user-profile` field in a security policy enables you to specify a device identity profile that identifies the traffic source based on the device from which the traffic issued. The security policy action is applied to traffic issuing from a device if the device matches the attributes specified in the profile and it matches the rest of the security policy parameters.

The device identity profile feature provides a solution for cases in which you cannot or do not want to use the user identity to control access to network resources. The device identity feature allows you to use the identity of a device and its attributes to control access to network resources instead of the identity of the user of that device.

You might want to control network access based on the device identity for various reasons. For example, you might allow your users to use their own devices (BYOD) to access network resources and you do not want to use captive portal authentication. Also, some companies might have older switches that do not support 802.1, or they might not have a Network Access Control (NAC) system.

Options

device-identity-profile-name	Device identity profile that specifies characteristics that can apply to one or more devices.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D70.

source-except

IN THIS SECTION

- Syntax | 29333
- Hierarchy Level | 29333
- Description | 29333
- Options | 29333
- Required Privilege Level | 29333
- Release Information | 29334

Syntax

```
source-except [address-name];
```

Hierarchy Level

```
[edit security idp idp-policy policy-name rulebase-exempt rule rule-name match]
[edit security idp idp-policy policy-name rulebase-ips rule rule-name match]
```

Description

Specify a source IP address or IP address set object to specify all source address objects except the specified address objects. The default value is any.

Options

address-name—IP address or IP address set object.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

source-filtering (Interfaces)

IN THIS SECTION

- Syntax | 29334
- Hierarchy Level | 29334
- Description | 29334
- Required Privilege Level | 29335
- Release Information | 29335

Syntax

```
(source-filtering | no-source-filtering);
```

Hierarchy Level

```
[edit interfaces interface-name redundant-ether-options]
```

Description

For redundant Ethernet interfaces, enable the filtering of MAC source addresses, which blocks all incoming packets to that interface. To allow the interface to receive packets from specific MAC addresses, include the `source-address-filter` statement.

If the remote Ethernet card is changed, the interface cannot receive packets from the new card because it has a different MAC address.

By default, source address filtering is disabled.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

- Release Information | 29336

Syntax

```
(source-filtering | no-source-filtering);
```

Hierarchy Level

```
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]
```

Description

For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and Gigabit Ethernet IQ interfaces only, enable the filtering of MAC source addresses, which blocks all incoming packets to that interface. To allow the interface to receive packets from specific MAC addresses, include the `source-address-filter` statement.

If the remote Ethernet card is changed, the interface is no longer able to receive packets from the new card because it has a different MAC address.

Default

Source address filtering is disabled.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Release Information | 29341

Syntax

```
source-id source-id;
```

Hierarchy Level

```
[edit services flow-monitoring version9 template template-name]
```

Description

For version 9 flows, a 32-bit value that identifies the Exporter Observation Domain is called the source ID. NetFlow collectors use the combination of the source IP address and the source ID field to separate different export streams originating from the same exporter.

MX and QFX Series: Typically, this attribute is used to limit the scope of other information elements. If the observation domain is not unique, the collector cannot uniquely identify an version 9 device. If you configure the same source ID for different template types, such as for IPv4 and IPv6, it does not impact flow monitoring because the actual or the base source ID is transmitted in the flow. The actual source ID is derived from the value you configure and plus other parameters such as the slot number, lookup chip (LU) instance, and Packet Forwarding Engine instance. Such a method of computation of the observation domain ID ensures that this ID is not the same for two version 9 devices.

PTX Series: When you configure the source ID, the software attaches the ID to a particular template type. If you configure the same source ID for two different template types, such as for IPv4 and IPv6, this does not impact flow monitoring, because the configured ID is not what is being sent. The value sent in the packets is derived from that configured value and the FPC slot value. This method ensures two version 9 devices can never have the same value of observation domain ID.

Options

source-id—Identifier for the source for version 9 flows.

- **Range:** 0 through 255

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

Statement introduced in Junos OS Evolved 22.4R1.

```

```
[edit security policies global policy policy-name match]
```

```
[edit security advance-policy-based-routing from-zone zone-name policy policy-name match]
```

Description

Identifies users and roles to be used as match criteria for a policy. If a value other than `any` is specified as match criteria for a policy within a zone pair, the traffic is matched to table entries to retrieve associated user and roles before policy lookup occurs. Users and roles are retrieved from the local authentication table or from a UIT pushed to the SRX Series Firewall from an access control service when a user is authenticated.

Options

The following entries specify the source identities that match a policy:

user-or-role-name A list of specific users and roles.

- **Range:** 0 through 39 characters

> **NOTE**: SRX Series Firewalls truncate imported roles to 39 characters. You need to ensure that all of your roles are 39 characters or less.

any Any user or role, as well as the keywords authenticated-user, unauthenticated-user, and unknown-user.

authenticated-user All users and roles that have been authenticated.

unauthenticated-user Any user or role that does not have an IP-address mapped to authentication sources and the authentication source is up and running.

unknown-user Any user or role that does not have an IP address mapped to authentication sources, because the authentication source is disconnected from the SRX Series Firewall. In this case, users are unable to be authenticated due to an authentication server disconnection, such as a power outage.

Unknown-user must be configured for non-domain users to be able to authenticate and log in.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1. Statement updated in Junos OS Release 12.1X44-D10. Statement is supported in [edit security advance-policy-based-routing from-zone *zone-name* policy *policy-name* match] hierarchy in Junos OS Release 19.1R1.

Security Policies Overview

source-identity-log (Security)

IN THIS SECTION

- Syntax | 29344
- Hierarchy Level | 29344
- Description | 29344

Required Privilege Level | 29344
Release Information | 29345

Syntax

```
source-identity-log
```

Hierarchy Level

```
[edit security zones security-zone zone-name]
```

Description

Specify the source-identity-log parameter as part of the configuration for a zone to enable it to trigger user identity logging when that zone is used as the source zone (from-zone) in a security policy. If a zone is configured for zone-based user identity logging and it is used as the source zone in a security policy, the system logs the user identity of any user who belongs to that zone and whose traffic matches the security policy's terms.

A zone configured for zone-based user identity logging is reusable. That is, you can use it as the source zone in any security policy.

For zone-based user identity logging to occur, you must have configured the session initialization (session-init) and the session termination (session-close) events as actions for the security policy.

Zone-based user identity logging allows you to broaden the scope of users whose identities are recorded in the session log. The source-identity security policy tuple writes the user or group name to log, but it restricts application of the security policy to the specified user or user group.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D60.

Syntax

```
source-interface-set-at-login {
    svlan;
}
```

Hierarchy Level

```
[edit protocols ppp-service]
```

Description

Enable PPP to generate the name of an interface set for use during subscriber login. The AAA process then sends the name by means of the Juniper Networks VSA QoS-Set-Name (26-130) to the RADIUS server in the Access-Request message. You can use this statement to discriminate between business and residential subscribers in heterogeneous networks. The interface set name is created for business subscribers. The RADIUS server then returns the VSA in Access-Accept messages only for business subscribers.

Options

svlan Specifies that PPP constructs the name of an interface from the physical interface name and the outer (SVLAN) VLAN tag.

Required Privilege Level

Syntax

```
source-ip-address-list address-list-name;
```

Hierarchy Level

```
[edit forwarding-options access-security router-advertisement-guard policy policy-name discard
(forwarding-options)],
[edit forwarding-options access-security router-advertisement-guard policy policy-name accept (Router
Advertisement Guard Policy) match-list]
```

Description

Configure a list of IPv6 addresses for an IPv6 Router Advertisement (RA) guard policy to validate the source IPv6 address of an incoming RA message against the IPv6 addresses in this list. RA guard protects against rogue RA messages generated either maliciously or unintentionally by unauthorized or improperly configured routers connecting to the network segment. An RA guard policy is used to validate incoming RA messages on the basis of whether they match the conditions defined in the policy.

You can use a list of IPv6 addresses for validating RA messages as part of either an accept policy or a discard policy. Before you can include a list in an RA policy, you must configure the list name at the [`edit policy-options prefix-list`] hierarchy level. When RA guard is enabled by using an accept policy, any RA messages that match the conditions defined in the policy are forwarded, and RA messages that do not

match the conditions are dropped. When RA guard is enabled by using a discard policy, any RA messages that match the conditions are dropped, and RA messages that do not match the conditions are forwarded.

Options

address-list-name Configure a list of IPv6 addresses to use in an RA guard policy. The policy is used to validate the source of an incoming RA message by comparing the IPv6 address of the RA message to the IPv6 addresses contained in the list.

Required Privilege Level

interface—To view this statement in the configuration.

```

Description

Limit the number of concurrent sessions the device can initiate from a single source IP address.

Options

number —Maximum number of concurrent sessions that can be initiated from a source IP address.

- **Range:** 1 through 1,000,000

For SRX Series Firewalls, the applicable range is 1 through 8,000,000.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

- Release Information | 29370

Syntax

```
source-lookup
```

Hierarchy Level

```
[edit interfaces interface name unit logical unit number family routing protocol family]
```

Description

On PTX platforms, enable the interface to perform a source lookup in the forwarding table using the packet's IP source address. `source-lookup` is used for `source-based-forwrding`.

> **NOTE**: The `source-lookup` configuration statement cannot be used alongside source-class-usage configuration statement (`set interfaces` *`interface name`* `unit` *`unit number`* `family` *`routing protocol family source-class-usage`*). But because `souce-lookup` is enabled per family for INET or INET 6, there can be a situation where INET has `source-lookup` enabled and INET6 has source-class-usage enabled - this use case is supported.

Syntax

```
source-mac-address-list address-list-name;
```

Hierarchy Level

```
[edit forwarding-options access-security router-advertisement-guard policy policy-name discard
(forwarding-options)],
[edit forwarding-options access-security router-advertisement-guard policy policy-name accept (Router
Advertisement Guard Policy) match-list]
```

Description

Configure a list of MAC addresses for an IPv6 Router Advertisement (RA) guard policy to validate the source MAC address of an incoming RA message against the MAC addresses in this list. RA guard protects against rogue RA messages generated either maliciously or unintentionally by unauthorized or improperly configured routers connecting to the network segment. An RA guard policy is used to validate incoming RA messages on the basis of whether they match the conditions defined in the policy.

You can use a list of MAC address for validating RA messages as part of either an accept policy or a discard policy. Before you can include a list in an RA policy, you much configure the list name at the [`edit policy-options mac-list`] hierarchy level. When RA guard is enabled by using an accept policy, any RA messages that match the conditions defined in the policy are forwarded, and RA messages that do not

match the conditions are dropped. When RA guard is enabled by using a discard policy, any RA messages that match the conditions are dropped, and RA messages that do not match the conditions are forwarded.

Options

address-list-name Configure the RA guard policy to match the MAC source address of an incoming RA message to a MAC address contained in the list.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

source-packet-routing (Junos Telemetry Interface)

IN THIS SECTION

- Syntax | 29377
- Hierarchy Level | 29377
- Description | 29378
- Default | 29379
- Options | 29379
- Required Privilege Level | 29379
- Release Information | 29379

Syntax

```
source-packet-routing {
    telemetry {
        statistics {
            per-source per-segment-list
            no-transit;
            no-ingress;
            }
        }
     source-routing-path {
         use-for-shortcut;
         }
    }
```

Hierarchy Level

```
[edit protocols]
```

Description

Enable BGP and statically configured Segment Routing Traffic Engineering (SR-TE) traffic statistics sensor support for Junos telemetry interface (JTI).

Export JTI statistics using either remote procedure call (gRPC) services or UDP native sensors to stream statistics. The following resource paths are supported. For UDP native sensors:

- **/junos/services/segment-routing/traffic-engineering/ingress/usage/**
- **/junos/services/segment-routing/traffic-engineering/transit/usage**

For gRPC streaming:

- /mpls/signaling-protocols/segment-routing/

Export SR-TE per Label Switched Path (LSP) route statistics using JTI and gRPC services. Using JTI and gRPC services. You can stream SR-TE telemetry statistics for uncolored SR-TE policies statistics to an outside collector. Ingress statistics include statistics for all traffic steered by means of an SR-TE LSP. Transit statistics include statistics for traffic to the Binding SID (BSID) of the SR-TE policy.

> **NOTE**: Enabling the parameter `per-segment-list` will disable tunnel sensors. For example, configuring `per-souorce per-segment-list` will disable the sensor `/junos/services/segment-routing/traffic-engineering/tunnel/ingress/usage/`.

To enable these statistics, include the **per-source per-segment-list** option at the [`edit protocols source-packet-routing telemetry statistics`] hierarchy level. When configuring:

- If the statement `set protocols source-packet-routing telemetry statistics no-ingress` is issued, ingress sensors are not created.
- If the statement `set protocols source-packet-routing telemetry statistics no-transit` is issued, transit sensors are not created. Otherwise, if BSID is configured for a tunnel, transit statistics are created.

The following resource paths (sensors) are supported:

- **/junos/services/segment-routing/traffic-engineering/tunnel/lsp/ingress/usage/**
- **/junos/services/segment-routing/traffic-engineering/tunnel/lsp/transit/usage/**

For exporting statistics using UDP native sensors, configure parameters at the [edit services analytics] hierarchy level. To provision sensors to export data through gRPC streaming, use the telemetrySubscribe RPC to specify telemetry parameters.

Default

Disabled.

Options

statistics	Create sensors for both the SR-TE policy nexthop and the binding SID that are installed in the forwarding plane. For the SR-TE policy nexthop, the sensors collect traffic statistics steered by all routes that use the SR-TE policy as a nexthop. For the binding SID, the sensors collect statistics on labeled traffic that is steered by the binding-SID route.
per-source per-segment-list	Create sensors to export SR-TE per LSP route statistics for uncolored SR-TE policies. Ingress statistics include statistics for all traffic steered by means of an SR-TE LSP. Transit statistics include statistics for traffic to the BSID of the SR-TE policy.
no-transit	Enable sensors only for SR-TE policy nexthops. The sensor will collect statistics on all steering routes that use the SR-TE policy as a nexthop.
no-ingress	Enable sensors only for Binding-SID transit routes.
source-routing-path	Specify the name of the source routing path.
use-for-shortcut	Enable to allow the LSP to be used as a shortcut tunnel.

Required Privilege Level

routing

Release Information

Statement introduced in Junos OS Release 18.3R1.

Option **per-source per-segment-list** is introduced in Junos OS Release 20,1R1 for MX Series and PTX Series routers.

Statement supported in Junos OS Release 20.2R1 for MX240. MX480, MX960, MX2010, and MX2020 with MPC-10E or MPC-11E routers.

Statement supported in Junos OS Evolved Release 21.4R1 for PTX10001-36MR, PTX10004, PTX10008, and PTX10016 routers.

```

Description

Enable source packet routing in networking (SPRING) feature on IS-IS levels or OSPF areas.

Source packet routing for IPv6 is supported only for IS-IS. The `adjacency-segment`, `explicit-null`, and `srgb` statements are supported only for IS-IS.

The remaining statements are explained separately.

Default

Disabled.

Options

adjacency-segment <hold-time *hold-time*>

Configure attributes for adjacency segments in source packet routing in networking (SPRING), or configure segment routing (SR) to ensure that the adjacency segment identifiers are retained during adjacency or link flaps. The adjacency segments are not released immediately and are retained for the configured hold time duration.

- hold-time *hold-time*—(Optional) Duration, in milliseconds, to retain adjacency segments after isolating from an interface. The range is 180,000 through 900,000, with the default being 300,000 milliseconds for IS-IS interfaces and 180,000 milliseconds for OSPF interfaces.

disable

Disable source packet routing from a specific level.

explicit-null

Configure E and P bits in all prefix segment identifier (SID) advertisements.

no-strict-spf

Disable strict spf algo 1 advertisement.

node-segment

Enable source packet routing in networking (SPRING) at all levels. SPRING or segment routing is a control-plane architecture that enables an ingress router to steer a packet through a specific set of nodes and links in the network without relying on the intermediate nodes in the network to determine the actual path it should take.

Provisioning the IPv4 and IPv6 node segment index is allowed per routing-instance, and will NOT be allowed per IS-IS level. Node segment index is attached to the IPv4 and IPv6 router-id, if the router-ids are configured on the loopback interface. Else, lowest IP address on the loopback is chosen to attach the node-sid.

index-range *index range*

Range of node segment indices allowed. The range is 32 through 16384, and the default is 4096.

ipv4-index *index*

IPv4 node segment index. The range is 0 through 1048575.

ipv6-index *index*

IPv6 node segment index. The range is 0 through 1048575.

udp-tunneling

Configure `udp-tunneling` option to enable SR-o-UDP feature. When this option is enabled, during route computation, IS-IS looks for routes whose next hop neighbor does not support segment routing. IS-IS creates UDP tunnel next hops to every route that does not support segment routing. The source address of UDP tunnel is set to self router-id and destination address of the UDP tunnel is set to the prefix for which route computation is being performed. The statement is introduced only at [edit protocols isis] hierarchy level.

encapsulation

The encapsulation statement enables SR-over-UDP encapsulation, thus creates a tunnel to traverse an SR traffic across a non-SR core.

> **NOTE**: Configure a filter-based de-encapsulation on MX series router and an FTI-based de-encapsulation on PTX Series routers.

use-flex-algorithm-metric-always

Specify to indicate flex-algo path computations to always use the metric advertised in FAPM during path computation. By default, flex-algo path computation will use FAPM for readvertised prefixes, for which the R bit in prefix SID is considered. In a multi-vendor environment, if this check needs to be relaxed, you can use this option. Path computations will still use FAPM if the winner FAD in that level is set to M flag.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2R1.

Support for `explicit-null` and `adjacency-segment` statements introduced in Junos OS Release 17.2R1 for MX Series routers, PTX Series routers, QFX5100 switches and QFX10000 switches.

The udp-tunneling option is introduced in Junos OS Evolved Release 21.2R1.

routing

Release Information

Statement introduced in Junos OS Release 18.2R1.

source-packet-routing (Segment Routing Traffic Engineering)

IN THIS SECTION

- Syntax | 29390
- Hierarchy Level | 29391
- Description | 29391
- Options | 29392
- Required Privilege Level | 29393
- Release Information | 29394

Syntax

```
source-packet-routing {
    inherit-label-nexthops;
    lsp-external-controller name;
    maximum-segment-list-depth maximum-segment-list-depth
    maximum-srv6-te-segment-list-depth maximum-srv6-segment-list-depth;
    preference preference;
    preserve-nexthop-hierarchy;
    retry-timer seconds;
    sbfd-frr;
    segment-list;
    source-routing-path name;
    sr-preference sr-preference;
    sr-preference-override sr-preference-override;
    telemetry;
```

```
    srv6;
    traceoptions;
    traffic-engineering (SR-TE import policy)
    tunnel-tracking;
}
```

Hierarchy Level

```
[edit logical-systems name protocols],
[edit protocols]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable Source Packet Routing in Networking (SPRING) or segment routing for traffic engineering packets for protocols that support segment routing. For example, you can configure segment routing capability for a BGP address family to steer traffic according to network requirements.

To enable segment routing traffic engineering for a BGP family, configure `segment-routing-te` at the `[edit protocols bgp family inet|inet6]` and `[edit protocols bgp group group-name neighbor neighborfamily inet|inet6]` hierarchy levels. Also, configure `sr-preference-override` at the `[edit protocols bgp family inet|inet6 source-packet-routing]` hierarchy level. This allows BGP to support segment routing policies and to steer traffic based on the segment list.

NOTE: `sr-preference-override` is not applicable for static SR-TE SRv6 LSPs.

A policy action `color: color-mode:color-value` is configured at the `[edit policy-options community name members]` hierarchy level to categorize segment routing traffic. The color value is attached to BGP communities when exporting prefixes from inet-unicast and inet6-unicast address families, which associates a BGP community with a segment routing policy path definition.

Options

inherit-label-nexthops

Inherit label next hops for first hop in all the segment lists.

When the `inherit-label-nexthops` is configured at the `[edit protocols source-packet-routing]` hierarchy, it is applied globally, and takes precedence over individual `segment-list` level configuration.

For dynamic non-colored static LSPs, that is the PCEP-driven segment routing LSPs, the `inherit-label-nexthops` statement must be enabled globally, as the segment-level configuration is not applied.

lsp-external-controller *name*

Specify an external path computing entity, typically the network controller.

maximum-segment-list-depth

Specify a maximum segment list depth for segment routing traffic engineering policies.

- **Default:** The default value is 5.
- **Range:** 1 through 16.

maximum-srv6-segment-list-depth

Specify a maximum srv6 segment list depth for segment routing traffic engineering policies.

- **Default:** For reduced SRH, the default value is 6.
- **Range:** 1 through 6.
- **Default:** For non-reduced SRH, the default value is 5.
- **Range:** 1 through 5.

NOTE: When `no-reduced-srh` is configured under the `[edit routing-options source-packet-routing srv6]` hierarchy level, ensure that the segment-list has a maximum of 5 SIDs, else configure `maximum-srv6-segment-list-depth` to have a commit constraint.

preference

Route preference for segment routing traffic engineering routes.

retry-timer Number of seconds to wait before trying to reconnect to the auto-translate service if the previous attempt failed. Connections may fail if there is no link, or node, for a given IP address, or if the link or node does not have a SID.

- **Default:** 30 seconds
- **Range:** 1 through 600

sbfd-frr Enable seamless BFD (S-BFD) fast re-route (FRR), a feature designed to enhance the resilience of SR-TE tunnels by monitoring end-to-end paths and initiating local repair mechanisms when failures are detected, rerouting traffic to alternate paths to minimize disruption.

sr-preference Specify a preference for static segment routing policies. BGP chooses a segment routing policy with a higher value over policies with lower values.

- **Range:** `0` through `4,294,967,295`

sr-preference-override Specify a preference override for static segment routing policies that BGP uses to select a segment routing policy. BGP chooses a policy with a higher value over policies with lower values.

- **Default:** The default value is `100`
- **Range:** `0` through`4,294,967,295`

traffic-engineering Enable import of all Spring-TE policies into TED

tunnel-tracking When the `tunnel-tracking` option is enabled, it does a first-hop validation for SR-TE tunnels according to their route resolution. Status of each path will also be displayed when this option is enabled.

srv6 Specify SRv6 support for SR-TE policies. Enable the `srv6` option to enable the SRv6 data plane support for statically configured SR-TE policies.

preserve-nexthop-hierarchy Specify preserve nexthop hierarchy support for SR-TE routes.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.4R1 for the MX Series and PTX Series with FPC-PTX-P1-A.

`telemetry` option introduced in Junos OS Release 18.3R1 for the MX Series and PTX Series with FPC-PTX-P1-A.

`inherit-label-nexthops` and `retry-timer` statements introduced in Junos OS Release 19.1R1 on MX Series routers.

`tunnel-tracking` option introduced in Junos OS Release 21.2R1.

`srv6` option introduced in Junos OS Release 21.3R1.

source-prefix (IDS)

IN THIS SECTION

- Syntax | 29410
- Hierarchy Level | 29410
- Description | 29411
- Options | 29411
- Required Privilege Level | 29411
- Release Information | 29411

Syntax

```
source-prefix prefix-value;
```

Hierarchy Level

```
[edit services ids rule rule-name term term-name then aggregation]
```

Description

Specify the prefix length for source IPv4 address aggregation for the IDS rule. This applies session limits to an aggregation of all attacks from within a subnet of the specified length.

For example, if you configure a value of 24 for `source-prefix`, then attacks from 10.1.1.2 and 10.1.1.3 are counted as attacks from the 10.1.1/24 subnet. However, if a single host on a subnet generates a large number of network probing or flooding attacks, the flows for the entire subnet might be stopped.

Options

`prefix-value`—Integer value.

- **Range:** 1 through 32

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

source-prefix-list (PCP)

IN THIS SECTION

Syntax | 29416

- Hierarchy Level | 29416
- Description | 29416
- Options | 29416
- Required Privilege Level | 29416
- Release Information | 29417

Syntax

```
source-prefix-list list-name <except>;
```

Hierarchy Level

```
[edit services pcp rule rule-name term term-name from]
```

Description

Specify the source prefix list that must be matched for the PCP rule. You configure the prefix list by including the `prefix-list` statement at the `[edit policy-options]` hierarchy level. A PCP rule assigns the PCP server that handles selected traffic.

PCP is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS. Starting in Junos OS Release 17.4R1, PCP is also supported on the MS-MPC and MS-MIC.

Options

list-name Source prefix list.

except (Optional) Prevent the specified prefix list from matching the PCP rule.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2R1.

Configuring Network Attack Protection With IDS Screens for Next Gen Services

source-routing

IN THIS SECTION

- Syntax | 29425
- Hierarchy Level | 29425
- Description | 29426
- Default | 29426
- Required Privilege Level | 29426
- Release Information | 29426

Syntax

```
source-routing {
    (ip | ipv6)
}
```

Hierarchy Level

```
[edit routing-options]
```

Description

Enable source routing.

Source routing allows a sender of a packet to partially or completely specify the route the packet takes through the network. In contrast, in non-source routing protocols, routers in the network determine the path based on the packet's destination.

> **NOTE**: We recommend that you not use source routing. Instead, we recommend that you use policy-based routing or filter-based forwarding to route packets based on source addresses.

Default

Disabled

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement for IPv6 introduced in Junos OS Release 8.2.

Statement for IPv4 introduced in Junos OS Release 8.5.

Statement introduced in Junos OS Release 9.0.

[edit services monitoring twamp client control-connection name test-session name]
[edit services rpm twamp client control-connection name test-session name]
```

Description

TWAMP supports segment routing as defined in RFC 8402, which broadly specifies the segment routing architecture. We support two types of segment routing for TWAMP probes:

- **SR-MPLS:** Uses a list of labels, each representing a segment end node.
- **SRv6:** Uses a type 4 IPv6 routing header introduced in RFC 8754, with each segment end node represented as an IPv6 address or IPv6 segment identifier (SID).

You can specify the list of SR-MPLS or SRv6 segments for a TWAMP probe to reach the reflector. In addition, you can specify the same information for the return path from the reflector to the client. This return path information is embedded in the probe itself by using the extensions proposed in *Simple TWAMP (STAMP) Extensions for Segment Routing Networks*, draft-ietf-ippm-stamp-srpm, namely the return path TLV and its return segment list sub-TLVs, as appropriate depending on the segment routing type. The TWAMP probes are timestamped in either the Routing Engine or the Packet Forwarding Engine.

You do not have to configure anything additional on the TWAMP server to activate this feature. You can specify only the forward path, only the return path, or both paths. If configuring both paths, the forward and return paths should be of the same type.

Options

forward (srmpls-nodes <label *hop1...n*> | srv6-nodes <IPv6 SID *hop1...n*>)	Specify the forward path.
return (srmpls-nodes <label *hop1...n*> | srv6-nodes <IPv6 SID *hop1...n*>)	Specify the return path.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

[edit protocols source-packet-routing]
```

Description

Configure a source-routing label switched path (LSP) for steering traffic at an ingress router. Specify a binding segment identifier from the static label range. Configure other parameters such as color, weight, preference, and segment routing preference for traffic engineering.

Starting with Junos OS Release 18.1R1, compute static noncolored segment routing LSPs for protocol SPRING-TE in an MPLS network. Configure parameters such as destination address, binding SIDs, primary segment, secondary segment, metric, and preference. These segment routing LSPs do not have a color associated with them. If an ingress route is not required for a non-colored segment routing LSP then the ingress route installation in inet.3 table can be disabled.

Options

name

Specify a name to identify a source routing path.

> **NOTE**: The combined length of tunnel-name and LSP name must not exceed 53 characters for per-path telemetry to work.

binding-sid

(Optional) Specify the binding label to enable transit functionality for this tunnel. For a non-colored static segment routing LSP, the binding SID label of protocol SPRING-TE have a default preference value of 8 and a metric of 1.

- **Range:** `16` through `1,048,576`

color

(Colored segment routing LSPs only) Specify a color identifier for the tunnel endpoint. For noncolored segment routing LSPs, you do not have to configure the color parameter.

lsp-external-controller

Enable external path computing capability for the device. See "lsp-external-controller" on page 10610 for more information.

metric

Specify metric for routes downloaded for the non-colored static segment routing tunnel.

- **Default:** 1,000,000 through 1,048,575
- **Range:** 1 through 16,777,215 (for BGP)

no-ingress

Disable ingress route that is not required for the non-colored static segment routing tunnel

primary

Specify a primary segment list for the configured source routing path.

The non-colored static segment routing LSP can have a maximum of 8 primary paths. incase of multiple operational primary paths, the PFE distributes the traffic over the paths based on the weight configured on the paths. If none of the paths have weights configured then the weights default to 1 making it an ECMP path. the paths become weighted ECMP if at least one of the paths have a non-zero weight. In both cases , when one or some of the paths fail, the PFE automatically re-balances the traffic over the remaining paths resulting in path protection.

compute *compute-profle-name*
Enable computation for the specified compute-profile. Note that if you include this option in the configuration, you don't need to explicitly configure the segment list. The segment list is dynamically created based on the specified compute-profile name.

return-path *return-segment-list-name*
Specify a reverse direction static segment-list name. You must configure a return-path segment-list that is similar to the path segment-list but in the reverse direction. Configuring return path is necessary for path delay measurement.

weight *weight_value*
Specify a percentage of the bandwidth with respect to the sum of weights of all paths for the primary segment list. If forwarding interfaces are also configured with weighted ECMP, then Junos OS applies hierarchical weighted ECMP. If the weight percentage is not configured, then only IGP weights are applied on the forwarding interfaces.

secondary
Specify a secondary segment list for the configured non-colored static segment routing LSP.

sr-preference
Configure a preference for segment routing routes for traffic engineering. BGP chooses a higher preference over a lower preference value.

- **Range:** `0` through `4,294,967,295`

te-group-id
Specify the Te group ID (1..128).

to
Specify the IP address of the tunnel end-point

srv6
Specify the tunnel type SRv6.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.4R1.

The `metric`, `no-ingress`, and `secondary` statements are introduced in Junos OS Release 18.1R1.

`lsp-external-controller` statement introduced in Junos OS Release 20.1R1.

`srv6` option introduced in Junos OS Release 21.3R1.

`return-path` option introduced in Junos OS Evolved Release 24.4R1.

source-routing-path-template name {
    bfd-liveness-detection;
```

```
    ldp-tunneling;
    metric metric;
    no-ingress;
    primary name {
        compute {
            compute-profile-name;
        }
        lsp-external-controller;
        weight weight;
    }
    secondary name;
    compute {
        compute-profile-name;
    }
    sr-preference sr-preference;
}
```

Hierarchy Level

```
[edit protocols source-packet-routing]
```

Description

Configure a source-routing path template for dynamic creation of segment routing label-switched paths (LSPs).

Options

name Name of the source routing path.

bfd-liveness-detection Configure Bidirectional Forwarding Detection (BFD) options for PCE-initiated segment routing LSP template. See "bfd-liveness-detection" on page 3161 for more information.

ldp-tunneling Allow LDP to use this LSP for tunneling. This configuration can be applied to PCE-initiated segment routing LSPs only.

lsp-external-controller Enable external path computing capability for the device. See "lsp-external-controller" on page 10610 for more information.

metric

Metric for routes downloaded for this tunnel.

- **Range:** 1 through 16,777,215

no-ingress

Disable ingress functionality for this tunnel.

primary *name*

Configure a named identifier for the segment-list that describes the primary segment routing path along which the packet is to be routed. This segment list must have the `dynamic` statement enabled for dynamic creation of segment routing LSPs.

compute *compute-profle-name*

Enable computation for the specified compute-profile.

weight *weight*

(Optional) Specify the balance factor for this segment list in SR-TE tunnel.

If the forwarding interfaces have weights assigned by IGP, then hierarchical weighted ECMP is applied. When weight is not specified, only the IGP weights are applied on the forwarding interfaces.

secondary *name*

Configure a named identifier for the segment-list that describes the secondary segment routing path along which the packet is to be routed. This segment list must have the `dynamic` statement enabled for dynamic creation of segment routing LSPs.

sr-preference

Segment routing preference for the segment routing traffic engineered (SPRING-TE) routes. A greater value indicates higher preference.

The preference value of the routes programmed for the segment routing LSP is inherited from the `preference` *`value`* statement at the `[edit protocols source-packet-routing` hierarchy level. When this value is not configured, the default preference value of 8 is used.

- **Range:** 0 through 4,294,967,295

Required Privilege Level

routing

Release Information

Statement introduced in Junos OS Release 19.2R1.

`bfd-liveness-detection` and `ldp-tunneling` options introduced in Junos OS Release 19.4R1.

`lsp-external-controller` statement introduced in Junos OS Release 20.1R1.

speed (24-port and 12-port 10 Gigabit Ethernet PIC)

IN THIS SECTION

- Syntax | 29441
- Hierarchy Level | 29441
- Description | 29441
- Options | 29442
- Required Privilege Level | 29442
- Release Information | 29442

Syntax

speed 1G | 10G

Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number],
[edit chassis fpc slot-number pic pic-number port port-number],
[edit chassis lcc number fpc slot-number pic pic-number mixed-rate-mode]
```

Description

Configure the port speed on the following interface modules:

- PF-24XGE-SFPP or the PF-12XGE-SFPP PIC on a T4000 standalone router or on an LCC in a TX Matrix Plus routing matrix with 3D SIBs

  NOTE: To change the port speed from 10 Gbps to 1 Gbps on PF-24XGE-SFPP and PF-12XGE-SFPP PICs, SFP optics is required.

- P1-PTX-24-10GE-SFPP PIC on the PTX3000 router
- P1-PTX-24-10GE-SFPP PIC with the FPC2-PTX-P1A on the PTX5000 router

Dual-rate support for the P1-PTX-24-10GE-SFPP enables you to switch all port speeds to either 1 Gbps or 10 Gbps. The default is 10 Gpbs. All ports are configured to the same speed; there is no mixed-rate-mode capability. Changing the port speed causes the PIC to reboot.

To return all ports to the 10-Gbps port speed, use the `delete chassis fpc` *`fpc-number`* `pic` *`pic-number`* `speed 1G` statement. To check the port speed, use the `show interfaces` command.

> **NOTE**: For the 1-Gbps port speed on the P1-PTX-24-10GE-SFPP PIC, you can use either the SFP-1GE-SX or the SFP-1GE-LX transceiver.

Options

1 G	1 Gbps
10 G	10 Gbps

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

- Options | 29444
- Required Privilege Level | 29444
- Release Information | 29444

Syntax

```
set chassis cluster control-port speed (1g |10g);
```

Hierarchy

```
[edit chassis cluster]
```

Description

The SRX4600 supports three different PIC types—8-port 10-Gigabit Ethernet PIC, 4-port 40-Gigabit or 100-Gigabit Ethernet PIC, and 4-port 10-Gigabit Ethernet PIC (in a chassis cluster). Out of the four ports on the 10-Gigabit Ethernet PIC in a chassis cluster, two ports are fabric ports and the other two ports are chassis cluster control ports. The two fabric ports do not support 1-Gbps speed. Only the two control ports of the chassis cluster support a port speed of 1 Gbps. When you replace a node through return merchandise authorization (RMA), set the speed and reboot the node to activate the control-link.

On chassis cluster control interfaces, you can configure the operating speed of the 4-port 10-Gigabit Ethernet PIC from default 10-Gbps port speed to 1-Gbps port speed. You must reboot the device for the changed configuration to take effect.

The chassis cluster control interfaces do not support multiple speeds.

Following are the list of optics supported on SRX4600:

- SRX-SFP-1GE-LX
- SRX-SFP-1GE-LX-ET
- SRX-SFP-1GE-SX
- SRX-SFP-1GE-SX-ET

Autonegotiation is automatically disabled when 1-Gbps speed is configured on the interfaces.

NOTE:

- The interface name for any xe interface remains same after converting its speed from 10G to 1G.
- To view the speed configured for the interface, execute the `show interfaces extensive` command. The `Speed Configuration` field's value of `1G` or `AUTO` in the command output indicates whether the current operation speed of the interface is 1 Gbps or the default 10 Gbps, respectively.

Options

- 1g — Link speed of 1 Gbps
- 10g — Link speed of 10 Gbps

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.1R1 for SRX4600.

Description

Configure the interface speed. This statement applies to the following interfaces:

- Management Ethernet interface (`fxp0` or `em0`)
- Fast Ethernet 12-port and 48-port PICs
- Built-in Fast Ethernet port on the FIC (M7i router)
- Combo Line Rate DPCs and Tri-Rate Ethernet Copper interfaces on MX Series routers
- Gigabit Ethernet interfaces on EX Series switches

If you enable autonegotiation, then the device automatically negotiates the speed based on the speed of the other end of the link. Table 1893 on page 29448 describes the autonegotiation option available for different platforms:

Table 1893: Autonegotiation Options

Autonegotiation Option	Description
`auto-negotiation`	Automatically negotiate the speed based on the speed of the other end of the link.
`auto`	Automatically negotiate the speed (10 Mbps, 100 Mbps, or 1 Gbps) based on the speed of the other end of the link.
`auto-10m-100m`	Automatically negotiate the speed (10 Mbps or 100 Mbps) based on the speed of the other end of the link.

See *Speed and Autonegotiation* for more details.

Options

Routers support autonegotiation by default. To enable or disable autonegotiation, see "autonegotiation (Routers)" on page 2917. Table 1894 on page 29449 summarizes the speed and autonegotiation supported on different routing platforms:

Table 1894: Speed and Autonegotiation support on Routers

Router	Speed	Autonegotiation Supported (Yes/No) ?
ACX Series	• 10M • 100M • 1G • 2.5G • 5G • 10G • auto • auto-10m-100m	Yes
ACX5448, ACX710	• 10G • 25G • 40G • 100G • 100M • 1G • auto	Yes

Table 1894: Speed and Autonegotiation support on Routers *(Continued)*

Router	Speed	Autonegotiation Supported (Yes/No) ?
ACX5448-D	• 10G • 25G • 40G • 100G • 100M • 1G • auto	Yes
ACX5448-M	• 10G • 25G • 40G • 100G • 1G • auto	Yes
ACX7100	• 10G • 25G • 40G • 100G • 200G • 400G	No

Table 1894: Speed and Autonegotiation support on Routers *(Continued)*

Router	Speed	Autonegotiation Supported (Yes/No) ?
ACX7509-FPC-20Y	• 1G • 10G • 25G	Yes
ACX7509-FPC-16C	• 40G • 100G	No
ACX7509-FPC-4CD	• 400G	No
MX Series	• 10M • 100M • 1G • 2.5G • 5G • 10G • auto • auto-10m-100m	Yes

Switches support autonegotiation by default. To enable or disable autonegotiation, see "auto-negotiation (Switches)" on page 2915. Table 1895 on page 29452 summarizes the speed and autonegotiation supported on different switching platforms:

Table 1895: Speed and Autonegotiation Support on Switches

Switch	Speed	Autonegotiation Support (Yes/No/NA)?	Autosense Support (Yes/No/NA)	HGoE Support (Yes/No/NA)?
EX2300-12 T or P, EX2300-24/48 T or P, and EX2300-24/48 MP	RJ-45 Interfaces • 10 Mbps • 100 Mbps • 1 Gbps • 2.5 Gbps (MP model only) • Auto (default)	Yes	NA	NA

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Speed option 2.5Gbps introduced in Junos OS Release 18.1R2 for EX2300 switch.

Speed option 10Gbps and 5Gbps introduced in Junos OS Release 18.2R1 for EX4300 switch.

Speed option 1-Gbps is introduced in Junos OS Release 19.1R1 on the 4-port 1-Gigabit Ethernet/10-Gigabit Ethernet uplink module on EX4300-48MP switches.

Speed options 100-Mbps, 1-Gbps, and auto is introduced in Junos OS Releases 18.4R1S2, 18.4R2, and 19.2R1 and later for ACX5448 Universal Metro Routers.

Speed option 10Gbps, 40Gbps, and 100Gbps introduced in Junos OS Evolved Release 19.1R1 for PTX10003-80C, PTX10003-160C routers.

Speed options 100-Gbps, 40-Gbps, 25-Gbps, and 10-Gbps introduced in Junos OS Release 19.2R1-S1 for ACX5448-D routers.

- Default | 29469
- Options | 29469
- Required Privilege Level | 29469
- Release Information | 29469

Syntax

```
speed (1G | 10G);
```

Hierarchy Level

```
[edit interfaces intf-name gigether-options]
```

Description

(MX10003, MX204, MX10008, and MX10016 routers) the 10-Gbps port can operate in 1-Gbps mode also. When a port operates in 10-Gbps speed, you can change the operating speed to 1-Gpbs using the configuration `speed 1G` in this configuration statement. After you commit this configuration, the operating speed of the 10-Gbps port changes to 1-Gbps speed.

On fixed-port PIC and non-MACsec MIC of MX10003 router, you can configure any or all 10-Gbps port operating in 4X10-Gbps speed to operate in 1-Gbps speed. On MX204 routers, you can configure the 4X10-Gbps port on one of the fixed-port PICs to operate in 1-Gbps mode. And on the other fixed-port PIC, you can configure the 10-Gbps port to 1-Gbps speed. On MX10003 and MX204 routers, 1-Gbps speed is supported with `speed 1g` configuration. You can configure auto-negotiation by using the command `set interfaces` *`interface-name`* `gigether-options auto-negotiation`. For more information, see "auto-negotiation" on page 2917.

On JNP10K-LC2101 MPC, you can configure one or all 10-Gbps ports operating in 4x10-Gbps speed to operate in 1-Gbps speed. Also, autonegotiation is supported when the interface speed is configured for 1-Gbps speed.

Starting in Junos OS Release 20.4R1, you can configure 1-Gbps speed on all 40 10-Gbps Ethernet ports of the MPC7E-10G line cards.

As of Junos OS Release 23.1R1, the MX304 supports 1G fibre optic speeds in addition to the previously supported speeds of 400G, 100G, 40G, 25G, and 10G.

NOTE:

- On the MX10003 router, the MACsec MIC does not provide 1-Gbps speed. If you attempt to change the operating speed to 1-Gbps, syslog displays that this feature is not supported on the MACsec MIC.
- (MX10003, MX204, MX10008, and MX10016 routers) Rate selectability at PIC level and port level does not support 1-Gbps speed.
- (MX10003, MX204, MX10008, and MX10016 routers) The interface name prefix is **xe**.
- (MX10003, MX204, MX10008, and MX10016 routers) After configuring 1-Gbps speed, the protocol continues to advertise the bandwidth as 10-Gigabit Ethernet.
- On MX10003 and MX204 routers, Link Aggregation Group (LAG) is supported on 10-Gbps speed only. It is not supported on 1-Gbps speed.
- On MX304 for 1G interface, the maximum MTU supported is 2000 bytes. Hence, the maximum MRU supported is 2008 bytes.
- On MX304, 1G interface does not support MACsec in this release.
- MPC7E-10G for LAG with 1Gbps speed and native 1G ports from MPC2-NG/MPC2E/MPC cards together are not supported.

To view the speed configured for the interface, execute the " show interfaces extensive" on page 21833 command. The `Speed Configuration` output parameter in the command output indicates the current

operation speed of the interface. If the interface is configured with 1-Gbps speed, then `Speed Configuration` displays 1G; if the interface is configured with 10-Gbps speed, Speed Configuration displays AUTO.

Default

`10G`

Options

`1G`—Supported ports operate at 1-Gbps speed.

`10G`—Supported ports operate at 10-Gbps speed.

Required Privilege Level | 29471
Release Information | 29471

Syntax

```
speed (1g |10g);
```

Hierarchy Level

```
[edit interfaces interface-name gigether-options]
```

Description

Configure the operating speed of the 8-port 10-Gigabit Ethernet PIC from default 10-Gbps port speed to 1-Gbps port speed. Each of the interfaces in the 8-port 10-Gigabit Ethernet PIC can be independently configured to 1Gbps or 10Gbps speeds. For information about platforms support, see hardware compatibility tool (HCT).

Autonegotiation is automatically disabled when 1-Gbps speed is configured on the interfaces.

On 1/10-Gbps capable Gigabit Ethernet SFP interfaces, the duplex is always full and the speed matches that of the inserted optic. These interfaces support either 1-Gbps or 10-Gbps SFP optics. For SRX Series Firewalls, the display and configuration is always xe- only, even if a 1G optic is inserted. The xe- value is used to denote that the interface is 10G capable. If a 1G optic is used, show commands for the interface will display the correct speed, but the config will always show as xe-. If a speed configuration is changed, you cannot change it again in the next 180 seconds. The interface link might drop down, if you try to change the speed configuration again within 180 seconds of the first speed configuration change. The 8x10-Gbps ports supports multiple port speeds, that is, some ports operates at 10G speed and some at 1G speed. To view the speed configured for the interface, execute the `show interfaces extensive` command. The `Speed Configuration` field's value of `1G` or `AUTO` in the command output indicates whether the current operation speed of the interface is 1 Gbps or the default 10 Gbps, respectively.

Options

- 1g — Link speed of 1 Gbps
- 10g — Link speed of 10 Gbps

Required Privilege Level

Syntax

```
speed (auto | 1Gbps | 100Mbps | 10Mbps);
```

Hierarchy Level

```
[edit interfaces ge-fpc/pic/port]
```

Description

On MX Series routers with Combo Line Rate DPCs and Tri-Rate Copper SFPs you can set auto negotiation of speed. To specify the auto negotiation speed, use the `speed (auto | 1Gbps | 100Mbps | 10Mbps)` statement under the `[edit interface ge-/fpc/pic/port]` hierarchy level. The `auto` option will attempt to automatically match the rate of the connected interface. To set port speed negotiation to a specific rate, set the port speed to `1Gbps`, `100Mbps`, or `10Mbps`.

> **NOTE**: If the negotiated speed and the interface speed do not match, the link will not be brought up. Half duplex mode is not supported.

Options

You can specify the speed as either `auto` (autonegotiate), `10Mbps` (10 Mbps), `100Mbps` (100 Mbps), or `1Gbps` (1 Gbps).

Required Privilege Level

interface—To view this statement in the configuration.

```
speed (oc3-stm1 | oc12-stm4 | oc48-stm16 | 10G | 25G | 40G | 50G | 100G | 200G | 400G | 800G);
```

Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number port port-number]
```

Description

Configure the port speed for the ports on a line card or a device with a built-in FPC.

Default

`oc3-stm1`

Options

100g	Supported ports operate at 100-Gbps speed.
10g	Supported ports operate at 10-Gbps speed.
1g	Supported ports operate at 1-Gbps speed.
200g	Supported ports operate at 200-Gbps speed.
25g	Supported ports operate at 25-Gbps speed.
40g	Supported ports operate at 40-Gbps speed.
50g	Supported ports operate at 50-Gbps speed.
400g	Supported ports operate at 400-Gbps speed.
800g	Supported ports operate at 800-Gbps speed.
oc12-stm4	Supported ports operate at OC12 or STM4 speed.
oc3-stm1	Supported ports operate at OC3 or STM1 speed.
oc48-stm16	Supported ports operate at OC48 or STM16 speed.

NOTE: You can configure the `oc12-stm4`, `oc3-stm1`, and `oc48-stm16` port speed options for SONET/SDH OC3/STM1 (Multi-Rate) MICs. However, for Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP and ATM MICs, you can configure only the `oc12-stm4` and `oc3-stm1` port speed options.

(MX Series with MPCs and ATM MICs with SFP) To configure up to OC12 CBR bandwidth speed per VC on an ATM MIC with SFP (MIC-3D-8OC3-2OC12-ATM), specify `oc12-stm4` as the speed for the specified port. You can configure the `oc12-stm4` port speed option only for ports 0 and 4 on an ATM MIC. If you

configure the `oc12-stm4` port speed option for port 0, then ports 1, 2, and 3 are disabled. Similarly, if you configure the `oc12-stm4` port speed for port 4, then ports 5, 6, and 7 are disabled.

(MX Series with MPC7E-MRATE) To configure 100-Gbps, 10-Gbps, or 40-Gbps speed per port on an MPC7E (Multi-Rate) MPC, specify `100G`, `10G`, or `40G`, respectively, as the speed for the specified port. You can configure `10G` and `40G` port speed options on all the six ports of PIC 0 and PIC 1 of an MPC7E-MRATE MPC. However, you can configure the `100G` port speed option only for ports 2 and 5 of PIC 0 and PIC 1 of an MPC7E-MRATE MPC.

(MX10003 routers with MX10003 MPC) To configure 100 Gbps, 10 Gbps, and 40 Gbps speed on all supported ports, specify 100GbE, 10GbE, or 40GbE, respectively, as the speed for the specified PIC. All the six ports of the fixed port PIC support 10-Gbps and 40-Gbps speeds. All the 12 ports of the Multi-rate MIC support 100-Gbps, 10-Gbps and 40-Gbps speeds. For more information, seeMX10003 MPC (Multi-Rate) and Supported Active Physical Ports for Configuring Port Speed to Prevent Oversubscription on MX10003 MPC.

(MX204 Routers) The MX204 has four rate-selectable ports (referred to a PIC 0 ports) that can be configured as 100-Gigabit Ethernet ports or 40-Gigabit Ethernet port, or each port can be configured as four 10-Gigabit Ethernet ports (by using a breakout cable). The MX204 also has eight 10-Gigabit Ethernet ports (referred to as PIC 1 ports). For more information, see MX204 Router Overview and Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router

(PTX1000 routers) The PTX1000 routers has 72 network ports that support the QSFP+ transceivers and can be configured as channelized 4x10-Gigabit Ethernet interfaces by default (for a maximum of 288 10-Gigabit Ethernet ports). When you configure the speed of a port, you must reset the FPC for the configuration to take effect. If you do not reset the FPC after modifying the port speed configuration, the router displays the following error message:

```
pic_need_skip_port_speed_change: pic-0/0: Port speed changed while previous port speed transition is pending. This PIC needs to be restarted. Please take this PIC or FPC offline and online via CLI.
```

(PTX10001-36MR routers) See *Port Speed on PTX10001-36MR Router Overview* to learn about multiple port speeds supported on PTX10001-36MR router, guidelines, and how to configure the port speed.

(PTX10003-80C and PTX10003-160C) To configure 100-Gbps, 10-Gbps, or 40-Gbps speed per port on the PTX10003-80C and PTX10003-160C line cards, specify `100g`, `10g`, or `40g`, respectively, as the speed for the specified port. Use the `number-of-sub-ports` statement to configure the number of channels for a particular port if the optics are used in a channelized mode. Use the `number-of-sub-ports` statement with the `speed` statement to configure a supported for the different channels based on the optics used.

(ACX5448-D) To configure 100-Gbps, 10-Gbps, or 40-Gbps speed per port on the ACX5448-D router, specify `100g`, `10g`, or `40g`, respectively, as the speed for the specified port.

Reboot the PIC or FPC after you change an existing port speed configuration for the new configuration to take effect. See *Port Speed* for details.

[edit routing-instances routing-instance-name protocols isis]
```

Description

Configure options for running the shortest-path-first (SPF) algorithm.

Running the SPF algorithm is usually the beginning of a series of larger system-wide events. For example, the SPF algorithm can lead to interior gateway protocol (IGP) prefix changes, which then lead to BGP nexthop resolution changes. Consider what happens if there are rapid link changes in the network. The local routing device can become overwhelmed. This is why it sometimes makes sense to throttle the scheduling of the SPF algorithm.

You can configure the following SPF options:

- The delay in the time between the detection of a topology change and when the SPF algorithm actually runs.

- The maximum number of times that the SPF algorithm can run in succession before the hold-down timer begins.
- The time to hold down, or wait, before running another SPF calculation after the SPF algorithm has run in succession the configured maximum number of times.

If the network stabilizes during the hold-down period and the SPF algorithm does not need to run again, the system reverts to the configured values for the `delay` and `rapid-runs` statements.

Options

`delay` *`milliseconds`*—Time interval between the detection of a topology change and when the SPF algorithm runs.

- **Range:** 50 through 1000 milliseconds
- **Default:** 200 milliseconds

`holddown` *`milliseconds`*—Time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession.

- **Range:** 2000 through 10,000 milliseconds
- **Default:** 5000 milliseconds

`rapid-runs` *`number`*—Maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the holddown interval begins.

- **Range:** 1 through 5
- **Default:** 3

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

```

Description

Configure options for running the shortest-path-first (SPF) algorithm. You can configure the following:

- A delay for when to run the SPF algorithm after a network topology change is detected.
- The maximum number of times the SPF algorithm can run in succession.
- A hold-down interval after the SPF algorithm runs the maximum number of times. If the network stabilizes during the holddown period and the SPF algorithm does not need to run again, the system reverts to the configured values for the **delay** and `rapid-runs` statements.

Running the SPF algorithm is usually the beginning of a series of larger system-wide events. For example, the SPF algorithm can lead to interior gateway protocol (IGP) prefix changes, which then lead to BGP nexthop resolution changes. Consider what happens if there are rapid link changes in the network. The local routing device can become overwhelmed. This is why it sometimes makes sense to throttle the scheduling of the SPF algorithm.

Options

delay ***milliseconds***—Time interval between the detection of a topology change and when the SPF algorithm runs.

- **Range:** 50 through 8000 milliseconds
- **Default:** 200 milliseconds

holddown ***milliseconds***—Time interval to hold down, or to wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession.

- **Range:** 2000 through 20,000 milliseconds
- **Default:** 5000 milliseconds

rapid-runs ***number***—Maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the hold down interval begins.

- **Range:** 1 through 10
- **Default:** 3

splitting-merging

IN THIS SECTION

- Syntax | 29489
- Hierarchy Level | 29490
- Description | 29490
- Options | 29490
- Required Privilege Level | 29491
- Release Information | 29491

Syntax

```
splitting-merging {
    maximum-member-lsps number;
    maximum-signaling-bandwidth bps;
```

```
    merging-bandwidth bps;
    minimum-member-lsps number;
    minimum-signaling-bandwidth bps;
    normalization;
    sampling;
    splitting-bandwidth bps;
    splitting-merging-threshold percent;
    no-normalize-same-members;
}
```

Hierarchy Level

```
[edit protocols mpls container-label-switched-path lsp-name]
```

Description

Perform splitting and merging.

Options

maximum-member-lsps *number*

Number of label-switched paths (LSPs) that a container LSP can have as member LSPs at maximum.

- **Default:** 1

maximum-signaling-bandwidth *bandwidth*

Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at maximum after normalization. When `maximum-signaling-bandwidth` is not configured, the value is derived from the `splitting-bandwidth`.

When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the `splitting-bandwidth`.

- **Default:** 1 bps

merging-bandwidth *bandwidth*

Amount of bandwidth in bits per second (bps) that is used for merging during normalization.

- **Default:** 1 bps

minimum-member-lsps *number*

Number of LSPd that a container LSP can have as member LSPs at minimum.

- **Default:** 64

minimum-signaling-bandwidth *bandwidth*

Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at minimum after normalization. When `minimum-signaling-bandwidth` is not configured, the value is derived from the `merging-bandwidth`.

When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the `merging-bandwidth`.

- **Default:** 1 bps

splitting-bandwidth *bandwidth*

Amount of bandwidth in bits per second (bps) that can be used for splitting during normalization.

- **Default:** 1 bps

splitting-merging-threshold *percent*

Percentage changes in aggregate bandwidth relevant for splitting and merging.

- **Default:** 0%

no-normalize-same-members

Do not normalize when we are not splitting or merging member LSPs .

If normalization does not need to create or delete any member LSPs, we re-signal the member LSPs with equal bandwidth. Enabling `no-normalize-same-members` statement, we avoid such normalizations. .

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

        (color [ color ... ] | color-any);
    }
}
```

Hierarchy Level

```
[edit routing-options dynamic-tunnels]
```

Description

Enable next hop-base dynamic tunnel mode.

Options

source-routing-path-template Configure template color mapping for segment routing traffic-engineered (SPRING-TE) dynamic LSP parameters.

template-name

color Specify set of color list to be mapped to corresponding SPRING-TE template.

- When enabled, all templates should have color objects defined.
- All destinations are assumed to be colored as well.
- A color can be mapped to only one template at a given point in time.
- Both the `color` and `color-any` statements can coexist. When the two statements are enabled together, preference is given to a specific color template than color-any.
- A colored and non-colored destination cannot co-exist in the same SR-TE configuration.

color-any Enables mapping of any color to corresponding SPRING-TE template. Only one color-any template can be configured for one SR-TE LSP.

Required Privilege Level

```
squelch {
    method (ais | ql-dnu | rai | shut);
}
```

Hierarchy Level

```
[edit chassis synchronization esmc-transmit interfaces]
[edit chassis synchronization output interfaces bits]
```

Description

Squelch the transmitting signal.

Options

method Specify the method to squelch the transmitting signal. Choose from the following options:

- ais—Transmits an alarm indication signal (AIS).
- ql-dnu—Transmits a Synchronous Digital Hierarchy (SDH) synchronization status message (SSM) or a Synchronous Optical Networks (SONET) SSM.
- rai—Transmits a remote alarm indication (RAI).
- shut—Shuts down the output.

quality-level Specify the quality level below which `squelch` is activated. The available quality levels are given in Table 1896 on page 29504.

Table 1896: Quality Levels

Quality Level	Description
prc	Timing quality of a primary reference clock (option-1 only).
prs	Clock traceable to a primary reference source (option-2 only).
sec	Timing quality of an SDH equipment clock (option-1 only).
smc	Clock traceable to a self-timed SONET (option-2 only).
ssu-a	Timing quality of a type I or IV timeReceiver clock (option-1 only).

Table 1896: Quality Levels *(Continued)*

Quality Level	Description
ssu-b	Timing quality of a type VI timeReceiver clock (option-1 only).
st2	Clock traceable to Stratum 2 (option-2 only).
st3	Clock traceable to Stratum 3 (option-2 only).
st3e	Clock traceable to Stratum 3E (option-2 only).
st4	Clock traceable to Stratum 4 free-run (option-2 only).
stu	Clock traceable to an unknown quality (option-2 only).
tnc	Clock traceable to a transit node clock (option-2 only).

routing],
[edit protocols bgp source-packet-routing],
[edit routing-instances name protocols bgp source-packet-routing],
[edit tenants name routing-instances name protocols bgp source-packet-routing]
```

Description

Enable IPv6 segment routing capability in BGP. You can also configure BGP-based Layer 3 services over the SRv6 core network with BGP as the control pane and SRv6 as the dataplane.

Options

locator *locator-name* Specify a name to identify the locator.

end-dt4-sid *end-dt4-sid*	(optional) Specify the SID to enable IPv4 transport over SRv6 core network.
end-dt6-sid *end-dt6-sid*	(optional) Specify the SID to enable IPv6 transport over SRv6 core network.
end-dt46-sid *end-dt46-sid*	(optional) Specify the SID to enable endpoint decapsulation of outer IPV6 header and lookup of the inner IPV4 or IPv6 packets in specific route table,
micro-dt4-sid *micro-sid-value*	(optional) Specify a static micro SID value 16-bit or 32-bit. If you do not specify the micro SID value for IPv4 prefixes, BGP allocates a dynamic micro SID value.
micro-dt6-sid *micro-sid-value*	(optional) Specify a static micro SID value 16-bit or 32-bit. If you do not specify the micro SID value for IPv6 prefixes, BGP allocates a dynamic micro SID value.
micro-dt46-sid *micro-sid-value*	(optional) Specify a static micro SID value 16-bit or 32-bit. If you do not specify the micro SID value for IPv4 and IPv6 prefixes, BGP allocates a dynamic micro SID value.
non-default	Use this option to configure multiple service SIDs. Specify non-default SIDs through a BGP routing policy. Note that you can use this option for service prefixes only.

srv6 (Routing Options)

IN THIS SECTION

- Syntax | 29518
- Hierarchy Level | 29518
- Description | 29518
- Options | 29519
- Required Privilege Level | 29519
- Release Information | 29519

Syntax

```
srv6 {
  block block-name;
  locator locator-name;
  no-reduced-srh;
  transit-srh-insert;
  traceoptions;
  oam;
}
```

Hierarchy Level

```
[edit routing-instances name routing-options source-packet-routing],
[edit routing-options source-packet-routing],
[edit tenants name routing-instances name routing-options source-packet-routing]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions

commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable SRv6 source packet routing in an IPv6 network and configure the SRv6 options. SRv6 uses IPv6 addresses in extended headers instead of labels. These IPv6 addresses are stacked up in a routing extension header.

Options

no-reduced-srh Configure non-reduced Segment Routing Header (SRH) mode of tunnel encapsulation if you want to preserve the entire SID list in the SRH. In an SRv6 domain, an SRv6 segment can have multiple SRHs in an IPv6 header. Note that multiple SRHs can significantly raise the encapsulation overhead that can sometimes be larger than the actual packet payload.

- **Default:** Reduced SRH is enabled for SRv6 tunnel encapsulation. In a reduced SRH mode the device does not preserve the entire SID list in the SRH and thereby reduces the encapsulation overhead of an SRv6 packet.

transit-srh-insert Enable the SRv6 SRH insert mode on transit devices. IS-IS inserts an SRH as the next header in the original IPv6 packet header and modifies the next header according to the value of SRH. The IPv6 destination address is replaced with the IPv6 address of the first SID in the segment list and the original IPv6 destination address is carried in the SRH header as the last segment in the list.

The remaining statements are explained separately. See CLI Explorer.

```
ssh {
    client-alive-count-max number;
    client-alive-interval seconds;
    connection-limit limit;
    port port-number;
```

```
    rate-limit limit;
}
```

Hierarchy Level

```
[edit system services netconf]
```

Description

Enable access to the NETCONF SSH subsystem using the default port number 830, as specified by RFC 4742.

Options

client-alive-count-max *number*

(Optional) Threshold of client-alive responses that can be missed before the sshd process disconnects the client, thereby terminating the NETCONF session. Use this statement in conjunction with the `client-alive-interval` statement to disconnect unresponsive NETCONF clients.

- Default: 3
- Range: 0 through 255

client-alive-inteval *seconds*

(Optional) Timeout interval in seconds, after which, if no data has been received from the client, the sshd process sends a message through the encrypted channel to request a response from the client. Use this statement in conjunction with the `client-alive-count-max` statement to disconnect unresponsive NETCONF clients. This option applies to SSH protocol version 2 only.

- Default: 0 seconds
- Range: 0 through 65535 seconds

The remaining statements are explained separately. See CLI Explorer.

    sftp-server;
```

```
    trusted-user-ca-key-file filename
}
```

Hierarchy Level

```
[edit system services]
```

Description

Allow SSH requests from remote systems to access the local device.

Options

access-disable-external Disable external SSH access without disabling internal SSH access.

allow-tcp-forwarding Enable a user to create an SSH tunnel over a CLI session to a disaggregated Junos OS platform by using SSH.

Starting in Junos OS Release 22.2R1, we've disabled the TCP forwarding feature by default to enhance security. To enable the TCP forwarding feature, you can configure the `allow-tcp-forwarding` statement at the [`edit system services ssh`] hierarchy level. In addition, we've deprecated the `tcp-forwarding` and `no-tcp-forwarding` statements at the [`edit system services ssh`] hierarchy level.

authentication-order [*method1 method2*...] Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.

- **Default:** If you do not include the `authentication-order` statement, users are verified based on their configured passwords.
- **Syntax:** Specify one or more of the following authentication methods listed in the order in which they must be tried:
  - `ldaps`—Use LDAP authentication services.
  - `password`—Use the password configured for the user with the `authentication` statement at the [`edit system login user`] hierarchy level.

- `radius`—Use RADIUS authentication services.
- `tacplus`—Use TACACS+ authentication services.

authorized-keys-command

Specify a command string to be used to look up the user's public keys.

authorized-keys-command-user

Specify the user under whose account the authorized-keys-command is run.

authorized-principals ***principal-names***

Specify a list of principals that can be accepted for authenticaiton. Principals added through this command are supplemental to the principals added with the `authorized-principals-file` command.

> **NOTE**: The `authorized-principals` and `authorized-principals-command` options are mutually exclusive.

authorized-principals-file ***filename***

Configure the `AuthorizedPrincipals` file for SSH certificate-based authentication. This file contains a list of names, one of which must appear in the certificate for it to be accepted for authentication.

authorized-principals-command ***program-path***

Specify a program to be used for generating the list of allowed certificate principals found in the `AuthorizedPrincipals` file for SSH certificate-based authentication.

> **NOTE**: The `authorized-principals-command` and `authorized-principals` options are mutually exclusive.

ca-signature-algorithms ***algorithms***

Starting in Junos OS Evolved Release 25.2R1, configure the signature algorithms that Certificate Authorities (CAs) can use when signing certificates.

Values: Specify one or more of the following signature algorithms:

- `ecdsa-sha2-nistp256`
- `ecdsa-sha2-nistp521`
- `rsa-sha2-256`
- `rsa-sha2-512`
- `ssh-ed25519`

ciphers [***cipher-1 cipher-2 cipher-3*** **...]**

Specify the set of ciphers the SSH server can use to perform encryption and decryption functions.

Values: Specify one or more of the following ciphers:

- `aes128-ctr`—128-bit AES in counter mode.
- `aes128-gcm@openssh.com`—128-bit AES with Galois/Counter Mode
- `aes192-ctr`—192-bit AES in counter mode.
- `aes256-ctr`—256-bit AES in counter mode.
- `aes256-gcm@openssh.com`—256-bit AES with Galois/Counter Mode

client-alive-count-max *number*

Configure the number of client alive messages that can be sent without sshd receiving any messages back from the client. If this threshold is reached while client alive messages are being sent, sshd will disconnect the client, terminating the session. Client alive messages are sent through the encrypted channel. Use in conjunction with the client-alive-interval statement to disconnect unresponsive SSH clients.

- **Default:** 3 messages
- **Range:** 0 through 255 messages

client-alive-interval *seconds*

Configure a timeout interval in seconds, after which if no data has been received from the client, sshd will send a message through the encrypted channel to request a response from the client. This option applies to SSH protocol version 2 only. Use in conjunction with the client-alive-count-max statement to disconnect unresponsive SSH clients.

- **Default:** 0 seconds
- **Range:** 1 through 65535 seconds

fingerprint-hash (md5 | sha2-256)

Specify the hash algorithm used by the SSH server when it displays key fingerprints.

> **NOTE**: The FIPS image does not permit the use of MD5 fingerprints. On systems in FIPS mode, `sha2-256` is the only available option.

- **Values:** Specify one of the following:
  - md5—Enable the SSH server to use the MD5 algorithm.

- sha2-256—Enable the SSH server to use the sha2-256 algorithm.

- **Default:** sha2-256

host-certificate-file *filename*

Configure the `HostCertificate` file for SSH certificate-based authentication. This file contains the signed host certificate.

hostkey-algorithm-list

Configure the specified SSH hostkey algorithms.
Values: Specify one or more of the following SSH hostkey algorithms:

- `ecdsa-sha2-nistp256`
- `ecdsa-sha2-nistp384`
- `ecdsa-sha2-nistp521`
- `ed25519`
- `rsa`
- `rsa-sha2-256`
- `rsa-sha2-512`

log-key-changes *log-key-changes*

Enable Junos OS to log the authorized SSH keys. When the `log-key-changes` statement is configured and committed, Junos OS logs the changes to the set of authorized SSH keys for each user (including the keys that were added or removed). Junos OS logs the differences since the last time the `log-key-changes` statement was configured. If the `log-key-changes` statement was never configured, then Junos OS logs all the authorized SSH keys.

- **Default:** Junos OS logs all the authorized SSH keys.

macs [*algorithm1 algorithm2...***]**

Specify the set of message authentication code (MAC) algorithms that the SSH server can use to authenticate messages.

> **NOTE**: The *macs* configuration statement represents a set. Therefore, it must be configured as follows:
>
> `user@host#set system services ssh macs [hmac-md5 hmac-sha1]`

- **Values:** Specify one or more of the following MAC algorithms to authenticate messages:

- `hmac-md5`—Hash-based MAC using Message-Digest 5 (MD5)
- `hmac-md5-96`—96-bits of hash-based MAC using MD5
- `hmac-md5-96-etm@openssh.com`—96-bits of hash-based Encrypt-then-MAC using MD5
- `hmac-md5-etm@openssh.com`—Hash-based Encrypt-then-MAC using MMD5
- `hmac-sha1`—Hash-based MAC using secure hash algorithm-1 (SHA-1)
- `hmac-sha1-96`—96-bits of hash-based MAC using SHA-1
- `hmac-sha1-96-etm@openssh.com`—96-bits of hash-based Encrypt-then-MAC using SHA-1
- `hmac-sha1-etm@openssh.com`—Hash-based Encrypt-then-MAC using SHA-1
- `hmac-sha2-256`—256-bits of hash-based MAC using secure hash algorithm-2 (SHA-2)
- `hmac-sha2-256-etm@openssh.com`—Hash-based Encrypt-then-Mac using SHA-2
- `hmac-sha2-512`—512-bits of hash-based MAC using SHA-2
- `hmac-sha2-512-etm@openssh.com`—Hash-based Encrypt-then-Mac using SHA-2
- `umac-128-etm@openssh.com`—Encrypt-then-MAC using UMAC-128 algorithm specified in RFC4418
- `umac-128@openssh.com`—UMAC-128 algorithm specified in RFC4418
- `umac-64-etm@openssh.com`—Encrypt-then-MAC using UMAC-64 algorithm specified in RFC4418
- `umac-64@openssh.com`—UMAC-64 algorithm specified in RFC4418

max-pre-authentication-packets *number*

Define the maximum number of pre-authentication SSH packets that the SSH server will accept prior to user authentication.

- **Range:** 20 through 2147483647 packets
- **Default:** 128 packets

max-sessions-per-connection *number*

Specify the maximum number of ssh sessions allowed per single SSH connection.

- **Range:** 1 through 65535 sessions

- **Default:** 10 sessions

moduli type *name* refresh *frequency* [count *count*]

Specify the type, set the refresh frequency, and determine the count of the prime moduli that you need.

no-challenge-response

Disable SSH challenge-response-based authentication methods.

> **NOTE**: Configuring this statement under the `[edit system services ssh]` hierarchy affects both the **SSH** login service and the **NETCONF** over SSH service.

no-password-authentication

Disable SSH password-based authentication methods.

> **NOTE**: Configuring this statement under the `[edit system services ssh]` hierarchy affects both the **SSH** login service and the **NETCONF** over SSH service.

no-passwords

Disable both password-based and challenge-response-based authentication for SSH.

> **NOTE**: Configuring this statement under the `[edit system services ssh]` hierarchy affects both the **SSH** login service and the **NETCONF** over SSH service.

no-public-keys

Disable public key authentication system wide. If you specify the no-public-keys statement at the [edit system login user *user-name* authentication] hierarchy level, you disable public key authentication for a specific user.

port *port-number*

Specify the port number on which to accept incoming SSH connections.

- **Default:** 22
- **Range:** 1 through 65535

protocol-version [v2]

Specify the Secure Shell (SSH) protocol version.

Starting in Junos OS Release 19.3R1 and Junos OS Release 18.3R3, on all SRX Series devices, we've removed the nonsecure SSH protocol version 1 (`v1`) option from the [`edit system services ssh protocol-version`] hierarchy level. You can use the SSH protocol version 2 (`v2`) as the default option to remotely manage systems and

applications. With the `v1` option deprecated, Junos OS is compatible with OpenSSH 7.4 and later versions.

Junos OS releases before 19.3R1 and 18.3R3 continue to support the `v1` option to remotely manage systems and applications.

- **Default:** v2—SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.

rate-limit *number*

Configure the maximum number of connection attempts per minute, per protocol (either IPv6 or IPv4) on an access service. For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

- **Range:** 1 through 250 connections
- **Default:** 150 connections

rekey

Specify limits before the session keys are renegotiated.

data-limit *bytes*

Specify the data limit before renegotiating the session keys.

time-limit *minutes*

Specify the time limit before renegotiating the session keys.

- **Range:** 1 through 1440 minutes

root-login (allow | deny | deny-password)

Control user access through SSH.

- allow—Allow users to log in to the device as root through SSH.
- deny—Disable users from logging in to the device as root through SSH.
- deny-password—Allow users to log in to the device as root through SSH when the authentication method (for example, RSA authentication) does not require a password.
- **Default:** `deny-password` is the default for most systems.

  Starting in Junos release 17.4R1 for MX Series routers, the default for root-login is **deny**. In previous Junos OS releases, the default setting for the MX240, MX480, MX960, MX2010 and MX2020 was **allow**.

sftp-server

Globally enable incoming SSH File Transfer Protocol (SFTP) connections. By configuring the `sftp-server` statement, you enable authorized devices to connect to the device through SFTP. If the `sftp-server` statement is not present in the

configuration, then SFTP is globally disabled and no devices can connect to the device through SFTP.

trusted-user-ca-key-file *filename*

Configure the `TrustedUserCAKey` file for SSH certificate-based authentication. This file contains the public keys of an SSH certificate.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`ciphers`, `hostkey-algorithm`, `key-exchange`, and `macs` statements introduced in Junos OS Release 11.2.

`max-sessions-per-connection` and `no-tcp-forwarding` statements introduced in Junos OS Release 11.4.

SHA-2 options introduced in Junos OS Release 12.1.

Support for the curve25519-sha256 option on the `key-exchange` statement added in Junos OS Release 12.1X47-D10.

`client-alive-interval` and `client-alive-count-max` statements introduced in Junos OS Release 12.2.

`max-pre-authentication-packets` statement introduced in Junos OS Release 12.3X48-D10.

`no-passwords` statement introduced in Junos OS Release 13.3.

`no-public-keys` statement introduced in Junos OS release 15.1.

`tcp-forwarding` statement introduced in Junos OS Release 15.1X53-D50 for the NFX250 Network Services Platform.

`fingerprint-hash` statement introduced in Junos OS Release 16.1.

`log-key-changes` statement introduced in Junos OS Release 17.4R1.

`sftp-server` statement introduced in Junos OS Release 19.1R1.

`no-challenge-response` and `no-password-authentication` statements introduced in Junos OS Release 19.4R1.

Option `ldaps` introduced in Junos OS Release 20.2R1.

`allow-tcp-forwarding` option added in Junos OS Release 22.2R1.

`access-disable-external` option added in Junos OS Release 22.2R3.

The `athorized-prinicpals`, `authorized-principals-command`, and the `authorized-principals-file` options added in Junos OS Release 22.3R1.

`ca-signature-algorithms` option added in Junos OS Evolved Release 25.2R1.

IN THIS SECTION

- Syntax | **29537**
- Syntax (EX Series Switch and the QFX Series) | **29537**
- Description | **29537**
- Options | **29538**
- Additional Information | **29538**
- Required Privilege Level | **29539**
- Output Fields | **29539**
- Sample Output | **29539**
- Release Information | **29539**

Syntax

```
ssh host
<bypass-routing>
<verbose>
<extensive>
<inet | inet6>
<interface interface-name>
<logical-system logical-system-name>
<tenant tenant-name>
<routing-instance routing-instance-name>
<source address>
<v2>
<port port-number>
```

Syntax (EX Series Switch and the QFX Series)

```
ssh host
<bypass-routing>
<verbose>
<extensive>
<inet | inet6>
<interface interface-name>
<routing-instance routing-instance-name>
<source address>
<v2>
<port port-number>
```

Description

Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the `ssh` command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons:

```
ssh address 'cli-command1 ; cli-command2 '
```

Options

host	Name or address of the remote system.
bypass-routing	(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.
verbose	(Optional) Display verbose messages during the SSH attempt.
extensive	Display an extensive level of messaging during the SSH attempt.
inet | inet6	(Optional) Create an IPv4 or IPv6 connection, respectively.
interface *interface-name*	(Junos OS only) (Optional) Interface name for the SSH session. (This option does not work when *default-address-selection* is configured at the `[edit system]` hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)
logical-system *logical-system-name*	(Optional) Name of a particular logical system for the SSH attempt.
tenant *tenant-name*	(Optional) Name of a particular tenant system for the SSH attempt.
routing-instance *routing-instance-name*	(Optional) Name of the routing instance for the SSH attempt.
source *address*	(Optional) Source address of the SSH connection.
v2	(Optional) Use SSH version 2 when connecting to a remote host.
port *port-number*	(Optional) Specify a port number for the SSH connection.

Additional Information

To configure an SSH (version 2) key for your user account, include the `authentication dsa-rsa` statement at the `[edit system login user user-name]` hierarchy level.

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the `retry-options` statement at the `[edit system login]` hierarchy level.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

ssh

```
user@switch> ssh user
Host key not found from the list of known hosts.
Are you sure you want to continue connecting (yes/no)? yes

Host ?user' added to the list of known hosts.
user@device's password:
Last login: Sun Jun 21 10:43:42 1998 from junos-router
% ...
```

Release Information

Command introduced before Junos OS Release 7.4.

Command introduced in Junos OS Release 11.1 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.

The command `tenant` option is introduced in Junos OS Release 19.2R1 for SRX Series.

Configuring SSH Host Keys for Secure Copying of Data

ssh-known-hosts

IN THIS SECTION

- Syntax | 29540
- Hierarchy Level | 29540
- Description | 29540
- Options | 29541
- Required Privilege Level | 29541
- Release Information | 29541

Syntax

```
ssh-known-hosts {
    fetch-from-server server;
    host hostname {
        dsa-key key;
        ecdsa-sha2-nistp256-key key;
        ecdsa-sha2-nistp384-key key;
        ecdsa-sha2-nistp521-key key;
        ed25519-key key;
        rsa-key key;

    }
    load-key-file filename;
}
```

Hierarchy Level

```
[edit security]
```

Description

Configure SSH support for known hosts and for administering SSH host key updates.

Options

fetch-from-server *server*
Retrieve SSH public host key information from the specified server. Specify by server name or IP address.

host *host-name*
Hostname of the SSH known host entry. This option has the following suboptions:

- `dsa-key` *key*—Base64-encoded Digital Signature Algorithm (DSA) key for SSH version 2.
- `ecdsa-sha2-nistp256-key` *key*—Base64-encoded ECDSA-SHA2-NIST256 key.
- `ecdsa-sha2-nistp384-key` *key*—Base64-encoded ECDSA-SHA2-NIST384 key.
- `ecdsa-sha2-nistp521-key` *key*—Base64-encoded ECDSA-SHA2-NIST521 key.
- `ed25519-key` *key*—Base64-encoded ED25519 key.
- `rsa-key` *key*—Base64-encoded public key algorithm that supports encryption and digital signatures for SSH version 1 and SSH version 2.

load-key-file *filename*
Import SSH host key information from the named file. If the file is in a directory other than the home directory of the device, specify pathname as well. The default filename is `/var/tmp/ssh-known-hosts`.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

    }
    traceoptions {
        file {
```

```
            filename;
            files number;
            match regular-expression;
            (no-world-readable | world-readable);
            size maximum-file-size;
        }
        flag flag;
        level [brief | detail | extensive | verbose];
        no-remote-trace;
    }
}
```

Hierarchy Level

```
[edit services]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify the configuration for Secure Socket Layer (SSL) support service. This statement is supported on the SRX1500, SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices and vSRX Virtual Firewall.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10. The `crl` statement is supported from 15.1X49-D30. The `protocol-version` statement is updated to include `tls11` and `tls12` from Junos OS Release 15.1X49-D30.

- Options | 29546
- Required Privilege Level | 29547
- Release Information | 29547

Syntax

```
ssl {
    address ip-address;
    hot-reloading;
    local-certificate local-certificate;
    mutual-authentication {
        certificate-authority certificate-authority-profile-name;
        client-certificate-request (no-certificate | request-certificate | request-certificate-
and-verify | require-certificate | require-certificate-and-verify);
    }
    port port;
```

```
    use-pki;
}
```

Hierarchy Level

```
[edit system services extension-service request-response grpc]
```

Description

Configure API connection settings based on Secure Sockets Layer (SSL) technology.

Options

address *ip-address*

Specify the IP address to listen for incoming connections. If you use the default IP address 0.0.0.0, the JET service process (jsd) listens on the IP address in the default routing instance.

- **Default:** 0.0.0.0

mutual-authentication

Enable bidirectional authentication. Use this option, in conjunction with `client-certificate-request` and `certificate-authority` *`profile-name`* to configure client authentication using SSL-based certificates.

client-certificate-request

Specify the requirements for a client certificate.

`no-certificate`—Client certificate is not requested.

> **NOTE**: We strongly recommend that you use this option in a test environment only.

`request-certificate`—Request certificate from client but do not verify.

`request-certificate-and-verify`—Request certificate from client and verify if provided.

`require-certificate`—Client certificate is mandatory, but do not verify.

`require-certificate-and-verify`—Client certificate is mandatory, and certificate is verified.

- **Default:** no-certificate

> **NOTE**: You can specify only one value for a client certificate.

hot-reloading

Enable persistent gRPC sessions across SSL certificate updates between a network management system or collector and a network device. If this feature is not enabled, when a certificate is updated between the network device and remote management system, all existing gRPC sessions are terminated.

certificate-authority *profile-name*

Specify the name of a certificate-authorirty profile configured at the [`edit security pki ca-profile`] hierarchy level. This profile is used to validate the certificate provided by the client.

port *port*

Specify the port number to accept incoming connections.

> **NOTE**: For gRPC connections used to stream telemetry data, the required port number is 32767.

- **Range:** 1 through 65535
- **Default:** 9090

use-pki

Use the Public Key Infrastructure (PKI) database on the device for gRPC-based operations that require certificates.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

`mutual-authentication`, `client-certificate-request`, and `certificate-authority` options added in Junos OS Release 17.4R1.

`hot-reloading` option added in Junos OS Release 20.4R1.

`use-pki` option added in Junos OS Evolved Release 22.2R1.

ssl-encryption

IN THIS SECTION

- Syntax | 29548
- Hierarchy Level | 29548
- Description | 29548
- Options | 29549
- Required Privilege Level | 29549
- Release Information | 29549

Syntax

```
ssl-encryption (any | no | yes);
```

Hierarchy Level

```
[edit security application-firewall rule-sets rule-set-name rule rule-name match]
```

Description

Distinguishes between encrypted and unencrypted SSL traffic as match criteria for the rule. In application firewall usage, this option lets you specify different actions for encrypted and unencrypted SSL traffic.

Starting in Junos OS Release 18.2R1 application firewall (AppFW) functionality is deprecated. As a part of this change, the `[edit security application-firewall]` hierarchy and all the configuration options under

this hierarchy are deprecated— rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.

Options

- `any`—Matches both encrypted and unencrypted SSL traffic.
- `no`—Matches unencrypted SSL traffic only.
- `yes`—Matches encrypted SSL traffic only.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10.

Configuring SSL Forward Proxy

ssl-inspection

IN THIS SECTION

- Syntax | 29550
- Hierarchy Level | 29550
- Description | 29550
- Options | 29550
- Required Privilege Level | 29551
- Release Information | 29551

Syntax

```
ssl-inspection {
    cache-prune-chunk-size number;
    key-protection;
    maximum-cache-size number;
    session-id-cache-timeout seconds;
    sessions number;
}
```

Hierarchy Level

```
[edit security idp sensor-configuration]
```

Description

Inspect HTTP traffic encrypted in SSL protocol. SSL inspection is disabled by default. It is enabled if you configure SSL inspection.

With the Intrusion Detection and Prevention (IDP) Secure Sockets Layer (SSL) decryption feature, SRX Series Firewalls load configured RSA private keys to memory and use them to establish SSL session keys to decrypt data. IDP is required to decrypt the RSA keys and to check the integrity before performing normal encryption or decryption operations using the keys.

Options

The remaining statements are explained separately. See CLI Explorer.

cache-prune-chunk-size

Number of cache entries to delete when pruning SSL session ID cache.

- **Syntax:** *cache-prune-chunk-size*—Number of cache entries to delete when pruning SSL session ID cache.
- **Range:** 1 through 100,000
- **Default:** 100

key-protection

Enabling key protection provides improved security. When key protection is enabled, persistent keys are encrypted when not in use.

Enabling or disabling of this option requires rebooting the device.

Enable secure key handling. This option is off by default.

maximum-cache-size

Maximum SSL session ID cache size.

- **Syntax:** *maximum-cache-size*—Maximum number of SSL session ID cache size.
- **Range:** 1 through 5,000,000 sessions
- **Default:** 100,000

session-id-cache-timeout

Sets the timeout value for an IDP session ID cache (range: 1 through 7200 seconds).

- **Syntax:** *maximum-cache-size*—Maximum number of SSL session ID cache size.

sessions

Maximum number of SSL sessions for inspection. This limit is per Services Processing Unit (SPU).

- **Syntax:** *number*—Number of SSL session to inspect.
- **Range:** 1 through 100,000
- **Default:** 10,000

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statements introduced in Junos OS Release 9.3.

Options `cache-prune-chunk-size` and `maximum-cache-size` introduced in Junos OS Release 10.2.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1X49-D100	Starting from 15.1X49, the IDP SSL Inspection feature is deprecated. Juniper recommends use of SSL Proxy feature.

ssl-proxy (Application Services)

IN THIS SECTION

- Syntax | 29552
- Hierarchy Level | 29552
- Description | 29552
- Options | 29552
- Required Privilege Level | 29553
- Release Information | 29553

Syntax

```
ssl-proxy {
    profile-name profile-name
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
application-services]
```

Description

Enable SSL proxy and identify the name of the SSL proxy profile to be used. This option is supported on SRX340, SRX345, SRX550M, SRX1500, SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices.

Options

profile-name	SSL proxy profile.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

Security Policies Overview

ssm-groups

IN THIS SECTION

Syntax | 29555

- Hierarchy Level | 29555
- Description | 29555
- Options | 29555
- Required Privilege Level | 29556
- Release Information | 29556

Syntax

```
ssm-groups [ ip-addresses ];
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options multicast],
[edit logical-systems logical-system-name routing-options multicast],
[edit routing-instances routing-instance-name routing-options multicast],
[edit routing-options multicast]
```

Description

Configure source-specific multicast (SSM) groups.

By default, the SSM group multicast address is limited to the IP address range from 232.0.0.0 through 232.255.255.255. However, you can extend SSM operations into another Class D range by including the `ssm-groups` statement in the configuration. The default SSM address range from 232.0.0.0 through 232.255.255.255 cannot be used in the `ssm-groups` statement. This statement is for adding other multicast addresses to the default SSM group addresses. This statement does not override the default SSM group address range.

IGMPv3 supports SSM groups. By utilizing inclusion lists, only sources that are specified send to the SSM group.

Options

ip-addresses—List of one or more additional SSM group addresses separated by a space.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

ssm-map (Dynamic IGMP Interface)

IN THIS SECTION

- Syntax | 29556
- Hierarchy Level | 29556
- Description | 29557
- Options | 29557
- Required Privilege Level | 29557
- Release Information | 29557

Syntax

```
ssm-map ssm-map-name;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name protocols igmp interface interface-name]
```

Description

Apply an SSM map to a dynamic IGMP interface. SSM mapping translates IGMPv1 and IGMPv2 membership reports to an IGMPv3 report, which enables hosts running IGMPv1 or IGMPv2 to participate in SSM. The SSM map associates an SSM policy that matches group addresses to be translated with the source addresses where the group addresses are found.

Starting in Junos OS Release 16.1R5, 16.2R3, 17.1R3, and 17.2R2, the `ssm-map` statement is deprecated and no longer supported. Starting in Junos OS Release 17.3R1, the statement is removed from the CLI. Use the `ssm-map-policy` instead to associate the policy with the dynamic IGMP interface for all releases with enhanced subscriber management.

If you upgrade from an earlier release that does not support enhanced subscriber management (any release earlier than Junos OS Release 15.1R4) with a configuration that includes the `ssm-map` statement, the results vary depending on the release to which you are upgrading:

- Upgrade to Junos OS Release 16.1R5, 16.2R3, 17.1R3, 17.2R2, or later releases in those branches—The `ssm-map` configuration is allowed and does not cause the upgrade to fail. However, the configuration has no effect and subscribers cannot log in.
- Upgrade to Junos OS Release 17.3R1 or later releases—The upgrade fails because the `ssm-map` configuration is not allowed. If you perform the upgrade without validation (`no-validate`), the upgrade passes and the `ssm-map` configuration is accepted, but it has no effect.

BEST PRACTICE: Delete the `ssm-map` configuration before you upgrade.

Options

`ssm-map-name`—Name of SSM map.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Statement became non-functional in Junos OS Release 15.1R4.

Statement deprecated in Junos OS Release 16.1R5, 16.2R3, 17.1R3, 17.2R2, and 17.3R1.

Statement removed from CLI in Junos OS Release 17.3R1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
16.1R5	Starting in Junos OS Release 16.1R5, 16.2R3, 17.1R3, and 17.2R2, the `ssm-map` statement is deprecated and no longer supported. Starting in Junos OS Release 17.3R1, the statement is removed from the CLI.

stacked-interface-set (Dynamic Profiles)

IN THIS SECTION

- Syntax | 29572
- Hierarchy Level | 29572
- Description | 29572
- Options | 29573
- Required Privilege Level | 29573
- Release Information | 29573

Syntax

```
stacked-interface-set {
    interface-set-name interface-set-name {
        interface-set-name interface-set-name;
    }
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces]
```

Description

For MX Series routers with MPCs that support 5-level hierarchical scheduling, define an interface set over interface set hierarchy. The child interface set (L3) contains subscriber logical interfaces, and the parent interface set (L2) contains one or more interface sets as members.

NOTE: For both interface-sets in the stack (at L3 and L2), a CoS traffic-control-profile (TCP) must be assigned to each.

Options

interface-set-name—Name of the interface set to be configured or one of the following Junos OS predefined variables:

- $junos-aggregation-interface-set-name—L2 interface-set representing a logical intermediate node (DPU-C or PON tree) in the access network.
- $junos-default-interface-set-name—An intermediate, default variable used to resolve the L3 (child) interface-set name based on whether subscriber access is via a logical intermediate aggregation node
- $junos-interface-set-name—Predefined variable that, when used, is replaced with the interface-set obtained from the RADIUS server when a subscriber authenticates over the interface to which the dynamic profile is attached.
- $junos-phy-ifd-underlying-intf-set-name—A default, topology-based interface-set derived from the predefined variable, $junos-phy-ifd-underlying-intf-set-name by appending “-underlying” to conserve L2 CoS nodes. It is a variation of the $junos-phy-ifd-interface-set-name variable used as a default L2 interface-set for 4-level hierarchy or default L3 interface-set for 5-level hierarchy.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.4R1.

stacked-vlan-ranges (any | low-outer-tag-high-outer-tag),any;
```

Hierarchy Level

```
[edit interfaces interface-name radius-options nas-port-options nas-port-options-name]
```

Description

Configure the stacked VLAN (S-VLAN) range of subscribers to which the named NAS-Port options definition applies.

NOTE: You can configure a maximum of 16 NAS-Port options definitions per physical interface. Each definition can include a maximum of 32 VLAN ranges or 32 S-VLAN ranges, but cannot include a combination of VLAN ranges and S-VLAN ranges.

Options

any Entire S-VLAN range representing all S-VLAN IDs. The inner tag (S-VLAN ID) of the S-VLAN range must be configured as `any` to represent all inner VLAN ID tags.

low-outer-tag Outer VLAN ID tag representing the lower limit of the S-VLAN range.

- **Range:** 1 through 4094

high-outer-tag Outer VLAN ID tag representing the upper limit of the S-VLAN range.

- **Range:** 1 through 4094

> **NOTE**: To specify a single outer VLAN ID tag, set `low-outer-tag` and `high-outer-tag` to the same value.

Required Privilege Level

```
stale-labels-holddown-period stale-labels-holddown-period;
```

Hierarchy Level

```
[edit fabric protocols bgp],
[edit protocols bgp],
[edit routing-instances name protocols bgp]
```

Description

Configure a time duration for which the BGP allocated MPLS labels are retained after they go stale. Holding the stale labels without deleting them immediately allows the upstream peers to receive and install the new labeled advertisements. Note that these MPLS stale labels are retained even when MPLS fast reroute (FRR) is not configured.

> **NOTE**: During this hold down period you cannot use the label space for new label allocation, which momentarily reduces the supported label scale. Therefore, we recommend setting an appropriate minimum value as the hold down time period for stale labels.

Options

stale-labels-holddown-period

Specify a time duration in seconds for which the MPLS labels allocated by BGP are kept after they go stale.

- **Range:** 1 through 600

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R1.

Syntax

```
stale-routes-time seconds;
```

Hierarchy Level

```
[edit fabric protocols fabric-control graceful-restart]
```

Description

Set the length of time that the fabric control Routing Engine waits to receive messages from devices before declaring them down. Configure a stale routes time of 1800 seconds if the number of VLAN members (vmembers) exceeds 32k.

Options

seconds Amount of time that the fabric control Routing Engine waits to receive messages from other devices before declaring them down.

- **Default:** 900 seconds
- **Range:** 900 to 1800 seconds

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X52-D10.

```

Description

Specify the maximum time that stale routes are kept during a restart. The `stale-routes-time` statement allows you to set the length of time the routing device waits to receive messages from restarting neighbors before declaring them down.

Options

seconds—Time the router device waits to receive messages from restarting neighbors before declaring them down.

- **Range:** 1 through 600 seconds
- **Default:** 300 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

flow) graceful-restart long-lived restarter],
[edit protocols bgp group group-name neighbor address family (l2vpn | route-target | inet)
(labeled-unicast | flow) graceful-restart long-lived restarter]
```

NOTE: Each routing table is identified by the protocol family or address family indicator (AFI) and a subsequent address family identifier (SAFI). The AFI parameter can be one of the `(l2vpn | inet | route-target)` protocols and the SAFI parameter can be either of the `(flow | labeled-unicast)` protocols for inet family and one of the `(auto-discovery-mspw | auto-discovery-only | signaling)` protcols for L2VPN family..

Configuring LLGR does not require that BGP graceful restart also be configured. The long-lived-graceful-restart section is visible only for families l2vpn, inet labeled-unicast, inet flow and route-target. It is prohibited for inet-mvpn, inet6-mvpn and inet-mdt. It is hidden for other families.

Description

Specify the period of time for which stale routes must be preserved by using le the long-lived graceful restart capability for BGP sessions on the restarting router. When LLGR restarter is enabled or disabled for a family or the stale- time is changed, the session is reset so that the new capability can be sent to

the neighbor. You can configure the stale period for each address family at the logical system or routing instance level.

The stanzas in the per-family graceful-restart long-lived restarter configuration section enables LLGR restarter mode negotiation for BGP globally, or for a group or neighbor. The values are inherited by groups from the global configuration, and by neighbors from the group configuration. The disable attribute is used to override configuration inherited from a higher level. It does not disable LLGR receiver mode; you must disable LLGR receiver mode explicitly for all families as necessary.

In addition, times can also be configured using the following notation: <hours>:<minutes>:<seconds> For example, 12:00:00 specifies twelve hours. The hours and minutes are optional.

The two notations can be combined, for example, 2w1d 12:00:02 specifies two weeks, one day, twelve hours and two seconds (1339202 seconds). (Note that the CLI requires double-quotes around a value like this with spaces in it.) Expressed in this notation, the maximum stale time is 27w5d 04:20:15 (27 weeks, 5 days, 4 hours, 20 minutes and 15 seconds). While the show configuration command displays the actually configured values, when the associated timers are displayed in run-time show commands such as `show bgp neighbor`, the values are normalized, such as 1d36h becoming 2d 12:00:00. The full rules for displaying normalized LLGR times depend on the `clear bgp neighbor neighbor-address gracefully` command configuration.

Options

interval Period as a measure of the number of weeks, days, hours, minutes, and seconds for which stale routes must be maintained when long-lived graceful restart mechanism is enabled on the restarter router.

The range of values for stale-time is from 1 to 16777215 (2^24 – 1) seconds. The value is a simple integer giving the number of seconds by default, but it can also be specified using the following notation:

```
[<weeks>w][<days>d][<hours>h][<minutes>m][<seconds>s]
```

For example, you can specify 27 days as 27d, 648h, 38880m or 2332800s. 90 minutes can be configured as 1h30m, 90m or 5400s. The specified number of days is multiplied by 86400, the number of hours by 3600 and the number of minutes by 60; these are added to the seconds to get the total. A combined format of days and hours, in different time period units, such as 1d36h are permitted, as long as the specified total does not exceed the maximum stale time.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

[edit logical-systems logical-system-name routing-instances routing-instance-name protocols vpls
neighbor address backup-neighbor address],
[edit protocols l2circuit neighbor address interface interface-name backup-neighbor address],
[edit routing-instances routing-instance-name protocols vpls neighbor address backup-neighbor
address]
```

Description

Configure the pseudowire to the specified backup neighbor as the standby. When you configure this statement, traffic flows over both the active and standby pseudowires to the backup device (either a CE device or PE router). The backup device drops the traffic from the standby pseudowire, unless the active pseudowire fails. If the active pseudowire fails, the backup device automatically switches to the standby pseudowire.

The `standby` statement is quite similar to the `hot-standby` statement introduced in Junos OS Release 12.3. The `hot-standby` statement allows for a faster forwarding-path switchover during transition periods, as compared to what is allowed by the `standby` statement.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit system extensions extension-service application file filename],
[edit system scripts op],
```

```
[edit system scripts op file filename],
[edit system scripts snmp],
[edit system scripts snmp file filename]
```

Description

Configure options to control script execution.

> **NOTE**: Junos devices do not enforce script start options for remote op scripts, which are executed using the `op url` command. Script start options are enforced only for local op scripts.

Default

If you do not configure start options for an individual script or script type, the device does not perform any system resource checks before executing a script.

Options

mem-factor *percentage*

System memory usage threshold, specified as a percentage, above which a script does not execute.

You can configure the statement for op, event, SNMP, and Juniper Extension Toolkit (JET) scripts. You can apply the statement to an individual script or to all scripts of a given script type. If you define different thresholds for the script type and an individual script of the same type, the configuration for the individual script takes precedence.

If a device prevents the execution of a script, the cscript process records system log messages in the log file. The CLI does not issue any warning or error that the script was halted.

- Range: 1 through 100

> **NOTE**: For JET applications, the `mem-factor` and `daemonize` statements are mutually exclusive.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 22.4R1.

Statement introduced in Junos OS Evolved Release 23.1R1.

- Sample Output | 29597
- Release Information | 29597

Syntax

```
start shell (csh | sh)
<user username>
```

Description

Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type `exit` from the shell.

Juniper Networks does not provide support for operations in the shell.

NOTE:

- To issue this command, the user must have the required login access privileges configured by including the `permissions` statement at the `[edit system login class` *`class-name`*`]` hierarchy level.
- UNIX wheel group membership or permissions are no longer required to issue this command.

Options

csh	Create a UNIX C shell.
sh	Create a UNIX Bourne shell.
user ***username***	(Optional) Start the shell as another user.

Additional Information

When you are in the shell, the shell prompt has the following format:

```
username@hostname%
```

An example of the prompt is:

```
root@host%
```

Required Privilege Level

shell or maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

start shell csh

```
user@host> start shell csh
%

exit
%

username@hostname% start shell sh
%

exit
user@host>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

Configure a partial match criteria used with the DHCP relay agent selective processing feature. DHCP relay agent compares the configured partial match string with the option-specific string received in DHCP client packets. If there is an partial left-to-right match, DHCP performs the action you define for the match criteria.

The option-specific string in the DHCP client packets can contain a superset of the specified ASCII or hexadecimal match string, provided that the leftmost characters of the option-specific string entirely match the characters in the configured match string.

You can configure an unlimited number of match strings. If you have multiple partial match configurations, the longest match rule applies. For example, DHCP relay agent matches the string “test123” before it matches the string “test”. Match strings do not support wildcard attributes.

The `local-server-group` option is not supported for DHCPv6 relay agent.

Options

ascii-string ASCII string of 1 through 255 alphanumeric characters.

hexadecimal-string Hexadecimal string of 1 through 255 hexadecimal characters (0 through 9, a through f, A through F).

- Hierarchy Level | 29611
- Description | 29611
- Options | 29612
- Required Privilege Level | 29612
- Release Information | 29612

Syntax

```
event1.attribute-name starts-with event2.attribute-name;
```

Hierarchy Level

```
[edit event-options policy policy-name attributes-match]
```

Description

Configure an event policy to trigger only if the *event1* attribute value starts with the value of the *event2* attribute. The referenced events must be either the trigger event or the correlating events included in the event policy's `within` statements.

An `attributes-match` statement can include multiple comparison statements. The system evaluates multiple comparison statements using a logical AND operator. Thus, to execute the event policy, all of the `attributes-match` conditions must evaluate to true.

Options

event1.attribute-name	Attribute of one event.
event2.attribute-name	Attribute of another event.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

Syntax

```
startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);
```

Hierarchy Level

```
[edit snmp rmon alarm index]
```

Description

Set an initial alarm that is sent after the configured SNMP RMON alarm becomes active.

Options

`falling-alarm`—Generated if the first sample after the alarm entry becomes active is less than or equal to the falling threshold.

`rising-alarm`—Generated if the first sample after the alarm entry becomes active is greater than or equal to the rising threshold.

`rising-or-falling-alarm`—Generated if the first sample after the alarm entry becomes active satisfies either of the corresponding thresholds.

- **Default:** `rising-or-falling-alarm`

Required Privilege Level

        }
        not-master;
    }
}
```

Hierarchy Level

```
[edit protocols ptp]
```

Description

Configure the stateful port or bidirectional port with parameters. A stateful port is useful when you configure PTP over Ethernet for multicast mode of transmission of PTP traffic. A stateful port configuration for PTP over Ethernet and default profile is supported only on boundary clock mode and not on ordinary clock mode.

For PTP over Ethernet, you can configure a port to function as both a timeReceiver port and a timeTransmitter port. This type of port is called a stateful port, or a bidirectional port. Such a stateful port enables the transfer of frequency for synchronization services, in addition to time and phase alignment, when PTP functionality is not hop-by-hop and you have provisioned timeTransmitter and timeReceiver roles or interfaces.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1R1.

- Required Privilege Level | 29618
- Release Information | 29618

Syntax

```
(stateful | stateless);
```

Hierarchy Level

```
[edit forwarding-options access-security router-advertisement-guard interface  (interface-name |
interface-range-name)],
[edit forwarding-options access-security router-advertisement-guard vlans  vlan-name]
```

Description

Configure stateful IPv6 Router Advertisement (RA) guard. In an IPv6 deployment, RA guard protects against rogue RA messages generated either maliciously or unintentionally by unauthorized or

improperly configured routers connecting to the network segment. RA guard performs checks on incoming RA messages to make sure that they are sent from legitimate routers. If the sender of the RA message cannot be validated, the RA message is dropped.

Stateful RA guard enables the switch to learn about the sources of RA messages for a certain period of time. During this period, when the switch is known to be in the learning state, the information contained in attributes of received RA messages is stored and compared to the policy. When the learning period ends, the switch has a record of which interfaces are attached to links with valid IPv6 routers. If there is no valid IPv6 router attached to the interface, the switch dynamically transitions the interface from the learning state into the blocking state. Subsequent RA messages received after the transition to blocking state are dropped. If there is a valid IPv6 router attached to the interface, the interface transitions to the forwarding state, and subsequent RA messages that can be validated against the configured policy are forwarded.

You can enable stateful RA guard on an interface or on a VLAN. When you enable stateful RA guard, the initial state is `Off`. You initiate the learning state by issuing the `request access-security router-advertisement-guard-learn` command.

Default

RA guard is stateless by default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X53-D55.

(stateful | stateless);
```

Hierarchy Level

```
[edit forwarding-options access-security router-advertisement-guard interface  (interface-name |
interface-range-name)],
[edit forwarding-options access-security router-advertisement-guard vlans vlan-name]
```

Description

Configure stateless IPv6 Router Advertisement (RA) guard. In an IPv6 deployment, RA guard protects against rogue RA messages generated either maliciously or unintentionally by unauthorized or improperly configured routers connecting to the network segment. An RA guard policy is used to validate incoming RA messages on the basis of whether they match the conditions defined in a policy.

You can configure RA guard to be stateless or stateful. If stateless RA guard is enabled, the switch examines incoming RA messages and filters each message on the basis of whether it matches the conditions configured in the policy. After the switch has validated the content of the RA message, it forwards the RA message to its destination; otherwise, the RA message is dropped. For example, an interface can be statically configured to forward RA messages only from predefined sources.

You can enable stateless RA guard on an interface or on a VLAN.

Default

RA guard is stateless by default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Configuring Stateful IPv6 Router Advertisement Guard

static (802.1X)

IN THIS SECTION

- Syntax | 29627
- Hierarchy Level | 29627
- Description | 29627
- Options | 29628
- Required Privilege Level | 29628
- Release Information | 29628

Syntax

```
static mac-address {
    bridge-domain-assignment bridge-domain-assignment;
        interface [interface-names];
    vlan-assignment (vlan-id |vlan-name );
}
```

Hierarchy Level

```
[edit protocols dot1x                 authenticator]
```

Description

Configure MAC addresses to exclude from 802.1X authentication. The static MAC list provides an authentication bypass mechanism for supplicants connecting to a port, permitting devices such as printers that are not 802.1X-enabled to be connected to the network on 802.1X-enabled ports.

Using this 802.1X authentication-bypass mechanism, the supplicant connected to the MAC address is assumed to be successfully authenticated and the port is opened for it. No further authentication is done for the supplicant.

You can optionally configure the VLAN so that the supplicant is moved to or the interfaces on which the MAC address can gain access from.

Options

mac-address	The MAC address of the device for which 802.1X authentication should be bypassed and the device permitted access to the port.
bridge-domain-assignment *bridge-domain-assignment*	(MX Series only) Specify the bridge-domain name or 802.1q tag identifier for the MAC address that should be allowed to bypass RADIUS authentication.
interface [*interface-names*]	Specify a list of interfaces on which the specified MAC addresses are allowed to bypass RADIUS authentication and allowed to connect to the LAN without authentication.
vlan-assignment (*vlan-id* | *vlan-name*	(EX, QFX, and SRX Series only) Specify the VLAN 802.1q tag identifier or VLAN name associated with the list of MAC addresses that should be allowed to bypass RADIUS authentication.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Syntax

```
static {
    group ip-address;
}
```

Hierarchy Level

```
[edit protocols igmp-snooping vlan (all | vlan-name) interface interface-name]
```

Description

Statically define multicast groups for IGMP snooping on a Layer 2 (L2) interface.

You might use this statement to configure an L2 interface to statically join a particular multicast group in cases such as the following:

- In a network that doesn't include Layer 3 (L3) multicast. You can't establish a static IGMP state at L3, but you can create a static join state on an interface for multicast forwarding at L2.
- To enable static IGMP join states with more granularity in a network with L2 and L3 multicast elements.

For example, consider that you have Layer 2 interfaces in a VLAN associated with an IRB interface for Layer 3 multicast routing. You have two options to establish a static join state on an interface at the two different levels:

- Assign a static group membership on an individual Layer 2 interface in the VLAN associated with the IRB interface:

  In this case, the device creates IGMP and PIM join states for the static group at L3 on the IRB interface. However, with IGMP snooping enabled and the group membership established only on that individual L2 interface, the device forwards traffic for the group only on that interface.

- Assign a static group membership only on the IRB interface itself at L3:

  In this case, without enabling IGMP snooping, the device creates creates IGMP and PIM join states for the group at L3 on the IRB interface, pulls multicast traffic, and floods it on all L2 ports in the VLAN. With IGMP snooping enabled, the device pulls multicast traffic for the group, but doesn't forward it on the VLAN (because you didn't configure any particular L2 ports to join that multicast group).

The remaining statement is explained separately. See CLI Explorer.

Default

No multicast groups are statically defined.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

validation],
[edit logical-systems logical-system-name routing-options validation],
[edit routing-instances instance-name routing-options validation],
[edit routing-options validation]
```

Description

Configure a static route validation (RV) record.

RV records are received from the RPKI cache server using the protocol defined in Internet draft draft-ietf-sidr-rpki-rtr-19, *The RPKI/Router Protocol*, and can also be configured statically, as shown here.

Static records are useful for overwriting the information received from an RPKI cache server.

An RV record matches any route whose prefix matches the RV prefix "record" on page 14681, whose prefix length does not exceed the "maximum-length" on page 10973 given in the RV record, and whose origin AS equals the "origin-autonomous-system" on page 12428 number given in the RV record.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

```

Description

Test multicast forwarding on an interface without a receiver host.

The `static` statement simulates IGMP joins on a routing device statically on an interface without any IGMP hosts. It is supported for both IGMPv2 and IGMPv3 joins. This statement is especially useful for testing multicast forwarding on an interface without a receiver host.

> **NOTE**: To prevent joining too many groups accidentally, the `static` statement is not supported with the `interface all` statement.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

address],
```

```
[edit routing-instances routing-instance-name protocols vpls neighbor address],
[edit routing-instances routing-instance-name protocols vpls neighbor address backup-neighbor
address]
```

Description

Specifies a static pseudowire for a VPLS domain. By configuring static pseudowires for the VPLS domain, you do not need to configure the LDP or BGP protocols that would normally be used for signaling. Static pseudowires require that you configure a set of in and out labels for each pseudowire configured for the VPLS domain. You can configure both static and dynamic neighbors within the same VPLS routing instance. You can also configure a static pseudowire for a backup neighbor (if you configure the neighbor as static the backup must also be static) and for a mesh group.

Options

`incoming-label` *label*—You must configure an incoming label for the static pseudowire.

- **Range:** 29,696 through 41,983 and 1,000,000 through 1,048,575

`outgoing-label` *label*—You must configure an outgoing label for the static pseudowire.

- **Range:** 16 through 1,048,575

`control-word`—Set `control-word` to request that other routers insert a control word between the label stack and the MPLS payload.

`no-control-word`—Set `no-control-word` to request that other routers not insert a control word between the label stack and the MPLS payload. This is the default setting for BGP VPLS.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

Options `control-word` and `no-control-word` are introduced in Junos OS Release 20.3R1.

NOTE: Options `control-word` and `no-control-word` are not introduced at the [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols vpls neighbor *address* backup-neighbor *address*] and [edit routing-instances *routing-instance-name* protocols vpls neighbor *address* backup-neighbor *address*] hierarchy level.

```

Description

Configure static routes to be installed in the routing table. You can specify any number of routes within a single `static` statement, and you can specify any number of **static** options in the configuration.

Options

defaults—(Optional) Specify global static route options. These options only set default attributes inherited by all newly created static routes. These are treated as global defaults and apply to all the static routes you configure in the `static` statement.

> **NOTE**: Specifying the global static route options does not create default routes. These options only set default attributes inherited by all newly created static routes.

route—Configure individual static routes. In this part of the `static` statement, you optionally can configure static route options. These options apply to the individual destination only and override any options you configured in the **defaults** part of the `static` statement.

- ***destination-prefix/ prefix-length***—***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.

When you configure an individual static route in the **route** part of the `static` statement, specify the destination of the route (in **route** ***destination-prefix***) in one of the following ways:

- ***network/ mask-length***, where ***network*** is the network portion of the IP address and ***mask-length*** is the destination prefix length.
- **default** if this is the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.

> **NOTE**: IPv4 packets with a destination of **0.0.0.0** (the obsoleted limited broadcast address) and IPv6 packets with a destination of **0::0** are discarded by default. To forward traffic destined to these addresses, you can add a static route to **0.0.0.0/32** for IPv4 or **0::0/128** for IPv6.

- ***nsap-prefix***—***nsap-prefix*** is the network service access point (NSAP) address for ISO.
- **next-hop *address***—Reach the next-hop routing device by specifying an IP address, an interface name, or an ISO network entity title (NET).

  IPv4 or IPv6 address of the next hop to the destination, specified as:

  - IPv4 or IPv6 address of the next hop
  - Interface name (for point-to-point interfaces only)
  - ***address*** or ***interface-name*** to specify an IP address of a multipoint interface or an interface name of a point-to-point interface.

    > **NOTE**: If an interface becomes unavailable, all configured static routes on that interface are withdrawn from the routing table.

    > **NOTE**: Load balancing is not supported on management and internal Ethernet (**fxo**) interfaces because this type of interface cannot handle the routing process. On **fxp** interfaces, you cannot configure multiple next hops and enable load balancing.

- ***next-hop-options***—Additional information for how to manage forwarding of packets to the next hop.

  - **backup-pe-group:**—Backup provider edge (PE) (ingress PE) redundancy provides a backup resource when point-to-multipoint LSPs are configured for multicast distribution.
  - **discard**—Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP (or ICMPv6) unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.
  - **explicit-null**—Indicate label 0 to the egress router of an LSP. The default classification for explicit-null packets is based on the payload (IPv4 or IPv6 DSCP bits)
  - ***iso-net***—Reach the next-hop routing device by specifying an ISO NSAP.

- **longest-match**—The longest match is an entry of the IP routers to select the best route from a routing table. The router uses the longest (prefix) match to determine the egress interface and the address of the next device to which to send a packet.
- **no-longest-match**—The routers overrides the longest match to select the best route.
- **lsp-next-hop**—The LSP next-hop preference overrides the route preference and metric (for that specific LSP next hop). `lsp-next-hop allows` dynamically signalled MPLS LSP to be used as the next-hop for a static route.

```
# First configure RSVP-TE LSP
set protocols rsvp interface all
set protocols mpls label-switched-path to-pe2 to 10.0.0.2

# Then use it as nexthop
set routing-options static route 1.1.1.1/32 lsp-next-hop to-pe2
```

- **next-table** ***routing-table-name***—Name of the next routing table to the destination.

  If you use the **next-table** action, the configuration must include a term qualifier that specifies a different table than the one specified in the **next-table** action. In other words, the term qualifier in the `from` statement must exclude the table in the **next-table** action. In the following example, the first term contains **rib vrf-customer2.inet.0** as a matching condition. The action specifies a next-hop in a different routing table, **vrf-customer1.inet.0**. The second term does the opposite by using **rib vrf-customer1.inet.0** in the match condition and **vrf-customer2.inet.0** In the **next-table** action.

```
term 1 {
    from {
        protocol bgp;
        rib vrf-customer2.inet.0;
        community customer;
    }
    then {
        next-hop next-table vrf-customer1.inet.0;
    }
}
term 2 {
    from {
        protocol bgp;
        rib vrf-customer1.inet.0;
        community customer;
    }
```

```
    then {
        next-hop next-table vrf-customer2.inet.0;
    }
}
```

NOTE: Within a routing instance, you cannot configure a static route with the `next-table inet.0` statement if any static route in the main routing instance is already configured with the `next-table` statement to point to the **inet.0** routing table of the routing instance. For example, if you configure on the main routing instance a static route **192.168.88.88/32** with the `next-table test.inet.0` statement and the routing instance test is also configured with a static route **192.168.88.88/32** with the `next-table inet.0` statement, the commit operation fails. Instead, you must configure a routing table group both on the main instance and on the routing instance, which enables you to install the static route into both routing tables.

NOTE:
With the fix for PR 1383419, configuring a static route with a next-table action on QFX5xxx/EX4xxx switches results in software forwarding when the prefix length is less than 16 bits for IPv4 or 64 bits for IPv6. To avoid possible performance impact you should configure multiple static routes with prefixes equal to or longer than 16 and 64 bits for IPv6 and IPv6, respectively

- **p2mp-ldp-next-hop**—Specify a point-to-multipoint LDP label-switched path (LSP) as the next hop for a static route, and configure a root and provide an lsp-id on that LDP-signalled label-switched path.

- **p2mp-lsp-next-hop**—Specify a point-to-multipoint LSP as the next hop for a static route, and configure an independent metric or preference on that next-hop LSP. p2mp-lsp-next-hop is used with RSVP-TE that differentiates from p2mp-ldp-next-hop used with LDP protocol.

- **priority**—If insufficient link bandwidth is available during session establishment, the setup priority is compared with other setup priorities for established sessions on the link to determine whether some of them should be preempted to accommodate the new session. Sessions with low priorities are prioritized.

- **receive**—Install a route for this next-hop destination into the routing table.

  The **receive** option forces the packet to be sent to the Routing Engine.

  The **receive** option can be useful in the following cases:

  - For receiving MPLS packets destined to a VRF instance's loopback address

- For receiving packets on a link's subnet address, with zeros in the host portion of the address

- **reject**—Do not forward packets addressed to this destination. Instead, drop the packets, send ICMP (or ICMPv6) unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

- **static-lsp-next-hop**—Static point-to-multipoint (P2MP) LSPs are used for a specific MBGP MVPN; static P2MP LSP next-hop cannot be shared by multiple VPNs.

  `static-lsp-next-hop` refers to a manually configured next hop in a static Label Switched Path. Unlike dynamic LSPs, static LSPs do not rely on protocols like LDP for label distribution and require manual configuration of the label paths.

  ```
  # First configure static LSP with explicit labels
  set protocols mpls static-label-switched-path to-pe2 ingress next-hop 10.1.1.2
  set protocols mpls static-label-switched-path to-pe2 ingress to 10.0.0.2
  set protocols mpls static-label-switched-path to-pe2 ingress push 100200

  # Then use it as nexthop
  set routing-options static route 1.1.1.1/32 static-lsp-next-hop to-pe2
  ```

- **tag2**—tag2 value is configured to assign access route.

static-options—(Optional under **route**) Additional information about static routes, which is included with the route when it is installed in the routing table.

You can specify one or more of the following in ***static-options***. Each of the options is explained separately.

- **(active | passive)**;
- **as-path <*as-path*> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator *as-number in-address*>**;
- **community [*community-ids*]**;
- **(install | no-install)**;
- **(metric | metric2 | metric3 | metric4) *value* <type *type*>**;
- **(preference | preference2 | color | color2) *preference* <type *type*>**;
- **(readvertise | no-readvertise)**;
- **(resolve | no-resolve)**;
- **(retain | no-retain)**;

- **tag** *metric* **type** *number*;

The remaining statements are explained separately. See CLI Explorer.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3. The `description` option added in Junos OS Release 12.1. Statement modified in Junos OS Release 12.1X45-D10. Statement modified in Junos OS Release 12.3X48-D25.

static-binding

IN THIS SECTION

Syntax | 29659

- Hierarchy Level | 29659
- Description | 29659
- Options | 29659
- Required Privilege Level | 29660
- Release Information | 29660

Syntax

```
static-binding mac-address {
    client-identifier (ascii client-id | hexadecimal client-id);
    fixed-address {
        address;
    }
    host-name client-hostname;
}
```

Hierarchy Level

```
[edit system services dhcp]
```

Description

For J Series Services routers and EX Series switches only. Set static bindings for DHCP clients. A static binding is a mapping between a fixed IP address and the client's MAC address or client identifier.

Options

mac-address—The MAC address of the client. This is a hardware address that uniquely identifies a client on the network.

`fixed-address` *address*—Fixed IP address assigned to the client. Typically a client has one address assigned, but you can assign more.

`host-name` *client-hostname*—Hostname of the client requesting the DHCP server. The name can include the local domain name. Otherwise, the name is resolved based on the `domain-name` statement.

`client-identifier (ascii client-id | hexadecimal client-id)`—Used by the DHCP server to index the database of address bindings. The client identifier is an ASCII string or hexadecimal number and can include a type-value pair as specified in RFC 1700, *Assigned Numbers*. Either a client identifier or the client's MAC address must be configured to uniquely identify the client on the network.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

static-host-mapping

IN THIS SECTION

- Syntax | 29660
- Hierarchy Level | 29661
- Description | 29661
- Default | 29661
- Options | 29661
- Required Privilege Level | 29661
- Release Information | 29662

Syntax

```
static-host-mapping {
    hostname {
        alias [ aliases ];
        inet [ addresses ];
        inet6 [ addresses];
        sysid system-identifier;
```

```
    }
}
```

Hierarchy Level

```
[edit system]
```

Description

(Optional) Statically map a hostname to one or more IP addresses and aliases, and configure an International Organization for Standardization (ISO) system identifier (system ID).

Default

If you do not statically map the hostname, the mapping is generated dynamically, based on the system configuration. For instance, if you omit the `static-host-mapping` *`hostname`* `sysid` statement, the IS-IS system ID is dynamically generated from the host portion of the ISO address configured on the loopback interface (lo0) and is mapped to the `host-name` statement configured at the `[edit system]` hierarchy level.

Options

alias ***alias***	Alias for the hostname.
hostname	Fully qualified hostname.
inet ***address***	IP address. You can specify one or more IP addresses for the host.
sysid ***system-identifier***	ISO system identifier (system ID). This is the 6-byte portion of the Intermediate System-to-Intermediate System (IS-IS) network service access point (NSAP). We recommend that you use the host's IP address represented in binary-coded decimal (BCD) format. For example, the IP address 208.197.169.18 is 2081.9716.9018 in BCD.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 11.1. for the QFX Series.

static-interface

IN THIS SECTION

- Syntax | 29662
- Hierarchy Level | 29662
- Description | 29663
- Options | 29663
- Required Privilege Level | 29663
- Release Information | 29663

Syntax

```
static-interface interface-name;
```

Hierarchy Level

```
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci
circuit-id-string ari remote-id-string]
```

Description

Reserve the specified static PPPoE interface for use only by the PPPoE client with matching agent circuit identifier (ACI) and agent remote identifier (ARI) information. You can specify only one static interface per ACI/ARI pair configured for a named service entry, `empty` service entry, or `any` service entry in the PPPoE service name table.

The static interface associated with an ACI/ARI pair takes precedence over the general pool of static interfaces associated with the PPPoE underlying interface.

If you include the `static-interface` statement in the configuration, you cannot also include either the `dynamic-profile` statement or the `routing-instance` statement. The `dynamic-profile`, `routing-instance`, and `static-interface` statements are mutually exclusive for ACI/ARI pair configurations.

Options

`interface-name`—Name of the static PPPoE interface reserved for use by the PPPoE client with matching ACI/ARI information. Specify the interface in the format `pp0.`*`logical`*, where *`logical`* is a logical unit number from 0 through 16385 for static interfaces.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

```

Description

Specify the name of the static point-to-multipoint (P2MP) LSP used for a specific MBGP MVPN; static P2MP LSP cannot be shared by multiple VPNs. Use this statement to specify the static LSP for both inclusive and selective point-to-multipoint LSPs.

Use a static P2MP LSP when you know all the egress PE router endpoints (receiver nodes) and you want to avoid the setup delay incurred by dynamically created P2MP LSPs (configured with the `label-switched-path-template`). These static LSPs are signaled before the MVPN requires or uses them, consequently avoiding any signaling latency and minimizing traffic loss due to latency.

If you add new endpoints after the static P2MP LSP is established, you must update the configuration on the ingress PE router. In contrast, a dynamic P2MP LSP learns new endpoints without any configuration changes.

BEST PRACTICE: Multiple multicast flows can share the same static P2MP LSP; this is the preferred configuration when the set of egress PE router endpoints on the LSP are all interested in the same set of multicast flows. When the set of relevant flows is different between endpoints, we recommend that you create a new static P2MP LSP to associate endpoints with flows of interest.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

static-multihoming-peer

IN THIS SECTION

- Syntax | 29677
- Hierarchy Level | 29677
- Description | 29677
- Options | 29678

Required Privilege Level | 29678
Release Information | 29678

Syntax

```
static-multihoming-peer (static-multihoming-peer-IP-address | [ static-multihoming-peer-IP-address ... ]);
```

Hierarchy Level

```
[edit logical-systems name protocols evpn],
[edit protocols evpn]
```

Description

Statically identify a device's multihoming peer leaf devices in an Ethernet VPN (EVPN) network running enhanced optimized intersubnet multicast (OISM).

OISM leaf devices are multihoming peers when they share an Ethernet segment (ES) for a multihomed customer edge (CE) device or attached host. When enhanced OISM leaf devices have static information about their multihoming peers, the multihoming peer leaf devices can avoid multicast traffic loss when their peer devices go up and down.

We support this statement with OISM in enhanced OISM mode only.

NOTE: In Junos OS Release 24.2R1, this statement was named `multihoming-peer-gateways` to support multiple multihoming feature use cases.

Starting in Junos OS and Junos OS Evolved Release 24.4R1, instead we provide this `static-multihoming-peer` statement for OISM multihoming peer leaf devices. You won't see the `multihoming-peer-gateways` statement in the Junos OS CLI anymore.

Options

(*static-multihoming-peer-IP-address* | [*static-multihoming-peer-IP-address* ...])—One or more multihoming peer device loopback IPv4 addresses. Specify a single address, or list multiple peer device addresses within square brackets.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS and Junos OS Evolved Release 24.4R1.

Statement modified in Junos OS Release 9.6. Statement modified in Junos OS Release 12.1X45-D10. Statement modified in Junos OS Release 12.3X48-D25.

static-policy-control

IN THIS SECTION

- Syntax | 29680
- Hierarchy Level | 29680
- Description | 29681
- Required Privilege Level | 29681
- Release Information | 29681

Syntax

```
static-policy-control {
    pcc-rules {
        [rule-name precedence number <time-of-day-profile profile-name>];
    }
    pcc-rulebases {
        [rulebase-name <time-of-day-profile profile-name>];
    }
}
```

Hierarchy Level

```
[edit unified-edge pcef profiles profile-name],
[edit services pcef profiles profile-name]
```

Description

Configure static policy control for the policy and charging control (PCC) rules or PCC rulebase in a policy and charging enforcement function (PCEF) profile. You can configure a maximum of 32 PCC rules in a PCEF profile. There is no limit to the number of PCC rulebases you can configure in a PCEF profile.

> **NOTE**: For Junos OS Subscriber Aware, you can configure only one of the following statements in a PCEF profile: `aaa-policy-control`, `static-policy-control`, or `dynamic-policy-control`. For Junos OS Subscriber Management, you can configure only `static-policy-control`.

If you are using Junos OS Subscriber Aware, configure static policy control at the [`edit unified-edge pcef profiles` *`profile-name`*] hierarchy level.

If you are using Junos OS Broadband Subscriber Management, configure static policy control at the [`edit services pcef profiles` *`profile-name`*] hierarchy level.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

For Junos OS Subscriber Aware:

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

For Junos OS Broadband Subscriber Management:

services—To view this statement in the configuration.

services–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support at the [`edit services pcef profiles` *`profile-name`*] hierarchy level introduced for Junos OS Broadband Subscriber Management in Junos OS Release 17.2 on MX Series.

static-remote-vtep-list

IN THIS SECTION

- Syntax | 29682
- Hierarchy Level | 29682
- Description | 29682
- Options | 29686
- Required Privilege Level | 29686
- Release Information | 29686

Syntax

```
static-remote-vtep-list [ remote-vtep-loopback-address ... ];
```

Hierarchy Level

```
[edit bridge-domains name vxlan],
[edit routing-instances name bridge-domains name vxlan],
[edit routing-instances name vlans name vxlan],
[edit vlans name vxlan]
```

Description

Statically configure a list of one or more remote virtual tunnel endpoints (VTEPs) on an Layer 2 (L2) VXLAN gateway device, and map the list to a particular bridge domain or VLAN.

You can configure a static VXLAN configuration at the VLAN level or bridge domain level as follows:

- In the default switch instance, supported on:
  - MX Series routers—Bridge domain and VLAN levels.
  - QFX Series switches—VLAN level.
- In a configured `virtual-switch` L2 routing instance, supported on:
  - MX Series routers—Bridge domain and VLAN levels.
  - The PTX10000 line of routers (running Junos OS Evolved)—VLAN level.

When configuring a static remote VTEP list, keep the following in mind:

- When specifying remote VTEPs at the bridge domain level in a routing instance, you must also use the `remote-vtep-list` statement to specify the same VTEPs at the global level in the same routing instance.

  When specifying remote VTEPs at the VLAN level in the default switching instance, you must also use the `remote-vtep-list` statement to specify the same VTEPs at the global level in the default switching instance.

  To illustrate this point, note the following in sample configurations 1 and 2:

  - Routing instance `rt1` and the default switching instance include the VTEPs with the loopback addresses of 10.1.1.1 and 10.1.1.2.
  - Bridge domain `bd1` and `VLAN-1` include the VTEPs with the loopback addresses of 10.1.1.1 and 10.1.1.2.
  - Bridge domain `bd2` and `VLAN-2` include the VTEP with the loopback address of 10.1.1.1.
  - Bridge domain `bd3` and `VLAN-3` don't include a static remote VTEP list. As a result, `bd3` and `VLAN-3` inherit all VTEPs specified in routing instance `rt1` and the default switching instance (the VTEPs with the loopback addresses of 10.1.1.1 and 10.1.1.2), respectively.

> **NOTE**: If you configure a global list of VTEPs in a routing instance using the `remote-vtep-list` statement, but you don't also configure the `static-remote-vtep-list` statement for a VLAN in the routing instance, then that VLAN inherits all the globally configured remote VTEPs.
>
> Also, on platforms that support EVPN with VXLAN encapsulation, you can have EVPN-VXLAN and static VXLAN configurations on the same device, as long as the two configurations use different sets of remote peer VTEPs.

- To replicate and flood broadcast, unknown unicast, and multicast (BUM) traffic, you must specify the `ingress-node-replication` configuration statement at the `[edit vlans name vxlan]`, `[edit bridge-domains name vxlan]`, or `[edit routing-instances name bridge-domains name vxlan]` hierarchy level. In sample configuration 1, `ingress-node-replication` is configured for all bridge domains in routing instance `rt1`. In sample configuration 2, `ingress-node-replication` is configured for all VLANs in the default switching instance.

  Note that this ingress node replication configuration restricts the BUM traffic flood domain to only those VTEPs mapped to a particular bridge domain or VLAN. For example, for sample configurations 1 and 2, the BUM traffic flood domain is restricted as described for each bridge domain and VLAN, respectively:

  - `bd1` and `bd3`; `VLAN-1` and `VLAN-3`—BUM traffic is flooded to the VTEPs with the loopback addresses of 10.1.1.1 and 10.1.1.2.
  - `bd2`; `VLAN-2`—BUM traffic is flooded to the VTEP with the loopback address of 10.1.1.1.

> **NOTE**: To ensure that BUM traffic is flooded to only those VTEPs mapped to a particular VLAN, we strongly recommend that the static VTEP lists on all QFX5*XXX* switches are symmetric. We provide this guidance to avoid a situation where, for example:
>
> - Switch 1's list includes switches 2 and 3,
> - Switch 2's list includes switches 1 and 3, and
> - Switch 3's list includes only switch 2.
>
> Because of this asymmetric configuration, when switch 1 sends BUM traffic to switch 2 and switch 3 on its list, Switch 3 forwards the BUM traffic to its local ports in the VLAN.

Sample Configuration 1 From MX Router (Routing Instance of Type virtual-switch)

```
routing-instances {
    rt1 {
        vtep-source-interface lo0.0;
        remote-vtep-list [ 10.1.1.1 10.1.1.2 ];
        instance-type virtual-switch;
        bridge-domains {
            bd1 {
                vlan-id 101;
                vxlan {
                    vni 101;
                    ingress-node-replication;
                    static-remote-vtep-list [ 10.1.1.1 10.1.1.2 ];
                }
```

```
            }
            bd2 {
                vlan-id 102;
                vxlan {
                    vni 102;
                    ingress-node-replication;
                    static-remote-vtep-list [ 10.1.1.1 ];
                }
            }
            bd3 {
                vlan-id 103;
                vxlan {
                    vni 103;
                    ingress-node-replication;
                }
            }
        }
    }
}
```

Sample Configuration 2 From QFX5XXX Switch (Default Switching Instance)

```
switch-options {
    vtep-source-interface lo0.0;
    remote-vtep-list [ 10.1.1.1 10.1.1.2 ];
}
vlans {
    VLAN-1 {
        vlan-id 10001;
        interface xe-0/0/0:0.1001;
        vxlan {
            vni 10001;
            ingress-node-replication;
            static-remote-vtep-list [ 10.1.1.1 10.1.1.2 ];
        }
    }
    VLAN-2 {
        vlan-id 10002;
        interface xe-0/0/0:0.1002;
        vxlan {
            vni 10002;
            ingress-node-replication;
```

```
            static-remote-vtep-list [ 10.1.1.1 ];
        }
    }
    VLAN-3 {
        vlan-id 10003;
        interface xe-0/0/0:0.1003;
        vxlan {
            vni 10003;
            ingress-node-replication;
        }
    }
}
```

Options

static-remote-vtep-list	Specify the loopback address of one or more remote VTEPs in square brackets ([]). You do not need to include a delimiter such as a comma between names.

Required Privilege Level

routing

Release Information

Statement introduced in Junos OS Release 20.4R1.

RELATED DOCUMENTATION

Static VXLAN

static-subscriber-application

IN THIS SECTION

Syntax | 29687

- Hierarchy Level | 29687
- Description | 29687
- Additional Information | 29688
- Required Privilege Level | 29688
- Release Information | 29688

Syntax

```
static-subscriber-application;
```

Hierarchy Level

```
[edit services service-set name service-set-options]
```

Description

Apply advanced services, such as deep packet inspection, to static subscribers configured under a dynamic profile. Static subscribers are supported on GE, AE, and PS logical interfaces over LT interfaces.

To configure advanced services for static subscribers, in addition to the `static-subscriber-application` statement, you must also configure the:

- `access-profile`, `dynamic-profile`, `authentication`, and the `interface` statements at the `[edit system services static-subscribers group]` hierarchy level. You configure a demux interface for the group.
- Demux interface and the GE, AE, or PS interface at the `[edit interfaces]` hierarchy level.
- `profile` statement at both the `[edit services hcm]` and `[edit services pcef]` hierarchy levels.
- `service-set` statement at the `[edit services]` hierarchy level. Be sure to configure the `hcm-profile`, `pcef-profile`, and the `interface-service` statements. For the `interface-service` statement, configure the `ms-` or `ams-` interface name.
- `service-filter` statement at the `[edit firewall family (inet|inet6)]` hierarchy level.

- `dynamic-profiles` statement at the `[edit]` hierarchy level, making sure to include the service-set and service-filter for each family on an interface, and configure the PCEF profile name on the `pcef` statement at the `[edit dynamic-profiles` *`name`* `interfaces` *`name`* `unit` *`number`*`]` hierarchy level.

Additional Information

To verify that the services have been applied to the static subscriber, use these operational-mode commands:

- `show services pcef subscriber (terse|extensive)`
- `show services pcef pic` *`fpc-shot-number pic-slot-number`*
- `show subscriber extensive`

RELATED DOCUMENTATION

JSRC and Subscribers on Static Interfaces

static-subscribers

IN THIS SECTION

- Syntax | 29691
- Hierarchy Level | 29691

- Description | 29691
- Options | 29692
- Required Privilege Level | 29692
- Release Information | 29692

Syntax

```
static-subscribers {
    disable;
    traceoptions {
        file filename<files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
        flag flag;
        level (all | error | info | notice | verbose | warning);
        no-remote-trace;
    }
}
```

Hierarchy Level

```
[edit system processes]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Disable static subscribers processes or configure tracing operations for static subscriber processes

Options

`disable`—Disable the static subscribers process.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

static-tei-val

}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
mvpn],
[edit routing-instances routing-instance-name protocols mvpn]
```

Description

In a BGP multicast VPN (MVPN) with RSVP-TE point-to-multipoint provider tunnels, statically set the upstream multicast hop (UMH), instead of using one of the dynamic methods to choose the UMH routers, such as that described in `unicast-umh-election`.

The `static-umh` statement causes all type 7 (S,G) routes to use the configured primary and backup upstream multicast hops. If these UMHs are not available, no UMH is selected. If the primary is not available, but the backup UMH is available, the backup is used as the UMH.

The `static-umh` statement only affects type 7 (S,G) routes. Type 6 routes are sent toward the rendezvous point (RP), and use the dynamic UMH selection that is configured with the `unicast-umh-election` statement, or the default method of highest IP address is used if `unicast-umh-election` is not configured.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

interface-tag (Junos OS Evolved)

IN THIS SECTION

- Syntax | **29695**
- Hierarchy Level | **29696**
- Description | **29696**
- Options | **29696**
- Required Privilege Level | **29697**
- Release Information | **29697**

Syntax

```
interface-tag name {
    dynamic-profile dynamic-profile;
    authentication {
        password password;
        username-include {
            delimiter delimiter;
            domain-name domain-name;
            interface-name;
            radius-realm radius-realm;
            unit-number;
            user-prefix user-prefix;
            vlan-tags;
            }
        }
    access-profile access-profile;
}
```

Hierarchy Level

```
[edit interfaces interface <varname>name</varname> auto-configure static-vlan-identity]
```

Description

Configure interface tag for the system to initiate a DHCP relay session over a static IFL (logical interface). To initiate the session, you must also configure interface tag under the `[edit interfaces interface name unit unit_number]` hierarchy. The system uses the *tag-name* to identify the subscriber interface and create a dynamic VLAN to initiate a DHCP relay session.

Options

name	Interface tag name. The length of the interface tag name cannot exceed 64 characters. The only supported special characters are ^_-*$.
dynamic-profile *dynamic-profile*	Specify the dynamic profile name to dynamically configure the interface.
authentication	Auto-configure static VLAN authentication.
password *password*	(Optional) Specify the password for authentication.
username-include	Include username options.
delimiter *delimiter-character*	Include the character used as the delimiter between the concatenated components of the username. You cannot use the semicolon (;) as a delimiter.
domain-name *domain-name-string*	Include the domain name formatted string that is concatenated with the username during the subscriber authentication process.
interface-name	Include the interface name to the username string.
radius-realm *radius-realm*	Include the redius realm name.
unit-number	Include the interface unit number.
user-prefix *user-prefix-string*	Include the user prefix that is concatenated with the username.
vlan-tags	Include vlan tag(s). You can include either `vlan-tags` or `unit-number`. If you specify both, the system uses unit-number.

access-profile *access-profile* Include the access profile name for access control.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 25.4R1

RADIUS Servers and Parameters for Subscriber Access

statistics (Protocols MPLS)

IN THIS SECTION

- Syntax | 29699
- Hierarchy Level | 29699
- Description | 29699
- Options | 29699
- Required Privilege Level | 29701

Release Information | 29701

Syntax

```
statistics {
    auto-bandwidth (MPLS Statistics);
    file filename <files number> <size size> <world-readable | no-world-readable>;
    interval seconds;
    no-transit-statistics;
    traffic-class-statistics;
    transit-statistics-polling;
    statistics-query-batch-size <batch-size>;

}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

Description

Enable MPLS statistics collection and reporting.

Options

`file filename`—(Optional) Name of the file to receive the output. We recommend that you place MPLS tracing output in the file mpls-stat in the /var/log directory.

`files number`—(Optional) Maximum number of trace files. When a trace file named *file* reaches its maximum size, it is renamed *file*.0, then *file*.1, and so on, until the maximum number of files is reached. Then, the oldest file is overwritten.

- **Range:** 2 or more
- **Default:** 2 files

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

`interval` *seconds*—Interval at which to periodically collect statistics.

- **Range:** 1 through 65,535
- **Default:** 300 seconds

`no-world-readable`—(Optional) Prevent users from reading the log file.

`size` *size*—(Optional) Maximum size of each file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a file named *file* reaches this size, it is renamed *file*.0. When the *file* again reaches its maximum size, *file*.0 is renamed *file*.1 and *file* is renamed *file*.0. This renaming scheme continues until the maximum number of files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of files with the `files` option.

`world-readable`—(Optional) Enable users to read the log file.

- **Syntax:** Syntax: *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

`traffic-class-statistics`—(Optional) Create counters that maintain data traffic statistics per traffic class at the ingress of all types of LSPs and egress of ultimate hop popping (UHP) point-to-point LSPs. These counters are not created by default and are required to be configured to perform traffic-class-scoped loss measurement.

`transit-statistics-polling`—(Optional) Enable the polling and display of MPLS statistics for LSPs transiting the router. By default, RSVP does not periodically poll for transit LSP statistics. You cannot configure this statement and the `no-transit-statistics` statement at the same time.

`statistics-query-batch-size`—(Optional) Indicates the number of LSPs for which statistics will be queried together. By default, the system collects periodic statistics for Label Switched Paths (LSPs) one query at a time. It initiates each subsequent request only after receiving a response to the previous request, which limits efficiency in large-scale deployments. Use batching to enhance performance and reduce latency. The statistics-query-batch-size parameter groups multiple LSP statistics requests (1–25) into a single request. Adjust the parameter to optimize performance. You can set an appropriate parameter value to match your deployment scale and performance requirements.

- **Range:** 1 to 25.

- **NOTE**: If you do not configure statistics-query-batch-size value, by default, the batch size is 1.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`traffic-class-statistics` option introduced in Junos OS Release 14.2.

Syntax

```
statistics (time | volume-time);
```

Hierarchy Level

```
[edit access profile profile-name service accounting]
```

Description

Configure the router to collect time statistics, or both volume and time statistics, for the service accounting sessions being managed by AAA.

Options

`time`—Collect uptime statistics only.

`volume-time`—Collect both volume and uptime statistics.

> **NOTE**: You must not configure the `volume-time` option if the `local` option is configured at the `[edit access profile profile-name service accounting-order]` hierarchy level, because the `local` configuration automatically determines that both volume and time statistics are collected for the service accounting sessions. If you configure the `volume-time` option in this case, an error is generated when you commit the configuration.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2R1.

    no-ingress;
    no-transit;
}
```

Hierarchy Level

```
[edit logical-systems name protocols source-packet-routing telemetry],
[edit protocols source-packet-routing telemetry]
```

Description

Enable traffic-statistics collection on SR-TE policies through sensors for both SR-TE policy next hop and binding segment identifier (SID) installed in the forwarding table, by using JVISION traffic sensors in Junos data plane to stream out traffic statistics on static segment routing policies and their corresponding binding SID routes.

Options

- **Default:** By default statistics collection is disabled for static SR-TE routes.

no-ingress (Optional) Create sensors for binding SID transit routes only.

no-transit (Optional) Create sensors for SR-TE policy next hops and collect statistics on all steering routes that use the SR-TE policy as nexthop.

> **NOTE**: `no-ingress` and `no-transit` are mutually exclusive. You cannot disable traffic collection at both destination route and binding SID route.If you enable statistics collection and do not configure one of the two options then the sensors collect traffic statistics steered by all routes that use the SR-TE policy as a nexthop and the labeled traffic steered by the binding SID that are installed in the forwarding table.

Required Privilege Level

stickydr

IN THIS SECTION

- Syntax | 29716
- Hierarchy Level | 29716
- Description | 29716
- Required Privilege Level | 29717
- Release Information | 29717

Syntax

```
stickydr
```

Hierarchy Level

```
[edit protocols pim interface interface-name]
[edit routing-instances instance-name protocols pim interface interface-name]
```

Description

The `stickydr` feature protects against traffic loss as can happen when the designated router (DR) changes once a new router joins the LAN and/or following an interface down event, or device upgrade. Set `stickydr` on all the last hop devices in the LAN, and it will assign one DR special priority (that is, `0xfffffffe`, the second highest priority) irrespective of existing DR election logic (DM priority and IP address of PIM neighbors). The sticky DR priority remains with the device until it is explicitly transferred to another eligible device on the LAN.

This feature is especially useful for countering DR elections cases wherein a new interface on the LAN appears, immediately wins the DR election, and even before it has received an IGMP join from host, starts pulling traffic from the upstream router.

Consider the example of a new device with higher DM priority and/or IP address that joins the LAN. Instead of immediately ceding DR status to the new interface, an existing device with a lower IP address and/or lower priority can remain the DR and receive IGMP joins and send PIM joins upstream. When the

new device (with higher priority or IP address) appears, it detects the sticky DR and joins as a non-DR. No traffic is lost because of a DR transition.

Another example is when a DR interface goes down. If the devices in the LAN were configured for `stickydr`, a new DR election amongst the remaining PIM routers will take place as usual, and as per the RFC, but the election winner will inherit the "sticky" property of the down DR when wins. The sticky status will persist even if another device with higher priority joins the LAN. Later, when the previous DR comes back up, it's DR status is not resumed.

Syntax

```
store {
   database;
   file name {
```

```
        files number;
        (no-world-readable | world-readable);
        size size;
    }
    fwding-file name {
        files number;
        (no-world-readable | world-readable);
        size size;
    }
}
```

Hierarchy Level

```
[edit system resiliency]
```

Description

Store exception data in a file or database.

The on-box collector is disabled by default.

To enable the on-box collector for forwarding exceptions and store the exception data in a file, configure the following:

```
user@host# set system resiliency exceptions forwarding
user@host# set system resiliency store fwding-file file-name
user@host# set system resiliency store fwding-file size size
```

For forwarding exceptions, you must also configure inline-monitoring services to create the IPFIX records used to carry the exception data; see *Understand Juniper Resiliency Interface*.

To enable the on-box collector for routing and kernel exceptions and store the telemetry key-value-pair exception data in a file, configure the following:

```
user@host# set system resiliency exceptions routing
user@host# set system resiliency exceptions os
user@host# set system resiliency store file file-name
user@host# set system resiliency store size size
```

Default

database

Options

database

Store exceptions data in the on-box SQLite database, in the **/var/db** directory. You can copy this database to a remote server and issue SQL commands using the SQLite command line interface.

Starting in Release 22.2R1, you can only configure one place to store your exception data, either in the database or in a file on the device. You cannot store data in both places. If you configure both the `database` statement and the `file` or `fwding-file` statement, you won't be able to commit the configuration.

file *file-name*

Use the specified file to receive the telemetry exceptions data. All files are placed in the directory **/var/log**. The files are also archived in the same way as trace logs.

Starting in Release 22.2R1, you can only configure one place to store your exception data, either in the database or in a file on the device. You cannot store data in both places. If you configure both the `database` statement and the `file` statement, you won't be able to commit the configuration.

files *files*

(Optional) Use the specified maximum number of files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Default:** 3 files
- **Range:** 2 through 1000 files

fwding-file *file-name*

Use the specified file to receive the forwarding IPFIX exceptions data. All files are placed in the directory **/var/log**. The files are also archived in the same way as trace logs.

Starting in Release 22.2R1, you can only configure one place to store your exception data, either in the database or in a file on the device. You cannot store data in both places. If you configure both the `database` statement and the `fwding-file` statement, you won't be able to commit the configuration.

no-world-readable

(Default) Disable unrestricted file access. This means the exceptions file can be accessed only by the user who configured the exceptions operation.

world-readable

(Optional) Enable unrestricted file access.

size *size* (Optional) Use the specified maximum size of each file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of files with the `files` option.

- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

storm-control (switch)

IN THIS SECTION

- Syntax | 29726
- Hierarchy Level | 29726
- Description | 29726
- Default | 29726
- Required Privilege Level | 29727
- Release Information | 29727

Syntax

```
storm-control {
    action-shutdown;
    interface (all |  interface-name) {
        bandwidth bandwidth;
        level level;
        multicast;
        no-broadcast;
        no-multicast;
        no-registered-multicast;
        no-unknown-unicast;
        no-unregistered-multicast;
    }
}
```

Hierarchy Level

```
[edit ethernet-switching-options]
```

Description

Configure storm control on the switch.

Apply storm control to all interfaces or to the specified interfaces on switches running non-ELS software. (For the equivalent statement for switches running ELS software, see "storm-control" on page 29729.

The remaining statements are explained separately. See CLI Explorer.

Default

On switches running non-ELS software, storm control is disabled by default on all switch interfaces. If you enable storm control and do not specify a storm control level, the default level is 80 percent of the available bandwidth for ingress traffic.You can change the storm control level by configuring it as a specific bandwidth value.

When you configure storm control bandwidth on an aggregated Ethernet interface, each member of the aggregated interface is assigned that bandwidth. For example, if you configure 7000000 Kbps on aggregated interface `ae1`, and `ae1` has two members, `xe-2:0/0/0` and `xe-2:0/0/1`, each member is allowed a

bandwidth level of 7000000 Kbps. Thus, the storm control bandwidth on ae1 could be as much as 14000000 Kbps of combined broadcast and unknown unicast traffic.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

storm-control

IN THIS SECTION

- Syntax | 29729
- Hierarchy Level | 29729
- Description | 29729
- Required Privilege Level | 29730
- Release Information | 29730

Syntax

```
storm-control storm-control-profile;
```

Hierarchy Level

```
[edit interfaces interface-name unit number family ethernet-switching],
[edit interfaces interface-name unit number family bridge]
[edit interfaces interface-name ether-options ethernet-switch-profile]
[edit logical-systems name  interfaces interface-name unit number family bridge]
```

Description

Bind a storm control profile to a given interface.

On switches running ELS software, storm control is enabled by default on all switch interfaces at a level of 80 percent of the combined broadcast and unknown unicast streams. (For the equivalent statement for platforms running non-ELS software, see "storm-control" on page 29725.)

NOTE: On ACX7000 series family of switches running Junos OS Evolved, storm control is applied under this hierarchy: `[edit interfaces <interface name> ether-options ethernet-switch-profiles]`

NOTE: If you configure storm control on an aggregated Ethernet interface, the storm-control level is applies to each member interface individually. For example, if the aggregated interface has two members and you configure a storm-control level of 20 kbps, Junos will not detect a storm if one or both of the member interfaces receives traffic at 15 kbps because in neither of these cases does an individual member receive traffic at a rate greater than the configured storm-control level. In this example, Junos detects a storm only if at least one member interface receives traffic at greater than 20 Kbps.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X50-D10.

Starting in Junos OS release 17.4R1 for MX Series routers, support for storm control was added for logical systems.

        no-unregistered-multicast;
    }
}
```

Hierarchy Level

```
[edit forwarding-options]
[edit logical-systems name forwarding-options]
```

Description

Configure a storm control profile on a switch or router. Storm control is used to prevent network outages that are caused by broadcast traffic storms. Storm control enables the switching device to monitor traffic levels and to drop broadcast, multicast, and unknown unicast packets when a specified traffic level—called the storm control level or storm control bandwidth—is exceeded, thus preventing packets from proliferating and degrading the LAN.

NOTE: The name of the storm control profile can contain no more than 127 characters.

The remaining statements are explained separately. See CLI Explorer.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X50-D10.

Starting in Junos OS release 17.4R1 for MX Series routers, support for storm control was added for logical systems.

                            traceoptions {
        file filename <files number > <size size> <no-stamp | world-readable | no-world-
readable>;
        flag flag;
    }
}
```

Hierarchy Level

```
[edit protocols],
[edit protocols rstp force-version]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

When you explicitly configure STP, a switch uses the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP (defined in the IEEE 802.1D 1998 specification).

The remaining statements are explained separately. See CLI Explorer.

NOTE: Although the `edge` configuration statement appears in the CLI on the switch, this statement has no effect on the switch operation if you configure it.

Default

STP is disabled; by default, RSTP is enabled on all Ethernet switching ports.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

stream (Logical Systems and Tenant Systems)

IN THIS SECTION

- Syntax | 29736
- Hierarchy Level | 29736
- Description | 29736
- Options | 29736
- Required Privilege Level | 29737
- Release Information | 29738

Syntax

```
stream name {
    category name;
    filter name;
    host {
        ipaddr;
        port port;
        routing-instance routing-instance;
    }
    rate-limit rate;
}
```

Hierarchy Level

```
[edit logical-systems name security log]
[edit tenants name security log]
```

Description

Define security log stream options for a logical and tenant system. When the logging mode is set to `stream`, security logs generated in the data plane are streamed out a revenue traffic port directly to a remote server. All the categories can be configured for sending specific category logs to different log servers for stream mode log forwarding.

Options

category Type of logged events.

- Values:
  - aamw—AAMW events are logged.
  - alg—Alg events are logged.
  - all—All events are logged.
  - appqos—Appqos events are logged.

- content-security—Content security events are logged.
- flow—Flow events are logged.
- fw-auth—Fw-auth events are logged.
- gtp—Gtp events are logged.
- idp—Idp events are logged.
- ipsec—Ipsec events are logged.
- nat—Nat events are logged.
- pst-ds-lite—Pst-ds-lite events are logged.
- rtlog—Rtlog events are logged.
- screen—Screen events are logged.
- sctp—Sctp events are logged.
- secintel—Secintel events are logged.

`filter` Selects the filter to filter the logs to be logged.

- Values:
  - `threat-attack` — Threat attack security events are logged.

`host` Destination to send security logs.

- *ip-address*—Specify IP address of the host.
- `port` *port-number*—Specify host port number.
- `routing-instance` *routing-instance*—Specify the routing instance.

`rate-limit` Rate-limit for security logs.

- **Range:** 1 through 65535
- **Default:** 65535

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1 for logical Systems.

Statement introduced in Junos OS Release 18.3R1.

The `routing-instance` option introduced in Junos OS Release 18.3R1 for tenant systems.

        year;
    }
    transport {

        protocol (tcp | tls | udp);
        tcp-connections tcp-connections;
        tls-profile tls-profile;
    }
}
```

Hierarchy Level

```
[edit services service-set name syslog]
```

Description

Set UDP based syslog log stream for Next Gen Services (Unified Services).

Options

name Name of security log stream.

category Selects the type of events that may be logged

- aamw—AAMW events are logged
- alg—Alg events are logged
- all—All events are logged
- appqos—Appqos events are logged
- content-security—Content security events are logged
- dns—DNS events are logged
- dnsf—DNS Filtering events are logged
- flow—Flow events are logged
- fw-auth—Fw-auth events are logged
- gtp—Gtp events are logged
- ha—Stateful High-Availability open and close events are logged
- ha-close—Stateful High-Availability close events are logged
- ha-open—Stateful High-Availability open events are logged
- idp—Idp events are logged

- ipsec—Ipsec events are logged
- nat—Nat events are logged
- pcp—PCP logs
- pst-ds-lite—Pst-ds-lite events are logged
- rtlog—Rtlog events are logged
- screen—Screen events are logged
- sctp—Sctp events are logged
- secintel—Secintel events are logged
- session—Session open and close events are logged
- session-close—Session close events are logged
- session-open—Session open events are logged
- sfw—Stateful Firewall events are logged
- urlf—URL filtering events are logged

format Specify the log stream format

- binary—Binary log
- protobuf—Protobuf log
- sd-syslog—Structured syslog
- syslog—Traditional syslog
- welf—Web Trends Extended Log Format

host Send logs to host

- ipaddr—IP address or host name
- log-tag—Tag included in logs to this host. Supported for *sw*, *session*, *session-open*, and *session-close* categories only.
- port—Host port number
- routing-instance—Routing-instance name

radius Radius configuration

- ipaddr—IP address for primary and backup radius server
- port—Radius server port number
- secret—Radius secret

rate-limit Rate-limit for security logs. The log rate range is 1 through 65535

severity Severity threshold for security logs

- alert—Conditions that require immediate attention
- critical—Critical conditions
- debug—Information normally used in debugging
- emergency—Conditions that cause security functions to stop
- error—General error conditions
- info—Information about normal security operations
- notice—Non-error conditions that are of interest
- warning—General warning conditions

source-address Source ip address used when exporting security logs

time-format Time format for syslog events

- millisecond—Millisecond in time format for syslog
- year—Year in time format for syslog

transport Set security log transport settings

- protocol—Set security log transport protocol for the device
  - tcp—TCP transfer for log
  - tls—TLS transfer for log
  - udp—UDP transfer for log
- tcp-connections—Set tcp connection number per-stream. Range is 1 through 5
- tls-profile—TLS profile

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

        protocol (tcp | tls | udp);
        tcp-connections tcp-connections;
        tls-profile tls-profile;
    }
}
```

Hierarchy Level

```
[edit security log]
[edit logical-systems name security log]
[edit tenants tenant-name security log]
```

Description

Define the security log steam settings.

Define security log stream options for a logical and tenant system. When the logging mode is set to `stream`, security logs generated in the data plane are streamed out a revenue traffic port directly to a remote server. All the categories can be configured for sending specific category logs to different log servers for stream mode log forwarding.

Options

stream Every stream can configure file or host.

- Values:
  - category— Type of events that may be logged.
    - all— All events are logged
    - content-security — Content security events are logged
    - fw-auth— Fw-auth events are logged.
    - screen— Screen events are logged.
    - alg— Alg events are logged.
    - nat— Nat events are logged.
    - flow— Flow events are logged.
    - sctp— Sctp events are logged.
    - gtp— Gtp events are logged.
    - ipsec— IPsec events are logged.
    - idp— Idp events are logged.
    - rtlog— Rtlog events are logged.
    - pst-ds-lite— Pst-ds-lite events are logged.
    - appqos— Appqos events are logged.
    - secintel— AAMW events are logged.
  - file— Security log file options for logs in local file.
    - allow-duplicates— To disable log consolidation.
    - file-name— Name of local log file.
    - file-size— Specify the local log file size in megabytes.

    - **Range:** 10M through 50M.
  - `rotation`— Configure the max file number for rotation.
    - **Range:** 2 through 19.
- `filter` *`threat-attack`*— Selects the filter to filter the threat attack security events to be logged
- `format` *`(binary | sd-syslog | syslog)`*— Specify the log stream format in binary or sd-syslog or syslog formats.
- `host` *`ip-address`*— Destination to send security logs.
  - `port`— Specify the host port number.
  - `routing-instance`— Specify the routing instance name.
- `radius`— Configure RADIUS accounting for security events by specifying the RADIUS accounting server.
  - `ipaddr` — Specify the IP address of the RADIUS server for accounting messages.
    - `primary` — IP address of the Primary RADIUS server. Configure the primary IP address to enable `radius` stream.
    - `backup` — IP address of the backup RADIUS server.
- `rate-limit` *`rate`*— Specify the rate limit for security logs.
  - The range is 1 through 65535 logs per second and the default value is 65535
- `severity`— Specify the severity threshold for security logs.
  - `alert`— Specify the conditions that require immediate attention.
  - `critical`— Specify the critical conditions.
  - `debug`— Specify the information normally used in debugging.
  - `emergency`— Specify the conditions that cause security functions to stop.
  - `error`— Specify the general error conditions.
  - `info`— Specify the Information about normal security operations.

- `notice`— Specify the non error conditions that are of interest.
- `warning`— Specify the general warning conditions.

- `source-address`— Specify the source address to the stream log.
- `time-format` *(year | millisecond)*— Specify the year, the millisecond, or both in the timestamp.
- `transport`— Set the security log transport settings.
  - `protocol` *(tcp | tls | udp)*— Specify the security log transport protocol for the device. Values: tcp, tls, and udp.
  - `tcp-connections`— Specify the number of tcp connections per stream. Values: 1 through 5.

    NOTE: `tcp-connections` is not supported on logical and tenant systems.

  - `tls-profile`— Specify the tls profile.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

The [edit `logical-systems` *name* security log] and [edit `tenants` *tenant-name* security log] hierarchy levels introduced in Junos OS Release 19.1R1.

`time-format`, `source-address`, and `transport` options are introduced in Junos OS Release 20.2R1.

`radius` option is introduced in Junos OS Release 24.2R1.

streaming-server (Junos Telemetry Interface)

IN THIS SECTION

- Syntax | 29752
- Hierarchy Level | 29752
- Description | 29752
- Options | 29753

Required Privilege Level | 29754
Release Information | 29754

Syntax

```
streaming-server streaming-server-name {
    remote-address ip-address;
    remote-port number;
    tls {
        certificate-id local-cert-id;
        ca-profiles ca-profiles;
        }
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

For Junos telemetry interface, configure the parameters of the server that collects exported data streamed by a monitored system resource. You can configure more than one streaming server. To collect data, you must associate a configured server with one or more configured sensors. The sensor configuration defines the parameters to monitor a specific system resource. To configure a sensor, include the `sensor sensor-name` statement at the `[edit services analytics]` hierarchy level.

To configure the server that collects data, you must also configure a destination IP address and a destination port. Junos telemetry interface relies on neighbor reachability information to deliver packets to the destination address. That means that all policies, such as filtering, that apply to the packets for that destination also apply to the exported packets.

NOTE: Starting with Junos OS Release 15.1F6. you can also associate more than one server with a specific sensor configuration, which enables you to transmit streamed data for the same sensor to more than one server.

NOTE: Junos telemetry interface was introduced in Junos OS Release 15.1F3 on MX Series routers with interfaces configured on MPC1 through MPC6E and on PTX Series routers with interfaces configured on FPC3. Starting in Junos OS Release 15.1F5, Junos Telemetry Interface is also supported on MPC7E, MPC8E, and MPC9E on MX Series routers.

Starting with Junos OS Release 16.1R3, FPC1 and FPC2 on PTX Series routers are also supported.

You can configure TLS, local certificate-id, and ca-profile for each streaming server.

NOTE: Use the following Public Key Infrastructure (PKI) commands to load the local certificates and certificate authority (CA) profile:

- `request security pki local-certificate load certificate-id` *`certificate id`* `filename` *`dialout_client.crt`* `key` *`dialout_client.key`*
- `request security pki ca-certificate load ca-profile` *`ca-profile-name`* `filename` *`path/filename`*

Options

streaming-server-name	Specify a name for the server configured to collect data streamed through Junos Telemetry Interface. You can configure multiple streaming servers. To associate as many as four server names with a sensor configuration, include each name at the `[edit services analytics sensor` *`sensor-name`* `streaming server [` *`streaming-server-names`* `] ]` hierarchy level. If you specify more than one streaming server, you must enclose the names in brackets.
remote-address ***ip-address***	Specify the destination address of the streaming server for exported packets.
remote-port ***number***	Specify a port number for the destination address of the streaming server for exported packets.
tls	Configure the Transport Layer Security (TLS) protocol parameters.
certificate-id ***local-cert-id***	Specify the local digital certificate.
ca-profiles ***ca-profiles***	Specify the certificate authority (CA) profile.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F3.

        }
```

```
    }
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Configure remote servers to receive streaming output for the network analytics monitoring of traffic and queue statistics. The streaming function supports TCP connections only, and sends records separated by a newline character.

> **NOTE**: Before you use the remote server to receive streaming data, you must set up the TCP server software to process records that are separated by the newline character (\n).

You can configure multiple servers and multiple ports on each server to receive the streaming data. You can configure different streaming data types and formats for different ports on a server, but you can configure only one streaming type and one format for each port on a server.

Options

address *ip-address*
: IP address of the remote server receiving the streaming data.

port *number*
: Port number of the remote server receiving the streaming data.

stream-format *format*
: Format of the streaming data being sent to a server. Only one format can be sent to each port on a server.

- Values:
  - **csv**—Comma-separated Values (CSV). Records sent in this format contain a “q” for a queue statistics, or a “t” for a traffic statistics.
  - **json**—JavaScript Object Notification (JSON). Records sent in this format contain “queue-statistics” or “traffic-statistics” in the “record type” field.
  - **tsv**—Tab-separated Values (TSV). Records sent in this format contain a “q” for a queue statistics, or a “t” for a traffic statistics.

stream-type *type*

Type of streaming data sent to a port. You can specify different types of streaming data to be sent to different ports on the same server.

- Values:
  - **queue-statistics**
  - **traffic-statistics**

[edit routing-instances name protocols isis source-packet-routing],
[edit tenants name routing-instances name protocols isis source-packet-routing]
```

Release Information

Statement introduced in Junos OS 21.3R1.

Description

Configure IS-IS to ignore links that do not have TE Attributes advertised in Flex-Algo specific Application-Specific Link Attribute (ASLA) sub-TLVs. This is applicable only to the following TE attribute sub-TLVs:

- Min unidirectional link delay
- TE default metric
- Administrative group

> **NOTE**: If you do not enable strict ASLA-based flexible algorithm, but have routers in your network that do not advertise ASLA sub-TLVs, the route computation of the flexible algorithm could be incorrect and might cause network issues such as routing loops.

Advertising Delay-Metric in Flex Algo ASLA

You can advertise delay-metric inside flex algo Application Specific Link Attributes (ASLA). This functionality is essential in a multi-vendor deployment running latency-based flex algo.

strict-dual-isis (Protocols IS-IS)

IN THIS SECTION

- Syntax | 29760
- Hierarchy Level | 29760
- Description | 29760
- Default | 29761
- Options | 29761
- Required Privilege Level | 29761
- Release Information | 29761

Syntax

```
strict-dual-isis {
    holddown delay-value;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis],
[edit protocols isis]
```

Description

Configure strict dual stack (IPv4 and IPv6) support for IS-IS.

The `strict-dual-isis` option was introduced in Junos release 18.RR1-S6. This option avoids protocol flap when both IPv4 and IPv6 are configured on the same interface or in the same ISIS instance. The option works by introducing a holdown delay to allow both IPv4 ARP and IPv6 ND to complete before the interface is advertised. The default hold time is 15 seconds. Use the `holddown` argument to specify the desired delay in the range of 1 to 65535 seconds.

To configure IS-IS for strict dual stack operation include the following statements:

```
isis {
    strict-dual-isis {
       holdown delay-value;
    }
}
```

Default

Strict dual stack operation for IS-IS is not enabled.

Options

holddown Specify the delay before ISIS advertises IPv4 and IPv6 reachability, either for the entire ISIS instance or under a specific interface. For details on interface level application, see "interface (Protocols IS-IS)" on page 9316

By default the `holdown` delay is 15 seconds. Users can configure a value in the range of 1 to 65535 seconds.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

strict-priority-scheduler

IN THIS SECTION

- Syntax | 29762
- Hierarchy Level | 29762
- Description | 29762
- Required Privilege Level | 29763
- Release Information | 29763

Syntax

```
strict-priority-scheduler;
```

Hierarchy Level

```
[edit class-of-service traffic-control-profiles profile-name]
```

Description

On PTX Series routers only, enable *strict-priority scheduling* for all scheduler maps within the traffic control profile.

Physical interfaces on PTX Series routers support two mutually exclusive scheduling processes:

- *normal scheduling* (default mode) — A queue's transmit-rate is used to determine whether it is operating within the *guaranteed region* or in the *excess region*.

  Within the *guaranteed region* (transmit-rates credits are positive), the scheduler uses the transmit rates to decide the bandwidth allocation. Queues that are at priority-level `low` or higher and have transmit-rate credits are serviced first by priority order and then within a priority level using packet round robin algorithm.

- *strict-priority scheduling* — Queues are processed in strict-priority order. There is no concept of guaranteed region and excess region. The packet scheduler is always operating in the guaranteed region, with the exception of priority `low`, which is always assigned to the excess priority level. The

configured `transmit-rate` does not affect how the queue is serviced because packets are processed in order of queue priority. Among queues that are configured `low` priority, if `excess-rate` weights are configured, they are used by the hardware to perform WRR. Queues that are mapped to the same hardware priority or that have the same configured priority other than `low` are serviced in a packet round-robin fashion.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

Release Information | 29769

Syntax

```
strip-as-path;
```

Hierarchy Level

```
[edit policy-options policy-statement policy-name term term-name then]
```

Description

Removes the incoming autonomous system (AS) path as part of the import policy for a BGP session and replaces the received autonomous system (AS) path with the receiving router's local AS number for the receiving session. Note that the local AS number may be different from the number configured under `autonomous system` in the `[edit routing-options]` hierarchy.

If you need to normalize externally injected routes, you can use this policy option for the incoming autonomous system (AS) path so that it may be used similarly to routes that originate solely within the fabric. The new `strip-as-path` policy option has no impact on the BGP export policy.

You can configure the `strip-as-path` option under `policy-options then` clause:

```
set policy-options policy-statement do-strip term a then strip-as-path
```

Required Privilege Level

admin—To view this statement in the configuration.

Syntax

```
strip-user-name {
    delimiter delimiter;
    parse-direction (left-to-right | right-to-left);
}
```

Hierarchy Level

```
[edit access profile profile-name session-options]
```

Description

Configure the details of username stripping for a subscriber access profile. This configuration determines how a portion of a subscriber login string is identified and discarded, leaving the remainder for subsequent use as a modified username by an external AAA server for session authentication and accounting. For example, the modified username might appear in RADIUS Access-Request, Acct-Start, and Acct-Stop messages, as well as RADIUS-initiated disconnect requests and change of authorization (CoA) requests.

You can use the `aaa-options` *`aaa-options-name`* statement at the `[edit access]` hierarchy level to define options that specify the LS:RI context for AAA authorization and configuration for a specific subscriber or a set of subscribers, overriding any such configuration within a domain map.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

    tunnel-profile tunnel-profile;
    using-user-password;
   }
```

Hierarchy Level

```
[edit access domain map]
```

Description

You can configure subdomains under a domain map. Subdomain allows you to select different access-profile for users within the same domain different VLAN ID or VLAN ID range. Subdomain gives the flexibility to differentiate the users in a domain. It provides different services per the profile configuration.

The options available at the domain map level are also available at the subdomain. But the options defined for a subdomain are independent from other subdomains and the options at the domain map level.

Characteristics of a Subdomain

- Subdomain configuration within a domain takes the higher precedence than the domain map level configuration.
- The qualifier option is mandatory to define a subdomain.
- Qualifiers (VLAN ID) cannot have any overlap within a domain.
- You can configure maximum of 16 subdomains within a domain.

Here're some examples of different types of subdomain configurations and their behavior.

1. Access profile configuration in a domain with VLAN ID qualifier using subdomain.

```
[edit access domain map abc.com]
user@host# set access-profile A
user@host# set sub-domain sub1 qualifier vlan-id-list 1
```

```
user@host# set sub-domain sub1 access-profile B
user@host# set sub-domain sub2 qualifier vlan-id-list [ 11 20 29-35 100-199 ]
user@host# set sub-domain sub2 access-profile C
user@host# set sub-domain sub3 qualifier vlan-id-list 300-399
user@host# set sub-domain sub3 access-profile D
```

This configuration creates different access profiles using the VLAN ID qualifier and subdomain.

2. Access profile and strip domain configuration through domain map.

```
[edit access domain map abc.com]
user@host# set access-profile A
user@host# set strip-domain
user@host# set sub-domain sub1 qualifier vlan-id-list 1
user@host# set sub-domain sub1 access-profile B
user@host# set sub-domain sub1 strip-domain
user@host# set sub-domain sub2 qualifier vlan-id-list [ 11 20 29-35 100-199 ]
user@host# set sub-domain sub2 access-profile C
user@host# set sub-domain sub2 strip-domain
user@host# set sub-domain sub3 qualifier vlan-id-list 300-399
user@host# set sub-domain sub3 access-profile D
user@host# set sub-domain sub3 strip-domain
```

The intention of this configuration is to use the domain map for an access profile selection, then strip the domain name. For each subdomain you can assign different access profile depending on the VLAN ID, but the `strip-domain` kept common for all cases. Though it appears a repeat configuration in subdomain, since the subdomain is totally independent, it gives better flexibility when it comes to assign modifiers selectively.

3. Domain map and subdomain configuration for completely independent attribute selection.

```
[edit access domain map abc.com]
user@host# set access-profile A
user@host# set strip-domain
user@host# set sub-domain sub1 qualifier vlan-id-list 1
user@host# set sub-domain sub1 access-profile B
user@host# set sub-domain sub1 strip-domain
user@host# set sub-domain sub2 qualifier vlan-id-list [ 11 20 29-35 100-199 ]
user@host# set sub-domain sub2 access-profile C
user@host# set sub-domain sub2 address-pool
user@host# set sub-domain sub3 qualifier vlan-id-list 900-399
```

```
user@host# set sub-domain sub3 access-profile D
user@host# set sub-domain sub3 dynamic-profile vlan-profile-9xx
```

For the same domain abc.com, each subdomain and unqualified domain map (top level) is independently defining its actions. VLAN ID is the qualifier for subdomain, which takes precedence and overrides the unqualified attributes with independent set available in the qualified subdomain.

4. Configure an empty subdomain.

```
[edit access domain map abc.com]
user@host# set access-profile A
user@host# set strip-domain
user@host# set sub-domain sub1 qualifier vlan-id-list [ 100 200-299 400-450 ]
```

This configuration creates an empty subdomain with a set of VLAN ranges. This configuration is an example to exclude the users of the same domain depending on their VLAN ID.

Any user login qualifying for the subdomain match do not apply any options. All the other non-matching users in the domain get the options from un-qualified top level domain map.

5. Invalid subdomain configuration (overlapping VLAN ID ranges in subdomains).

```
[edit access domain map abc.com]
user@host# set access-profile A
user@host# set strip-domain
user@host# set sub-domain sub1 qualifier vlan-id-list [ 100 200-299 400-450 ]
user@host# set sub-domain sub1 access-profile B
user@host# set sub-domain sub1 strip-domain
user@host# set sub-domain sub2 qualifier vlan-id-list [ 250-300 ]
user@host# set sub-domain sub2 access-profile C
user@host# set sub-domain sub2 strip-domain
```

This configuration gets rejected during commit. The qualifiers within the same domain map cannot have any overlap.

Example of an error message while trying such invalid subdomain configuration commit:

```
root@host# commit
2021-02-03 22:50:39.730422 IST: Running FIPS Self-tests
Veriexec is not enforced, FIPS mode not available
2021-02-03 22:50:39.768595 IST: FIPS Self-tests Skipped
[edit access domain map abc.com sub-domain sub2 qualifier]
```

```
  'vlan-id-list 250-300'
    Range 250-300 overlaps with range 200-299 in another sub-domain under same domain
error: configuration check-out failed
```

Options

sub-domain *name*
Name of a subdomain.

aaa-logical-system
Logical system used for applying AAA services.

aaa-routing-instance
Routing instance used for applying AAA services.

- default—Default routing instance.
- name—Name of the routing instance you want to configure.

target-routing-instance
Specify the routing instance of the subscriber context.

- default—Default routing instance.
- name—Name of the routing instance you want to configure.

access-profile *profile-name*
Name of an access profile.

address-pool
Specify the address pool used to assign addresses to subscribers associated with the domain map.

dynamic-profile
Specify the dynamic profile that is used for subscriber sessions associated with the subdomain.

override-chap-password
Use this CHAP password for authentication.

override-password
Use this password for authentication.

strip-domain
Enable domain name stripping from the username.

strip-username
Enable user name stripping from the username.

- left-to-right—Strip to first domain delimiter on the left.
- right-to-left—Strip to first domain delimiter on the right.

tunnel-profile
Specify the tunnel profile that provides definitions for tunnels associated with the subdomain.

using-user-password Send overridden CHAP-Password using User-Password.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.3R1.

subnet-address (Easy EVPN LAG Configuration)

IN THIS SECTION

Syntax | 29787

- Hierarchy Level | 29787
- Description | 29787
- Options | 29789
- Required Privilege Level | 29791
- Release Information | 29791

Syntax

```
subnet-address {
    inet (ipv4-subnet-addr | [ipv4-subnet-addr1 ipv4-subnet-addr2 ...]);
    inet6 (ipv6-subnet-addr | [ipv6-subnet-addr1 ipv6-subnet-addr2 ...]);
    no-irb-address-auto-derive;
    virtual-gateway-v4-address ipv4-virtual-gateway-address;
    virtual-gateway-v6-address ipv6-virtual-gateway-address;
}
```

Hierarchy Level

```
[edit services evpn evpn-vxlan irb irb-instance]
```

Description

Specify IRB instance subnet address parameters as part of a generated Ethernet VPN (EVPN) fabric configuration.

You use statements at the `[edit services evpn]` hierarchy level to simplify configuring an EVPN fabric with Ethernet segment identifier (ESI) link aggregation groups (LAGs) in the topology. The feature you enable with statements in this hierarchy is an easy EVPN LAG configuration feature, also called EZ-LAG.

You only need to configure a few statements to provide the parameters required for an EVPN core fabric with multihomed or single-homed customer edge (CE) devices (or end server devices). When you commit the `[edit services evpn]` configuration statements, the device uses a commit script to generate the corresponding standard EVPN fabric configuration statements.

The commit script uses the parameters you specify at the `[edit services evpn evpn-vxlan irb irb-instance subnet-address]` hierarchy level to generate IPv4 and/or IPv6 address configurations for an IRB instance as follows:

- IRB interface subnet address.

> **NOTE**: For IPv6 data traffic, you can configure a global IPv6 address and an IPv6 link-local address for the IRB interface.

- Virtual gateway address

> **NOTE**: By default, the commit script sets the virtual gateway MAC address for the device (which applies to all IRB instances) as follows:
>
> - IPv4 virtual gateway MAC address—00:00:5e:00:01:01
> - IPv6 virtual gateway MAC address—00:00:5e:00:02:01
>
> You can override the default virtual gateway MAC addresses using the following options at the `[edit services evpn global-parameters]` hierarchy level:
>
> - `virtual-gateway (v4-mac | v6-mac) virtual-gateway-mac-address`—To set different virtual gateway MAC addresses for IPv4 traffic or IPv6 traffic
> - `virtual-gateway-mac virtual-gateway-mac-address`—To set the same virtual gateway MAC address for both IPv4 traffic and IPv6 traffic.

Starting in Junos OS and Junos OS Evolved Release 23.4R1, with the `subnet-address inet` and `subnet-address inet6` options, you can specify multiple IRB subnet addresses using a list syntax [*addr1addr2* ...]. You can still use the original syntax with a single subnet address (no list brackets), and use multiple statements with single subnet addresses to specify multiple IRB addresses.

Also as of those releases, in the generated configuration, the commit script includes `router-advertisement` statements at the `[edit protocols]` hierarchy level as follows to configure the device with default values to send router advertisement packets for a configured EZ-LAG IRB instance:

- With an anycast gateway EZ-LAG configuration:

```
set protocols router-advertisement interface irb.unit max-advertisement-interval 30
set protocols router-advertisement interface irb.unit min-advertisement-interval 10
```

- With a virtual gateway address EZ-LAG configuration:

```
set protocols router-advertisement interface irb.unit max-advertisement-interval 30
set protocols router-advertisement interface irb.unit min-advertisement-interval 10
set protocols router-advertisement interface irb.unit virtual-router-only
```

Options

inet *address(es)*

Specify an IPv4 subnet address or multiple IPv4 subnet addresses for the IRB interface —you can specify a single address value *ipv4-subnet-addr* or an address list [*ipv4-subnet-addr1 ipv4-subnet-addr2* …].

You must configure this option or the `inet6` option (or both options).

inet6 *address(es)*

Specify an IPv6 subnet address or multiple IPv6 subnet addresses for the IRB interface —you can specify a single address value *ipv6-subnet-addr* or an address list [*ipv6-subnet-addr1 ipv6-subnet-addr2* …].

You must configure this option or the `inet` option (or both options).

For IPv6 data traffic on an IRB interface, you can use either multiple statements with single addresses or one statement with an address list to specify the IPv6 global subnet address and the IPv6 link-local address (prefix fe80::) of the IRB interface. For example, if you include the following statements for an IRB interface IPv6 subnet address and an IPv6 link-local address for logical unit 10 in your EZ-LAG configuration:

```
set services evpn evpn-vxlan irb irb_10 subnet-address inet6
2001:db8::10:a:1:1/112
set services evpn evpn-vxlan irb irb_10 subnet-address inet6 fe80::10:a:1:1/112
```

or:

```
set services evpn evpn-vxlan irb irb_10 subnet-address inet6
[ 2001:db8::10:a:1:1/112 fe80::10:a:1:1/112 ]
```

then the commit script adds the following statements in the generated configuration:

```
set interfaces irb unit 10 family inet6 address 2001:db8::10:a:1:1/112
set interfaces irb unit 10 family inet6 address fe80::10:a:1:1/112
```

The commit script also includes default `router-advertisement` statements in the generated configuration for that IRB interface. For example, if you have an EZ-LAG virtual gateway configuration, the generated configuration also includes the `virtual-router-only` option, which enables sending router advertisement packets only for the link-local virtual gateway address:

```
set protocols router-advertisement interface irb.10 max-advertisement-interval 30
set protocols router-advertisement interface irb.10 min-advertisement-interval 10
set protocols router-advertisement interface irb.10 virtual-router-only
```

See *Routing IPv6 Data Traffic through an EVPN-VXLAN Network with an IPv4 Underlay* and *IPv6 Neighbor Discovery* for more on EVPN-VXLAN IPv6 data traffic and setting IPv6 link-local addresses.

no-irb-address-auto-derive

Instruct the commit script to not derive IRB interface subnet addresses in the generated configuration for this IRB instance.

For configuration simplicity, with this feature you can set the same IRB interface subnet address on connected PE devices using this `subnet-address` option at the `[edit services evpn evpn-vxlan irb irb-instance]` hierarchy level. By default, the commit script derives different device IRB subnet addresses from the `subnet-address` value you configure for peer ID 1, based on the peer ID of the device on which it's running.

When you set `no-irb-address-auto-derive`, instead of the default behavior, the commit script uses exactly the IPv4 or IPv6 subnet addresses you specify with the `subnet-address` options on each device.

> **NOTE**: This option applies individually to the specified IRB instance. You can alternatively set this option globally at the `[edit services evpn global-parameters]` hierarchy level. In that case, the option takes effect for all IRB instances on the device that you configure with the `irb irb-instance` statement at the `[edit services evpn evpn-vxlan]` hierarchy level.

If you don't set `no-irb-address-auto-derive` (either per IRB instance or globally), by default the commit script derives the subnet address based on the provided *subnet-address* value on each device. In this case, the commit process doesn't do a commit check to enforce setting the same subnet address across both devices.

> **NOTE**: We strongly recommend that you make sure you set `subnet-address` to the same base value on both peer PE devices in the easy

EVPN LAG configuration. That way the default address derivation works as expected for the IRB interface subnet addresses on each peer PE device.

virtual-gateway-v4-address *ipv4-virtual-gateway-address*

Specify an IPv4 virtual gateway address for the IRB interface.

If you don't include this option to set a specific IPv4 virtual gateway address, the device derives a virtual gateway IPv4 address for the IRB interface from the address you specify with the `inet` option and the highest configurable IPv4 address in the subnet range.

For example, if you configure subnet address `10.1.1.1/24`, the commit script generates IRB interface configuration statements with an IPv4 virtual gateway address `10.1.1.254`.

virtual-gateway-v6-address *ipv6-virtual-gateway-address*

Specify an IPv6 virtual gateway address for the IRB interface.

If you don't include this option to set a specific IPv6 virtual gateway address, the device derives a virtual gateway IPv6 address for the IRB interface from the address you specify with the `inet6` option and the highest configurable IPv6 address in the subnet range.

For example, if you configure subnet address `2001:db8::10:1:1:1/112` , the commit script generates IRB interface configuration statements with an IPv6 virtual gateway address `2001:db8::10:1:1:fffe`.

Easy EVPN LAG (EZ-LAG) Configuration

subscriber (Access Profile)

IN THIS SECTION

- Syntax | 29792
- Hierarchy Level | 29792
- Description | 29792
- Options | 29793
- Required Privilege Level | 29794
- Release Information | 29794

Syntax

```
subscriber username {
    delegated-pool delegated-pool-name;
    framed-ip-address ipv4-address;
    framed-ipv6-pool ipv6-pool-name;
    framed-pool ipv4-pool-name;
    password password;
    target-logical-system logical-system-name<(target-routing-instance (default | routing-
instance-name)>;
    target-routing-instance (default | routing-instance-name);
}
```

Hierarchy Level

```
[edit access profile profile-name]
```

Description

Enable local authentication for subscribers by configuring a password to match the subscriber. Local authentication can take the form of either user password authentication or Challenge Handshake Authentication Protocol' (CHAP) authentication. For user password authentication, the configured password is used to verify the subscriber's login password. For CHAP authentication, the configured

password acts as the challenge secret to verify the subscriber's challenge password and challenge response credential.

> **NOTE**: Local authentication and authorization also requires the `password` option to be configured as an `authentication-order` method for the access profile.

You can also optionally configure several attributes, such as an address, address pool, logical system, or routing instance, to be authorized locally for the subscriber when authentication is successful.

Local authentication supports all subscriber types that are currently supported by subscriber management and services on MX Series routers.

Local authentication is useful when you do not want to use external authentication servers. The associated local authorization similarly is useful when you do not want to use external authorization servers. Another use case might be when you are migrating a network from E Series routers running JunosE software to MX Series routers running Junos OS. You may also want to configure local authentication and authorization as a backup for RADIUS authentication.

If you do not configure an address or address pool for local authorization, address assignment is based on network matching or the first address pool assigned to the routing instance.

> **NOTE**: Local authentication and authorization supports a chassis-wide maximum of 100 subscribers. If subscribers are configured in access profiles where `authentication-order password` is not configured, local authentication does not occur, but these subscriber count against the system limit of 100 subscribers for local authentication.

Options

delegated-pool *delegated-pool-name*	(Optional) Specify the name of an address pool used to locally allocate a delegated IPv6 prefix for the subscriber. Corresponds to RADIUS standard attribute Delegated-IPv6-Prefix (123).
framed-ip-address *ipv4-address*	(Optional) Specify the IP address to be configured for the subscriber. Corresponds to RADIUS standard attribute Framed-IP-Address (8).
framed-ipv6-pool *ipv6-pool-name*	(Optional) Specify the name of an address pool used to assign a router advertisement IPv6 prefix or a DHCPv6 IA_NA/128 address for the subscriber. Corresponds to RADIUS standard attribute Framed-IPv6-Pool (100).
framed-pool *ipv4-pool-name*	(Optional) Specify the name of an address pool used to assign an IPv4 address for the subscriber. Corresponds to RADIUS standard attribute Framed-Pool (88).

password *password*	Specify the password used to authenticate the subscriber locally. Corresponds to RADIUS standard attributes User-Password (2) or CHAP-Password (3).
target-logical-system *logical-system-name*	(Optional) Specify the name of the logical system assigned to the subscriber.
target-routing-instance (default | *routing-instance-name*)	(Optional) Specify the name of the routing instance assigned to the subscriber; either the default routing instance or a nondefault routing instance.

subscriber (DDoS Flow Detection)

IN THIS SECTION

- Syntax | 29795
- Hierarchy Level | 29795
- Description | 29795
- Options | 29795
- Required Privilege Level | 29796
- Release Information | 29796

Syntax

```
subscriber (flow-bandwidth | flow-control-mode | flow-detection-mode)
```

Hierarchy Level

```
[edit system ddos-protection protocols protocol-group packet-type flow-level-bandwidth],
[edit system ddos-protection protocols protocol-group packet-type flow-level-control],
[edit system ddos-protection protocols protocol-group packet-type flow-level-detection]
```

Description

(MX Series routers with only MPCs, T4000 Core Routers with only FPC5s, or EX9200 switches) Configure flow bandwidth, flow control mode, or flow detection mode at the subscriber flow aggregation level for the packet type.

Options

flow-bandwidth—Specify the bandwidth for the flow at the subscriber level. Available only at the `[edit system ddos-protection protocols protocol-group packet-type flow-level-bandwidth]` hierarchy level.

- **Default:** 100 packets per second
- **Range:** 1 through 10,000 packets per second

flow-control-mode—Specify how traffic in the detected flow is controlled at the subscriber level. Available only at the `[edit system ddos-protection protocols protocol-group packet-type flow-level-control]` hierarchy level.

> **NOTE**: The configuration at this level overrides the global configuration using the `flow-level-control` statement at the `[edit system ddos-protection global]` hierarchy level.

- `drop`—Drop all traffic in flow.
- `keep`—Keep all traffic in flow.
- `police`—Police the traffic to within its allowed bandwidth.
- **Default:** `drop`

flow-detection-mode—Specify how flow detection operates at the subscriber level when a policer has been violated. Available only at the [edit system ddos-protection protocols *protocol-group packet-type* flow-level-detection] hierarchy level.

> **NOTE**: The configuration at this level overrides the global configuration using the flow-detection-mode statement at the [edit system ddos-protection global] hierarchy level.

- automatic—Search flows at the subscriber level only when a DDoS policer is being violated and only until it is established that the flow causing the violation is not at this level. When the suspicious flow is not at this level, then the search moves to a coarser level of flow aggregation (logical interface). Flows at the subscriber level are subsequently not searched again until the policer is no longer violated at the coarser level.
- off—Disable flow detection at the subscriber level so that flows are never searched at this level.
- on—Search flows at the subscriber level, even when no DDoS protection policer is currently being violated. Monitoring continues at this level regardless of whether a suspect flow is identified at this level.
- **Default:** automatic

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Syntax

```
subscriber-info {
    service-statistics;
    subscriber-statistics;
}
```

Hierarchy Level

```
[edit dynamic-profiles name telemetry]
```

Description

The `subscriber-info` statement enables the streaming of subscriber metadata to an external telemetry server when the subscriber logs into or logs out of the device under test (DUT). Subscriber metadata includes subscriber-related information such as username, profile name, underlying interface name, customer VLAN (C-VLAN), and service VLAN (S-VLAN) tags. The subscriber-info is a mandatory config under the telemetry stanza.

Options

service-statistics	Enables service accounting statistics telemetry. Use this option to allow periodic streaming of firewall filter statistics for IPv4 and IPv6 filters to an external telemetry server.
subscriber-statistics	Enables periodic streaming of subscriber accounting statistics such as input packets/octets and output packets/octets to an external telemetry server.

```

```
readable | no-world-readable>;
        flag flag;
    }
}
```

Hierarchy Level

```
[edit system services]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure global services for subscriber management, such as maintaining subscribers, tracing operations, and enabling enhanced subscriber management.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

subscriber-management-helper

IN THIS SECTION

- Syntax | 29811
- Hierarchy Level | 29811
- Description | 29811
- Options | 29812
- Required Privilege Level | 29812
- Release Information | 29812

Syntax

```
subscriber-management-helper {
    command binary-file-path;
    disable;
    failover (alternate-media | other-routing-engine);
}
```

Hierarchy Level

```
[edit system processes]
```

Description

Specify the subscriber management helper process.

Options

- `command` *`binary-file-path`*—Path to the binary process.
- `disable`—Disable the subscriber management helper process.
- `failover`—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.
  - `alternate-media`—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.
  - `other-routing-engine`—Instruct the secondary Routing Engine to take primary role if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

subscriber-packet-idle-timeout

IN THIS SECTION

- Syntax | 29813
- Hierarchy Level | 29813
- Description | 29813
- Options | 29813
- Required Privilege Level | 29813

Syntax

```
subscriber-packet-idle-timeout subscriber-packet-idle-timeout;
```

Hierarchy Level

```
[edit system services packet-triggered-subscribers]
```

Description

The subscriber packet idle timeout for packet triggered subscribers.

Options

subscriber-packet-idle-timeout—Maximum idle time.

- **Range:** 15 through 1440 minutes.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

RELATED DOCUMENTATION

Packet-Triggered Subscribers Services Overview

subscriber-pool-utilization-alarm

IN THIS SECTION

Syntax | 29814

Hierarchy Level | 29814

- Description | 29814
- Options | 29814
- Required Privilege Level | 29815
- Release Information | 29815

Syntax

```
subscriber-pool-utilization-alarm
<clear-threshold clear-threshold alarm value>
<dampening-interval dampening-interval value>
<log-type <snmp-trap><syslog>>
<raise-threshold raise-threshold alarm value>;
```

Hierarchy Level

```
[edit security nat source],
[edit services nat source]
```

Description

You can configure threshold limits to receive notifications when port or port block usage exceeds the configured thresholds.

Options

clear-threshold

Clear threshold for subscriber pool utilization alarm.

- **Range:** 40 through 100

dampening-interval

Configure dampening interval for subscriber pool alarm.

- **Range:** 5 through 60

log-type

Define log type. By default, `snmp-trap` and `syslog` are enabled.

- snmp-trap—Enable SNMP trap for subscriber pool utilization.
- syslog—Enable system log for subscriber pool utilization.

raise-threshold Raise threshold for subscriber pool utilization alarm.

- **Range:** 50 through 100

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration

Release Information

Statement introduced in Junos OS Release 24.4R1.

subscriber-profile

IN THIS SECTION

- Syntax | 29815
- Hierarchy Level | 29816
- Description | 29816
- Options | 29816
- Required Privilege Level | 29816
- Release Information | 29816

Syntax

```
subscriber-profile profile-name {
    enable service-name {
        concurrent-data-sessions max-session-number;
    }
```

```
    disable service-name;
    max-data-sessions-per-subscriber {
        limit max-sub-sessions;
        exceed-action {
            drop;
            syslog;
        }
    }
}
```

Hierarchy Level

```
[edit services service-set services-set-name]
```

Description

Specify the subscriber profile name. A subscriber profile specifies which services should be enabled and which services should be disabled for traffic belonging to a subscriber bound to a particular subscriber profile. A subscriber is bound to a minimum of one subscriber profile at any given time.

Options

profile-name—Name of the profile.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

subscriber-type (TDF Domain)

IN THIS SECTION

- Syntax | 29817
- Hierarchy Level | 29817
- Description | 29817
- Options | 29817
- Required Privilege Level | 29818
- Release Information | 29818

Syntax

```
subscriber-type (ip | ifl);
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name domains domain-name]
```

Description

Configure the type of subscriber that this domain is applied to — an IP-based subscriber or an IFL-based (interface-based) subscriber. If you do not include this statement, `subscriber-type ip` is used.

Options

ip (Default) Apply the TDF domain to IP-based subscribers, for which a RADIUS accounting request is sent to the MX Series router. An individual subscriber session is created for each unique source IP address.

ifl Apply the TDF domain to IFL-based subscribers, which are defined by a set of interfaces. One subscriber session is created for all traffic that is received on those interfaces.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

subscribers-limit (Resource Monitor)

IN THIS SECTION

- Syntax | 29818
- Hierarchy Level | 29819
- Description | 29819
- Required Privilege Level | 29819
- Release Information | 29819

Syntax

```
subscribers-limit {
    client-type (any | dhcp | l2tp | pppoe) {
        chassis {
            limit limit;
```

```
        }
        fpc slot-number {
            limit limit;
            pic number {
                limit limit;
                port number {
                    limit limit;
                }
            }
        }
    }
}
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

Configure the maximum number of subscribers of a specified client type allowed to be logged in on the chassis, per MPC, per MIC, and per port. When that number is reached, subsequent logins are denied until the current number of subscribers drops below the maximum allowed.

Limit the number of subscribers allowed to log in per chassis, MPC, MIC, or port.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.3R1.

[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name link-protection]
```

Description

Configure the amount of bandwidth subscribed to a class type (when you have enabled Differentiated Services) or bypass LSP (when you have enabled link protection). `subscription` is the percentage of the link bandwidth that can be used for the RSVP reservation process.

Options

`ct`*`number percentage`*—Percentage of the class-type bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type. You can specify bandwidth subscriptions for class types 0 through 3. This option is not available for bypass LSPs.

- **Range:** 0 through 65,000
- **Default:** 100 percent

`percentage`—Percentage of the class-type or bypass LSP bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type or bypass LSP.

- **Range:** 0 through 65,000
- **Default:** 100 percent

`priority` *`priority-value percentage`*—Priority for which subscription percent is being configured.

- **Range:** 0 through 7
- **Default:** 100 percent

`percentage`—Subscription percent for the specific priority.

- **Range:** 0 through 65,000
- **Default:** 100 percent

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`priority` option introduced in Junos OS Release 20.4R1 for MX960, MX2008, MX2010, MX2020, and PTX Series.

subscription-id-data-include (PCRF Partition)

IN THIS SECTION

- Syntax | 29824
- Hierarchy Level | 29824
- Description | 29824
- Options | 29825
- Required Privilege Level | 29826
- Release Information | 29826

Syntax

```
subscription-id-data-include {
    base-interface-name;
    delimiter delimiter-character;
    domain-name name;
    interface-name;
    mac-address;
    nas-port-id;
    origin-host;
    origin-realm;
    user-name;
    user-prefix prefix;
    vlan-tags;
}
```

Hierarchy Level

```
[edit access pcrf partition partition-name]
```

Description

Configure the subscriber data to use in a Policy and Charging Rules Function (PCRF).

Options

base-interface-name
Use the specified physical or underlying interface name. If both the underlying interface and the client application perform authentication, authorization, and provisioning, the identification attributes in the server requests enable the AAA or PCRF server to make an association between the two entities.

delimiter *delimiter-character*
Use the specified character used as the delimiter between the concatenated components of the subscription-id-data-include. You cannot use the semicolon (;) as a delimiter.

- **Default:** @

domain-name *name*
Use the specified domain name that is concatenated with the subscription-id-data-include during the subscriber identification process.

interface-name
Use the specified interface name that is concatenated with the subscription-id-data-include during the subscriber identification process; for example, demux0.

mac-address
Use the specified client hardware address (chaddr) from the incoming packet that is concatenated with the subscription-id-data-include during the subscriber identification process.

nas-port-id
Use the specified NAS-Port-ID (RADIUS attribute 87), which identifies the physical interface that subscriber management uses to identify subscribers that is concatenated with the subscription-id-data-include during the subscriber identification process. By default, the NAS-Port-ID includes the interface-description value that describes the physical interface.

origin-host
Use the specified name of the host that originates the Diameter message that is concatenated with the subscription-id-data-include during the subscriber identification process. Supplied as the value of Origin-Host AVP for all messages sent by the Diameter master instance.

origin-realm
Use the specified realm of the host that originates the Diameter message that is concatenated with the subscription-id-data-include during the subscriber identification process. Supplied as the value of Origin-Realm AVP for all messages sent by the Diameter master instance.

user-name
Use the specified subscriber username that is concatenated with the subscription-id-data-include during the subscriber identification process.

user-prefix *prefix*
Use the specified user prefix that is concatenated with the subscription-id-data-include during the subscriber identification process.

vlan-tags Include the subscriber session VLAN tags in the subscription ID. Both single-tagged and double-tagged VLANs are supported: The tags are added in the format *outer-vlan-tag-inner-vlan-tag*. The outer tag is always included; the inner tag is included for double-tagged VLANs.

Use this option instead of the `interface-name` option when you the outer VLAN tag is unique across the system and you do not need the underlying physical interface name to be part of the format.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

`vlan-tags` option added in Junos OS Release 18.3R1 on MX Series routers.

subscription-id-type (PCRF Partition)

IN THIS SECTION

- Syntax | 29830
- Hierarchy Level | 29830
- Description | 29830
- Options | 29831
- Required Privilege Level | 29831
- Release Information | 29831

Syntax

```
subscription-id-type number;
```

Hierarchy Level

```
[edit access pcrf partition partition-name]
```

Description

Identify the subscriber. You can identify the subscriber using several IANA predefined values, or define your own. The Policy and Charging Rule Function (PCRF) uses the subscription-id-type during a subscriber login session using for CCR-GX-I and CCA-GX-I messages.

BEST PRACTICE: For wireline service, we recommend that you define your own customer-specific value.

If you do not define or include any data in the `subscription-id-data-include` statement, then the value defaults to reserved. For some applications, the PCRF may be configured to identify subscribers using another method, and instead use the subscription-id-type for protocol compliance. If the dynamic-subscription-id is provided by the AAA server, then the PCRF uses the dynamic-subscription-id as the identifier regardless of what you defined for the local configuration.

Options

number Identifier for the type of subscriber for a PCRF partition.

- **Default:** 4 (END_USER_PRIVATE)
- **Range:** 1 through 2147483647
- **Values:** 1 (END_USER_IMSI)
  2 (END_USER_SIP_URI)
  3 (END_USER_NAI)
  4 (END_USER_PRIVATE)

Required Privilege Level

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify the Sun Microsystems remote procedure call (RPC) ALG on the device. Sun Microsystems Remote Procedure Call (Sun RPC)—also known as Open Network Computing Remote Procedure Call (ONC RPC)—provides a way for a program running on one host to call procedures in a program running on another host.

Options

- `disable`—Disable the Sun RPC ALG. By default, the Sun RPC ALG is enabled.
- `map-entry-timeout` *`map-entry-timeout`*—Specify the Sun RPC ALG mapping entry timeout value in hours.

  Range: 1 through 72 hours.

  Default: 32 hours.
- `traceoptions`—Configure the Sun RPC ALG tracing options.
  - `flag`—Trace operation to perform.
    - `all`—Trace all events.
    - *`extensive`*—Display extensive amount of data.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

The `tenant` option is introduced in Junos OS Release 18.3R1.

Understanding Sun RPC ALGs

supplementary-blackout-timer (Host Fast Reroute)

IN THIS SECTION

- Syntax | 29835
- Hierarchy Level | 29835
- Description | 29836
- Default | 29836
- Options | 29837
- Required Privilege Level | 29837
- Release Information | 29837

Syntax

```
supplementary-blackout-timer minutes;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name routing-options
interface interface-name],
[edit routing-instances instance-name routing-options interface interface-name]
```

Description

Override the global supplementary blackout timer for the specified host fast-reroute (HFRR) profile.

When you configure HFRR, an optional ARP prefix limit sets a maximum for the number of ARP routes and, therefore FRR routes created for each HFRR profile in the routing table. This limit prevents ARP attacks from exhausting the virtual memory on the routing devices.

There are two configuration statements (`global-arp-prefix-limit` and `arp-prefix-limit`) that set the ARP prefix limit, one at the global `[edit routing-options host-fast-reroute]` hierarchy level and the other at the `[edit routing-instances *instance-name* routing-options interface *interface-name*]` hierarchy level, respectively. The global `global-arp-prefix-limit` statement sets a default ARP prefix limit for all HFRR profiles configured on the routing device. The `arp-prefix-limit` statement overrides the `global-arp-prefix-limit` for that HFRR profile for that protected interface.

Warning system log messages begin when the ARP routes in an HFRR profile reaches 80% of the configured limit. When the number crosses the 100% threshold, the HFRR profile is deactivated. When this happens, all ARP/FRR routes are deleted from the routing table. FRR routes are deleted from forwarding table as well.

After the HFRR profile is deactivated, a blackout timer is started. The timeout value of this timer is the ARP cache timeout (kernel timeout) + the supplementary blackout timer.

There are global and per-HFRR CLI statements (`global-supplementary-blackout-timer` and `supplementary-blackout-timer`) to configure the supplementary blackout timer. The global value is at the `[edit routing-options host-fast-reroute]` hierarchy level and applies to all HFRR profiles on the routing device. The value for the routing-instance interface is at the `[edit routing-instances *instance-name* routing-options interface *interface-name*]` hierarchy level, and overrides the global value for that HFRR profile only.

When the blackout timer expires, the HFRR profile is reactivated, and the Junos OS relearns the ARP routes and re-creates the HFRR routes. If the ARP prefix limit is not exceeded again, the HFRR routes will be up.

If an HFRR profile is in the deactivated state, a reevaluation of the ARP state is preformed during every commit operation or whenever the routing process (rpd) is restarted with the `restart routing` command.

Default

If you omit the-`supplementary-blackout-timer` statement, the `global-supplementary-blackout-timer` takes effect for all HFRR profiles on the device. If you omit both of these statements, the blackout timeout value is set to the ARP cache timeout value, which by default is 20 minutes and is configurable with the `aging-timer` statement at the `[edit system arp]` hierarchy level.

Options

minutes Number of minutes, in addition to the ARP cache timeout value, before an HFRR profile is reactivated after the ARP prefix limit is exceeded.

- **Range:** 1 through 15 minutes

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

supplicant

IN THIS SECTION

- Syntax | 29838
- Hierarchy Level | 29838
- Description | 29838
- Options | 29838
- Required Privilege Level | 29839
- Release Information | 29839

Syntax

```
supplicant  {
    interface interface-name {
        local-certificate certificate-id;
        authentication-method eap-tls;
        user-id user-id;
    }
}
```

Hierarchy Level

```
[edit protocols dot1x]
```

Description

Configure the interface as a supplicant for 802.1X authentication. You can configure an interface to act as both an authenticator and as a supplicant on a link connecting switches or routers. This can be a switch-to-switch, switch-to-router, or router-to-router link. This enables the devices to authenticate each other, which is required to secure the link using MACsec in dynamic connectivity association key (CAK) mode.

MACsec in dynamic CAK mode relies on certificate-based validation using Extensible Authentication Protocol – Transport Layer Security (EAP-TLS). You must configure the supplicant interface to use EAP-TLS and assign a digital certificate to the interface.

Supplicant interfaces do not support captive portal or MAC RADIUS authentication.

Options

local-certificate *certificate-id*	Specify the the local certificate for the supplicant interface when the local device has multiple loaded certificates.
authentication-method (eap-tls | eap-md5)	Configure the authentication method for the supplicant. To support MACsec in dynamic CAK mode, you must configure EAP-TLS authentication.
user-id *user-id*	Configure the user ID.

password *password* Configure the password.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 22.2R1.

suppress-host-routes-from-dci-to-dc

IN THIS SECTION

- Syntax | 29839
- Hierarchy Level | 29839
- Description | 29840
- Required Privilege Level | 29840
- Release Information | 29840

Syntax

```
suppress-host-routes-from-dci-to-dc
```

Hierarchy Level

```
[edit routing-instances routing-instance-name protocols evpn interconnect]
```

Description

You can suppress Ethernet VPN (EVPN) Type 5 host route advertisements re-originated across the data center interconnect (DCI), to the local data center (DC). Setting this statement achieves better scaling and performance on leaf devices by preventing host route advertisements for non-existing subnets on the local DC. Host routes corresponding to existing subnets stretched from the DCI gateway (GW) to the local DC will be advertised.

The DCI GW device treats the following Type 5 routes as host routes:

- IPv4 routes with a /32 prefix
- IPv6 routes with a /128 prefix

The DCI GW will continue to advertise non-host Type 5 routes to the DC by default.

Consider the following points before deploying this configuration:

- You configure this option on the DCI GW devices.
- You must configure integrated routing and bridging (IRB) interfaceds on DCI GW devices in edge-routed bridging (ERB) mode.
- Setting this option applies to every DCI-learned host route, and could suppress necessary route advertisements. You can selectively suppress Type 5 route advertisements with an `export` policy at the `[edit routing-instances *routing-instance-name* protocols evpn ip-prefix-routes]` hierarchy, instead of using this option. Setting this option doesn't affect locally learned host route advertisements.
- Setting this option doesn't affect IRB's configured with the `disable` statement. IRB's associated both with a Layer 3 context and EVPN bridge domain are still validated when a subnet is stretched from DCI GW to DC.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

suppression

IN THIS SECTION

- Syntax | 29842
- Hierarchy Level | 29843
- Description | 29843
- Options | 29843
- Required Privilege Level | 29844
- Release Information | 29844

Syntax

```
suppression {
    disable;
    (include-destination-address | no-include-destination-address);
    max-logs-operate value;
    max-time-report value;
    start-log value;
}
```

Hierarchy Level

```
[edit security idp sensor-configuration log]
```

Description

Log suppression reduces the number of logs by displaying a single record for multiple occurrences of the same event. Log suppression can negatively impact sensor performance if the reporting interval is set too high. By default this feature is enabled.

Options

disable —Disable log suppression.

include-destination-address When log suppression is enabled, multiple occurrences of events with the same source, service, and matching attack object generate a single log record with a count of occurrences. If you enable this option, log suppression will only combine log records for events with a matching source as well. The IDP Sensor does not consider destination when determining matching events for log suppression. By default this setting is disabled.

max-logs-operate When log suppression is enabled, IDP must cache log records so that it can identify when multiple occurrences of the same event occur. This setting specifies how many log records are tracked simultaneously by IDP.

- **Syntax:** *value*—Maximum number of log records are tracked by IDP.
- **Range:** 256 through 65,536 records
- **Default:** 16,384 records

max-time-report When log suppression is enabled, IDP maintains a count of multiple occurrences of the same event. After the specified number of seconds has passed, IDP writes a single log entry containing the count of occurrences.

- **Syntax:** *value*—Time after which IDP writes a single log entry containing the count of occurrences.
- **Range:** 1 through 60 seconds
- **Default:** 5 seconds

start-log Specify how many instances of a specific event must occur before log suppression begins.

- **Syntax:** *value*—Log suppression begins after how many occurrences.
- **Range:** 1 through 128
- **Default:** 1

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Release	Description
15.1X49-D10	The surf-control- integrated feature is not supported from Junos OS Release 15.1X49-D10 onwards.

suspend-for

IN THIS SECTION

- Syntax | 29846
- Hierarchy Level | 29847
- Description | 29847
- Default | 29847
- Required Privilege Level | 29847
- Release Information | 29847

Syntax

```
suspend-for;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name mka]
```

Description

Configure the `suspend-for` statement to maintain non-stop MACsec service during graceful routing engine switchover (GRES).

The MACsec Key Agreement (MKA) protocol maintains the MACsec session between two nodes on a point-to-point MACsec link. The MKA protocol works at the control plane level between the two nodes. When you configure the `suspend-for` statement on the local node, in the event of an RE switchover, it sends a request to the remote peer node to suspend the MACsec session at the control plane. The suspension lasts for 120 seconds.

At the data plane, traffic continues to traverse the point-to-point link during suspension. The secure association key (SAK) that was programmed prior to suspension remains in use until the switchover is complete. After the switchover, the key server generates a new SAK to secure the link. The key server will continue to periodically create and share a SAK over the link for as long as MACsec is enabled.

Default

You must configure the `suspend-for` statement to enable this feature. It is not enabled by default. If this statement is not configured, in the event of an RE switchover, the MACsec session is terminated, resulting in traffic loss during the switchover.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.2R1.

suspend-on-request

IN THIS SECTION

- Syntax | 29848
- Hierarchy Level | 29848
- Description | 29848
- Default | 29849
- Required Privilege Level | 29849
- Release Information | 29849

Syntax

```
suspend-on-request;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name mka]
```

Description

Configure the `suspend-on-request` statement to maintain non-stop MACsec service during graceful routing engine switchover (GRES).

The MACsec Key Agreement (MKA) protocol maintains the MACsec session between two nodes on a point-to-point MACsec link. The MKA protocol works at the control plane level between the two nodes. With GRES for MACsec is enabled, when one node initiates an RE switchover, it sends an MKA hello packet with a suspension request to the peer node. The peer node suspends the MACsec session at the control plane.

At the data plane, traffic continues to traverse the point-to-point link during suspension. The secure association key (SAK) that was programmed prior to suspension remains in use until the switchover is complete. After the switchover, the key server generates a new SAK to secure the link. The key server will continue to periodically create and share a SAK over the link for as long as MACsec is enabled.

You must configure the `suspend-on-request` statement on the key server so that it can accept a request for suspension from the peer node. If this statement is not configured, a suspension request sent to the key server results in termination of the MACsec session, which can cause traffic loss during the switchover.

Default

You must configure the `suspend-on-request` statement to enable a node on a MACsec link to accept requests for suspension of MACsec sessions. Suspension requests are not accepted by default.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.2R1.

switch (IPLC)

IN THIS SECTION

- Syntax | 29859
- Hierarchy Level | 29860
- Description | 29860
- Default | 29860
- Options | 29860
- Example: Switching Wavelengths to an Optical Interface on the Local Chassis | 29861
- Example: Switching Wavelengths to an Optical Interface on the Remote Chassis | 29861
- Required Privilege Level | 29861
- Release Information | 29861

Syntax

```
switch interface-name | remote;
```

Hierarchy Level

```
[edit chassis fpc fpc-slot optical-options wavelength nm]
```

Description

Switch the specified wavelength from the IPLC port to the specified local or remote optical interface.

The IPLC is designed to connect the `ADD` and `DROP` ports on the front panel to compatible optical PICs or MICs on the local or remote chassis. Wavelengths configured on the local IPLC `ADD` ports are multiplexed and sent over the `Line OUT` port of the IPLC base module. The remote IPLC base module receives the signal on the `Line IN` port and demultiplexes the wavelengths to the `DROP` ports on the front panel of the IPLC according to the configuration of the remote IPLC. After you have made the physical connections between the IPLC ports and the local and remote optical interfaces, you need to configure the IPLC to switch the wavelengths to the optical interfaces.

This statement requires you to make the following connections:

- Install the optical interfaces and configure the wavelength number on the interface so that it is compatible with the wavelength on the IPLC. See Configuring the 10-Gigabit or 100-Gigabit Ethernet DWDM Interface Wavelength. For a list of optical interfaces that are compatible with the IPLC ports, see PTX Series IPLC Compatibility.
- Install the IPLC module in the local or remote PTX Series chassis and connect the ADD and DROP ports to the respective optical interfaces.

NOTE: The specified slot must contain an IPLC base module or IPLC expansion module.

Default

Options

fpc-slot Specify the IPLC slot number.

interface-name Specify the name of the optical interface to which you want to switch the specified wavelength. This field is free-form text.

nm Specify the wavelength number you want to switch.

Remote Specify that the wavelength is to be switched to an optical interface on a remote chassis.

Example: Switching Wavelengths to an Optical Interface on the Local Chassis

To switch wavelength 1550.12 on the local IPLC module in slot 2 to the local et-1/1/0 interface, enter the following:

```
[edit]
user@host# set chassis fpc 2optical-options wavelength 1550.12 switch et-1/1/0
```

Example: Switching Wavelengths to an Optical Interface on the Remote Chassis

To switch wavelength 1550.12 on the local IPLC module in slot 2 to an optical interface on a remote chassis, enter the following:

```
[edit]
user@host# set chassis fpc 2optical-options wavelength 1550.12 switch remote
```

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Releases 15.1F6 17.1R1.

switch-away-lsps

IN THIS SECTION

- Syntax | **29864**
- Hierarchy Level | **29864**

- Description | 29864
- Required Privilege Level | 29864
- Release Information | 29864

Syntax

```
switch-away-lsps;
```

Hierarchy Level

```
[edit logical-systems logical-systems-name protocols mpls interface interface-name],
[edit protocols mpls interface interface-name]
```

Description

(MX Series routers only) Enable you to switch an LSP away from a network node using a bypass LSP. This feature could be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic. Configure this statement only after you have configured and committed the `always-mark-connection-protection-tlv` statement.

The `always-mark-connection-protection-tlv` statement marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. When you configure the `switch-away-lsps` statement, traffic is switched to the bypass LSP.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

RELATED DOCUMENTATION

Switching LSPs Away from a Network Node

switchover-delay

IN THIS SECTION

- Syntax | 29875
- Hierarchy Level | 29875
- Description | 29876
- Options | 29876
- Required Privilege Level | 29876
- Release Information | 29876

Syntax

```
switchover-delay milliseconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols l2circuit neighbor address interface
interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols vpls
neighbor address],
[edit protocols l2circuit neighbor address interface interface-name],
[edit routing-instances routing-instance-name protocols vpls neighbor address]
```

Description

After the primary pseudowire goes down, specifies the delay (in milliseconds) to wait before the backup pseudowire takes over. You configure this statement for each backup neighbor configuration to adjust the switchover time after a failure is detected.

Options

milliseconds—Specify the time to wait before switching to the backup pseudowire after the primary pseudowire fails.

- **Default:** 10,000 milliseconds
- **Range:** 0 through 180,000 milliseconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

- Syntax | 29877
- Hierarchy Level | 29877
- Description | 29877
- Default | 29877

- Options | 29877
- Required Privilege Level | 29877
- Release Information | 29878

Syntax

```
switchover-mode (revertive | non-revertive);
```

Hierarchy Level

```
[edit chassis synchronization]
```

Description

Specify whether the device should switch to a higher-quality clock source or use the current clock source only.

Default

The default is revertive mode.

Options

revertive In revertive mode (the default), the system automatically switches from a lower to a higher quality clock source whenever the higher clock source becomes available.

non-revertive Set this option so that the router continues to use the current clock source as long as it is valid.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

switchover-on-routing-crash

IN THIS SECTION

- Syntax | 29878
- Hierarchy Level | 29878
- Description | 29879
- Required Privilege Level | 29879
- Release Information | 29879

Syntax

```
switchover-on-routing-crash;
```

Hierarchy Level

```
[edit system]
```

Description

Prevent loss of traffic in the case of NSR being configured. With the `switchover-on-routing-crash` configuration statement enabled, when rpd on the primary Routing Engine crashes with NSR configured, the Routing Engine will switch over immediately to the backup Routing Engine to preserve protocol state and adjacencies. Prior to having this statement, if NSR was configured and rpd on the primary Routing Engine crashed, it would cause network impact (protocol neighbor and adjacency drops and traffic loss).

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Configuring Nonstop Active Routing

sxl-retry

IN THIS SECTION

- Syntax | 29880
- Hierarchy Level | 29880
- Description | 29880
- Options | 29880
- Required Privilege Level | 29880
- Release Information | 29880

Syntax

```
sxl-retry value;
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus sophos-engine]
```

Description

Configure the number of retry attempts to the remote Sophos Extensible List (SXL) server when a request timeout occurs.

Starting in Junos OS Release 23.1R1, we've deprecated the `sxl-retry` statement at the [`edit security utm default-configuration anti-virus sophos-engine`] and [`security utm feature-profile anti-virus sophos-engine`] hierarchy levels.

Options

value —Number of retries.

- **Range:** 0 through 5
- **Default:** 1

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

The [`edit security utm default-configuration`] hierarchy level is introduced in Junos OS Release 18.2R1.

sxl-timeout

IN THIS SECTION

- Syntax | 29881
- Hierarchy Level | 29881
- Description | 29881
- Options | 29881
- Required Privilege Level | 29882
- Release Information | 29882

Syntax

```
sxl-timeout seconds;
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus sophos-engine]
```

Description

Configure the timeout value for responses to a Sophos checksum or URI query.

Starting in Junos OS Release 23.1R1, we've deprecated the `sxl-timeout` statement at the [`edit security utm default-configuration anti-virus sophos-engine`] and [`security utm feature-profile anti-virus sophos-engine`] hierarchy levels.

Options

seconds —Number of seconds before timeout occurs.

- **Range:** 1 through 5 seconds
- **Default:** 2 seconds

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

symbol-period

IN THIS SECTION

- Syntax | 29882
- Hierarchy Level | 29882
- Description | 29883
- Options | 29883
- Required Privilege Level | 29883
- Release Information | 29883

Syntax

```
symbol-period count;
```

Hierarchy Level

```
[edit protocols oam ethernet link-fault-management action-profile name event link-event-rate],
[edit protocols oam ethernet link-fault-management interface name event-thresholds]
```

Description

Configure the threshold for sending symbol period events or taking the action specified in the action profile.

A symbol error is any symbol code error on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period window. The default period window is the number of symbols that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.

Options

count—Threshold count in seconds for symbol period events.

- **Range:** 0 through 100 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

syn-ack-ack-proxy (IDS Screen Next Gen Services)

IN THIS SECTION

- Syntax | 29885
- Hierarchy Level | 29885
- Description | 29885
- Options | 29886
- Required Privilege Level | 29886
- Release Information | 29886

Syntax

```
syn-ack-ack-proxy {
    threshold number;
}
```

Hierarchy Level

```
[edit services screen ids-option screen-name tcp]
```

Description

Configure the maximum number of connections from an IP address that can be opened without being completed. Once this threshold has been reached, further connection requests are rejected. In the SYN-ACK-ACK attack, the session table can fill up, resulting in the device rejecting legitimate connection requests.

Options

threshold ***number*** Maximum number of uncompleted connections from any single IP address.

- **Range:** 1 through 250,000
- **Default:** 512

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

syn-cookie (IDS MS-DPC)

IN THIS SECTION

- Syntax | 29889
- Hierarchy Level | 29889
- Description | 29889
- Options | 29890
- Required Privilege Level | 29890
- Release Information | 29890

Syntax

```
syn-cookie {
    mss value;
    threshold rate;
}
```

Hierarchy Level

```
[edit services ids rule rule-name term term-name then]
```

Description

Enable SYN-cookie defenses against SYN attacks when using the MS-DPC. By default, SYN-cookie techniques are not applied.

When SYN cookie is enabled on Junos OS and becomes the TCP-negotiating proxy for the destination server, it replies to each incoming SYN segment with a SYN/ACK containing an encrypted cookie as its initial sequence number (ISN). The cookie is an MD5 hash of the original source address and port number, destination address and port number, and ISN from the original SYN packet. After sending the cookie, Junos OS drops the original SYN packet and deletes the calculated cookie from memory. If there is no response to the packet containing the cookie, the attack is noted as an active SYN attack and is effectively stopped.

If the initiating host responds with a TCP packet containing the cookie +1 in the TCP ACK field, Junos OS extracts the cookie, subtracts 1 from the value, and recomputes the cookie to validate that it is a legitimate ACK. If it is legitimate, Junos OS starts the TCP proxy process by setting up a session and sending a SYN to the server containing the source information from the original SYN. When Junos OS receives a SYN/ACK from the server, it sends ACKs to the server and to the initiation host. At this point the connection is established and the host and server are able to communicate directly.

Options

Attack Detection and Prevention Overview

Example: Configuring Multiple Screening Options

syn-flood

IN THIS SECTION

- Syntax | 29893
- Hierarchy Level | 29894
- Description | 29894
- Options | 29894
- Required Privilege Level | 29894
- Release Information | 29894

Syntax

```
syn-flood {
    alarm-threshold number;
    attack-threshold number;
    destination-threshold number;
    source-threshold number;
    timeout seconds;
    white-list name {
        destination-address destination-address;
        source-address source-address;
    }
}
```

Hierarchy Level

```
[edit security screen ids-option          screen-name        tcp]
```

Description

Configure detection and prevention of SYN flood attacks. Such attacks occur when the connecting host continuously sends TCP SYN requests without replying to the corresponding ACK responses.

> **NOTE**: On all SRX Series Firewalls, the TCP synchronization flood alarm threshold value does not indicate the number of packets dropped, however the value does show the packet information after the alarm threshold has been reached.
>
> The synchronization cookie or proxy never drops packets; therefore the `alarm-without-drop` (not `drop`) action is shown in the system log.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

```
syn-flood-protection-mode (syn-cookie | syn-proxy);
```

Hierarchy Level

```
[edit security flow]
```

Description

Enable SYN cookie or SYN proxy defenses against SYN attacks. SYN flood protection mode is enabled globally on the device and is activated when the configured `syn-flood attack-threshold value` is exceeded.

Options

- `syn-cookie`—Uses a cryptographic hash to generate a unique Initial Sequence Number (ISN). This is enabled by default.
- `syn-proxy`—Uses a proxy to handle the SYN attack.

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5; support.

syn-frag (IDS Screen Next Gen Services)

IN THIS SECTION

- Syntax | 29896
- Hierarchy Level | 29896
- Description | 29896
- Required Privilege Level | 29896
- Release Information | 29896

Syntax

```
syn-frag;
```

Hierarchy Level

```
[edit services screen ids-option screen-name tcp]
```

Description

Identify and drop SYN packet fragments. In TCP SYN fragment attacks, the target caches SYN fragments, waiting for the remaining fragments to arrive so it can reassemble them and complete the connection. A flood of SYN fragments eventually fills the host's memory buffer, preventing valid traffic connections.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

- Description | 29897
- Required Privilege Level | 29897
- Release Information | 29898

Syntax

```
syn-frag;
```

Hierarchy Level

```
[edit security screen ids-option screen-name tcp]
```

Description

Enable detection of a SYN fragment attack and drops any packet fragments used for the attack. A SYN fragment attack floods the target host with SYN packet fragments. The host caches these fragments, waiting for the remaining fragments to arrive so it can reassemble them. The flood of connections that cannot be completed eventually fills the host's memory buffer. No further connections are possible, and damage to the host's operating system can occur.

```

```
[edit protocols mpls label-switched-path lsp-name auto-bandwidth],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

Description

When you have a primary and a secondary path configuration, specify that a path needs to be signaled with the active-path bandwidth when the auto-bandwidth adjustment happens and that the secondary path synchronizes the bandwidth reservations to that of the primary path.

When a primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. If you include the `sync-active-path-bandwidth` statement, the secondary path releases the bandwidth it has reserved and adjusts its bandwidth after the primary path begins carrying traffic.

For example, suppose the active path is a secondary path with a reserved bandwidth of 10 GB as a result of the automatic bandwidth adjustment. Then suppose there is a switchover from the secondary path to the primary path. After some time the primary path reserves 5 GB as a result of a new automatic adjustment. Without the `sync-active-path-bandwidth` statement, the secondary path does not release the 10 GB after a switchover occurs. That bandwidth is wasted. If the `sync-active-path-bandwidth` is included in the configuration, the secondary path adjusts its bandwidth to 5 GB along with the primary path.

Default

When you have a primary and a secondary path configuration, and the primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. When the primary path comes back and the traffic switches over, the secondary path does not release its bandwidth reservations.

[edit dynamic-profiles name interfaces name aggregated-ether-options lacp],
[edit dynamic-profiles name logical-systems name interfaces name aggregated-ether-options lacp]
```

Description

For redundant Ethernet interface link aggregation group links, you can configure the minimum number of physical child links on the primary node in the redundant Ethernet interface that must be working. If the minimum number of operating child links falls below the configured value, the interface is marked down even if some of the child interfaces are working. LACP marks these operating child interfaces or links that are working, as out of synchronization. This enables a peer switch, that does not have the minimum link configuration, to mark its interface as down as well. The peer switch can be a Juniper Switch or any other third party switch. As a result, the interface is marked as down on both the switches until the number of operating child links is more than the configured value.

For an aggregated ethernet interface, you cannot configure all three configuration options, `bfd-liveness-detection`, `minimum-links`, and `sync-reset` at the same time.

Default

(ACX Series routers) Disabled.

(MX Series routers) Disabled.

(PTX Series routers) Disabled.

(QFX Series switches) Disabled.

(EX Series switches) Disabled.

Options

disable	Disable synchronization reset.
enable	Enable synchronization reset.

Description

(M320, M40e, M120, T320, T640, and T1600 routers and PTX Series Packet Transport Routers only) Configure an external synchronization interface to synchronize the internal Stratum 3 clock to an external source, and then synchronize the chassis interface clock to that source.

Options

`primary`—First external timing source specified in the configuration hierarchy. This statement has the following suboptions:

- `external-a`—Use `external-a` as the timeTransmitter clock synchronization source.
- `external-b`—Use `external-b` as the timeTransmitter clock synchronization source.
- `fpc-`*`slot-number`*—Use `fpc-`*`slot-number`* as the timeTransmitter clock synchronization source. For the PTX5000 Packet Transport Router, replace *slot-number* with a value from `0` through `7`.
- `gps-0-10mhz`—Use `gps-0-10mhz` as the timeTransmitter clock synchronization source.
- `gps-0-5mhz`—Use `gps-0-5mhz` as the timeTransmitter clock synchronization source.
- `gps-1-10mhz`—Use `gps-1-10mhz` as the timeTransmitter clock synchronization source.
- `gps-1-5mhz`—Use `gps-1-5mhz` as the timeTransmitter clock synchronization source.
- `bits-a`—Use `bits-a` as the timeTransmitter clock synchronization source.
- `bits-b`—Use `bits-b` as the timeTransmitter clock synchronization source.

`secondary`—Second external timing source specified in the configuration hierarchy.

- `external-a`—Use `external-a` as the secondary clock synchronization source.
- `external-b`—Use `external-b` as the secondary clock synchronization source.
- `fpc-`*`slot-number`*—Use `fpc-`*`slot-number`* as the secondary clock synchronization source. For the PTX5000 Packet Transport Router, replace *slot-number* with a value from `0` to `7`.
- `gps-0-10mhz`—Use`gps-0-10mhz` as the secondary clock synchronization source.
- `gps-0-5mhz`—Use `gps-0-5mhz` as the secondary clock synchronization source.
- `gps-1-10mhz`—Use `gps-1-10mhz` as the secondary clock synchronization source.
- `gps-1-5mhz`—Use `gps-1-5mhz` as the secondary clock synchronization source.
- `bits-a`—Use `bits-a` as the secondary clock synchronization source.

- `bits-b`—Use `bits-b` as the secondary clock synchronization source.

`signal-type`—Specify the line encoding mode for interfaces: either `t1` or `e1`. For the M40e router, only the `t1 signal-type` mode is supported.

- **Default:** `t1`

`switching-mode`—Specify `revertive` if a lower-priority synchronization can be switched to a valid, higher-priority synchronization.

- **Default:** `non-revertive`

`transmitter-enable`—(M320 routers only) Control whether the diagnostic timing signal is transmitted.

`validation-interval`—Validate the synchronized deviation. If revertive switching is enabled and a higher-priority clock is validated, the clock module is directed to the higher-priority clock, and all configured and active synchronizations are validated. The validation timer resumes after the current validation interval expires. This feature is not supported on PTX Series Packet Transport Routers.

- **Range:** (M320, M40e, T320, T640, T1600 routers) 90 through 86,400 seconds.

  (M120 routers) 30 through 86,400 seconds.

- **Default:** (M320, M40e, T320, T640, T1600 routers) 90 seconds. (M120 routers) 30 seconds

`y-cable-line-termination`—(M320 routers only) Specify that a single signal be wired to both Control Boards (CBs) using a Y-cable.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Description

(MX5-T, MX10-T, MX40-T, MX80-T, MX240, MX480, MX960 , and MX10003 routers) Configure Synchronous Ethernet parameters. For configuration details, see *Configuring Clock Synchronization Interface on MX Series Routers*.

(MX240, MX480, MX960, and MX2020 routers with SCBE or SCBE2) Configure centralized clocking parameters.

- Starting in Junos 12.2, configure distribution of the selected chassis clock source to downstream network elements through supported line interfaces.
- Starting in Junos 12.3, configure an external building-integrated timing supply (BITS) timing source. You can also configure the selected chassis clock, or an incoming Synchronous Ethernet or PTP line source for transmission out the external interface.
- Starting in Junos 16.1 for the MX104 routers, SSM is supported on the BITS interface and can be configured at the `[edit chassis synchronization interfaces bits e1-options]` hierarchy level.

For configuration details, see *Example: Configuring Centralized Clocking on the Enhanced MX Switch Control Board*.

NOTE:

- Unified ISSU is not supported when clock synchronization is configured for Synchronous Ethernet.
- The commit operation fails if you configure bits as source, without first configuring bits interface.

Options

`clock-mode (auto-select | free-run)`—Specify the mode of operation to select the clock source either from a free-run local oscillator or from an external qualified clock. On MX240, MX480, and MX960 routers with enhanced MPCs, the free-run clock is provided by a local oscillator. On other MX Series routers, the free-run clock is provided by the SCB. The default setting is auto-select mode.

`hold-interval (configuration-change | restart | switchover)` *seconds*—Specify the chassis synchronization hold interval type and clock selection wait time:

- `configuration-change`—Clock select wait time after change in configuration. The range is 15 through 60 seconds.
- `restart`— Clock select wait time after reboot. The range is 60 through 180 seconds. The default is 120 seconds.
- `switchover`— Switchover wait time after clock recovery. The range is 30 to 60 seconds. The default is 30 seconds.

`interfaces (external | (external-0/0 | external-1/0))`—Configure the external interface for operating with a connected external device. This interface can be configured as a clock source, which then becomes a candidate for selection as the chassis clock source by the clock source selection algorithm.

- `signal-type (1mhz | 5mhz | 10mhz | 2048khz | e1 | t1)`—Specify the external interface signal type:
  1. `1mhz`—Set the signal with a clock frequency of 1 MHz.
  2. `5mhz`—Set the signal with a clock frequency of 5 MHz.
  3. `10mhz`—Set the signal with a clock frequency of 10 MHz.
  4. `2048khz`—Set the signal with a clock frequency of 2048 kHz.
  5. `e1`—Set the signal as an E1-coded 2048 kHz signal on a 120-ohm balanced line.
  6. `t1`—Set the signal as a T1-coded 1.544 MHz signal on a 100-ohm balanced line.
- `e1-options`—Specify the E1 options:
  1. `framing (g704 | g704-no-crc4)`—Specify the framing format:
     - `g704`—G.704 framing format for E1 interfaces
     - `g704-no-crc4`—G.704 framing with no CRC4 for E1 interfaces
  2. `line-encoding (ami | hdb3)`—Specify the line encoding:
     - `ami`— Alternate mark inversion (AMI)
     - `hdb3`—High-d Density bipolar 3 code (HDB3)
  3. `sabit` *number*—Specify the San synchronization status bit used for exchanging SSN quality. The value can be 4, 5, 6, 7, or 8. The default is 4.
- `t1-options`—Specify the T1 options:
  1. `framing (esf | sf)`—Specify the framing format:
     - `esf`—Extended superframe (ESF)

- `sf`—Superframe (SF)

2. `line-encoding (ami | b8zs)`—Specify the line encoding:
   - `ami`— Alternate mark inversion (AMI)
   - `b8zs`—8-bit zero suppression, bipolar with 8-zero substitution (B8ZS)

`network-option (option-1 | option-2)`—Specify the synchronization networking:

- `option-1`— EEC-1 maps to G.813 option 1 clock
- `option-2`—EEC-2 maps to G.812 type IV clock

`quality-mode-enable`—Specify the clock selection, quality level, and priority setting. The quality level parameter for a Synchronous Ethernet interface is optional when quality mode is enabled and the selection mode is set to `received-quality`. The default quality level for a Synchronous Ethernet interface is based on the value of `network-option`: `option-1` selects `SEC` and `option-2` selects `ST3`. Table 1897 on page 29914 shows whether SSM quality level is supported for a given external interface signal type and framing. The default setting is disabled.

Table 1897: SSM-Quality Level Support by Signal Type and Framing

Signal Type	Framing	SSM Quality Level Supported
E1	G.704	yes
E1	G.704 no CRC4	no
T1	ESF	yes
T1	SF	no
2048 KHz	Not applicable	no

`selection-mode (configured-quality | received-quality)`—Specify whether the clock source selection should use the configured or received ESMC or SSM quality level for a qualifying interface. In both selection modes, the interface qualifies for clock source selection only when the received ESMC or SSM quality level on the interface is equal to or greater than the configured ESMC or SSM quality level for the interface.

> **NOTE**: For the `selection-mode` statement configuration to take effect, you must set the `quality-mode-enable` statement at the `[edit chassis synchronization]` hierarchy level.

1. `configured-quality`—The clock source selection algorithm uses the ESMC or SSM quality level configured for a qualifying interface.
2. `received-quality`—The clock source selection algorithm uses the ESMC or SSM quality level received on the qualifying interface.

`source (external-a | external-b | interfaces (`*`interface-name`*`) | external | (external-0/0 | external-1/0))`—Specify clock sources.

(SCB only) The timeTransmitter clock source is external-a interface, the secondary clock source is external-b interface. The clock source is chosen using the clock selection process.

(SCBE only) Specify the external interface to select the external clock source.

(SCBE2 only) Specify the external-0/0 interface or external-1/0 interface to select the external clock source.

- `priority` *`number`*—Specify a priority level from 1 to 5. When not specified, `external-a` has higher default priority than external-b interface , and external-b interface has higher default priority than other Gigabit Ethernet or 10-Gigabit Ethernet clock sources, which have the lowest default priority. Any priority you configure is higher than any default priority.
- `quality-level (prc | prs |sec | smc | ssu-a | ssu-b | st2 | st3 | st3e | st4 | stu | tnc)`—Specify the `quality-level` option based on the configured `network-option`. For quality level details, see "quality-level" on page 14461.

> **NOTE**: Starting with Junos OS Release 12.2R1, the `quality-level` parameter for a Synchronous Ethernet interface is optional when quality mode is enabled and the selection mode is set to received quality. The default quality level for a Synchronous Ethernet interface is `SEC` for the `option-1` network type and `ST3` for the `option-2` network type.
>
> Both option I and option II SSM quality levels are supported:
>
> - For option-1, quality level must be configured for external clocks (`external-a` or `external-b`) whether or not quality level is enabled.
> - For option-2, the default quality level for external clocks is QL_STU whether or not quality level is enabled.

- Quality level is set to DNU for network-option 1 and set to DUS for network-option 2, if quality-level is not configured and no ESMC messages are received.
- On the selected active source (primary or secondary, whichever is active), even if ESMC transmit is not enabled, a DNU ESMC will be sent out if `network-option` is 1, and DUS ESMC will be sent out if `network-option` is 2. This is applicable only for sources of Ethernet interface type to avoid source looping.

- `request force-switch`—Force a switch to this source if the source is enabled and not locked out. You can configure only one source to be force-switched.
- `request lockout`—You can configure lockout for any source. When configured, this source is not considered by the clock selection process.

The remaining statements are explained separately. See CLI Explorer.

synchronize (Scripts)

IN THIS SECTION

- Syntax | 29919
- Hierarchy Level | 29919
- Description | 29919
- Required Privilege Level | 29920
- Release Information | 29920

Syntax

```
synchronize;
```

Hierarchy Level

```
[edit system scripts]
```

Description

Synchronize all commit, event, lib, op, and SNMP scripts from the requesting Routing Engine to the responding Routing Engine when executing a `commit synchronize` operation. The device synchronizes all scripts regardless of whether they are enabled in the configuration or have been updated since the last synchronization.

If the `load-scripts-from-flash` statement is present in the requesting Routing Engine configuration, the device synchronizes the scripts that are in flash memory. Otherwise, the device synchronizes the scripts that are on the hard disk. If the `load-scripts-from-flash` statement is present in the final configuration for the responding Routing Engine, the device synchronizes the scripts to flash memory. Otherwise, the device synchronizes the scripts to the hard disk.

When you issue the `commit synchronize` command, the device:

1. Performs a commit check on the requesting Routing Engine
2. Synchronizes the scripts to the other Routing Engine

3. Synchronizes the configuration to the other Routing Engine
4. Performs a commit check on the other Routing Engine
5. Commits the configuration on the other Routing Engine
6. Commits the configuration on the requesting Routing Engine

If the commit check operation fails for the requesting Routing Engine, the process stops, and the device does not copy the scripts to the responding Routing Engine. If the commit check or commit operation fails for the responding Routing Engine, the device still synchronizes the scripts.

> **NOTE**: Configuring the `synchronize` statement causes the device to synchronize all scripts even if they have not been updated since the last synchronization. If the device has a large number of scripts that are infrequently updated, it might be more suitable to synchronize scripts either manually using the `request system scripts synchronize` operational mode command or on a per-commit basis using the `commit synchronize scripts` command.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

RELATED DOCUMENTATION

Synchronize Scripts Between Routing Engines

commit | **4679**

request system scripts synchronize | **15751**

synchronize

IN THIS SECTION

- Syntax | **29921**

- Hierarchy Level | 29921
- Description | 29921
- Options | 29922
- Required Privilege Level | 29923
- Release Information | 29923

Syntax

```
synchronize;
```

Hierarchy Level

```
[edit system commit]
```

Description

For devices with multiple Routing Engines only. Configure the `commit` command to automatically perform a `commit synchronize` action between dual Routing Engines within the same chassis. The Routing Engine on which you execute the `commit` command (the requesting Routing Engine) copies and loads its candidate configuration to the other (the responding) Routing Engine. Each Routing Engine then performs a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines.

NOTE: If you configure the `commit synchronize` statement at the `[edit system]` hierarchy level and issue a `commit` in the primary Routing Engine, the primary configuration is automatically synchronized with the backup. However, if the backup Routing Engine is down when you issue the `commit`, the Junos OS displays a warning and commits the candidate configuration in the primary Routing Engine. When the backup Routing Engine comes up, its configuration will automatically be synchronized with the primary. A newly inserted backup Routing Engine automatically synchronizes its configuration with the primary Routing Engine configuration.

> **NOTE**: When you configure nonstop active routing (NSR), you must configure the `commit synchronize` statement. Otherwise, the commit operation fails.

> **NOTE**: Starting in Junos OS Release 20.2R1, when the `commit synchronize` statement is configured and the backup Routing Engine synchronizes its configuration with the primary Routing Engine, for example, when it is newly inserted, brought back online, or during a change in primary role, it also synchronizes the ephemeral configuration database.

On the TX Matrix router, synchronization only occurs between the Routing Engines within the same chassis. When synchronization is complete, the new configuration is then distributed to the Routing Engines on the T640 routers. That is, the primary Routing Engine on the TX Matrix router distributes the configuration to the primary Routing Engine on each T640 router. Likewise, the backup Routing Engine on the TX Matrix router distributes the configuration to the backup Routing Engine on each T640 router.

On the TX Matrix Plus router, synchronization only occurs between the Routing Engines within the switch-fabric chassis and when synchronization is complete, the new configuration is then distributed to the Routing Engines on the line-card chassis (LCC). That is, the primary Routing Engine on the TX Matrix Plus router distributes the configuration to the primary Routing Engine on each LCC. Likewise, the backup Routing Engine on the TX Matrix Plus router distributes the configuration to the backup Routing Engine on each LCC.

In EX Series Virtual Chassis configurations:

- On EX4200 switches in Virtual Chassis, synchronization occurs between the switch in the primary role and the switch in the backup role.
- On EX8200 switches in a Virtual Chassis, synchronization occurs only between the primary and backup XRE200 External Routing Engines.

Options

and-quit (Optional) Quit configuration mode if the commit synchronization succeeds.

at (Optional) Time at which to activate configuration changes.

comment (Optional) Write a message to the commit log.

force (Optional) Force a commit synchronization on the other Routing Engine (ignore warnings).

scripts (Optional) Push scripts to the other Routing Engine.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

- Options | 29926
- Required Privilege Level | 29926
- Release Information | 29926

Syntax

```
syntonized-e2e-transparent;
```

Hierarchy Level

```
[edit protocols ptp]
```

Description

Configure the syntonized-end-to-end (E2E) transparent clock for Precision Time Protocol (PTP). In syntonized transparent clock, the transparent clock requires physical layer frequency based on the ITU-T G.8262/.1 standard. To set syntonized transparent clock, you can enable Synchronous Ethernet configuration with Ethernet Synchronization Message Channel (ESMC) along with PTP transparent clock configuration. Syntonization supports frequency synchronization but does not support phase or time synchronization.

The transparent clock measures the residence time of PTP packets as the packets pass through the router. Transparent clock adds the residence time into the correction field of the PTP packet. The timeReceiver or boundary clocks determine this resident time while they receive the PTP packet from the upstream transparent clock router. The timeReceiver clock estimates and removes these delays from the offset computation and reduce the packet's jitter effects.

Transparent clock functionality is supported on PTP over Ethernet, IPv4, IPv6, unicast, and multicast. Transparent clock functionality is enabled globally and might be required in scenarios in which the interface and the packets are received and transmitted is unknown.

ACX5048 and ACX5096 routers do not support PTP over IPv6 for transparent clocks.

Options

There are no options.

provider]
```

Description

Enable PIC system logging to record or view system log messages on a specific PIC. The system log information is passed to the kernel for logging in the **/var/log** directory.

Options

facility—Group of messages that are either generated by the same software process or concern a similar condition or activity. Possible values include the following: `daemon`, `external`, `kernel`, and `pfe`.

severity—Classification of effect on functioning. Possible values are the following options:

- `any`—Include all severity levels.
- `none`—Disable logging of the associated facility to a destination.
- `emergency`—System panic or other condition that causes the routing platform to stop functioning.
- `alert`—Conditions that require immediate correction, such as a corrupted system database.
- `critical`—Critical conditions, such as hard errors.
- `error`—Error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.
- `warning`—Conditions that warrant monitoring.
- `notice`—Conditions that are not errors but might warrant special handling.

- `info`—Events or nonerror conditions of interest.

The remaining statement is explained separately. See CLI Explorer.

            urlf-logs;
            log-tag;
        }
        facility-override facility-name;
        interface-service prefix-value;
        log-prefix prefix-value;
        port port-number;
        services severity-level;
        source-address source-address;
    }
}
```

Hierarchy Level

```
[edit services service-set service-set-name]
```

Description

Configure generation of system log messages for the service set. The system log information is passed to the kernel for logging in the **/var/log** directory. These settings override the values defined at the `[edit interfaces interface-name services-options]` hierarchy level; for more information on configuring those values, see *Configuring System Logging for Services Interfaces*.

> **NOTE**: Starting with Junos OS release 14.1X55, 14.2R5, 15.1R3, and 16.1R1, for multiservices (ms-) interfaces, you cannot configure system logging for PCP and ALGs by including the pcp-logs and alg-logs statements at the [edit services service-set service-set-name syslog host hostname class] hierarchy level. An error message is displayed if you attempt to commit a configuration that contains the pcp-logs and alg-logs options to define system logging for PCP and ALGs for ms- interfaces.

Options

`stream stream-name`—Assigns a stream name to a data stream. Stream is assigned to a host:

- `host hostname`—Assigns name to a host system.
- `log-tag`—Tag included in logs to this host.The remaining statements are described separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

syslog (Services Stateful Firewall)

IN THIS SECTION

Syntax | 29944

- Hierarchy Level | 29944

}
```

Hierarchy Level

```
[edit system]
```

Description

Configure the system log messages types to send to different destinations such as files, remote destinations, user terminals, or the system console.

The remaining statements are explained separately.

Options

archive	Define parameters for archiving log messages.
allow-duplicates	Allow the repeated log messages for all targets.
alternate-format	Configure to append node name with daemon name.
console	Send log messages of a specified class and severity to the console.
file	Send log messages to a named file.
host	Remote location to be notified of specific log messages.
log-rotate-frequency	Configure the interval for checking logfile size and archiving messages.
server	Enable a syslog server for compute nodes and VMs in an App Engine.
shell	Configure to log command executed from the shell.
source-address	Include a specified address as the source address for log messages.
time-format	Additional information to include in the system log time stamp.

- millisecond — Include milliseconds in time stamp.
- year — Include year in time stamp.

user Notify a specific user of the log event.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Option `alternate-format` introduced in Junos OS Evolved Release 20.4R2.

Option `shell` introduced in Junos OS Evolved Release 23.1R1.

`application-status` option introduced in Junos OS Evolved Release 23.1R1.

system (Analytics Resource)

IN THIS SECTION

- Syntax | **29953**
- Hierarchy Level | **29953**
- Description | **29953**
- Options | **29953**
- Required Privilege Level | **29954**
- Release Information | **29954**

Syntax

```
system {
    polling-interval {
        queue-monitoring interval;
        traffic-monitoring interval;
    }
    resource-profile profile-name;
}
```

Hierarchy Level

```
[edit services analytics resource]
```

Description

Apply a network analytics resource profile to a system for which you wish to enable queue or traffic monitoring. The resource profile is a template that specifies the parameters for queue and traffic monitoring, as well as for the depth and latency thresholds.

NOTE: The `system` statement in the `[edit services analytics resource]` hierarchy is not available in Junos OS Releases prior to 13.2X51-D15.

Options

polling-interval Configure the polling interval for queue and traffic monitoring:

- **queue-monitoring *polling-interval*** Configure the queue monitoring interval in milliseconds.

  - **Range:** 1 to 1000 milliseconds (1 millisecond to 1 second) on devices other than EX4300 switches.

    8 to 1000 milliseconds (8 milliseconds to 1 second) on EX4300 switches.

- **traffic-monitoring *polling-interval*** Configure the traffic monitoring interval in seconds.

- **Range:** 1 to 300 seconds (1 second to 5 minutes) on devices other than EX4300 switches.

  5 to 300 seconds (5 seconds to 5 minutes) on EX 4300 switches.

resource-profile *profile-name*

Name of a resource profile containing the global analytics parameters that have been configured for the system. Information contained in a resource profile includes the configuration of queue and traffic monitoring (whether enabled or disabled), and values for the depth and latency thresholds (if applicable).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

- Release Information | 29957

Syntax

```
system {
    frequency (minutes | hours | days) value;
    minor-event {
        threshold swap-usage value ;
        action snmp-trap;
    }
    major-event {
        threshold swap-usage value ;
        action [snmp-trap | live-vmcore];
    }
    critical-event {
```

```
        threshold swap-usage value ;
        action [snmp-trap | live-vmcore | (RE-restart | RE-switchover)];
    }
}
```

Hierarchy Level

```
[edit system monitor memory]
```

Description

Configure system level memory monitoring.

Options

frequency Specify the frequency of system level memory monitoring. You can specify the frequency in days, hours or minutes. Possible values: 1 through 65535.

minor-event Indicates a non-critical event that, if left unchecked, may cause an interruption in service or degradation in performance but does not significantly affect the device.

major-event Indicates an event that, if left unchecked, may result in significant loss of service or interruption of traffic.

critical-event Indicates an event that, if left unchecked, may result in serious loss of service or interruption of traffic. In case a critical event is triggered, you can either restart the Routing Engine or configure the primary Routing Engine to switchover gracefully to a backup Routing Engine without interruption in packet forwarding.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.1.

Syntax

```
system login {
    user username ;
    class class-name;
    idle-timeout idle-timeout;
}
```

Hierarchy Level

```
[edit ]
```

Description

Create a non-root user in JDM for Junos node slicing. The non-root user accounts function only inside JDM, not on the host server.

Options

user *username* Username of the account.

class *class-name* Predefined login classes that JDM supports for non-root users.

- super-user
- operator
- read-only
- unauthorized

idle-timeout Maximum idle time before logout. We recommend that you set an idle time-out. Otherwise, if a user forgets to log out of a VNF console session, another user can log in to it without providing the access credentials.

- **Range:** 1 through 60 minutes

Setting Up Junos Node Slicing

system-defaults

IN THIS SECTION

Syntax | 29960

- Hierarchy Level | 29960
- Description | 29960
- Options | 29961
- Required Privilege Level | 29961
- Release Information | 29961

Syntax

```
system-defaults {
    classifiers exp {
        classifier-name;
    }
    traffic-control-profiles {
        interface-set-input profile-name;
        interface-set-output profile-name;
    }
}
```

Hierarchy Level

```
[edit class-of-service],
[edit dynamic-profiles name class-of-service]
```

Description

Define system defaults for CoS parameters. You can define a global system default EXP classifier, a global default input traffic control profile (TCP), and/or a global default output TCP.

If you configure a global system default EXP classifier, then all interfaces use that EXP classifier to classify MPLS traffic.

On devices that have a default EXP classifier, if you do not configure a global system default classifier, interfaces configured as `family mpls` use the default EXP classifier.

On devices that do not have a default EXP classifier, if you do not configure a global system default EXP classifier, then if a fixed classifier is applied to the interface, the MPLS traffic uses the fixed classifier. If

no EXP classifier and no fixed classifier are applied to the interface, MPLS traffic is treated as best-effort traffic using the IEEE 802.1 default untrusted classifier. DSCP classifiers are not applied to MPLS traffic. Because the EXP classifier is global, you cannot configure some ports to use a fixed IEEE 802.1p classifier for MPLS traffic on some interfaces and the global EXP classifier for MPLS traffic on other interfaces. When you configure a global EXP classifier, all MPLS traffic on all interfaces uses the EXP classifier.

Options

`classifier-name`—Name of the behavior aggregate (BA) `exp` classifier or *default* for the default `exp` classifier.

`profile-name`—For `interface-set-input`, the default input TCP for dynamic interface-sets. For `interface-set-output`, the default output TCP for dynamic interface-sets.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

- Release Information | 29962

Syntax

```
system-id system-id;
```

Hierarchy Level

```
[edit interfaces aeX aggregated-ether-options lacp]
```

Description

Define the LACP system identifier at the aggregated Ethernet interface level.

The user-defined system identifier in LACP enables two ports from two separate routers (M Series or MX Series routers) to act as though they were part of the same aggregate group.

The system identifier is a 48-bit (6-byte) globally unique field. It is used in combination with a 16-bit system-priority value, which results in a unique LACP system identifier.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2R1

system-id (Junos Fusion Satellite Device Cluster)

IN THIS SECTION

- Syntax | 29963
- Hierarchy Level | 29963
- Description | 29963
- Default | 29964
- Options | 29964
- Required Privilege Level | 29964
- Release Information | 29964

Syntax

```
system-id mac-address;
```

Hierarchy Level

```
[edit chassis satellite-management cluster cluster-name fpc slot-id ]
```

Description

Assign the specified FPC identifier to the satellite device in the satellite device cluster based on the satellite device's MAC address.

For instance, if you wanted the satellite device using MAC address **01:02:03:AA:BB:CC** in the satellite device cluster named `building-1` to be assigned FPC identifier 101, enter the **set chassis satellite-management cluster building-1 fpc 101 system-id 01:02:03:AA:BB:CC** statement.

If the MAC address that is configured using this statement does not match the MAC address of the satellite device, the device is not converted into a satellite device.

Default

No FPC slot ID numbers are associated with satellite devices, by default.

Options

mac-address Specifies the MAC address of the satellite device.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

system-id (Junos Fusion)

IN THIS SECTION

- Syntax | 29965
- Hierarchy Level | 29965
- Description | 29965
- Default | 29965
- Options | 29966
- Required Privilege Level | 29966
- Release Information | 29966

Syntax

```
system-id mac-address;
```

Hierarchy Level

```
[edit chassis satellite-management fpc slot-id]
```

Description

Assign the specified FPC identifier to the satellite device based on the satellite device's MAC address.

For instance, if you wanted the satellite device using MAC address **01:02:03:AA:BB:CC** to be assigned FPC identifier 101, enter the **set chassis satellite-management fpc 101 system-id 01:02:03:AA:BB:CC** statement.

A Junos Fusion provides two methods of assigning an FPC identifier: Unique ID-based FPC identification and connectivity-based FPC identification. Unique ID-based FPC identification maps an FPC slot ID to a satellite device's MAC address or serial number, while connectivity-based FPC identification maps an FPC slot ID to a cascade port. This statement is used to assign an FPC ID using unique ID-based FPC identification by mapping the FPC slot ID to the satellite device's MAC address.

In a Junos Fusion, each satellite device must be mapped to an FPC identifier (FPC ID). The FPC ID is used for Junos Fusion configuration, monitoring, and maintenance. Interface names—which are identified using the *type-fpc* / *pic* / *port* format—use the FPC ID as the *fpc* variable when the satellite device is participating in a Junos Fusion. For instance, built-in port 2—a gigabit Ethernet interface on a satellite device that is using 101 as its FPC ID— uses ge-101/0/2 as its interface name.

For additional information on the role of FPC slot IDs in a Junos Fusion, see *Understanding Junos Fusion Provider Edge Components* or Understanding Junos Fusion Enterprise Components.

If the serial number that is configured using this statement does not match the serial number of the satellite device, the device is not converted into a satellite device.

If the MAC address that is configured using this statement does not match the MAC address of the satellite device, the device is not converted into a satellite device.

Default

No FPC slot IDs are associated with satellite devices, by default.

Options

mac-address Specifies the MAC address of the satellite device.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

system-priority (chassis)

IN THIS SECTION

- Syntax | 29968
- Hierarchy Level | 29968
- Description | 29969
- Options | 29969
- Required Privilege Level | 29969
- Release Information | 29969

Syntax

```
system-priority priority;
```

Hierarchy Level

```
[edit chassis aggregated-devices ethernet lacp]
```

Description

Define LACP system priority for aggregated Ethernet interfaces at the global (chassis) level.

The device with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 127), the device MAC address determines which switch is in control.

Options

priority—Priority for the aggregated Ethernet system. A smaller value indicates a higher priority.

- **Range:** 0 through 65535
- **Default:** 127

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Syntax

```
system-priority priority;
```

Hierarchy Level

```
[edit interfaces aeX aggregated-ether-options lacp]
```

Description

Define LACP system priority at the aggregated Ethernet interface level. This system priority value takes precedence over a system priority value configured at the global `[edit chassis]` hierarchy level.

The device with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 127), the device MAC address determines which switch is in control.

Options

priority—Priority for the aggregated Ethernet system. A smaller value indicates a higher priority.

- **Range:** 0 through 65535

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

system-services (Security Zones Host Inbound Traffic)

IN THIS SECTION

- Syntax | 29971
- Hierarchy Level | 29972
- Description | 29972
- Options | 29972
- Required Privilege Level | 29974
- Release Information | 29974

Syntax

```
system-services {
    (service-name | all <service-name except>);
}
```

Hierarchy Level

```
[edit security zones security-zone zone-name host-inbound-traffic]
```

Description

Specify the types of incoming system service traffic that can reach the device for all interfaces in a security zone. By default, a security zone has all system services disabled. You can allow the inbound system services traffic in one of the following ways:

- Allow system services individually.
- Allow all system services.
- Allow all system services with the exception of the specified services.

Options

***service-name*—** Name of system service traffic that can reach the device.

- `all`—Traffic from the defined system services available on the Routing Engine (RE). Use the *except* option to disallow specific system services. Enabling all the system services does not override any interface-specific configuration under a particular zone.
- `any-service`—All system services on an entire port range including the system services that are not defined.
- `bootp`—Traffic destined to BOOTP and DHCP relay agents
- `dhcp`—DHCP requests
- `dhcpv6`—DHCP requests for IPv6
- `dns`—DNS services
- `finger`—Finger traffic
- `ftp`—FTP traffic
- `http`—J-Web or clear-text Web authentication traffic
- `https`—J-Web or Web authentication traffic over Secure Sockets Layer (SSL)
- `ident-reset`—Access that has been blocked by an unacknowledged identification request

- `ike`—Internet Key Exchange (IKE) traffic
- `lsping`—Label-switched path (LSP) ping service
- `netconf`—NETCONF service
- `ntp`—Network Time Protocol (NTP) traffic
- `ping`—ICMP echo request responses
- `r2cp`—Radio-to-Router Control Protocol traffic
- `reverse-ssh`—Reverse SSH traffic
- `reverse-telnet`—Reverse Telnet traffic
- `rlogin`—Incoming `rlogin` (remote login) traffic
- `rpm`—Real-time performance monitoring (RPM) traffic
- `rsh`—Remote shell (`rsh`) traffic
- `snmp`—SNMP traffic (UDP port 161)
- `snmp-trap`—SNMP traps (UDP port 162)
- `ssh`—SSH traffic
- `telnet`—Telnet traffic
- `tftp`—TFTP services
- `traceroute`—Traceroute traffic (UDP port 33434)
- `xnm-clear-text`—Junos XML protocol traffic for all specified interfaces
- `xnm-ssl`— Junos XML protocol-over-SSL traffic for all specified interfaces

***service-name* except—** (Optional) Allow all inbound service traffic, except the specified service traffic types, to reach the device. In the following example, the configuration allows all system service traffic, with the exception of FTP and HTTP, to reach the device:

```
[edit]
user@host# set security zones security-zone trust host-inbound-traffic system-
services all
user@host# set security zones security-zone trust host-inbound-traffic system-
services ftp except
```

```
user@host# set security zones security-zone trust host-inbound-traffic system-
services http except
```

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Supported System Services for Host Inbound Traffic

system-services (Security Zones Interfaces)

IN THIS SECTION

- Syntax | 29975
- Hierarchy Level | 29975
- Description | 29975
- Options | 29975
- Required Privilege Level | 29976
- Release Information | 29976

Syntax

```
system-services service-name {
               except;
}
```

Hierarchy Level

```
[edit security zones security-zone zone-name interfaces interface-name host-inbound-traffic]
```

Description

Specify the types of traffic that can reach the device on a particular interface.

Options

- *service-name* —Service for which traffic is allowed. The following services are supported:
  - `all`—Enable all possible system services available on the Routing Engine (RE).
  - `any-service`—Enable services on entire port range.
  - `bootp`—Enable traffic destined to BOOTP and DHCP relay agents.
  - `dhcp`—Enable incoming DHCP requests.
  - `dhcpv6`—Enable incoming DHCP requests for IPv6.
  - `dns`—Enable incoming DNS services.
  - `finger`—Enable incoming finger traffic.
  - `ftp`—Enable incoming FTP traffic.
  - `http`—Enable incoming J-Web or clear-text Web authentication traffic.
  - `https`—Enable incoming J-Web or Web authentication traffic over Secure Sockets Layer (SSL).
  - `ident-reset`—Enable the access that has been blocked by an unacknowledged identification request.
  - `ike`—Enable Internet Key Exchange traffic.

- `netconf SSH`—Enable incoming NetScreen Security Manager (NSM) traffic over SSH.
- `ntp`—Enable incoming Network Time Protocol (NTP) traffic.
- `ping`—Allow the device to respond to ICMP echo requests.
- `r2cp`—Enable incoming Radio Router Control Protocol traffic.
- `reverse-ssh`—Reverse SSH traffic.
- `reverse-telnet`—Reverse Telnet traffic.
- `rlogin`—Enable incoming `rlogin` (remote login) traffic.
- `rpm`—Enable incoming real-time performance monitoring (RPM) traffic.
- `rsh`—Enable incoming Remote Shell (`rsh`) traffic.
- `snmp`—Enable incoming SNMP traffic (UDP port 161).
- `snmp-trap`—Enable incoming SNMP traps (UDP port 162).
- `ssh`—Enable incoming SSH traffic.
- `telnet`—Enable incoming Telnet traffic.
- `tftp`—Enable TFTP services.
- `traceroute`—Enable incoming traceroute traffic (UDP port 33434).
- `xnm-clear-text`—Enable incoming Junos XML protocol traffic for all specified interfaces.
- `xnm-ssl`— Enable incoming Junos XML protocol-over-SSL traffic for all specified interfaces.

- `except`—(Optional) except can only be used if all has been defined.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

t1-interval

IN THIS SECTION

- Syntax | 29998
- Hierarchy Level | 29998
- Description | 29998
- Options | 29998
- Required Privilege Level | 29998
- Release Information | 29998

Syntax

```
t1-interval value-in-milliseconds;
```

Hierarchy Level

```
[edit logical-systems name security alg sip],
[edit logical-systems name tenants name security alg sip],
[edit security alg sip],
[edit services alg sip],
[edit tenants name security alg sip]
```

Description

Configure t1-interval parameter to specify the maximum round-trip time (RTT) (in milliseconds) allowed for Session Initiation Protocol (SIP) transactions.

Options

value-in-milliseconds—Maximum round-trip time (RTT) allowed measured in milliseconds.

- **Range:** 500 through 5000 milliseconds
- **Default:** 500 milliseconds

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

RELATED DOCUMENTATION

t1-options (BITS Interfaces Signal Type)

IN THIS SECTION

- Syntax | 29999
- Hierarchy Level | 29999
- Description | 29999
- Options | 29999
- Required Privilege Level | 30000
- Release Information | 30000

Syntax

```
t1-options {
    framing (esf | sf);
}
```

Hierarchy Level

```
[edit chassis synchronization interfaces bits]
```

Description

Specify options for the T1 signal type for the building-integrated timing supply (BITS) interface. Valid only if `t1` is the `signal-type` configured at the [`edit chassis synchronization source interfaces` *`interface-name`* `bits signal-type`] hierarchy.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

RELATED DOCUMENTATION

t1-options

IN THIS SECTION

- Syntax | 30000
- Hierarchy Level | 30001
- Description | 30001
- Options | 30001
- Required Privilege Level | 30001
- Release Information | 30001

Syntax

```
t1-options {
    framing (esf | sf);
```

```
    line-encoding (ami | b8zs);
}
```

Hierarchy Level

```
[edit chassis synchronization interfaces external],
[edit chassis synchronization interfaces (external-0/0 | external-1/0) e1-options]
```

Description

Configure the T1 interface options.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

t310

IN THIS SECTION

- Syntax | 30002
- Hierarchy Level | 30002
- Description | 30002
- Options | 30002
- Required Privilege Level | 30003
- Release Information | 30003

Syntax

```
t310-value seconds;
```

Hierarchy Level

```
[edit interfaces br-pim/0/port isdn-options]
```

Description

For ISDN interfaces, configure the Q.931-specific timer for T310, in seconds. The Q.931 protocol is involved in the setup and termination of connections.

Options

seconds—Timer value, in seconds.

- **Range:** 1 through 65,536 seconds
- **Default:** 10 seconds

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

t391

IN THIS SECTION

- Syntax | 30003
- Hierarchy Level | 30003
- Description | 30003
- Options | 30004
- Required Privilege Level | 30004
- Release Information | 30004

Syntax

```
t391 number;
```

Hierarchy Level

```
[edit interfaces ls-fpc/pic/port:channel mlfr-uni-nni-bundle-options]
```

Description

For link services interfaces only, set the Frame Relay link integrity polling interval.

Options

number—Link integrity polling interval.

- **Range:** 5 through 30 seconds
- **Default:** 10 seconds

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

t4-interval

IN THIS SECTION

- Syntax | 30006
- Hierarchy Level | 30006
- Description | 30006
- Options | 30007
- Required Privilege Level | 30007
- Release Information | 30007

Syntax

```
t4-interval value-in-seconds;
```

Hierarchy Level

```
[edit logical-systems name security alg sip],
[edit logical-systems name tenants name security alg sip],
[edit security alg sip],
[edit services alg sip],
[edit tenants name security alg sip]
```

Description

Configure t4-interval parameter to specify the maximum length of time (in seconds) that the network can take to clear messages between client and server Session Initiation Protocol (SIP) transactions.

Options

value-in-seconds—Maximum number of seconds that the network can take to clear messages between client and server transactions.

- **Range:** 5 through 10 seconds
- **Default:** 5 seconds

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

inet],
[edit policy-options condition if-route-exists],
[edit policy-options condition if-route-exists address-family ccc],
[edit policy-options condition if-route-exists address-family inet]
```

Description

Specify a routing table in which the route must exist for the condition to be met and the route to be considered a match.

Options

`table` *`table-name`*—Routing table name, such as inet.0.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

Support for configuration in the dynamic database introduced in Junos OS Release 9.5.

Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.

Support for the address families introduced in Junos OS Release 13.2.

tacplus

IN THIS SECTION

- Syntax | **30009**
- Hierarchy Level | **30010**
- Description | **30010**
- Options | **30010**
- Required Privilege Level | **30010**
- Release Information | **30010**

Syntax

```
tacplus {
    server {
        server-address {
            port port-number;
            routing-instance routing-instance;
            secret password;
            single-connection;
            source-address address;
            timeout seconds;
        }
    }
}
```

Hierarchy Level

```
[edit system accounting destination]
```

Description

Configure the Terminal Access Controller Access Control System Plus (TACACS+) servers.

Options

server-address—Address of the TACACS++ authentication server.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`routing-instance` option introduced in Junos OS Release 17.4R1.

RELATED DOCUMENTATION

Configuring TACACS+ System Accounting

tacplus-options

IN THIS SECTION

Syntax | 30011

- Hierarchy Level | 30011
- Description | 30011
- Options | 30011
- Required Privilege Level | 30013
- Release Information | 30014

Syntax

```
tacplus-options {
    (exclude-cmd-attribute | no-cmd-attribute-value);
    authorization-time-interval minutes;
    enhanced-accounting;
    (strict-authorization | no-strict-authorization);
    service-name service-name;
    timestamp-and-timezone;
}
```

Hierarchy Level

```
[edit system]
```

Description

Configure TACACS+ options for authentication and accounting.

Options

authorization-time-interval *minutes*

Configure the time interval at which the authorization profile that is configured on the TACACS+ server is fetched by the Junos OS device during a TACACS+ authentication session. The TACACS+ server sends the authorization profile once by default after the user is successfully authenticated, and the authorization profile is stored locally on the Junos OS device. The authorization-time-interval option enables the Junos OS device to periodically check the authorization profile configured remotely on the TACACS+ server at the configured time interval.

If there is a change in the remote authorization profile, the device fetches the authorization profile from the TACACS+ server and the authorization profile configured locally under the [edit system login class class-name] hierarchy. The device refreshes the authorization profile stored locally by combining the remote and locally-configured authorization profiles. This ensures that any changes made to the authorization profile configuration on the TACACS+ server are reflected on the Junos OS device without the user having to restart the authentication process.

To enable the periodic refresh of the authorization profile, you must set the authorization time interval at which the Junos OS device fetches the authorization profile configuration from the TACACS+ server and refreshes the authorization profile stored locally. The time interval can be configured directly on the TACACS+ server or locally on the Junos OS device using the CLI. Use the following guidelines to determine which time interval configuration takes precedence:

- If there is no time interval configured on the TACACS+ server for periodic refresh, the Junos OS device does not receive the time interval value in the authorization response. In this case, the value configured locally on the Junos OS device will take effect.
- If the time interval is configured on the TACACS+ server and there is no authorization time interval configured locally on the Junos OS device, the value configured on the TACACS+ server will take effect.
- If the periodic refresh time interval is configured on the TACACS+ server and also locally on the Junos OS device, the value configured on the TACACS+ server will take precedence.
- If there is no periodic refresh time interval configured on the TACACS+ server and there is no authorization time interval configured on the Junos OS device, there will be no periodic refresh.
- If the periodic refresh time interval configured on the TACACS+ server is out of range or invalid, the authorization time interval value configured locally will take effect.
- If the periodic refresh time interval configured on the TACACS+ server is out of range or invalid and there is no authorization time interval configured locally, there will be no periodic refresh.

After the periodic authorization time interval is set, if the user changes the interval before the authorization request is sent from the Junos OS device, the updated interval takes effect after the next immediate periodic refresh.

- **Default:** If the authorization time interval is not configured, the authorization profile is not refreshed during a TACACS+ authentication session.
- **Range:** 15 through 1440 minutes

enhanced-accounting

Configure the audit of TACACS+ authentication events, such as access method, remote port, and access privileges.

exclude-cmd-attribute

Exclude the `cmd` attribute value completely from start and stop accounting records to enable logging of accounting records in the correct log file on a TACACS+ server.

no-cmd-attribute-value

Set the `cmd` attribute value to an empty string in the TACACS+ accounting start and stop requests to enable logging of accounting records in the correct log file on a TACACS+ server.

no-strict-authorization

Don't deny login if the authorization request fails. When a user is logging in, Junos OS issues two TACACS+ requests—first the authentication request followed by the authorization request.

- **Default:** By default, when the authorization request is rejected by the TACACS+ server, Junos OS ignores this and allows full access to the user. Specifying `no-strict-authorization` restores this default behavior.

service-name *service-name*

Name of the authentication service used when you configure multiple TACACS+ servers to use the same authentication service.

- **Default:** `junos-exec`

strict-authorization

Deny login if the authorization request fails. When a user is logging in, Junos OS issues two TACACS+ requests—first the authentication request followed by the authorization request. When the `strict-authorization` option is specified, Junos OS denies access to the user even when the TACACS+ authorization request fails.

- **Default:** By default, when the authorization request is rejected by the TACACS+ server, Junos OS ignores this and allows full access to the user.

timestamp-and-timezone

Include this statement if you want start time, stop time, and time zone attributes included in the start and stop accounting records.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`no-cmd-attribute-value` and `exclude-cmd-attribute` options introduced in Junos OS Release 9.3.

`timestamp-and-timezone` option introduced in Junos OS Release 12.2.

`strict-authorization` and `no-strict-authorization` options introduced in Junos OS Release 13.3 for EX Series, M Series, MX Series, PTX Series, and T Series. Support for these options was added to Junos OS Evolved starting in Release 21.1.

`enhanced-accounting` option introduced in Junos OS Release 14.1.

`authorization-time-interval` option introduced in Junos OS Release 17.4.

Determine the Authentication Order for LDAPS, RADIUS, TACACS+, and Password Authentication

tacplus-server

IN THIS SECTION

- Syntax | **30015**
- Hierarchy Level | **30015**
- Description | **30015**
- Options | **30015**
- Required Privilege Level | **30016**
- Release Information | **30017**

Syntax

```
tacplus-server server-address {
    port port-number;
    routing-instance routing-instance;
    secret password;
    single-connection;
    source-address source-address;
    timeout seconds;
}
```

Hierarchy Level

```
[edit system]
```

Description

Configure the IPv4 or IPv6 TACACS+ server.

Options

server-address

Address of the IPv4 or IPv6 TACACS+ authentication server.

> **NOTE**: Wildcard characters cannot be used in the TACACS+ server address or source address. This is because the TACACS+ server and source can accept both IPv4 and IPv6 addresses and, if you use wildcard characters for these addresses, Junos OS cannot validate mismatching server and source address families.

port *port-number*

Configure the port number on which to contact the TACACS+ authentication server.

- **Default:** 49

routing-instance *routing-instance*

Configure the routing instance name for the management routing instance, that is `mgmt_junos`. Configuring this parameter along with the `management-instance` statement enables authentication processes (for example, RADIUS and TACACS+) to use the non-default management routing instance for packet traffic.

> **NOTE**: You must also define the mgmt_junos routing instance under the `[edit routing-instances]` hierarchy level.

If you no not configure the mgmt_junos instance under the `[edit routing-instances]` hierarchy level and configure it only under `tacplus-server` or `radius-server`, the commit will fail.

secret *password*

Configure the password to use with the RADIUS or TACACS+ server. The secret password used by the local router or switch must match that used by the server. The password can include spaces included in quotation marks.

> **NOTE**: To ensure better security, we recommend you configure the TACACS+ secret password with a minimum of 14 characters.

single-connection

Optimize attempts to connect to a TACACS+ server. The software maintains one open TCP connection to the server for multiple requests rather than opening a connection for each connection attempt.

source-address *source-address*

Specify a source address for each configured TACACS+ server to record in system log messages that are directed to a remote machine. Configure a valid IP address on one of the device interfaces. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all `host` *`hostname`* statements at the `[edit system syslog]` hierarchy level.

- **Default:** The primary address of the interface.

timeout *seconds*

The amount of time that the local device waits to receive a response from a TACACS+ server.

- **Default:** 3 seconds
- **Range:** 1 through 90 seconds

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`routing-instance` option introduced in Junos OS Release 17.4R1.

tag (Access)

IN THIS SECTION

- Syntax | 30017
- Hierarchy Level | 30017
- Description | 30018
- Options | 30018
- Required Privilege Level | 30018
- Release Information | 30018

Syntax

```
tag route-tag;
```

Hierarchy Level

```
[edit routing-options access route ip-prefix</prefix-length>],
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options
access route prefix],
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options
```

```
rib routing-table-name access route prefix],
[edit dynamic-profiles profile-name routing-options access route prefix]
```

Description

Dynamically configure the tag for an access route.

Options

route-tag—Either the specific tag you want to assign to the access route or either of the following tag variables:

- `$junos-framed-route-tag`—Tag assigned to an IPv4 access route; the variable is dynamically replaced with the preference value (Subattribute 6) from the RADIUS Framed-Route attribute [22].
- `$junos-framed-route-ipv6-tag`—Tag assigned to an IPv6 access route; the variable is dynamically replaced with the preference value (Subattribute 6) from the RADIUS Framed-IPv6-Route attribute [99].

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

Support at the `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options access route prefix]` and `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options rib routing-table-name access route prefix]` hierarchy levels introduced in Junos OS Release 10.1.

tag (Configuring Notification Targets)

IN THIS SECTION

- Syntax | 30019
- Hierarchy Level | 30019
- Description | 30019
- Options | 30019
- Required Privilege Level | 30019
- Release Information | 30020

Syntax

```
tag tag-name;
```

Hierarchy Level

```
[edit snmp v3 notify name]
```

Description

Configure a set of target addresses to receive SNMP traps or informs (for IPv4 packets only).

Options

tag-name—Define the target addresses to which an SNMP notification is sent. Target addresses containing the same tag in their tag list are sent the same notification. The ***tag-name*** is not included in the notification.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

tag-group

IN THIS SECTION

- Syntax | 30029
- Hierarchy Level | 30030
- Description | 30030
- Options | 30030
- Required Privilege Level | 30030
- Release Information | 30030

Syntax

```
tag-group name {
      application-tags [ application-tags... ]
      }
```

Hierarchy Level

```
[edit services application-identification application-group application-group-name
```

Description

Specify a unique tag group identifier to create your own application group based on the application attributes. Application group allows you to associate a related applications under a single name for simplified, consistent reuse when using any application services.

For example: If you want to group application traffic for web or remote access, you can specify respective tags as follows:

```
user@host# set services application-identification application-group A1 tag-group TG-1
application-tags [web remote_access]
```

You can use the application groups as match condition when defining security policies.

Options

name A unique tag group identifier

application-tags Application tag to configure the application group.

(Supported tags available in the latest version of application signature) - basic, networking, email, webmail, im_mc, chat, audio_chat, video_chat, file_transfer, social_network, voip, web, web_search, web_ecom, web_sites, mobile, p2p, file_mngt, db, enterprise, update, gaming, aaa, remote_access, mm_streaming, vpn_tun, cdn, news_portal, classified_ads, advertising, analytics, adult_content, anonymizer, blog, forum, standardized, scada, iot, cloud_services, dea_mail, ebook_reader, transportation, cryptocurrency, map_service, crowdfunding, speedtest, payment_service

input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
output-vlan-map]
```

Description

For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces only, configure the outer TPID value. All TPIDs you include in input and output VLAN maps must be among those you specify at the `[edit interfaces interface-name gigether-options ethernet-switch-profile tag-protocol-id [ tpids ]]` hierarchy level.

For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers the default TPID value (`0x8100`) is supported.

Default

If the `tag-protocol-id` statement is not configured, the TPID value is 0x8100.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring Inner and Outer TPIDs and VLAN IDs

tag-protocol-id TPID (TPIDs Expected to Be Sent or Received)

IN THIS SECTION

- Syntax | 30038
- Hierarchy Level | 30038
- Description | 30039
- Options | 30039
- Required Privilege Level | 30039
- Release Information | 30039

Syntax

```
tag-protocol-id [tpids];
```

Hierarchy Level

```
[edit interfaces interface-name gigether-options ethernet-switch-profile],
[edit interfaces interface-name aggregated-ether-options ethernet-switch-profile],
[edit interfaces interface-name aggregated-ether-options ethernet-switch-profile],
[edit interfaces interface-name ether-options ethernet-switch-profile]
```

Description

For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, aggregated Ethernet with Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, and the built-in Gigabit Ethernet port on the M7i router), define the TPIDs expected to be sent or received on a particular VLAN. For each Gigabit Ethernet port, you can configure up to eight TPIDs using the `tag-protocol-id` statement; but only the first four TPIDs are supported on IQ2 and IQ2-E interfaces.

For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers only the default TPID value (`0x8100`) is supported.

For Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, define the TPIDs expected to be sent or received on a particular VLAN. The default TPID value is `0x8100`. Other supported values are `0x88a8`, `0x9100`, and `0x9200`.

Starting in Junos OS Release 22.4R1, the QFX5100, QFX5110, QFX5120, QFX5200, and QFX5210 switches support up to four TPID configurations per VLAN. The system supports the following values for the TPID configuration: 0x8100, 0x9200, 0x88a8, and 0x9100. A TPID needs to be defined in the command-line interface for aggregated ethernet interfaces and the ether interfaces for the device, before it can be sent or received.

> **NOTE**: Routing Engine can handle only the default TPID `0x8100`. The traffic destined to the Routing Engine is discarded if the TPID is not `0x8100`.

Options

`tpids`—TPIDs to be accepted on the VLAN. Specify TPIDs in hexadecimal.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

```

Description

Configure the tag rules that enrich HTTP headers with the appropriate tags.

You must configure at least one term for a tag rule, but you can configure multiple terms. Terms are evaluated in the order they are configured. If a data packet matches all the criteria in the `from` statement in any of the terms, then the actions specified in the `then` statement are applied. If the `from` statement does not identify any criteria, then all traffic matches. After a term matches a data packet, further terms are not evaluated. If no terms match, then the HTTP header is not enriched.

For subscriber traffic under static policy control, a tag rule is used if it is included in the HCM profile specified in a PCC rule that the traffic matches. For subscribers under dynamic policy control, a message from the PCRF identifies the configured HCM profile and tag rules to use for HTTP header enrichment.

Options

rule-name—Name of the tag rule.

- **Range:** 1 through 63 alphanumeric characters

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

talk

IN THIS SECTION

- Syntax | 30052
- Hierarchy Level | 30053
- Description | 30053
- Options | 30053
- Required Privilege Level | 30053
- Release Information | 30054

Syntax

```
talk {
    disable;
    traceoptions {
        flag {
            all {
                extensive
            }
        }
```

```
    }
}
```

Hierarchy Level

```
[edit logical-systems name security alg],
[edit logical-systems name tenants name security alg],
[edit security alg],
[edit services alg],
[edit tenants name security alg]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure `talk` to specify the TALK program ALG on the device. TALK ALG is a visual communication program used for interactive communication between two users.

Options

- `disable`—Disable the TALK program ALG. By default, the TALK program ALG is enabled.
- `traceoptions`—Configure TALK program ALG tracing options.
  - `flag`—Trace operation to perform.
    - `all`—Trace all events.
    - *`extensive`*—Display extensive amount of data.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

The `tenant` option is introduced in Junos OS Release 18.3R1.

- Hierarchy Level (Junos OS Evolved) | 30056
- Description | 30057
- Options | 30057
- Required Privilege Level | 30058
- Release Information | 30058

Syntax (Junos OS)

```
target (address IPv4-address | fqdn FQDN-for-IPv4-target-address | fqdnv6 FQDN-for-IPv6-target-address | inet6-address IPv6-address | inet6-url IPv6-URL| url IPv4-URL)
```

Syntax (Junos OS Evolved)

```
target (url URL | address) local-link IPv6-link-local-interface-name;
```

Hierarchy Level (Junos OS)

```
[edit services rpm probe owner test test-name]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rpm owner name test name]
```

Description

(Required) Specify the destination IPv4 or IPv6 address or URL used for the probes.

Options

address
(Junos OS Evolved) For all RPM probe types other than the HTTP probes, use the specified IPv4 or IPv6 address for the target host. (Prior to Junos OS Evolved Release 23.1R1, only IPv4 addresses are supported for RPM probes.) If you also configure the `link-local` option, you must configure an IPv6 address in the link-local prefix fe80::/8 range.

address *IPv4-address*
(Junos OS) For all RPM probe types other than the HTTP probes, use the specified IPv4 address for the target host.

> **NOTE**: Starting with Junos OS Release 14.2R2, the RPM client router (the router or switch that originates the RPM probes) can send probe packets to the RPM probe server (the device that receives the RPM probes) that contains an IPv6 address.

fqdn *FQDN-for-IPv4-target-address*
(Junos OS) Specify a fully qualified domain name (FQDN) as a target instead of the IPv4 address of the destination. The device resolves the FQDN through the Domain Name System (DNS) at the start of each test, then sends probes to the resolved address at each interval. Telemetry first displays the FQDN until resolution, then shows the destination address to help you track changes. If DNS resolution fails, the probe results retain the FQDN as the target address. If the DNS server is slow in responding, does not respond, or is not reachable, the RPM test might be slow to start or fail to start.

fqdnv6 *FQDN-for-IPv6-target-address*
(Junos OS) Specify a fully qualified domain name (FQDN) as a target instead of the IPv6 address of the destination. The device resolves the FQDN through the Domain Name System (DNS) at the start of each test, then sends probes to the resolved address at each interval. Telemetry first displays the FQDN until resolution, then shows the destination address to help you track changes. If DNS resolution fails, the probe results retain the FQDN as the target address. If the DNS server is slow in responding, does not respond, or is not reachable, the RPM test might be slow to start or fail to start.

inet6-address *IPv6-address*
(Junos OS) For all RPM probe types other than the HTTP probes, use the specified IPv6 address for the target host.

inet6-url *IPv6-URL*
(Junos OS) For HTTP probe types, use the specified fully formed URL that includes `http://` in the URL address. You can specify an IPv6 address of a host in the URL to denote the destination or server to which the RPM probes must be sent.

local-link *IPv6-link-local-interface-name*
(Junos OS Evolved) For test sessions with IPv6 target addresses, configure the link-local logical interface name for the egress interface. If you configure this option, you cannot configure the `source-address` statement for the test.

url *URL*
For HTTP probe types, use the specified fully formed URL that includes `http://` in the URL address. You can specify an IPv4 address of a host in the URL to denote the destination or server to which the RPM probes must be sent. For Junos OS Evolved, you can also use this option to specify an IPv6 address of a host in the URL; for Junos OS, you use the `inet6-url` option instead to specify the same.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Syntax

```
target-address target-address-name {
    address (SNMP) address;
    address-mask address-mask;
    logical-system (SNMP) logical-system;
    port port-number;
    retry-count (SNMP) number;
    routing-instance (SNMPv3) instance;
    tag-list tag-list;
    target-parameters target-parameters-name;
    timeout (SNMP) seconds;
}
```

Hierarchy Level

```
[edit snmp v3]
```

Description

Configure the address of an SNMP management application and the parameters to be used in sending notifications.

Options

target-address-name—String that identifies the target address.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

target-address (TWAMP)

IN THIS SECTION

- Syntax | 30060
- Hierarchy Level (Junos OS) | 30061
- Description | 30061
- Options | 30061
- Required Privilege Level | 30061
- Release Information | 30061

Syntax

```
target-address address local-link IPv6-link-local-interface-name;
```

Hierarchy Level (Junos OS)

```
[edit services rpm twamp client control-connection control-client-name],
[edit services rpm twamp client control-connection control-client-name test-session session-name]
```

Description

(Required) Specify the destination IPv4 or IPv6 address used for Junos OS probes. For specifying the target address for TWAMP control connections and tests, see "control-connection (Junos OS Evolved)" on page 4864.

Options

address

For TWAMP managed control connections and test sessions, use the specified IPv4 or IPv6 address for the target host. MX Series and PTX Series Junos OS TWAMP Light test sessions support both IPv4 and IPv6 addresses.

> **NOTE**: Starting with Junos OS Release 14.2R2, the RPM client router (the router or switch that originates the RPM probes) can send probe packets to the RPM probe server (the device that receives the RPM probes) that contains an IPv6 address.

local-link *IPv6-link-local-interface-name*

For TWAMP Light test sessions with IPv6 target addresses (where the `control-type light` statement is configured for the control connection), configure the link-local logical interface name for the egress interface.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.3 for EX Series switches.

Statement introduced in Junos OS Release 13.2 for PTX Packet Transport routers.

Support at the [`edit services rpm twamp client control-connection` *`control-client-name`*] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.

Statement introduced in Junos OS Release 18.1 for QFX Series switches.

Support for IPv6 addresses for TWAMP Light test sessions introduced in Junos OS Release 21.3R1 for MX Series and PTX1000, PTX3000, and PTX5000 routers.

`local-link` option for IPv6 TWAMP Light test sessions introduced in Junos OS Release 21.4R1.

Understanding Two-Way Active Measurement Protocol on Routers

target-attachment-identifier (Protocols VPWS)

IN THIS SECTION

- Syntax | **30062**
- Hierarchy Level | **30063**
- Description | **30063**
- Options | **30063**
- Required Privilege Level | **30063**
- Release Information | **30063**

Syntax

```
target-attachment-identifier identifier;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name protocols l2vpn site
site-name interface interface-name],
[edit routing-instances instance-name protocols l2vpn site site-name interface interface-name]
```

Description

For FEC 129, specify the VPWS target attachment identifier. The point-to-point nature of VPWS requires that you specify the source access individual identifier (SAII) and the target access individual identifier (TAII). This SAII-TAII pair defines a unique pseudowire between two PE devices.

Auto-discovery routes are used by BGP to allow auto-discovery of SAIIs (the sources of the point-to-point pseudowires). One auto-discovery route is advertised for each source attachment identifier (SAI) in the instance or mesh group.

The SAII is specified with the `source-attachment-identifier` statement within the FEC 129 VPWS routing instance. You configure the source attachment identifier and the interfaces to associate with that source attachment identifier. Under each interface, you can configure the TAII with the `target-attachment-identifier` statement. If the configured target identifier matches a source identifier advertised by a remote PE device by way of a BGP auto-discovery message, the pseudowire between that source-target pair is signaled. If there is no match between an advertised source identifier and the configured target identifier, the pseudowire is not established.

Options

identifier—The numerical identifier for the Layer 2 VPN site.

- **Range:** 1 through 4,292,967,295

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

target-parameters

IN THIS SECTION

- Syntax | 30066
- Hierarchy Level | 30066

- Description | 30066
- Required Privilege Level | 30067
- Release Information | 30067

Syntax

At the [edit snmp v3] hierarchy level:

```
target-parameters target-parameters-name {
    profile-name;
    parameters {
        message-processing-model (v1 | v2c | V3);
        security-level (authentication | none | privacy);
        security-model (usm | v1 | v2c);
        security-name security-name;
    }
}
```

At the [edit snmp v3 target-address *target-address-name*] hierarchy level:

```
target-parameters target-parameters-name;
```

Hierarchy Level

```
[edit snmp v3]
[edit snmp v3 target-address target-address-name]
```

Description

Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the [edit snmp v3] hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the [edit snmp v3 target-parameters *target-parameters-name*] hierarchy level to the target address configuration at the [edit snmp v3] hierarchy level.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

target-routing-instance (Domain Map)

IN THIS SECTION

- Required Privilege Level | 30068
- Release Information | 30068

Syntax

```
target-routing-instance (routing-instance-name | default);
```

Hierarchy Level

```
[edit access domain map domain-map-name],
[edit access domain map domain-map-name target-logical-system logical-system-name]
```

Description

Configure the routing instance of the subscriber context.

> **NOTE**: Subscriber management is supported in the default logical system only. The `target-logical-system` statement, which appears in the CLI, is not supported in current Junos OS releases.

Default

For dynamic LNS sessions, the routing instance of the peer (LAC facing) interface. For all other sessions, the default logical system/routing instance context.

Options

routing-instance-name—Name of the routing instance.

`default`—The default routing instance.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

`default` option added in Junos OS Release 13.3.

[edit interfaces interface-name unit logical-unit-number family inet],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family inet]
```

Hierarchy Level (SRX Series)

```
[edit interfaces interface-name unit name family inet]
```

Description

Specify the IP packets destined for a Layer 3 broadcast address to be forwarded to both an egress interface and the Routing Engine, or to an egress interface only. The packets are broadcast only if the egress interface is a LAN interface.

The remaining statements are explained separately. See CLI Explorer.

Options

forward-and-send-to-re	Allow packets to be forwarded and sent to Routing Engine.
forward-only	Allow packets only to be forwarded.

Default

When this statement is not included, broadcast packets are sent to the Routing Engine only.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Statement introduced in Junos OS Release 20.4R1 for the SRX Series.

Understanding Targeted Broadcast

targeted-distribution (Dynamic Demux Interfaces over Aggregated Ethernet)

IN THIS SECTION

- Syntax | 30071
- Hierarchy Level | 30071
- Description | 30071
- Required Privilege Level | 30072
- Release Information | 30072

Syntax

```
targeted-distribution;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number]
```

Description

Configure egress data for a dynamic logical interface to be sent across a single member link in an aggregated Ethernet bundle. A backup link is provisioned and CoS scheduling resources are switched to the backup link in the event that the primary assigned link goes down. The aggregated Ethernet interface must be configured without link protection.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

- Description | 30073
- Default | 30073
- Options | 30073
- Required Privilege Level | 30073
- Release Information | 30073

Syntax

```
targeted-distribution (replicate | scale);
```

Hierarchy Level

```
[edit interfaces demux0 unit logical-unit-number],
[edit interfaces pp0 unit logical-unit-number]
```

Description

Configure egress data for a logical interface to be sent across a single member link in an aggregated Ethernet bundle. A backup link is provisioned and CoS scheduling resources are switched to the backup link in the event that the primary assigned link goes down. The aggregated Ethernet interface must be configured without link protection.

Default

By default, if you do not include the targeted-scheduler statement, scheduler parameters are applied to the targeted links in the scale mode.

Options

`replicate`—Scheduler parameters are copied to each of the targeted aggregated interface links.

`scale`—Scheduler parameters are scaled based on number of targeted links and applied each of the aggregated interface targeted links.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

targeted-options (Grouping Subscribers by Bandwidth Usage)

IN THIS SECTION

- Syntax | 30077
- Hierarchy Level | 30077
- Description | 30077
- Options | 30078
- Required Privilege Level | 30078
- Release Information | 30078

Syntax

```
targeted-options {
    backup backup;
    group group;
    primary primary;
    weight ($junos-interface-target-weight | weight-value);
}
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces name unit logical-unit-number],
[edit dynamic-profiles name logical-systems name interfaces name unit logical-unit-number],
[edit interfaces name unit logical-unit-number]
```

Description

Configure primary and backup links, group similar subscribers, and specify a subscriber weight for manual targeting to distribute subscribers across aggregated Ethernet member links.

Options

backup (Optional) Specify a backup member link per subscriber when you configure manual targeting.

group (Optional) Assign a group name for subscribers with similar bandwidth usage. Subscribers that are configured for targeted distribution without a group name are added to the `default` group and distributed evenly across member links. Grouping of subscribers is supported only for static subscribers.

- **Default:** default

primary Specify a primary member link per subscriber when you configure manual targeting. You must always configure a primary link when you configure manual targeting.

weight ($junos-interface-target-weight | *weight-value*) Specify the weight for targeted subscribers like PPPoe, demux, and conventional VLANs based on factors such as customer preferences, class of service (CoS), or bandwidth requirement. Member links for logical interfaces of aggregated Ethernet logical interfaces are assigned based on the value of the weight . When a new VLAN is added to the same aggregated Ethernet bundle, then the primary member link selected for targeting is the one with the minimum primary load and the backup link selected for targeting is the one with the minimum overall load.

The $junos-interface-target-weight predefined variable is supported for dynamic configuration only. When you configure this predefined variable, the weight value is sourced from VSA 26-213 in the RADIUS Access-Accept message when a dynamic subscriber is authenticated.

- **Range:** 1 through 1000

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

`weight` option added in Junos OS Release 17.3 for MX Series and MX Virtual Chassis.

`$junos-interface-target-weight` option added in Junos OS Release 18.4R1.

targeted-options (Manual Targeting)

IN THIS SECTION

- Syntax | 30079
- Hierarchy Level | 30080
- Description | 30080
- Options | 30080
- Required Privilege Level | 30081
- Release Information | 30081

Syntax

```
targeted-options {
    (logical-interface-chassis-redundancy | logical-interface-fpc-redundancy);
    rebalance-periodic {
        interval interval;
        start-time start-time;
    }
    rebalance-subscriber-granularity rebalance-subscriber-granularity;
    type (auto | manual);
}
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces name aggregated-ether-options],
[edit dynamic-profiles name logical-systems name interfaces name aggregated-ether-options],
[edit interfaces name aggregated-ether-options]
```

Description

Configure manual targeting or auto-targeting.

Specify the type of targeting to be used for targeted distribution. Specify the targeting option as `manual` for conventional VLAN targeting. By default, the targeting option is `auto`.

Options

type Configure manual targeting type as `manual` or `auto`.

Specify the type of targeting to be used for targeted distribution.

- Values:
  - `auto`—Configure targeted-distribution without specific primary and backup links.
  - `manual`—Configure targeted distribution with specific member links as primary and backup for a subscriber. When you configure manual targeting, you must always configure a primary link. Configuring a backup link is optional. You specify the primary and backup links for a subscriber in the individual interface configuration. You configure primary and backup links by using the "targeted-options" on page 30077 statement at the `[edit interfaces name unit]` hierarchy level.

    Manual targeting enhances the distribution of targeted VLANs or subscribers across member links of an aggregated Ethernet bundle by making it bandwidth-aware.

    Use `manual` keyword to enforce manual targeting on conventional VLANs.
- **Default:** `auto`—By default, targeted option is set to `auto`.

rebalance-subscriber-granularity Rebalancing takes place when the member links have more subscribers than the configured value on the rebalance-subscriber-granularity option.

The remaining statements are described separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

Syntax

```
targets {
    target-name {
        <destination-host hostname>;
        destination-realm realm-name;
        network-element element-name;
        priority priority-value;
    }
}
```

Hierarchy Level

```
[edit unified-edge diameter-profiles gx-profile profile-name]
```

Description

Configure the targets for this Diameter profile.

Options

target-name	Name of the target.

destination-host *hostname*
(Optional) Use the name of the destination host associated with this target.

destination-realm *realm-name*
Use the name of the destination realm associated with this target.

network-element *element-name*
Use the name of the network element.

> **NOTE**: The Diameter network element must be previously configured at the `[edit access diameter network-element]` hierarchy level.

- **Range:** 1 through 32 characters

priority *priority-value*
Use the specified priority for the target within the Diameter profile. A value with a lower number has a higher priority. For load balancing, configure the targets with the same priority.

> **NOTE**: Failover handling depends on how the policy for the application is configured. For example, switching between the primary and secondary online charging servers set with the appropriate priority can occur only when the failover handling policy is configured to do so.

- **Range:** 1 through 65,535

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

tca (IPLC)

IN THIS SECTION

- Syntax | 30086
- Hierarchy Level | 30086
- Description | 30086
- Default | 30093
- Options | 30093
- Example | 30093
- Required Privilege Level | 30094
- Release Information | 30094

Syntax

```
tca tca-identifier (enable-tca | no-enable-tca) (threshold number | threshold-24hrs number) ;
```

Hierarchy Level

```
[edit chassis fpc fpc-slot optical-options]
```

Description

Configure the threshold crossing alerts (TCA)s for the integrated photonic line card (IPLC).

TCAs can give the management system an early indication as to the state of the associated entity when it crosses a certain threshold. The timely detection of TCAs is essential to proactively manage the IPLC modules. TCAs are not an indication of a fault, but rather an indication that the entity may be close to a fault. You can choose which TCAs you want monitored by enabling the TCA. You can either keep the default threshold settings or modify the settings.

You can enable TCAs on the IPLC for the performance monitors listed in Table 1898 on page 30087.

Table 1898: IPLC Optical Performance Monitors

Performance Monitor	15 Min Bin	24 Hr Bin	TCA High	TCA Low
OSC TX power	Yes	Yes	Yes	Yes
OSC RX power	Yes	Yes	Yes	Yes
OSC/FPGA estimated fiber loss	Yes	Yes	No	No
Line OUT VOA attenuation	Yes	Yes	Yes	Yes
EDFA Input power (for both EDFAs)	Yes	Yes	Yes	Yes
EDFA Output power (for both EDFAs)	Yes	Yes	Yes	Yes
EDFA Signal output power (for both EDFAs)	Yes	Yes	Yes	Yes
EDFA Pump current (for both EDFAs)	Yes	Yes	Yes	Yes
OCM power readings (64 channels x 1 monitoring points)	Yes	Yes	Yes	Yes

Table 1898: IPLC Optical Performance Monitors *(Continued)*

Performance Monitor	15 Min Bin	24 Hr Bin	TCA High	TCA Low
Power monitor at ADD port	Yes	Yes	Yes	Yes
Power monitor at EXPRESS IN port	Yes	Yes	Yes	Yes

Each performance monitor supports:

- 15-minute and 24-hour binning
- Low and high threshold levels

describes each TCA as well as their default, minimum, maximum, and recommended values.

Table 1899: IPLC Threshold Crossing Alert Minimum and Maximum Values

TCA Identifier	Description	Granularity	Range Minimum/ Maximum Default and Recommended Value

Erbium-Doped Fiber Amplifier (EDFA) Input Power (for Both EDFAs)			
osc-tx-power-low-tca	OSC TX power low TCA		—2/-0.5 dBm —1 dBm

Default

By default, TCAs are disabled.

Options

tca-identifier Specify the name of the TCA identifier.

enable-tca | no-enable-tca Enable or disable the threshold crossing alert.

threshold *number* Specify the 15-minute interval threshold.

threshold-24hrs *number* Specify the 24-hour interval threshold.

See Table 2 on page 30088 for a description of all TCAs, as well as the default, minimum, maximum, and recommended threshold values.

Example

To specify the 15-minute and 24-hour interval thresholds for the optical supervisory channel receive power, enter the following:

```
[edit]
user@host# set chassis fpc 2 optical-options tca osc-rx-power-low-tca threshold -46 enable-tca
user@host# set chassis fpc 2 optical-options tca osc-rx-power-high-tca threshold 5.5 enable-tca
```

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

tca

IN THIS SECTION

- Syntax | 30095
- Hierarchy Level | 30095
- Description | 30095
- Default | 30095
- Options | 30095
- Required Privilege Level | 30097
- Release Information | 30097

Syntax

```
tca tca-identifier (enable-tca | no-enable-tca) (threshold number | threshold-24hrs number)
```

Hierarchy Level

```
[edit interfaces interface-name optics-options]
```

```
[edit interfaces interface-name otn-options]
```

Description

TCAs can give the management system an early indication as to the state of the associated entity when it crosses a certain threshold. TCAs can be set for both minimum and maximum values for gauges and only maximum values for counters. The timely detection of TCAs is essential to proactively manage the interface. TCAs are not an indication of a fault, but rather an indication that the entity may be close to a fault. You can choose which TCAs you want monitored by enabling the TCA. You can either keep the default threshold settings or change the settings.

Enable threshold crossing alerts (TCAs) for the following:

- Optical channel data unit (ODU)
- Optical channel transport unit (OTU)
- Laser power
- Laser temperature

Default

By default, TCAs are not enabled.

Options

tca-identifier —At the otn-options hierarchy level, it can be one of the following:

- `odu-tca-bbe`—ODU background block error threshold-crossing defect trigger
- `odu-tca-bbe-fe`—ODU far-end background block error threshold-crossing defect trigger

- `odu-tca-es`—ODU errored seconds threshold-crossing defect trigger
- `odu-tca-es-fe`—ODU far-end errored seconds threshold-crossing defect trigger
- `odu-tca-ses`—ODU severely errored seconds threshold-crossing defect trigger
- `odu-tca-ses-fe`—ODU far-end severely errored seconds threshold-crossing defect trigger

tcp-encap

IN THIS SECTION

- Syntax | 30107
- Hierarchy Level | 30107
- Description | 30108
- Options | 30108
- Required Privilege Level | 30108
- Release Information | 30108

Syntax

```
tcp-encap {
    profile profile-name;
        ssl-profile ssl-profile-name;
        log ;
    }
    traceoptions {
        file filename {
            files number;
            match regular-expression;
            size maximum-file-size;
            (world-readable | no-world-readable);
        }
        flag (all | configuration | session | tunnel);
        level (all | error | info | notice | verbose | warning);
        no-remote-trace’
    }
```

Hierarchy Level

```
[edit security]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify TCP encapsulation operations for a remote access client to a remote access gateway on an SRX Series Firewall to support IPsec messages encapsulated within a TCP connection.

Options

profile *profile-name*
Configure a TCP encapsulation profile for a remote access client to a remote access gateway on an SRX Series Firewall to define the data encapsulation operation.

- **ssl-profile *ssl-profile-name***
  Specify the SSL termination profile that is configured at the [`edit services ssl termination profile`] hierarchy level. This parameter is required for NCP Exclusive Remote Access Client of Full SSL Session.
- **log**
  Enable logging for remote access client connections.

traceoptions
Configure TCP encapsulation tracing options.

Required Privilege Level

view-level—To view this statement in the configuration.

control-level—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D80.

Support for the `ssl-profile` option added in Junos OS Release 18.1R1.

tcp-fast-open

IN THIS SECTION

- Syntax | 30109
- Hierarchy Level | 30109
- Description | 30109
- Default | 30109
- Options | 30110
- Required Privilege Level | 30110
- Release Information | 30110

Syntax

```
tcp-fast-open  {
    disabled;
    drop;
}
```

Hierarchy Level

```
[edit services service-set service-set-name service-set-options]
```

Description

Specify how TCP Fast Open (TFO) enabled packets are to be handled.

Default

By default, all TFO packets are forwarded by the service PIC.

Options

`disabled` Any TCP packet with the TFO option present has the TFO option stripped from the TCP header of the packet, and the rest of the packet is forwarded as is. The benefit of stripping the header over dropping the packet is that the client does not have to wait for the retransmission timer to go off and then retransmit the SYN packet without the TFO option.

`drop` Any TCP packet with the TFO option present is dropped.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2.

RELATED DOCUMENTATION

Exchanging Data More Efficiently Using TCP Fast Open

tcp-flags

IN THIS SECTION

- Syntax | 30111
- Hierarchy Level | 30111
- Description | 30111
- Options | 30111
- Required Privilege Level | 30112
- Release Information | 30112

Syntax

```
tcp-flags {
    (ack | no-ack);
    (fin | no-fin);
    (psh | no-psh);
    (r1 | no-r1);
    (r2 | no-r2);
    (rst | no-rst);
    (syn | no-syn);
    (urg | no-urg);
}
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type signature protocol tcp]
```

Description

Specify that IDP looks for a pattern match whether or not the TCP flag is set.

Options

- `ack` | `no-ack`—When set, the acknowledgment flag acknowledges receipt of a packet.
- `fin` | `no-fin`—When set, the final flag indicates that the packet transfer is complete and the connection can be closed.
- `psh` | `no-psh`—When set, the push flag indicates that the receiver should push all data in the current sequence to the destination application (identified by the port number) without waiting for the remaining packets in the sequence.
- `r1` | `no-r1`—When set, indicates that the R1 retransmission threshold has been reached.
- `r2` | `no-r2`—When set, indicates that the R2 retransmission threshold has been reached.
- `rst` | `no-rst`—When set, the reset flag resets the TCP connection, discarding all packets in an existing sequence.
- `syn` | `no-syn`—When set, indicates that the sending device is asking for a three-way handshake to initialize communications.

- `urg` | `no-urg`—When set, the urgent flag indicates that the packet data is urgent.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

tcp-forwarding (Processes)

IN THIS SECTION

- Syntax | 30112
- Hierarchy Level | 30113

tcp-forwarding (Remote Device Management)

IN THIS SECTION

- Syntax | 30114
- Hierarchy Level | 30114
- Description | 30115
- Options | 30115
- Required Privilege Level | 30116
- Release Information | 30116

Syntax

```
tcp-forwarding {
    listening-port port-number listening-address ipv4-listening-address {
        allowed-source ipv4-prefix;
        forwarding-address ipv4-forwarding-address;
        forwarding-port forwarding-port-number;
        max-connections number;
    }

}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name system
services],
[edit logical-systems logical-system-name system services],
[edit routing-instances routing-instance-name system services],
[edit system services]
```

Description

Configure the mapping between the TCP listening address/listening port combination on the BNG and the TCP port forwarding address/port combination where the BNG forwards the incoming data stream. TCP port forwarding is used when the BNG, together with one or more access nodes, is treated as a single addressable point of management by an external management system. The TCP port forwarding connections enable the BNG to demultiplex and multiplex management requests exchanged between the access nodes and the management system.

Options

allowed-source *ipv4-prefix*

(Optional) Restrict the IPv4 prefixes from which TCP connections are accepted on the listening port. The `allowed-source` value is compared to the source address in the TCP header from the triggering entity. When you do not configure an allowed source, TCP connections are accepted from any source prefix.

You can use a /32 IPv4 mask to specify a single address as the source or you can use other masks to specify an IPv4 subnet as the source. You can configure an unlimited number of prefixes for each listening port. To configure multiple sources, you must include the statement multiple times, once for each additional source prefix.

> **NOTE**: You can also configure an unlimited number of allowed-source prefixes across the system.

forwarding-address *ipv4-forwarding-address*

Specify the IPv4 address to which MX BNG must open the second connection of the TCP pair after it opens the first connection triggered on the listening port/listening address combination. All packets received on one connection of the TCP pair are transmitted on the peer (second) connection. This address is used with the forwarding port to open the peer connection.

forwarding-port *forwarding-port-number*

Specify the TCP port of the peer (second) connection of the TCP pair. This port is used with the forwarding address to open the peer connection.

- **Range:** 1 through 65,535

listening-address *ipv4-listening-address*

Specify a particular IPv4 address on the BNG that a triggering entity (an external management or provisioning system or a remote device) must use when attempting to trigger connections on the listening port. You must configure a unique combination of listening port and listening address for each TCP mapping.

listening-port *port-number*

Specify the TCP port that the BNG monitors for connections to be triggered by a remote device or an external management or provisioning system.

- **Range:** 8000 through 8031

max-connections *number*

(Optional) Set a limit on the number of simultaneous TCP connections that the BNG allows on a single listening port. Connection requests received after this limit is reached are rejected.

> **NOTE**: In addition to this per-listening port limit, the system-wide limit for TCP connections is 128 (64 pairs) across all routing instances and listening ports.

- **Range:** 1 through 16
- **Default:** 1

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Syntax

```
tcp-initial-timeout seconds;
```

Hierarchy Level

```
[edit security flow tcp-session]
```

Description

Define the length of time (in seconds) that the device keeps an initial TCP session in the session table before dropping it, or until the device receives a FIN (no more data) or RST (reset) packet. The FIN flag indicates the end of data transmission to finish a TCP connection.

Options

seconds—Number of seconds that the device keeps an initial TCP session in the session table before dropping it.

- **Range:** 4 through 300 seconds
- **Default:** 20 seconds

> **NOTE**: The minimum value you can configure for TCP session initialization is 4 seconds. The default value is 20 seconds; if required you can set the TCP session initialization value to less than 20 seconds.

Required Privilege Level

security—To view this in the configuration.

[edit interfaces name unit name family inet],
[edit interfaces name unit name family inet6]
```

Description

Enable and specify the TCP maximum segment size (MSS) in bytes for transit packets in the specified protocol family. The TCP MSS value must be lower than the MTU of the interface.

When the device receives a TCP packet with the SYN bit and MSS option set, it examines the MSS value. If the MSS option specified in the packet is larger than the MSS you configured with the `tcp-mss` statement, the router replaces the MSS value in the packet with the lower value you configured.

You cannot configure TCP MSS on service interfaces (ms, vms, or ams).

> **NOTE**: This configuration statement is for transit packets. To adjust the TCP MSS for host-originated packets, see "tcp-mss (Protocols BGP)" on page 30127.

Options

bytes TCP MSS value for SYN packets with a higher MSS value set.

- **Range:** 64 through 65535 bytes.
- **Default:** TCP MSS is disabled.

Required Privilege Level

system—To view this statement in the configuration.

Syntax

```
tcp-mss bytes;
```

Hierarchy Level

```
[edit system internet-options]
```

Description

Enable and specify the TCP maximum segment size (MSS) for IPV4 traffic in bytes.

When the device receives a TCP packet with the SYN bit and MSS option set, it examines the MSS value. If the MSS option specified in the packet is larger than the MSS you configured with the `tcp-mss` statement, the router replaces the MSS value in the packet with the lower value you configured.

> **NOTE**: This configuration statement is for transit packets. To adjust the TCP MSS for host-originated packets, see "tcp-mss (Protocols BGP)" on page 30127.

There are multiple factors that define the MSS value for TCP packets, which are reflected in the MSS value displayed in the output of the `show system connections` command:

- The MSS value offered by the peer in the SYN packet.

- Rounding the MSS off to the nearest multiple of 2048.
- The MTU value of the interface.
- The configured path MTU value.
- Whether TCP sessions are not directly connected and path MTU discovery is disabled.
- Whether the TCP sessions are on a directly-connected network.

This statement enables you to specify the MSS size in TCP SYN packets used during session establishment. Decreasing the MSS size helps to limit packet fragmentation and to protect against packet loss that can occur when a packet must be fragmented to meet the MTU size but the packet's DF (don't fragment) bit is set.

> **NOTE**: SRX Series Firewalls running in packet mode with MPLS do not support TCP MSS.

Options

bytes TCP MSS value for SYN packets with a higher MSS value set.

- **Range:** 64 through 65535 bytes.
- **Default:** TCP MSS is disabled.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2. Use Feature Explorer to confirm platform and release support for this feature.

name]
```

Description

Configure the maximum segment size (MSS) for the TCP connection for BGP neighbors. You can set the MSS globally or for a particular neighbor. If the router receives a TCP packet with the SYN bit and the MSS option set, and the MSS option specified in the packet is larger than the MSS value specified by the `tcp-mss` statement, the router replaces the MSS value in the packet with the lower value specified by the `tcp-mss` statement.

The MSS is only valid in increments of 2 KB. The value used is based on the value set, but is rounded down to the nearest multiple of 2048.

> **NOTE**: This configuration statement is for host-originated packets. To configure the TCP MSS value for transit traffic on a particular interface, see tcp-mss (Interfaces) .

There are multiple factors that define the MSS value for TCP packets, which are reflected in the MSS value displayed in the output of the `show system connections` command:

- The MSS value offered by the peer in the SYN packet.
- Rounding the MSS off to the nearest multiple of 2048.
- The MTU value of the interface.
- The configured path MTU value.
- Whether TCP sessions are not directly connected and path MTU discovery is disabled.
- Whether the TCP sessions are on a directly-connected network.

Limitations

- The `tcp-mss` configuration is **not supported for dynamic (allow) or auto-discovered BGP peers**. This limitation exists due to the current BGP session establishment design in the operating system, which does not apply the TCP MSS setting to sessions formed with dynamically discovered peers.
- This setting is effective only for statically configured BGP neighbors.

Options

segment-size

MSS for the TCP connection.

- **Range:** 1 through 4096

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

tcp-mss (Security Flow)

IN THIS SECTION

- Syntax | 30129
- Hierarchy Level | 30130
- Description | 30130
- Options | 30131
- Required Privilege Level | 30131
- Release Information | 30131

Syntax

```
tcp-mss {
    all-tcp {
        mss value;
    }
    gre-in {
        mss value;
```

```
    }
    gre-out {
        mss value;
    }
    ipsec-vpn {
        mss value;
    }
}
```

Hierarchy Level

```
[edit security flow]
```

Description

Configure TCP maximum segment size (TCP MSS) for the following packet types:

- All TCP packets for network traffic.
- GRE packets entering the IPsec VPN tunnel.
- GRE packets exiting the IPsec VPN tunnel.
- TCP packets entering the IPsec VPN tunnel.

If all the four TCP MSS options are configured simultaneously, then the order of preference is as follows:

- If TCP packet enters an IPsec VPN tunnel, then an ipsec-vpn mss value has high priority over all-tcp mss value, hence ipsec-vpn mss value is set.
- If TCP packet enters GRE , then gre-in mss value overrides all-tcp mss value, hence gre-in mss value is set.
- If TCP packet exits GRE, then all-tcp mss value overrides gre-in mss value, hence all-tcp mss value is set.

TCP MSS may not override in GRE over IPsec (GREoIPsec) scenarios. Consequently, there may be more fragmentation in the network as GREoIPsec traffic isn't modified for TCP MSS. To ensure that TCP MSS works with GREoIPsec, set the priority of MSS applied to the TCP traffic in the following order (highest to lowest):

1. `gre-in`
2. `gre-out` based on direction of the GREoIPSec TCP traffic

3. `ipsec-vpn` for GREoIPsec
4. IPsec traffic
5. `all-tcp` for all the TCP traffic.

```
tcp-non-syn  {
    drop-flow;
    drop-flow-send-rst;
}
```

Hierarchy Level

```
[edit services service-set service-set-options]
```

Description

Specify how the first non-SYN TCP packet is processed on services PICs. When a services PIC receives the first non-SYN TCP packet for processing, the packet is dropped.

Options

`drop-flow` When a services PIC receives the first non-SYN TCP packet for processing, the packet is dropped.

A drop flow created on the services PIC ensures that subsequent non-SYN TCP packets with the same 5-tuple information (source and destination addresses, protocol, and source and destination ports) are dropped. If this statement is not configured, a session is created when a packet hits the services set and matches the stateful firewall rule even if the packet is a non-SYN packet.

`drop-flow-send-rst` When a services PIC receives the first non-SYN TCP packet for processing, the packet is dropped and a reset packet is sent to originator to ensure that no further packets are generated.

A drop flow created on the services PIC ensures that subsequent non-SYN TCP packets with the same 5-tuple information (source and destination addresses, protocol, and source and destination ports) are dropped. If this statement is not configured, a session is created when a packet hits the services set and matches the stateful firewall rule even if the packet is a non-SYN packet.

Required Privilege Level

system—To view this statement in the configuration.

name then permit]
```

Description

Specify the TCP options for each policy. You can configure sync and sequence checks for each policy based on your requirements, and, because each policy has two directions, you can configure a TCP MSS value for both directions or for just one direction. To configure per-policy TCP options, you must turn off the respective global options. Otherwise, the commit check will fail.

NOTE: TCP maximum segment size (MSS) does not have a default value. The value is determined either from policy configuration or from flow configuration.

Example:

[set security flow tcp-mss all-tcp mss *mss-value*]

The priority for setting the MSS is given to the policy-level configuration. If there are no configurations at both the policy and flow levels, then the MSS indicated by the respective endpoint will remain as it is.

See tcp-mss (Security Flow) for details.

NOTE: TCP maximum segment size (MSS) does not have a default value. The value is determined either from policy configuration or from flow configuration.

Example:

[set security flow tcp-mss all-tcp mss <*mss-value*>]

The priority for setting the MSS is given to the policy-level configuration. If there are no configurations at both the policy and flow levels, then the MSS indicated by the respective endpoint will remain as it is.

See tcp-mss (Security Flow) for details.

Options

initial-tcp-mss

Configure the TCP maximum segment size (MSS) for packets that arrive at the ingress interface (initial direction), match a specific policy, and for which a session is created. The value you configure overrides the TCP MSS value in the incoming packet when the value in the packet is higher than the one you specify.

The `initial-tcp-mss` value per policy takes precedence over a global `tcp-mss` value (`all-tcp`, `ipsec-vpn`, `gre-in`, `gre-out`), if one is configured. However, when the `syn-flood-protection-mode syn-proxy` statement at the `[edit security flow]` hierarchy level is used to enable SYN proxy defenses against SYN attacks, the TCP MSS value is not overriden.

Because each policy has two directions, you can configure a value for both directions or for just one direction. To configure a TCP MSS value for the reverse session, use the `reverse-tcp-mss` option.

- **Range:** 64 through 65535

reverse-tcp-mss

Configure the TCP maximum segment size (MSS) for packets that match a specific policy and travel in the reverse direction of a session. The value you configure replaces the TCP MSS value when the value in the packet is higher than the one you specify.

The `reverse-tcp-mss` value per policy takes precedence over a global `tcp-mss` value (`all-tcp`, `ipsec-vpn`, `gre-in`, `gre-out`), if one is configured. However, when the `syn-flood-protection-mode`

syn-proxy statement at the [edit security flow] hierarchy level is used to enable SYN proxy defenses against SYN attacks, the TCP MSS value is not overridden.

Because each policy has two directions, you can configure a value for both directions or for just one direction. To configure the TCP MSS value for the initial session, use the initial-tcp-mss option.

- **Range:** 64 through 65535

sequence-check-required Enable sequence check per policy. The sequence-check-required value overrides the global value no-sequence-check.

syn-check-required Enable sync check per policy. The syn-check-required value overrides the global value no-syn-check.

window-scale Enable window-scale per policy.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The tcp-options, sequence-check-required, and syn-check-required statements are introduced in Junos OS Release 10.4.

The initial-tcp-mss and reverse-tcp-mss statements are introduced in Junos OS Release 12.3X48-D20.

The window-scale statement is introduced in Junos OS Release 15.1X49-D70.

TCP Sessions

tcp-sweep

IN THIS SECTION

- Syntax | 30149
- Hierarchy Level | 30149
- Description | 30149
- Options | 30149
- Required Privilege Level | 30149
- Release Information | 30149

Syntax

```
tcp-sweep {
    threshold number;
}
```

Hierarchy Level

```
[edit security screen ids-option screen-name tcp]
```

Description

Configure the device to detect and prevent TCP sweep attack. In a TCP sweep attack, an attacker sends TCP SYN packets to the target device as part of the TCP handshake. If the device responds to those packets, the attacker gets an indication that a port in the target device is open, which makes the port vulnerable to attack. If a remote host sends TCP packets to 10 addresses in 0.005 seconds (5000 microseconds), then the device flags this as a TCP sweep attack.

If the `alarm-without-drop` option is not set, the device rejects the eleventh and all further TCP packets from that host for the remainder of the specified threshold period.

Options

`threshold` *`number`*—Maximum number of microseconds during which up to 10 TCP SYN packets from the same host are allowed into the device. More than 10 requests from a host during this period triggers TCP Sweep attack response on the router during the remainder of the second.

- **Range:** 1000 through 1,000,000 microseconds
- **Default:** 5000 microseconds

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

tcpao-auth-mismatch

IN THIS SECTION

- Syntax | 30156
- Hierarchy Level | 30156
- Description | 30156
- Options | 30157
- Required Privilege Level | 30157
- Release Information | 30157

Syntax

```
tcpao-auth-mismatch {
    allow-without-tcpao;
}
```

Hierarchy Level

```
[edit fabric protocols bgp]
[edit logical-systems name protocols bgp]
[edit logical-systems name routing-instances name protocols bgp]
[edit logical-systems name tenants name routing-instances name protocols bgp]
[edit routing-instances name protocols bgp]
[edit tenants name routing-instances name protocols bgp]
[edit protocols bgp group group neighbor neighbor]
[edit protocols bgp]
[edit protocols ldp session session]
```

Description

Continue without TCP-AO if any one TCP endpoint does not have TCP-AO configured.

Options

allow-without-tcpao Allow the connection establishment without TCP-AO.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.2R1.

RELATED DOCUMENTATION

TCP Authentication Option (TCP-AO)

tdf (Unified Edge)

IN THIS SECTION

- Syntax | 30157
- Hierarchy Level | 30158
- Description | 30158
- Options | 30158
- Required Privilege Level | 30158
- Release Information | 30158

Syntax

```
tdf gateway-name;
```

Hierarchy Level

```
[edit unified-edge gateways]
```

Description

Specify the name to be used for the traffic detection function (TDF) gateway.

Options

gateway-name

Name of the gateway.

- **Range:** 1 through 16 characters.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

RELATED DOCUMENTATION

tdf-interface

IN THIS SECTION

- Syntax | 30159
- Hierarchy Level | 30159

- Description | 30159
- Options | 30159
- Required Privilege Level | 30159
- Release Information | 30160

Syntax

```
tdf-interface mif.number;
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name domains domain-name]
```

Description

Specify the TDF interface that the TDF domain uses. A TDF interface is different from other types of interfaces, and is associated with the TDF service set that is used for the TDF subscriber.

> **NOTE**: The TDF interface must have been previously configured at the `[edit interfaces]` hierarchy level.
>
> The TDF interface and the access-facing interfaces in the TDF domain must be included in the same VRF routing instance.

Options

mif.*number* Use the specified TDF interface unit number.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

        tdm-out-loop;
    }
```

Hierarchy Level

```
[edit interfaces interface],
[edit interfaces interface-range]
```

Description

Options

ces-psn-port-channel-id-override-disable	Disable Channel identifier override smart SFP
ces-psn-port-dmac-check-enable	Enable DMAC check on smart SFP
sfp-type	Smart SFP type

- CHAN-STM1—Channelised SFP STM1
- DS3—DS3 smart SFP
- E1—E1 smart SFP
- STM1—STM1 smart SFP
- STM16—STM16 smart SFP
- STM4—STM4 smart SFP
- T1—T1 smart SFP

tdm-in-loop

Configure port in TDM IN-LOOP mode

tdm-interface-mode

Channelized TDM port interface signal mode

- OC3—OC3 signal type with 84 DS1 channels
- STM1—STM1 signal type with 63 E1 channels
- **Default:** STM1

tdm-out-loop

Configure port in TDM OUT-LOOP mode

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

[none specified]

Release Information

Statement introduced in Junos OS Evolved Release 25.4R1

tdm-options (Interfaces)

IN THIS SECTION

Syntax | 30163

- Hierarchy Level | 30163
- Description | 30163
- Options | 30163
- Required Privilege Level | 30164
- Release Information | 30164

Syntax

```
tdm-options {
    ces-psn-channel ...
        ces-psn-port-dmac-check-enable ;
        iwf-params...
        sfp-type sfptype;
        tdm-in-loop ;
    tdm-out-loop ;
}
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

Configure TDM options to enable the smart SFP to encapsulate PDH (Plesiochronous Digital Hierarchy) and SDH (synchronous Digital Hierarchy) traffic over packet switched networks (PSNs).

Options

ces-psn-port-dmac-check-enable

Enables checking of the destination MAC address of the incoming packets on the receiving SFP. If you have configured the destination MAC address using the `dmac-address` option, use this option to verify the MAC address on the receiving SFP. If you have enabled MAC address verification and the MAC address does not match, the packet is discarded by the smart SFP.

sfp-type ***sfp-type***	Specify the smart SFP type you want to configure on the interface. Values: T1, E1, DS3, STM1, STM4, and STM16.
tdm-in-loop	Enables looping back of the input path (Rx) of TDM traffic on the SFP TDM port.
tdm-out-loop	Enables looping back of the output path (Tx) of TDM traffic on the SFP TDM port.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.4.

te-class-matrix

IN THIS SECTION

- Syntax | 30165
- Hierarchy Level | 30165
- Description | 30165
- Default | 30165
- Options | 30166
- Required Privilege Level | 30166
- Release Information | 30166

Syntax

```
te-class-matrix {
    te number {
        priority priority;
        traffic-class {
            ct number priority priority;
        }
    }
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls diffserv-te],
[edit protocols mpls diffserv-te]
```

Description

Specify the traffic engineering class matrix for a multiclass LSP or a DiffServ-aware traffic engineering LSP.

Default

The default traffic engineering class matrix is:

```
te-class-matrix {
    te0 traffic-class ct0 priority 7;
    te1 traffic-class ct1 priority 7;
    te2 traffic-class ct2 priority 7;
    te3 traffic-class ct3 priority 7;
    te4 traffic-class ct0 priority 0;
    te5 traffic-class ct1 priority 0;
    te6 traffic-class ct2 priority 0;
    te7 traffic-class ct3 priority 0;
}
```

If you define any of the traffic engineering classes, all the default values are dropped.

Options

`ct`*number*—Specify the number of the class type. It can be one of four values: `ct0`, `ct1`, `ct2`, or `ct3`.

`priority` *priority*—Specify the priority of the class type. It can be one of eight values from 0 through 7.

`te`*number*—Specify the number of the traffic engineering class. It can be one of eight values: `te0`, `te1`, `te2`, `te3`, `te4`, `te5`, `te6`, or `te7`. You must configure the traffic engineering classes in order, starting with `te0`.

`traffic-class`—Specify the traffic class for the traffic engineering class.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

te-link

IN THIS SECTION

- Syntax | 30167
- Hierarchy Level | 30167
- Description | 30167
- Options | 30167
- Required Privilege Level | 30167
- Release Information | 30168

Syntax

```
te-link te-link-name {
    disable;
    ethernet-vlan;
    interface interface-name {
        disable;
        local-address ip-address;
        remote-address ip-address;
        remote-id id-number;
    }
    local-address ip-address;
    remote-address ip-address;
    remote-id id-number;
}
```

Hierarchy Level

```
[edit protocols link-management],
[edit protocols link-management peer peer-name]
```

Description

Represent a collection of physical ports or time slots. Assign a traffic engineering link to the specified network peer.

Options

te-link-name—Name of the collection of physical ports or the name of the time slots.

`disable`—Disable the traffic engineering link or an interface to a traffic engineering link.

The remaining statements are explained separately..

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`ethernet-vlan` option introduced in Junos OS Release 14.2.

Link-State Distribution using BGP

tear-drop (IDS Screen Next Gen Services)

IN THIS SECTION

- Syntax | 30170
- Hierarchy Level | 30170
- Description | 30170

Required Privilege Level | 30170
Release Information | 30170

Syntax

```
tear-drop;
```

Hierarchy Level

```
[edit services screen ids-option screen-name ip]
```

Description

Identify and drop fragmented IP packets that overlap, which protects against teardrop attacks. In teardrop attacks, the target machine uses up its resources as it attempts to reassemble the packets, and then it can no longer process valid traffic.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

RELATED DOCUMENTATION

tei-option

IN THIS SECTION

- Syntax | 30171
- Hierarchy Level | 30171
- Description | 30171
- Options | 30171
- Required Privilege Level | 30172
- Release Information | 30172

Syntax

```
tei-option (first-call | power-up);
```

Hierarchy Level

```
[edit interfaces br-pim/0/portisdn-options]
```

Description

For ISDN interfaces, configure when the Terminal Endpoint Identifier (TEI) negotiates with the ISDN provider.

Options

`first-call`—Activation does not occur until the call setup is sent.

`power-up`—Activation occurs when the Services Router is powered on.

- **Default:** `power-up`

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

telemetries (PoE)

IN THIS SECTION

- Syntax | 30172
- Hierarchy Level | 30172
- Description | 30173
- Default | 30173
- Required Privilege Level | 30173
- Release Information | 30173

Syntax

```
telemetries {
    disable;
    duration hours;
    interval minutes;
}
```

Hierarchy Level

```
[edit poe interface (all | interface-name)]
```

Description

Allow logging of per-port PoE power consumption. The telemetries section must be explicitly specified to enable logging. If left unspecified, telemetries is disabled by default.

Default

If the telemetries statement is specified, logging is enabled with the default values for interval and duration.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

telemetries

IN THIS SECTION

- Syntax | 30174
- Hierarchy Level | 30174
- Description | 30174
- Default | 30174
- Required Privilege Level | 30174
- Release Information | 30174

Syntax

```
telemetries {
    disable;
    duration hours;
    interval minutes;
}
```

Hierarchy Level

```
[edit poe interface (all | interface-name)]
```

Description

Enable the logging of power consumption of a PoE interface over time.

If you want to log the power consumption of a PoE interface, you must explicitly specify the `telemetries` statement. When you commit the configuration, logging begins, with data being collected at the specified intervals. Logging stops at the end of the specified duration. If you do not specify the **duration** and `interval` statements, data is collected at the default interval of five minute intervals every hour.

The remaining statements are explained separately. See CLI Explorer.

Default

Logging of power consumption is disabled.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

Statement introduced in Junos OS Release 12.2 for ACX2000 Universal Metro Routers.

telemetry

IN THIS SECTION

- Syntax | 30175
- Hierarchy Level | 30176
- Description | 30176
- Options | 30177
- Required Privilege Level | 30177
- Release Information | 30177

Syntax

```
telemetry {
    subscriber-statistics;
    service-statistics;
    }
    interfaces junos-interface-name {
        unit "$junos-interface-unit" {
            family [inet | inet6] {
                filter {
                    input "inputFilter";
                    output "outputFilter";
                }
            }
        }
    }
    queue-statistics {
        interface $junos-interface-name {
            refresh rate;
```

```
            queues queue-set;
        }
        interface-set $junos-interface-set-name {
            refresh rate;
            queues queue-set;
        }
    }
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name]
```

Description

Enable telemetry collection of subscriber statistics and queue statistics.

Include the **subscriber-statistics** statement to enable the export of subscriber statistics through telemetry. When this statement is configured, you must also include the **actual-transit-statistics** statement at the [`edit dynamic-profiles` *`profile-name`* `interfaces` *`interface-name`* `unit` *`unit-name`*} hierarchy level to enable subscriber-statistics.

Include the **queue-statistics** statement to instruct the statistics infrastructure to collect queue statistics for dynamic interfaces or interface-sets queue-statistics and enable export via Junos Telelemetry Interface (JTI).

The profile variable `$junos-interface-name`" and "`$junos-interface-set-name`" are generated from the corresponding device, unit and interface-set elements in the interfaces stanza at profile instantiation time. Using these derived variables is a convenient way to configure telemetry behavior for the interface or interface-set without the need to mimic the specific configuration in the interfaces stanza.

After telemetry for these statistics is enabled, they are eligible for export through a collector subscription.

For information about subscribing to the statistics through an external collector, see *Configure a NETCONF Proxy Telemetry Sensor in Junos*. For information about supported sensors for subscriber statistics and queue statistics, see *Guidelines for gRPC and gNMI Sensors (Junos Telemetry Interface)*.

Options

subscriber-statistics

Enable the export of interface meta-data and export of subscriber accurate statistics. When this statement is configured, you must also include the **actual-transit-statistics** statement at the [`edit dynamic-profiles` *`profile-name`* `interfaces` *`interface-name`* `unit` *`unit-name`*] hierarchy level.

queue statistics interface "$junos-interface-name"

Enable the export of interface meta-data and interface queue statistics. The profile variable `$junos-interface-name"` is generated from the corresponding device, unit and interface elements in the interfaces stanza at profile instantiation time.

queue statistics interface-set "$junos-interface-set-name"

Enable the export of interface-set meta-data and interface-set queue statistics. The profile variable `"$junos-interface-set-name"` is generated from the corresponding device, unit and interface-set elements in the interfaces stanza at profile instantiation time.

refresh *rate*

Override the default internal queue statistics collection interval. If dynamic interfaces and interface-sets are created as a result of multiple dynamic profiles, each with their own refresh intervals, the smallest interval for each object type (interface or interface-set) is used to poll queue statistics for that object type. The default is 900 seconds.

Range: 300 seconds (5 minutes) to 86,400 seconds (24 hours)

queue "*queue-set*"

Specify the set of queues for which queue-statistics will be exported. The queue set is a comma delimited string of integers. The default is all queues (`0,1,2,3,4,5,6,7`) are eligible for export.

Range: 0 to 7

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS 18.4.

RELATED DOCUMENTATION

telemetry

IN THIS SECTION

- Syntax | **30178**
- Hierarchy Level | **30178**
- Description | **30179**
- Options | **30179**
- Required Privilege Level | **30179**
- Release Information | **30179**

Syntax

```
telemetry {
    statistics{
        no-ingress;
        no-transit;
    }
}
```

Hierarchy Level

```
[edit logical-systems name protocols source-packet-routing],
[edit protocols source-packet-routing]
```

Description

Enable telemetry on segment routing traffic engineering policies at ingress nodes. Junos OS creates the following sensors to collect traffic statistics for segment routing:

- BGP-SRTE policies for ingress routes, sensors are attached to nexthops in inet{6}color.0 table.
- Static SRTE policies for ingress routes, sensors are attached to nexthops in inet{6}color.0 table.
- Transit routes for BGP-SRTE policies in mpls.0 table.
- Transit routes for static SRTE policies in mpls.0 table.

> **NOTE**: If both static SRTE policy and BGP SRTE policy are to present for the same destination and color then only one of them is made active and BSID of the corresponding active policy is programmed to the mpls.0 table. In this case the sensor is attached to BSID of the active policy only.

Options

statistics Enable collection of traffic statistics on segment routing traffic engineering policies.

Required Privilege Level

routing

Release Information

telnet (Services)

IN THIS SECTION

- Syntax | 30181
- Hierarchy Level | 30182
- Description | 30182
- Options | 30182
- Required Privilege Level | 30183
- Release Information | 30183

Syntax

```
telnet {
    authentication-order [authentication-methods];
    connection-limit limit;
    rate-limit limit;
}
```

Hierarchy Level

```
[edit system services]
```

Description

Provide Telnet connections from remote systems to the local device.

Options

authentication-order [*authentication-methods*]

Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.

- **Values:** Specify one or more of the following authentication methods listed in the order in which they must be tried:
  - `ldaps`—Use LDAP authentication services.
  - `password`—Use the password configured for the user with the `authentication` statement at the `[edit system login user]` hierarchy level.
  - `radius`—Use RADIUS authentication services.
  - `tacplus`—Use TACACS+ authentication services.
- **Default:** If you do not include the `authentication-order` statement, users are verified based on their configured passwords.

connection-limit *limit*

Configure the maximum number of connections sessions for the telnet service per protocol (either IPv6 or IPv4).

> **NOTE**: The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured `connection-limit` value if the system resources are limited.

- **Range:** 1 through 250 connections
- **Default:** 75 connections

rate-limit *limit*

Configure the maximum number of connections attempts per minute, per protocol (either IPv6 or IPv4) on an access service. For example, a rate limit of 10 allows 10 IPv6 telnet session connection attempts per minute and 10 IPv4 telnet session connection attempts per minute.

- **Range:** 1 through 250 connections
- **Default:** 150 connections

Required Privilege Level

system—To view this statement in the configuration.

Description

Open a telnet session to a remote system. Type Ctrl+] to escape from the telnet session to the telnet command level, and then type `quit` to exit from telnet.

> **NOTE**: For Junos OS Evolved, use the `routing-instance mgmt_junos` option to access a remote system through the management interface.

Options

host	Name or address of the remote system.
8bit	(Optional) Use an 8-bit data path.
bypass-routing	(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.
inet | inet6	(Optional) Open an IPv4 or IPv6 session, respectively.
interface ***interface-name***	(Optional) Interface name for the telnet session. (This option does not work when `default-address-selection` is configured at the `[edit system]` hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)
logical-system ***logical-system-name***	(Optional) Name of a particular logical system for the telnet attempt.
tenant ***tenant-name***	(Optional) Name of a particular tenant system for the telnet attempt.
no-resolve	(Optional) This option is not supported for Junos OS Evolved Release 18.3R1. Do not attempt to determine the hostname that corresponds to the IP address.
port ***port-number***	(Optional) Port number or service name on the remote system.
routing-instance ***routing-instance-name***	(Optional) Name of the routing instance for the telnet attempt.
source ***source-address***	(Optional) This option is not supported for Junos OS Evolved Release 18.3R1. Source address of the telnet connection.

Additional Information

You can limit the number of times a user can attempt to enter a password while logging in through telnet. To specify the number of times a user can attempt to enter a password to log in through telnet, include the "retry-options" on page 16305 statement at the [`edit system login`] hierarchy level.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

telnet

```
user@host> telnet 192.154.1.254
Trying 192.154.169.254...
Connected to level5.company.net.
Escape character is '^]'.
ttypa
login:
```

Release Information

Command introduced before Junos OS Release 7.4.

The following options are deprecated in Junos OS Evolved Release 18.3R1: `bypass-routing`, `interface`, `no-resolve`, and `source`.

The command `tenant` option is introduced in Junos OS Release 19.2R1 for SRX Series.

Description

Modify the temperature thresholds at which fan speeds change using the `temperature-sensor` command to thermally manage high-power optics such as 400G ZR and ZR-M in Junos OS and Junos OS Evolved releases. This manual configuration is not required if your platform and software release support Optics EM Policy.

> **NOTE**: Manual fan speed provisioning for high power optics (ex. 400G ZR/ZR+) is not required for platforms and software releases that support Optics EM Policy. Optics EM Policy incorporates periodically polled temperature reading of pluggable optical modules in the system's automated control of fan speed behavior. Please check Feature Explorer to verify if your device and software release supports Optics EM Policy.

The command is supported for the following platforms and releases only:

Table 1900: Supported Platforms and Releases

Platforms	Releases
PTX10K with PTX10K-LC1201-36CD	Prior to Junos Evolved Release 23.4R1
PTX10001-36MR	Prior to Junos Evolved Release 23.4R1
ACX7100-32C, ACX7100-48L	Prior to Junos Evolved Release 24.4R1
MX10K with MX10K-LC9600	Prior to Junos Release 24.4R1
MX304 with MX304-LMIC16	Prior to Junos Release 24.2R1

Options

Options	Description
temperature sensor *sensor-name*	Specify name of the temperature sensor in quotes if the name includes spaces. Use the *sensor-name* as given below: • **"Temp Sensor PSM Inlet"** for PTX10001-36MR devices. • **"Intake A Temp Sensor"** for PTX10K devices with PTX10K-LC1201-36CD line card. • **"Main PCBLeft"** and **"Main PCBRight"** for ACX7100-32C and ACX7100-48L devices. • **"Intake A Temp Sensor"** for MX10K devices with MX10K-LC9600 line card. • **"Intake_A Temp Sensor"** for MX304 devices with MX304-LMIC16 line card. • **xcvr-*fpc-slot-number/ pic-number/ port-number*** for devices with optic modules. Please use the `show chassis temperature-thresholds` command to verify the temperature sensor name.
temperature threshold	Specify the temperature threshold values.
fans-on-full-speed *fans-full-speed-temp*	Temperature threshold based on chassis-cooling requirements for fans on full speed.
fans-on-full-speed-if-failed-fan *full-speed-failed-fan-temp*	Temperature threshold based on chassis-cooling requirements if fans are at full speed and any fan fails.
fans-on-intermediate-speed *fans-intermediate-speed-temp*	Temperature threshold based on chassis-cooling requirements when fans are at intermediate speed.
fans-to-normal-speed *fans-normal-speed-temp*	Temperature threshold based on chassis-cooling requirements for fans at normal speed.

(Continued)

Options	Description
fire-shutdown *fire-shutdown-temp*	Temperature threshold beyond which Junos triggers a fire shutdown.
red-alarm *red-alarm-temp*	Temperature threshold beyond which Junos triggers a red alarm alert.
red-alarm-if-failed-fan *red-alarm-failed-fan-temp*	Temperature threshold beyond which Junos triggers a red alarm when any fan fails.
yellow-alarm *yellow-alarm-temp*	Temperature threshold beyond which Junos triggers a yellow alarm alert.
yellow-alarm-if-failed-fan *yellow-alarm-failed-fan-temp*	Temperature threshold beyond which Junos triggers a yellow alarm when any fan fails.

NOTE: When configuring temperature thresholds, you must maintain the following order:

`fans-to-normal-speed-temp < fans-on-intermediate-speed-temp < fans-full-speed-temp <= yellow-alarm-temp < red-alarm-temp < fire-shutdown-temp`

The following snippets are examples of temperature thresholds (in celsius) configuration for several platforms.

PTX10001-36MR

```
[edit chassis cb 0]
temperature-sensor "Temp Sensor PSM Inlet" {
    temperature-threshold {
        fans-on-full-speed 30;
        fans-on-full-speed-if-failed-fan 28;
        fans-on-intermediate-speed 20;
        fans-to-normal-speed 15;
        fire-shutdown 80;
        red-alarm 75;
        red-alarm-if-failed-fan 72;
```

```
        yellow-alarm 65;
        yellow-alarm-if-failed-fan 62;
    }
}
```

PTX10K-LC1201-36CD line card for PTX10004, PTX10008, and PTX10016

```
[edit chassis cb 0]
temperature-sensor "Intake A Temp Sensor" {
    temperature-threshold {
        fans-on-full-speed 3;
        fans-on-full-speed-if-failed-fan 0;
        fans-on-intermediate-speed 2;
        fans-to-normal-speed 1;
        fire-shutdown 80;
        red-alarm 75;
        red-alarm-if-failed-fan 72;
        yellow-alarm 65;
        yellow-alarm-if-failed-fan 62;
    }
}
```

    }
}
```

MX10K-LC9600 Line Card for MX10004 and MX10008

```
[edit chassis fpc fpc_number]
temperature-sensor "Intake-A Temp Sensor" {
    temperature-threshold {
        fans-on-full-speed 3;
        fans-on-full-speed-if-failed-fan 0;
        fans-on-intermediate-speed 2;
        fans-to-normal-speed 1;
        fire-shutdown 80;
        red-alarm 75;
        red-alarm-if-failed-fan 72;
        yellow-alarm 65;
        yellow-alarm-if-failed-fan 62;
    }
}
```

NOTE: The *fpc_number* is the FPC where MX10K-LC9600 line card is installed.

MX304-LMIC16 Line Card for MX304

```
[edit chassis cb 0]
temperature-sensor Intake_A Temp Sensor {
    temperature-threshold {
        fans-to-normal-speed 5;
        fans-on-intermediate-speed 15;
        fans-on-full-speed 20;
        fans-on-full-speed-if-failed-fan 17;
        yellow-alarm 50;
        yellow-alarm-if-failed-fan 50;
        red-alarm 70;
        red-alarm-if-failed-fan 70;
```

```
        fire-shutdown 75;
    }
}
```

Verify Configured Thresholds

You can verify the configured thresholds using the `show chassis temperature-thresholds` command:

```
user@host> show chassis temperature-thresholds
                                        Fan speed      Yellow alarm      Red alarm      Fire
Shutdown
                                       (degrees C)      (degrees C)     (degrees C)
(degrees C)

}
```

Hierarchy Level

```
[edit services inline-monitoring]
```

Description

Configure template for inline monitoring services.

Options

name	Name of the template.
flow-inactive-timeout ***seconds***	(EX switches only) Configure the inactive-timeout period for a flow, in seconds, for flow-based telemetry. Once there is no active traffic for a flow, the flow is aged out after the configured inactive-timeout period.
flow-monitoring	(EX switches only) Configure flow-based telemetry. See flow-monitoring (Inline Monitoring Services) for more information.
observation-domain-id ***observation-domain-id***	Significant one byte of observation domain ID used to uniquely identify the exporting process. The other three bytes are system generated and are unique within the chassis. • **Default:** 0 • **Range:** 1 through 255
option-template-id ***option-template-id***	(Junos OS only) Option template ID. For Junos OS Evolved, the system generates the option template ID.

- **Default:** 640
- **Range:** 1024 through 65535

option-template-refresh-rate *seconds*

Option refresh rate in seconds.

- **Default:** 600 seconds
- **Range:** 10 through 600 seconds

primary-data-record-fields *name*

Configure which IPFIX information elements (IEs) to include in the primary data record for Juniper Resiliency Interface. See "primary-data-record-fields" on page 13681 for more information.

template-id *template-id*

(Junos OS only) Template ID. For Junos OS Evolved, the system generates the template ID.

- **Default:** 384
- **Range (EX4400):** 1024 through 65535
- **Range (EX4100 and EX4100-F):** 32768 through 32831

template-refresh-rate *seconds*

Refresh rate in seconds.

- **Default:** 600 seconds
- **Range:** 10 through 600 seconds

template-type (ipv4-template | ipv6-template)

(QFX5120 only, Junos OS only) For flow-based telemetry for VXLANs, specify that the template is for either IPv4 or IPv6 traffic.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.4R1.

        }
        then {
            accept;
            custom-page custom-page;
            http-status-code http-status-code;
            redirect-url redirect-url;
            tcp-reset;
        }
    }
    url-filter-database filename
}
```

Hierarchy Level

```
[edit services url-filter profile profile-name]
```

Description

Configure a URL filter template.

> **NOTE**: Starting in Junos OS Release 18.3R1, the `template` statement is deprecated and has been replaced by the `url-filter-template` statement. The `template` statement is supported for backward compatibility.

Options

template-name	Name of the template.
client-interfaces [*client-interface-name1 client-interface-name2* **]**	The list of client-facing logical interfaces (uplink) on which the URL filtering is configured. This option is mandatory.

`disable-url-filtering`	Disables the filtering of HTTP traffic that contains an embedded IP address (for example, http:/10.1.1.1) belonging to a blocklisted domain name in the URL filter database.
`dns-resolution-interval` *`minutes`*	DNS resolution time interval in minutes. • **Default:** 1440 • **Range:** 60 through 1440 minutes.
`dns-resolution-rate` *`seconds`*	Number of DNS queries per second sent out from the system before initiating further DNS queries. • **Default:** 50 • **Range:** 50 through 100.
`dns-retries` *`number`*	Number of retries for a DNS query in case query fails or times out. • **Default:** 3 • **Range:** 1 through 5.
`dns-routing-instance` *`dns-routing-instance-name`*	The VRF on which the DNS server is reachable. This option is mandatory. You can use the default routing instance inet.0 or a defined routing instance.
`dns-server [` *`ip-address1 ip-address2 ip-address3`* `]`	One or more IP (IPv4 or IPv6) addresses of DNS servers to which the DNS queries are sent out. This option is mandatory.
`dns-source-interface` *`loopback-interface-name`*	The loopback interface for which source IP address is picked for sending DNS queries. This option is mandatory.
`routing-instance` *`routing-instance-name`*	The VRF on which URL filtering feature is configured. This option is mandatory. You can use the default routing instance inet.0 or a defined routing instance.
`server-interfaces [` *`server-interface-name1 server-interface-name2`* `]`	Server-facing interfaces to which traffic is destined. This option is mandatory. The list of server-facing logical interfaces (downlink) on which the URL filtering is configured. This option is mandatory.
`url-filter-database` *`filename`*	The filename of the URL filter database. The file should be placed in the **/var/db/url-filterd** directory, but indicate just the filename here and not the full path.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2.

template-id

IN THIS SECTION

- Syntax | 30215
- Hierarchy Level | 30215
- Description | 30215
- Options | 30216
- Required Privilege Level | 30216
- Release Information | 30216

Syntax

```
template-id id;
```

Hierarchy Level

```
[edit services flow-monitoring version9 template template-name],
[edit services flow-monitoring version-ipfix template template-name]
```

Description

Define a template ID to be used for flow aggregation of version 9 and IPFIX flows.

MX and QFX Series

The template ID can be a value in the range of 1024 through 65535. If you do not configure a value for the template ID, a default value is assumed for this ID, which is different for the various address families. If you configure the same template ID value for different address families, such a setting is not processed properly and might cause unexpected behavior. For example, if you configure the same template ID value for both IPv4 and IPv6, the collector validates the export data based on the template ID value that it last receives. In this case, if IPv6 is configured after IPv4, the value is effective for IPv6 and the default value is used for IPv4.

PTX Series

If you choose to configure the template ID, the range is 1024 to 65520. If you do not configure this ID, the default value that are set is in the range 256-511 and is different for each template.

You can configure the `template-id` statement for family `inet`, `inet6`, and `mpls` only.

You must not configure the same IDs for different templates (option or data template). The operating system does not check to ensure that you do not configure the same ID value for different templates. If you configure the same ID value, such a setting is not processed properly and might cause unexpected behavior.

The template ID range [configured `template-id` value + 20) is reserved and you must not configure any another ID in this range. The difference between configured template IDs across families should be at least 20; for example, if `template-id 1056` is configured for family `inet`, you should not configure template IDs in the range of 1056 to 1075 for any other families.

For Junos OS, if you change the template ID, all flows are inactively timed out. New flows are learned afresh.

For Junos OS Evolved, if you change the template ID, this change does not impact the flows.

Options

id—Unique identifier for the template to be used for version 9 or IPFIX flows. The range 0-255 is reserved and is used for template sets, options template sets, and for future expansion. If you do not configure a template ID, the software generates a template ID for you.

- **Range:** 1024 through 65,535

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

Syntax

```
template-profile template-profile-name;
```

Hierarchy Level

```
[edit services jflow-log],
[edit services service-set service-set-name jflow-log]
```

Description

Specify the name of the flow template profile to be used for generating flow monitoring format messages for NAT events and for transmitting them to the collector. You can define a template profile for the Jflow service by using this statement at the `[edit services jflow-log]` hierarchy level, and associate the template profile with a service set by using this statement at the `[edit services service-set` *`service-set-name`* `jflow-log]` hierarchy level.

Options

`template-profile-name`—Name of the flow template profile for NAT events. The name can be up to 32 alphanumeric characters in length. Allowed characters are [a-zA-Z0-9_].

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

Syntax

```
template-tx-interval tx-time;
```

Hierarchy Level

```
[edit services lrf profile profile-name template template-name]
```

Description

Configure the interval at which to retransmit the template to the collector.

Options

tx-time Time interval in seconds.

- **Default:** 60
- **Range:** 10 through 600

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support for Next Gen Services introduced in Junos OS Release 19.3R1 on MX Series.

template-type (Flow Monitoring Logs for NAT)

IN THIS SECTION

- Syntax | 30225
- Hierarchy Level | 30225
- Description | 30225
- Options | 30225
- Required Privilege Level | 30225
- Release Information | 30226

Syntax

```
template-type nat;
```

Hierarchy Level

```
[edit services jflow-log template-profile template-profile-name]
```

Description

Specify the type of service for which flow template profiles, in version or IPFIX format, must be used for generating flow monitoring format messages for NAT events and for transmitting them to the collector. Currently, you can configure only NAT events or services for generation of log messages in flow monitoring format.

Options

`nat`—Use flow template profiles for generation of flow monitoring logs for NAT events.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

template-type (LRF Profile)

IN THIS SECTION

- Syntax | 30226
- Hierarchy Level | 30227
- Description | 30227
- Options | 30227
- Required Privilege Level | 30228
- Release Information | 30228

Syntax

```
template-type template-type;
```

Hierarchy Level

```
[edit services lrf profile profile-name template template-name]
```

Description

Configure the template types for the template, which specify the data fields to include. You must configure at least one type, and you can configure multiple types.

If Next Gen Services is enabled, then the template types `dns`, `ifl-subscriber`, `ipv4-extended`, `ipv6-extended`, `mobile-subscriber`, `video`, and `wireline-subscriber` are not available.

Options

template-type

Template type. You must configure at least one of the following types, and you can configure multiple types:

- `device-data`—Use data fields specific to the device collecting the logging feed.
- `dns`—(Not available if Next Gen Services is enabled) Use the DNS response time data field.
- `flow-id`—Use the Flow ID data field.
- `http`—Use data fields for the HTTP metadata from header fields.
- `ifl-subscriber`—(Not available if Next Gen Services is enabled) Use data fields specific to interface-based subscribers.
- `ipflow`—Use data fields for the uplink and downlink octets and bytes.
- `ipflow-extended`—Use data fields for the service set name, routing instance, and payload timestamps.
- `ipflow-tcp`—Use data fields for TCP-related timestamps.
- `ipflow-tcp-ts`—Use IBM-specific data fields for TCP-related timestamps.When configuring a `ipflow-tcp-ts` template, configure `vendor-support ibm` at the `[edit services lrf profile profile-name]` hierarchy level to avoid a commit warning.
- `ipflow-ts`—Use data fields for the flow start and end timestamps.
- `ipv4`—Use data fields for the basic source and destination IPv4 information.

- `ipv4-extended`—(Not available if Next Gen Services is enabled) Use data fields for the elements of IPv4 extended fields.
- `ipv6`—Use data fields for the basic source and destination IPv6 information.
- `ipv6-extended`—(Not available if Next Gen Services is enabled) Use data fields for the elements of IPv6 extended fields.
- `l7-app`—Use data fields for the Layer 7 application.
- `mobile-subscriber`—(Not available if Next Gen Services is enabled) Use data fields specific to mobile subscribers.
- `pcc`—Use the PCC rule name data field.
- `status-code-dist`—Use data fields for the HTTP or DNS status codes.
- `subscriber-data`—Use data fields for Generic Subscriber information that can be included with wireless (mobile) subscribers or wireline subscribers.
- `transport-layer`—Use data fields for the transport layer.
- `video`—(Not available if Next Gen Services is enabled) Use data fields for video traffic.
- `wireline-subscriber`—(Not available if Next Gen Services is enabled) Use the UserName data field for wireline subscribers.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

        media-packet-size media-packet-size;
    }
}
```

Hierarchy Level

```
[edit services video-monitoring]
```

Description

Configure the media delivery index template containing the measurement parameters for video monitoring.

Options

delay-factor	Define delay factor syslog threshold levels.
delay-factor-threshold	Delay factor threshold in milliseconds. When the threshold is exceeded, a syslog message is generated. • **Default:** 0—Do not generate syslogs. • **Range:** 0 though 65,535 milliseconds
disable	Disable logging for the threshold.
inactive-timeout	Number of seconds of flow inactivity after which time media delivery index statistics collection for a flow is terminated. • **Range:** 30 through 300 seconds
info | warning | critical	Level of syslog message generated when a threshold is exceeded.
interval-duration	Number of seconds after which time media delivery index flow monitoring statistics for the interval are reported. • **Range:** 1 through 50

layer3-packets-per-second
Layer 3 packet rate in IP packets per second.

- **Range:** 0 though 4,294,967,295 pps

media-bits-per-second
Media bit rate for the stream in bits per second.

media-loss-rate
Define media loss rate syslog threshold levels.

media-packets-count-in-layer-3
Number of media packets in an IP packet.

- **Range:** 1 through 32

media-packet-size
Size of media packet in bits.

- **Default:** 188
- **Range:** 1 through 2048

media-rate-variation
Define delay factor syslog threshold levels.

mlr-packet-count
Media loss rate threshold expressed as the number of packets dropped. When the threshold is exceeded, a syslog message is generated.

mlr-percentage
Media loss rate threshold expressed as the percentage of total packets dropped. When the threshold is exceeded, a syslog message is generated.

- **Range:** 0 through 100

mrv-variation
Media rate variation threshold. The variation is the ratio of actual media rate to the configured media rate, expressed as a percentage.

template-name
Name of the template containing media delivery index measurement criteria. The template can be assigned to an interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

Security Policy Applications Overview

term (candidate-uplink-policy)

IN THIS SECTION

- Syntax | 30235
- Hierarchy Level | 30236
- Description | 30236
- Options | 30236
- Required Privilege Level | 30236
- Release Information | 30237

Syntax

```
term term-name{
    from {
        product-model model-name;
```

```
        <holddown holddown-time>;
        <minimum-links number-of-links>;
        <uplink-port-group uplink-port-group-name>;
    }
}
```

Hierarchy Level

```
[edit policy-options satellite-policies candidate-uplink-port-profile policy-name]
```

Description

Create and configure a term in a candidate uplink satellite policy within a Junos Fusion.

A term in a candidate uplink port policy in a Junos Fusion is used to apply an uplink failure detection configuration to certain satellite devices, based on their product model only. The more complex options that are available for other policies in Junos OS—such as the terms available for routing policies—are not available for candidate uplink port policies.

Options

term-name The user-defined name of the term.

A *term* is a named structure in which match conditions and configuration statements are defined. A candidate uplink policy policy can contain multiple terms. The terms are evaluated in the order they appear in the configuration. The first term that matches a satellite device is applied to that satellite device.

from The statements under the `from` statement define the satellite device model match criteria and uplink failure detection configuration for the term. Each term can contain only one `from` statement.

The remaining statements are explained separately.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2R3.

term (Dynamic Profiles)

IN THIS SECTION

- Syntax | 30239
- Hierarchy Level | 30240
- Description | 30240
- Options | 30240
- Required Privilege Level | 30240
- Release Information | 30240

Syntax

```
term term-name {
    from {
        match-conditions;
    }
    then {
        action;
        action-modifiers;
    }
    only-at-create;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall family family-name fast-update-filter filter-name],
[edit dynamic-profiles profile-name firewall family family-name  filter filter-name]
```

Description

Define terms for fast update filters.

Options

action—(Optional) An action to take if conditions match. If you do not specify an action, the packets that match the conditions in the `from` statement are accepted.

action-modifiers—(Optional) One or more actions to perform on a packet.

`from`—(Optional) Match packet fields to values. If not included, all packets are considered to match and the actions and action modifiers in the `then` statement are taken.

match-conditions—One or more conditions to make a match.

`only-at-create`—(Optional) Specify that the term is added only when the fast update filter is first created. No subsequent changes can be made to the term in the filter. Use this option only for terms that do not include subscriber-specific data in their match conditions, such as common or default terms (for example, counting the default drop packets).

term-name—Name that identifies the term. The name can contain letters, numbers, and hyphens (-), and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks (“ ”).

`then`—(Optional) Actions to take on matching packets. If not included and a packet matches all the conditions in the `from` statement, the packet is accepted.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

Support at the [edit dynamic-profiles ... filter *filter-name*] hierarchy level introduced in Junos OS Release 11.4.

[edit logical-systems logical-system-name firewall family family-name service-filter filter-name],
[edit logical-systems logical-system-name firewall family family-name simple-filter filter-name]
```

Description

Define a firewall filter term.

Options

actions—(Optional) Actions to perform on the packet if conditions match. You can specify one *terminating action* supported for the specified filter type. If you do not specify a terminating action, the packets that match the conditions in the `from` statement are accepted by default. As an option, you can specify one or more *nonterminating actions* supported for the specified filter type.

filter-name—(Optional) For `family` *family-name* `filter` *filter-name* only, reference another standard stateless firewall filter from within this term.

`from`—(Optional) Match packet fields to values. If not included, all packets are considered to match and the actions and action modifiers in the `then` statement are taken.

match-conditions—One or more conditions to use to make a match on a packet.

match-conditions-mpls-ipv4-address—(MPLS-tagged IPv4 traffic only) One or more IP address match conditions to match on the IPv4 packet header. Supports network-based service in a core network with IPv4 packets as an inner payload of an MPLS packet with labels stacked up to five deep.

match-conditions-mpls-ipv4-port—(MPLS-tagged IPv4 traffic only) One or more UDP or TCP port match conditions to use to match a packet in an MPLS flow. Supports network-based service in a core network with IPv4 packets as an inner payload of an MPLS packet with labels stacked up to five deep.

vxlan—(Optional) Match packets belonging to a particular VXLAN Network Identifier (VNI).

term-name—Name that identifies the term. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks (“ ”).

`then`—(Optional) Actions to take on matching packets. If not included and a packet matches all the conditions in the `from` statement, the packet is accepted.

The Firewall Filer Match Conditions for the different protocols are explained separately:

- *Firewall Filter Match Conditions for IPv4 Traffic*
- *Firewall Filter Match Conditions for IPv6 Traffic*
- *Firewall Filter Match Conditions for MPLS Traffic*
- *Firewall Filter Match Conditions for MPLS-Tagged IPv4 or IPv6 Traffic*
- *Firewall Filter Match Conditions for VPLS Traffic*
- *Firewall Filter Match Conditions for Protocol-Independent Traffic*
- *Firewall Filter Match Conditions for Protocol-Independent Traffic in Dynamic Service Profiles*
- *Firewall Filter Match Conditions Based on Numbers or Text Aliases*
- *Firewall Filter Match Conditions Based on Bit-Field Values*
- *Firewall Filter Match Conditions Based on Address Fields*
- *Firewall Filter Match Conditions Based on Address Classes*
- *Firewall Filter Match Conditions for Layer 2 Bridging Traffic*

- *Firewall Filter Match Conditions for Layer 2 CCC Traffic*

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

            tag-separator separator;
        }
    }
}
```

Hierarchy Level

```
[edit services hcm tag-rule rule-name]
```

Description

Configure a term in a tag rule, which is used to enrich HTTP headers with the appropriate tags. You must configure at least one term for a tag rule, but you can configure multiple terms. Terms are evaluated in the order they are configured. If a data packet matches all the criteria in the `from` statement in any of the terms, then the actions specified in the `then` statement are applied. If the `from` statement does not identify any criteria, then all traffic matches. After a term matches a data packet, further terms are not evaluated. If no terms match, then the HTTP header is not enriched.

For subscriber traffic under static policy control, a tag rule is used if it is included in the HCM profile specified in a PCC rule that the traffic matches. For subscribers under dynamic policy control, a message from the PCRF identifies the configured HCM profile and tag rules to use for HTTP header enrichment.

Options

term-number

Number for the term.

- **Range:** 1 through 32,767

The remaining statements are explained separately. See CLI Explorer.

Configuring Port Control Protocol

term (satellite-policies)

IN THIS SECTION

- Syntax | 30256
- Hierarchy Level | 30257
- Description | 30257
- Options | 30257
- Required Privilege Level | 30258
- Release Information | 30258

Syntax

```
term term-name{
    from {
        product-model model-name;
    }
}
```

Hierarchy Level

```
[edit policy-options satellite-policies candidate-uplink-policy policy-name],
[edit policy-options satellite-policies environment-monitoring-policy policy-name],
[edit policy-options satellite-policies forwarding-policy policy-name]
```

Description

Create and configure a term in a candidate uplink satellite policy, an environment monitoring satellite policy, or a forwarding policy satellite policy, within a satellite policy.

A term in a candidate uplink policy, an environment monitoring policy, or a forwarding policy for satellite devices is used to apply the policy to certain satellite devices only. The more complex options that are available for other policies in Junos OS—such as the terms available for routing policies—are not available for satellite policies.

The actions of a candidate uplink satellite policy, an environment monitoring satellite policy, or forwarding-policy satellite policy are defined at the [`edit policy-options satellite-policies candidate-uplink-policy` *`policy-name`* , [`edit policy-options satellite-policies environment-monitoring-policy` *`policy-name`*], and [`edit policy-options satellite-policies forwarding-policy` *`policy-name`*hierarchy levels.

Options

term *term-name*

Specifies the user-defined name of the term.

A *term* is a named structure in which match conditions and actions are defined. A candidate uplink policy or environment monitoring policy can contain multiple terms. The term name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

from

(Optional) Defines the match criteria for the satellite policy.

The only match criteria available for a satellite policy is the product model.

If you omit the `from` option, the satellite policy is applied globally.

product-model *model-name*

Defines the product model of the satellite device that uses the satellite policy.

If you want the satellite policy to apply to all EX4300 switches in the satellite device role, enter `EX4300*` as the *model-name*.

If you want the satellite policy to apply to all QFX5100 switches in the satellite device role, enter `QFX5100*` as the *model-name*.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Configuring Stateful Firewall Rules

term (Simple Filter)

IN THIS SECTION

- Syntax | 30264
- Hierarchy Level | 30264
- Description | 30264
- Options | 30265
- Required Privilege Level | 30265
- Release Information | 30265

Syntax

```
term term-name {
    from {
        match-conditions;
    }
    then {
        forwarding-class class-name;
        loss-priority (high | low | medium);
    }
}
```

Hierarchy Level

```
[edit firewall family inet simple-filter filter-name]
```

Description

Define a simple filter term.

Options

`from`—Match packet fields to values. If the `from` option is not included, all packets are considered to match and the actions and action modifiers in the `then` statement are taken.

`match-conditions`—One or more conditions to use to make a match.

`term-name`—Name that identifies the term. The name can contain letters, numbers, and hyphens (-), and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (“ ”).

`then`—Actions to take on matching packets. If the `then` option is not included and a packet matches all the conditions in the `from` statement, the packet is accepted. For CoS, only the actions listed are allowed. These statements are explained separately.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.6.

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name domain-selection]
```

Description

Configure a term that can be used to select the TDF domain for an IP-based subscriber. You can configure multiple terms (up to 10 terms) for the TDF domain selection, and each term is applied in the order in which it is configured. You can specify multiple match conditions within the `from` statement of a term, and all of the conditions have to match. If the incoming RADIUS request from the subscriber matches the criteria in a term, then the TDF domain specified in the `then` statement of the term is used to create the TDF subscriber session.

A term can also be used to select a PCEF profile for a an IP-based subscriber. Setting up a term so that it is used to select a profile is required if the TDF domain selected for a subscriber does not specify a PCEF profile or you want to allow different members of the same TDF domain to have different PCEF profiles.

After a term matches and a TDF domain is selected, further terms are not evaluated when the PCEF profile is specified in either the `then` statement or in the selected TDF domain. If a PCEF profile is not

specified in either the `then` statement or in the selected TDF domain, further terms are evaluated to find a PCEF profile for the subscriber.

If no TDF domain is selected for a subscriber, then a TDF subscriber session is not created.

> **NOTE**: The TDF domain must have been previously configured at the `[edit unified-edge gateways tdf gateway-name domains]` hierarchy level.
>
> The PCEF profile must have been previously configured at the `[edit unified-edge pcef]` hierarchy level.

Options

term-name Identifier for the term.

- **Range:** 1 through 50 alphanumeric characters.

The remaining statements are explained separately. See CLI Explorer.

> **NOTE**: You must configure at least one term.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

```

Hierarchy Level (before Junos OS Release 18.3R1)

```
[edit services url-filter profile profile-name template template-name]
```

Description

Define a URL filtering term. A term is a set of match criteria with actions to be taken if the match criteria is met. You must configure `term` to configure URL filtering.

Options

term-name Name of the term.

from Define match criteria.

The `from` statement is optional. If you omit the `from` statement, all source IP prefixes and all destination ports are considered to match. All such combinations then take the configured actions of the term.

Only one term in a template can have an optional `from` statement. If you omit more than one `from` statement per template, you will get the following error message on commit:

```
URLFD_CONFIG_FAILURE: Configuration not valid:
Cannot have two wild card terms in template template1
error: configuration check-out failed
```

Similarly, no two templates within a profile can have a term without a `from` statement.

dest-ports Destination port list specification.

- **Range:** 1 through 65535

src-ip-prefix Source IP prefix list specification.

then Specify one of the following actions to be taken if the `from` condition is matched:

accept Accept the traffic and allow it to flow as normal.

custom-page ***custom-page*** Custom-page string.

http-status-code ***http-status-code*** HTTP status code value.

	• **Range:** 400 through 599
`redirect-url` *`redirect-url`*	URL to redirect traffic to.
`tcp-reset`	Reset TCP.

Required Privilege Level

[edit protocols pppoe service-name-tables table-name service service-name],
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci
circuit-id-string ari remote-id-string]
```

Description

Direct the router to immediately respond to a PPPoE Active Discovery Initiation (PADI) control packet received from a PPPoE client by sending the client a PPPoE Active Discovery Offer (PADO) packet. The PADO packet contains the name of the access concentrator (router) that can service the client request. The `terminate` action is the default action for a named service entry, `empty` service entry, `any` service entry, or agent circuit identifier/agent remote identifier (ACI/ARI) pair in a PPPoE service name table.

Required Privilege Level

Syntax

```
terminate-code (aaa (deny | service-shutdown | shutdown) | dhcp | l2tp | ppp | vlan) term-reason
radius value;
```

Hierarchy Level

```
[edit access]
```

Description

Customize the mapping between a termination cause (the internal termination identifier) and a numerical code value for the cause that is reported in the RADIUS Acct-Terminate-Cause attribute (49).

When a RADIUS Acct-Stop message is issued as a result of the termination of a subscriber or service session, the RADIUS Acct-Terminate-Cause attribute (49) reports the cause or reason for the termination. This attribute is included only in RADIUS Acct-Stop messages. The termination cause is conveyed as a code value in the attribute. *RFC 2866, RADIUS Accounting,* defines the standard mapping between 18 code values and termination causes.

Junos OS defines a set of internal termination cause codes for AAA, DHCP, L2TP, PPP, and VLAN subscriber and service session failures. By default, these internal cause codes are mapped to the RFC-defined code values. When a subscriber or service session is terminated, the router logs a message for the internal termination cause and logs another message for the RADIUS Acct-Terminate-Cause attribute. You can use the logged information to help monitor and troubleshoot the events.

Because there are many different Junos OS internal identifiers for termination causes and only 18 supported, RFC-defined standard code values, by default a given code value can map to multiple identifiers. Instead of using the default code values, you can use the `terminate-code` statement to map any of the internally defined termination causes to any 32-bit number (1 through 4,294,967,295). The

flexibility of customized mapping greatly increases the possibilities for fine-grained analytics and failure tracking.

Options

aaa Map internal identifiers for AAA-specific termination causes to a numerical value.

deny Limit selection of termination causes to those associated with denial of subscriber access.

dhcp Map internal identifiers for DHCP-specific termination causes to a numerical value.

l2tp Map internal identifiers for L2TP-specific termination causes to a numerical value.

ppp Map internal identifiers for PPP-specific termination causes to a numerical value.

radius *value* Number that represents the termination cause in the RADIUS Acct-Terminate-Cause attribute (49).

- **Range:** 1 through 4,294,967,295

service-shutdown Limit selection of termination causes to those associated with established service sessions independent of the parent subscriber session.

shutdown Limit selection of termination causes to those associated with established subscriber sessions.

vlan Map internal identifiers for VLAN-specific termination causes to a numerical value.

term-reason Internal identifier for the termination causes defined for the specified protocol type.

For protocol-specific termination causes, see the following topics:

- *AAA Termination Causes and Code Values*
- *DHCP Termination Causes and Code Values*
- *L2TP Termination Causes and Code Values*
- *PPP Termination Causes and Code Values*
- *VLAN Termination Causes and Code Values*

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

`vlan` option added in Junos OS Release 16.1.

```
        trusted-ca  ;
    }
}
```

Hierarchy Level

```
[edit services ssl]
```

Description

Specify the configuration for Secure Socket Layer (SSL) termination support service.

Following types of SSL profiles are supported on SRX Series to secure connections based on the role of the SRX Series Firewall:

- SSL initiation: The SRX Series Firewall, acting as an SSL proxy client, initiates and maintains SSL sessions between itself and an SSL server. SRX Series Firewall receives unencrypted data from an HTTP client, and encrypts and transmits the data as ciphertext to the SSL server.
- SSL termination: The SRX Series Firewall, actings as an SSL proxy server, terminates the SSL session from the client and then establishing a new SSL connection to the server. The SRX Series Firewall decrypts the data and then sends the data as un-encrypted request to the other servers (HTTP server).

The SSL proxy profile will be applied to the security policy as application services.

test aaa authd-lite user

IN THIS SECTION

- Syntax | 30280
- Description | 30280
- Options | 30281
- Required Privilege Level | 30281
- Output Fields | 30281
- Sample Output | 30282
- Release Information | 30285

Syntax

```
test aaa authd-lite user username password password profile access-profile-name
<port nas-port>
<zero-stats>
```

Description

Verify authd-lite subscriber access authentication, accounting, and address allocation configuration.

The `test aaa` command supports all RADIUS-sourced attributes, both IETF standard attributes and Juniper Networks VSAs. Received attributes are displayed in the output. For information about standard RADIUS attributes, see *Standard and Vendor-Specific RADIUS Attributes*. For information about Juniper Networks VSAs, see *Standard and Vendor-Specific RADIUS Attributes*.

Starting in Junos OS Release 19.3R1, the XML output format has changed. Each RADIUS server attribute name has an associated attribute value. Each of these pairs is now enclosed by the <radius-server-data> tag. The new tag makes it easier to recognize the name/value pairs, both for operators and

API clients. You may have to change any scripts that use the XML output to work properly with the new format.

Options

username	Specify the subscriber username to test.
password *password*	Specify the password associated with the username.
profile *access-profile-name*	Specify the access profile associated with the subscriber.
port *nas-port*	(Optional) Specify the NAS port used for the test.
zero-stats	(Optional) Specify that no accounting statistics are set for this test.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request. For information about output fields related to authentication, accounting, and subscriber-specific information, see the **show network-access aaa statistics**, **show network-access aaa statistics authentication**, **show network-access aaa subscribers**, and **show subscribers** commands.

The **test** command does not support volume-time accounting. If volume-time accounting is configured for the test subscriber, the **test** command replaces the statistics with time-only accounting statistics.

This command displays only attributes that are supported by Junos OS; these attributes appear even when their values are not set. The Virtual Router Name (LS:RI) field matches the Juniper Networks Virtual-Router VSA (26-1), if present; otherwise the field displays default:default. The displayed value for all other attributes that are not received is `<not set>`.

Sample Output

test aaa authd-lite user

The following example tests the configuration for authd-lite subscriber user1bt with a password of $ABC123 and an access profile of employee12, and displays the resulting output:

```
user@host> test aaa authd-lite user user1bt password $ABC123 profile employee12

AAA Testing and Troubleshooting

Understanding External Authentication Servers

test aaa dhcp user

IN THIS SECTION

- Syntax | 30286
- Description | 30286
- Options | 30287

- Required Privilege Level | 30288
- Output Fields | 30288
- Sample Output | 30289
- Release Information | 30292

Syntax

```
test aaa dhcp user username
<agent-remote-id ari>
<logical-system logical-system-name>
<mac-address mac-address>
<no-address-request>
<option-82 option-82>
<password password>
<profile access-profile-name>
<routing-instance routing-instance-name>
<service-type service-type>
<source-address source-address>
<terminate-code code-value>
```

Description

Verify Dynamic Host Configuration Protocol (DHCP) subscriber access authentication, accounting, and address allocation configuration by creating a test pseudo session.

NOTE: The `test aaa` command supports all RADIUS-sourced attributes, both IETF standard attributes and Juniper Networks VSAs. Received attributes are displayed in the output. For information about standard RADIUS attributes, see *Standard and Vendor-Specific RADIUS Attributes*. For information about Juniper Networks VSAs, see *Standard and Vendor-Specific RADIUS Attributes*.

NOTE: Starting in Junos OS Release 19.3R1, the XML output format has changed. Each RADIUS server attribute name has an associated attribute value. Each of these pairs is now enclosed by the <radius-server-data> tag. The new tag makes it easier to recognize

the name/value pairs, both for operators and API clients. You may have to change any scripts that use the XML output to work properly with the new format.

Options

username	Subscriber username to test.
agent-remote-id *ari*	(Optional) Value of the DSL Forum Agent-Remote-Id (VSA 26–2).
logical-system *logical-system-name*	(Optional) Logical system in which the subscriber is authenticated. This is the logical system in the AAA LS:RI context for the subscriber. This context differs from the subscriber context, which is the LS:RI in which the subscriber is placed, by either the Virtual-Router VSA (26-1) or the Redirect-VRouter-Name VSA (26–25).
mac-address *mac-address*	(Optional) MAC address of the DHCP client.
no-address-request	(Optional) Request is sent for authentication without address allocation. Use for Layer 2-only scenarios where no address allocation request is needed.

> **NOTE**: The `test aaa dhcp user` command tries to allocate an IPv4 address even when the subscriber is supposed to get only an IPv6 address. If that behavior is undesirable, include the `no-address-request option` when you issue the command.

option-82 *option-82*	(Optional) DHCP relay agent information option (option-82) value.
password *password*	(Optional) Password associated with the username.
profile *access-profile-name*	(Optional) Access profile associated with the subscriber.
routing-instance *routing-instance-name*	(Optional) Routing instance in which the subscriber is authenticated. This is the routing instance in the AAA LS:RI context for the subscriber. This context differs from the subscriber context, which is the LS:RI in which the subscriber is placed, by either the Virtual-Router VSA (26-1) or the Redirect-VRouter-Name VSA (26–25). In the case of VSA 26-25, the subscriber is re-authenticated in the subscriber context.
service-type *service-type*	(Optional) Value of the Service Type RADIUS attribute [6] that is associated with the test user; either a number in the range 1 through 255 or one of the following strings that corresponds to an RFC-defined service type; the numbers are the values that are carried in the RADIUS attribute to specify the service:

administrative (6)	callback-nas-prompt (9)
authenticate-only (8)	framed (2)
call-check (10)	login (1)
callback-admin (11)	nas-prompt (7)
callback-framed (4)	outbound (5)
callback-login (3)	–

source-address *source-address* (Optional) IP address of the outgoing interface.

terminate-code *code-value* (Optional) Code associated with the subscriber termination.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request. For information about output fields related to authentication, accounting, and subscriber-specific information, see the **show network-access aaa statistics**, **show network-access aaa statistics authentication**, **show network-access aaa subscribers**, and **show subscribers** commands.

The **test** command does not support volume-time accounting. If volume-time accounting is configured for the test subscriber, the **test** command replaces the statistics with time-only accounting statistics.

This command displays only attributes that are supported by Junos OS; these attributes appear even when their values are not set. The Virtual Router Name (LS:RI) field matches the Juniper Networks Virtual-Router VSA (26-1), if present; otherwise the field displays default:default. The displayed value for all other attributes that are not received is `<not set>`.

Sample Output

test aaa dhcp user

The following example tests the configuration for DHCP subscriber user1DB and password $ABC123, and displays the resulting output:

```
user@host> test aaa dhcp user user1DB@test.net password $ABC123
Authentication Grant
    ************User Attributes***********
         User Name -                              user1DB@test.net
         Client IP Address -                      192.168.1.1
         Client IP Netmask -                      255.255.0.0
         Virtual Router Name (LS:RI)-             default:default

         Agent Remote Id -                        NULL
         Reply Message -                          NULL
         Primary DNS IP Address -                 0.0.0.0
         Secondary DNS IP Address -               0.0.0.0
         Primary WINS IP Address -                0.0.0.0
         Secondary WINS IP Address -              0.0.0.0

Release Information

Command introduced in Junos OS Release 11.2.

Option `terminate-code` added in Junos OS Release 11.4.

Option `agent-remote-id` added in Junos OS Release 14.1.

Options `no-address-request` and `service-type` added in Junos OS Release 16.1.

RELATED DOCUMENTATION

AAA Testing and Troubleshooting

test aaa ppp user

IN THIS SECTION

- Syntax | 30293
- Description | 30293
- Options | 30294
- Required Privilege Level | 30296
- Output Fields | 30296
- Sample Output | 30296
- Release Information | 30302

Syntax

```
test aaa ppp user username
<agent-remote-id ari>
<logical-system logical-system-name>
<no-address-request>
<password password>
<profile access-profile-name>
<routing-instance routing-instance-name>
<service-type service-type>
<terminate-code code-value>
```

Description

Verify Point-to-Point Protocol (PPP) subscriber access authentication, accounting, and address allocation configuration by creating a test pseudo session.

NOTE: The `test aaa` command supports all RADIUS-sourced attributes, both IETF standard attributes and Juniper Networks VSAs. Received attributes are displayed in the output. For information about standard RADIUS attributes, see *Standard and Vendor-Specific RADIUS Attributes*. For information about Juniper Networks VSAs, see *Standard and Vendor-Specific RADIUS Attributes*.

NOTE: Starting in Junos OS Release 19.3R1, the XML output format has changed. Each RADIUS server attribute name has an associated attribute value. Each of these pairs is now enclosed by the <radius-server-data> tag. The new tag makes it easier to recognize the name/value pairs, both for operators and API clients. You may have to change any scripts that use the XML output to work properly with the new format.

Options

username Subscriber username to test.

agent-remote-id *ari* (Optional) Value of the DSL Forum Agent-Remote-Id (VSA 26–2).

logical-system *logical-system-name* (Optional) Logical system in which the subscriber is authenticated. This is the logical system in the AAA LS:RI context for the subscriber. This context differs from the subscriber context, which is the LS:RI in which the subscriber is placed, by either the Virtual-Router VSA (26-1) or the Redirect-VRouter-Name VSA (26–25).

no-address-request (Optional) Request is sent for authentication without address allocation. Use for Layer 2-only scenarios where no address allocation request is needed.

> **NOTE**: The `test aaa ppp user` command tries to allocate an IPv4 address even when the subscriber is supposed to get only an IPv6 address. If that behavior is undesirable, include the `no-address-request option` when you issue the command.

password *password* (Optional) Password associated with the username.

profile *access-profile-name* (Optional) Access profile associated with the subscriber.

> **NOTE**: The system logically treats this profile as a client-level configuration. An access profile configured in a domain map takes

precedence over client-level configurations. If you have configured one or more domain maps, the username for the user under test is evaluated against the domain maps the same as any other subscriber.

For example, the username can exactly match a domain map or partially match a wildcard domain map. If it matches neither of those, then it matches the `default` domain map if it is configured. If the username has no domain or realm ,then it matches the `none` domain map, if it is configured.

The consequence is that if the test user matches any configured domain map, then an access profile configured in that map is used for the test in preference to an access profile that you specify with the `test` command.

See Specifying an Access Profile in a Domain Map for more information about domain maps and access profiles.

routing-instance *routing-instance-name*

(Optional) Routing instance in which the subscriber is authenticated. This is the routing instance in the AAA LS:RI context for the subscriber. This context differs from the subscriber context, which is the LS:RI in which the subscriber is placed, by either the Virtual-Router VSA (26-1) or the Redirect-VRouter-Name VSA (26–25). In the case of VSA 26-25, the subscriber is re-authenticated in the subscriber context.

service-type *service-type*

(Optional) Value of the Service Type RADIUS attribute [6] that is associated with the test user; either a number in the range 1 through 255 or one of the following strings that corresponds to an RFC-defined service type; the numbers are the values that are carried in the RADIUS attribute to specify the service:

administrative (6)	callback-nas-prompt (9)
authenticate-only (8)	framed (2)
call-check (10)	login (1)
callback-admin (11)	nas-prompt (7)
callback-framed (4)	outbound (5)
callback-login (3)	–

terminate-code *code-value* (Optional) Code associated with the subscriber termination.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request. For information about output fields related to authentication, accounting, and subscriber-specific information, see the **show network-access aaa statistics**, **show network-access aaa statistics authentication**, **show network-access aaa subscribers**, and **show subscribers** commands.

The **test** command does not support volume-time accounting. If volume-time accounting is configured for the test subscriber, the **test** command replaces the statistics with time-only accounting statistics.

This command displays only attributes that are supported by Junos OS; these attributes appear even when their values are not set. The Virtual Router Name (LS:RI) field matches the Juniper Networks Virtual-Router VSA (26-1), if present; otherwise the field displays default:default. The displayed value for all other attributes that are not received is `<not set>`.

Sample Output

test aaa ppp user

The following example tests the configuration for PPP subscriber user98BEDC and password $ABC123, and displays the resulting output:

```
user@host> test aaa ppp user user98BEDC@test.net password $ABC123

Release Information

Command introduced in Junos OS Release 11.2.

Option `terminate-code` added in Junos OS Release 11.4.

Option `agent-remote-id` added in Junos OS Release 14.1.

Options `no-address-request` and `service-type` added in Junos OS Release 16.1.

Sample Output | 30305
Release Information | 30308

Syntax

```
test access profile profile-name user username password password <detail>
```

Description

Specify a profile to use to get information from a RADIUS server, which includes all the information from the `test access radius-server` command.

Options

detail (Optional) Show the RADIUS attributes returned by the server.

profile-name Access profile name configured.

password Password for the username.

username User name to be authenticated to the RADIUS server.

Required Privilege Level

view

Output Fields

Table 1901 on page 30304 lists the output fields for the `test access profile` command. Output fields are listed in the approximate order in which they appear.

Table 1901: test access profile Output Fields

Field Name	Field Description
`Profile Name`	Name of the configured access profile.
`Client Username`	The user name authenticated by the RADIUS server.
`Client Password`	The user password authenticated by the RADIUS server.
`Num Servers`	Number of RADIUS servers in the configured access profile.
`Server List`	List of RADIUS servers in the configure access profile.
`IP Address`	The IP address of the RADIUS server authenticated.
`UDP Port`	The RADIUS server port utilized during the authentication test.
`Source Address`	The source IP address of the client making the RADIUS request. If no address is shown, it defaults to the address of the outgoing interface.
`Timeout`	The RADIUS server timeout period.
`Retry Count`	The number of authentication attempts allowed by the RADIUS server.
`Secret`	The shared secret used for authentication with the RADIUS server.
`Status`	The test result status (Accepted or Rejected) and the number of retransmits utilized during authentication.
`Attempts`	The number of authentication attempts on the RADIUS server.
`Attribute List`	The list of returned RADIUS attributes, sorted by the attribute name, and including parameter length and value. See your RADIUS server documentation for attribute descriptions.

Table 1901: test access profile Output Fields *(Continued)*

Field Name	Field Description
`(Attribute) Name`	The name of the attribute.
`(Attribute) Length`	The attribute length in bytes.
`(Attribute) Value`	The attribute value.

Sample Output

test access profile

The following example uses the `test access profile` command to access and display basic information about the RADIUS server(s) shown in the resulting output:

```
user@host> test access profile alpha user TEST password TEST
  user@host> test access profile alpha user TEST password TEST
  Test Radius Profile Access
      Profile Name        : alpha
      Client Username     : TEST
      Client Password     : TEST
      Num Servers         : 5
                            Server List
                 UDP      Source                  Retry
    IP Address   Port     Address         Timeout Count Secret        Status      Attempts
  10.1.1.1        1812     10.10.10.10     2       1     TEST          Timeout     2
  10.1.3.4        1812     Default         1       2     TEST          Timeout     3
  192.168.10.10   1812     Default         3       3     TEST          Accepted    1
```

test access profile detail

The following example uses the `test access profile detail` command to access and display detailed information about the RADIUS server(s) shown in the resulting output:

```
user@host> test access profile alpha user TEST password TEST detail
  user@host> test access profile alpha user TEST password TEST detail
  Test Radius Profile Access Detailed
      Profile Name        : alpha
      Client Username     : TEST
      Client Password     : TEST
      Num Servers         : 5
                      Radius Server List

         IP Address           : 10.1.3.4
         UDP Port             : 1812
         Source Address       : 192.168.10.10
         Timeout              : 2
         Retry Count          : 1
         Secret               : TEST
         Status               : Timeout
         Attempts             : 2

         IP Address           : 10.1.3.5
         UDP Port             : 1812
         Source Address       : Default
         Timeout              : 1
         Retry Count          : 2
         Secret               : TEST
         Status               : Timeout
         Attempts             : 3

         IP Address           : 192.168.10.10
         UDP Port             : 1812
         Source Address       : Default
         Timeout              : 3
         Retry Count          : 3
         Secret               : TEST
         Status               : Accepted
         Attempts             : 1

test access radius-server

IN THIS SECTION

- Syntax | 30309
- Description | 30309
- Options | 30309
- Required Privilege Level | 30309

- Output Fields | 30310
- Sample Output | 30311
- Release Information | 30311

Syntax

```
test access radius-server address user username password password secret secret
<authentication-port port>
<retry number>
<source-address address>
<timeout number>
```

Description

Verify RADIUS server authentication parameters.

Options

address	RADIUS server under test IP address.
password	Password for the user.
secret	Secret shared with the RADIUS server.
user	User name to be authenticated to the RADIUS server.
authentication-port	(Optional) RADIUS server authentication port number (1through 65535).
retry	(Optional) Retry attempts (1through 10).
source-address	(Optional) Use an alternate address as the source address.
timeout	(Optional) Request timeout period (1through 90 seconds).

Required Privilege Level

view

Output Fields

Table 1902 on page 30310 lists the output fields for the `test access radius-server` command. Output fields are listed in the approximate order in which they appear.

Table 1902: test access radius-server Output Fields

Field Name	Field Description
`Server`	The IP address of the RADIUS server authenticated.
`UDP port`	The RADIUS server port utilized during the authentication test.
`Source IP Address`	“Default” is shown if the IP address is the same as that of the RADIUS server. Alternatively, an IP address specified for authentication is shown.
`Server timeout`	The RADIUS server timeout period.
`Sever retry count`	The number of authentication attempts allowed by the RADIUS server.
`Secret`	The shared secret used for authentication with the RADIUS server.
`Client Username`	The user name authenticated by the RADIUS server.
`Client Password`	The user password authenticated by the RADIUS server.
`Status`	The test result status (`Accepted` or `Rejected`) and the number of retransmits utilized during authentication.

Sample Output

test access radius-server user password secret

The following example command tests RADIUS authentication with a specific server (172.28.30.95), user (JOHNDOE), secret (No1Knows), and password (JohnPass); and displays the resulting output:

```
user@host> test access radius-server 172.28.30.95 user JOHNDOE password JohnPass secret No1Knows
Test Radius Server Access
       Server              : 172.28.30.95
       UDP port            : 1812
       Source IP Address   : Default
       Server timeout      : 3
       Sever retry count   : 3
       Secret              : No1Knows
       Client Username     : JOHNDOE
       Client Password     : JohnPass
       Status              : Accepted, retransmits: 0
```

Release Information

Command introduced in Junos OS Release 9.1.

test configuration

IN THIS SECTION

- Syntax | 30312
- Description | 30312
- Options | 30312
- Required Privilege Level | 30312
- Output Fields | 30312
- Sample Output | 30312
- Release Information | 30313

Syntax

```
test configuration filename
syntax-only
```

Description

Verify that the syntax of a configuration file is correct. If the configuration contains any syntax or commit check errors, a message is displayed to indicate the line number and column number in which the error was found. When using the *filename* option, this command only accepts text files.

Options

filename	Name of the configuration file. This file must be a text file and no other type.
syntax-only	(Optional) Check the syntax of a partial configuration file, without checking for commit errors.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

test configuration

```
user@host> test configuration terminal
[Type ^D to end input]
system {
host-name host;
test1;
login;
}
terminal:3:(8) syntax error: test
```

```
  [edit system]
    'test;'
      syntax error
terminal:4:(11) statement must contain additional statements: ;
  [edit system login]
    'login ;'
      statement must contain additional statements
configuration syntax failed
```

Release Information

Command introduced before Junos OS Release 7.4.

`syntax-only` option introduced in Junos OS Release 12.1.

test interface restart-auto-negotiation

- Release Information | 30314

Syntax

```
test interface restart-auto-negotiation interface-name
```

Description

Restarts auto-negotiation on a Fast Ethernet or Gigabit Ethernet interface.

Options

interface-name	Interface name: **fe-***fpc/pic/port* or **ge-***fpc/pic/port*.

Required Privilege Level

view

Output Fields

Use the `show interfaces extensive` command to see the state for auto-negotiation.

Sample Output

test interface restart-auto-negotiation

```
user@host> test interface restart-auto-negotiation fe-1/0/0
```

Release Information

Command introduced in Junos OS Release 7.6.

test msdp

IN THIS SECTION

- Syntax | 30315
- Description | 30315
- Options | 30315
- Required Privilege Level | 30315

- Output Fields | **30315**
- Sample Output | **30316**
- Release Information | **30316**

Syntax

```
test msdp (dependent-peers prefix | rpf-peer originator)
<instance instance-name>
<logical-system (all | logical-system-name)>
```

Description

Find Multicast Source Discovery Protocol (MSDP) peers.

Options

dependent-peers *prefix*	Find downstream dependent MSDP peers.
rpf-peer *originator*	Find the MSDP reverse-path-forwarding (RPF) peer for the originator.
instance *instance-name*	(Optional) Find MDSP peers for the specified routing instance.
logical-system (all | *logical-system-name)*	(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

test msdp dependent-peers

```
user@host> test msdp dependent-peers 10.0.0.1/24
```

Release Information

Command introduced before Junos OS Release 7.4.

test policy

IN THIS SECTION

- Syntax | 30316
- Description | 30316
- Options | 30317
- Additional Information | 30317
- Required Privilege Level | 30317
- Output Fields | 30317
- Sample Output | 30318
- Release Information | 30318

Syntax

```
test policy policy-name prefix
```

Description

Test a policy configuration to determine which prefixes match routes in the routing table.

> **NOTE**: If you are using the `test policy` command on a logical system, you must first set the CLI to the logical system context. For example, if you want to test a routing policy that is configured on logical system R2, first run the `set cli logical-system R2` command. If you want to return to the main instance, run the `clear cli logical-system R2` command.

Options

policy-name	Name of a policy.
prefix	Destination prefix to match.

Additional Information

All prefixes in the default unicast routing table (inet.0) that match prefixes that are the same as or longer than the specific prefix are processed by the `from` clause in the specified policy. All prefixes accepted by the policy are displayed. The `test policy` command evaluates a policy differently from the BGP import process. When testing a policy that contains an `interface` match condition in the `from` clause, the `test policy` command uses the match condition. In contrast, BGP does not use the `interface` match condition when evaluating the policy against routes learned from internal BGP (IBGP) or external BGP (EGBP) multihop peers.

When testing a policy, you can see the length of time (in microseconds) required to evaluate the policy and the number of times it has been executed by running the `show policy` *`policy-name`* `statistics` command.

Required Privilege Level

view

Output Fields

For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

Sample Output

test policy

```
user@host> test policy test-statics 172.16.0.1/8
inet.0: 44 destinations, 44 routes (44 active, 0 holddown, 0 hidden)
Prefixes passing policy:

172.16.3.0/8          *[BGP/170] 16:22:46, localpref 100, from 10.255.255.41
                    AS Path: 50888 I
                     > to 10.11.4.32 via en0.2, label-switched-path l2
172.16.3.1/32         *[IS-IS/18] 2d 00:21:46, metric 0, tag 2
                     > to 10.0.4.7 via fxp0.0
172.16.3.2/32         *[IS-IS/18] 2d 00:21:46, metric 0, tag 2
                     > to 10.0.4.7 via fxp0.0
172.16.3.3/32         *[IS-IS/18] 2d 00:21:46, metric 0, tag 2
                     > to 10.0.4.7 via fxp0.0
172.16.3.4/32         *[IS-IS/18] 2d 00:21:46, metric 0, tag 2
                     > to 10.0.4.7 via fxp0.0
Policy test-statics: 5 prefixes accepted, 0 prefixes rejected
```

Release Information

Command introduced before Junos OS Release 7.4.

test security utm anti-spam

IN THIS SECTION

- Syntax | 30319
- Description | 30319
- Options | 30319
- Required Privilege Level | 30319
- Output Fields | 30319
- Sample Output | 30320
- Release Information | 30323

Syntax

```
test security utm anti-spam ip-check <test-IP>
<test-IP> test security utm anti-spam.
```

Description

Use this command to check if the IP (Internet Protocol) is a spam source or it is a configuration problem when the device doesn't block the spam. The anti-spam feature requires internet connectivity with the Spam Block List (SBL) server. Domain Name Service (DNS) must be available to access the SBL server.

Options

test-IP	Supports both IPv4 and IPv6.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Table 1903 on page 30320 lists the output fields for the `test security utm anti-spam` command. Output fields are listed in the approximate order in which they appear.

Table 1903: test security utm anti-spam

Field Name	Field Description
`SBL Server`	Spam block list (SBL) contains the list of the disallowed IPs.
`DNS Server`	The firewall performs SBL lookups through the Domain Name Service (DNS) protocol.

Sample Output

test security utm anti-spam

The following examples test IP 1.0.0.1 in SBL server msgsecurity.juniper.net through DNS server 172.29.151.60:

```
user@host> test security utm anti-spam ip-check 1.0.0.1

UTM anti-spam IP-check result:

    SBL Server:
        msgsecurity.juniper.net

    DNS Server:
        172.29.151.60

       Test result for IP check:
        SPAM (Match sbl server blacklist)
```

command-name

The following examples test IP 1.0.0.2 in SBL server msgsecurity.juniper.net through DNS server 172.29.151.60:

```

```

```
    UTM anti-spam IP-check result:

    SBL Server:
        msgsecurity.juniper.net

    DNS Server:
        172.29.151.60

       Test result for IP check:
           NON SPAM (No match)
```

command-name

The following examples test IP 1.0.0.2 in SBL server msgsecurity.juniper.net through DNS server 172.29.151.60:

```
user@host>test security utm anti-spam ip-check 1.0.0.2

UTM anti-spam IP-check result:

    SBL Server:
        msgsecurity.juniper.net

    DNS Server:
        172.29.151.60

       Test result for IP check:
        NON SPAM (DNS error)
```

command-name

The following examples test IP 1.0.0.3 in SBL server msgsecurity.juniper.net through DNS server 172.29.151.66:

```
user@host>test security utm anti-spam ip-check 1.0.0.3

UTM anti-spam IP-check result:

    SBL Server:
        msgsecurity.juniper.net
```

```
    DNS Server:
        172.29.151.66

       Test result for IP check:
           NON SPAM (Timeout error)
```

command-name

The following examples test IP 1.0.0.4 in SBL server msgsecurity.juniper.net through DNS server 172.29.151.66:

```
user@host>test security utm anti-spam ip-check 1.0.0.4

UTM anti-spam IP-check result:

    SBL Server:
        msgsecurity.juniper.net

    DNS Server:
        172.29.151.66

       Test result for IP check:
           NON SPAM (Anti-Spam is not enable)
```

command-name

The following examples test IP 1.0.0.4 in SBL server msgsecurity.juniper.net through DNS server 172.29.151.66:

```
user@host>test security utm anti-spam ip-check 1.0.0.4

UTM anti-spam IP-check result:

    SBL Server:
        msgsecurity.juniper.net

    DNS Server:
        172.29.151.66
```

```
        Test result for IP check:
           No license
```

test security utm enhanced-web-filtering url-check
test-url Enhanced-web-filtering threat-check test URL
```

Syntax (Starting in Junos OS Release 23.3R1)

```
test security utm web-filtering url-check
```

Description

Use this test command to send the test-string to web-filtering server (example: Websense ThreatSeeker Cloud) to test the category and reputation of the test-string.

Starting in Junos OS Release 23.3R1, you can use the `test security utm web-filtering url-check` test command to check the category and reputation of a URL.

Options

<test-url> Enhanced-web-filtering threat-check test URL. The maximum length of test URL is 249.

Required Privilege Level

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Table 1904 on page 30324 lists the output fields for the `test security utm enhanced-web-filtering url-check` command. Output fields are listed in the approximate order in which they appear.

Table 1904: test security utm enhanced-web-filtering

Field Name	Field Description
`Enhance web-filtering server`	Enhanced Web Filtering (EWF) supports HTTP methods.

Sample Output

test security utm enhanced-web-filtering

The following example sends URL www.google.com to EWF rp.cloud.threatseeker.com check the category and reputation:

```
user@host> test security utm enhanced-web-filtering url-check www.google.com

UTM enhanced-web-filtering URL-check result:

    Enhance web-filtering server:
        rp.cloud.threatseeker.com

    Test result for URL check:
           Category name: Enhanced_Search_Engines_and_Portals
           Reputation: 90
           Threat level: very-safe
```

command-name

The following example sends URL www.aaa.com to EWF rp.cloud.threatseeker.com check the category and reputation:

```
user@host>test security utm enhanced-web-filtering url-check www.aaa.com

    UTM enhanced-web-filtering URL-check result:

        Enhance web-filtering server:
         rp.cloud.threatseeker.com

     Test result for URL check:
            URL does not match on remote server
```

command-name

The following example sends URL www.bbb.com to EWF rp.cloud.threatseeker.com check the category and reputation:

```
user@host>test security utm enhanced-web-filtering url-check www.bbb.com

UTM enhanced-web-filtering URL-check result:

       Enhance web-filtering server:
           rp.cloud.threatseeker.com

    Test result for URL check:
           UTM enhanced web filtering URL check test failed
```

command-name

The following example sends URL www.bbb.com to EWF rp.cloud.threatseeker.com check the category and reputation:

```
user@host>test security utm enhanced-web-filtering url-check www.bbb.com

UTM enhanced-web-filtering URL-check result:

       Enhance web-filtering server:
           rp.cloud.threatseeker.com

    Test result for URL check:
           No license
```

command-name

The following example sends URL www.google.com to EWF rp.cloud.threatseeker.com check the category and reputation:

```
user@host>test security utm enhanced-web-filtering url-check www.google.com

UTM enhanced-web-filtering URL-check result:
```

```
    Enhanced web-filtering server:
        rp.cloud.threatseeker.com

    Test result for URL check:
        EWF query timeout
```

test security utm web-filtering url-check

The following example sends URL www.yahoo.com to check the category and reputation:

```
user@host>test security utm web-filtering url-check www.yahoo.com
UTM Web-filtering URL-check result:

    Web-filtering server:
        signatures.juniper.net

    Test result for URL check:
        Type: NG-Juniper
        Category name: NG_Search_Engines_and_Portals
        Reputation: 2
        Reputation level: very safe
```

Release Information

Command introduced in Junos OS Release 20.2.

Syntax

```
test security utm web-filtering profile <profile-name>
<test-url> Web-filtering test URL
```

Description

Use this command to check if the test-string matches the specific profile in the Web filtering server.

Options

test-url Enhanced Web filtering threat-check test URL. The maximum length of test URL is 249.

Required Privilege Level

view

Sample Output

test security utm web-filtering profile

The following example sends profile *sportclass* and test url *www.google.com* to the Web filtering server to check whether the test string matches the specific profile:

```
user@host>  test security utm web-filtering profile sportclass www.google.com

UTM web-filtering profile test:

    Test result:       Match EWF category
    Execute action:    Permit
       Match category:    Enhanced_Search_Engines_and_Portals
```

command-name

The following example sends profile *dangerclass* and test url *www.gun-clubs.com* to the Web filtering server to check whether the test string matches the specific profile:

```
user@host> test security utm web-filtering profile dangerclass www.gun-clubs.com

    UTM web-filtering profile test:

    Test result:       Match custom category
    Execute action:    Permit
       Match category:    custom_category
```

command-name

The following example sends profile *dangerclass* and test url *www.gun-clubs.com* to the Web filtering server to check whether the test string matches the specific profile:

```
user@host> test security utm web-filtering profile dangerclass www.gun-clubs.com

UTM web-filtering profile test:
```

```
    Test result:       Hit global reputation action
    Execute action:    Permit
       Match category:    N/A
```

command-name

The following example sends profile *dangerclass* and test url *www.gun-clubs.com* to the Web filtering server to check whether the test string matches the specific profile:

```
user@host> test security utm web-filtering profile dangerclass www.gun-clubs.com

UTM web-filtering profile test:

        Test result: Web filtering engine is not ready, please try again later
```

command-name

The following example sends profile *dangerclass* and test url *www.gun-clubs.com* to the Web filtering server to check whether the test string matches the specific profile:

```
user@host> test security utm web-filtering profile dangerclass www.gun-clubs.com

UTM web-filtering profile test:

        Test result: Can't find webfilter profile dangerclass
```

command-name

The following example sends profile *dangerclass* and test url *www.gun-clubs.com* to the Web filtering server to check whether the test string matches the specific profile:

```
user@host> test security utm web-filtering profile dangerclass www.gun-clubs.com

UTM web-filtering profile test:
```

```
    Test result:       No license
    Execute action:    Permit
       Match category:    N/A
```

command-name

The following example sends profile *junos-wf-enhanced-default* and test *www.google.com* to the Web filtering server to check whether the test string matches the specific profile:

```
user@host> test security utm web-filtering profile junos-wf-enhanced-default www.google.com

UTM web-filtering profile test:

    Test result:       Fallback (query timeout)
    Execute action:    Log and permit
    Match category:    N/A
```

Release Information

Command introduced in Junos OS Release 20.2R1.

test services l2tp tunnel

IN THIS SECTION

- Syntax | 30332
- Description | 30332
- Options | 30332

- Required Privilege Level | 30332
- Output Fields | 30332
- Sample Output | 30333
- Release Information | 30334

Syntax

```
test services l2tp tunnel user user-name
<password user-password>
<tunnel-name name>
```

Description

(MX Series routers only) Test and verify Layer 2 Tunneling Protocol (L2TP) tunnel configurations from the L2TP access concentrator (LAC). The test determines whether the user can be authenticated and tunneled according to the L2TP configuration. The establishment of all tunnels associated with the user is tested. You can optionally specify a particular tunnel to test for the user.

Options

user *user-name*	Name of the user under test. You must use an existing configured username, although it can be created solely for testing a tunnel configuration.
password *user-password*	(Optional) Authentication password for the specified user. If you omit this option, the test generates a dummy password—*testpass*—for the user.
tunnel-name *name*	(Optional) Name of a tunnel to test.

Required Privilege Level

view

Output Fields

Table 1905 on page 30333 lists the output fields for the `test services l2tp tunnel` command. Output fields are listed in the approximate order in which they appear.

Table 1905: test services l2tp tunnel Output Fields

Field Name	Field Description
Tunnel-name	Name of the tunnel as configured in the local tunnel profile.
Tunnel-peer	IP address of the tunnel's remote peer (the L2TP network server [LNS]).
Logical-System	Logical system in which the tunnel is created.
Routing-Instance	Routing instance in which the tunnel is created.
Status	Status of the tunnel.

Sample Output

test services l2tp tunnel user (User authentication fails)

```
user@host> test services l2tp tunnel user testuser@example.com
Subscriber: testuser@example.com, authentication failed
```

test services l2tp tunnel user (Multiple tunnels tested)

```
user@host> test services l2tp tunnel user testuser@example.com
Subscriber: testuser@example.com, authentication success, l2tp tunneled
  Tunnel-name   Tunnel-peer   Logical-System  Routing-Instance Status
  test1tunnel    192.0.2.3        default         default         Up
  test2tunnel    198.51.100.243   default         default        Peer unresponsive
  test3tunnel    198.51.100.251   default           test          Up
```

test services l2tp tunnel user tunnel-name (Specific tunnel tested)

```
user@host> test services l2tp tunnel user testuser@example.com tunnel-name test1tunnel
Subscriber: testuser@example.com, authentication success, l2tp tunneled
```

```
Tunnel-name   Tunnel-peer   Logical-System  Routing-Instance Status
test1tunnel    192.0.2.3        default         default         Up
```

Release Information

Command introduced in Junos OS Release 11.4.

test services monitoring rfc2544

IN THIS SECTION

- Syntax | 30334
- Description | 30335
- Options | 30335
- Additional Information | 30335
- Required Privilege Level | 30335
- Sample Output | 30335
- Release Information | 30338

Syntax

```
test services monitoring rfc2544
(test test-name | test-id id)
<routing-instance <routing-instance-name>>
(clear-counters | start | stop)
```

Description

Start or stop an RFC 2544-based benchmarking test, or clear the statistical counters for a test. You can start or stop a specific test name, or you can stop a test based on its test identifier. When you trigger an RFC 2544-based benchmarking test, it passes through a series of states. These states are displayed in the Test state field of the `show services monitoring rfc2544` command.

> **NOTE**: The RFC 2544 test is stopped at the initiator automatically after the test successfully completes all of the test steps. You need not explicitly enter the `test services monitoring rfc2544-benchmarking (test test-name | test-id test-id) stop` command. However, at the reflector, you must explicitly enter this command to stop the test after the test is completed at the initiator.

Options

(test *test-name* | test-id *id*)	Name of the test to be started or stopped or the unique identifier of the test to be stopped.
routing-instance *routing-instance-name*	(Optional) Name of the routing instance for the test.
(clear-counters | start | stop)	Clear the statistics associated with a test, or start or stop a test.

Additional Information

Required Privilege Level

view

Sample Output

test services monitoring rfc2544 test *test-name* start

```
user@host> test services monitoring rfc2544 test mytest start
```

If successful, the identifier of the started test is displayed:

```
Test mytestid 1 started
```

If unsuccessful, an error message is displayed:

```
Error starting test mytest: error-description
```

Some examples:

- If you try to start a test that is already running:

  ```
  Error starting test mytest: previous session with id 1 still active
  ```

- If you try to start an INET reflector test that has an incorrect address configured on the `destination-ipv4-address` statement:

  ```
  Error starting test mytest: inet address '192.0.2.2' not local for default routing-instance
  ```

- If you try to start a test for a test name that has not been configured on the `test-name` statement:

  ```
  Error starting test mytest: configuration entry for test 'mytest' not found
  ```

test services monitoring rfc2544 test *test-name* routing-instance *instance-name* start

```
user@host> test services monitoring rfc2544 test mytest routing-instance lg01 start
```

If successful, the identifier of the started test is displayed:

```
Test mytest id 1 started
```

If unsuccessful, an error message is displayed:

```
Error starting test mytest: error-description
```

Some examples:

- If you try to start an INET reflector test in a routing instance that has an address configured on the `destination-ipv4-address` statement that is not in the given routing-instance:

```
Error starting test mytest: inet address '192.0.2.2' not local in routing-instance lg01
```

- If you try to start a test for a routing instance that has not been configured on the `routing-instance` statement:

```
Error starting test mytest: routing instance 'lg01' not found
```

test services monitoring rfc2544 test-id *test-id* stop

```
user@host> test services monitoring rfc2544 test-id 1 stop
```

If successful, the identifier of the started test is displayed:

```
Test test-name id 1 stopped
```

If unsuccessful, an error message is displayed:

```
Error stopping test with id 1: error-description
```

For example, if the test identifier you specified when you issued the command doesn't exist:

```
Error stopping test test-name: no active sessions found
```

test services monitoring rfc2544 test *test-name* clear-counters

```
user@host> test services monitoring rfc2544 test mytest clear-counters
```

If successful, a message is displayed describing which counters were cleared.

```
Test mytest id test-id clearing counters
```

If unsuccessful, an error message is displayed:

```
Error clearing counters for test mytest: error-description
```

For example, if you try to clear counters for a test that does not have active sessions:

```
Error clearing counters for test mytest: no active sessions found
```

Release Information

Command introduced for Junos OS Evolved Release 21.1R1.

test services rpm rfc2544-benchmarking test

- Release Information | **30341**

Syntax (ACX Series)

```
test services rpm rfc2544-benchmarking test
<clear-counters>
<routing-instance routing-instance-name>
```

```
<test-name>
<test-id>
<start | stop>
```

Syntax (MX104 Router)

```
test services rpm rfc2544-benchmarking test
<test-name>
<test-id>
<start | stop>
```

Syntax (SRX300 and SRX550HM)

```
test services rpm rfc2544-benchmarking test
<clear-counters>
<test-name>
<test-id>
<start | stop>
```

Description

Start or stop an RFC 2544-based benchmarking test. You can start or stop all of the test names that are defined on a device, or start or stop a specific test name. You can also stop a test based on its test identifier. You can also clear the statistical counters associated with the test. When you trigger an RFC 2544-based benchmarking test, it passes through a series of states. These states are displayed in the Test state field in the brief or displayed output information of the `show services rpm rfc2544-benchmarking` command.

> **NOTE**: The RFC 2544 test is stopped at the initiator automatically after the test successfully completes all of the test steps. You need not explicitly enter the `test services rpm rfc2544-benchmarking test <test-name / test-id> stop` command. However, at the reflector, you must explicitly enter this command to stop the test after the test is completed at the initiator.

When a Layer 2 circuit pseudowire is not up, you cannot start the RFC 2544-based benchmarking test in reflection test mode by entering the `test services rpm rfc2544-benchmarking test test-name start` command. If you attempt to start the reflection test mode, a message is displayed explaining the reason for the failure to commence the test.

Options

start	Start the RFC 2544-based benchmarking test
stop	Terminate the RFC 2544-based benchmarking test
clear-counters	(ACX Series routers, SRX300, and SRX550HM devices only) Clear the statistics associated with the benchmarking test that was run.
routing-instance	(ACX Series routers only) (Optional) Name of the routing instance for the test.
test-name	(Optional) Name of the benchmarking test that must be started or stopped.
test-id	(Optional) Unique identifier of the test that must be stopped. You can stop a test based on the test identifier. You can use the *test-id* option with only the `test services rpm rfc2544-benchmarking stop` command.

Additional Information

The test session is supported in out-of-service mode for the underlying service. You must not transmit any traffic to the UNI port, configured as a generator or a reflector, that is being tested during the duration of the test.

Required Privilege Level

view

Output Fields

To display the results of the benchmarking test, use the `show services rpm rfc2544-benchmarking test` command.

Sample Output

test services rpm rfc2544-benchmarking test start

```
user@host> test services rpm rfc2544-benchmarking test test1 start
Test "test1" id 56 started
```

The response specifies that a test has been started with test id 56. The test ID can be further used in `show` commands to view test output.

Release Information

Command introduced in Junos OS Release 12.3X52.

Hierarchy Level (Junos OS)

```
[edit services rpm probe owner]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rpm owner name]
```

Description

Specify the range of probes over which the standard deviation, average, and jitter are calculated. The test name combined with the owner name represent a single RPM configuration instance.

Options

`test` *`name`*—You can configure any name up to 32 characters in length. For Junos OS Evolved, if the owner name is one of the pre-defined names, then four pre-defined test names are available to choose from. For example, if the owner name is the pre-defined name `icmp-evo`, then these four pre-defined test names are available to configure: `icmp-evo-1`, `icmp-evo-2`, `icmp-evo-3`, and `icmp-evo-4`.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`inet6-options` option added in Junos OS Release 14.1R4 for MX Series routers.

Statement introduced in Junos OS Evolved Release 20.1R1.

`traps` option introduced in Junos OS Evolved Release 21.2R1.

test-agent (Paragon Active Assurance)

IN THIS SECTION

- Syntax | 30345
- Hierarchy Level | 30345
- Description | 30345
- Default | 30346
- Options | 30346
- Required Privilege Level | 30347
- Release Information | 30347

Syntax

```
test-agent {
   cc-account user-account-name;
   cc-host DNS-name;
   cc-insecure;
   cc-password plain-text-password;
   cc-port port-number;
   cc-user "user@domain";
   ta-name test-agent-name;
   ta-version version-number;
}
```

Hierarchy Level

```
[edit services paa]
```

Description

Installs and runs an instance of the Paragon Active Assurance (PAA) test agent on the node. Once this configuration is committed, the node downloads the PAA test agent Docker image from the PAA Control Center. The node then starts the Docker daemon and loads the PAA test agent Docker image into a

Docker container. The loaded software sets up the `nlsd` configuration required by the PAA test agent and then starts the PAA test agent.

Install the Paragon Active Assurance (PAA) test agent. Once the configuration for the test agent is committed, the system fetches the PAA test agent software image from the PAA Control Center for you and installs the software into a Docker container.

Before configuring this statement, make sure you have an HTTPS connection to the PAA Control Center (port 443 is open) and either port 6800 or a port of your choosing is open to connect the test agent with the PAA Control Center. In the PAA Control Center, make sure your SSL certificate is correct on both ports, and both are either secure or self-signed.

If the test agent version is prior to 4.2.0, you must configure 127.0.0.1 as the loopback address (lo0.0) on the router. For more information about loopback addresses and how to configure them, see Loopback Interfaces (Junos OS Evolved). If the test agent version is 4.2.0 or newer, you do not need to configure a loopback address.

We support installation on two VRFs, `vrf0` and `mgmt_junos`. By default, the operating system installs the PAA test agent on the `vrf0` VRF. If configuration for `mgmt_junos` is present, the operating system installs the PAA test agent on the `mgmt_junos` VRF.

If you already have a committed configuration for the PAA test agent, and you make and commit some changes to the options below, the PAA test agent is re-installed using the new changes to the configuration.

Default

For `cc-port`, 6800. For `ta-name`, the node name.

Options

cc-account ***user-account-name***	(Required) Your PAA Control Center user account.
cc-host ***DNS-name***	(Required) IP address or DNS host name of the PAA Control Center.
cc-insecure	(Optional) Allow an insecure connection between the test agent and the PAA Control Center. In other words, disable SSL certificate checking and use self-signed SSL certificates.
cc-password ***plain-text-password***	(Required) Your PAA Control Center password. The plain-text password is encrypted and is shown as such in the configuration. But the password is decrypted before being passed along to the test agent, which uses it when

authenticating towards the Control Center. The test agent sends the password itself, but inside a secure SSL connection.

cc-port ***port-number***

(Optional) Port over which the router can communicate with the PAA Control Center. Make sure the port you specify here (or port 6800 if taking the default) is open.

- Range: 1-65535
- Default: 6800

cc-user ***"user@domain"***

(Required) The email address registered with the PAA Control Center.

ta-name ***test-agent-name***

(Optional) The name you want to use to refer to this PAA test agent. The default is the router's hostname.

The `ta-name` is used to identify the test agent in the PAA Control Center, and PAA won't allow two test agents with the same name to run at the same time.

ta-version ***version-number***

(Optional) The PAA test agent software version you would like to install. Check the PAA Control Center for the versions available. If not specified, the operating system installs the latest PAA test agent software version from the Control Center.

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rfc2544 tests test-name test-name]
```

Description

Specify the logical interface on which the RFC 2544-based benchmarking test is run.

For Junos OS, if you configure an `inet` family and the test mode to initiate and terminate test frames on the same device, the interface you configure is not effective. Instead, the test is run on the egress logical interface that is determined using route lookup on the specified destination IPv4 address. If you configure an `inet` family and the test mode to reflect the frames back on the sender from the other end, the logical interface is used as the interface to enable the reflection service (reflection is performed on the packets entering the specified interface). If you not configure the logical interface for reflection test mode, a lookup is performed on the source IPv4 address to determine the interface that hosts the address.

For Junos OS Evolved, you can configure this statement for only family `ccc` or `ethernet-switching`. You cannot configure this statement for a Layer 3 reflector (family `inet`).

Options

`interface-name` Name of the logical interface on which the test needs to be run.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

test-interval

IN THIS SECTION

- Syntax | **30352**
- Hierarchy Level (Junos OS) | **30352**
- Hierarchy Level (Junos OS Evolved) | **30352**
- Description | **30353**
- Options | **30353**
- Required Privilege Level | **30353**
- Release Information | **30353**

Syntax

```
test-interval seconds;
```

Hierarchy Level (Junos OS)

```
[edit services rpm bgp],
[edit services rpm probe owner test test-name],
[edit services rpm twamp client control-connection control-client-name]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rpm owner name test name]
```

Description

Specify the time to wait between tests, in seconds. A test interval of 0 seconds causes the RPM test to stop after one iteration.

Options

seconds—Number of seconds to wait between tests.

- **Range:** [edit services rpm bgp], [edit services rpm probe *owner* test *test-name*], and [edit services monitoring rpm owner *name* test *name*] hierarchy levels: 0 through 86,400
- **Range:** [edit services rpm twamp client control-connection *control-client-name*] hierarchy level: 1 through 255
- **Default:** 1

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.3 for EX Series switches.

Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport routers.

Support at the [edit services rpm twamp client control-connection *control-client-name*] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.

Statement introduced in Junos OS Evolved Release 20.1R1.

test-iterator-duration (RFC 2544 Benchmarking)

IN THIS SECTION

- Syntax | 30354
- Hierarchy Level (Junos OS) | 30354
- Hierarchy Level (Junos OS Evolved) | 30354
- Description | 30354
- Options | 30355
- Required Privilege Level | 30355
- Release Information | 30355

Syntax

```
test-iterator-duration seconds;
```

Hierarchy Level (Junos OS)

```
[edit services rpm rfc2544-benchmarking tests test-name test-name]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rfc2544 tests test-name test-name]
```

Description

Specify the duration of each iteration in seconds. If you configure this value, the default value of each iteration depends on the type of test being run. For throughput, back-to-back-frames and frame-loss types of tests, the default value is 20 seconds. For latency tests, the default value is 120 seconds for Junos OS and 20 seconds for Junos OS Evolved.

Options

seconds Number of seconds for which each test iteration is run.

- **Range:** 10 through 120 seconds

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X53.

Statement introduced in Junos OS Evolved Release 23.4R1.

[edit services monitoring rfc2544 tests]
```

Description

Define the name of the RFC 2544-based benchmarking test. For each unique test name that you configure, you can specify a test profile, which contains the settings for a test and its type, and also a test interface, which contains the settings for test packets that are sent and received on the selected interface.

Options

test-name Test name. The name can be up to 32 characters in length.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

Statement introduced in Junos OS Evolved Release 21.1R1.

test-only-mode

IN THIS SECTION

- Syntax | **30360**
- Hierarchy Level | **30361**
- Description | **30361**
- Required Privilege Level | **30361**
- Release Information | **30361**

Syntax

```
test-only-mode (true | false);
```

Hierarchy Level

```
[edit services unified-access-control ]
```

Description

Configure the device in test-only mode to log access decisions from the IC Series device without actually enforcing the decisions. When configured in test-only mode, the SRX Series Firewall enables all UAC traffic to go through so you can test the implementation without impeding traffic.

Use this statement when you are configuring the SRX Series Firewall to act as a Junos OS Enforcer in a Unified Access Control (UAC) deployment. When deployed as a Junos OS Enforcer, the SRX Series Firewall enforces the policies that are defined on the UAC's IC Series device.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

Junos OS Syntax

```
test-profile profile-name;
```

Junos OS Evolved Syntax

```
[edit services monitoring rfc2544]
test-profile profile-name {
    bandwidth bandwidth;
    packet-size size;
    step-percent percent;
    test-type (throughput | latency | frame-loss | back-back-frames);
}
[edit services monitoring rfc2544 tests test-name test-name]
test-profile profile-name;
```

Hierarchy Level (Junos OS)

```
[edit services rpm rfc2544-benchmarking tests test-name test-name],
[edit services rpm rfc2544-benchmarking profiles]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rfc2544],
[edit services monitoring rfc2544 tests test-name test-name]
```

Description

Specify the name of the test profile to be associated with a particular test name. This parameter is required when the test mode is configured as initiate-and-terminate. This parameter is disregarded when

the test mode is configured as reflection. A reflection service does not use the parameters specified in the test profile.

For Junos OS Evolved, when configured at the [edit services monitoring rfc2544] hierarchy level, configures a test profile, which specifies the type of test and the manner in which it must be performed. You then use the `test-profile` statement at the [edit services monitoring rfc2544 tests test-name *test-name*] hierarchy level to associate the test profile name with a particular test name. You can associate the same test profile with multiple test names.

Options

profile-name Name of the test profile. The name can be up 32 characters in length. The name must start with a letter. Allowed characters are [a-zA-Z0-9_]

Required Privilege Level

system—To view this statement in the configuration.

system -control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X53 for ACX Series routers.

Statement introduced in Junos OS Evolved Release 23.4R1.

                    test-failure;
    }
    ttl hop-count;
}
```

Hierarchy Level

```
[edit services monitoring twamp client control-connection name]
```

Description

Specify the TWAMP test session details, including the session name, the contents of the test packet, the data size, the probe details, and the target destination. You must configure at least one test session.

Options

name Name of the test session.

data-size *bytes* Specify the size of the data portion of the test packet, in bytes.

- **Range:** 0 through 65400 bytes
- **Default:** 0

destination-port *port* Specify the User Datagram Protocol (UDP) port number to which a probe is sent. You must have the control-type option for the control-connection statement set to `light` to be able to configure a destination port for a particular test session. If you set the control-type option to `managed`, the destination port is negotiated for you between the client and the server, and so you cannot configure the destination port for a particular test session.

- **Range:** You can specify port 862, or any port from 49152 through 65535.
- **Default:** 862 (IANA port for TWAMP)

dscp-code-points ***dscp-bits***

Configure the value of the Differentiated Services (DiffServ) field within the IP header. The DiffServ code point (DSCP) bits value must be set to a valid 6-bit pattern.

- **Values:** Configure a valid 6-bit pattern; for example, `001111`, or one of the following DSCP aliases:
  - `af11`—Default: 001010
  - `af12`—Default: 001100
  - `af13`—Default: 001110
  - `af21`—Default: 010010
  - `af22`—Default: 010100
  - `af23` —Default: 010110
  - `af31` —Default: 011010
  - `af32` —Default: 011100
  - `af33` —Default: 011110
  - `af41` —Default: 100010
  - `af42` —Default:100100
  - `af43` —Default:100110
  - `be`—Default: 000000
  - `cs1`—Default: 001000
  - `cs2`—Default: 010000
  - `cs3`—Default: 011000
  - `cs4`—Default: 100000
  - `cs5`—Default: 101000
  - `cs6`—Default: 110000
  - `cs7`—Default: 111000
  - `ef`—Default: 101110

- `nc1`—Default: 110000
- `nc2`—Default: 111000

history-size *number*

Specify the number of stored history entries. The value configured for the history-size option must be equal to or larger than the value configured for the probe-count option, or the configuration will not commit.

- **Range:** 0 to 255
- **Default:** 50

moving-average-size *number*

Enable statistical calculations to be performed across a configurable number of the most recent samples.

- **Range:** 0 through 512
- **Default:** 0 (disable)

offload-type (none | inline-timestamp | pfe-timestamp)

Enable timestamping of TWAMP probe messages in the Routing Engine, inline in the hardware, or Packet Forwarding Engine host processor. Prior to Junos OS Evolved 22.3R1, for IPv6 traffic, you must configure `none`, as only Routing Engine timestamping is supported. Starting in Junos OS Evolved 22.3R1, you can configure the `pfe-timestamping` option for IPv6 traffic.

- **none**—Timestamping in the Routing Engine.
- **inline-timestamping**—Timestamping inline, in the hardware at the generator, and reflection in the hardware at the reflector. When this option is configured for an ACX router, the ACX can act as either a server or client, but not both. Also for an ACX router, `inline-timestamping` is not supported on PM50 ports if FEC74 is enabled on that port. You can configure the `inline-timestamping` option for up to 256 test sessions.
- **pfe-timestamping**—Timestamping in the Packet Forwarding Engine.
- **Default:** pfe-timestamp

probe-count *number*

Specify the number of probes within a test. The value configured for the probe-count option must be smaller than the value configured for the history-size option, or the configuration will not commit.

- **Range:** 1 through 255
- **Default:** 1

probe-interval *seconds*

Specify the number of seconds to wait before sending the next probe.

- **Range:** 1 through 255 seconds
- **Default:** 1

source-address *address*

Specify the IPv4 or IPv6 source address used for test probes. If the source address is not one of the device's assigned addresses, the probe uses the outgoing interface's address as its source.

You cannot use IPv6 link-local addresses or the following addresses as the source address for probes:

- 0.0.0.0
- 127.0.0.0/8 (loopback)
- 224.0.0.0/4 (multicast)
- 255.255.255.255 (broadcast)

When an IPv6 link-local address is configured with the `target` *`target-address`* `local-link` *`IPv6-link-local-interface-name`* option, you cannot configure the `source-address` *`address`* option. Instead, the operating system sets this option for you.

target *target-address* **local-link** *IPv6-link-local-interface-name*

Specify the IPv4 or IPv6 address for the target destination of the probe. Prior to Junos OS Evolved 22.3R1, you cannot use an IPv6 link-local address for the target destination of a probe. Starting in Junos OS Evolved 22.3R1, for TWAMP Light test sessions with IPv6 target addresses (where the `control-type light` statement is configured for the control connection), configure the link-local logical interface name for the egress interface. You cannot configure IPv6 link-local addresses for TWAMP managed test sessions (where the `control-type managed` statement is configured for the control connection) .

ttl *hop-count*

Specify the maximum number of hops a TWAMP probe can travel. You configure the ttl option when necessary to restrict the scope of a probe, so that a probe does not unintentionally monitor an alternative path to the destination (such as may occur after a BGP re-routing). You can also use the ttl option to monitor direct reachability by specifying a TTL of 1. Probes that exceed the number configured are discarded.

- **Range:** 1 through 255 hops
- **Default:** 64 hops

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rfc2544 test-profile profile-name]
```

Description

RFC 2544 defines four main test types. You can configure and perform a test for a certain service, such as IPv4 or Ethernet, and analyze the results of the test to examine the various SLA parameters of the service. The test packets traverse through the same path as the regular service traffic. These tests are repeated for different frame sizes before calculating the measurement. (For example: 64, 128, 256, 512, 1024, 1280 and 1518 bytes.)

Configure the type of RFC 2544-based benchmarking test to be performed. Because of the ability of these tests to measure throughput, bursty frames, frame loss, and latency, this mechanism is also used to diagnose and examine Ethernet-based networks.

Options

throughput Measure the maximum rate at which none of the offered or transmitted frames are dropped by the device on which the test is performed. You use this test to measure the rate of successful transmission against the theoretical rate of the Ethernet media used for testing.

latency Measure the time interval between the arrival of the last bit of the input frame at the input port and the output of the first bit of the frame on the output port. The test is repeated 20 times and the average latency is recorded as the measure for the frame size under test.

`frame-loss` Measure the percentage of frames that must have been forwarded by a network device under steady state (constant) load conditions, but were not forwarded due to lack of resources. The test is repeated for the maximum rate of the Ethernet media (100%) and further lower granular rates by steps, which are configurable with the `step-percent` statement. The test is repeated to find the rate where there are no frames lost for at least 2 iterations of this test. The same test is repeated for various stream sizes supported for the tested traffic rate.

`back-back-frames` **(Junos OS) or** `back-to-back` **(Junos OS Evolved)** Measure the number of frames that are forwarded by the device on which the test is performed when a burst of frames with minimum inter-frame gaps is sent to that device from another source device. The minimum burst length must be at least 2 seconds. If the transmitted frames are equal to the frame count of the burst, then the test is repeated by increasing the number of frames in the burst. The back to back value is then determined as the frame count with the maximum burst size transmitted by the device under test with no loss.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X53 for ACX Series routers.

Statement introduced in Junos OS Evolved 23.4R1.

tftp (Security ALG)

IN THIS SECTION

- Syntax | 30378
- Hierarchy Level | 30378
- Description | 30379
- Options | 30379
- Required Privilege Level | 30379
- Release Information | 30379

Syntax

```
tftp {
    disable;
    traceoptions {
        flag {
            all {
                extensive
            }
        }
    }
}
```

Hierarchy Level

```
[edit logical-systems name security alg],
[edit logical-systems name tenants name security alg],
[edit security alg],
[edit services alg],
[edit tenants name security alg]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure the Trivial File Transfer Protocol (TFTP) ALG on the device. TFTP is a simple protocol used for files transfer (RFC 1350). By default, the TFTP ALG is disabled for NFX Series and SRX Series Firewalls.

Options

- `disable`—Disable the TFTP ALG. By default, the TFTP ALG is enabled.
- `traceoptions`—Configure TFTP ALG tracing options.
  - `flag`—Trace operation to perform.
    - `all`—Trace all events.
    - *`extensive`*—Display extensive amount of data.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

The `tenant` option is introduced in Junos OS Release 18.3R1.

then (Captive Portal Content Delivery)

IN THIS SECTION

- Syntax | 30383
- Hierarchy Level | 30383
- Description | 30383
- Options | 30384
- Required Privilege Level | 30385
- Release Information | 30385

Syntax

```
then {
    accept;
    insert tag-name tag-name tag-value tag-value;
    redirect url;
    rewrite destination-address address <destination-port port-number>;
    syslog;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name services captive-portal-content-delivery rule rule-name term
term-name],
[edit services captive-portal-content-delivery rule rule-name term term-name]
```

Description

Define the term actions and any optional action modifiers for the captive portal content delivery rule. Use the statement at the `[edit services...]` hierarchy level for static CPCD. Use the statement at the `[edit dynamic-profiles profile-name services...]` hierarchy level for converged services CPCD.

Options

action Actions to accept, redirect, or rewrite packets and all subsequent packets in flows that match the rules.

- `accept`—Accept the packets and all subsequent packets in flows that match the rules.
- `insert`—Insert a tag with a specified value that is added to the HTTP packet header when the term is matched. You must insert the following action modifiers.
  - `tag` *`tag-name`*—Name of the tag inserted in the packet header, with a maximum size of 127 characters. The tag name is case-sensitive, such that `tag ABCD` and `tag abcd` are processed as different names:
  - `tag-value` *`tag-value`*—Value of the specified tag, with a maximum size of 127 characters. You can specify a customer value or use one of four predefined options that causes the associated value to be inserted:
    - *custom*—Value defined by user, with a maximum size of 127 characters.
    - `hostname`—Hostname of the router.
    - `subscriber-ip`—Subscriber's IPv4 address.
    - `subscriber-ipv6`—Subscriber's IPv6 address.
    - `subscriber-mac-addr`—MAC address of the subscriber.
- `redirect`—Redirect the packet and all subsequent packets in flows that match the rules. You can optionally configure the following action modifier:
  - *`url`*— URL destination for the redirected packet. The URL must begin with `http://` or `https://`.

rewrite Rewrite the packet and all subsequent packets in flows that match the rules. You can optionally configure one or both of the following action modifiers:

- `destination-address` *`address`*—Destination address for the rewritten packet.
- `destination-port` *`port-number`*—(Optional) Destination port for the rewritten packet.

syslog Log information about the packet to a system log file.

action Actions to accept, redirect, or rewrite packets and all subsequent packets in flows that match the rules.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

Support at the `[edit dynamic-profiles profile-name services captive-portal-content-delivery rule rule-name term term-name]` hierarchy level added in Junos OS Release 17.2R1.

`insert` option added in Junos OS Release 19.1R1.

Support for Next Gen Services introduced in Junos OS Release 19.3R2.

then (Filters)

IN THIS SECTION

- Syntax | 30388
- Hierarchy Level | 30388
- Description | 30388
- Options | 30388
- Required Privilege Level | 30389
- Release Information | 30389

Syntax

```
then {
        action;
        action-modifiers;
}
```

Hierarchy Level

```
[edit firewall family family-name filter filter-name term term-name]
```

Description

Configure a firewall filter action.

Options

action Actions to accept, discard, or forward packets that match all conditions specified in a filter term.

Starting in Junos OS Release 18.4R1, two new actions – `port-mirror` and `port-mirror-instance` – are added for all match conditions, which enable selective port mirroring of MPLS traffic to a mirrored destination.

The `port-mirror` action enables port mirroring globally on the device, which applies to all Packet Forwarding Engines (PFEs) and associated interfaces.

The `port-mirror-instance` action enables you to customize each instance with different properties for input sampling and port mirroring output destinations, instead of having to use a single system-wide configuration for port mirroring.

NOTE:

- You can configure only two port mirroring instances per Flexible PIC Concentrator (FPC) by including the instance `port-mirror-instance-name` statement at the `[edit forwarding-options port-mirror]` hierarchy level. You can then associate individual port mirroring instances with an FPC, PIC, or (Forwarding Engine Board (FEB) depending on the device hardware.
- For both `port-mirror` and `port-mirror-instance` actions, the output interface must be enabled with Layer 2 family and not family MPLS (Layer 3) for the selective port mirroring feature to work.

action-modifiers Additional actions to analyze, classify, count, or police packets that match all conditions specified in a filter term.

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

- Release Information | 30391

Syntax

```
then {
        action;
        action-modifiers;
}
```

Hierarchy Level

```
[edit firewall family family-name filter filter-name term term-name]
```

Description

Configure a filter action.

Options

action Action to accept, discard, sample or forward packets that match all match conditions specified in a filter term.

action-modifiers Additional actions to analyze, classify, count, or police packets that match all conditions specified in a filter term.

The `inline-monitoring-instance` action maps the instance for inline monitoring services to the firewall term. You must attach the inline monitoring filter under `inet` or `inet6` family of the logical unit of the interface for applying inline monitoring on the ingress or egress direction. Starting in Junos OS Release 21.1, the `inline-monitoring-instance` option is also supported by the `any`, `bridge`, `ccc`, `mpls`, and `vpls` families.

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

`inline-monitoring-instance` option added in Junos OS Release 19.4R1 on MX Series routers with MPCs excluding MPC10E and MPC11E linecards.

Added additional family support to the `inline-monitoring-instance` option in Junos OS Release 21.1R1.

then (PCC Rules)

IN THIS SECTION

- Syntax | 30403
- Hierarchy Level | 30404
- Description | 30404
- Required Privilege Level | 30404
- Release Information | 30404

Syntax

```
then {
    pcc-action-profile  profile-name;
}
```

Hierarchy Level

```
[edit unified-edge pcef pcc-rules rule-name],
[edit services pcef pcc-rules rule-name]
```

Description

Specify the policy and charging control (PCC) action profile for a PCC rule. The PCC action profile specifies the actions to apply to subscriber traffic that matches any of the `from` statements in the PCC rule. A PCC rule configuration must include the `then` statement and a PCC action profile. The referenced PCC action profile must be configured.

If you are using Junos OS Subscriber Aware, specify the name of the PCC action profile at the `[edit unified-edge pcef pcc-rules rule-name]` hierarchy level.

If you are using Junos OS Broadband Subscriber Management, specify the name of the PCC action profile at the `[edit services pcef pcc-rules rule-name]` hierarchy level.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

For Junos OS Subscriber Aware:

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

For Junos OS Broadband Subscriber Management:

services—To view this statement in the configuration.

services–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support at the `[edit services pcef pcc-rules rule-name]` hierarchy level introduced for Junos OS Broadband Subscriber Management in Junos OS Release 17.2 on MX Series.

Support for Next Gen Services for Junos OS Broadband Subscriber Management introduced in Junos OS Release 19.3R2 on MX Series.

RELATED DOCUMENTATION

then (PCP)

IN THIS SECTION

- Syntax | 30405
- Hierarchy Level | 30405
- Description | 30405
- Required Privilege Level | 30406
- Release Information | 30406

Syntax

```
then {
    pcp-server server-name;
}
```

Hierarchy Level

```
[edit services pcp rule rule-name term term-name]
```

Description

Specify the PCP server to handle the traffic that matches the PCP rule term.

PCP is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS. Starting in Junos OS Release 17.4R1, PCP is also supported on the MS-MPC and MS-MIC.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2R1.

RELATED DOCUMENTATION

Configuring Port Control Protocol

then (Policer Action)

IN THIS SECTION

- Syntax | 30406
- Hierarchy Level | 30407
- Description | 30407
- Options | 30407
- Required Privilege Level | 30407
- Release Information | 30407

Syntax

```
then {
                    policer-action;
}
```

Hierarchy Level

```
[edit firewall policer policer-name]
[edit logical-systems logical-system-name firewall policer policer-name]
```

Description

Configure a policer action.

Options

policer-action—Actions to take are:

- `discard`—Discard traffic that exceeds the rate limits defined by the policer.
- `forwarding-class` *class-name*—Classify traffic that exceeds the rate limits defined by the policer.
- `loss-priority`—Set the loss priority for traffic that exceeds the rate limits defined by the policer.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall -control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

then (Policers)

IN THIS SECTION

- Syntax | 30408
- Hierarchy Level | 30408
- Description | 30408
- Options | 30408
- Required Privilege Level | 30409
- Release Information | 30409

Syntax

```
then {
    policer-action;
}
```

Hierarchy Level

```
[edit firewall policer policer-name]
```

Description

Configure a policer action.

Options

policer-action—Allowed policer actions are **discard**, **loss-priority high**, and **loss-priority low**. **discard** causes the system to drop traffic that exceeds the rate limits defined by the policer. Use **loss-priority high** to allow the system to forward matching traffic in some cases.

NOTE: If you specify a policer in an egress firewall filter, the only supported action is **discard**.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Overview of Policers

then (Security Application Firewall)

IN THIS SECTION

- Syntax | **30410**
- Hierarchy Level | **30410**
- Description | **30410**
- Options | **30410**
- Required Privilege Level | **30411**
- Release Information | **30411**

Syntax

```
then {
    (deny [block-message] | permit | reject [block-message]);
}
```

Hierarchy Level

```
[edit security application-firewall rule-set rule-set-name rule rule-name]
```

Description

Specify the action to be performed when traffic matches the associated match criteria.

Note that an application firewall is applied after a session has already been created by the security firewall. When traffic is rejected or denied by an application firewall, therefore, logs contain a session open message, a session reject or deny message, and a session close message.

Starting in Junos OS Release 18.2R1, the application firewall (AppFW) functionality is deprecated. As a part of this change, the `[edit security application-firewall]` hierarchy and all the configuration options under this hierarchy are deprecated— rather than immediately removed—to provide backward compatibility and an opportunity to bring your configuration into compliance with the new configuration.

Options

- `deny`—Block the traffic at the firewall. The device drops the packet. By default, no message is returned to the sender.
  - `block-message`—(Optional) In application firewall rules, provide information to the user regarding blocked traffic. Depending on the content of the `profile` option for this rule set, including the `block-message` option displays a default message or customized message, or redirects the user for denied HTTP or HTTPS traffic. All other traffic is dropped silently.
- `permit`—Permit traffic at the firewall.
- `reject`—Block the traffic at the firewall. For TCP traffic, by default the device drops the packet and returns a TCP reset (RST) message to the source host. For UDP and other protocol traffic, by default the device drops the packet and returns an ICMP “destination unreachable, port unreachable” message to both the client and the server.

- `block-message`—(Optional) In application firewall rules, provide information to the user regarding blocked traffic. Depending on the content of the `profile` option for this rule set, including the `block-message` option displays a default message or customized message, or redirects the user for rejected HTTP or HTTPS traffic. All other traffic is dropped as specified in the default action for the `reject` option.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1. Statement updated in Junos OS Release 12.1X44-D10 with the `reject` option. The `block-message` option added in Junos OS Release 12.1X45-D10.

        forwarding-class class-name;
    }
}
```

Hierarchy Level

```
[edit services cos rule rule-name policy policy-name]
```

Description

Specify the Differentiated Services (DiffServ) code point (DSCP) marking and forwarding-class assignments for packets that are processed by a service set and that match the conditions of the policy in a services CoS rule.

The service set that the CoS rule is assigned to must include at least one stateful firewall rule or NAT rule, or CoS does not work. Only stateful firewall and NAT rules can be used with CoS rules in a service set.

Options

application-profile *profile-name*
: The application profile that sets the CoS actions for FTP and SIP traffic.

dscp (*alias* | *bits*)
: Either a code point alias or a DSCP bit value to apply to the packet.

forwarding-class *class-name*
: Forwarding class name to apply to the packet. The choices are:

- assured-forwarding
- best-effort
- expedited-forwarding
- network-control

reflexive
: Applies the CoS rule policy actions to flows in the reverse direction as well as to flows in the matching direction.

revert
: Stores the DSCP and forwarding class of a packet that is received in the match direction of the rule and then applies that DSCP and forwarding class to packets that are received in the reverse direction of the same session.

reverse
: Specifies actions to apply to flows in the reverse direction of the matching direction.

Required Privilege Level

interface—To view this statement in the configuration.

thermal-health-check

IN THIS SECTION

- Syntax (Junos OS) | **30432**
- Syntax (Junos OS Evolved) | **30433**
- Hierarchy Level | **30433**
- Description | **30433**
- Options | **30434**
- Required Privilege Level | **30436**
- Release Information | **30436**

Syntax (Junos OS)

```
thermal-health-check {
      fet-failure-check {
          action-onfail (auto-shutdown | none);
      }
      action-onfail (auto-shutdown | none);
      shutdown-timer value;
      power-threshold value;
```

```
      power-threshold-percent value;
}
```

Syntax (Junos OS Evolved)

```
thermal-health-check {
      action-onfail (auto-shutdown | none);
      power-threshold-percent value;
}
```

Hierarchy Level

```
[edit chassis]
```

Description

Enable thermal health check, and configure an action that will respond to the detection of a thermal health event such as power leakage on PTX5K, MX10K, PTX10K and QFX10K devices. The thermal health check feature monitors the PSM power output and FRU power consumption every minute. When the PSM power output exceeds the FRU power consumption by a default or configured threshold for three consecutive iterations, it assumes a thermal health event and takes an action based on user configuration.

NOTE: The default threshold for QFX10002 devices is 100 W and for other devices is 600 W.

The default action is set to none. You can use the following command to shut down all PSMs when a thermal health check fails:

```
set chassis thermal-health-check action-onfail auto-shutdown shutdown-timer value (power-
threshold | power-threshold-percent) value
```

NOTE: On a Junos OS device, you can configure only `power-threshold` or `power-threshold-percentage` at a time since they cannot coexist.

You can configure `power-threshold-percent` for systems that are connected to either second or third generation power supplies.

To ensure accurate operation, the thermal health check feature enables the system to shut down the PSMs with a load under 20%. You can expect a margin of error in total FRU input and PSM output power readings compared to actual hardware values.

You must enable the PSM watchdog feature along with thermal-health check to shutdown the system in case a thermal health event causes Junos to go down. Please note that PEM firmware upgrade is required for the thermal health check and PSM watchdog feature.

You can enable the `fet-failure-check` option to monitor a failing power supply due to a Field-effect Transistor (FET) failure and take corrective action. You can choose to shutdown a reporting PSM if a redundant power supply is available, raise an alarm and log the events when a risk of thermal event is determined.

NOTE: The `fet-failure-check` option is supported on MX10K and PTX10K devices that run on Junos OS.

Options

fet-failure-check Enable FET failure detection, and configure an action to be taken upon FET failure.

action-onfail Choose an action to be performed on detection of a thermal health event. The following options are available:

- `auto-shutdown`—The software shuts down all PSMs when a thermal health event is detected. It turn off power to the router to avoid further damage or fire.
- `none`—The software raises a major alarm when a thermal health event is detected.

shutdown-timer *value* Set the timer in seconds to shutdown the PSMs (Range: 10sec to 15mins). This setting is necessary if the automatic shutdown did not occur during a thermal health event due to a software freeze. The default shutdown timer is 900 seconds, and you have the option to reconfigure it. Please note that if the configured timer value is shorter than the default, then you need to deactivate it before rebooting the system. The reboot delay could cause the timer to expire. The shutdown-timer option is not available on Junos OS Evolved. Instead, the timeout value configured for the PSM watchdog feature serves as the shutdown-timer.

power-threshold *value* Set power threshold value in watts. The default value for power-threshold is 600. Avoid using the default value for systems connected to second or third generation power supplies.

power-threshold-percent *value*

Set power threshold value in percent of Total System Power Output (Range: 4 to 10 percent). This value indicates the percentage difference between the parameters: Total System Power Output and Total System FRU Input Power. On Junos OS, you must set a value to configure power-threshold-percentage because the system doesn't provide a default. On Junos OS Evolved, power-threshold-percent value has a default value of 8.

Table 1906: Thermal health check alarms

Alarm	Description	Remedy	Severity
`Thermal Check Failed: Exceeded threshold value`	Appears when thermal health check fails upon exceeding the threshold value. If you have configured auto-shutdown, then the system will shut down.	If the action is set to `none` following a thermal health check failure, the alarm clears once the failure is resolved. If the action is set to `auto-shutdown`, you must power-cycle the chassis to recover.	Major
`Thermal Check did not meet conditions`	Appears when the load of any active PSM is below 20%. System will shut down these PSMs, provided N+2 redundancy criteria is met. If the redundancy criteria is not met, the thermal health check feature will raise this alarm because it cannot shut down these PSMs. On Junos OS Evolved, the PSM state becomes `Spare` under this condition.	Shut down the less loaded PSMs to increase the load of active PSMs.	Minor

Table 1906: Thermal health check alarms *(Continued)*

Alarm	Description	Remedy	Severity
`PEM %d shutdown - Insufficient system load` (Junos OS) `PSM %d shutdown - Insufficient system load` (Junos OS Evolved)	Appears at PSM-level when the load of any active PSM is below 20%. System shuts down these PSMs, provided N+2 redundancy criteria is met.	No remedy required for this alarm. Maintaining a load above 20% for all PSMs is recommended to ensure accurate thermal health check feature functionality and shutdown of unnecessary PSMs.	Minor

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.1R1.

`fet-failure-check` option introduced in Junos OS Release 21.2R1.

[edit routing-instances routing-instance-name routing-options multicast forwarding-cache (inet |
inet6)],
[edit routing-options multicast forwarding-cache],
[edit routing-options multicast forwarding-cache family (inet | inet6)]
```

Description

Configure the suppression, reuse, and warning log message thresholds for multicast forwarding cache limits. You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the `threshold` statement globally for the multicast forwarding cache or including the `family` statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.

When general forwarding-cache suppression is active, the multicast forwarding-cache prevents forwarding traffic on the shared RP tree (RPT). At the same time, MVPN (*,G) forwarding states are not created for new RPT c-mcast entires, and , (*,G) installed by BGP-MVPN protocol are deleted. When general forwarding-cache suppression ends, BGP-MVPN (*,G) entries are re-added in the RIB and restored to the FIB (up to the MVPN (*,G) limit).

When MVPN RPT suppression is active, for all PE routers in excess of the threshold (including RP PEs), MVPN will not add new (*,G) forwarding entries to the forwarding-cache. Changes are visible once the entries in the current forwarding-cache have timed out or are deleted.

To use `mvpn-rpt-suppress` and/or `mvpn-rpt-reuse`, you must first configure the general `suppress` threshold. If `suppress` is configured but `mvpn-rpt-suppress` is not, both `mvpn-rpt-suppress` and `mvpn-rpt-reuse` will inherit *and use* the value set for the general `suppress`.

Options

reuse or **mvpn-rpt-reuse** *value* (Optional) Value at which to begin creating new multicast forwarding cache entries. If configured, this number should be less than the **suppress** value.

- **Range:** 1 through 200,000

suppress or **mvpn-rpt-suppress** *value* —Value at which to begin suppressing new multicast forwarding cache entries. This value is mandatory. This number should be greater than the **reuse** value.

- **Range:** 1 through 200,000

Required Privilege Level

[edit protocols pim rp register-limit family],
[edit routing-instances routing-instance-name protocols pim rp register-limit],
[edit routing-instances routing-instance-name protocols pim rp register-limit family]
```

Description

Configure a threshold at which a warning message is logged when a certain number of PIM entries have been received by the device.

Options

value—Threshold at which a warning message is logged. This is a percentage of the maximum number of entries accepted by the device as defined with the `maximum` statement. You can apply this threshold to incoming PIM join messages, PIM register messages, and group-to-RP mappings.

For example, if you configure a maximum number of 1,000 incoming group-to-RP mappings, and you configure a threshold value of 90 percent, warning messages are logged in the system log when the device receives 900 group-to-RP mappings. The same formula applies to incoming PIM join messages and PIM register messages if configured with both the **maximum *limit*** and the `threshold value` statements.

- **Default:** 1 through 100

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

```

Description

Establish a threshold to trigger the automatic creation of a data MDT.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4. In Junos OS Release 17.3R1, the `mdt` hierarchy was moved from `provider-tunnel` to the `provider-tunnel family inet` and `provider-tunnel family inet6` hierarchies as part of an upgrade to add IPv6 support for default MDT in Rosen 7, and data MDT for Rosen 6 and Rosen 7. The `provider-tunnel mdt` hierarchy is now hidden for backward compatibility with existing scripts.

threshold (Services IPsec)

IN THIS SECTION

- Syntax | 30460
- Hierarchy Level | 30461
- Description | 30461
- Options | 30461
- Required Privilege Level | 30461
- Release Information | 30461

Syntax

```
threshold number;
```

Hierarchy Level

```
[edit services ipsec-vpn rule rule-name term term-name then dead-peer-detection]
```

Description

Specify the maximum number of unsuccessful dead peer detection (DPD) requests to be sent before the peer is considered unavailable. The `threshold` value is used for IKEv1 security associations (SAs). Starting in Junos OS Release 17.2R1, the `threshold` value is also applicable to IKEv2 SAs. In Junos OS Release 17.1 and earlier, the `threshold` option is not applicable to IKEv2 SAs, which use the default value.

Options

number Maximum number of unsuccessful DPD requests to be sent.

- **Range:** 1 through 10
- **Default:** 3

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

IKEv2 support introduced in Junos OS Release 17.2.

- Description | 30465
- Default | 30466
- Options | 30466
- Required Privilege Level | 30466
- Release Information | 30466

Syntax

```
threshold threshold-value;
```

Hierarchy Level

```
[edit chassis fpc slot-number error  fatal],
[edit chassis fpc slot-number error  major],
[edit chassis fpc slot-number error  minor],
[edit chassis error  fatal],
[edit chassis error  major],
[edit chassis error  minor]
```

Description

Configure the threshold value at which to take action. If the severity level of the error is fatal, the action is carried out only once when the total number of errors crosses the threshold value. If the severity level of the error is major, the action is carried out once after the occurrence crosses the threshold. If the severity level is minor, the action is carried out as many times as the value specified by the threshold. For example, when the severity level is minor, and you have configured the threshold value as 10, the action is carried out after the tenth occurrence.

> **NOTE**: You can set the threshold value to 0 for errors with severity level as minor. This implies that no action is taken for that error. You cannot set the threshold value to 0 for errors with severity level as major or fatal.

Default

By default, the error count for fatal and major actions is 1. The default error count for minor actions is 10.

Options

number Specify the threshold of error counts at which to take action.

- **Range:** 0 through 4,294,967,295

thresholds (Junos OS Evolved)

IN THIS SECTION

- Syntax | 30473
- Hierarchy Level | 30473
- Description | 30474
- Options | 30474
- Required Privilege Level | 30475
- Release Information | 30475

Syntax

```
thresholds {
    control-failure (on | off);
    successive-loss number;
    total-loss number;
    threshold-type (microseconds | average);
}
```

Hierarchy Level

```
[edit services monitoring rpm owner name test name]
[edit services monitoring twamp client control-connection name test-session name]
```

Description

Specify the thresholds used for real-time performance monitoring (RPM) and Two-Way Active Measurement Protocol (TWAMP) probes. A system log message is generated when the configured threshold is exceeded.

Options

control-failure (on | off)

Specify whether control failure should be reported as a test failure.

- **Default:** on

successive-loss *number*

Measures the number of packets lost in succession. Set this number to specify how many packets should be lost in succession before indicating a probe failure.

- **Range:** 0 through 15; setting this option to zero disables this counter.
- **Default:** 1, which indicates that the test should fail with any packet loss.

total-loss *number*

Measures total number of packets lost per test. Set this number to specify how many packets should be lost in total before indicating a probe failure.

- **Range:** 0 through 15; setting this option to zero disables this counter.
- **Default:** 1, which indicates that the test should fail with any packet loss.

***threshold-type* (*microseconds* | average)**

Specify one or more measurement options and set thresholds for them. By default, these options set the maximum threshold. To configure the option to use the average measurement and not the maximum, configure the average option on each configured threshold type. To set the threshold type back to maximum, either delete the average option from the configuration or configure the threshold type again without the average option.

- **Range:** 0 through 60,000,000 microseconds; setting this option to zero disables the configured threshold type.
- **Values:** You can configure these threshold types:
  - egress-time—Source-to-destination time per probe.
  - ingress-time—Destination-to-source time per probe.
  - jitter-egress—Source-to-destination jitter per test.

- jitter-ingress—Destination-to- source jitter per test.
- jitter-rtt—Round-trip jitter per test.
- rtt—Round-trip time per probe.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved 20.1R1 for RPM.

Statement introduced in Junos OS Evolved 20.3R1 for TWAMP.

thresholds (Junos OS)

IN THIS SECTION

- Syntax | 30476
- Hierarchy Level | 30476
- Description | 30476
- Options | 30476
- Required Privilege Level | 30477
- Release Information | 30477

Syntax

```
thresholds thresholds;
```

Hierarchy Level

```
[edit services rpm probe owner test test-name],
[edit services rpm twamp client control-connection control-client-name]
```

Description

Specify thresholds used for the probes. A system log message is generated when the configured threshold is exceeded. Likewise, an SNMP trap (if configured) is generated when a threshold is exceeded.

> **NOTE**: If you configure a value of zero using the *thresholds* option for a certain probe parameter, the generation of SNMP traps is disabled for the corresponding probe attribute. For example, if you specify the `set thresholds jitter-egress 0` statement, it denotes that traps are not triggered when the jitter in egress time threshold is met or exceeded.

Options

thresholds—Specify one or more threshold measurements. The following options are supported:

- `egress-time`—Measures maximum source-to-destination time per probe.
- `ingress-time`—Measures maximum destination-to-source time per probe.
- `jitter-egress`—Measures maximum source-to-destination jitter per test.
- `jitter-ingress`—Measures maximum destination-to- source jitter per test.
- `jitter-rtt`—Measures maximum jitter per test, from 0 through 60,000,000 microseconds.
- `rtt`—Measures maximum round-trip time per probe, in microseconds.
- `std-dev-egress`—Measures maximum source-to-destination standard deviation per test.
- `std-dev-ingress`—Measures maximum destination-to-source standard deviation per test.

- `std-dev-rtt`—Measures maximum standard deviation per test, in microseconds.
- `successive-loss`—Measures successive probe loss count, indicating probe failure.
- `total-loss`—Measures total probe loss count indicating test failure, from 0 through 15. The default for this threshold is 1.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the [`edit services rpm twamp client control-connection` *`control-client-name`*] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.

thresholds

IN THIS SECTION

- Syntax | 30478
- Hierarchy Level | 30478
- Description | 30478
- Options | 30478
- Required Privilege Level | 30479
- Release Information | 30479

Syntax

```
thresholds {
    clear clear-value;
    interval interval-value;
    set set-value;
    warning-clear warning-clear-value;
    warning-set warning-set-value;
}
```

Hierarchy Level

```
[edit interfaces interfaces-name link-degrade-monitor]
```

Description

Configure the BER threshold values (such as set and clear thresholds) at which different corrective actions must be triggered on a degraded interface.

Options

clear *clear-value*
The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted. You can configure this value in the 1E–*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of IE–3 refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 12.

interval *interval-value*
The number of consecutive link degrade events that are considered before any corrective action is taken. The supported value range for the interval is 1 through 256, and the default interval is 10.

set *set-value*
The BER threshold value at which the link is considered degraded and a corrective action, specified by the user, is triggered. You can configure this value in the 1E–*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of IE–3 refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 7.

warning clear *warning-clear-value*

The link clear warning threshold. Every time this threshold value is reached, a system message is logged to indicate that the link degrade condition has been cleared on the interface. You can configure this value in the 1E–*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of IE–3 refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 11.

warning set *warning-set-value*

The link degrade warning threshold. Every time this threshold value is reached, a system message is logged to indicate that a link degrade has occurred on the interface. You can configure this value in the 1E–*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of IE–3 refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 9.

NOTE: The lower the BER with high confidence level, the longer it takes to estimate it. In such cases, a few packet drops might be noticed (based on the bit error distribution) before a link degrade event is detected.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

Syntax

```
time {
    equals {
        value;
    }
    greater-than value;
    less-than value;
}
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name domain-selection term term-name from attribute name
format]
```

Description

Specify the custom AVP attribute's format as time and the value to match for the incoming RADIUS request from the IP-based subscriber.

After this criterion and the other match criteria specified for the TDF domain or PCEF profile selection term are matched, the specified TDF domain or PCEF profile is selected.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Syntax

```
time-binding {
    count count-value;
```

```
    scope (destination | peer | source);
    interval time-interval;
}
```

Hierarchy Level

```
[edit security idp custom-attack attack-name]
```

Description

Allow IDP to detect a sequence of the same attacks over a period of time.

Options

count *count-value*

Specify the number of times that IDP detects the attack within the specified scope before triggering an event.

interval *time-interval*

Specify the maximum time interval between any two instances of a time-binding custom attack.

- **Syntax:** 00m-00s
- **Default:** 60 seconds
- **Range:** 0 minutes and 0 seconds to 60 minutes and 0 seconds

scope (destination | peer | source)

Specify whether the counting of the attack is from the same source IP address, the same destination IP address, or a peer.

- Values:

  destination IDP detects attacks to a given destination IP address for the specified number of times, regardless of the source IP address.

  peer IDP detects attacks between source and destination IP addresses of the sessions for the specified number of times.

  source IDP detects attacks from a given source IP address for the specified number of times, regardless of the destination IP address.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

`Interval` option introduced in Junos OS Release 18.4R1.

Time Bindings

time-format

IN THIS SECTION

- Syntax | 30483
- Hierarchy Level | 30484
- Description | 30484
- Options | 30484
- Required Privilege Level | 30484
- Release Information | 30485

Syntax

```
time-format (year | millisecond | year millisecond);
```

Hierarchy Level

```
[edit system syslog]
[edit security log]
```

Description

Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a `file`, `console`, or `user` statement at the `[edit system syslog]` hierarchy level, but not to destinations configured by a `host` statement.

However, in a Junos OS specific implementation using the FreeBSD console for a syslog destination, additional time information is available in system log messages for that destination when you configure the destination through a `host` statement.

By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, `Aug 21 12:36:30`.

The following example illustrates the format for a timestamp that includes both the millisecond (`401`) and the year (`2006`):

```
Aug 21 12:36:30.401 2006
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the `[edit system syslog time-format]` statement.

> **NOTE**: When the `structured-data` statement is included at the `[edit system syslog file *filename*]` hierarchy level, this statement is ignored for the file.

Options

`millisecond`—Include the millisecond in the timestamp.

`year`—Include the year in the timestamp.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Include the Year or Millisecond in Timestamps

structured-data | 29775

time-interval (Dampen Options)

IN THIS SECTION

- Syntax | 30485
- Hierarchy Level | 30485
- Description | 30486
- Options | 30486
- Required Privilege Level | 30486
- Release Information | 30486

Syntax

```
time-interval microseconds;
```

Hierarchy Level

```
[edit event-options event-script dampen dampen-options],
[edit event-options event-script file filename dampen dampen-options],
[edit system scripts commit dampen dampen-options],
```

```
[edit system scripts op dampen dampen-options],
[edit system scripts op file filename dampen dampen-options]
```

Description

Specify the length of time during which to pause the execution of one or more scripts.

Script dampening is initiated when CPU use exceeds the value specified using the `cpu-factor` statement. Junos OS then executes the number of lines of script specified using the `line-interval` statement and then pauses script execution for the time specified using the `time-interval` statement. If you do not configure values for these statements, the defaults are used.

Options

microseconds Specify the time in microseconds to pause script execution.

- **Range:** 1 through 4,294,967,295 microseconds
- **Default:** 100 microseconds

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

Syntax

```
time-wait-state {
    (session-ageout | session-timeout seconds);
}
```

Hierarchy Level

```
[edit security flow tcp-session]
```

Description

Defines the length of time (in seconds) that the device keeps the defined TCP session in the session table. The default is 150 seconds.

Options

- `session-ageout`—Set a TCP session to age out, using the service based timeout value.
- `session-timeout` *seconds*—Set the session timeout value allowed before the device ages out a session from its session table.

  Range: 2 through 600 seconds

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

timeout (Flow Maps)

IN THIS SECTION

- Syntax | 30498
- Hierarchy Level | 30498
- Description | 30498
- Options | 30498
- Required Privilege Level | 30499
- Release Information | 30499

Syntax

```
timeout (never non-discard-entry-only | minutes);
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options multicast flow-map flow-map-name],
[edit logical-systems logical-system-name routing-options multicast flow-map flow-map-name],
[edit routing-instances routing-instance-name routing-options multicast flow-map flow-map-name],
[edit routing-options multicast flow-map flow-map-name]
```

Description

Configure the timeout value for multicast forwarding cache entries associated with the flow map.

Options

minutes—Length of time that the forwarding cache entry remains active.

- **Range:** 1 through 720

never non-discard-entry-only—Specify that the forwarding cache entry always remain active. If you omit the **non-discard-entry-only** option, all multicast forwarding entries, including those in forwarding and pruned states, are kept forever. If you include the **non-discard-entry-only** option, entries with forwarding states are kept forever, and entries with pruned states time out.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.2.

timeout (Multicast)

IN THIS SECTION

- Syntax | 30499
- Hierarchy Level | 30500
- Description | 30500
- Options | 30500
- Required Privilege Level | 30500
- Release Information | 30500

Syntax

```
timeout minutes <family (inet | inet6)>;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options multicast forwarding-cache],
[edit logical-systems logical-system-name routing-options multicast forwarding-cache],
[edit routing-instances routing-instance-name routing-options multicast forwarding-cache],
[edit routing-options multicast forwarding-cache]
```

Description

Configure the timeout value for multicast forwarding cache entries. In general, you should regularly refresh the forwarding cache so it does not fill up with old entries and thus prevent newer, higher-priority, entries from being added.

Options

minutes—Length of time that the forwarding cache limit remains active.

- **Range:** 1 through 720

family (inet | inet6)—(Optional) Apply the configured timeout to either IPv4 or IPv6 multicast forwarding cache entries. Configuring the `timeout` statement globally for the multicast forwarding cache or including the `family` statement to configure the timeout value for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.

- **Default:** Six minutes. By default, the configured timeout applies to both IPv4 and IPv6 multicast forwarding cache entries.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.2.

timeout (Security Antivirus Fallback Options Sophos Engine)

IN THIS SECTION

- Syntax | 30503
- Hierarchy Level | 30503
- Description | 30503
- Options | 30503

Required Privilege Level | 30503
Release Information | 30504

Syntax

```
default (block | log-and-permit | permit);
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus sophos-engine profile profile-name fallback-
options]
```

Description

Scanning a complex file could consume resources and time. If the time it is taking to scan exceeds the timeout setting in the antivirus profile, the processing is terminated and the content is either passed or blocked without completing the virus checking. The decision is made based on the timeout fallback option.

Options

- `block`—Log the error and deny the traffic
- `log-and-permit`—Log the error and permit the traffic
- `permit`—Permit the traffic

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

timeout (Security Antivirus Fallback Options)

IN THIS SECTION

- Syntax | 30504
- Hierarchy Level | 30504
- Description | 30504
- Options | 30505
- Required Privilege Level | 30505
- Release Information | 30505

Syntax

```
timeout (block | log-and-permit);
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus juniper-express-engine profile profile-name
fallback-options]
[edit security utm feature-profile anti-virus kaspersky-lab-engine profile profile-name fallback-
options]
```

Description

Scanning a complex file could consume resources and time. If the time it is taking to scan exceeds the timeout setting in the antivirus profile, the processing is terminated and the content is either passed or

blocked without completing the virus checking. The decision is made based on the timeout fallback option. The default action is block.

Options

- `block`—Log the error and deny the traffic
- `log-and-permit`—Log the error and permit the traffic

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1X49-D10	The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards.

timeout (Security Antivirus Scan Options)

IN THIS SECTION

- Syntax | 30506
- Hierarchy Level | 30506
- Description | 30506

Required Privilege Level | 30506
Release Information | 30506

Syntax

```
timeout value;
```

Hierarchy Level

```
[edit security utm feature-profile anti-virus juniper-express-engine profile profile-name scan-options]
[edit security utm feature-profile anti-virus kaspersky-lab-engine profile profile-name scan-options]
[edit security utm default-configuration anti-virus scan-options]
```

Description

The scanning timeout value includes the time frame from when the scan request is generated to when the scan result is returned by the scan engine. The time range can be 1 to 1800 seconds. By default, it is 180 seconds.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

Support for Avira engine added in Junos OS Release 18.4R1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1X49-D10	The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards.

timeout (Security GTP)

IN THIS SECTION

- Syntax | 30507
- Hierarchy Level | 30507
- Description | 30507
- Options | 30508
- Required Privilege Level | 30508
- Release Information | 30508

Syntax

```
timeout value;
```

Hierarchy Level

```
[edit security gtp profile profile-name]
```

Description

Use the timeout option to set the tunnel timeout value in hours. The default is 36 hours. If a device detects no activity in a tunnel for a specified period, it removes the tunnel from the state table.

From Junos OS Release 20.4R1 onwards, the [`edit security gprs gtp profile` *`profile-name`*] hierarchy level is replaced by [`edit security gtp profile` *`profile-name`*].

Options

- **Range:** 1 through 1,000 hours.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0. Support.

RELATED DOCUMENTATION

Example: Setting the Timeout Value for GTPv2 Tunnels

timeout (Security Screen)

IN THIS SECTION

- Syntax | 30509
- Hierarchy Level | 30509
- Description | 30509
- Options | 30509
- Required Privilege Level | 30509
- Release Information | 30509

Syntax

```
timeout seconds;
```

Hierarchy Level

```
[edit security screen ids-option screen-name tcp syn-flood]
```

Description

Specify the maximum length of time before a half-completed connection is dropped from the queue. You can decrease the timeout value until you see any connections dropped during normal traffic conditions.

Options

seconds —Time interval before a half-completed connection is dropped from the queue.

- **Range:** 1 through 50 seconds
- **Default:** 20 seconds

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

timeout (Security Web Filtering Cache)

IN THIS SECTION

- Syntax | 30510
- Hierarchy Level | 30510
- Description | 30510
- Options | 30510
- Required Privilege Level | 30510
- Release Information | 30511

Syntax

```
timeout value;
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile web-filtering surf-control-integrated cache]
[edit security utm feature-profile web-filtering juniper-enhanced cache]
```

Description

Set the cache timeout parameters for surf-control-integrated web filtering (24 hours is the default and the maximum allowed life span of cached items).

Options

- **Range:** 1 through 1800 minutes.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The surf-control-integrated feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5.

Statement introduced in Junos OS Release 11.4 .

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1X49-D10	The surf-control-integrated feature is not supported from Junos OS Release 15.1X49-D10 onwards.

timeout (Security Web Filtering Fallback Settings)

IN THIS SECTION

- Syntax | 30511
- Hierarchy Level | 30512
- Description | 30512
- Options | 30512
- Required Privilege Level | 30512
- Release Information | 30512

Syntax

```
timeout (block | log-and-permit);
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile web-filtering surf-control-integrated profile profile-name
fallback-settings]
[edit security utm feature-profile web-filtering websense-redirect profile profile-name fallback-
settings]
[edit security utm feature-profile web-filtering juniper-enhanced profile profile-name fallback-
settings]
```

Description

Fallback settings tell the system how to handle errors.

Options

- log-and-permit—Log the error and permit the traffic
- block—Log the error and deny the traffic

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The surf-control-integrated feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5.

Statement introduced in Junos OS Release 11.4 .

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1X49-D10	The surf-control-integrated feature is not supported from Junos OS Release 15.1X49-D10 onwards.

timeout (Security Web Filtering)

IN THIS SECTION

- Syntax | 30513
- Hierarchy Level | 30513
- Description | 30513
- Required Privilege Level | 30514
- Release Information | 30514

Syntax

```
timeout value;
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile web-filtering websense-redirect profile profile-name]
[edit security utm feature-profile web-filtering juniper-enhanced profile profile-name]
```

Description

Enter a timeout limit for requests. Once this limit is reached, fail mode settings are applied. The default here is 15 seconds.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

timeout (Services)

IN THIS SECTION

- Syntax | 30514
- Hierarchy Level | 30514
- Description | 30515
- Required Privilege Level | 30515
- Release Information | 30515

Syntax

```
timeout seconds;
```

Hierarchy Level

```
[edit services unified-access-control ]
```

Description

Specify the value, in seconds, that the SRX Series Firewall should wait to get a heartbeat response from an IC Series UAC Appliance (default is 300). If the SRX Series Firewall does not receive it in the specified time, it takes the action specified by the `timeout-action` configuration statement. It also tries again to make a connection to the IC Series appliance. After the second failed attempt, the SRX Series Firewall fails over to the next IC Series appliance in the cluster. The SRX Series Firewall continues trying to reach IC Series appliances in the cluster until a connection is established.

Use this statement when you are configuring the SRX Series Firewall to act as a Junos OS Enforcer in a Unified Access Control (UAC) deployment. When deployed as a Junos OS Enforcer, the SRX Series Firewall enforces the policies that are defined on the UAC's IC Series appliance. When working with a cluster of IC Series appliances, the Junos OS Enforcer connects to one at a time, failing over to other IC Series appliances in the cluster as required.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

timeout-grace (Access)

IN THIS SECTION

- Syntax | 30522
- Hierarchy Level | 30522
- Description | 30522
- Options | 30522
- Required Privilege Level | 30522
- Release Information | 30522

Syntax

```
timeout grace seconds;
```

Hierarchy Level

```
[edit access radius-options]
```

Description

Configure a grace period during which a RADIUS server that times out after failing to respond to an authentication request is not considered to be down (if other servers are available) or unreachable (if it is the only configured server). The server is marked as down or unreachable only when it does not successfully respond to an authentication request during the grace period and times out again after the period expires.

You can use long grace periods to give unresponsive servers more opportunities to respond before abandoning them. You can use short grace periods to cause the router to declare unresponsive servers down and direct requests to available servers sooner.

Options

seconds—Duration of the server timeout grace period.

- **Range:** 0 through 30
- **Default:** 10

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

- Syntax | 30527
- Hierarchy Level | 30527
- Description | 30527
- Options | 30528
- Required Privilege Level | 30528
- Release Information | 30528

Syntax

```
tls {
    local-certificate certificate-id;
    mutual-authentication {
        authentication-type (dont-request-cert | request-and-require-cert-and-verify | request-
and-require-cert-but-dont-verify | request-cert-and-verify | request-cert-but-dont-verify);
        certificate-authority certificate-authority-profile-name;
    }
}
```

Hierarchy Level

```
[edit system services http servers server]
```

Description

Configure Transport Layer Security (TLS) settings for the given server.

You must specify the local certificate that the server uses for authentication. You can optionally configure mutual authentication and define the settings that the network device uses for the client certificate.

Options

authentication-type

(Optional) Specify the requirement for client certificates.

- `dont-request-cert`—Do not request a client certificate.

  > **NOTE**: We strongly recommend that you use this option in a test environment only.

- `request-and-require-cert-and-verify`—Require a certificate from the client and verify the certificate.
- `request-and-require-cert-but-dont-verify`—Require a certificate from the client but do not verify the certificate.
- `request-cert-and-verify`—Request a certificate from the client and verify if provided.
- `request-cert-but-dont-verify`—Request a certificate from the client but do not verify the certificate.
- **Default:** `request-and-require-cert-and-verify`

certificate-authority *certificate-authority-profile-name*

Specify the name of a certificate authority profile that is used to validate the certificate provided by a client. The profile must be configured at the `[edit security pki (ca-profile | ca-profile-group)]` hierarchy level.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

        no-remote-trace;
```

```
    }
}
```

Hierarchy Level

```
[edit system services netconf]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable NETCONF sessions over Transport Layer Security (TLS) with mutual X.509 certificate-based authentication. To enable NETCONF sessions over TLS, you must configure the `local-certificate` statement and either a `client-identity` statement or the `default-client-identity` statement.

Junos devices support TLS version 1.2 for NETCONF sessions over TLS. The TLS server listens for incoming NETCONF-over-TLS connections on TCP port 6513.

Options

`local-certificate` ***`local-certificate`***	TLS server's local certificate ID, which must be loaded into the Junos public key infrastructure (PKI).

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

tls

IN THIS SECTION

- Syntax | 30531
- Hierarchy Level | 30531
- Description | 30531
- Release Information | 30532

Syntax

```
tls
```

Hierarchy Level

```
[edit system syslog host host transport]
```

Description

Configure this Transport Layer Security (TLS) protocol to forward syslog messages securely.

This configuration uses certificates to authenticate peers. Before configuring this statement, make sure that your device has CA certificate and the PKI. To know more about CA certificate and PKI, refer Self-Signed Digital Certificates.

Encapsulating syslog over TLS allows you to:

- Validate the remote destination (syslog server) before transmitting any sensitive syslog information. (Authentication)
- Encrypt the syslog during the transport. (Encryption)
- Verify that the data has not been modified or tampered with (Integrity).

The remaining statements are explained separately. See CLI Explorer.

```
[edit access profile profile-name ldap-server ip-address]
```

Description

Specify timeout value on the Transport Layer Security (TLS) handshake. The TLS handshake is responsible for the encryption keys exchange necessary to establish secure sessions between client and server.

Range: 3 through 90 seconds.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D70.

- Hierarchy Level | **30536**
- Description | **30537**
- Options | **30537**
- Required Privilege Level | **30537**
- Release Information | **30537**

Syntax

```
tls-type {
    start-tls;
}
```

Hierarchy Level

```
[edit access profile profile-name ldap-server ip-address]
```

Description

Configure Lightweight Directory Access Protocol (LDAP) over Secure Sockets Layer/Transport Layer Security (SSL/TLS) for secure communication. Transport Layer Security StartTLS extension for LDAP is used for the firewall user authentication and the integrated user firewall authentication for obtaining username and role information through firewall authentication. StartTTLS allows protocol data transfers between the LDAP server and client over the TLS layer after successful negotiation between the peers. StartTLS upgrades an existing insecure LDAP connection to a secure Secure Sockets Layer/Transport Layer Security (SSL/TLS) connection.

Options

- **start-tls**—Configure LDAP over StartTLS. The StartTLS communications occurs over TCP port 389.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D70.

       local-certificate certificate-id;
       trusted-ca-group trusted-ca-group-name {
            ca-profiles ca-profile-name};
      }
```

Hierarchy Level

```
[edit system syslog host host]
```

Description

Configure the TLS authentication parameter.

Options

local-certificate *certificate-id*	Use this option to specify the local certificate ID for authentication. The local certificate contains the public key and identify information for the device.
certificate-authority *certificate-authority*	Use this option to specify Certificate Authority (CA) for authentication.
trusted-ca-group *trusted-ca-group-name*	Use this option to specify trusted CA group for authentication.
ca-profiles *ca-profile-name*	CA profile contains the name and URL of the CA or RA, as well as retry-timer settings.

Release Information

Statement introduced in Junos OS Release 21.2R1 for EX and MX Series routers.

Statement introduced in Junos OS Release 21.3R1 for SRX Series and vSRX Virtual Firewall devices.

tlv-filter

IN THIS SECTION

- Syntax | 30539
- Hierarchy Level | 30539
- Description | 30540
- Default | 30540
- Options | 30540
- Required Privilege Level | 30541
- Release Information | 30542

Syntax

```
tlv-filter tlv-name;
```

Hierarchy Level

```
[edit protocols lldp],
[edit protocols lldp-med],
[edit protocols lldp interface interface-name],
[edit protocols lldp-med interface interface-name]
```

Description

Select the type, length, and value (TLV) messages that should not be advertised by the Link Layer Discovery Protocol (LLDP) or LLDP Media Endpoint Discovery (LLDP-MED) protocol. LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include information such as chassis and port identification and system name and system capabilities.

In multi-vendor networks, it might not be desirable to send TLV messages because they can contain sensitive information about a network device. You can configure LLDP or LLDP-MED to disable any non-mandatory TLV message. (These mandatory TLVs are always advertised: chassis-id, port-id, and time-to-live.)

When you configure the `tlv-filter` statement, you specify the TLVs that you want to disable. This is useful when you want to allow most, but not all, TLVs.

You can also disable TLVs using the `tlv-select` statement. When you configure the tlv-select statement, you specify the TLVs that you want to be advertised by LLDP or LLDP-MED. All other non-mandatory TLVs are disabled.

> **NOTE**: The `tlv-select` and `tlv-filter` statements are mutually exclusive and cannot be used on the same configuration stanza at the same time.

Default

All TLVs for LLDP and LLDP-MED are enabled by default.

Options

tlv-name Specify the non-mandatory TLV message that you want to disable.

- **Values:** You can disable the following TLV messages for LLDP:
  - `cloud-reach-event-tlv`—Use to have cloud-ready EX4400 Series switches stop sending cloud-reach-events. By default, once an EX4400 connects to the Juniper Mist Cloud Service via its phone-home routine, subsequent TLV messages are automatically halted.
  - `jnpr-chassis-serial`—The chassis serial number.
  - `jnpr-vcp`—Juniper virtual chassis port.

- `link-aggregation`—Advertises whether the port is aggregated and its aggregated port ID.
- `mac-phy-config-status`—Advertises information about the physical interface, such as autonegotiation status and support and MAU (medium attachment unit) type.
- `management-address`— The IP management address of the local system.
- `maximum-frame-size`—The maximum transmission unit (MTU) of the interface sending LLDP frames.
- `port-description`—The user-configured port description.
- `port-vid`—Indicates the port VLAN ID that will be associated with an untagged or priority tagged data frame received on the VLAN port.
- `power-vi-mdi`—Advertises MDI (media dependent interface) power support, PSE (power sourcing equipment) power pair, and power class information.
- `system-capabilities`—The primary function performed by the system. The capabilities that system supports are defined; for example, bridge or router. This information cannot be configured, but is based on the model of the product.
- `system-description`—The user-configured name of the local system.
- `system-name`—The user-configured name of the local system.
- `vlan-name`—Indicates the assigned name of any VLAN at the device.

You can disable the following TLV messages for LLDP-MED:

- `ext-power-via-mdi`—The power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.
- `location-id`—The physical location of the endpoint.
- `med-capabilities`—The primary function of the port.
- `network-policy`—The port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types, such as voice or streaming video, 802.1Q VLAN tagging, and 802.1p priority bits and Diffserv code points.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.3.

Description

Select the type, length, and value (TLV) messages that should be advertised by Link Layer Discovery Protocol (LLDP) or LLDP Media Endpoint Discovery (LLDP-MED) protocol. LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include information such as chassis and port identification and system name and system capabilities.

In multi-vendor networks, it might not be desirable to send TLV messages because they can contain sensitive information about a network device. You can configure LLDP or LLDP-MED to choose which non-mandatory TLV messages to advertise. (These mandatory TLVs are always advertised: chassis-id, port-id, and time-to-live.)

When you configure the tlv-select statement, you specify the TLVs that LLDP or LLDP-MED should advertise. All other non-mandatory TLVs are disabled. This is useful when you want to disable most, but not all, TLVs.

You can also disable TLVs using the tlv-filter statement. When you configure the tlv-filter statement, you specify the TLVs that should be disabled.

> **NOTE**: The `tlv-select` and `tlv-filter` statements are mutually exclusive and cannot be used on the same configuration stanza at the same time.

Default

All TLVs for LLDP and LLDP-MED are enabled by default.

Options

tlv-name Specify the non-mandatory TLV message that you want to advertise.

- **Values:** You can advertise the following TLV messages for LLDP:

- `jnpr-chassis-serial`—The chassis serial number.
- `jnpr-vcp`—Juniper virtual chassis port.
- `link-aggregation`—Advertises whether the port is aggregated and its aggregated port ID.
- `mac-phy-config-status`—Advertises information about the physical interface, such as autonegotiation status and support and MAU (medium attachment unit) type.
- `management-address`— The IP management address of the local system.
- `maximum-frame-size`—The maximum transmission unit (MTU) of the interface sending LLDP frames.
- `port-description`—The user-configured port description.
- `port-vid`—Indicates the port VLAN ID that will be associated with an untagged or priority tagged data frame received on the VLAN port.
- `power-vi-mdi`—Advertises MDI (media dependent interface) power support, PSE (power sourcing equipment) power pair, and power class information.
- `system-capabilities`—The primary function performed by the system. The capabilities that system supports are defined; for example, bridge or router. This information cannot be configured, but is based on the model of the product.
- `system-description`—The user-configured name of the local system.
- `system-name`—The user-configured name of the local system.
- `vlan-name`—Indicates the assigned name of any VLAN at the device.

You can advertise the following TLV messages for LLDP-MED:

- `ext-power-via-mdi`—The power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.
- `location-id`—The physical location of the endpoint.
- `med-capabilities`—The primary function of the port.
- `network-policy`—The port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types, such as voice or streaming video, 802.1Q VLAN tagging, and 802.1p priority bits and Diffserv code points.

```

Description

Configure a plain-text token for all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. The token enables rudimentary entity authentication to protect against inadvertently instantiated DHCP servers. A null token (empty string) indicates that the configuration token functionality is not enabled. A group configuration takes precedence over a DHCP local server configuration. For more information about tokens, see RFC 3118, *Authentication for DHCP Messages*, section 4.

Options

token-value—Plain-text alphanumeric string.

- **Default:** null (empty string)

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

Support at the `[edit ... dhcpv6 ...]` hierarchy levels introduced in Junos OS Release 10.4.

Description

If the total number of messages received concurrently exceeds the device limits, the content is either passed or blocked depending on the too-many-request fallback option. (The allowed request limit is not configurable.)

Options

- `block`—Log the error and deny the traffic
- `log-and-permit`—Log the error and permit the traffic
- `permit`—Permit the traffic

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

too-many-requests (Security Antivirus Fallback Options)

IN THIS SECTION

Syntax | 30561

- Hierarchy Level | 30561
- Description | 30561
- Options | 30561
- Required Privilege Level | 30561
- Release Information | 30562

Syntax

```
too-many-requests (block | log-and-permit);
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus juniper-express-engine profile profile-name
fallback-options]
[edit security utm feature-profile anti-virus kaspersky-lab-engine profile profile-name fallback-
options]
```

Description

If the total number of messages received concurrently exceeds 4000, the content is either passed or blocked depending on the too-many-request fallback option. The default action is block. (The allowed request limit is not configurable.)

Options

- `block`—Log the error and deny the traffic
- `log-and-permit`—Log the error and permit the traffic

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1X49-D10	The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards.

too-many-requests (Security Web Filtering Fallback Settings)

IN THIS SECTION

- Syntax | 30562

```
topologies {
    ipv4-multicast;
    ipv6-multicast;
    ipv6-unicast;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]
```

Description

Configure alternate IS-IS multicast or unicast topologies.

The remaining statements are explained separately. See CLI Explorer.

> **NOTE**: The IS-IS interface metrics for the IPv4 topology can be configured independently of the IPv6 metrics. You can also selectively disable interfaces from participating in the IPv6 topology while continuing to participate in the IPv4 topology. This lets you exercise control over the paths that unicast data takes through a network.

Default

By default, multicast and unicast topologies are disabled.

Options

ipv4-multicast Configure alternate IPv4 multicast topologies.

ipv6-multicast Configure alternate IPv6 multicast topologies.

ipv6-unicast Configure alternate IPv6 unicast topologies. This statement causes IS-IS to calculate an alternate IPv6 unicast topology, in addition to the normal IPv4 unicast topology, and add the corresponding routes to inet6.0.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

topology (Filter-Based Forwarding)

IN THIS SECTION

- Syntax | 30569
- Hierarchy Level | 30569
- Description | 30569
- Options | 30570
- Required Privilege Level | 30570
- Release Information | 30570

Syntax

```
topology topology-name;
```

Hierarchy Level

```
[edit firewall family (inet | inet6) filter filter-name term term-name then],
[edit firewall family (inet | inet6) filter filter-name term term-name then logical-system
logical-system-name],
[edit firewall family (inet | inet6) filter filter-name term term-name then logical-system
logical-system-name routing-instance routing-instance-name],
[edit firewall family (inet | inet6) filter filter-name term term-name then routing-instance
routing-instance-name]
```

Description

Configure a topology for filter-based forwarding for multitopology routing. The firewall filter you apply to the ingress interface is used to look up traffic against the configured topology, and, if a route matches

the conditions you configure for the term, the route is accepted and added to the routing table for the specific topology.

There are multiple ways to configure a topology for filter-based forwarding, depending on the type of instance or logical system you want to specify for the forwarding class.

> **NOTE**: The options for logical system and routing instance precede the `topology` statement with the `then` statement.

Options

topology-name—Name of a topology against which you want to match traffic.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

area area-id interface interface-name],
[edit protocols ospf area area-id interface interface-name],
```

```
[edit routing-instances routing-instance-name protocols ospf area area-id interface interface-name]
```

Description

Configure interface-specific properties for multitopology OSPF, including topology-specific metric values for an interface.

All OSPF interfaces have a cost, which is a routing metric that is used in the link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics. The default value for the OSPF metric for an interface is 1. You can modify the default value for an OSPF interface and configure a topology-specific metric for that interface. The topology-specific metric applies to routes advertised from the interface that belong only to that topology.

Default

The default value of the topology metric is the same as the default metric value calculated by OSPF or the value configured for the OSPF metric.

Options

ipv4-multicast—Name of the topology for IPv4 multicast traffic.

name—Name of a topology created under the `[edit routing-options]` hierarchy level.

metric *metric*—Cost of a route from an OSPF interface. You can specify a metric value for a topology that is different from the value specified for the interface.

- **Range:** 1 through 65,535
- **Default:** 1

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

inet6) unicast],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address
family (inet | inet6)]
```

Description

Enable a topology for BGP multitopology routing. You must first configure one or more topologies under the `[edit routing-options]` hierarchy level.

Apply the community tags to identify the application topologies by configuring a routing topology name and BGP community value.

In Junos OS, multitopology support for BGP is based on the community value in a BGP route. This configuration determines the association between a topology and one or more community values and populates the topology routing tables. Arriving BGP updates that have a matching community value are replicated in the associated topology routing table. You decide which BGP community values are associated with a given topology.

For example, you can create a configuration that causes BGP updates that are received with community value `target:40:40` to be added into topology routing table `voice.inet.0` (in addition to the default routing table `inet.0`). Likewise, you configuration can specify that updates that are received with community value `target:50:50` are added into topology routing table `video.inet.0` (in addition to the default routing table `inet.0`).

Options

name Name of a topology you configured at the `[edit routing-options]` hierarchy level to create a topology for a specific type of traffic, such as voice or video.

community Configure the community to identify the multitopology routes. BGP uses the target community identifier to install the routes it learns in the appropriate multitopology routing tables.

- **Syntax:** target *identifier*—Configure the destination to which the route is going.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

trace (EVPN-VXLAN)

IN THIS SECTION

- Syntax | 30586
- Hierarchy Level | 30587
- Description | 30587
- Options | 30588
- Required Privilege Level | 30588
- Release Information | 30588

Syntax

```
trace {
evpn-vxlan;
}
```

Hierarchy Level

```
[edit services]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable EVPN-VXLAN tracing in multiple modules and hierarchies. The `trace` command invokes a built-in commit script to generate the tracing configurations required for troubleshooting EVPN-VXLAN. The commit script for this feature, `services_evpn_commit_script.py`, is included with supported platforms.

NOTE: Configure EVPN-VXLAN tracing and enable the commit-script using the following commands.

```
set services trace evpn-vxlan
set system scripts commit allow-transients
set system scripts commit file services_evpn_commit_script.py
```

See *Commit Script Overview* and *Overview of Generating Persistent or Transient Configuration Changes Using Commit Scripts* for more information about commit scripts.

When you commit the configuration, the commit script generates the following EVPN-VXLAN tracing configurations.

RPD/routing-instances tracing for each routing-instance configured.

```
set routing-instances routing-instance-name protocols evpn traceoptions file routing-instance-name.log
set routing-instances routing-instance-name protocols evpn traceoptions file size 50m
set routing-instances routing-instance-name protocols evpn traceoptions file files 50
set routing-instances routing-instance-name protocols evpn traceoptions flag all detail
```

BGP tracing for each BGP group configured.

```
set protocols bgp group bgp-group-name traceoptions file bgp-group-name.log
set protocols bgp group bgp-group-name traceoptions file size 50m
set protocols bgp group bgp-group-name traceoptions file files 50
set protocols bgp group bgp-group-name traceoptions flag all
```

L2ALD tracing for protocols l2-learning.

```
set protocols l2-learning traceoptions file l2ald.log
set protocols l2-learning traceoptions file size 50m
set protocols l2-learning traceoptions file files 50
set protocols l2-learning traceoptions level all
set protocols l2-learning traceoptions flag all
```

DHCP tracing when DHCP is configured.

```
set system processes dhcp-service traceoptions file dhcp_service.log
set system processes dhcp-service traceoptions file size 50m
set system processes dhcp-service traceoptions file files 50
set system processes dhcp-service traceoptions level all
set system processes dhcp-service traceoptions flag all

```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set system-wide tracing options for Junos OS Evolved. Tracing is a process about getting information regarding a program's execution. A programmer adds specific code to a program, called a *tracepoint*, which when enabled triggers a log event, which gives the programmer visibility into how the program is executing.

Options

application-name
Name of the application for which tracing should be applied. You can see a list of the applications for Junos OS Evolved by issuing the `show system applications` command. If you want to enable tracing for all applications, use the value `all`.

`enabled (on | off)`
Enter `on` to enable or `off` to to disable. This option has two locations in the hierarchy, one for enabling or disabling an entire group, and one for enabling or disabling specific tracepoints.

`group` *`group-name`*
The name of the trace group for which the configuration should be applied.

`level` *`level`*
Trace level of the application. The following levels are available, listed in the order of highest severity first:

- emergency—Trace emergency messages (system is unusable).
- alert—Trace alert messages (take immediate action).
- critical—Trace critical conditions.
- error—Trace error conditions.

- warning—Trace warning conditions.
- notice—Trace normal but significant conditions.
- info—Trace informational messages.
- debug—Trace debug messages.

You can configure the application's level here. The program determines the level of the tracepoints. If the application's level is at least as inclusive as (that is, the same as or of higher severity) the tracepoint's level, then the trace event is able to fire. If the application's level is less inclusive (of lower severity) than the tracepoint's level, then the trace event is not able to fire.

The default trace level is `info`.

node *node-name* — Name of a node. Node names can be `re0`, `re1`, `fpc0`, `fpc1`, and so on, depending on the system.

tracepoint *tracepoint-name* — Name of a tracepoint. A tracepoint is an event in the program, which can give the developer visibility into how the program is executing.

Release Information

Statement introduced in Junos OS Evolved 18.2R1.

traceoptions (802.1X)

IN THIS SECTION

- Syntax | 30592
- Hierarchy Level | 30592
- Description | 30592
- Default | 30592

- Options | 30592
- Required Privilege Level | 30594
- Release Information | 30594

Syntax

```
traceoptions  {
    file filename <files number> <size size> <world-readable | no-world-readable> <match regex>;
    flag flag;
}
```

Hierarchy Level

```
[edit protocols dot1x]
```

Description

Define tracing operations for the 802.1X protocol.

Default

Tracing operations are disabled.

Options

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size by using the **size** option.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- `all`—All tracing operations.
- `config-internal`—Trace internal configuration operations.
- `dot1x-event`—(Switches with ELS only) Trace 802.1x events.
- `dot1x-debug`—(Switches without ELS) Trace 802.1x events.
- `dot1x-ipc`—(Switches with ELS only) Trace IPC interactions.
- `eapol`—Trace EAPOL packets transmitted and received.
- `esw-if`—(Switches without ELS) Trace ESW interactions.
- `general`—Trace general operations.
- `normal`—Trace normal operations.
- `parse`—Trace reading of the configuration.
- `regex-parse`—Trace regular-expression parsing operations.
- `state`—Trace protocol state changes.
- `task`—Trace protocol task operations.
- `timer`—Trace protocol timer operations.
- `vlan`—Trace VLAN transactions.

match *regex*—(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable—(Optional) Restrict file access to the user who created the file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files with the **files** option, you also must specify a maximum file size.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

Support for the `dot1x-event` and `dot1x-ipc` options introduced in Junos OS Release 13.2X50 for EX Series switches.

traceoptions (Access Port Security)

IN THIS SECTION

- Syntax | 30595
- Hierarchy Level | 30595
- Description | 30595
- Default | 30595
- Options | 30595
- Required Privilege Level | 30597
- Release Information | 30597

Syntax

```
traceoptions {
    file (file-name | files files | match match | no-world-readable | size size | world-
readable);
    flag ( all | asynch | chassis-scheduler | cos-adjustment | dynamic | hardware-database |
init | parse | performance-monitor | process | restart | route-socket | show | snmp | util);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit ethernet-switching-options],
[edit class-of-service]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define global tracing operations for access security features on Ethernet switches.

Default

The **traceoptions** feature is disabled by default.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename*** —Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace

files is reached (*x***k** to specify KB, *x***m** to specify MB, or *x***g** to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

- **Range:** 2 through 1000
- **Default:** 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **access-security**—Trace access security events.
- **all**—All tracing operations.
- **config-internals**—Trace internal configuration operations.
- **forwarding-database**—Trace forwarding database and next-hop events.
- **general**—Trace general events.
- **interface**—Trace interface events.
- **ip-source-guard**—Trace IP source guard events.
- **krt**—Trace communications over routing sockets.
- **lib**—Trace library calls.
- **normal**—Trace normal events.
- **parse**—Trace reading of the configuration.
- **regex-parse**—Trace regular-expression parsing operations.
- **rtg**—Trace redundant trunk group events.
- **state**—Trace state transitions.
- **stp**—Trace spanning-tree events.
- **task**—Trace Ethernet-switching task processing.
- **timer**—Trace Ethernet-switching timer processing.
- **vlan**—Trace VLAN events.

no-stamp—(Optional) Do not timestamp the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Restrict file access to the user who created the file.

replace—(Optional) Replace an existing trace file if there is one rather than appending to it.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes
- **Range:** 10 KB through 1 gigabyte
- **Default:** 128 KB

world-readable—(Optional) Enable unrestricted file access.

no-remote-trace—(Optional) Disable remote tracing.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

- Options | 30599
- Required Privilege Level | 30600
- Release Information | 30600

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit access firewall-authentication]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define Routing Engine firewall authentication tracing options.

Options

- `file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.
- `files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file.0`*, then *`trace-file.1`*, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.
- If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.
- **Range:** 2 through 1000 files
- **Default:** 10 files
- `match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.
- `size`*`maximum-file-size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file.0`*. When the `trace-file` again reaches its maximum size, *`trace-file.0`* is renamed *`trace-file.1`* and *`trace-file`* is renamed *`trace-file.0`*. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.
- If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and filename.
- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

- `world-readable | no-world-readable`—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.
- `flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags.
- `all`—All tracing operations
- `authentication`—Trace authentication events
- `configuration`—Trace configuration events
- `setup`—Trace setup of firewall authentication service

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define Active Directory trace options for the integrated user firewall feature.

Options

file *filename*
Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

flag
Trace the operation or operations to perform on the integrated user firewall. To specify more than one trace operation, include multiple flag statements.

- **active-directory-authentication** — Trace the building of and modifications to the Active Directory authentication table.
- **all** — Trace everything.
- **configuration** — Trace configuration events.
- **db** — Trace the database.
- **ip-user-mapping** — Trace the ip-user-mapping module.
- **ip-user-probe** — Trace PC client probing.
- **ipc** — Trace communication events with the Packet Forwarding Engine.
- **user-group-mapping** — Trace the process of getting user-to-group-mapping.
- **wmic** — Trace the Windows Management Instrumentation Client process.

level
Level of trace operation to perform.

- **all** — Match all levels.

error	Match error conditions.
info	Match informational messages.
notice	Match conditions that should be handled specially.
verbose	Match verbose messages.
warning	Match warning messages.

no-remote-trace	Disallow tracing from a remote device.

Required Privilege Level

security—To view this statement in the configuration.

```
[edit system processes general-authentication-service]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure tracing options.

Options

file ***filename***—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory **/var/log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `address-assignment`—All address-assignment events
- `all`—All tracing operations
- `configuration`—Configuration events
- `framework`—Authentication framework events
- `ldap`—LDAP authentication events
- `local-authentication`—Local authentication events
- `radius`—RADIUS authentication events

`match` *`regex`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-world-readable`—(Optional) Restrict access to the originator of the trace operation only.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and filename.

- **Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Flag for tracing address-assignment pool operations introduced in Junos OS Release 9.0.

            (world-readable | no-world-readable);
        }
        flag flag;
        no-remote-trace;
    }
```

Hierarchy Level

```
[edit security advance-policy-based-routing]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure tracing operations for advanced policy-based routing.

Options

- `file`—Configure the trace file options.
  - *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*—Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    Range: 2 through 1000 files

Default: 10 files

- `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.
- `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

  Syntax: *`x`* `K` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB

  Range: 10 KB through 1 GB

  Default: 128 KB

- `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.
  - `all`—Trace with all flags enabled
  - `compilation`—Trace rule set compilation events
  - `configuration`—Trace configuration events
  - `ipc`—Trace process inter communication events
  - `lookup`—Trace rule set lookup events
- `no-remote-trace`—Set remote tracing as disabled.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

traceoptions (Analytics Agent)

IN THIS SECTION

- Syntax | 30609
- Hierarchy Level | 30609
- Description | 30610
- Options | 30610
- Required Privilege Level | 30610
- Release Information | 30611

Syntax

```
traceoptions {
    file filename;
    flag (debug | error | info | trace);
}
```

Hierarchy Level

```
[edit services analytics agent]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure tracing operations for Network Telemetry Framework (NTF) agent. You can specify the name of the file where the NTF agent log messages are stored. You can also specify a severity level for messages to be logged. The severity level that you configure depends on the issue that you are trying to resolve. In some cases you might be interested in seeing all messages relevant to the logged event, so you specify `trace`. As levels become more restrictive, fewer messages are logged.

> **NOTE**: Although the syntax uses the keyword `flag`, its function in this statement corresponds to the `level` keyword used for other `traceoptions` statements.

Options

file *filename*

Name of the file to receive the output of the tracing operation. The file is stored in the **/var/log/** directory of your device.

- **Default:** ntf-agent

flag (debug | error | info | trace)

Specify the severity level for messages to be logged. The order of severity, from most to least severe is as follows:

error > info > debug > trace

- `debug`—Match debug messages.
- `error`—Match error messages. This is the most restrictive level.
- `info`—Match informational messages.
- `trace`—Match all messages.
- **Default:** error

Required Privilege Level

system

Release Information

Statement introduced in Junos OS Release 18.3R1.

traceoptions (ANCP)

IN THIS SECTION

- Syntax | 30613
- Hierarchy Level | 30613
- Description | 30613
- Options | 30614
- Required Privilege Level | 30615
- Release Information | 30615

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    flag flag <disable>;
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols ancp]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for ANCP agent processes.

Options

`file` *`filename`*— Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

`files` *`number`*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. Include the `disable` option after a flag to disable tracing for that flag. You can include the following flags:

- `all`—Trace all operations.
- `config`—Trace configuration events.
- `cos`—Trace class-of-service events.
- `general`—Trace general flow.
- `packet`—Trace ANCP packet transmit and receive operations.
- `process`—Trace process internals.
- `protocol`—Trace protocol events.
- `restart`—Trace process restart flow
- `routing-socket`—Trace routing socket events.
- `session`—Trace connection events and flow.
- `startup`—Trace ANCP startup events and flow.
- `subscriber`—Trace subscriber events.
- `timer`—Trace timer processing.

`level`—Level of tracing to perform. You can specify any of the following levels:

- `all`—Match all levels.
- `error`—Match error conditions.

- `info`—Match informational messages.
- `notice`—Match notice messages about conditions reqcliring special handling.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.
- **Default:** `error`

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`—Disable remote tracing.

`no-world-readable`—(Optional) Disable unrestricted file access.

`size` *`maximum-file-size`*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`size`*`k` to specify KB, *`size`*`m` to specify MB, or *`size`*`g` to specify GB
- **Range:** 10240 through 1073741824
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

traceoptions (App Engine Virtual Machine Management Service)

IN THIS SECTION

- Syntax | 30616
- Hierarchy Level | 30616
- Description | 30616
- Default | 30617
- Options | 30617
- Required Privilege Level | 30617
- Release Information | 30617

Syntax

```
traceoptions {
    file filename <files number> | match | no-world-readable |<size size> <world-readable >;
    flag (all |ccif | configuration | heartbeat | init | miscellaneous | platform | pxe |
routing-instances | snmp);
    level (all | error| info | notice | verbose | warning)
}
```

Hierarchy Level

```
[edit system processes app-engine-virtual-machine-management-service]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable traceoptions for the app-engine virtual machine management service system process.

Default

Traceoptions are not enabled.

Options

file	Trace file information.
flag	Perform defined tracing operation.
level	Set traceoptions level.
no-remote-trace	Disable remote tracing.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system-control

Release Information

Statement introduced in Junos OS Release 15.1F3.

NOTE: PTX3000 router supports the Routing and Control Board, RCBPTX.

traceoptions (Application Identification)

IN THIS SECTION

- Syntax | 30618
- Hierarchy Level | 30618
- Description | 30618
- Options | 30619
- Required Privilege Level | 30619
- Release Information | 30620

Syntax

```
traceoptions {
    file filename <files number> <match regex> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services application-identification]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure application identification tracing options.

To specify more than one tracing operation, include multiple `flag` statements.

Options

`file` *`filename`*—Use the specified file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

`files` *`number`*—(Optional) Use the specified maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 2 files

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

`flag`—Tracing operation to perform. `all` is the only valid completion.

- `all`—Trace all events.

`match` *`regex`*—(Optional) Use the specified regular expression for lines to be logged.

`no-world-readable`—(Optional) Disallow any user to read the log file.

`size` *`size`*—(Optional) Use the specified maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the *`trace-file`* again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 10,240 through 1,073,741,824 or the maximum file size supported on your system

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

`world-readable`—(Optional) Allow any user to read the log file.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

Tracing APPID Operations

traceoptions (Batch Commits)

IN THIS SECTION

- Syntax | 30620
- Hierarchy Level | 30621
- Description | 30621
- Options | 30621
- Required Privilege Level | 30622
- Release Information | 30622

Syntax

```
traceoptions {
    file filename;
    files number;
    flag (all | batch | commit-server | configuration);
    size maximum-file-size;
    (world-readable | no-world-readable);
}
```

Hierarchy Level

```
[edit system commit server],
[edit system commit synchronize server]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

For software batch commits, configure tracing operations.

Options

file *name*

Name of the file to receive the output of the tracing operation.

NOTE: If you configure traceoptions and do not explicitly specify a filename for logging the events, the batch commit events are logged in the `commitd` file (var/log/commitd) by default.

files *number*

Maximum number of trace files.

flag *flag*

Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—All tracing operations flags.
- `batch`—Tracing operations for batch events.
- `commit-server`—Tracing operations for commit server events.
- `configuration`—Tracing operations for the reading of configuration.

size

Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

world-readable |

readable—Grant all users permission to read archived log files, or restrict the permission only to the root user and users who have the Junos OS maintenance permission.

no-world-readable

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

traceoptions (Captive Portal Content Delivery)

IN THIS SECTION

- Syntax | 30622
- Hierarchy Level | 30623
- Description | 30623
- Options | 30623
- Required Privilege Level | 30624
- Release Information | 30624

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag;
```

```
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services captive-portal-content-delivery]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for captive-portal-content-delivery processes.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. Ensure that filenames are unique for each logical system or routing instance in which Mobile IP is configured.

> **NOTE**: Global messages (common to all logical systems and routing instances) are always saved in `/var/log/mipd`. Messages that are specific to a logical system or routing instance are never saved in `/var/log/mipd`. If you do not configure a trace filename for a logical system or routing instance, then nothing is traced for that entity.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Trace all operations.
- `clicommand`—Trace CLI command operations.
- `configuration`—Trace home agent state machine operations.
- `general`—Trace general operations.
- `gres`—Trace graceful routing switchover operations.
- `ipc`—Trace Inter-Process Communication (IPC) messages between the PIC and the Routing Engine.
- `rtsock`—Trace routing socket operations.
- `rules`—Trace rules operations.
- `ssets`—Trace service sets operations.
- `statistics`—Trace statistics operations.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

Support for Next Gen Services introduced in Junos OS Release 19.3R2.

traceoptions (CASB)

IN THIS SECTION

- Syntax | **30625**
- Hierarchy Level | **30626**
- Description | **30626**
- Options | **30626**
- Required Privilege Level | **30627**
- Release Information | **30627**

Syntax

```
    traceoptions {
        file (file-name | files files | match match | no-world-readable | size size | world-
readable);
        flag ( all | flow | memory | pfeman);
        level;
        no-remote-trace;
}
```

Hierarchy Level

```
[edit security casb]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure Cloud Access Security Broker (CASB) traceoptions.

Options

file

Configure the trace file options.

- `filename`—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.

- `files number`—Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed to `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

  If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

  Range: 2 through 1000 files

  Default: 10 files

- `match regular-expression`—Refine the output to include lines that contain the regular expression.

- `size maximum-file-size`—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme

continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

Syntax: `x K` to specify KB, `x m` to specify MB, or `x g` to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

- `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option

flag Set the level of debugging the output option.

- all—Trace with all flags enabled.
- flow—Trace flow information.
- memory—Trace memory usage.
- pfeman—Trace PFE information.

level Set the level of debugging.

no-remote-trace Set remote tracing as disabled.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 24.2R1.

traceoptions (Chassis Cluster)

IN THIS SECTION

- Syntax | 30628
- Hierarchy Level | 30628
- Description | 30629
- Options | 30629
- Required Privilege Level | 30630
- Release Information | 30630

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        (world-readable | no-world-readable);
        size maximum-file-size;
    }
    flag flag;
    level {
        (alert | all | critical | debug | emergency | error | info | notice | warning);
    }
    no-remote-trace;
}
```

Hierarchy Level

```
[edit chassis cluster]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define chassis cluster redundancy process tracing operations.

A minimum traceoptions configuration must include both a target file and a flag. The target file determines where the trace output is recorded. The flag defines what type of data is collected.

Options

- `file` *`filename`* —Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.
- `files` *`number`* —(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`* `.0`, then *`trace-file.1`* , and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.
- If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.
- **Range:** 2 through 1000 files
- **Default:** 10 files
- `match` *`regular-expression`* —(Optional) Refine the output to include lines that contain the regular expression.
- `size` *`maximum-file-size`* —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`* `.0`. When the `trace-file` again reaches its maximum size, *`trace-file`* `.0` is renamed *`trace-file`* `.1` and *`trace-file`* is renamed *`trace-file`* `.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.
- If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and filename.
- **Syntax:** *`x`* `k` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB
- **Range:** 0 KB through 1 GB

- **Default:** 128 KB
- `world-readable | no-world-readable`—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.
- `flag`—Trace operation or operations to perform on chassis cluster redundancy processes. To specify more than one trace operation, include multiple `flag` statements.
  - `all`—Trace all the events
    - `configuration`—Trace configuration events
    - `routing-socket`—Trace logging of rtsock activity
    - `snmp`—Trace SNMP events

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.5.

traceoptions (Class of Service)

IN THIS SECTION

Syntax | 30631
Hierarchy Level | 30631
Description | 30631

- Default | 30631
- Options | 30632
- Required Privilege Level | 30633
- Release Information | 30633

Syntax

```
traceoptions {
    file filename <size size> <files number>
    <world-readable | no-world-readable>;
    flag flag <flag-modifier>;
    no-remote-trace
}
```

Hierarchy Level

```
[edit class-of-service]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set class-of-service (CoS) tracing options.

NOTE: The `traceoptions` statement is not supported on the QFabric system.

Default

Traceoptions is disabled.

Options

file *filename*

Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the `/var/log/` directory.

files *number*

(Optional) Maximum number of trace files. When a trace file named *trace-file* reaches its maximum size, it is renamed *trace-file*.0. The traceoption output continues in a second trace file named *trace-file*.1. When *trace-file*.1 reaches its maximum size, output continues in a third file named *trace-file*.2, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

- **Range:** 2 through 1000 files
- **Default:** 1 trace file

flag

Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements:

- `all`—Trace all operations.
- `asynch`—Trace asynchronous configuration processing.
- `chassis-scheduler`—Trace chassis stream scheduler processing.
- `cos-adjustment`—Trace CoS rate adjustments.
- `dynamic`—Trace dynamic CoS functions.
- `hardware-database`—Trace the chassis hardware database related processing.
- `init`—Trace initialization events.
- `performance-monitor`—Trace performance monitor countors.
- `process`—Trace configuration processing.
- `restart`—Trace restart processing.
- `route-socket`—Trace route-socket events.
- `show`—Trace show command servicing.
- `snmp`—Trace SNMP-related processing.

- `util`—Trace utilities.

The following are the global tracing options:

- `all`—Perform all tracing operations
- `parse`—Trace parser processing.

no-remote-trace (Optional) Disable remote tracing.

no-world-readable (Optional) Prevent any user from reading the log file.

size *size* (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches its maximum size, it is renamed *trace-file*`.0`. Incoming tracefile data is logged in the now empty *trace-file*. When *trace-file* again reaches its maximum size, *trace-file*`.0` is renamed *trace-file*`.1` and *trace-file* is renamed *trace-file*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the `files` option.

- **Syntax:** *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB
- **Range:** 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)
- **Default:** 1 MB

world-readable (Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

traceoptions (Commit, Op, and SNMP Scripts)

IN THIS SECTION

- Syntax | 30634
- Hierarchy Level | 30634
- Description | 30634
- Default | 30635
- Options | 30635
- Required Privilege Level | 30637
- Release Information | 30637

Syntax

```
traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system scripts commit],
[edit system scripts op],
[edit system scripts snmp]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the

debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for commit, op, and SNMP scripts.

Default

If you do not include this statement, the default operation during script execution is to log important events in the default trace file for that script type, because the traceoptions `events` flag is turned on by default, regardless of the configuration settings. When the file reaches 128 kilobytes (KB), it is renamed and compressed.

NOTE: For op scripts, you can only customize tracing operations for local op scripts. For remote op scripts (op scripts executed using the `op url` command), Junos OS always logs the default trace events in the default op script log file.

Options

file ***filename***

Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**. By default, commit script process tracing output is placed in the file **cscript.log**, op script process tracing is placed in the file **op-script.log**, and SNMP script tracing is placed in the file **snmp.log**. If you include the `file` statement, you must specify a filename. To retain the default, you can specify **cscript.log**, **op-script.log**, or **snmp.log** as the filename.

- Default:
  - Commit scripts: **/var/log/cscript.log**
  - Op scripts: **/var/log/op-script.log**
  - SNMP scripts: **/var/log/snmp.log**

files ***number***

(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- Range: 2 through 1000
- Default: 10 files

flag *flag*

Tracing operation to perform. The `events` flag is turned on by default, regardless of the configuration settings. You can include the following flags. To specify more than one tracing operation, include multiple `flag` statements.

- `all`—Log all operations
- `events`—Log important events, including errors, warnings, progress messages, and script processing events
- `input`—Log script input data
- `offline`—Generate data for offline development
- `output`—Log script output data
- `rpc`—Log script RPCs
- `xslt`—Log the XSLT library
- Default: `events`

no-world-readable

Restrict file access to owner. This is the default.

size *size*

(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

- Syntax: *size* to specify bytes, *size*k to specify KB, *size*m to specify MB, or *size*g to specify GB
- Range: 10 KB through 1 GB
- Default: 128 KB

world-readable

Enable unrestricted file access.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

traceoptions (DDoS)

IN THIS SECTION

- Syntax | 30637
- Hierarchy Level | 30638
- Description | 30638
- Options | 30638
- Required Privilege Level | 30640
- Release Information | 30640

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    flag flag;
    level (all | error | info | notice | verbose | warning);
```

```
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system ddos-protection]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for DDoS protection processes.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory `/var/log`.

`files` *`number`*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Trace all operations.
- `config`—Trace processing of the DDoS configuration at an extensive level.
- `events`—Trace jddosd event processing; currently only exit events are traced.
- `gres`—Trace messages exchanged with the kernel and jddosd process that could affect graceful Routing Engine switchover (GRES).
- `init`—Trace jddosd initialization.

- `ipc`—Trace interface interprocess communication (IPC) messages.
- `memory`—Trace memory management code. This flag is not currently supported.
- `protocol`—Trace DDoS protocol state processing. Only the violation state is currently traced.
- `rtsock`—Trace messages exchanged with the kernel and jddosd process.
- `signal`—Trace system signals that are passed to jddosd, such as SIGTERM.
- `socket`—Trace socket messages that are passed to jddosd from the Packet Forwarding Engine.
- `state`—Trace state machine events. This flag is not currently supported.
- `timer`—Trace jddosd timer events.
- `ui`—Trace user interface processing. This flag is not currently supported.

`level`—Level of tracing to perform. You can specify any of the following levels:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match notice messages about conditions requiring special handling.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`—Disable remote tracing.

`no-world-readable`—(Optional) Disable unrestricted file access.

`size` *`maximum-file-size`*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`size`*`k` to specify KB, *`size`*`m` to specify MB, or *`size`*`g` to specify GB
- **Range:** 10,240 through 1,073,741,824

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

Support for Enhanced Subscriber Management added in Junos OS Release 17.3R1.

traceoptions (DHCP Server)

IN THIS SECTION

- Syntax | 30640
- Hierarchy Level | 30641
- Description | 30641
- Options | 30641
- Required Privilege Level | 30643
- Release Information | 30643

Syntax

```
traceoptions {
    file filename <files number> <match regex> <size size> <world-readable | no-world-readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit system services dhcp]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for DHCP processes.

Options

file ***filename***—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory **/var/log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—All tracing operations
- `binding`—Trace binding operations
- `config`—Log reading of configuration
- `conflict`—Trace user-detected conflicts for IP addresses
- `event`—Trace important events

- `ifdb`—Trace interface database operations
- `io`— Trace I/O operations
- `lease`—Trace lease operations
- `main`—Trace main loop operations
- `misc`— Trace miscellaneous operations
- `packet`—Trace DHCP packets
- `options`—Trace DHCP options
- `pool`—Trace address pool operations
- `protocol`—Trace protocol operations
- `rtsock`—Trace routing socket operations
- `scope`—Trace scope operations
- `signal`—Trace DHCP signal operations
- `trace`—All tracing operations
- `ui`—Trace user interface operations

`match` *`regex`*—(Optional) Refine the output to include lines that contain the regular expression.

- `all`—All tracing operations
- `binding`—Trace binding operations
- `config`— Log reading of configuration
- `conflict`—Trace user-detected conflicts for IP addresses
- `event`—Trace important events
- `ifdb`— Trace interface database operations
- `io`—Trace I/O operations
- `lease`—Trace lease operations
- `main`—Trace main loop operations
- `match` *`regex`*— Refine the output to include lines that contain the regular expression.
- `misc`—Trace miscellaneous operations

- `packet`—Trace DHCP packets
- `options`—Trace DHCP options
- `pool`—Trace address pool operations
- `protocol`—Trace protocol operations
- `rtsock`—Trace routing socket operations
- `scope`—Trace scope operations
- `signal`—Trace DHCP signal operations
- `trace`—All tracing operations
- `ui`—Trace user interface operations

`no-world-readable`—(Optional) Disable unrestricted file access.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and filename.

- **Syntax:** *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

traceoptions (DHCP)

IN THIS SECTION

- Syntax | 30644
- Hierarchy Level | 30644
- Description | 30644
- Options | 30645
- Required Privilege Level | 30647
- Release Information | 30647

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    flag flag;
    level  (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system processes dhcp-service]
[edit security dynamic-address]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the

debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define global tracing operations for extended DHCP local server and extended DHCP relay agent processes.

This statement replaces the deprecated `traceoptions` statements at the `[edit forwarding-options dhcp-relay]` and `[edit system services dhcp-local-server]` hierarchy levels.

NOTE: Traceoptions does not differentiate between a logical system and tenant system, and can be configured under the root logical system.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

`files` *`number`*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements:

- `all`—Trace all events.
- `auth`—Trace authentication events.
- `database`—Trace database events.
- `fwd`—Trace firewall process events.
- `general`—Trace miscellaneous events.
- `ha`—Trace high availability-related events.
- `era`—Enables logging.
- `interface`—Trace interface operations.
- `io`—Trace I/O operations.
- `liveness-detection`—Trace liveness detection operations.

- `packet`—Trace packet and option decoding operations.
- `performance`—Trace performance measurement operations.
- `profile`—Trace profile operations.
- `rpd`—Trace routing protocol process events.
- `rtsock`—Trace routing socket operations.
- `security-persistence`—Trace security persistence events.
- `session-db`—Trace session database events.
- `state`—Trace changes in state.
- `statistics`—Trace baseline statistics.
- `ui`—Trace user interface operations.

`level`—Level of tracing to perform; also known as severity level. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- `all`—Match messages of all levels.
- `error`—Match error messages.
- `info`—Match informational messages.
- `notice`—Match notice messages about conditions requiring special handling.
- `verbose`—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure `verbose`, messages at all higher levels are traced. Therefore, the result is the same as when you configure `all`.
- `warning`—Match warning messages.
- **Default:** `error`

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`—Disable remote tracing.

`no-world-readable`—(Optional) Disable unrestricted file access, allowing only the user `root` and users who have the Junos OS `maintenance` permission to access the trace files.

`size` *`maximum-file-size`*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (*`maximum-file-`*

*size*k), megabytes (*maximum-file-size*m), or gigabytes (*maximum-file-size*g). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Range:** 10,240 through 1,073,741,824
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

traceoptions (Diameter Base Protocol for Subscriber Aware Policy Control)

IN THIS SECTION

- Syntax | 30648
- Hierarchy Level | 30648
- Description | 30648
- Options | 30648
- Required Privilege Level | 30650
- Release Information | 30650

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    flag flag;
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
    <peer peer-name>;
}
```

Hierarchy Level

```
[edit access diameter]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing options for Diameter peers.

Options

file *filename*
: Use the specified file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory `/var/log`.

files *number*
: (Optional) Create the specified maximum number of trace files before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

flag *flag*

Use the specified tracing operation. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Trace all operations.
- `receive`—Trace received packets.
- `receive-detail`—Trace received packets in detail.
- `send`—Trace transmitted packets.
- `send-detail`—Trace transmitted packets in detail.
- `state`—Trace Diameter peer state changes.
- `timeout`—Trace timeout events.

level

Use the specified level of tracing. You can specify any of the following levels:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match notice messages about conditions requiring special handling.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

match *regular-expression*

(Optional) Refine the output to include lines that contain the specified regular expression.

no-remote-trace

Disable remote tracing.

no-world-readable

(Optional) Disable unrestricted file access.

peer *peer-name*

(Optional) Trace packets sent to or received from the specified peer. The specified peer must be defined at the `[edit access diameter peer]` hierarchy level.

size *maximum-file-size*

(Optional) Use the specified maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *size*k to specify KB, *size*m to specify MB, or *size*g to specify GB
- **Range:** 10240 through 1073741824
- **Default:** 128 KB

`world-readable` (Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

- Description | 30654
- Default | 30654
- Options | 30654
- Required Privilege Level | 30656
- Release Information | 30656

Syntax

```
traceoptions {
    file filename  <files number> <match regular-expression> <size bytes> <world-readable | no-world-readable>;
    flag flag;
```

```
    level level;
    <no-remote-trace>;
}
```

Hierarchy Level

```
[edit forwarding-options helpers]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure tracing operations for BOOTP, DNS, TFTP, or custom UDP port packet forwarding.

Default

If you do not include this statement, no tracing operations are performed.

Options

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" "). All files are placed in a file named **fud** in the directory **/var/log**. If you include the `file` statement, you must specify a filename.

files ***number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

- **Range:** 2 through 1000
- **Default:** 3 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- **address**—Trace address management events
- **all**—Trace all events
- **bootp**—Trace BOOTP or DHCP services events
- **config**—Trace configuration events
- **domain**—Trace DNS service events
- **ifdb**—Trace interface database operations
- **io**—Trace I/O operations
- **main**—Trace main loop events
- **port**—Trace arbitrary protocol events
- **rtsock**—Trace routing socket operations
- **tftp**—Trace TFTP service events
- **trace**—Trace tracing operations
- **ui**—Trace user interface operations
- **util**—Trace miscellaneous utility operations

match ***regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

no-remote-trace—(Optional) Disable remote tracing globally or for a specific tracing operation.

no-world-readable—(Optional) Restrict file access to the owner.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** file again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 0 bytes through 4,294,967,295 KB

- **Default:** 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure dynamic application tracing options.

NOTE: NOTE: Traceoptions does not differentiate between a logical system and tenant system, and can be configured under the root logical system.

Options

file Trace file information

- Values:

  filename Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.

  files *number* Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed as *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a *filename*.

- **Range:** 2 through 1000
- **Default:** 3 files

match *regular-expression*
Refine the output to include lines that contain the regular expression.

size *maximum-file-size*
Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*.0. When the `trace-file` again reaches its maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

world-readable|no-world-readable
By default, the log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

flag
Configure tracing parameters

- Values:

all
Trace with all flags enabled.

configuration
Trace configuration events.

compilation
Trace compilation events.

ipc
Trace process intercommunication events.

lookup
Trace lookup events.

no-remote-trace
Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1.

Unified Security Policies

traceoptions (Egress Protection)

IN THIS SECTION

- Syntax | 30663
- Hierarchy Level | 30664
- Description | 30664
- Options | 30664
- Required Privilege Level | 30665
- Release Information | 30665

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit protocols mpls egress-protection]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure tracing operations for egress protection.

Options

filename Name of the file to receive the output of the tracing operation.

files ***number*** (Optional) Maximum number of trace files. If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size. When a trace file named *trace-file* reaches its maximum size, it is renamed *trace-file*.0, then *trace-file*.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

flag Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- `all`—Trace all operations
- `error`—Trace error conditions
- `route`—Trace route transitions
- `state`—Trace state transitions

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4R3.

traceoptions (Enhanced Subscriber Management)

IN THIS SECTION

- Syntax | 30665
- Hierarchy Level | 30666
- Description | 30666
- Options | 30666
- Required Privilege Level | 30668
- Release Information | 30668

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    flag flag <disable>;
    level level;
```

```
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system processes smg-service]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for the main enhanced subscriber management session management process.

Options

`file` *`filename`*— Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All trace logs are stored in the directory `/var/log/bbesmgd`.

`files` *`number`*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 5 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. Include the `disable` option after a flag to disable tracing for that flag. You can include the following flags:

- `all`—Trace all operations.
- `auth`—Trace general authentication events.
- `autoconf`—Trace autoconfiguration events.
- `config`—Trace configuration events.
- `demux`—Trace demultiplexing (demux) events.

- `dhcp`—Trace DHCP Server events.
- `dprof`—Trace dynamic profile events.
- `interface`—Trace interface events.
- `io`—Trace packet socket events.
- `l2tp`—Trace L2TP events.
- `main`—Trace main operations.
- `net`—Trace network processing events.
- `ppp`—Trace PPP events.
- `pppoe`—Trace PPPoE events.
- `rpd`—Trace routing protocol process events.
- `rtsock`—Trace routing socket events.
- `service`—Trace service events.
- `session`—Trace connection events and flow.
- `stats`—Trace statistics events.
- `ucac`—Trace universal call admission control events.
- `ui`—Trace user interface events.
- `vbf`—Trace variable-based forwarding events.

`level` *`level`*—Level of tracing to perform. You can specify any of the following levels:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match notice messages about conditions reqcliring special handling.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`—Disable remote tracing.

`no-world-readable`—(Optional) Disable unrestricted file access.

`size` *`maximum-file-size`*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`size`*`k` to specify KB, *`size`*`m` to specify MB, or *`size`*`g` to specify GB
- **Range:** 10,240 through 1,073,741,824 bytes
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1R3.

Description

Define global tracing operations for access security features on Ethernet switches.

Configure trace options for the protection group.

Define global tracing operations for edge virtual bridging (EVB) features on Ethernet switches.

Default

The Ethernet Switching Options **traceoptions** feature is disabled by default.

Edge Virtual Bridging tracing operations are disabled by default.

Ethernet Ring Protection trace options are not set by default. On some EX Series switches, logging of basic ERPS state transitions is set by default. You can configure trace options on those switches to obtain more details than are provided by the default log. See *Understanding Ethernet Ring Protection Switching Functionality* for additional information about default logging of the basic state transitions.

Options

For Ethernet Switching Options:

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename*** —Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files ***number*** —(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached (***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes), at which point the

oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

- **Range:** 2 through 1000
- **Default:** 3 files

flag ***flag*** —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **access-security**—Trace access security events.
- **all**—All tracing operations.
- **analyzer**—Trace analyzer events.
- **config-internal**—Trace internal configuration operations.
- **filter**—Trace filter transaction events.
- **forwarding-database**—Trace forwarding database events.
- **general**—Trace general events.
- **interface**—Trace interface events.
- **krt**—Trace communications over routing sockets.
- **lib**—Trace library calls.
- **nexthop**—Trace next-hop events.
- **normal**—Trace normal events.
- **parse**—Trace reading of the configuration.
- **regex-parse**—Trace regular-expression parsing operations.
- **rtg**—Trace redundant trunk group events.
- **state**—Trace state transitions.
- **stp**—Trace spanning-tree events.
- **task**—Trace Ethernet-switching task processing.
- **timer**—Trace Ethernet-switching timer processing.
- **unknown-unicast-forwarding**—Trace unknown unicast forwarding events.
- **vlan**—Trace VLAN events.

no-stamp—(Optional) Do not timestamp the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Restrict file access to the user who created the file.

replace—(Optional) Replace an existing trace file if there is one rather than appending to it.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size*** —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes

- **Range:** 10 KB through 1 gigabyte

- **Default:** 128 KB

world-readable—(Optional) Enable unrestricted file access.

For Ethernet Ring Protection:

file ***filename***—Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**. You can include the following file options:

- **no-stamp**—(Optional) Do not timestamp trace file.

- **no-world-readable**—(Optional) Do not allow any user to read the log file.

- **replace**—(Optional) Replace the trace file rather than appending to it.

- **size**—(Optional) Maximum trace file size (10240..4294967295).

- **world-readable**—(Optional) Allow any user to read the log file.

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. The following flags are available for both EX Switches and MX Series routers:

- **all**—Trace all

- **config** —Trace configuration messages

- **debug**—Trace debug messages

- **events**—Trace events to the protocol state machine

- **normal**—Trace normal messages

- **pdu** —Trace RAPS PDU reception and transmission
- **periodic-packet-management**—Trace periodic packet management state and events
- **state-machine**—Trace RAPS state machine
- **timers**—Trace protocol timers

For Edge Virtual Bridging:

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached (***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

- **Range:** 2 through 1000
- **Default:** 3 files

no-world-readable—(Optional) Restrict file access to the user who created the file.

replace—(Optional) Replace an existing trace file if there is one rather than appending output to it.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes
- **Range:** 10 KB through 1 gigabyte
- **Default:** 128 KB

world-readable—(Optional) Enable unrestricted file access.

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—Trace everything.
- **ecp**—Trace Edge Control Protocol (ECP) events.
- **evb-tlv**— Trace EVB type, length, and value (TLV) events.

- **parse**—Trace configuration parsing.
- **policy**—Trace policy events.
- **vdp**—Trace Virtual Station Interface (VSI) Discovery and Configuration Protocol (VDP) events.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

NOTE: The `traceoptions` statement is not supported on the QFX3000 QFabric system.

traceoptions (Event Options)

IN THIS SECTION

- Syntax (Junos OS) | **30675**
- Hierarchy Level | **30675**
- Description | **30675**

- Default | 30676
- Options | 30676
- Required Privilege Level | 30677
- Release Information | 30677

Syntax (Junos OS)

```
traceoptions {
    file <filename> <files number> <match regular-expression> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit event-options]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for event policies on devices running Junos OS.

Junos OS Evolved uses a different tracing infrastructure, which collects trace data from all applications on all nodes by default. For more information, see *Trace Event Policy Processing on Devices Running Junos OS Evolved*.

Default

If you do not include this statement, no event-policy-specific tracing operations are performed.

Options

file ***filename***

Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**. By default, event policy process tracing output is placed in the file **eventd**. If you include the `file` statement, you must specify a filename. To retain the default, you can specify **eventd** as the filename.

- **Default:** /var/log/eventd

files ***number***

(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000
- **Default:** 3 files

flag ***flag***

Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Log all operations
- `configuration`—Log reading of configuration at the `[edit event-options]` hierarchy level
- `events`—Log eventd processing
- `database`—Log events involving storage and retrieval in events database
- `server`—Log communication with processes that are generating events
- `timer-events`—Log internally generated events

match ***regular-expression***

(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable

Restrict file access to owner. This is the default.

size *size*

(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed and compressed to ***trace-file*.0.gz**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and filename.

- **Syntax:** *size* to specify bytes, *size*k to specify KB, *size*m to specify MB, or *size*g to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

world-readable

(Optional) Enable unrestricted file access.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

traceoptions (Event Scripts)

IN THIS SECTION

- Syntax | 30678
- Hierarchy Level | 30678

- Description | 30678
- Default | 30678
- Options | 30679
- Required Privilege Level | 30680
- Release Information | 30680

Syntax

```
traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit event-options event-script]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for event scripts.

Default

If you do not include this statement, the default operation during script execution is to log important events in the default trace file **/var/log/escript.log**, because the traceoptions `events` flag is turned on by default, regardless of the configuration settings. When the file reaches 128 kilobytes (KB), it is renamed and compressed.

Options

file ***filename***

Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**. By default, event script process tracing output is placed in the file **escript.log**. If you include the `file` statement, you must specify a filename. To retain the default, you can specify **escript.log** as the filename.

- **Default: /var/log/escript.log**

files ***number***

(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000
- **Default:** 10 files

flag ***flag***

Tracing operation to perform. The `events` flag is turned on by default, regardless of the configuration settings. You can include the following flags. To specify more than one tracing operation, include multiple `flag` statements.

- `all`—Log all operations
- `events`—Log important events, including errors, warnings, progress messages, and script processing events
- `input`—Log event script input data
- `offline`—Generate data for offline development
- `output`—Log event script output data
- `rpc`—Log event script RPCs
- `xslt`—Log the XSLT library
- **Default:** `events`

no-world-readable

Restrict file access to owner. This is the default.

size *size*

(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

- **Syntax:** *size* to specify bytes, *size*k to specify KB, *size*m to specify MB, or *size*g to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

world-readable

Enable unrestricted file access.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 7.6.

- Required Privilege Level | 30682
- Release Information | 30682

Syntax

```
traceoptions file file-name flag authentication | flag configuration | flag dictionary | flag
fsm | flag statistics | flag kernel | flag dynamic | flag database | flag op-script | flag
general | flag all
```

Hierarchy Level

```
[edit system processes extensible-subscriber-services]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure the trace options for Extensible Subscriber Services Manager. essmd supports Junos OS daemon trace options.

Options

traceoptions	Configure the trace options for Extensible Subscriber Services Manager.
file-name	Name of the trace file.

`flag all`	Configure trace settings for all operations.
`flag authentication`	Configure trace settings for authentication operations.
`flag configuration`	Configure trace settings for configuration operations.
`flag database`	Configure trace settings for database operations.
`flag dictionary`	Configure trace settings for dictionary operations.
`flag dynamic`	Configure trace settings for dynamic profile operations.
`flag fsm`	Configure trace settings for finite state machine operations.
`flag general`	Configure trace settings for general operations.
`flag kernel`	Configure trace settings for kernel state-change operations.
`flag op-script`	Configure trace settings for op script operations.
`flag statistics`	Configure trace settings for statistics-collection operations.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

traceoptions (Extensions)

IN THIS SECTION

- Syntax | 30683
- Hierarchy Level | 30683
- Description | 30683

- Options | 30684
- Required Privilege Level | 30685
- Release Information | 30685

Syntax

```
traceoptions {
    file <filename> <files number> <match regex> <size size> <world-readable | no-world-
readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system extensions extension-service application],
[edit system extensions extension-service application file script-name]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Trace options for extension-service applications. You can set the `traceoptions` statement for the `application` level or for the `file` *`script-name`* level or for both. If the `traceoptions` statement is set for both the `application` and `file` *`script-name`* levels, the latter will have a higher priority.

NOTE: Global traceoptions for daemonized applications do not take effect if the daemonized application and global traceoptions are committed separately

Options

file Indicate trace file information.

- ***filename*** Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.
- **files *number*** (Optional) Specify maximum number of trace files.
  - **Range:** 2 through 1000
  - **Default:** 3
- **size *size*** (Optional) Specify the maximum size of each trace file. When a trace file named *trace-file* reaches its maximum size, it is renamed *trace-file*.0. The traceoption output continues in a second trace file named *trace-file*.1. When *trace-file*.1 reaches its maximum size, output continues in a third file named *trace-file*.2, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.
  - **Range:** 10240 through 1073741824
  - **Default:** 128k
- **world-readable | no-world-readable** (Optional). Grant all users permission to read log files, or restrict the permission only to the root user and users who have Junos OS maintenance permission.

flag *flag* Specify the tracing operation to perform. To specify more than one tracing operation, include multiple flag statements:

- **all** Trace all operations.
- **config** Trace important events.
- **general** Trace script input data.
- **grpc** Trace grpc server events.
- **notification** Trace notification events.
- **routing-socket** Trace routing socket calls.
- **timeouts** Trace timeouts.

`timer`	Trace internal timer events.
`no-remote-trace`	Disable remote tracing. This option is valid only when [system tracing] is configured.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

traceoptions (FC-2 Fibre Channel)

IN THIS SECTION

- Syntax | 30686
- Hierarchy Level | 30686
- Description | 30686
- Default | 30686
- Options | 30686
- Required Privilege Level | 30688
- Release Information | 30688

Syntax

```
traceoptions {
    file filename <replace> <size size> <files number> <no-stamp>;
    <world-readable | no-world-readable>;
    flag flag <flag-modifier>;
}
```

Hierarchy Level

```
[edit fc-fabrics fabric-name fc2]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set FC-2 protocol tracing options.

NOTE: The `traceoptions` statement is not supported on the QFabric system.

Default

Traceoptions is disabled.

Options

file ***name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. The traceoption output continues in a second trace file named ***trace-file*.1**. When ***trace-file*.1** reaches its maximum size, output continues in a third file named ***trace-file*.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements:

- **all** —Trace all operations.
- **error**—Trace all error events
- **normal**—Trace all normal events.
- **Default:** If you do not specify the **normal** option, only unusual or abnormal operations are traced.
- **parse**—Trace configuration parsing.
- **rx-frame**—(Optional) Trace received frames.
- **rx-frame-header**—(Optional) Trace received frame headers.
- **tx-frame**—(Optional) Trace transmitted frames.
- **tx-frame-header**—(Optional) Trace transmitted frame headers.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Prevent any user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*** **.0**. Incoming tracefile data is logged in the now empty ***trace-file***. When ***trace-file*** again reaches its maximum size, ***trace-file*****.0** is renamed ***trace-file*****.1** and ***trace-file*** is renamed ***trace-file*****.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*****k** to specify KB, ***x*****m** to specify MB, or ***x*****g** to specify GB

- **Range:** 10 KB through the maximum file size of 4 GB (the maximum is lower if 4 GB is not supported on your system)
- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

traceoptions (Fibre Channel)

IN THIS SECTION

- Syntax | 30688
- Hierarchy Level | 30689
- Description | 30689
- Default | 30689
- Options | 30689
- Required Privilege Level | 30691
- Release Information | 30691

Syntax

```
traceoptions {
    file filename <replace> <size size> <files number> <no-stamp>
    <world-readable | no-world-readable>;
```

```
    flag flag <flag-modifier>;
}
```

Hierarchy Level

```
[edit fc-options]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set FC protocol tracing options.

> **NOTE**: The `traceoptions` statement is not supported on the QFabric system.

Default

Traceoptions is disabled.

Options

file ***name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. The traceoption output continues in a second trace file named ***trace-file*.1**. When ***trace-file*.1** reaches its maximum size, output continues in a third file named ***trace-file*.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements:

- **all**—Trace all operations.
- **fabric**—Trace virtual fabric events.
- **fc2**—Trace the FC2 (network layer protocols) events.
- **fip**—Trace the Fibre Channel over Ethernet (FCoE) Initialization Protocol events.
- **flogi** —Trace the fabric login server events.
- **forwarding-database**—Trace the forwarding database and next-hop events.
- **interface**—Trace the interface events.
- **krt**—Trace the communication over the routing socket.
- **lib**—Trace library calls.
- **lif**—Trace Fibre Channel logical interface (fc-lif) events.
- **vswitch**—Trace virtual switch events.

The following are the global tracing options:

- **all**—All trace operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events.
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **parse**—Trace configuration parsing.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Prevent any user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*** **.0.** Incoming tracefile data is logged in the now empty ***trace-file***. When ***trace-file*** again reaches its maximum size, ***trace-file*****.0** is renamed ***trace-file*****.1** and ***trace-file*** is renamed ***trace-file*****.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*****k** to specify KB, ***x*****m** to specify MB, or ***x*****g** to specify GB
- **Range:** 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)
- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

traceoptions (FIP Protocol Fibre Channel)

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set proxy FC protocol tracing options.

NOTE: The `traceoptions` statement is not supported on the QFabric system.

Default

Traceoptions is disabled.

Options

file ***name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

files ***number*** —(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. The traceoption output continues in a second trace file named ***trace-file*.1**. When ***trace-file*.1** reaches its maximum size, output continues in a third file named ***trace-file*.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

- **Range:** 2 through 1000 files
- **Default:** 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements:

- **all**—Trace all operations.
- **error**—Trace all error events
- **normal**—Trace all normal events.
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **packet**—Trace packet decoding operations
- **parse**—Trace configuration parsing.
- **state**—Trace state transitions.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Prevent any user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0.** Incoming tracefile data is logged in the now empty ***trace-file***. When ***trace-file*** again reaches its maximum size,

trace-file.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

- **Syntax:** *x***k** to specify KB, *x***m** to specify MB, or *x***g** to specify GB
- **Range:** 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)
- **Default:** 1 MB

[edit logical-systems name security flow]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Starting in Junos OS Release 24.2R1, we support `local-debug-buf` option to configure number of lines for the flow local trace buffer, and the maximum lines allowed is 40,000. A new flag `packet-track` has been introduced to get information about the packet being handled in SRX data path, The flag `packet-track` should be configured in root logical system. To track information about the packets in non root logical system use the option `root-override` along with flag `packet-track`.

Options

no-remote-trace Disable remote tracing

rate-limit Limit the incoming rate of trace messages

- **Default:** 0
- **Range:** 0 through 4294967295

root-override Allow collect flow trace in root from all logical-systems and tenants

trace-level Flow trace level

- brief—Brief messages including notice, in addition to minimal messages

- detail—Detail messages including info and debug, in addition to brief messages
- minimal—Significant messages including warning, error, criticality, alert and emergency.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

traceoptions (General Authentication Service)

IN THIS SECTION

- Syntax | 30699
- Hierarchy Level | 30699
- Description | 30699
- Options | 30700
- Required Privilege Level | 30701
- Release Information | 30701

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    filter {
        user user@domain;
    }
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system processes general-authentication-service]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the

debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure tracing options for the general authentication service.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. All files are placed in the directory `/var/log`.

`files` *`number`*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`filter`—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifier simplifies troubleshooting in a scaled environment.

- `user` *user@domain*—Username of a subscriber. Optionally use an asterisk (*) as a wildcard to substitute for characters at the beginning or end of either term or both terms.

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `address-assignment`—Trace address-assignment pool events
- `all`—Trace all tracing operations
- `configuration`—Trace configuration events
- `framework`—Trace authentication framework events
- `gx-plus`—Trace Gx-Plus events
- `jsrc`—Trace JSRC events
- `ldap`—Trace LDAP authentication events
- `local-authentication`—Trace local authentication events
- `radius`—Trace RADIUS authentication events
- `user-access`—Trace user access events, such as login, logout, and authenticate.

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`—Disable remote tracing.

`no-world-readable`—(Optional) Disable unrestricted file access.

`size` *`maximum-file-size`*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`size`*`k` to specify KB, *`size`*`m` to specify MB, or *`size`*`g` to specify GB
- **Range:** 10240 through 1073741824
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

- Release Information | 30705

Syntax

```
traceoptions {
    file file-name ;
    flag flag;
    level (all | error | info | notice | verbose | warning);
    monitor monitor-object-name {
        group-name group-name;
        real-services-name real-service-name;
    }
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services network-monitoring]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify tracing options for the traffic load balancer health check monitoring function.

Options

file *file-name*

Use the specified name of the file to receive the output of the tracing operation.

flag *flag*

Specify which operations you want to trace. To specify more than one operation, include multiple flag statements. Table 1907 on page 30703 species the various values you can set this option to.

Table 1907: Trace Flags

Flag	Support on MS-MPC and SPC3 Cards	Description
all	MS-MPC and SPC3	Trace all operations.
all-real-services	SPC3	Trace all real services.
config	MS-MPC	Trace traffic load balancer configuration events.
connect	MS-MPC	Trace traffic load balancer ipc events.
database	MS-MPC and SPC3	Trace database events.
file-descriptor-queue	MS-MPC	Trace file descriptor queue events.
inter-thread	MS-MPC	Trace inter-thread communication events.
filter	MS-MPC	Trace traffic load balancer filter programming events.
health	MS-MPC	Trace traffic load balancer health events.
messages	MS-MPC and SPC3	Trace normal events.
normal	MS-MPC	Trace normal events.

Table 1907: Trace Flags *(Continued)*

Flag	Support on MS-MPC and SPC3 Cards	Description
operational-commands	MS-MPC	Trace traffic load balancer show events.
parse	MS-MPC	Trace traffic load balancer parse events.
probe	MS-MPC and SPC3	Trace probe events.
probe-infra	MS-MPC and SPC3	Trace probe infra events.
route	MS-MPC	Trace traffic load balancer route events.
snmp	MS-MPC	Trace traffic load balancer SNMP events.
statistics	MS-MPC	Trace traffic load balancer statistics events.
system	MS-MPC	Trace traffic load balancer system events.

group-name *group-name*

Specify which server group is to be traced.

level

Use the specified level of tracing. You can specify any of the following levels:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages
- `notice`—Match conditions that must be handled specially.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

monitor *monitor-object-name*	Name of a monitoring object that contains server group or real service.
no-remote-trace	Disable remote tracing.
real-services-name *real-service-name*	Specify which real service is to be traced.

Required Privilege Level

trace and interface—To view this statement in the configuration.

trace-control and interface-control—To add this statement to the configuration.

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set Multinode High Availability traceoptions

Options

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks

file *name*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place global routing protocol tracing output in the file **routing-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files

- **Default:** 2 files

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

no-world-readable—Restrict users from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

  If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

world-readable—Allow users to read the log file.

level—Set a level of tracing.

- Values:
  - alert—Match alert conditions
  - all—Match all levels
  - critical—Match critical conditions
  - debug—Match debug messages
  - emergency—Match emergency conditions
  - error—Match error conditions
  - info—Match informational messages
  - notice—Match notice level messages
  - warning—Match warning messages

no-remote-trace—Disable remote tracing.

Description

Define tracing operations for IGMP snooping.

Default

The **traceoptions** feature is disabled by default.

Options

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files ***number***—(Optional) Maximum number of trace files, including the active trace file. When a trace file reaches its maximum size, its contents are archived into a compressed file named ***filename*.0** and the trace file is emptied. When the trace file reaches its maximum size again, the ***filename*.0** archive file is renamed ***filename*.1** and a new ***filename*.0** archive file is created from the contents of the trace file. This process continues until the maximum number of trace files is reached, at which point the system starts overwriting the oldest archive file each time the trace file is archived. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

- **Range:** 2 through 1000
- **Default:** 10 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **general**—Trace general IGMP snooping protocol events.
- **krt**—Trace communication over routing socket.
- **leave**—Trace leave group messages (IGMPv2 and IGMPv3 only).
- **nexthop**—Trace nexthop-related events.
- **normal**—Trace normal IGMP snooping protocol events. If you do not specify this flag, only unusual or abnormal operations are traced.

- **packets**—Trace all IGMP packets.
- **policy**—Trace policy processing.
- **query**—Trace IGMP membership query messages.
- **report**—Trace membership report messages.
- **route**—Trace routing information.
- **state**—Trace IGMP state transitions.
- **task**—Trace routing protocol task processing.
- **timer**—Trace routing protocol timer processing.
- **vlan**—Trace VLAN-related events.

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers per flag:

- **detail**—Provide detailed trace information
- **disable**—Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

no-stamp—(Optional) Omit the timestamp at the beginning of each line in the trace file.

no-world-readable—(Optional) Restrict file access to the user who created the file.

replace—(Optional) Replace an existing trace file if there is one. If you do not include this option, tracing output is appended to an existing trace file.

size ***size*** —(Optional) Maximum size of each trace file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is zipped and renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum size, you also must specify a maximum number of files with the **files** option.

- **Syntax:** ***x*** to specify bytes, ***x*****k** to specify KB, ***x*****m** to specify MB, or ***x*****g** to specify GB
- **Range:** 10240 through 4294967295 bytes
- **Default:** 128 KB

world-readable—(Optional) Allow unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

traceoptions (Individual Interfaces)

IN THIS SECTION

- Syntax (Individual interfaces with PTX Series, EX Series, ACX Series) | 30711

    file filename <files number> <match regex> <size size> <world-readable | no-world-readable>;
    flag flag ;
    no-remote-trace;
}
```

Syntax (Interface process with ACX Series, SRX Series, MX Series, M Series, T Series)

```
traceoptions {
    file <filename> <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag <disable>;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for individual interfaces.

To specify more than one tracing operation, include multiple `flag` statements.

The interfaces `traceoptions` statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system `syslog` file in the directory */var/log/dcd* .

On EX Series, QFX Series, and NFX Series platforms, configure tracing options the link fault management.

On ACX Series, SRX Series, MX Series, M Series, and T Series platforms define tracing operations for the interface process (dcd).

Default

If you do not include this statement, no interface-specific tracing operations are performed.

Options

Table 1908 on page 30713 lists options for traceoption command for the following platforms:

Table 1908: Options for traceoptions

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
`file` *filename*	—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory */var/log/dcd* . By default, interface process tracing output is placed in the file.		—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory */var/log/dcd* .	—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory */var/log/dcd* . By default, interface process tracing output is placed in the file `dcd`.

Table 1908: Options for traceoptions *(Continued)*

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
files *number*	—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.		—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum *x*k to specify KB, *x*m to specify MB, or *x*g to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the size option.	—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option. *Range:* 2 through 1000 *Default:* 3 files

Table 1908: Options for traceoptions *(Continued)*

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
flag	—Tracing operation to perform. To specify more than one tracing operation, include multiple *flag* statements. The following are the interface-specific tracing options. • `all`—All interface tracing operations • `event`—Interface events • `ipc`—Interface interprocess communication (IPC) messages • `media`—Interface media changes • `q921`—Trace ISDN Q.921 frames • `q931`—Trace ISDN Q.931 frames	—Tracing operation to perform. To specify more than one tracing operation, include multiple *flag* statements. The following are the interface-specific tracing options. • `all`—All interface tracing operations • `event`—Interface events • `ipc`—Interface interprocess communication (IPC) messages • `media`—Interface media changes • `q921`—Trace ISDN Q.921 frames • `q931`—Trace ISDN Q.931 frames	—Tracing operation to perform. To specify more than one tracing operation, include multiple *flag* statements. You can include the following flags: • `action-profile`—Trace action profile invocation events. • `all`—Trace all events. • `configuration`—Trace configuration events. • `protocol`—Trace protocol processing events. • `routing socket`—Trace routing socket events.	—Tracing operation to perform. To specify more than one tracing operation, include multiple *flag* statements. You can include the following flags: • `all` • `change-events`—Log changes that produce configuration events • `config-states`—Log the configuration state machine changes • `kernel`—Log configuration IPC messages to kernel • `kernel-detail`—Log details of configuration messages to kernel

Table 1908: Options for traceoptions *(Continued)*

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
`match`	—(Optional) Regular expression for lines to be traced.		—(Optional) Refine the output to log only those lines that match the given regular expression.	

Table 1908: Options for traceoptions *(Continued)*

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
size *size*	—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.		—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the files option. *Syntax:* *x*k to specify KB, *x*m to specify MB, or *x*g to specify GB *Range:* 10 KB through 1 GB *Default:* 128 KB *Default:* If you do not include this option, tracing output is appended	—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the *`trace-file`* again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option. *Syntax:* *x*k to specify kilobytes, *x*m to specify megabytes, or *x*g to specify gigabytes

traceoptions (Inline Monitoring)

IN THIS SECTION

- Syntax | 30720
- Hierarchy Level | 30720
- Description | 30720
- Options | 30721
- Additional Information | 30721
- Required Privilege Level | 30722
- Release Information | 30722

Syntax

```
traceoptions {
    file <filename> <files files> <match match> <size size> <(world-readable | no-world-
readable)>;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services inline-monitoring]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

(Junos OS only) Configure traceoptions for the inline monitoring process.

Options

file ***file-name***
Use the specified file to receive the output of the tracing operation. All files are placed in the directory **/var/log**.

files ***files***
(Optional) Use the specified maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Default:** 3 files
- **Range:** 2 through 1000 files

match ***match***
(Optional) Use the specified regular expression to refine the output to include lines that contain the regular expression.

no-remote-trace
Disable remote tracing.

no-world-readable
(Default) Disable unrestricted file access. This means the log file can be accessed only by the user who configured the tracing operation.

world-readable
(Optional) Enable unrestricted file access.

size ***size***
(Optional) Use the specified maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

Additional Information

Junos OS Evolved uses a new tracing architecture. All running applications create trace information, with multiple instances of the same application having their own trace information. In Junos OS, you enable tracing operations by configuring the traceoptions statement at the specific hierarchy level you want to trace. Junos OS Evolved, on the other hand, uses an application-based model, and thus trace messages are logged, viewed, and configured by application. As a result, Junos OS Evolved does not support the `traceoptions` statement at many of the hierarchy levels that Junos OS supports.

In Junos OS Evolved, you do not view trace files directly, and you should never add, edit, or remove trace files under the **/var/log/traces** directory because this can corrupt the traces. Instead, you use the `show trace application` *`application-name`* `node` *`node-name`* command to read and decode trace messages stored

in the trace files. All running applications on Junos OS Evolved create trace information at the `info` level by default.

Inline monitoring services are governed by the `imond` application. For Junos OS Evolved, to configure traces for a severity other than `info` for the `imond` application, include the `application imond node` *`node-name`* `level` *`severity`* statement at the [edit system trace] hierarchy level.

> **NOTE**: For general monitoring and troubleshooting of devices running Junos OS or Junos OS Evolved, we recommend using standard tools such as CLI show commands, system log messages, SNMP, and telemetry data. You should avoid using trace messages for general debugging purposes and long-term solutions because they are subject to change without notice.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS 19.4R1.

traceoptions (LACP)

IN THIS SECTION

- Syntax | 30727
- Hierarchy Level | 30727
- Description | 30727
- Default | 30727
- Options | 30727
- Required Privilege Level | 30728
- Release Information | 30729

Syntax

```
traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols lacp]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for the LACP protocol.

Default

If you do not include this statement, no LACP protocol tracing operations are performed.

Options

filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, interface process tracing output is placed in the file `lacpd`.

`files` *number*—(Optional) Maximum number of trace files. When a trace file named *trace-file* reaches its maximum size, it is renamed *trace-file*`.0`, then *trace-file*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—All LACP tracing operations
- `configuration`—Configuration code
- `packet`—Packets sent and received
- `process`—LACP process events
- `protocol`—LACP protocol state machine
- `routing-socket`—Routing socket events
- `startup`—Process startup events

`no-world-readable`—(Optional) Prevent any user from reading the log file.

`size` *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*`.0`. When the *trace-file* again reaches its maximum size, *trace-file*`.0` is renamed *trace-file*`.1` and *trace-file* is renamed *trace-file*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option:

- **Syntax:** *x*`k` to specify kilobytes, *x*`m` to specify megabytes, or *x*`g` to specify gigabytes
- **Range:** 10 KB through the maximum file size supported on your router
- **Default:** 1 MB

`world-readable`—(Optional) Allow any user to read the log file.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.6.

traceoptions (Layer 2 Learning)

IN THIS SECTION

- Syntax | 30729
- Hierarchy Level | 30730
- Description | 30730
- Default | 30730
- Options | 30730
- Required Privilege Level | 30731
- Release Information | 30732

Syntax

```
traceoptions  {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag (detail | disable | receive | send);
    in-memory-debug;
    level;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols l2-learning]
```

Description

Define tracing operations for Layer 2 learning.

Default

The `traceoptions` feature is disabled by default.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

You can specify the following options:

- `no-world-readable`—(Optional) Restrict file access to the user who created the file.
- `size` *`size`* —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `files` option. Use *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify gigabytes.
- `world-readable`—(Optional) Enable unrestricted file access.

`flag` *`flag`* —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- `all`—All tracing operations.
- `bmac-next-hop`—Trace backbone MAC next hop operations.
- `bridge-bmac-next-hop`—Trace backbone MAC next hop bridge operations.
- `bridging-interface`—Trace interface bridge operations.
- `bridging-domain`—Trace bridging domain operations.
- `configuration`—Trace configuration operations.

- `flood-next-hop`—Trace flood next hop operations.
- `initialization`—Trace initialization operations.
- `interface-device`—Trace interface device operations.
- `interface-family`—Trace interface family operations.
- `interface-logical`—Trace logical interface operations.
- `ipc`—Trace inter-process communications operations.
- `irb`—Trace integrated routing and bridging operations.
- `isid`—Trace i-tagged service ID operations.
- `kack`—Trace kernel-acknowledgment.
- `learning-domain`—Trace learning domain operations.
- `logical-system`—Trace logical system operations.
- `mac-learning`—Trace MAC address learning.
- `mc-ae`—Trace multichassis aggregated Ethernet interface operations.
- `redundant-trunk-group`—Trace redundant trunk group operations.
- `routing-instance`—Trace routing instance operations.
- `routing-socket`—Trace routing socket operations.
- `storm-control`—Trace storm control operations.
- `unknown-unicast-forwarding`—Trace unknown unicast forwarding events.
- `vpls-ping`—Trace Virtual Private VLAN Service (VPLS) ping operations.

`in-memory-debug`—Enable trace parameters in the memory.

`level`—Specify level of debugging output.

`no-remote-trace`—Disable remote tracing.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

traceoptions (LLDP)

IN THIS SECTION

- Syntax | 30732

```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for the Link Layer Discovery Protocol (LLDP). You can trace messages under LLDP for LLDP and physical topology SNMP MIBs.

NOTE: The traceoptions statement is not supported on the QFX3000 QFabric system.

Default

The default LLDP protocol-level trace options are inherited from the global `traceoptions` statement.

Options

disable (Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

file *filename* Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory `/var/log`. We recommend that you place spanning-tree protocol tracing output in the file `/var/log/stp-log`.

files *number* (Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 1 trace file only

flag Specify a tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- **Values:** The following are the LLDP-specific tracing options:
  - `all`—Trace all operations.
  - `configuration`—Log configuration events.
  - `interface`—Trace interface update events.
  - `packet`—Trace packet events.
  - `protocol`—Trace protocol information.
  - `rtsock`—Trace socket events.
  - `snmp`—Trace SNMP configuration operations.
  - `vlan`—Trace VLAN update events.

  The following are the global tracing options:
  - `all`—All tracing operations.
  - `config-internal`—Trace configuration internals.
  - `general`—Trace general events.
  - `normal`—All normal events. This is the default. If you do not specify this option, only unusual or abnormal operations are traced.
  - `parse`—Trace configuration parsing.
  - `policy`—Trace policy operations and actions.
  - `regex-parse`—Trace regular-expression parsing.
  - `route`—Trace routing table changes.
  - `state`—Trace state transitions.
  - `task`—Trace protocol task processing.
  - `timer`—Trace protocol task timer processing.

no-world-readable (Optional) Prevent any user from reading the log file. This is the default. If you do not include this option, tracing output is appended to an existing trace file.

size *maximum-file-size* (Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the *`trace-`*

file again reaches its maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the files option.

- **Syntax:** *x*k to specify KB, *x*m to specify MB, or *x*g to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

world-readable (Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

traceoptions (MACsec interfaces)

IN THIS SECTION

Syntax | 30736

- Hierarchy Level | 30736
- Description | 30736
- Default | 30737
- Options | 30737
- Required Privilege Level | 30738
- Release Information | 30738

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit security macsec interfaces interface-name]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for individual MACsec interfaces. Tracing operations provide support for debugging protocol-level issues. MACsec is an industry-standard security technology that provides secure communication for almost all types of traffic on Ethernet links. To specify more than one tracing operation, include multiple `flag` statements.

The interfaces `traceoptions` statement does not support a separate trace file. The logging is done by the kernel, so the tracing information is placed in the system `syslog` file in the directory `/var/log/dcd`.

> **NOTE**: Interface level tracing options cannot be enabled when the connectivity association is configured on the sub-interfaces.

Default

If you do not include this statement, no tracing operations are performed.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. By default, interface process tracing output is placed in the directory. If you do not specify the name of the tracefile, all files are placed in the directory `/var/log/dcd`.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named trace-file reaches the maximum value, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. Values range from 2 through 1000.

flag *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. The following are the tracing operation options:

`all` Trace all operations.

`keys` Trace key creation or generation information.

`mka-packets` Trace MACsec Key Agreement (MKA) protocol input and output packet information.

`normal` Trace all normal events and messages.

`state` Trace MKA protocol state information.

`to-secy` Trace MKA to security entity state change information.

`no-world-readable`—(Optional) Prevent any user from reading the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

`world-readable`—(Optional) Allow any user to read the log file.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set multicast snooping tracing options.

Default

Tracing operations are disabled.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***name***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place multicast snooping tracing output in the file **/var/log/multicast-snooping-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 1 trace file only

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

The following are the tracing options:

- **all**—All tracing operations
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events.
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

For Multiple VLAN Registration Protocol (MVRP), configure tracing options.

Default

Traceoptions is disabled.

Options

disable (Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename* Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the `file` statement, you must specify a filename. Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place MVRP tracing output in the file **/var/log/mvrp-log**.

files *number* (Optional) Maximum number of trace files, in the range from 2 through 1000. The default is 1 trace file. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

flag *flag* Specify which tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- **all**—Enable all trace options flags.
- **error**—Trace all failure conditions.
- **events**—Trace process state change and cleanup events.
- **pdu**—Trace RAPS PDU reception and transmission.
- **socket**—Trace socket activity.
- **state-machine**—Trace information about the state machine.
- **timers**—Trace protocol timers.

no-world-readable (Optional) Prevent any user from reading the log file.

size *size* (Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file***reaches this size, it is renamed ***trace-file*.0.** When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0** . This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. The file size range is from 10240 through 4294967295. The default file size is 1 MB.

world-readable (Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for the MX Series Virtual Chassis configuration.

Default

Tracing operations are disabled.

Options

detail—(Optional) Generate detailed trace information for a flag.

disable—(Optional) Disable a flag.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files ***number***—(Optional) Maximum number of trace files. You can specify 2 through 1000 trace files. The default is 3 trace files.

> **NOTE**: When you specify the maximum number of trace files, you must also specify the maximum trace file size with the **size** ***size*** option.

When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **auto-configuration**—Trace Virtual Chassis ports that have been automatically configured.
- **csn**—Trace Virtual Chassis complete sequence number (CSN) packets.
- **error**—Trace Virtual Chassis errored packets.
- **graceful-restart**—Trace Virtual Chassis graceful restart events.
- **heartbeat**—Trace Virtual Chassis heartbeat packets.
- **hello**—Trace Virtual Chassis hello packets.
- **krt**—Trace Virtual Chassis kernel routing table (KRT) events.
- **lsp**—Trace Virtual Chassis link-state packets.
- **lsp-generation**—Trace Virtual Chassis link-state packet generation.
- **me**—Trace Virtual Chassis primary-role election (ME) events.
- **normal**—Trace normal events.
- **packets**—Trace Virtual Chassis packets.
- **parse**—Trace reading of the configuration.
- **psn**—Trace partial sequence number (PSN) packets.
- **route**—Trace Virtual Chassis routing information.
- **spf**—Trace Virtual Chassis shortest-path-first (SPF) events.
- **state**—Trace Virtual Chassis state transitions.
- **task**—Trace Virtual Chassis task operations.

match ***regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

no-stamp—(Optional) Do not place a timestamp on any trace file.

no-world-readable—(Optional) Restrict file access to the user who created the file.

receive—(Optional) Trace received packets.

replace—(Optional) Replace a trace file instead of appending information to it.

send—(Optional) Trace transmitted packets.

size ***size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can indicate the unit of measure with ***size*** **k** to specify KB, ***size*** **m** to specify MB, or ***size*** **g** to specify GB. You can specify a trace file size of 10240 through 1073741824 bytes.

> **NOTE**: If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** ***number*** option.

vccpd— (Optional) Include VCCPD messages in the trace files.

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

traceoptions (NETCONF and Junos XML Protocol)

IN THIS SECTION

- Syntax | 30750
- Hierarchy Level | 30750
- Description | 30750

- Default | 30751
- Options | 30751
- Required Privilege Level | 30752
- Release Information | 30752

Syntax

```
traceoptions {
    file <filename> <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag;
    no-remote-trace;
    on-demand;
}
```

Hierarchy Level

```
[edit system services netconf]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for NETCONF and Junos XML protocol sessions.

NOTE: Starting in Junos OS Release 16.1, when you enable tracing operations at the `[edit system services netconf traceoptions]` hierarchy, Junos OS enables tracing operations for both NETCONF and Junos XML protocol sessions and adds the `[NETCONF]` and

[JUNOScript] tags to the log file entries to distinguish the type of session. Prior to Junos OS Release 16.1, only NETCONF session data was logged, and the [NETCONF] tag was omitted.

Default

If you do not include this statement, NETCONF and Junos XML protocol-specific tracing operations are not performed.

Options

`file` *`filename`* Name of the file in which to write trace information. All files are placed in the **/var/log** directory.

- **Default: /var/log/netconf**

`files` *`number`* (Optional) Maximum number of trace files.

When a trace file named ***trace-file*** reaches its maximum size, it is renamed and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz**, and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000 files
- **Default:** 10 files

`flag` *`flag`* Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Log all incoming and outgoing data from NETCONF and Junos XML protocol sessions.
- `debug`—Log debug level information. Using the `flag all` option is recommended.
- `incoming`—Log all incoming data from NETCONF and Junos XML protocol sessions.
- `outgoing`—Log all outgoing data from NETCONF and Junos XML protocol sessions.

match *regular-expression* (Optional) Refine the output to include only those lines that match the regular expression.

no-remote-trace (Optional) Disable remote tracing.

no-world-readable (Optional) Disable unrestricted file access, which restricts file access to the owner. This is the default.

on-demand (Optional) Enable on-demand tracing, which requires that you start and stop tracing operations from within the NETCONF or Junos XML protocol session. If configured, tracing operations are performed for a session only when requested through the `<request-netconf-trace>` operation.

Within a session, issue the `<request-netconf-trace><start/></request-netconf-trace>` RPC to start tracing operations for that session, and issue the `<request-netconf-trace><stop/></request-netconf-trace>` RPC to stop tracing operations for that session.

size *size* (Optional) Maximum size of each trace file in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). If you don't specify a unit, the default is bytes. If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

- **Syntax:** *size* to specify bytes, *size*k to specify KB, *size*m to specify MB, or *size*g to specify GB
- **Range:** 10240 through 1073741824 bytes
- **Default:** 128 KB

world-readable (Optional) Enable unrestricted file access.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

Support for Junos XML protocol sessions added in Junos OS Release 16.1.

Option `flag debug` introduced in Junos OS Release 16.1.

traceoptions (NETCONF TLS)

IN THIS SECTION

- Syntax | 30753
- Hierarchy Level | 30753
- Description | 30754
- Default | 30754
- Options | 30754
- Required Privilege Level | 30756
- Release Information | 30756

Syntax

```
traceoptions {
    file <filename> <files files> <match match> <size size> <(world-readable | no-world-
readable)>;
    flag name;
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system services netconf tls]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable trace options for NETCONF sessions that use the Transport Layer Security (TLS) protocol.

Default

If you do not include this statement, NETCONF-over-TLS-specific tracing operations are not performed.

Options

`file` *`filename`*

Name of the file to receive the output of the tracing operation. All files are placed in the **/var/log** directory.

- **Default: /var/log/netconf-tls**

`files` *`number`*

(Optional) Maximum number of trace files.

When a trace file named ***trace-file*** reaches its maximum size, it is renamed and compressed to ***trace-file*.0.gz**, then ***trace-file*.1.gz** and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000 files
- **Default:** 3 files

`flag` *`flag`*

Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- Values:
  - all—Log all communication

- app—Log the application data in plain text
- general—Log tls-proxyd process-related messages
- pki—Log PKI-related messages
- plugin—Log plugin messages

level

Level of debugging output.

- Values:
  - all—Match all levels
  - error—Match error conditions
  - info—Match informational messages
  - notice—Match conditions that should be handled specially
  - verbose—Match verbose messages
  - warning—Match warning messages
- **Default:** error

`match` *`regular-expression`*

(Optional) Refine the output to include only those lines that match the regular expression.

`no-remote-trace`

Disable remote tracing.

`no-world-readable`

(Optional) Disable unrestricted file access, which restricts file access to the owner. This is the default.

`size` *`size`*

(Optional) Maximum trace file size in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB).

If you don't specify a unit, the default is bytes. If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

- **Syntax:** *`size`* to specify bytes, *`size`*`k` to specify KB, *`size`*`m` to specify MB, or *`size`*`g` to specify GB
- **Range:** 10,240 through 1,073,741,824 bytes
- **Default:** 128 KB

`world-readable`

(Optional) Enable unrestricted file access.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.2R1.

Statement introduced in Junos OS Evolved Release 21.4R1.

traceoptions (Next Gen Services Global System Logging)

IN THIS SECTION

- Syntax | 30756
- Hierarchy Level | 30757
- Description | 30757
- Options | 30757
- Required Privilege Level | 30757
- Release Information | 30757

Syntax

```
traceoptions {
    apply-groups group-names;
    apply-groups-except group-names;
    flag name;
    file filename,
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services rtlog]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify the trace information you want to include in the system log messages.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system

Release Information

Support introduced in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

        interface interface-name;
        protocol protocol-identifier;
        source-port port-identifier;
        source-prefix address;
    }
    rate-limit messages-per-second;
    trace-level (brief | detail | error);
}
```

Hierarchy Level

```
[edit services service-set name flow]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure flow tracing options for a service-set.

Options

file
Configure the trace file options.

filename
Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.

files *number*
Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000 files
- **Default:** 10 files

match *regular-expression*
Refine the output to include lines that contain the regular expression.

size *maximum-file-size*
Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is

renamed *trace-file*.0. When the trace-file again reaches its maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.

Syntax: *x* K to specify KB, *x* m to specify MB, or *x* g to specify GB

- **Range:** 0 KB through 1 GB
- **Default:** 128 KB

world-readable | no-world-readable

By default, log files can be accessed only by the user who configures the tracing operation. The world-readable option enables any user to read the file. To explicitly set the default behavior, use the no-world-readable option.

flag

Trace operation to perform. To specify more than one trace operation, include multiple flag statements.

all	Trace with all flags enabled
basic-datapath	Trace basic packet flow activity
fragmentation	Trace IP fragmentation and reassembly events
high-availability	Trace flow high-availability information
host-traffic	Trace flow host traffic information
multicast	Trace multicast flow information
route	Trace route lookup information
session	Trace session creation and deletion events
session-scan	Trace session scan information
tcp-basic	Trace TCP packet flow information
tunnel	Trace tunnel information

no-remote-trace

Set remote tracing as disabled.

packet-filter *filter-name*

Packet filter to enable during the tracing operation. Configure the filtering options.

destination-port *port-identifier*	Match TCP/UDP destination port
destination-prefix *address*	Destination IP address prefix
interface *interface-name*	Logical interface
protocol *protocol-identifier*	Match IP protocol type
source-port *port-identifier*	Match TCP/UDP source port
source-prefix *address*	Source IP address prefix

rate-limit *messages-per-second*

Limit the incoming rate of trace messages.

trace-level

Set the level for trace logging. This option is available only when the flag is set.

brief	Trace key flow information, such as message types sent between SPU and central point, policy match, and packet drop reasons.
detail	Trace extensive flow information, such as detailed information about sessions and fragments. Detail is the default level.
error	Trace error information, such as system failure, unknown message type, and packet drop.

Required Privilege Level

trace—To view this in the configuration.

trace-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 20.3R1.

traceoptions (Next Gen Services Softwires)

IN THIS SECTION

- Syntax | 30762
- Hierarchy Level | 30762
- Description | 30763
- Options | 30763
- Required Privilege Level | 30763
- Release Information | 30764

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        (no-world-readable | world-readable);
        size maximum-file-size;
    }
    flag (all | configuration | flow);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security softwires]
```

Description

> ⚠ **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure softwire tracing options.

Options

- **file**—Configure trace file information.
  - *filename*—Name of the file to which to write the trace information.
  - **files** *number*—Maximum number of trace files.

    Range: 2 through 1000 files
  - **match** *regular-expression*—Regular expression for lines to be logged.
  - **no-world-readable | world-readable**—Allow or deny any user to read the log file.
  - **size** *maximum-file-size*—Maximum trace file size.

    Range: 10,240 to 1,073,741,824 bytes
- **flag**—Specify events to trace.
  - **all**—Trace all events
  - **configuration**—Trace configuration events
  - **flow**—Trace flow events
- **no-remote-trace**—Disable remote tracing.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Release 12.1 of Junos OS.

traceoptions (Origin Validation for BGP)

traceoptions (Outbound SSH)

IN THIS SECTION

- Syntax | 30766
- Hierarchy Level | 30766
- Description | 30766
- Options | 30767
- Required Privilege Level | 30768
- Release Information | 30768

Syntax

```
traceoptions {
    file <filename> <files number> <match regular-expression> <size size> <(world-readable | no-
world-readable)>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system services outbound-ssh]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set the trace options for the outbound SSH service. By default, tracing operations are disabled.

Options

- `file`—Configure the trace file information.
  - `filename`—(Optional) By default, the name of the file is the name of the process being traced. Use this option to override the default file name and specify a file to receive the output of the tracing operation. Enclose the name within quotation marks. All trace files are placed in the directory `/var/log`.
  - `files` *`number`*—(Optional) Specify the maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a file name with the `filename` option.

    Range: 2 through 1000 files

    Default: 3 files
  - `match` *`regular-expression`*—(Optional) When configured, the system adds only those lines to the trace file that match the regular expression. For example, if the regular expression is set to `=error`, the system only adds lines to the trace file that include the string `error`.
  - `size` *`maximum-file-size`*—(Optional) Specify the maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

    If you specify a maximum file size, you also must specify a maximum number of trace files by using the `files` option and a filename by using the `file` option.

    Syntax: x K to specify KB, x m to specify MB, or x g to specify GB

    Range: 10 KB through 1 GB

    Default: 128 KB
  - `world-readable | no-world-readable`—(Optional) By default, access to the trace files is restricted to the user who configured the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, configure the `no-world-readable` option.
- `flag`—Specify the tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:
  - `all`—Trace all events.
  - `configuration`—Trace configuration events.
  - `connectivity`—Trace TCP connection handling between the management application and the device.

- `no-remote-trace`—(Optional) Disable remote tracing and logging operations that track normal operations, error conditions, and packets that are generated by or passed through the device.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

Displaying Log and Trace Files

traceoptions (OVSDB)

IN THIS SECTION

- Syntax | 30768
- Hierarchy Level | 30769
- Description | 30769
- Default | 30769
- Options | 30769
- Required Privilege Level | 30771
- Release Information | 30771

Syntax

```
traceoptions {
    file <filename> <files number> <match regular-expression> <no-world-readable | world-
readable> <size size>;
```

```
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols ovsdb]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for the *Open vSwitch Database (OVSDB)* management protocol, which is supported on Juniper Networks devices.

Default

If you do not include this statement, OVSDB-specific tracing operations are not performed.

Options

file ***filename***

Name of file in which the system places the output of the tracing operations. By default, the system places all files in the **/var/log** directory.

- **Default: /var/log/vgd**

files ***number***

(Optional) Maximum number of trace files. When a trace file reaches the size specified by the `size` option, the filename is appended with 0 and compressed. For example, a trace file named **trace-file.gz** would be renamed **trace-file.0.gz**. When **trace-file.0.gz** reaches the specified size, it is renamed **trace-file.1.gz** and its contents are compressed to **trace-file.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000 files
- **Default:** 10 files

flag *flag*

Tracing operation to perform. You can include one or more of the following flags:

all	All OVSDB events.
configuration	OVSDB configuration events.
core	OVSDB core events.
function	OVSDB function events.
interface	OVSDB interface events.
l2-client	OVSDB Layer 2 client events.
netconf-client	(QFX Series switches only) Events for the dynamic configuration of Virtual Extensible LANs (VXLANs).
ovs-client	OVSDB client events.

match *regular-expression*

(Optional) Only log lines that match the regular expression.

no-remote-trace

(Optional) Disable tracing and logging operations that track normal operations, error conditions, and packets that are generated by or passed through the Juniper Networks device.

no-world-readable

Restrict access to the trace files to the owner.

- **Default:** no-world-readable

size *size*

(Optional) Maximum size of each trace file in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). If you do not specify a unit, the default is bytes. If you specify a maximum file size, you also must specify a maximum number of trace files by using the `files` option and a filename by using the `file` option.

- **Syntax:** *size* to specify bytes, *size*k to specify KB, *size*m to specify MB, or *size*g to specify GB.
- **Range:** 10,240 through 1,073,741,824 bytes
- **Default:** 128 KB

world-readable Enable any user to access the trace files.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1R2.

traceoptions (PCE)

IN THIS SECTION

- Syntax | 30771
- Hierarchy Level | 30772
- Description | 30772
- Options | 30772
- Required Privilege Level | 30773

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag (all | pcep);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols pcep pce pce-id]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure the Path Computation Element Protocol (PCEP) tracing options.

Options

filename Name of the file to receive the output of the tracing operation. All files are placed in the directory `/var/log`.

`files` *number* (Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 2 files.

  If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

flag Area of path computation client process (pccd) to enable debugging output.

- all—Trace all areas of PCD code.
- pcep—Trace Path Computation Element Protocol (PCEP) operations.

no-remote-trace (Optional) Disable remote tracing options.

no-world-readable (Optional) Allow only certain users to read the log file.

`size` *`size`* (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches this size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.
- **Range:** 10 KB through the maximum file size supported on your system.
- **Default:** 1 MB.

  If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

`world-readable` (Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

traceoptions (PCEF)

IN THIS SECTION

- Syntax | 30774
- Hierarchy Level | 30774
- Description | 30774
- Options | 30774
- Required Privilege Level | 30776
- Release Information | 30776

Syntax

```
traceoptions {
    file file-name <files number> <no-word-readable | world-readable> <size size>;
    flag flag;
    level (all | critical | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit unified-edge pcef]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify tracing options for policy and charging enforcement functions (PCEF).

Options

file *file-name*
Use the specified name of the file to receive the output of the tracing operation.

files *number*
(Optional) Use the specified maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000
- **Default:** 3 files

flag *flag*
Specify which operations are to be traced. To specify more than one operation, include multiple flag statements.

> **BEST PRACTICE**: You might want to enable traceoptions only when you want to debug specific charging operations. Enabling the traceoption flags might have an impact on the system performance.

- `all`—Trace all operations.
- `config`—Trace configuration events.
- `debug`—Trace debug internal events.
- `fsm`—Trace finite state machine events.
- `general`—Trace general events that do not fit in any specific traces.
- `high-availability`—Trace high-availability events.
- `init`—Trace initialization events.
- `tftmgr`—Trace tftmgr events.

level

Use the specified level of tracing. You can specify any of the following levels:

- `all`—Match all levels.
- `critical`—Match critical conditions.
- `error`—Match error conditions.
- `info`—Match informational messages
- `notice`—Match conditions that must be handled specially.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

no-remote-trace

(Optional) Disable remote tracing.

no-world-readable

(Optional) Disable unrestricted file access.

size *size*

(Optional) Use the specified maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you

specify a maximum number of files, you must also specify a maximum file size with the size option.

- **Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.
- **Range:** 10,240 through 1,073,741,824 bytes
- **Default:** 128 KB

word-readable (Optional) Enable unrestricted file access.

Required Privilege Level

trace and unified-edge—To view this statement in the configuration.

trace-control and unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Configuring Tracing for PCEF Operations

traceoptions (PIM Snooping)

IN THIS SECTION

- Syntax | 30777
- Hierarchy Level | 30777
- Description | 30777
- Default | 30777
- Options | 30777
- Required Privilege Level | 30778
- Release Information | 30778

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit routing-instances <instance-name> protocols pim-snooping],
[edit logical-systems <logical-system-name> routing-instances <instance-name> protocols pim-
snooping]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for PIM snooping.

Default

The `traceoptions` feature is disabled by default.

The default PIM trace options are those inherited from the routing protocol's `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

PIM Snooping Tracing Flags:

- `all`—All tracing operations.
- `general`—Trace general PIM snooping events.
- `hello`—Trace hello packets.
- `join`—Trace join messages.
- `normal`—Trace normal PIM snooping events. If you do not specify this flag, only unusual or abnormal operations are traced.
- `packets`—Trace all PIM packets.
- `policy`—Trace policy processing.
- `prune`—Trace prune messages.
- `route`—Trace routing information.
- `state`—Trace PIM state transitions.
- `task`—Trace PIM protocol task processing.
- `timer`—Trace PIM protocol timer processing.

`flag-modifier`—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers per flag:

- `detail`—Provide detailed trace information.
- `disable`—Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.
- `receive`—Packets being received.
- `send`—Packets being transmitted.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for the PPP process.

To specify more than one tracing operation, include multiple `flag` statements.

You cannot specify a separate trace tile. Tracing information is placed in the system `syslog` file in the directory `/var/log/pppd`.

Default

If you do not include this statement, no PPPD-specific tracing operations are performed.

Options

`filename`—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, commit script process tracing

output is placed in the file `ppd`. If you include the `file` statement, you must specify a filename. To retain the default, you can specify `eventd` as the filename.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000
- **Default:** 3 files

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`flag`—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. The following are the PPPD-specific tracing options.

- `access`—Access code
- `address-pool`—Address pool code
- `all`—All areas of code
- `auth`—Authentication code
- `chap`—Challenge Handshake Authentication Protocol (CHAP) code
- `config`—Configuration code
- `ifdb`—Interface database code
- `lcp`—LCP state machine code
- `memory`—Memory management code
- `message`—Message processing code
- `mlppp`—Trace MLPPP code
- `ncp`—NCP state machine code
- `pap`—Password Authentication Protocol (PAP) code
- `ppp`—PPP protocol processing code
- `radius`—RADIUS processing code

- `rtsock`—Routing socket code
- `session`—Session management code
- `signal`—Signal handling code
- `timer`—Timer code
- `ui`—User interface code

`match` *`regex`*—(Optional) Refine the output to include only those lines that match the given regular expression.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the *`trace-file`* again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and filename.

- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

`non-world-readable`—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. Specify `non-world-readable` to reset the default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for PPPoE processes.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

`files` *`number`*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`disable`—Disable this trace flag.

`filter`—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.

> **BEST PRACTICE**: Due to the complexity of agent circuit identifiers and agent remote identifiers, we recommend that you do not try an exact match when filtering on these options. For service names, searching on the exact name is appropriate, but you can also use a regular expression with that option.

- `aci` *`regular-expression`*—Regular expression to match the agent circuit identifier provided by PPPoE client.
- `ari` *`regular-expression`*—Regular expression to match the agent remote identifier provided by PPPoE client.
- `service` *`regular-expression`*—Regular expression to match the name of PPPoE service.
- `underlying-interface` *`interface-name`*—Name of a PPPoE underlying interface. You cannot use a regular expression for this filter option.

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Trace all operations.
- `config`—Trace configuration events.
- `events`—Trace events.
- `gres`—Trace GRES events.
- `init`—Trace initialization events.
- `interface-db`—Trace interface database operations.
- `memory`—Trace memory processing events.
- `protocol`—Trace protocol events.
- `rtsock`—Trace routing socket events.
- `session-db`—Trace connection events and flow.
- `signal`—Trace signal operations.
- `state`—Trace state handling events.
- `timer`—Trace timer processing.
- `ui`—Trace user interface processing.

`level`—Level of tracing to perform. You can specify any of the following levels:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match notice messages about conditions requiring special handling.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.
- **Default:** `error`

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`—Disable remote tracing.

`no-world-readable`—(Optional) Disable unrestricted file access.

`size` *`maximum-file-size`*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`size`*`k` to specify KB, *`size`*`m` to specify MB, or *`size`*`g` to specify GB
- **Range:** 10240 through 1073741824
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

traceoptions (Process Monitor)

IN THIS SECTION

Syntax | 30788

Hierarchy Level | 30788

- Description | 30788
- Options | 30789
- Required Privilege Level | 30790
- Release Information | 30790

Syntax

```
traceoptions {
    file filename files number match regex size size (world-readable | no-world-readable);
    flag flag;
    level level;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system processes process-monitor]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable tracing options for the process health monitor process (pmond).

NOTE: Starting with Junos OS Release 15.1R2, the pmond process is enabled by default on the Routing Engines of MX Series routers, even when no service interfaces are configured.

Options

file *filename*
Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the `file` statement, you must specify a filename.

files *number*
(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

flag *flag*
Specify which tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Enable all trace options flags.
- `events`—Trace process state change and cleanup events.
- `gencfg`—Trace GENCFG blobs recorded for cleanup.
- `module`—Trace module code.
- `sysvsem`—Trace SYSV semaphores recorded for cleanup.
- `sysvshm`—Trace SYSV shared memory segments recorded for cleanup.
- `tracking`—Trace tracking code.
- `ui`—Trace user interface operations.

level *level*
Specify the level of debugging output:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match conditions that warrant special handling (but are not errors).
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

match *regex*
(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`	Disable remote tracing.
`size` *`size`*	(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` *`number`* option.

- **Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`world-readable | no-world-readable`	(Optional). Grant all users permission to read log files, or restrict the permission only to the `root` user and users who have the Junos `maintenance` permission.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

traceoptions (programmable-rpd)

IN THIS SECTION

- Syntax | 30791
- Hierarchy Level | 30791
- Description | 30791
- Default | 30791
- Options | 30791
- Required Privilege Level | 30793
- Release Information | 30793

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <disable>;
}
```

Hierarchy Level

```
[edit routing-options programmable-rpd]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Starts logging traces related to the programmable routing protocol process (prpd). Use the `traceoptions` statement, along with related show commands, to help debug client-server interactions, identify the flow of control, and detect errors, get client-level information and statistics. You can filter traces according to the flag(s) you have enabled.

Default

If you do not include this statement, no tracing operations are performed.

Options

`file` *`filename`*
: Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

`files` *`number`*
: (Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you

specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

`no-world-readable` (Optional) Prevent any user from reading the log file.

`size` *`size`* (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the *`trace-file`* again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 1024 to 4,294,967,295 bytes
- **Default:** 128 KB

`world-readable` (Optional) Allow any user to read the log file.

`flag` *`flag`* Specifies the tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. The options are:

- `all`—All tracing operations.
- `client`—Client events.
- `general`—All normal operations and routing table changes (a combination of the `normal` and `route` trace operations).
- `japi`—JAPI-related changes.
- `normal`—All normal operations.
- `policy`—Routing policy operations and actions.
- `route`—Routing table changes.
- `routing-interface`—Routing interface changes.

- `state`—State transitions.
- `task`—Interface transactions and processing.
- `te-path-compute`—Traffic engineering path computation changes.
- `timer`—Timer usage.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure Automatic Multicast Tunneling (AMT) tracing options.

To specify more than one tracing operation, include multiple `flag` statements.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place tracing output in the file **igmp-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

- **Range:** 2 through 1000 files
- **Default:** 2 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

AMT Tracing Flags

- **errors**—All error conditions
- **packets**—All AMT packets
- **tunnels**—All AMT tunnel-related information

Global Tracing Flags

- **all**—All tracing operations
- **normal**—All normal operations
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Do not allow users to read the log file.

replace—(Optional) Replace an existing trace file if there is one.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of trace files.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

Syntax

```
traceoptions {
    file name <size size> <files number> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit protocols bfd]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations that track unified in-service software upgrade (ISSU) functionality in the router.

To specify more than one tracing operation, include multiple `flag` statements.

Default

If you do not include this statement, no global tracing operations are performed.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***name***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place global routing protocol tracing output in the file **routing-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 2 files

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

flag ***flag***—Tracing operation to perform. The tracing options are as follows:

- **adjacency**—Trace adjacency messages.
- **all**—Trace everything.
- **error**—Trace all errors.
- **events**—Trace all events.
- **issu**—Trace ISSU packet activity.
- **nsr-packet**—Trace packet activity of NSR.
- **nsr-synchronization**—Trace NSR synchronization events.
- **packet**—Trace all packets.
- **pipe**—Trace pipe messages.
- **pipe-detail**—Trace pipe messages in detail.
- **ppm-packet**—Trace packet activity by periodic packet management.
- **state**—Trace state transitions.
- **timer**—Trace timer processing.

no-world-readable—Restrict users from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

world-readable—Allow users to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure BGP protocol-level tracing options. To specify more than one tracing operation, include multiple flag statements.

> **NOTE**: The `traceoptions` statement is not supported on QFabric systems.

Default

The default BGP protocol-level tracing options are inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level. The default group-level trace options are inherited from the BGP protocol-level `traceoptions` statement. The default peer-level trace options are inherited from the group-level `traceoptions` statement.

Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`file` *`name`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place BGP tracing output in the file **bgp-log**.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*.0** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the `size` option.

> **NOTE**: The maximum file size for traceoptions should be set large enough to accommodate the expected logging volume, based on the configured flags. This helps prevent frequent file rollovers and compression. It is recommended to activate traceoptions only during investigation periods to avoid unnecessary logging.

- **Range:** 2 through 1000 files

- **Default:** 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

BGP Tracing Flags

- `4byte-as`—4-byte AS events.
- `bfd`—BFD protocol events.
- `damping`—Damping operations.
- `graceful-restart`—Graceful restart events.
- `ipsec`—Events related to IPsec support for BGP peers when the IPsec is configured.
- `keepalive`—BGP keepalive messages. If you enable the the BGP `update` flag only, received keepalive messages do not generate a trace message.
- `nsr-synchronization`—Nonstop routing synchronization events.
- `open`—Open packets. These packets are sent between peers when they are establishing a connection.
- `packets`—All BGP protocol packets.
- `refresh`—BGP refresh packets.
- `update`—Update packets. These packets provide routing updates to BGP systems. If you enable only this flag, received keepalive messages do not generate a trace message. Use the `keepalive` flag to generate a trace message for keepalive messages.

Global Tracing Flags

- `all`—All tracing operations
- `general`—A combination of the `normal` and `route` trace operations
- `normal`—All normal operations
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- `policy`—Policy operations and actions
- `route`—Routing table changes
- `state`—State transitions
- `task`—Routing protocol task processing

- `timer`—Routing protocol timer processing

`flag-modifier`—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- `detail`—Provide detailed trace information.
- `filter`—Provide filter trace information. Applies only to `route`, `damping`, and `update` tracing flags.
- `receive`—Trace the packets being received.
- `send`—Trace the packets being transmitted.

`no-world-readable`—(Optional) Prevent any user from reading the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

`world-readable`—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`4byte-as` statement introduced in Junos OS Release 9.2.

`4byte-as` statement introduced in Junos OS Release 9.2 for EX Series switches.

`ipsec` statement introduced in Junos OS Evolved Release 21.3R1.

- Hierarchy Level | 30804
- Description | 30805
- Options | 30805
- Required Privilege Level | 30806
- Release Information | 30807

Syntax

```
traceoptions {
    file file-name <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options bmp],
[edit logical-systems logical-system-name routing-options bmp station station-name],
[edit routing-options bmp],
[edit routing-options bmp station station-name]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure tracing options for BMP monitoring. To specify more than one tracing operation, include multiple flag statements.

Options

`file` *`file-name`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place BMP tracing output in the file **bmp-log**.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*.0** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

`flag`—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- `all`—Trace all BMP monitoring operations.
- `down`—Down messages.
- `error`—Error conditions.
- `event`—Major events, station establishment, errors, and events.
- `general`—General events.
- `normal`—Normal events.
- `packets`—All messages.
- `policy`—Policy processing.
- `route`—Routing information.

- `route-monitoring`—Route monitoring messages.
- `state`—State transitions.
- `statistics`—Statistics messages.
- `task`—Routing protocol task processing.
- `timer`—Routing protocol timer processing.
- `up`—Up messages.
- `write`—Writing of messages.

`flag-modifier`—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- `detail`—Provide detailed trace information.
- `disable`—Disable the tracing flag.
- `receive`—Trace the packets being received.
- `send`—Trace the packets being transmitted.

`no-world-readable`—(Optional) Prevent any user from reading the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

`world-readable`—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X51-D15.

- Description | 30808
- Default | 30808
- Options | 30808
- Required Privilege Level | 30810
- Release Information | 30810

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols dvmrp],
[edit protocols dvmrp]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure DVMRP tracing options.

To specify more than one tracing operation, include multiple `flag` statements.

Default

The default DVMRP trace options are those inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place tracing output in the **dvmrp-log** file.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

- **Range:** 2 through 1000 files
- **Default:** 2 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

DVMRP Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **graft**—Graft messages
- **neighbor**—Neighbor probe messages
- **normal**—All normal operations
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **packets**—All DVMRP packets
- **poison**—Poison-route-reverse packets
- **probe**—Probe packets
- **prune**—Prune messages
- **report**—DVMRP route report packets
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Do not allow users to read the log file.

replace—(Optional) Replace an existing trace file if there is one.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of trace files.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

> **NOTE**: Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Statement introduced before Junos OS Release 7.4.

- Required Privilege Level | 30813
- Release Information | 30813

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols]
[edit routing-instances routing-instance-name protocols evpn]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Trace traffic flowing through an EVPN routing instance.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" ").

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches the maximum size as specified by the `size` option, it is renamed *`trace-file`*`.0`. When *`trace-file`* again reaches the maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 2 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can specify the following tracing flags:

- `all`—All EVPN tracing options
- `error`—Error conditions
- `gbptagdb`—GBP tag database related messages. This option is not available for logical systems.
- `general`—General events
- `mac-database`—MAC route database in the EVPN routing instance
- `nlri`—EVPN advertisements received or sent by means of BGP
- `normal`—Normal events
- `oam`—OAM messages
- `policy`—Policy processing
- `route`—Routing information
- `state`—State transitions
- `task`—Routing protocol task processing
- `timer`—Routing protocol timer processing
- `topology`—EVPN topology changes caused by reconfiguration or advertisements received from other provider edge (PE) routers using BGP

flag-modifier—(Optional) Modifier for the tracing flag. You can specify the following modifiers:

- detail—Provide detailed trace information.
- disable—Disable this trace flag.
- receive—Trace received packets.
- send—Trace sent packets.

no-world-readable—Do not allow any user to read the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*.0. When *trace-file* again reaches the maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files (as specified by the files option) is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the files option.

- **Syntax:** *x*k to specify kilobytes, *x*m to specify megabytes, or *x*g to specify gigabytes
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

world-readable—Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2 .

Support for logical systems on MX Series routers added in Junos OS Release 17.4R1.

[edit routing-instances instance-name bridge-domains domain-name protocols igmp-snooping],
[edit routing-instances instance-name protocols igmp-snooping]
[edit protocols igmp-snooping vlan]
```

Description

Define tracing operations for IGMP snooping.

Default

The **traceoptions** feature is disabled by default.

Enabling **traceoptions** under the `igmp-snooping` hierarchy enables **igmp-snooping**. Correspondingly, disabling **traceoptions** under the `igmp-snooping` hierarchy disables **igmp-snooping**.

Options

file ***filename***—Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached (***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

- **Range:** 2 through 1000
- **Default:** 3 files

flag ***flag*** —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **client-notification**—Trace notifications.
- **general**—Trace general IGMP snooping protocol events.
- **group**—Trace group operations.
- **host-notification**—Trace host notifications.
- **leave**—Trace leave group messages (IGMPv2 only).
- **normal**—Trace normal IGMP snooping protocol events.
- **packets**—Trace all IGMP packets.
- **policy**—Trace policy processing.
- **query**—Trace IGMP membership query messages.
- **report**—Trace membership report messages.
- **route**—Trace routing information.

- **state**—Trace IGMP state transitions.
- **task**—Trace routing protocol task processing.
- **timer**—Trace routing protocol timer processing.

no-world-readable—(Optional) Restrict file access to the user who created the file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes
- **Range:** 10 KB through 1 gigabytes
- **Default:** 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols igmp],
[edit protocols igmp]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure IGMP tracing options.

To specify more than one tracing operation, include multiple `flag` statements.

To trace the paths of multicast packets, use the `mtrace` command.

Default

The default IGMP trace options are those inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place tracing output in the file **igmp-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

- **Range:** 2 through 1000 files
- **Default:** 2 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

IGMP Tracing Flags

- **leave**—Leave group messages (for IGMP version 2 only).
- **mtrace**—Mtrace packets. Use the `mtrace` command to troubleshoot the software.
- **packets**—All IGMP packets.
- **query**—IGMP membership query messages, including general and group-specific queries.
- **report**—Membership report messages.

Global Tracing Flags

- **all**—All tracing operations

- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Do not allow users to read the log file.

replace—(Optional) Replace an existing trace file if there is one.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of trace files.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Tracing IGMP Protocol Traffic

traceoptions (Protocols IPv6 Neighbor Discovery)

IN THIS SECTION

- Syntax | 30820
- Hierarchy Level | 30821
- Description | 30821
- Default | 30821
- Options | 30821
- Required Privilege Level | 30823
- Release Information | 30823

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
```

```
    flag flag <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement],
[edit protocols router-advertisement]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

For IPv6 neighbor discovery, specify router advertisement protocol-level tracing options.

Trace IPv6 Neighbor Discovery protocol traffic to help debug Neighbor Discovery protocol issues.

Global tracing options are inherited from the configuration set by the `traceoptions` statement at the `[edit routing-options]` hierarchy level. You can override the following global trace options for the IPv6 Neighbor Discovery protocol using the `traceoptions flag` statement included at the `[edit protocols router-advertisement]` hierarchy level:

Default

The default trace options are inherited from the global `traceoptions` statement.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place router advertisement tracing output in the file **/var/log/router-advertisement-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace

files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- **all**—All tracing operations

> **NOTE**: Use the trace flag **all** with caution as this may cause the CPU to become very busy.

- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations.
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—IPv6 interface transactions and processing
- **timer**—IPv6 neighbor discovery protocol timer processing

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

traceoptions (Protocols IS-IS)

IN THIS SECTION

- Syntax | 30823
- Hierarchy Level | 30824
- Description | 30824
- Default | 30824
- Options | 30824
- Required Privilege Level | 30826
- Release Information | 30826

Syntax

```
traceoptions {
    file name <size size> <files number> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure IS-IS protocol-level tracing options. To specify more than one tracing operation, include multiple `flag` statements.

NOTE: The `traceoptions` statement is not supported on QFabric systems.

Default

The default IS-IS protocol-level tracing options are those inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`file` *`name`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks (“ ”). All files are placed in the directory `/var/log`. We recommend that you place IS-IS tracing output in the file `isis-log`.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one flag, include multiple `flag` statements.

`IS-IS Protocol-Specific Tracing Flags`

- `csn`—Complete sequence number PDU (CSNP) packets
- `error`—Errored IS-IS packets
- `graceful-restart`—Graceful restart operation
- `hello`—Hello packets
- `layer2-map`—Mapped ARP or neighbor discovery next hops in the kernel
- `ldp-synchronization`—Synchronization between IS-IS and LDP
- `lsp`—Link-state PDUs
- `lsp-generation`—Link-state PDU generation packets
- `packets`—All IS-IS protocol packets
- `psn`—Partial sequence number PDU (PSNP) packets
- `spf`—Shortest-path-first calculations
- `srv6`—Segment routing for IPv6.

`Global Tracing Flags`

- `all`—All tracing operations
- `general`—A combination of the `normal` and `route` trace operations
- `normal`—All normal operations, including adjacency changes
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- `policy`—Policy operations and actions
- `route`—Routing table changes
- `state`—State transitions

- `task`—Routing protocol task processing
- `timer`—Routing protocol timer processing

`flag-modifier`—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- `detail`—Provide detailed trace information.
- `receive`—Trace the packets being received.
- `send`—Trace the packets being transmitted.
-

`no-world-readable`—(Optional) Prevent any user from reading the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the *`trace-file`* again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

`world-readable`—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

traceoptions (Protocols Layer 2 Circuit)

IN THIS SECTION

- Syntax | 30827
- Hierarchy Level | 30827
- Description | 30828
- Options | 30828
- Required Privilege Level | 30829
- Release Information | 30829

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols l2circuit],
[edit protocols l2circuit]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Trace traffic flowing through a Layer 2 circuit.

Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" ").

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 2 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- `connections`—Layer 2 circuit connections (events and state changes)
- `error`—Error conditions
- `fec`—Layer 2 circuit advertisements received or sent by means of LDP
- `topology`—Layer 2 circuit topology changes caused by reconfiguration or advertisements received from other PE routers

`flag-modifier`—(Optional) Modifier for the tracing flag. You can specify the `detail` modifier if you want to provide detailed trace information.

`no-world-readable`—(Optional) Do not allow any user to read the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*.0. When the *trace-file* again reaches its maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *x*`k` to specify kilobytes, *x*`m` to specify megabytes, or *x*`g` to specify gigabytes
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

`world-readable`—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Trace traffic flowing through a Layer 2 VPN.

Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" ").

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *trace-file* reaches its maximum size, it is renamed *trace-file*.0, then *trace-file*.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 2 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- `all`—All Layer 2 VPN tracing options
- `connections`—Layer 2 connections (events and state changes)
- `error`—Error conditions
- `general`—General events
- `nlri`—Layer 2 advertisements received or sent by means of the BGP
- `normal`—Normal events
- `policy`—Policy processing
- `route`—Routing information
- `state`—State transitions
- `task`—Routing protocol task processing
- `timer`—Routing protocol timer processing
- `topology`—Layer 2 VPN topology changes caused by reconfiguration or advertisements received from other PE routers using BGP

`flag-modifier`—(Optional) Modifier for the tracing flag. You can specify the following modifier:

- `detail`—Provide detailed trace information
- `receive`—Trace received packets
- `send`—Trace transmitted packets

`no-world-readable`—(Optional) Prevents any user from reading the trace file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*.0. When *trace-file* again reaches its maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *x*`k` to specify kilobytes, *x*`m` to specify megabytes, or *x*`g` to specify gigabytes
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

`world-readable`—(Optional) Allow any user to read the trace file.

- **Default:** The default is `no-world-readable`.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit routing-instances routing-instance-name protocols ldp]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify LDP protocol-level trace options.

Default

The default LDP protocol-level trace options are inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **ldp-log**. We recommend that you place LDP tracing output in the file **ldp-log**.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- `address`—Operation of address and address withdrawal messages
- `binding`—Label-binding operations
- `error`—Error conditions
- `event`—Protocol events
- `initialization`—Operation of initialization messages
- `label`—Operation of label request, label map, label withdrawal, and label release messages
- `notification`—Operation of notification messages
- `nsr-synchronization`— Nonstop active routing synchronization events
- `p2mp-nsr-synchronization`—Point-to-multipoint nonstop active routing synchronization events
- `packets`—Equivalent to setting `address`, `initialization`, `label`, `notification`, and `periodic` flags (see also the `filter` flag modifier)
- `path`—Label-switched path operations
- `periodic`—Operation of hello and keepalive messages
- `route`—Operation of route messages

- `state`—Protocol state transitions

`flag-modifier`—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- `detail`—Provide detailed trace information.
- `disable`—Disable this trace flag.
- `filter`—Filter to apply to this flag. The `filter` flag modifier can be applied only to the `route`, `path`, and `binding` flags. This flag modifier has the following options:
  - `match-on`—Match on argument specified. The `match-on` option has the following suboptions:
    - `address`—Filter based on the source and destination addresses of packets. Available for the `packets` flag option only.
    - `fec`—Filter based on the FEC associated with the traced object.
  - `policy` *`policy-name`*—Specify the filter policy.
- `receive`—Packets being received.
- `send`—Packets being transmitted.

`no-world-readable`—(Optional) Prevent all users from reading the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the *`trace-file`* again reaches this size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

`world-readable`—(Optional) Enable any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`match-on address` option for the `filter` flag modifier added in Junos OS Release 10.4.

`nsr-synchronization` and `p2mp-nsr-synchronization` operations for `flag` statement introduced in Junos OS Release 13.3.

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Trace options for the LMP protocol.

Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`filename`—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

`flag`—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- `all`—Trace all available operations
- `hello-packets`—Trace hello packets on any LMP control channel
- `init`—Output from the initialization messages

- `packets`—Trace all packets other than hello packets on any LMP control channel
- `parse`—Operation of the parser
- `process`—Operation of the general configuration
- `route-socket`—Operation of route socket events
- `routing`—Operation of the routing protocols
- `server`—Server processing operations
- `show`—`show` command servicing operations
- `state`—Trace state transitions of the LMP control channels and traffic engineering links

`flag-modifier`—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- `detail`—Provide detailed trace information
- `receive`—Packets being received
- `send`—Packets being transmitted

`no-world-readable`—(Optional) Prevent all users from reading the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the *`trace-file`* again reaches this size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

`world-readable`—(Optional) Enable log file access for all users.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for `hello-packets`, `packets`, and `state` flags added in Junos OS Release 8.1.

- Description | 30840
- Default | 30840
- Options | 30840
- Required Privilege Level | 30842
- Release Information | 30842

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure MPLS tracing options at the protocol level or for a label-switched path.

To specify more than one tracing operation, include multiple `flag` statements.

Default

The default MPLS protocol-level tracing options are inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

`filename`—Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**. We recommend that you place MPLS tracing output in the file **mpls-log**.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

MPLS Tracing Flags

- `all`—Trace all operations
- `autobw-state`—Automatic bandwidth events.
- `connection`—All circuit cross-connect (CCC) activity
- `connection-detail`—Detailed CCC activity
- `cspf`—CSPF computations
- `cspf-link`—Links visited during CSPF computations
- `cspf-node`—Nodes visited during CSPF computations
- `error`—MPLS error packets
- `graceful-restart`—Trace MPLS graceful restart events
- `lsp-history`—Trace LSP history events
- `lsping`—Trace lsping packets and return codes
- `nsr-synchronization`—Trace NSR synchronization events
- `nsr-synchronization-detail`—Trace NSR synchronization events in detail
- `state`—All LSP state transitions
- `static`—Trace static label-switched path
- `ted-export`—Trace leaking of entries from `lsdist.0` table into the traffic engineering database
- `ted-import`—Trace leaking traffic engineering database entries into the `lsdist.0` table
- `timer`—Timer usage

`no-world-readable`—(Optional) Allow only certain users to read the log file.

`size` *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB

- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

`world-readable`—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

`ted-export` option introduced in Junos OS Release 14.2.

`ted-import` option introduced in Junos OS Release 14.2.

`lsp-history` option added in Junos OS Release 15.1.

```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure MSDP tracing options.

To specify more than one tracing operation, include multiple `flag` statements.

Default

The default MSDP trace options are those inherited from the routing protocol's `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place tracing output in the **msdp-log** file.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

- **Range:** 2 through 1000 files
- **Default:** 2 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

MSDP Tracing Flags

- **keepalive—**Keepalive messages
- **packets**—All MSDP packets

- **route**—MSDP changes to the routing table
- **source-active**—Source-active packets
- **source-active-request**—Source-active request packets
- **source-active-response**—Source-active response packets

Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Do not allow any user to read the log file.

replace—(Optional) Replace an existing trace file if there is one.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming

scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of trace files.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Trace traffic flowing through a Multicast BGP (*MBGP*) MVPN.

Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" ").

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When *`trace-file`* again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 2 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can specify any of the following flags:

- `all`—All multicast VPN tracing options
- `cmcast-join`—Multicast VPN C-multicast join routes
- `error`—Error conditions
- `general`—General events
- `inter-as-ad`—Multicast VPN inter-AS automatic discovery routes
- `intra-as-ad`—Multicast VPN intra-AS automatic discovery routes
- `leaf-ad`—Multicast VPN leaf automatic discovery routes
- `mdt-safi-ad`—Multicast VPN *MDT SAFI* automatic discovery routes
- `nlri`—Multicast VPN advertisements received or sent by means of the BGP
- `normal`—Normal events
- `policy`—Policy processing
- `route`—Routing information
- `source-active`—Multicast VPN source active routes
- `spmsi-ad`—Multicast VPN SPMSI auto discovery active routes
- `state`—State transitions
- `task`—Routing protocol task processing
- `timer`—Routing protocol timer processing
- `tunnel`—Provider tunnel events
- `umh`—Upstream multicast hop (UMH) events

`flag-modifier`—(Optional) Modifier for the tracing flag. You can specify the following modifiers:

- `detail`—Provide detailed trace information
- `disable`—Disable the tracing flag
- `receive`—Trace received packets
- `send`—Trace sent packets

`no-world-readable`—Do not allow any user to read the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When *`trace-file`* again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`x`*`k` to specify kilobytes, *`x`*`m` to specify megabytes, or *`x`*`g` to specify gigabytes
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

`world-readable`—Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Support at the `[edit protocols mvpn]` hierarchy level introduced in Junos OS Release 13.3.

RELATED DOCUMENTATION

Tracing MBGP MVPN Traffic and Operations

traceoptions (Protocols OpenFlow)

IN THIS SECTION

- Syntax | 30850
- Hierarchy Level | 30850
- Description | 30850
- Default | 30851
- Options | 30851
- Required Privilege Level | 30852
- Release Information | 30852

Syntax

```
traceoptions {
    file <filename> <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols openflow]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for OpenFlow.

Default

If you do not include this statement, no OpenFlow-specific tracing operations are performed.

Options

file ***filename***

Name of the file to receive the output of the tracing operation. All files are placed in the **/var/log** directory.

- **Default: /var/log/ofd**

files ***number***

(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz**, and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. After this, the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size by using the `size` option and also a filename.

- **Range:** 2 through 1000 files
- **Default:** 10 files

flag ***flag***

Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- `all`—All OpenFlow events.
- `barrier`—OpenFlow barrier events.
- `configuration`—OpenFlow configuration events.
- `filter`—OpenFlow filter events.
- `flow`—OpenFlow flow events.
- `function`—OpenFlow entry and exit events.
- `group`—(Appears only for Juniper Networks devices running OpenFlow v1.3.1 or later) OpenFlow group events.
- `interface`—OpenFlow interface events.

- `nh`—OpenFlow next-hop events.
- `packet-io`—OpenFlow packet in and packet out events.
- `packets`—OpenFlow packet events.
- `statistics`—OpenFlow statistics request and reply events.
- `switch`—OpenFlow switch events including controller connection messages and keepalives, and packets sent to and received from the controller.

match *regular-expression*
(Optional) Log only those lines that match the regular expression.

no-remote-trace
(Optional) Disable tracing and logging operations that track normal operations, error conditions, and packets that are generated by or have passed through the Juniper Networks device.

no-world-readable
(Optional) Disable unrestricted file access, which restricts file access to the owner. This is the default.

size *size*
(Optional) Maximum size of each trace file in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). If you do not specify a unit, the default is bytes. If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

- **Syntax:** *size* to specify bytes, *size*`k` to specify KB, *size*`m` to specify MB, or *size*`g` to specify GB
- **Range:** 10,240 through 1,073,741,824 bytes
- **Default:** 128 KB

world-readable
(Optional) Enable unrestricted file access.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure OSPF protocol-level tracing options.

To specify more than one tracing operation, include multiple `flag` statements.

NOTE: The `traceoptions` statement is not supported on QFabric systems.

Default

The default OSPF protocol-level tracing options are those inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place OSPF tracing output in the file **ospf-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.
If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files

- **Default:** 10 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

OSPF Tracing Flags

- **database-description**—Database description packets, which are used in synchronizing the OSPF and OSPFv3 topological database.
- **error**—OSPF and OSPFv3 error packets.
- **event**—OSPF and OSPFv3 state transitions.
- **flooding**—Link-state flooding packets.
- **graceful-restart**—Graceful-restart events.
- **hello**—Hello packets, which are used to establish neighbor adjacencies and to determine whether neighbors are reachable.
- **ldp-synchronization**—Synchronization events between OSPF and LDP.
- **lsa-ack**—Link-state acknowledgment packets, which are used in synchronizing the OSPF topological database.
- **lsa-analysis**—Link-state analysis. Specific to the Juniper Networks implementation of OSPF, Junos OS performs LSA analysis before running the shortest-path-first (SPF) algorithm. LSA analysis helps to speed the calculations performed by the SPF algorithm.
- **lsa-request**—Link-state request packets, which are used in synchronizing the OSPF topological database.
- **lsa-update**—Link-state updates packets, which are used in synchronizing the OSPF topological database.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **on-demand**—Trace demand circuit extensions.
- **packet-dump**—Content of selected packet types.
- **packets**—All OSPF packets.
- **restart-signaling**—(OSPFv2 only) Restart-signaling graceful restart events.
- **spf**—Shortest-path-first (SPF) calculations.

Global Tracing Flags

- **all**—All tracing operations.
- **general**—A combination of the **normal** and **route** trace operations.
- **normal**—All normal operations. If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions.
- **route**—Routing table changes.
- **state**—State transitions.
- **task**—Routing protocol task processing.
- **timer**—Routing protocol timer processing.

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.
If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for the `realm` statement introduced in Junos OS Release 9.2.

Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.

traceoptions (Protocols PCEP)

IN THIS SECTION

- Syntax | 30857
- Hierarchy Level | 30857
- Description | 30858
- Options | 30858
- Required Privilege Level | 30859

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols pcep]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure the Path Computation Element Protocol (PCEP) tracing options.

Options

filename — Name of the file to receive the output of the tracing operation. All files are placed in the directory `/var/log`.

`files` *number* — (Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 2 files.

  If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

flag — Area of path computation client process (pccd) to enable debugging output.

PCEP Tracing Flags

- *all*—Trace all areas of PCCD code
- *pccd-config*—All configuration parsing operations
- *pccd-core*—PCCD core operations
- *pccd-functions*—PCCD function entries and outs
- *pccd-main*—PCCD main module
- *pccd-rpd*—PCCD communication with RPD
- *pccd-ui*—PCCD user interface handling

no-remote-trace — (Optional) Disable remote tracing options.

no-world-readable (Optional) Allow only certain users to read the log file.

`size` *size* (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches this size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.
- **Range:** 10 KB through the maximum file size supported on your system.
- **Default:** 1 MB.

  If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

world-readable (Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

traceoptions (Protocols PIM)

IN THIS SECTION

- Syntax | 30860
- Hierarchy Level | 30860
- Description | 30860
- Default | 30860

- Options | 30861
- Required Privilege Level | 30863
- Release Information | 30863

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols pim],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim],
[edit protocols pim],
[edit routing-instances routing-instance-name protocols pim]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure PIM tracing options.

To specify more than one tracing operation, include multiple `flag` statements.

Default

The default PIM trace options are those inherited from the routing protocol's `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place tracing output in the **pim-log** file.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

- **Range:** 2 through 1000 files
- **Default:** 2 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

PIM Tracing Flags

- **assert**—Assert messages
- **bidirectional-df-election**—Bidirectional PIM designated-forwarder (DF) election events
- **bootstrap**—Bootstrap messages
- **cache**—Packets in the PIM sparse mode routing cache
- **graft**—Graft and graft acknowledgment messages
- **hello**—Hello packets
- **join**—Join messages
- **mt**—Multicast tunnel messages
- **nsr-synchronization**—Nonstop active routing (NSR) synchronization messages
- **packets**—All PIM packets
- **prune**—Prune messages
- **register**—Register and register stop messages
- **rp**—Candidate RP advertisements

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Do not allow users to read the log file.

replace—(Optional) Replace an existing trace file if there is one.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of trace files.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 0 KB through the maximum file size supported on your system

- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

traceoptions (Protocols PPP Service)

IN THIS SECTION

- Syntax | 30864
- Hierarchy Level | 30864
- Description | 30864
- Options | 30864
- Required Privilege Level | 30867
- Release Information | 30867

Syntax

```
traceoptions {
    file <filename> <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    filter {
        aci regular-expression;
        ari regular-expresion;
        service-name regular-expresion;
        underlying-interface interface-name;
        user user@domain;
    }
    flag flag;
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols ppp-service]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for PPP service processes.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

`files` *`number`*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`disable`—Disable this trace flag.

`filter`—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.

> **BEST PRACTICE**: Due to the complexity of agent circuit identifiers and agent remote identifiers, we recommend that you do not try an exact match when filtering on these options. For service names, searching on the exact name is appropriate, but you can also use a regular expression with that option.

- `aci` *`regular-expression`*—Regular expression to match the agent circuit identifier provided by PPP client.
- `ari` *`regular-expression`*—Regular expression to match the agent remote identifier provided by PPP client.
- `service` *`regular-expression`*—Regular expression to match the name of PPPoE service.
- `underlying-interface` *`interface-name`*—Name of a PPP underlying interface. You cannot use a regular expression for this filter option.
- `user` *user@domain*—Username of a subscriber. Optionally use an asterisk (*) as a wildcard to substitute for characters at the beginning or end of either term or both terms.

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `accounting-statistics`—Trace accounting statistics events.
- `all`—Trace all operations.
- `authentication`—Trace authentication events.
- `chap`—Trace CHAP events.
- `events`—Trace interface events.
- `gres`—Trace GRES events.
- `init`—Trace daemon initialization events.
- `interface-db`—Trace interface database events.
- `lcp`—Trace LCP state machine events.

- `memory`—Trace memory processing events.
- `ncp`—Trace NCP state machine events.
- `packet-error`—Trace packet error events.
- `pap`—Trace PAP events.
- `parse`—Trace parsing events.
- `profile`—Trace libdynamic profile events.
- `receive-packets`—Trace received PPP packets.
- `routing-process`—Trace routing process interactions.
- `rtp`—Trace real-time priority events.
- `rtsock`—Trace routing socket events.
- `session-db`—Trace session database interactions.
- `smi-services-sentry`—Trace SMI services requests and retries.
- `states`—Trace state machine events.
- `transmit-packets`—Trace transmitted PPP packets.
- `tunnel`—Trace L2TP tunneling events.

`level`—Level of tracing to perform. You can specify any of the following levels:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match notice messages about conditions requiring special handling.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.
- **Default:** `error`

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`—Disable remote tracing.

`no-world-readable`—(Optional) Disable unrestricted file access.

`size` *`maximum-file-size`*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`size`*`k` to specify KB, *`size`*`m` to specify MB, or *`size`*`g` to specify GB
- **Range:** 10240 through 1073741824
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

`user` option added in Junos OS Release 14.1.

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set RIP protocol-level tracing options.

NOTE: The `traceoptions` statement is not supported on QFabric systems.

Default

The default RIP protocol-level trace options are inherited from the global `traceoptions` statement.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIP tracing output in the file **/var/log/rip-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

RIP Tracing Options

- **auth**—RIP authentication
- **error**—RIP error packets
- **expiration**—RIP route expiration processing
- **holddown**—RIP hold-down processing
- **nsr-synchronization**—Nonstop routing synchronization events
- **packets**—All RIP packets
- **request**—RIP information packets such as request, poll, and poll entry packets
- **trigger**—RIP triggered updates
- **update**—RIP update packets

Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **receive-detail**—Provide detailed trace information for packets being received.
- **send**—Trace the packets being transmitted.
- **send-detail**—Provide detailed trace information for packets being transmitted.

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set RIPng protocol-level tracing options.

Default

The default RIPng protocol-level trace options are inherited from the global `traceoptions` statement.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIPng tracing output in the file **/var/log/ripng-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

RIPng Tracing Options

- **error**—RIPng error packets
- **expiration**—RIPng route expiration processing
- **holddown**—RIPng hold-down processing
- **nsr-synchronization**—Nonstop routing synchronization events
- **packets**—All RIPng packets

- **request**—RIPng information packets such as request, poll, and poll entry packets
- **trigger**—RIPng triggered updates
- **update**—RIPng update packets

Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **receive-detail**—Provide detailed trace information for packets being received.
- **send**—Trace the packets being transmitted.
- **send-detail**—Provide detailed trace information for packets being transmitted.

no-world-readable—(Optional) Do not allow any user to read the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system

- **Default:** 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for routing instances introduced in Junos OS Release 9.0.

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure ICMP protocol-level tracing options.

To specify more than one tracing operation, include multiple `flag` statements.

Default

The default ICMP protocol-level tracing options are inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place ICMP tracing output in the file **icmp-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named *trace-file* reaches its maximum size, it is renamed *trace-file*.0, then *trace-file*.1, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 2 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

These are the global tracing options:

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*.0. When the *trace-file* again reaches its maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

traceoptions (Protocols RSVP)

IN THIS SECTION

- Syntax | 30878
- Hierarchy Level | 30878
- Description | 30878
- Default | 30878
- Options | 30878
- Required Privilege Level | 30880
- Release Information | 30880

Syntax

```
traceoptions {
    enhanced-frr ;
    file filename  <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable RSVP-level trace options.

Default

The default RSVP-level trace options are those inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`enhanced-frr` —(Optional) Enable this option to trace internal events and state changes related to the FRR facility protection enhancements associated with the increased RSVP scaling introduced in Junos OS Release 16.1.

filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place RSVP tracing output in the file **rsvp-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

If you specify a maximum number of files, you must also include the size statement to specify the maximum file size.

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.

- all—All tracing operations
- error—All detected error conditions
- event—RSVP-related events. New trace messages are added in the file that you create.
- io-event [detail] [disable] —Enable tracing of events that occur within the RSVP I/O task; can only be configured for the master routing instance. The trace output is generally independent of routing instance.
- io-packets [detail] [disable] [receive] [send] —Enable tracing of messages as they are received from the network or as they are sent out. This flag can be configured independently for each routing instance. Both bundled and individual messages are identified. Use *detail* to show all objects contained in the message. Use *send* and *receive* to limit tracing to outgoing or incoming packets.
- lmp—RSVP-LMP interactions
- packets—All RSVP packets
- path—All path messages
- pathtear—PathTear messages
- resv—Resv messages
- resvtear—ResvTear messages
- route—Routing information
- state—Session state transitions, including when RSVP-signaled LSPs come up and go down.

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- detail—Provide detailed trace information
- receive—Packets being received
- send—Packets being transmitted

no-world-readable—(Optional) Enable only certain users to read the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *x*k to specify KB, *x*m to specify MB, or *x*g to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

If you specify a maximum file size, you must also include the files statement to specify the maximum number of files.

world-readable—(Optional) Enable any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

- Release Information | 30883

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols neighbor-discovery secure]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure tracing operations for Secure Neighbor Discovery events. To specify more than one tracing operation, include multiple `flag` statements.

Options

file ***filename***—Name of the file to receive the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1** and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.
If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

Secure Neighbor Discovery Tracing Options

- **configuration**—All configuration events.
- **cryptographic-address**—Cryptographically generated address events.
- **protocol**—All protocol processing events.
- **rsa**—RSA events.

Global Tracing Options

- **all**—All tracing operations.

You can specify one or more of following flag modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

match ***regular-expression***—(Optional) Specify a regular expression to match the output of the trace file you want to log.

no-remote-trace—Disable remote tracing globally or for a specific tracing operation.

no-world-readable—(Optional) Prevent any user from reading this log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1**, and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

world-readable—(Optional) Allow any user to read this log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

- Description | 30884

Options | 30884
Required Privilege Level | 30886

Syntax

```
traceoptions {
file filename <files number> <size size> <world-readable | no-world-readable>;
    flag (all | bfd | compute | controller | dtm | general | interface | route | state |
telemetry-statistics | translation) {
        detail;
    }
```

Hierarchy Level

```
[edit protocols source-packet-routing]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure the segment routing traffic-engineered (SPRING-TE) protocol tracing options. To specify more than one tracing operation, include multiple flag statements.

Options

filename Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**.

files *number* (Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 2 files.

  If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

flag Area of path computation client process (pccd) to enable debugging output.

SPRING-TE Tracing Flags

- `all`—Trace everything.
- `bfd`—Bfd-related activity.
- `compute`—Compute profile and computed lsp related activity.
- `controller`—Controller-related activity
- `dtm`—Dtm-related activity
- `general`—General activity
- `interface`—Interface-related activity
- `route`—Route-related activity
- `state`—LSP state-related activity
- `telemetry-statistics`—Telemetry statistics related activity
- `translation`—Translation-related activity.

detail Provide detailed trace information.

filename Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**.

no-remote-trace (Optional) Disable remote tracing options.

no-world-readable (Optional) Allow only certain users to read the log file.

`size size` (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches this size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.
- **Range:** 10 KB through the maximum file size supported on your system.
- **Default:** 1 MB.

  If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

world-readable (Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
vpls],
[edit routing-instances routing-instance-name protocols vpls]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Trace traffic flowing through a VPLS routing instance.

Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" ").

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When *`trace-file`* again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 2 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can specify the following tracing flags:

- `all`—All VPLS tracing options
- `connections`—VPLS connections (events and state changes)
- `error`—Error conditions
- `nlri`—VPLS advertisements received or sent by means of the BGP
- `route`—Routing information
- `topology`—VPLS topology changes caused by reconfiguration or advertisements received from other provider edge (PE) routers using BGP

`flag-modifier`—(Optional) Modifier for the tracing flag. You can specify the following modifiers:

- `detail`—Provide detailed trace information.
- `disable`—Disable the tracing flag.
- `receive`—Trace received packets.
- `send`—Trace sent packets.

`no-world-readable`—Do not allow any user to read the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When *`trace-file`* again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`x`*`k` to specify kilobytes, *`x`*`m` to specify megabytes, or *`x`*`g` to specify gigabytes
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

`world-readable`—Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Tracing VPLS Traffic and Operations

traceoptions (Protocols VRRP)

IN THIS SECTION

- Syntax | 30889
- Hierarchy Level | 30890
- Description | 30890
- Default | 30890
- Options | 30890
- Required Privilege Level | 30891
- Release Information | 30892

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression> <microsecond-stamp> <size size>
<world-readable | no-world-readable>;
    flag flag;
```

```
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols vrrp]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for the Virtual Router Redundancy Protocol (VRRP) process.

To specify more than one tracing operation, include multiple `flag` statements.

By default, VRRP logs the error, dcd configuration, and routing socket events in a file in the directory **/var/log**.

Default

If you do not include this statement, no VRRP-specific tracing operations are performed.

Options

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, VRRP tracing output is placed in the file **vrrpd**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten.

- **Range:** 0 through 4,294,967,296 files
- **Default:** 3 files

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. These are the VRRP-specific tracing options:

- **all**—All VRRP tracing operations
- **database**—Database changes
- **general**—General events
- **interfaces**—Interface changes
- **normal**—Normal events
- **packets**—Packets sent and received
- **state**—State transitions
- **timer**—Timer events

match ***regular-expression***—(Optional) Refine the output to include only those lines that match the given regular expression.

microsecond-stamp—(Optional) Provide a timestamp with microsecond granularity.

no-world-readable—(Optional) Restrict users from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes, megabytes, or gigabytes. When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0.** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your routing platform
- **Default:** 1 MB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

world-readable—(Optional) Allow users to read the log file.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Tracing VRRP Operations

traceoptions (Protocols)

IN THIS SECTION

- Syntax | 30892
- Hierarchy Level | 30893
- Description | 30893
- Default | 30893
- Options | 30893
- Required Privilege Level | 30894
- Release Information | 30894

Syntax

```
traceoptions {
    file name <size size> <files number> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit protocols isis],
[edit protocols (ospf | ospf3)]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations that graceful restart functionality in the router or switch.

To specify more than one tracing operation, include multiple `flag` statements.

Default

If you do not include this statement, no global tracing operations are performed.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***name***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place global routing protocol tracing output in the file **routing-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 2 files

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. The nonstop active routing tracing option is:

- **graceful-restart**—Tracing operations for nonstop active routing

no-world-readable—Restrict users from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

world-readable—Allow users to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

graceful-restart flag for IS-IS and OSPF/OSPFv3 added in Junos OS Release 8.4.

traceoptions (Proxy Fibre Channel)

IN THIS SECTION

- Syntax | 30895
- Hierarchy Level | 30895
- Description | 30895
- Default | 30896
- Options | 30896
- Required Privilege Level | 30897
- Release Information | 30897

Syntax

```
traceoptions {
    file filename <replace> <size size> <files number> <no-stamp>
    <world-readable | no-world-readable>;
    flag flag <flag-modifier>
}
```

Hierarchy Level

```
[edit fc-fabrics fabric-name proxy]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set proxy FC protocol tracing options.

NOTE: The `traceoptions` statement is not supported on the QFabric system.

Default

Traceoptions is disabled.

Options

file ***name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. The traceoption output continues in a second trace file named ***trace-file*.1**. When ***trace-file*.1** reaches its maximum size, output continues in a third file named ***trace-file*.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements:

- **all**—Trace all operations.
- **error**—Trace all error events.
- **interface**—Trace the interface events.
- **normal**—Trace all normal events.
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **packet**—Trace packet decoding operations
- **parse**—Trace configuration parsing.
- **state**—Trace state transitions.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

- **Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Prevent any user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. Incoming tracefile data is logged in the now empty ***trace-file***. When ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

- **Range:** 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)

- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

traceoptions (Resiliency)

IN THIS SECTION

Syntax | 30898

- Hierarchy Level | 30898
- Description | 30898
- Options | 30899
- Additional Information | 30899
- Required Privilege Level | 30900
- Release Information | 30900

Syntax

```
traceoptions {
   file name {
      files number;
      match;
      (no-world-readable | world-readable);
      size size;
   }
   flag flag;
   no-remote-trace;
   }
```

Hierarchy Level

```
[edit system resiliency]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

(Junos OS only) Configure trace options for the Juniper Resiliency Interface.

Options

file *file-name*
(Required) Use the specified file to receive the output of the tracing operation. All files are placed in the directory **/var/log**.

files *files*
(Optional) Use the specified maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Default:** 3 files
- **Range:** 2 through 1000 files

flag *flag*
Use the specified tracing operation. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `error`—Trace errored packets.
- `state`—Trace state transitions.
- `telemetry`—Trace telemetry state machine events.

match *match*
(Optional) Use the specified regular expression to refine the output to include lines that contain the regular expression.

no-remote-trace
(Optional) Disable remote tracing.

no-world-readable
(Default) Disable unrestricted file access. This means the log file can be accessed only by the user who configured the tracing operation.

world-readable
(Optional) Enable unrestricted file access.

size *size*
(Optional) Use the specified maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

Additional Information

Junos OS Evolved uses a new tracing architecture. All running applications create trace information, with multiple instances of the same application having their own trace information. In Junos OS, you enable

tracing operations by configuring the traceoptions statement at the specific hierarchy level you want to trace. Junos OS Evolved, on the other hand, uses an application-based model, and thus trace messages are logged, viewed, and configured by application. As a result, Junos OS Evolved does not support the `traceoptions` statement at many of the hierarchy levels that Junos OS supports.

In Junos OS Evolved, you do not view trace files directly, and you should never add, edit, or remove trace files under the **/var/log/traces** directory because this can corrupt the traces. Instead, you use the `show trace application` *`application-name`* `node` *`node-name`* command to read and decode trace messages stored in the trace files. All running applications on Junos OS Evolved create trace information at the `info` level by default.

The Juniper Resiliency Interface is governed by the `rpdtmd` application. For Junos OS Evolved, to configure traces for a severity other than `info` for the `rpdtmd` application, include the `application rpdtmd node` *`node-name`* `level` *`severity`* statement at the [edit system trace] hierarchy level.

> **NOTE**: For general monitoring and troubleshooting of devices running Junos OS or Junos OS Evolved, we recommend using standard tools such as CLI show commands, system log messages, SNMP, and telemetry data. You should avoid using trace messages for general debugging purposes and long-term solutions because they are subject to change without notice.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.2R1.

RELATED DOCUMENTATION

Juniper Resiliency Interface

traceoptions (Resource Cleanup)

IN THIS SECTION

- Syntax | 30901
- Hierarchy Level | 30901
- Description | 30901
- Options | 30902
- Required Privilege Level | 30903
- Release Information | 30903

Syntax

```
traceoptions {
    file filename files number match regex size size (world-readable | no-world-readable);
    flag flag;
    level level;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system processes resource-cleanup]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable debugging tracing for resource cleanup process.

Options

file *filename*
Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the `file statement`, you must specify a filename.

files *number*
(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

flag *flag*
Specify which tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Enable all trace options flags.
- `events`—Trace process state change and cleanup events.
- `gencfg`-—Trace GENCFG blobs recorded for cleanup.
- `module`—Trace module code.
- `sysvsem`—Trace SYSV semaphores recorded for cleanup.
- `sysvshm`—Trace SYSV shared memory segments recorded for cleanup.
- `tracking`—Trace tracking code.
- `ui`—Trace user interface operations.

level *level*
Specify the level of debugging output:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match conditions that warrant special handling (but are not errors).
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

match *regex*
(Optional) Refine the output to include lines that contain the regular expression.

no-remote-trace	Disable remote tracing.
size *size*	(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` *number* option.

- **Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

world-readable | no-world-readable	(Optional). Grant all users permission to read log files, or restrict the permission only to the `root` user and users who have the Junos `maintenance` permission.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

traceoptions (Resource Monitor)

IN THIS SECTION

- Syntax | 30904
- Hierarchy Level | 30904
- Description | 30904
- Options | 30904
- Required Privilege Level | 30905
- Release Information | 30905

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for the memory resource utilization processes.

Options

file ***filename***

Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**.

- **Default: rmopd**

files ***number***

(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

match ***regular-expression***

(Optional) Refine the output to include lines that contain the regular expression.

`size` *`maximum-file-size`*	(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option. • **Range:** 10 KB through 1 GB • **Default:** 128 KB
`world-readable`	(Optional) Enable unrestricted file access.
`no-world-readable`	(Default) Disable unrestricted file access. This means the log file can be accessed only by the user who configured the tracing operation.
flag *flag*	Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags: • `all`—Trace all operations.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

traceoptions (REST API)

IN THIS SECTION

- Syntax | 30906
- Hierarchy Level | 30906
- Description | 30906
- Options | 30906
- Required Privilege Level | 30907

Release Information | 30907

Syntax

```
traceoptions {
    flag flag;
}
```

Hierarchy Level

```
[edit system services rest]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for the REST API service.

Options

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, specify `all`. REST API tracing options include:

- `all`—All tracing operations. A combination of the juise and lighttpd tracing operations.
- `juise`—Trace juise operations. Trace information is captured in **/var/chroot/rest-api/var/log/juise**.
- `lighttpd`—Trace lighttpd operations. Trace information is captured in **/var/chroot/rest-api/var/log/lighttpd**.

> **NOTE**: The REST API `traceoptions` do not support parameters to control log file size or the number of log files.
>
> The `juise` trace log uses a default rotation setting: `size=10m`, `files=10`.
>
> The `lighttpd`trace log writes to a single file without any size limit.
>
> On MX Series platforms, both logs are stored in `/var/jails/rest-api/log/`.
>
> If left enabled for extended periods, `lighttpd` tracing may cause the log file to grow indefinitely, potentially leading to filesystem full conditions or software upgrade failures.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

traceoptions (routing-options)

IN THIS SECTION

- Syntax | 30908
- Hierarchy Level | 30908
- Description | 30908
- Default | 30909
- Options | 30909
- Required Privilege Level | 30910
- Release Information | 30910

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options],
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options multicast],
[edit logical-systems logical-system-name routing-options],
[edit logical-systems logical-system-name routing-options multicast],
[edit routing-instances routing-instance-name routing-options],
[edit routing-instances routing-instance-name routing-options multicast],
[edit routing-options],
[edit routing-options flow],
[edit routing-options multicast]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations that track all routing protocol functionality in the routing device. You can also trace clock synchronization information using this command.

To specify more than one tracing operation, include multiple `flag` statements.

NOTE: On Junos OS Evolved, `traceoptions` is disabled for op, event, and commit scripts. Instead, Junos OS Evolved enables default tracking and trace messages that are logged under `/var/log/traces`.

Default

If you do not include this statement, no global tracing operations are performed.

Options

Values:

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place global routing protocol tracing output in the file **routing-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals
- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-packet**—Detailed trace information for BFD nonstop active routing only
- **nsr-synchronization**—Tracing operations for nonstop active routing
- **nsr-synchronization**—Nonstop active routing synchronization
- **parse**—Configuration parsing

- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

nsr-synchronization flag for BGP, IS-IS, LDP, and OSPF added in Junos OS Release 8.4.

nsr-synchronization and **nsr-packet** flags for BFD sessions added in Junos OS Release 8.5.

nsr-synchronization flag for RIP and RIPng added in Junos OS Release 9.0.

nsr-synchronization flag for Layer 2 VPNs and VPLS added in Junos OS Release 9.1.

nsr-synchronization flag for PIM added in Junos OS Release 9.3.

nsr-synchronization flag for MPLS added in Junos OS Release 10.1.

nsr-synchronization flag for MSDP added in Junos OS Release 12.1.

- Syntax | 30911
- Hierarchy Level | 30911
- Description | 30912
- Options | 30912
- Additional Information | 30913
- Required Privilege Level | 30913
- Release Information | 30914

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit services rpm]
```

Description

> ⚠ **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

(Junos OS only) Define tracing operations for RPM processes.

Options

file ***filename***

Use the specified file to receive the output of the tracing operation. All files are placed in the directory **/var/log**.

- **Default: rmopd**

files ***number***

(Optional) Use the specified maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

match ***regular-expression***

(Optional) Use the specified regular expression to refine the output to include lines that contain the regular expression.

size ***maximum-file-size***

(Optional) Use the specified maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

world-readable

(Optional) Enable unrestricted file access.

no-world-readable

(Default) Disable unrestricted file access. This means the log file can be accessed only by the user who configured the tracing operation.

flag ***flag***

Use the specified tracing operation. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Trace all operations.
- `configuration`—Trace configuration events.
- `error`—Trace events related to catastrophic errors in daemon.
- `ipc`—Trace IPC events.
- `ppm`—Trace ppm events.
- `rpd`—Trace rpd events.
- `statistics`—Trace statistics.

Additional Information

Junos OS Evolved uses a new tracing architecture. All running applications create trace information, with multiple instances of the same application having their own trace information. In Junos OS, you enable tracing operations by configuring the traceoptions statement at the specific hierarchy level you want to trace. Junos OS Evolved, on the other hand, uses an application-based model, and thus trace messages are logged, viewed, and configured by application. As a result, Junos OS Evolved does not support the `traceoptions` statement at many of the hierarchy levels that Junos OS supports.

In Junos OS Evolved, you do not view trace files directly, and you should never add, edit, or remove trace files under the **/var/log/traces** directory because this can corrupt the traces. Instead, you use the `show trace application` *`application-name`* `node` *`node-name`* command to read and decode trace messages stored in the trace files. All running applications on Junos OS Evolved create trace information at the `info` level by default.

RPM is governed by the `rmopd` application. For Junos OS Evolved, to configure traces for a severity other than `info` for the `rmopd` application, include the `application rmopd node` *`node-name`* `level` *`severity`* statement at the [edit system trace] hierarchy level.

> **NOTE**: For general monitoring and troubleshooting of devices running Junos OS or Junos OS Evolved, we recommend using standard tools such as CLI show commands, system log messages, SNMP, and telemetry data. You should avoid using trace messages for general debugging purposes and long-term solutions because they are subject to change without notice.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

`rpd` flag added in Junos OS Release 18.4R1.

- Syntax | 30914
- Hierarchy Level | 30915
- Description | 30915
- Options | 30915
- Required Privilege Level | 30916
- Release Information | 30916

Syntax

```
traceoptions {
    file filename <files number> <match regex> <size size> <world-readable | no-world-readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit system processes sbc-configuration-process]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure trace options for the session border controller (SBC) process of the border signaling gateway (BSG).

Options

file ***filename***—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory **/var/log**. You can include the following file options:

- **files** ***number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum number of files, you must also specify a maximum file size with the **size** option and a filename.

- **Range:** 2 through 1000

- **Default:** 3 files

- `match` *regex*—(Optional) Refine the output to include lines that contain the regular expression.

- `no-world-readable`—(Optional) Disable unrestricted file access.

- `size` *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the trace-file again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and filename.

- **Syntax:** *x*k to specify KB, *x*m to specify MB, or *x*g to specify GB.
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB
- world-readable—(Optional) Enable unrestricted file access.

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- all *trace-level*—Trace all SBC process operations.
- common *trace-level*—Trace common events.
- configuration *trace-level*—Trace configuration events.
- device-monitor *trace-level*—Trace device monitor events.
- ipc *trace-level*—Trace IPC events.
- memory-pool *trace-level*—Trace memory pool events.
- *trace-level*—Trace level options are related to the severity of the event being traced. When you choose a trace level, messages at that level and higher levels are captured. Enter one of the following trace levels as the *trace-level*:
  - debug—Log all code flow of control.
  - error—Log failures with a short-term effect.
  - info—Log summary for normal operations, such as the policy decisions made for a call.
  - trace—Log program trace START and EXIT macros.
  - warning—Log failure recovery events or failure of an external entity.
- ui *trace-level*—Trace user interface operations.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

traceoptions (Security ALG)

IN THIS SECTION

- Syntax | 30917
- Hierarchy Level | 30917
- Description | 30918
- Options | 30918
- Required Privilege Level | 30919
- Release Information | 30919

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    level (brief | detail | extensive | verbose);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit logical-systems name security alg],
[edit logical-systems name tenants name security alg],
[edit security alg],
[edit services alg],
[edit tenants name security alg]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure ALG tracing options.

Options

- `file`—Configure the trace file options.
  - *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*—Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    Range: 2 through 1000 files

    Default: 10 files
  - `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.
  - `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

    If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

    Syntax: *`x`* `K` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB

    Range: 10 KB through 1 GB

    Default: 128 KB

- `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `level`—Set the level of debugging the output option.
  - `brief`—Match brief messages
  - `detail`—Match detail messages.
  - `extensive`—Match extensive messages.
  - `verbose`—Match verbose messages.
- `no-remote-trace`—Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

traceoptions (Security Application Firewall)

IN THIS SECTION

- Syntax | 30923
- Hierarchy Level | 30924
- Description | 30924
- Options | 30924
- Required Privilege Level | 30925
- Release Information | 30925

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security application-firewall]
[edit tenants tenant-name security application-firewall]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure trace options for the application firewall.

Starting in Junos OS Release 18.2R1, the application firewall (AppFW) functionality is deprecated. As a part of this change, the `[edit security application-firewall]` hierarchy and all the configuration options under this hierarchy are deprecated— rather than immediately removed—to provide backward compatibility and an opportunity to bring your configuration into compliance with the new configuration.

Options

- `file`—Configure the trace file options.
  - *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*—Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    Range: 2 through 1000 files

    Default: 10 files
  - `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.

- size *maximum-file-size*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*.0. When the trace-file again reaches its maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.

  Syntax: *x* K to specify KB, *x* m to specify MB, or *x* g to specify GB

  Range: 10 KB through 1 GB

  Default: 128 KB

- world-readable | no-world-readable—By default, log files can be accessed only by the user who configures the tracing operation. The world-readable option enables any user to read the file. To explicitly set the default behavior, use the no-world-readable option.

- flag—Trace operation to perform. To specify more than one trace operation, include multiple flag statements.

  - all—Trace with all flags enabled
  - compilation—Trace rule set compilation events
  - configuration—Trace configuration events
  - ipc—Trace process inter communication events
  - lookup—Trace rule set lookup events

- no-remote-trace—Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

The statement set tenant *tenant-name* security application-firewall is introduced in Junos OS Release 18.4R1.

        (world-readable | no-world-readable);
    }
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security datapath-debug]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Sets the trace options for datapath-debug.

NOTE: Data path debugging is supported on SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800.

Options

- `file`—Configure the trace file options.
  - `filename`—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, the name of the file is the name of the process being traced.

- `files` *`number`*—Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed to **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

  If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.

  Range: 2 through 1000 files

  Default: 10 files

- `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.

- `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.

  Syntax: x K to specify KB, x m to specify MB, or x g to specify GB

  Range: 10 KB through 1 GB

  Default: 128 KB

- `world-readable | no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option

- `no-remote-trace`—Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Command introduced in Junos OS Release 9.6.

traceoptions (Security Dynamic VPN)

IN THIS SECTION

- Syntax | 30934
- Hierarchy Level | 30934
- Description | 30934

```
traceoptions {
    file <filename> <files files> <match match> <size size> <(world-readable | no-world-
readable)>;
    flag {
        all;
    }
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security dynamic-vpn]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the

debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure dynamic VPN tracing options. This feature is supported on SRX300, SRX320, SRX340, SRX345, and SRX550HM devices.

In Junos OS Release 21.4R1, we've deprecated the `traceoptions` configuration statement and we might remove it completely in a future release.

Options

file Configure the trace file options.

`file` *`filename`*—Name of the file to receive the output of the tracing operation.

flag Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.

- Values:
  - `all`—Enable all tracing operations

level Level of debugging output

- Values:
  - all—Match all levels
  - error—Match error conditions
  - info—Match informational messages
  - notice—Match conditions that should be handled specially
  - verbose—Match verbose messages
  - warning—Match warning messages

no-remote-trace Disable remote tracing

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10.

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure flow tracing options.

Starting in Junos OS Release 24.2R1, we support `local-debug-buf` option to configure number of lines for the flow local trace buffer, and the maximum lines allowed is 40,000. A new flag `packet-track` has been introduced to get information about the packet being handled in SRX data path, The flag `packet-track` should be configured in root logical system. To track information about the packets in non root logical system use the option `root-override` along with flag `packet-track`.

Options

file

Configure the trace file options.

filename

Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.

files *number*

Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000 files
- **Default:** 10 files

match *regular-expression*

Refine the output to include lines that contain the regular expression.

size *maximum-file-size*

Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

Syntax: *`x`* `K` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB

- **Range:** 0 KB through 1 GB
- **Default:** 128 KB

world-readable | no-world-readable

By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

flag

Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.

all	Trace with all flags enabled
basic-datapath	Trace basic packet flow activity
fragmentation	Trace IP fragmentation and reassembly events
high-availability	Trace flow high-availability information
host-traffic	Trace flow host traffic information
jexec	Trace packet footprints
multicast	Trace multicast flow information
route	Trace route lookup information
session	Trace session creation and deletion events
session-scan	Trace session scan information
tcp-basic	Trace TCP packet flow information
tunnel	Trace tunnel information

local-debug-buf

Configure number of lines for the flow local trace buffer. Maximum lines allowed is 40,000.

no-remote-trace

Set remote tracing as disabled.

packet-filter *filter-name*

Packet filter to enable during the tracing operation. Configure the filtering options.

destination-port *port-identifier*	Match TCP/UDP destination port
destination-prefix *address*	Destination IP address prefix
interface *interface-name*	Logical interface
protocol *protocol-identifier*	Match IP protocol type
source-port *port-identifier*	Match TCP/UDP source port
source-prefix *address*	Source IP address prefix

rate-limit *messages-per-second* — Limit the incoming rate of trace messages.

root-override — Root administrator can debug the packets flow traces from all the logical systems and tenant systems for debug by enabling the `root-override` option.

trace-level — Set the level for trace logging. This option is available only when the flag is set.

- **brief** — Trace key flow information, such as message types sent between SPU and central point, policy match, and packet drop reasons.
- **detail** — Trace extensive flow information, such as detailed information about sessions and fragments. Detail is the default level.
- **minimal** — Trace messages including notice, warning, error, criticality, alert, and emergency.

Table 1909 on page 30942 describes tracing of packet footprints with and without root override options.

Table 1909: Logical System or Tenant System Tracing of Packet Footprints With and Without Root Override Options

Trace Configuration	With Root Override	Without Root Override
Logical systems and tenant systems with own flow trace configuration	The flow trace of logical systems and tenant systems are recorded to the root.	The flow trace of logical systems and tenant systems are recorded to the configured logical systems and tenant systems.
Logical systems and tenant systems without own flow trace configuration	The flow trace of logical systems and tenant systems are recorded to root.	The flow trace of logical systems and tenant systems are not recorded anywhere

When the packets are switched by the VPLS switch in root logical system, the `jexec` trace packet footprints might not be complete in logical systems and tenant systems.

If a logical system or tenant system does not configure the `security flow traceoptions`, and there is no root-override configured under root either, the packet traces will not be recorded.

To get complete packet footprints for logical systems and tenant systems related `flow` and `jexec` trace packet footprints, we recommend that you configure the required flow trace with `root-override`.

Required Privilege Level

trace—To view this in the configuration.

trace-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Statement updated in Junos OS Release 12.1X46-D10 with the `trace-level` option and additional flags.

Statement updated in Junos OS Release 15.1X49-D70 with the addition of the `conn-tag` filter parameter.

Support at the following hierarchy levels introduced in Junos OS Release 19.4R1: `[edit logical-systems logical-system-name security flow]`, and `[edit tenants tenant-name security flow]`.

Statement `jexec`, `minimal`, and `root-override` options are introduced in Junos OS Release 20.4R1. The option `error` is now changed to `minimal`.

```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure group VPN tracing options to aid in troubleshooting the IKE or server issues. This helps troubleshoot one or multiple tunnels negotiation by standard tracefile configuration. Tracing allows the user to view the detailed packet exchange and the negotiation information. Group VPNv2 is supported on SRX300, SRX320, SRX340, SRX345, SRX550HM, SRX1500, SRX4100, SRX4200, and SRX4600 devices and vSRX Virtual Firewall instances.

Options

- `file`—Configure the trace file options.
  - *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.
  - `files` *`number`*—Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    Range: 2 through 1000 files

    Default: 10 files
  - `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.
