  - `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

    If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and filename.

    Syntax: *`x`* `k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB

    Range: 10 KB through 1 GB

    Default: 128 KB
  - `world-readable | no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.
- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.
  - `all`—Trace all activity.
  - `certificates`—Trace certificate-related activity.
  - `config`—Trace configuration activity.

  - `database`—Trace SA-related database activity.
  - `general`—Trace general activity.
  - `high-availability`—Trace high-availability operations.
  - `ike`—Trace IKE protocol activity.
  - `next-hop-tunnels`—Trace next-hop tunnel operations.
  - `parse`—Trace configuration processing.
  - `policy-manager`—Trace IKE callback activity.
  - `routing-socket`—Trace routing socket activity.
  - `thread`—Trace thread processing.
  - `timer`—Trace timer activity.
- `gateway-filter`—Configure debugging for the tunnel between the group VPN server and a group member. This option is configured on a group VPN server or member.
  - `local-address`—When configured on a server, the IP address of the group VPN server. When configured on a member, the IP address of the group VPN member.
  - `remote-address`—When configured on a server, the IP address of the group VPN member. When configured on a member, the IP address of the group VPN server.
- `level`—Set the level of debugging.
  - `all`—Match all levels.
  - `error`—Match error conditions.
  - `info`—Match informational messages.
  - `notice`—Match conditions that should be handled specifically.
  - `verbose`—Match verbose messages.
  - `warning`—Match warning messages.
- `no-remote-trace`—Disable remote tracing.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2. Support for `gateway-filter` option for the [`edit security group-vpn member ike`] hierarchy level added in Junos OS Release 15.1X49-D30 for vSRX Virtual Firewall.

Group VPNv2 Overview

traceoptions (Security GTP)

IN THIS SECTION

- Syntax | 30947
- Hierarchy Level | 30948
- Description | 30948
- Options | 30948
- Required Privilege Level | 30950
- Release Information | 30950

Syntax

```
traceoptions {
    file <filename> <files files> <match match> <size size> <(world-readable | no-world-
readable)>;
    flag name;
    no-remote-trace;
    trace-level {
        (error | info | notice | verbose | warning);
    }
}
```

Hierarchy Level

```
[edit security gtp]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Use the traceoptions function to enable the device to identify and log the contents of GTP-U or GTP-C messages based on IMSI prefixes or Mobile Station-Integrated Services Data Network (MS-ISDN) identification.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs gtp]` hierarchy level is replaced by `[edit security gtp]`.

Options

- `file`—Configure the trace file options.
  - *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*—Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    Range: 2 through 1000 files

    Default: 10 files
  - `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.
  - `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`.

When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

Syntax: *`x`* `K` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

- `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.
  - **all**—Trace everything.
  - **chassis-cluster**—Trace chassis cluster events.
  - **configuration**—Trace configuration events.
  - **flow**—Trace flow events.
  - **parser**—Trace parser events.
- `no-remote-trace`—Set remote tracing as disabled.

trace-level

GTP trace level

- Values:
  - error—Match error conditions
  - info—Match informational messages
  - notice—Match conditions that should be handled specially
  - verbose—Match verbose messages
  - warning—Match warning messages

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0. Support.

```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure H.323 tracing options. H.323 is a control-signaling protocol. H.323 endpoints use H.323 protocol to exchange messages.

Options

- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.
  - `all`—Trace with all flags enabled.
  - `chassis-cluster`—Trace chassis cluster information.
  - `h225-asn1`—Trace H.225 ASN.1 processing activity.
  - `h245`—Trace H.245 processing activity.
  - `h245-asn1`—Trace H.245 ASN.1 processing activity.
  - `q931`—Trace Q.931 processing activity.
  - `ras`—Trace remote access server (RAS) processing activity.

- `ras-asn1`—Trace RAS ASN.1 processing activity.

- `detail`—Display moderate amount of data in trace.
- `extensive`—Display extensive amount of data in trace.
- `terse`—Display minimum amount of data in trace.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

- Required Privilege Level | 30955
- Release Information | 30955

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag all;
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security idp]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure IDP tracing options.

Options

- `file`—Configure the trace file options.
  - *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, the name of the file is the name of the process being traced.

- `files` *`number`*—Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed to **trace-file.0** then **trace-file.1** and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

  If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

  Range: 2 through 1000 files

  Default: 10 files

- `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.

- `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When `trace-file.0` again reaches its maximum size, **trace-file.1** is renamed **trace-file.2** and **trace-file.0** is renamed **trace-file.1**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

  Syntax: *`x`* `K` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB

  Range: 10 KB through 1 GB

  Default: 128 KB

- `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `flag`—Trace operation to perform.

  - `all`—Trace with all flags enabled

- `level`—Set the level of debugging the output option.

  - `all`—Match all levels

  - `error`—Match error conditions

  - `info`—Match informational messages

  - `notice`—Match conditions that should be handled specially

  - `verbose`—Match verbose messages

  - `warning`—Match warning messages

- `no-remote-trace`—Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

traceoptions (Security IKE)

IN THIS SECTION

- Syntax | 30955
- Hierarchy Level | 30956
- Description | 30956
- Options | 30956
- Required Privilege Level | 30958
- Release Information | 30958

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }

    level (critical | error | terse | warning | detail);
```

```
    flag flag (all | certificates | config | database | general | high-availability | ike | next-
hop-tunnels | parse | policy-manager | routing-socket | thread | timer);
    no-remote-trace;
    rate-limit messages-per-second;
}
```

Hierarchy Level

```
[edit security ike]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure IKE tracing options to aid in troubleshooting the IKE issues. This helps troubleshoot one or multiple tunnels negotiation by standard tracefile configuration. IKE tracing allows the user to view the detailed packet exchange and the negotiation information in Phase 1 and Phase 2. IKE tracing is not enabled by default. By default , all IKE or IPsec negotiations are logged into /var/log/kmd. But user can also specify customized file name while configuring the IKE traceoptions.

Options

- file—Configure the trace file options.
  - *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

    Default: kmd

  - `files` *number*—Maximum number of trace files. When a trace file named *trace-file* reaches its maximum size, it is renamed to *trace-file*`.0`, then *trace-file*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    Range: 2 through 1000 files

Default: 10 files

- `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.
- `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and filename.

  Syntax: *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB

  Range: 10 KB through 1 GB

  Default: 1024 KB

- `world-readable | no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `level`—Specify the log levels.
  - `critical`—Log single point failures which needs your immediate attention
  - `error`—Log fatal application errors
  - `terse`—Log syslog messages
  - `warning`—Log recoverable errors
  - `detail`—Log all operational information
- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.
  - `all`—Trace all iked process modules activity
  - `certificates`—Trace certificate-related activity
  - `config`—Trace configuration download processing
  - `database`—Trace VPN-related database activity
  - `general`—Trace general activity
  - `high-availability`—Trace high-availability operations

- `ike`—Trace IKE protocol activity
- `next-hop-tunnels`—Trace next-hop tunnels operations
- `parse`—Trace VPN parsing activity
- `policy-manager`—Trace iked callback activity
- `routing-socket`—Trace routing socket activity
- `thread`—Trace thread processing
- `timer`—Trace timer activity

By default, the `flag` statement is not set. You need to explicitly configure the `flag` statement to perform trace operation.

- `no-remote-trace`—Set remote tracing as disabled.
- `rate-limit` *`messages-per-second`*—Configure the incoming rate of trace messages.

  Range: 0 through 4,294,967,295

  Default: 0

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

`level` options introduced in Junos OS Release 21.1R1.

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure security log tracing options.

Options

- `file`—Configure the trace file options.

- *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. By default, the name of the file is the name of the process being traced.

- files *number*—Maximum number of trace files. When a trace file named *trace-file* reaches its maximum size, it is renamed to *trace-file*.0, then *trace-file*.1, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

  If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.

  Range: 2 through 1000 files

  Default: 10 files

- match *regular-expression*—Refine the output to include lines that contain the regular expression.

- size *maximum-file-size*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*.0. When the trace-file again reaches its maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.

  Syntax: *x* K to specify KB, *x* m to specify MB, or *x* g to specify GB

  Range: 10 KB through 1 GB

  Default: 128 KB

- world-readable | no-world-readable—By default, log files can be accessed only by the user who configures the tracing operation. The world-readable option enables any user to read the file. To explicitly set the default behavior, use the no-world-readable option.

- flag—Trace operation to perform. To specify more than one trace operation, include multiple flag statements.

  - all—Trace with all flags enabled

  - configuration—Trace configuration events

  - hpl— Trace HPL logging

  - report— Trace report

  - source—Communicate with security log forwarder

- `no-remote-trace`—Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

    }
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security nat]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure NAT tracing options.

Options

- `file`—Configure the trace file options.
  - *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*—Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    Range: 2 through 1000 files

    Default: 10 files

- `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.
- `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

  Syntax: *`x`* `K` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB

  Range: 10 KB through 1 GB

  Default: 128 KB
- `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.
  - `all`—Trace with all flags enabled
  - `destination-nat-pfe`—Trace destination NAT events on PFE-ukernel side
  - `destination-nat-re`—Trace destination NAT events on Routing Engine (RE) side
  - `destination-nat-rt`—Trace destination NAT events on Packet Forwarding Engine real-time (PFE-RT) side
  - `source-nat-pfe`—Trace source NAT events on PFE-ukernel side
  - `source-nat-re`—Trace source NAT events on RE side
  - `source-nat-rt`—Trace source NAT events on PFE-RT side
  - `static-nat-pfe`—Trace static NAT events on PFE-ukernel side
  - `static-nat-re`—Trace static NAT events on RE side
  - `static-nat-rt`—Trace static NAT events on PFE-RT side
- `no-remote-trace`—Set remote tracing as disabled.

traceoptions (Security PKI)

IN THIS SECTION

- Syntax | 30968
- Hierarchy Level | 30969
- Description | 30969
- Options | 30969
- Required Privilege Level | 30970
- Release Information | 30970

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag {
        all;
        certificate-verification;
        online-crl-check;
```

```
    }
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security pki]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure public key infrastructure (PKI) tracing options. To specify more than one trace option, include multiple flag statements. Trace option output is recorded in the /var/log/pkid file.

Options

- `file`—Configure the trace file options.
  - *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*—Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    Range: 2 through 1000 files

    Default: 10 files
  - `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.

- `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

  Syntax: *`x`* `K` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB

  Range: 10 KB through 1 GB

  Default: 128 KB

- `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.

  - `all`—Trace with all flags enabled

  - `certificate-verification`—Trace PKI certificate verification events

  - `online-crl-check`—Trace PKI online certificate revocation list (CRL) events

- `no-remote-trace`—Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 8.5.

```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure policy tracing options.

Options

- `file`—Configure the trace file options.
  - *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*—Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    Range: 2 through 1000 files

    Default: 10 files
  - `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.
  - `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

    If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

    Syntax: *`x`* `K` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB

    Range: 10 KB through 1 GB

    Default: 128 KB

  - `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.
  - `all`—Trace with all flags enabled
  - `configuration`—Trace configuration events
  - `compilation`—Trace policy compilation events
  - `ipc`—Trace process inter communication events
  - `lookup`—Trace policy lookup events
  - `routing-socket`—Trace routing socket events
  - `rules`—Trace policy rules-related events
- `no-remote-trace`—Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

traceoptions (Security SCTP)

IN THIS SECTION

Syntax | 30979

Hierarchy Level | 30979

- Description | 30979
- Options | 30980
- Required Privilege Level | 30981
- Release Information | 30981

Syntax

```
traceoptions {
    file <filename> <files files> <match match> <size size> <(world-readable | no-world-
readable)>;
    flag name;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security sctp]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Use the traceoptions function to set the trace options for Stream Control Transmission Protocol (SCTP).

From Junos OS Release 20.4R1 onwards, the `[edit security gprs sctp]` hierarchy level is replaced by `[edit security sctp]`.

Options

file

Configure the trace file options.

filename

Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.

files *number*

Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000 files.
- **Default:** 10 files.

match *match*

Refine the output to include lines that contain the regular expression.

size *size*

Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

Syntax: *`x`* `K` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB

- **Range:** 10 KB through 1 GB.
- **Default:** 128 KB.

world-readable | no-world-readable

By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

flag

Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.

- all—Trace everything.

- chassis-cluster—Trace chassis cluster events.
- configuration—Trace configuration events.
- detail—Trace information used for debugging.
- flow—Trace flow events.
- parser—Trace parser events.

no-remote-trace Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2. The flag statement `detail` introduced in Junos OS Release 12.1X45-D10.

traceoptions (Security)

IN THIS SECTION

- Syntax | 30988
- Hierarchy Level | 30989
- Description | 30989
- Options | 30989
- Required Privilege Level | 30991
- Release Information | 30991

Syntax

```
traceoptions {
    file {
```

```
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag flag;
    level level
    no-remote-trace;
    rate-limit messages-per-second;
}
```

Hierarchy Level

```
[edit security]
[edit services ipsec-vpn]
```

Trace options can be configured at either the `[edit security]` or the `[edit services ipsec-vpn]` hierarchy level, but not at both levels.

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure security tracing options.

To specify more than one trace option, include multiple `flag` statements. Trace option output is recorded in the **/var/log/kmd** file.

NOTE: The `traceoptions`statement is not supported on QFabric systems.

Options

- `file`—Configure the trace file options.

- *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. By default, the name of the file is the name of the process being traced.

- files *number*—Maximum number of trace files. When a trace file named *trace-file* reaches its maximum size, it is renamed to *trace-file*.0, then *trace-file*.1, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

  If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.

  Range: 2 through 1000 files

  Default: 10 files

- match *regular-expression*—Refine the output to include lines that contain the regular expression.

- size *maximum-file-size*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*.0. When the trace-file again reaches its maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.

  Syntax: *x* K to specify KB, *x* m to specify MB, or *x* g to specify GB

  Range: 10 KB through 1 GB

  Default: 128 KB

- world-readable | no-world-readable—By default, log files can be accessed only by the user who configures the tracing operation. The world-readable option enables any user to read the file. To explicitly set the default behavior, use the no-world-readable option.

- flag—Trace operation to perform. To specify more than one trace operation, include multiple flag statements.

  - all—Trace all security events.

  - certificates—Trace certificate events.

  - database—Trace database events.

  - general—Trace general events.

  - ike—Trace IKE module processing.

  - `parse`—Trace configuration processing.
  - `policy-manager`—Trace policy manager processing.
  - `routing-socket`—Trace routing socket messages.
  - `timer`—Trace internal timer events.
- `level` *`level`*—(Optional) Set traceoptions level.
  - `all`—match all levels.
  - `error`—Match error conditions.
  - `info`—Match informational messages.
  - `notice`—Match conditions that should be handled specially.
  - `verbose`—Match verbose messages.
  - `warning`—Match warning messages.
- `no-remote-trace`—Set remote tracing as disabled.
- `rate-limit` *`messages-per-second`*—Limit the incoming rate of trace messages.

Required Privilege Level

trace—To view this in the configuration.

trace-control—To add this to the configuration.

Release Information

Statement modified in Junos OS Release 8.5.

RELATED DOCUMENTATION

traceoptions (Services Application Identification)

IN THIS SECTION

- Syntax | 30992
- Hierarchy Level | 30992
- Description | 30993
- Options | 30993
- Required Privilege Level | 30994
- Release Information | 30994

Syntax

```
traceoptions {
    file {
        filename ;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag all;
    level (all | error | info | notice | verbose | warning)
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services application-identification]
[edit services icap-redirect]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure tracing operations for application identification services.

Options

- `file`—Configure the trace file options.
  - *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*—Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed to *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    Range: 2 through 1000 files

    Default: 10 files
  - `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.
  - `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches this size, it is renamed *`trace-file`*`.0`. When the `trace-file` again reaches its maximum size, *`trace-file`*`.0` is renamed *`trace-file`*`.1` and *`trace-file`* is renamed *`trace-file`*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

    If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

    Syntax: *`x`* `K` to specify KB, *`x`* `m` to specify MB, or *`x`* `g` to specify GB

    Range: 10 KB through 1 GB

    Default: 128 KB

  - `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.

  `all`—Trace with all flags enabled.

- `level`—Set the level of debugging the output option.

  - `all`—Match all levels.
  - `error`—Match error conditions.
  - `info`—Match informational messages.
  - `notice`—Match conditions that should be handled specially
  - `verbose`—Match verbose messages.
  - `warning`—Match warning messages.

- `no-remote-trace`—Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

RELATED DOCUMENTATION

traceoptions (Services IPsec VPN)

IN THIS SECTION

- Syntax | 30995
- Hierarchy Level | 30995
- Description | 30995
- Options | 30996
- Required Privilege Level | 30996
- Release Information | 30997

Syntax

```
traceoptions {
    file <filename> <files number> <match regular-expression> <size bytes> <world-readable | no-
world-readable>;
    flag flag;
    level level;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services ipsec-vpn]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure IPsec tracing operations. By default, messages are written to **/var/log/kmd**.

Options

`files` *`number`*—Maximum number of trace data files.

- **Range:** 2 through 1000

`flag` *`flag`*—Tracing operation to perform:

- `all`—Trace everything.
- `certificates`—Trace certificates that apply to the IPsec service set.
- `database`—Trace security associations database events.
- `general`—Trace general events.
- `ike`—Trace IKE module processing.
- `parse`—Trace configuration processing.
- `policy-manager`—Trace policy manager processing.
- `routing-socket`—Trace routing socket messages.
- `snmp`—Trace SNMP operations.
- `timer`—Trace internal timer events.

`level` *`level`*—Key management process (kmd) tracing level. The following values are supported:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`–Match informational messages.
- `notice`—Match conditions that should be handled specially.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

`size` *`bytes`*—Maximum trace file size.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

`level` option added in Junos OS Release 10.0.

traceoptions (Services L2TP)

IN THIS SECTION

- Syntax | 30997
- Hierarchy Level | 30998
- Description | 30998
- Options | 30998
- Required Privilege Level | 31001
- Release Information | 31001

Syntax

```
traceoptions {
    debug-level level;
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    filter {
        protocol name;
        user user@domain;
        user-name username;
    }
    flag flag;
    interfaces interface-name {
        debug-level level;
        flag flag;
    }
```

```
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services l2tp]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for L2TP processes.

Options

`debug-level` *`level`*—Trace level for PPP, L2TP, RADIUS, and UDP; this option does not apply to L2TP on MX Series routers:

- `detail`—Trace detailed debug information.
- `error`—Trace error information.
- `packet-dump`—Trace packet decoding information.

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

`files` *`number`*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`filter`—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.

- `protocol` *name*—One of the following protocols; this option does not apply to L2TP on MX Series routers:
  - `l2tp`
  - `ppp`
  - `radius`
  - `udp`
- `user` *user@domain*—Username of a subscriber; this option does not apply to L2TP on M Series routers. Optionally use an asterisk (*) as a wildcard to substitute for characters at the beginning or end of either term or both terms.
- `user-name` *username*—Username of a subscriber; this option does not apply to L2TP on MX Series routers.

`flag` *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Trace all operations.
- `configuration`—Trace configuration events.
- `events`—Trace interface events.
- `general`—Trace general events.
- `gres`—Trace GRES events.
- `init`—Trace daemon initialization.
- `ipc-rx`—Trace IPC receive events.
- `ipc-tx`—Trace IPC transmit events.
- `memory`—Trace memory management code.
- `message`—Trace message processing code.
- `packet-error`—Trace packet error events.
- `parse`—Trace parsing events.
- `protocol`—Trace L2TP events.
- `receive-packets`—Trace received L2TP packets.
- `routing-process`—Trace routing process interactions.

- routing-socket—Trace routing socket events.
- session-db—Trace session database interactions.
- states—Trace state machine events.
- timer—Trace timer events.
- transmit-packets—Trace transmitted L2TP packets.
- tunnel—Trace tunnel events.

interfaces *interface-name*—Apply L2TP traceoptions to a specific services interface. This option does not apply to L2TP on MX Series routers.

- debug-level *level*—Trace level for the interface; this option does not apply to L2TP on MX Series routers:
  - detail—Trace detailed debug information.
  - error—Trace error information.
  - extensive—Trace all PIC debug information.
- flag *flag*—Tracing operation to perform for the interface. This option does not apply to L2TP on MX Series routers. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:
  - all—Trace everything.
  - ipc—Trace L2TP Inter-Process Communication (IPC) messages between the PIC and the Routing Engine.
  - packet-dump—Dump each packet content based on debug level.
  - protocol—Trace L2TP, PPP, and multilink handling.
  - system—Trace packet processing on the PIC.

level—Specify level of tracing to perform. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- all—Match messages of all levels.
- error—Match error messages.
- info—Match informational messages.
- notice—Match notice messages about conditions requiring special handling.

- `verbose`—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure `verbose`, messages at all higher levels are traced. Therefore, the result is the same as when you configure `all`.
- `warning`—Match warning messages.
- **Default:** `error`

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`—Disable remote tracing.

`no-world-readable`—(Optional) Disable unrestricted file access.

`size` *`maximum-file-size`*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`size`*`k` to specify KB, *`size`*`m` to specify MB, or *`size`*`g` to specify GB
- **Range:** 10240 through 1073741824

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

traceoptions (Services Logging)

IN THIS SECTION

- Syntax | 31002
- Hierarchy Level | 31002
- Description | 31002
- Options | 31003
- Required Privilege Level | 31004
- Release Information | 31004

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services adaptive-services-pics],
[edit services logging]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure Adaptive Services or Multiservices PIC tracing operations. The messages are output to **/var/log/serviced**.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform:

- `all`—Trace everything.
- `command-queued`—Trace command enqueue events.
- `config`—Trace configuration events.
- `handshake`—Trace handshake events.
- `init`—Trace initialization events.
- `interfaces`—Trace interface events.
- `mib`—Trace GGSN SNMP MIB events.
- `removed-client`—Trace client cleanup events.
- `show`—Trace CLI command servicing.

`match` *`regex`*—(Optional) Match output to a defined regular expression (regex).

- **Default:** If you do not include this option, the trace operation output includes all lines relevant to the logged events.

`no-world-readable`—(Optional) Prevent any user from reading the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**.

This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`world-readable`—(Optional) Allow any user to read the log file.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`file` option added in Release 8.0.

Tracing Services PIC Operations

traceoptions (Services Redundancy Daemon)

IN THIS SECTION

- Syntax | 31005
- Hierarchy Level | 31005
- Description | 31005
- Options | 31005

Required Privilege Level | 31007
Release Information | 31007

Syntax

```
traceoptions {
    file file-name <files number> <no-word-readable | world-readable> <size size>;
    flag flag;
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services redundancy-set]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify the level of redundancy system events to be traced.

Options

file *file-name*
Name of the file to receive the output of the tracing operation.

files *number*
(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 3 files

flag *flag*

Specify which operations are to be traced. To specify more than one operation, include multiple flag statements.

- `all`—Trace everything.
- `config`—Trace services redundancy configuration events.
- `connect`—Trace services redundancy ipc events.
- `error`—Trace services redundancy errors.
- `database`—Trace services database events.
- `normal`—Trace normal events.
- `opcmd`—Trace services redundancy opcmd events.
- `parse`—Trace services redundancy parse events.
- `route`—Trace services redundancy route events.
- `snmp`—Trace services redundancy snmp events.
- `state`—Trace services redundancy set state-machine.
- `switchover`—Trace switchover events.
- `system`—Trace services redundancy system events.

level

Use the specified level of tracing. You can specify any of the following levels:

- `all`—Match all levels.
- `critical`—Match critical conditions.
- `error`—Match error conditions.
- `info`—Match informational messages
- `notice`—Match conditions that must be handled specially.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

no-remote-trace (Optional) Disable remote tracing.

no-world-readable (Optional) Disable unrestricted file access.

size *size* (Optional) Use the maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the size option.

- **Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.
- **Range:** 10,240 through 1,073,741,824 bytes.
- **Default:** 128 KB

word-readable (Optional) Enable unrestricted file access.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

Syntax | 31008
Hierarchy Level | 31008

- Description | 31009
- Options | 31009
- Required Privilege Level | 31010
- Release Information | 31010

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size (Services) maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag flag;
    level [brief | detail | extensive | verbose];
    no-remote-trace;
    packet-filter {
        destination-ip;
        destination-port;
        source-ip;
        source-port;
    }
}
```

Hierarchy Level

```
[edit services ssl]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify the trace file information.

Debug tracing on both Routing Engine and the Packet Forwarding Engine can be enabled for SSL proxy by using `[edit services ssl traceoptions]` command.

Options

- *file-name*—Specify the name of file in which to write trace information.
  - `files`—Specify the maximum number of trace files. Range: 2 to 1000.
  - `match`—Specify the regular expression for lines to be logged. This statement is supported on the SRX1500, SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices and vSRX Virtual Firewall.
  - `no-world-readable size`—Do not allow any user to read the log file.
  - `size`—Specify the maximum trace file size. Range: 10,240 to 1,073,741,824.
  - `world-readable`—Allow any user to read the log file.
- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.
  - *all*—Trace all the parameters.
  - *cli-configuration*—Trace CLI configuration events.
  - *initiation*—Trace initiation service events.
  - *proxy*—Trace proxy service events.
  - *selected-profile*—Trace events for profiles with `enable-flow-tracing` set.
  - *termination*—Trace termination service events.
- `level`—Set the level of debugging the output option.

  - `brief`—Match brief messages.
  - `detail`—Match detail messages.
  - `extensive`—Match extensive messages.
  - `verbose`—Match verbose messages.
- `no-remote-trace`—Set remote tracing as disabled.
- `packet-filter`—Set packet filter to capture the traffic details.
  - `destination-ip` *ipvaddress*—Specify a destination IP address.

    Range—1 through 65535
  - `destination-port` *port-number*—Specify a destination port.
  - `source-ip` *ip-address*—Specify a source IP address.
  - `source-port` *port-number*—Specify a source IP port.

    Range—1 through 65535

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10. This statement is supported on the SRX1500, SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices and vSRX Virtual Firewall. Junos OS Release 19.3R1 introduces `packet-filter` statement.

IN THIS SECTION

- Syntax | 31011
- Hierarchy Level | 31011
- Description | 31012
- Options | 31012
- Required Privilege Level | 31012
- Release Information | 31012

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services unified-access-control ]
```

Description

> ⚠ **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define Unified Access Control (UAC) tracing options.

Use this statement when you are configuring the SRX Series Firewall to act as a Junos OS Enforcer in a Unified Access Control (UAC) deployment. When deployed as a Junos OS Enforcer, the SRX Series Firewall enforces the policies that are defined on the UAC's IC Series UAC Appliance.

Options

`flag`—Trace operation to perform. To specify more than one trace option, include multiple flag statements.

- `all`—Trace with all flags enabled
- `config`—Trace configuration information for all UAC-related configurations. This includes all configuration controlled through the `unified-access-control` statements at the `edit services` hierarchy level. It also includes other standard Junos OS configurations required for UAC enforcement such as zones, policies, and interfaces.
- `connect`—Trace communications between the Junos OS Enforcer and the IC Series appliance, including SSL handshakes and timeouts.
- `ipc`—Trace interprocess communications. Use this option to trace communications between the Routing Engine (RE) and the UACD enforcement plugin inside the Packet Forwarding Engine (PFE).

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

IN THIS SECTION

- Syntax | 31013
- Hierarchy Level | 31013
- Description | 31014
- Options | 31014
- Required Privilege Level | 31015
- Release Information | 31016

Syntax

```
traceoptions {
    file filename files files match match size size(world-readable | no-world-readable);
    flag name;
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services user-identification authentication-source (Services User Identification ClearPass)
aruba-clearpass]
```

Description

> ⚠ **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify the name of the trace log file and its characteristics. Messages about the behavior of the authentication source are written to this log file. Aruba ClearPass Policy Manager (CPPM) is the authentication source for the SRX Series Firewall integrated ClearPass authentication and enforcement feature.

file- Configure the name of the trace log file and its characteristics to which messages for the behavior of the authentication source are logged. For the SRX Series Firewall integrated ClearPass authentication and enforcement feature, the authentication source is the Aruba ClearPass Policy Manager (CPPM).

flag- Configure the tracing operation. To perform more than one tracing operation, include multiple *flag* statements. Messages about the behavior of the authentication source are written to this flag. Aruba ClearPass Policy Manager (CPPM) is the authentication source for the SRX Series Firewall integrated ClearPass authentication and enforcement feature.

level- Configure the level of messages that are written to trace log file about authentication source behavior.

For the integrated ClearPass authentication enforcement feature, the authentication source is Aruba ClearPass.

Options

file Trace file information.

filename Name of the log file.

- **files** Specifies the maximum number of trace files.
  - **Default:** 3
  - **Range:** 2 through 1000
- **match** Specifies a regular expression that determines which lines are logged.
- **no-world-readable** Denies users the ability to read the log file.

size Specifies the trace file maximum file size.

- **Default:** 128k
- **Range:** 10,240 through 1,073,741,824

world-readable Allows users to read the log file.

flag Tracing parameters.

- Values:
  - all—Trace Aruba ClearPass all modules
  - clearpass-authentication—Trace Aruba ClearPass auth table management module
  - configuration—Trace Aruba ClearPass configuration
  - dispatcher—Trace dispatcher module
  - ipc—Trace ipc
  - user-query—Trace user-query module

level Level of debugging output

- Values:
  - all—Matches all levels.
  - error—Matches error conditions.
  - info—Matches informational messages.
  - notice—Matches conditions that should be handled specially.
  - verbose—Matches verbose messages.
  - warning—Matches warning messages.

no-remote-trace Disable remote tracing

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

1. services—To view this statement in the configuration.

2. services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

- Options | 31017
- Required Privilege Level | 31018
- Release Information | 31018

Syntax

```
traceoptions {
    file <filename> <files number> <match regex> <size size> <world-readable | no-world-
readable>;
    flag flag;
    level <error>;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system services extension-service]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for the JET service process (jsd).

Options

file Indicate trace file information.

- ***filename*** Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.
- **files** *number* (Optional) Specify the maximum number of trace files.
  - **Range:** 2 through 1000
  - **Default:** 10
- **match** *regex* Specify the regular expression for lines to be logged.
- **size** *size* (Optional) Specify the maximum size of each trace file. When a trace file named *trace-file* reaches its maximum size, it is renamed *trace-file*.0. The traceoption output continues in a second trace file named *trace-file*.1. When *trace-file*.1 reaches its maximum size, output continues in a third file named *trace-file*.2, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.
  - **Range:** 10,240 through 1,073,741,824 bytes
  - **Default:** 1000k
- **world-readable | no-world-readable** (Optional). Grant all users permission to read log files, or restrict the permission only to the root user and users who have Junos OS maintenance permission.

flag *flag* Specify the tracing operation to perform. To specify more than one tracing operation, include multiple flag statements:

- `all`—Trace everything.
- `config`—Trace configuration events.
- `general`—Trace general events.
- `grpc`—Trace grpc server events.
- `libgrpc-debug`—(Junos OS Release 19.3R1 only) Trace all lib grpc-related events.
- `libgrpc-errors`—(Junos OS Release 19.3R1 only) Trace lib grpc errors.
- `libgrpc-info`—(Junos OS Release 19.3R1 only) Trace lib grpc info and errors.
- `notification`—Trace notification events.
- `routing-socket`—Trace routing socket calls
- `timeouts`—Trace timeouts.
- `timer`—Trace internal timer events.

> **NOTE**: The libgrpc trace flags are only supported in Junos OS Release 19.3R1. They allow you to see events from the grpc libraries in the jsd trace log. Within the grpc core there are multiple libraries (for example, iomgr, compression, and profiling).

level Set the trace log verbosity. Use the `error` option to only show error events.

> **NOTE**: This `error` option does not apply to the libgrpc trace flags.

no-remote-trace Disable remote tracing.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

`level` option introduced in Junos OS Release 20.2R1.

Trace flag options `libgrpc-debug`, `libgrpc-errors`, and `libgrpc-info` are supported in Junos OS Release 19.3R1 only.

traceoptions (sFlow Technology)

IN THIS SECTION

- Syntax | 31019
- Hierarchy Level | 31019
- Description | 31020
- Default | 31020
- Options | 31020
- Required Privilege Level | 31021
- Release Information | 31021

Syntax

```
traceoptions {
    file filename <files number> <no-stamp> <replace> <size size> <world-readable | no-world-
readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit protocols sflow]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for sFlow technology.

Default

The traceoptions feature is disabled.

NOTE: In Junos OS Evolved, the `traceoptions` functions have been moved to the trace application command. Use trace application commands instead. See How Junos OS Evolved Differs from Junos OS and Tracing Architecture for details.

Options

file *filename*

Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Output files are located in the **/var/log/** directory.

files *number*

(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. Incoming trace file data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify the maximum number of files, you must also specify the maximum file size using the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 1 trace file

flag *flag*

Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- all—Trace all sFlow monitoring events.

- client-server—Trace sFlow monitoring client-server events.
- configuration—Trace sFlow monitoring configuration events.
- interface—Trace sFlow monitoring interface events.
- rtsock—Trace routing socket code events.

no-stamp (Optional) Do not place timestamp information at the beginning of each line in the trace file.

no-world-readable (Optional) Prevent any user from reading the trace file.

replace (Optional) Replace an existing trace file if there is one.

size *size* (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. Incoming trace file data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the files option.

- **Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB
- **Range:** 10 KB through the maximum file size of 4 GB
- **Default:** 128 KB

world-readable (Optional) Allow any user to read the trace file.

Required Privilege Level

routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.3.

traceoptions (SNMP)

IN THIS SECTION

- Syntax | 31024
- Hierarchy Level | 31024
- Description | 31024

- Options | 31025
- Required Privilege Level | 31026
- Release Information | 31026

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit snmp]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Track the activities of SNMP agents on the switch and record the information in log files.

NOTE: The `traceoptions` statement is not supported on the QFabric system.

The output of the tracing operations is placed into log files in the `/var/log` directory. Each log file is named after the SNMP agent that generates it. Currently, the following logs are created in the `/var/log` directory when the `traceoptions` statement is used:

- chassisd

- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

Options

`file` *`filename`*—By default, the name of the log file that records trace output is the name of the process being traced (for example, `mib2d` or `snmpd`). Use this option to specify another name.

`files` *`number`*—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, `snmpd`) reaches its maximum size, it is archived by being renamed to `snmpd.0`. The previous `snmpd.1` is renamed to `snmpd.2`, and so on. The oldest archived file is deleted.

- **Range:** 2 through 1000 files
- **Default:** 10 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements:

- `all`—Log all SNMP events.
- `configuration`—Log reading of configuration at the `[edit snmp]` hierarchy level.
- `database`—Log events involving storage and retrieval in the events database.
- `events`—Log important events.
- `general`—Log general events.
- `interface-stats`—Log physical and logical interface statistics.
- `nonvolatile-sets`—Log nonvolatile SNMP set request handling.
- `pdu`—Log SNMP request and response packets.
- `policy`—Log policy processing.
- `protocol-timeouts`—Log SNMP response timeouts.
- `routing-socket`—Log routing socket calls.

- `server`—Log communication with processes that are generating events.
- `subagent`—Log subagent restarts.
- `timer-events`—Log internally generated events.
- `varbind-error`—Log variable binding errors.

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`size` *`size`*—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

- **Range:** 10 KB through 1 GB
- **Default:** 1000 KB

`world-readable | no-world-readable`—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`file` *`filename`* option added in Junos OS Release 8.1.

`world-readable | no-world-readable` option added in Junos OS Release 8.1.

(mstp | rstp | vstp)],
[edit protocols (mstp | rstp | vstp | vstp vlan vlan-id)],
[edit routing-instances routing-instance-name protocols (mstp | rstp | vstp)]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the

debug information, immediately disable tracing to minimize risk and restore normal system performance.

Sets protocol-level tracing options for for spanning-tree protocols MPLS, MVRP, STP, RSTP, MSTP, and VSTP.

Default

The default STP protocol-level trace options are inherited from the global `traceoptions` statement. Traceoptions is disabled.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place STP tracing output in the file **/var/log/stp-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 1 trace file only

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. The following are the STP-specific tracing options:

- **all**—Trace all operations.
- **all-failures**—Trace all failure conditions.
- **bpdu**—Trace BPDU reception and transmission.
- **bridge-detection-state-machine**—Trace the bridge detection state machine.
- `error`—Trace all failure conditions.
- **events**—Trace events of the protocol state machine.
- `pdu`—Trace PDUs that were received and sent.

- **port-information-state-machine**—Trace the port information state machine.
- **port-migration-state-machine**—Trace the port migration state machine.
- **port-receive-state-machine**—Trace the port receive state machine.
- **port-role-transit-state-machine**—Trace the port role transit state machine.
- **port-role-select-state-machine**—Trace the port role selection state machine.
- **port-state-transit-state-machine**—Trace the port state transit state machine.
- **port-transmit-state-machine**—Trace the port transmit state machine.
- **ppmd**—Trace the state and events for the ppmd process.
- `socket`—Trace socket activity.
- `state-machine`—Trace state machine information.
- **state-machine-variables**—Trace when the state machine variables change.
- **timers**—Trace protocol timers.
- **topology-change-state-machine**—Trace the topology change state machine.

The following are the global tracing options:

- **all**—All tracing operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events.
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **regex-parse**—Trace regular-expression parsing.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

no-world-readable—(Optional) Prevent any user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

- **Default:** If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the files option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

[edit system processes static-subscribers]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for static subscriber processes.

Options

`file` *`filename`*— Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

`files` *`number`*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Trace all operations.
- `authentication`—Trace authentication events.
- `configuration`—Trace configuration events.
- `database`—Trace database events.
- `general`—Trace general events.

- `gres`—Trace GRES events.
- `profile`—Trace dynamic profile events.
- `rtsock`—Trace routing socket events.
- `statistics`—Trace statistics events.
- `subscriber`—Trace subscriber events.

`level`—Level of tracing to perform. You can specify any of the following levels:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match notice messages about conditions requiring special handling.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.
- **Default:** `error`

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`—(Optional) Disable remote tracing.

`no-world-readable`—(Optional) Disable unrestricted file access.

`size` *`maximum-file-size`*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`size`*`k` to specify KB, *`size`*`m` to specify MB, or *`size`*`g` to specify GB
- **Range:** 10240 through 1073741824
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Tracing Subscriber Management Session Database Replication Events for Troubleshooting

traceoptions (System Accounting)

IN THIS SECTION

- Syntax | 31039
- Hierarchy Level | 31039
- Description | 31040
- Default | 31040
- Options | 31040
- Required Privilege Level | 31041
- Release Information | 31041

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag (all| config | events | radius | tacplus);
    no-remote-trace
}
```

Hierarchy Level

```
[edit system accounting]]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for System Accounting.

Default

Trace options are not enabled by default.

Options

`file` *`filename`*—Name of the file in which Junos OS stores the accounting logs. By default, this is created under the /var/log directory.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file reaches the size specified by the size option, the filename is appended with 0 and compressed. For example, when trace file named trace-file-log reaches size *<size>*, it is renamed and compressed to trace-file-log.0.gz. When trace-file-log reaches size *<size>* or the second time, the trace-file-log.0.gz is renamed to trace-file-log.1.gz and trace-file-log is renamed and compressed to trace-file-log.0.gz. This renaming shceme ensures that the older logs to have a greater index number. When number of trace files reach *<number>* then the oldest file is deleted.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000 files
- **Default:** 10

`flag` *`flag`*—Tracing operation to perform. You can include one or more of the following flags:

- `all`—Trace all operations.
- `config`—Trace configuration processing.
- `events`—Trace accounting events and their processing.
- `radius`—Trace RADIUS processing.

- `tacplus`—Trace TACPLUS processing.

`no-remote-trace`—(Optional) Disable tracing and logging operations that track normal operations, error conditions, and packets that are generated by or passed through the Juniper Networks device.

`no-world-readable`—Restrict access to the trace files to the owner.

- **Default:** no-world-readable

`size` *`size`*—(Optional) Maximum size of each trace file in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). If you do not specify a unit, the default is bytes. If you specify a maximum file size, you also must specify a maximum number of trace files by using the files option and a filename by using the file option.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** size to specify bytes, sizek to specify KB, sizem to specify MB, or sizeg to specify GB.
- **Range:** 10 KB through 1 MB
- **Default:** 128 KB

`world-readable`—Enable any user to access the trace files.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

`tacplus` option introduced in Junos OS Release 15.1.

traceoptions (System License)

IN THIS SECTION

Syntax | 31042

- Hierarchy Level | 31042
- Description | 31042
- Options | 31043
- Required Privilege Level | 31044
- Release Information | 31044

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit system license]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Set trace options for licenses.

Options

file Configure the trace file information.

filename Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, the name of the file is the name of the process being traced.

files *number* Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` *maximum file-size* option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

match *regular-expression* Refine the output to include lines that contain the regular expression.

size *size* Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` *number* option.

- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

world-readable | no-world-readable By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

flag *flag* Specify which tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags.

- `all`—Trace all operations.
- `config`—Trace license configuration processing.
- `events`—Trace licensing events and their processing.

no-remote-trace Disable the remote tracing.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

traceoptions (System Monitor)

IN THIS SECTION

- Syntax | 31044
- Hierarchy Level | 31045
- Description | 31045
- Options | 31045
- Required Privilege Level | 31046
- Release Information | 31046

Syntax

```
traceoptions {
    file {
        files files;
        size size;
    }
    level [ all | debug | info| warning| error | critical ];
}
```

Hierarchy Level

```
[edit system monitor]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure the system memory monitoring trace options on your PTX and MX Series routers. The memory monitoring system on your device monitors anomalies with respect to the memory utilization of Junos applications and overall system in the control plane of your device. Apart from monitoring the system memory, you can also configure the device to monitor the per-process memory footprint as well to help detect possible leaks and take configured action.

Options

file *filename*
: Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. The files are available at the **/var/log/jsysmon.log** .

files *number*
: (Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the size option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

Level
: Specify the level for trace logging.

all
: Trace all messages.

critical
: Trace critical messages.

debug
: Trace debug messages.

error Trace error messages.

info Trace information messages.

warning Trace warning messages.

- **Default:** error

Size *size* (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the files option.

- **Syntax:** xk to specify KB, xm to specify MB, and xg to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.2R1.

traceoptions (System Services DNS)

IN THIS SECTION

- Syntax | 31047
- Hierarchy Level | 31047
- Description | 31047
- Options | 31048
- Required Privilege Level | 31049
- Release Information | 31049

Syntax

```
traceoptions {
    category {
        category-type;
    }
    file;
}
```

Hierarchy Level

```
[edit system services dns]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Defines tracing options for DNS services.

Options

`category`—Specifies the logging category. See Table 1910 on page 31048 for the different logging categories and their descriptions.

`file`—Trace file information.

Table 1910: Category Names

Category Name	Description
client	Processing of client requests
config	Configuration file parsing and processing
database	Messages relating to the databases
default	Categories for which there is no specific configuration
delegation-only	Delegation only
dispatch	Dispatching of incoming packets to the server
dnssec	DNSSEC and TSIG protocol processing
edns-disabled	Log query using plain DNS
general	General information
lame-servers	Lame servers
network	Network options
notify	NOTIFY protocol
queries	DNS query resolver

Table 1910: Category Names *(Continued)*

Category Name	Description
resolver	DNS resolution security
security	Approval and denial of requests
unmatched	Unable to determine the class for messages named
update	Dynamic updates
update-security	Approval and denial of update requests
xfer-in	Zone transfers that the server is receiving xfer-out
xfer-out	Zone transfers that the server is sending

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

DNS Overview

traceoptions (TCP Encapsulation)

IN THIS SECTION

- Syntax | 31050
- Hierarchy Level | 31050
- Description | 31051
- Options | 31051
- Required Privilege Level | 31052
- Release Information | 31052

Syntax

```
traceoptions {
    file filename {
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag (all | configuration | session | tunnel);
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security tcp-encap]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure TCP encapsulation tracing options.

Options

file Configure the trace file options.

- *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.
- `files` *number*—Maximum number of trace files. When a trace file named *trace-file* reaches its maximum size, it is renamed to *trace-file*`.0`, then *trace-file*`.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

  If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

  Range: 2 through 1000 files

  Default: 10 files
- `match` *regular-expression*—Refine the output to include lines that contain the regular expression.
- `size` *maximum-file-size*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches its maximum size, it is renamed *trace-file*`.0`. When *trace-file*`.0` reaches its maximum size, it is renamed *trace-file*`.1` and *trace-file* is renamed *trace-file*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and filename.

  Syntax: *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB

  Range: 10 KB through 1 GB

Default: 128 KB

- `world-readable | no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

flag Trace operation to perform. To specify more than one trace operation, include multiple flag statements.

- `all`—Trace all activity.
- `configuration`—Trace configuration events.
- `session`—Trace session related events.
- `tunnel`—Trace tunnel events.

level Set the level of debugging.

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match conditions that should be handled specifically.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

no-remote-trace Disable remote tracing.

Required Privilege Level

view-level—To view this statement in the configuration.

control-level—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D80.

traceoptions (TCP Port Forwarding)

IN THIS SECTION

- Syntax | 31053
- Hierarchy Level | 31053
- Description | 31054
- Options | 31054
- Required Privilege Level | 31055
- Release Information | 31055

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    flag flag;
    level (all | error | info | notice | verbose | warning);
}
```

Hierarchy Level

```
[edit system processes tcp-forwarding]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Define tracing operations for TCP port forwarding processes.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory `/var/log`.

`files` *`number`*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Trace all events
- `configuration`—Trace configuration events
- `connection`—Trace TCP connection events
- `init`—Trace TCP port forwarding initialization events

`level`—Level of tracing to perform; also known as severity level. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- `all`—Match all levels.
- `error`—Match error messages.
- `info`—Match informational messages.
- `notice`—Match notice messages about conditions requiring special handling.

- `verbose`—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure `verbose`, messages at all higher levels are traced. Therefore, the result is the same as when you configure `all`.
- `warning`—Match warning messages.
- **Default:** `error`

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`no-remote-trace`—(Optional) Disable remote tracing.

`no-world-readable`—(Optional) Disable unrestricted file access.

`size` *`maximum-file-size`*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** *`size`*`k` to specify KB, *`size`*`m` to specify MB, or *`size`*`g` to specify GB
- **Range:** 10240 through 1073741824
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1.

traceoptions (TDF Gateway)

IN THIS SECTION

- Syntax | 31056
- Hierarchy Level | 31056
- Description | 31056
- Options | 31057
- Required Privilege Level | 31058
- Release Information | 31058

Syntax

```
traceoptions {
    file file-name <files number> <no-word-readable | world-readable> <size size>;
    flag flag;
    level (all | critical | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify tracing options for the TDF gateway.

Options

file *file-name*

Use the specified name of the file to receive the output of the tracing operation.

files *number*

(Optional) Use the specified maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 3 files

flag *flag*

Specify which operations are to be traced. To specify more than one operation, include multiple flag statements.

- `all`—Trace everything.
- `bulkjob`—Trace events that are handled by bulk jobs in order to prevent system overload.
- `config`—Trace configuration events.
- `cos-cac`—Trace class of service (CoS) and call admission control (CAC) events.
- `ctxt`—Trace user equipment, Packet Data Network (PDN), or bearer context events.
- `fsm`—Trace mobile subscriber finite state machine (FSM) events.
- `gtpu`—Trace GPRS tunneling protocol, user plane (GTP-U) events.
- `ha`—Trace high availability events.
- `init`—Trace initialization events.
- `pfem`—Trace Packet Forwarding Engine Manager events.
- `stats`—Trace `stats` events. This flag is used internally by Juniper Networks engineers.
- `waitq`—Trace `waitq` events. This flag is used internally by Juniper Networks engineers.

level

Use the specified level of tracing. You can specify any of the following levels:

- `all`—Match all levels.
- `critical`—Match critical conditions.

- `error`—Match error conditions.
- `info`—Match informational messages
- `notice`—Match conditions that must be handled specially.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

no-remote-trace (Optional) Disable remote tracing.

no-world-readable (Optional) Disable unrestricted file access.

size *size* (Optional) Use the specified maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the size option.

- **Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.
- **Range:** 10,240 through 1,073,741,824 bytes.
- **Default:** 128 KB

word-readable (Optional) Enable unrestricted file access.

Required Privilege Level

trace and unified-edge—To view this statement in the configuration.

trace-control and unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

traceoptions (Traffic Load Balancer)

IN THIS SECTION

- Syntax | 31059
- Hierarchy Level | 31059
- Description | 31059
- Options | 31060
- Required Privilege Level | 31062
- Release Information | 31062

Syntax

```
traceoptions {
    file file-name <files number> <no-word-readable | world-readable> <size size>;
    flag flag;
    level (all | critical | error | info | notice | verbose | warning);
    monitor monitor-object-name {
        instance-name instance-name;
        virtual-svc-name virtual-service-name;
    }
    no-remote-trace;
}
```

Hierarchy Level

```
[edit services traffic-load-balance]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions

commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure tracing options for the traffic load balancer.

Options

For Next Gen Services on the MX-SPC3 services card, set the *monitor-object-name* to either:

file ***file-name***

Name of the file to receive the output of the tracing operation.

files ***number***

(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 3 files

flag ***flag***

Specify which operations you want to trace from Table 1911 on page 31060. To specify more than one operation, include multiple flag statements.

Table 1911: Trace Flags

Flag	Support on MS-MPC and MX-SPC3 Cards	Description
all	MS-MPC and MX-SPC3	Trace all operations.
all-real-services	MS-MPC and MX-SPC3	Trace all real services.
database	MS-MPC and MX-SPC3	Trace database events.
file-descriptor-queue	MS-MPC and MX-SPC3	Trace file descriptor queue events.

Table 1911: Trace Flags *(Continued)*

Flag	Support on MS-MPC and MX-SPC3 Cards	Description
inter-thread	MS-MPC and MX-SPC3	Trace inter-thread communication events.
messages	MS-MPC and MX-SPC3	Trace normal events.
probe	MS-MPC and MX-SPC3	Trace probe events.
probe-infra	MS-MPC and MX-SPC3	Trace probe infra events.

instance-name *instance-name*

(Optional) Name of the TLB instance to monitor.

level

Use the specified level of tracing. You can specify any of the following levels:

- `all`—Match all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match conditions that must be handled specially.
- `verbose`—Match verbose messages.
- `warning`—Match warning messages.

These trace levels are available for both the MS-MPC and MX-SPC3 services cards unless otherwise specified.

monitor *monitor-object-name*

Name of a monitoring object that contains an instance name or virtual service name.

no-remote-trace

(Optional) Disable remote tracing.

no-world-readable

(Optional) Disable unrestricted file access.

group-name	Name of the group.
real-services-name	Name of the real service
size *size*	(Optional) Use the maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the size option. • **Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB. • **Range:** 10,240 through 1,073,741,824 bytes. • **Default:** 128 KB
virtual-svc-name *virtual-service-name*	(Optional) Name of the virtual service to monitor.
word-readable	(Optional) Enable unrestricted file access.

Required Privilege Level

trace and interface—To view this statement in the configuration.

trace-control and interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

`instance-name` and `virtual-service-name` options added in Junos OS Release 16.1R6 and 18.2R1 on MX Series.

Support for Next Gen Services MX-SPC3 services card add in Junos OS Release 19.3R2.

Configuring TLB

traceoptions (Uplink Failure Detection)

IN THIS SECTION

- Syntax | 31063
- Hierarchy Level | 31063
- Description | 31063
- Default | 31063
- Options | 31064
- Required Privilege Level | 31065
- Release Information | 31065

Syntax

```
traceoptions  {
    file filename <files number> <no-stamp> <replace> <size size> <world-readable | no-world-
readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit protocols uplink-failure-detection]
```

Description

Define tracing operations for uplink failure detection.

Default

The `traceoptions` feature is disabled by default.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached (*x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- `all`—Trace everything.
- `dcd`—Trace ufdd interaction with dcd.
- `groups`—Trace uplink-failure-detection group handling.
- `interface`—Trace interface notifcation handlers of ufdd.
- `parse`—Trace configuration parsing.

`no-stamp`—(Optional) Do not place a timestamp on any trace file.

`no-world-readable`—(Optional) Restricted file access to the user who created the file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `files` option.

- **Syntax:** *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify gigabytes
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

- Options | 31066
- Required Privilege Level | 31068
- Release Information | 31068

Syntax

```
traceoptions  {
    file filename <files number> <no-stamp> <replace> <size size> <world-readable | no-world-
readable>;
    flag flag <detail> <disable> <receive> <send>;
}
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

Define tracing operations for the Virtual Chassis or VCF.

Each Virtual Chassis or VCF member is updated with configured tracing options, and the log file is stored locally on each device.

> **NOTE**: In a large-scale VCF, use system logging and tracing with discretion, and only for troubleshooting. These operations place an extra load on the primary Routing Engine device, which can impact VCF convergence time and stability. All tracing options should be disabled during normal VCF operation. To troubleshoot particular problems, selectively enable tracing options, and disable them again after collecting the desired information.

Default

Tracing operations are disabled.

Options

`detail`—(Optional) Generate detailed trace information for a flag.

> **NOTE**: Enable tracing at the detail level only while troubleshooting a particular issue, and disable it again for normal system operation.

`disable`—(Optional) Disable a flag.

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000

- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- `all`—All tracing operations.

> **TIP**: The `all` flag displays a subset of logs that are generally useful in debugging issues, and for more detailed information, you can use options `all detail`. However, to avoid significantly impacting VCF stability, use this high level of tracing only for troubleshooting for a short period of time, and not during normal VCF operation.

- `auto-configuration`—Trace Virtual Chassis ports (VCPs) that have been automatically configured.
- `csn`—Trace Virtual Chassis complete sequence number (CSN) packets.
- `error`—Trace Virtual Chassis errored packets.
- `hello`—Trace Virtual Chassis hello packets.
- `krt`—Trace Virtual Chassis KRT events.
- `lsp`—Trace Virtual Chassis link-state packets.
- `lsp-generation`—Trace Virtual Chassis link-state packet generation.
- `me`—Trace Virtual Chassis ME events.
- `normal`—Trace normal events.
- `packets`—Trace Virtual Chassis packets.
- `parse`—Trace reading of the configuration.
- `psn`—Trace partial sequence number (PSN) packets.
- `route`—Trace Virtual Chassis routing information.
- `spf`—Trace Virtual Chassis SPF events.
- `state`—Trace Virtual Chassis state transitions.
- `task`—Trace Virtual Chassis task operations.

`no-stamp`—(Optional) Do not place a timestamp on any trace file.

`no-world-readable`—(Optional) Restrict file access to the user who created the file.

`receive`—(Optional) Trace received packets.

`replace`—(Optional) Replace a trace file rather than appending information to it.

`send`—(Optional) Trace transmitted packets.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `files` option.

- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

Option `detail` added in Junos OS Release 9.2 for EX Series switches.

- Options | 31069
- Required Privilege Level | 31070
- Output Fields | 31070
- Sample Output | 31070
- Release Information | 31071

Syntax

```
traceroute clns <host>
routing-instance <name>
source <source-address>
ttl <value>
wait <seconds>
```

Description

Trace the route belonging to Connectionless Network Service (CLNS).

Options

host	IP address or name of remote host.
routing-instance *name*	Name of the routing instance for a traceroute attempt.
source *source address*	Source address to be used in outgoing packets.
ttl *value*	CLNP maximum time-to-live value. The range of values is 1 through 255.

wait *seconds* Number of seconds to wait for a response. The range of values is 1 second through 1 day.

Required Privilege Level

traceroute ethernet

IN THIS SECTION

- Syntax | 31071
- Description | 31072
- Options | 31072
- Required Privilege Level | 31072
- Output Fields | 31072
- Sample Output | 31074
- Release Information | 31075

Syntax

```
traceroute ethernet
local-mep mep-id
maintenance-association ma-name
maintenance-domain md-name
<ttl value>
<wait seconds>
mac-address | mep-id
<detail>
```

Description

Triggers the linktrace protocol to trace the route between two maintenance points. The result of the traceroute protocol is stored in the path database. To display the path database, use the `show oam ethernet connectivity-fault-management path-database` command.

Before using the traceroute command, you can verify the remote MEP's MAC address using the `show oam ethernet connectivity-fault-management path-database` command.

Options

local-mep *mep-id*	(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.
detail	(Optional) Provide detailed information of the responder hostname, ingress port name, egress port name, TTL, and relay action.
mac-address	Destination unicast MAC address of the remote maintenance point.
mep-id	MEP identifier of the remote maintenance point. The range of values is 1 through 8191.
maintenance-association *ma-name*	Specifies an existing maintenance association from the set of configured maintenance associations.
maintenance-domain *md-name*	Specifies an existing maintenance domain from the set of configured maintenance domains.
ttl *value*	Number of hops to use in the linktrace request. The range is 1 to 255 hops. The default is 4.
wait *seconds*	(Optional) Maximum time to wait for a response to the traceroute request. The range is 1 to 255 seconds. The default is 5.

Required Privilege Level

network

Output Fields

Table 1913 on page 31073 lists the output fields for the `traceroute ethernet` command. Output fields are listed in the approximate order in which they appear.

Table 1913: traceroute ethernet Output Fields

Field Name	Field Description
`Linktrace to`	MAC address of the destination maintenance point.
`Interface`	Local interface used to send the linktrace message (LTM).
`Maintenance Domain`	Maintenance domain specified in the traceroute command.
`Level`	Maintenance domain level configured.
`Maintenance Association`	Maintenance association specified in the traceroute command.
`Local Mep`	The local maintenance end point identifier.
`Transaction Identifier`	4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all Maintenance Domains. Use the transaction identifier to match an incoming linktrace response (LTR), with a previously sent LTM.
`Hop`	Sequential hop count of the linktrace path.
`TTL`	Number of hops remaining in the linktrace message. The time to live (TTL) is decremented at each hop.
`Source MAC address`	MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.
`Next-hop MAC address`	MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.

Table 1913: traceroute ethernet Output Fields *(Continued)*

Field Name	Field Description
`Responder Hostname`	The hostname of the responding router. A valid hostname is received only when the responding system is a Juniper Networks router.
`Ingress port name`	The port name for ingress connections.
`Egress port name`	The port name for egress connections.
`Flags`	The configurable flags can include: • H— Hardware only, incoming LT frame has hardware bit set. • T— Terminal MEP, responder is a terminating MEP. • F— FWD yes, LTM frame is relayed further.
`Relay Action`	The associated relay action. Relay action can be one of the following: • RlyHit— Relay hit; target MAC address matches the MP mac address. • RlyFDB— Relay FDB; output port decided by consulting forwarding database. • RlyMPDB— Relay MIP; output port decided by consulting MIP database.

Sample Output

traceroute ethernet

```
user@host> traceroute ethernet maintenance-domain md1 maintenance-association ma1
00:01:02:03:04:05

traceroute fabric unicast-flow

IN THIS SECTION

- Syntax | 31076
- Description | 31076
- Options | 31077
- Required Privilege Level | 31077
- Output Fields | 31077
- Sample Output | 31078
- Sample Output | 31078
- Release Information | 31079

Syntax

```
traceroute fabric unicast-flow flow-spec-name flow-specification-name fma fma-name
<source-fmep fmep-name>
<dest-fmep fmep-name>
<forced-fte-interface fte-interface>
<count count>
<verbose>
```

Description

Trace the path taken by a specific unicast flow (ping) operation across a VLAN on the QFabric system from a source maintenance endpoint (FMEP) to a destination FMEP. The source and destination FMEPs may be on the same Node device, different Node devices connected to the same Interconnect device, or different Node devices connected to different Interconnect devices.

The flow path is the sequence of Packet Forwarding Engine forwarding hops along which the protocol data unit (PDU) travels. The hop-by-hop sequence and number of hops are reported in terms of fabric maintenance intermediate points (FMIPs), which are interfaces on the Packet Forwarding Engine of the Interconnect device. An FMIP sends a response to the source FMEP when the traceroute PDU is received.

Options

dest-fmep-id *source-fmep-id*	(Optional) ID of the destination FMEP of the traceroute operation.
flow-spec-name *flow-specification-name*	Name of the flow specification that defines the parameters of the traceroute operation.
fma-name *fma-name*	Name of the FMA that associates a VLAN with the FMEPs.
forced-fte-interface *fte-interface*	(Optional) Option to force the fabric ping operation to use the specified FTE interface to inject the PDU into the fabric instead of using the internal forwarding path lookup table to determine the FTE interface.
source-fmep-id *source-fmep-id*	(Optional) ID of the FMEP that is the source of the traceroute operation.
verbose	(Optional) Detailed version of the output display.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Output Fields

Table 1914 on page 31077 lists the output fields for the `traceroute fabric-unicast-flow` command. Output fields are listed in the approximate order in which they appear.

Table 1914: traceroute fabric unicast-flow Output Fields

Field Name	Field Description
`Fabric flow traceroute between source` *`source-fmep-name`* `destination` *`destination-fmep-name`*	Source and destination FMEP names.
`Using fabric flow-specification`	Name of the flow specification.
`Ethernet frame-size`	Ethernet frame size.

Table 1914: traceroute fabric unicast-flow Output Fields *(Continued)*

Field Name	Field Description
`Source-MAC`	MAC address of the source FMEP interface.
`Destination-MAC`	MAC address of the destination FMEP interface.
`Ethertype`	EtherType protocol.
`Received response from fmip-id, interface`	FMIP identifier and interface name of the FMIP that received the PDU and responded to the source FMEP.
`Received total` *`number`* `responses`	Number of responses that are received after the traceroute operation has finished.

Sample Output

traceroute fabric unicast-flow

```
user@host> traceroute fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2 flow-
spec-name fspec1
Received response from fmip-id 128.40.0.8, interface A0003:0/1/2
Received response from fmip-id 128.128.0.8, interface A0003:0/0/8
Received response from fmep-id 2
Received total 3 responses
```

Sample Output

traceroute fabric unicast-flow (Verbose)

```
user@host> traceroute fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2 flow-
spec-name fspec1 verbose
Fabric flow traceroute between source ED1494 destination ED1497
Using fabric flow-specification: fspec1
Ethernet frame-size: 256
```

```
Source-MAC: 0:EF:7:99:85:10
Destination-MAC: 0:D3:A6:11:39:21
Ethertype: 11564
Received response from fmip-id 128.40.0.8, interface A0003:0/1/2
Received response from fmip-id 128.128.0.8, interface A0003:0/0/8
Received response from fmep-id 2
Received total 3 responses
```

Syntax

```
traceroute monitor host
<count value>
<inet | inet 6>
<interval seconds>
<no resolve>
<size value>
<source source-address>
<summary>
```

Description

Display live monitoring of each hop in the route that packets take to a specified network host. Use as a debugging tool to locate points of failure in a network.

> **NOTE**: This command utilizes the global routing table. It does not support individual routing-instances.

Required Privilege Level

network

Options

host	IP address or name of remote host.
count *value*	Number of ping requests, in packets, to send in summary mode. The default value is 10.
inet | inet 6	(Optional) Trace the route belonging to IPv4 or IPv6.
interval *seconds*	(Optional) Number of seconds to wait before sending ping requests. The default value is 1.
no resolve	(Optional) Do not attempt to display addresses symbolically.
size *value*	(Optional) Receive the specified number of bytes for each packet. The ragne is 0 - 65468 bytes. The default value is 64.

source ***source-address***	(Optional) Source address of the outgoing ping packets.
summary	(Optional) Generate and display a summary of live monitoring of each hop on the route that packets take to a specified network host.

Output Fields

Table 1 on page 31145 lists the output fields for the `traceroute monitor` command.

Table 1915: traceroute monitor Output Fields

Field Name	Field Description
Host	Hostname or IP address of the router at each hop.
Loss%	Percent of packet loss. The number of ping responses divided by the number of ping requests, specified as a percentage.
Snt	Number of ping requests sent to the router at this hop.
Last	Most recent round-trip time, in milliseconds, to the router at this hop.
Avg	Average round-trip time, in milliseconds, to the router at this hop.
Best	Shortest round-trip time, in milliseconds, to the router at this hop.
Wrst	Longest round-trip time, in milliseconds, to the router at this hop.
StDev	Standard deviation of round-trip times, in milliseconds, to the router at this hop.

Sample Output

traceroute monitor

```
user@host> traceroute monitor 192.168.1.10
                   Loss   Snt  Last  Avg   Best   Wrst  StDev

Syntax

```
traceroute mpls bgp fec
<destination destination-address>
<detail>
```

```
<exp exp>
<fanout fanout-number>
<logical-system logical system-name>
<no-resolve>
<paths paths-number>
<pipe-mode>
<retries retries-number>
<routing-instance routing-instance-name>
<source source-address>
<ttl value>
<wait seconds>
```

Description

Trace route to a remote host for an MPLS label-switched path (LSP) signaled by the Border Gateway Protocol (BGP). Use `traceroute mpls bgp` as a debugging tool to locate MPLS BGP forwarding issues in a network. (Currently supported for IPv4 packets only.)

To use the `traceroute mpls bgp` command, make sure you have BGP routes with MPLS labels.

NOTE: The `traceroute mpls bgp` *fec* command only supports single paths.

Options

fec	Specify the IP address and optional prefix of the forwarding equivalence class (FEC). Suppose you are at PE1, use would want to use the IP address of PE2 to trace the BGP path to that router.
destination *destination-address*	(Optional) Specify the destination address to use when sending probes.
detail	(Optional) Display detailed output.
exp *exp*	(Optional) Specify the class of service to use when sending probes. • **Range:** 0 through 7 • **Default:** 7
fanout *fanout-number*	(Optional) Specify the maximum number of next hops to search per node. • **Range:** 1 through 16

- **Default:** 16

`logical-system` *`logical-system-name`*	(Optional) Specify the name of the logical system for the traceroute attempt.
`no-resolve`	(Optional) Specify not to resolve the hostname that corresponds to the IP address.
`paths` *`paths-number`*	(Optional) Specify the number of paths to search. • **Range:** 1 through 255 • **Default:** 16
`pipe-mode`	(Optional) Specify to trace only the outermost FEC.
`retries` *`retries-number`*	(Optional) Specify the number of times to resend probe values. • **Range:** 1 through 9 • **Default:** 3
`routing-instance` *`routing-instance-name`*	(Optional) Specify the name of the routing instance for the trace route attempt.
`source` *`source-address`*	(Optional) Specify the source address of the outgoing traceroute packets.
`ttl` *`value`*	(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds. • **Range:** 1 through 125 • **Default:** 64
`wait` *seconds*	(Optional) Specify the number of seconds to wait before resending a probe. • **Range:** 5 though 15 • **Default:** 10

Required Privilege Level

network

Output Fields

Table 1916 on page 31085 describes the output fields for the `traceroute mpls bgp` *fec* command and the `traceroute mpls bgp` *fec* `detail` command. Output fields are listed in the approximate order in which they appear.

Table 1916: traceroute mpls bgp Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the `traceroute mpls bgp` *fec* command.	All levels
ttl	Time to live value of the labeled packet.	None
Label	Outgoing label used for forwarding the packet along the label-switched paths.	None
Protocol	Signaling protocol used. For this command, it is BGP.	None
Address	Address of the next hop.	None
Previous Hop	Address of the previous hop. Previous hop address of the first hop is `null`.	None
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	None
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	`detail`
Parent	Address of the previous hop. Parent value for the first hop is `null`.	`detail`
Return Code	Return code for reporting the result of processing the echo request by the receiver.	`detail`
Response time	Time for the echo request to reach the receiver.	`detail`

Table 1916: traceroute mpls bgp Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is `none`.	`detail`
Label Stack	Label stack used to forward the packet.	`detail`

Sample Output

traceroute mpls bgp

```
user@host> traceroute mpls bgp fec
    Probe options: retries 3, exp 7
ttl Label  Protocol Address  Previous Hop  Probe Status Fec-Stack-Sent Fec-Change

<routing-instance routing-instance-name>
<source ip-address>
<ttl value>
<update>
<wait seconds>
```

Description

Trace route to a remote host for an MPLS label-switched path signaled by the LDP. Use `traceroute mpls ldp` as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

Options

fec
Specify the IP address and optional prefix of the forwarding equivalence class (FEC).

destination *ip-address*
(Optional) Specify the destination address to use when sending probes.

- **Values:** The destination IP address must be within the 127.0.0.0/8 IP address space for Operation, Administration, and Maintenance (OAM) packets.

detail
(Optional) Display detailed output.

exp *exp*
(Optional) Specify the class-of-service to use when sending probes.

- **Range:** 0 through 7
- **Default:** 7

fanout *fanout-number*
(Optional) Specify the maximum number of nexthops to search per node.

- **Range:** 1 through 16
- **Default:** 16

logical-system
(Optional) Specify the name of the logical system for the traceroute attempt.

no-resolve
(Optional) Specify not to resolve the hostname that corresponds to the IP address.

paths *maximum-paths*

(Optional) Specify the maximum number of paths to search.

- **Range:** 1 through 255
- **Default:** 16

pipe-mode

(Optional) Specify to trace only nodes that understand LDP FEC.

In an interoperation with other vendor devices or devices running Junos OS Release that do not support tracing of hierarchical LSPs as described in RFC 6424, continuous non-complaint probe status is displayed in the `traceroute mpls ldp` command output. To avoid this LDP loop creation, use the `pipe-mode` option with the `traceroute mpls ldp` *fec* command.

> **NOTE**: Even after using the `traceroute mpls ldp` *fec* `pipe-mode` command, one or more intermediate transit nodes that do not understand LDP FEC can return non-complaint probe status in the command output.

retries *retries-number*

(Optional) Specify the number of times to resend probe values.

- **Range:** 1 through 9
- **Default:** 3

routing-instance *routing-instance-name*

(Optional) Specify the name of the routing instance for the traceroute attempt.

source *source-address*

(Optional) Specify the source address of the outgoing traceroute packets.

ttl *value*

(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

- **Range:** 1 through 125
- **Default:** 64

update

(Optional) Update database contents with traceroute results.

wait *seconds*

(Optional) Specify the number of seconds to wait before resending a probe.

- **Range:** 5 through 15
- **Default:** 10

Required Privilege Level

network

Output Fields

Table 1917 on page 31090 describes the output fields for the `traceroute mpls ldp` *fec* command and the `traceroute mpls ldp` *fec* `detail` commands. Output fields are listed in the approximate order in which they appear.

Table 1917: traceroute mpls ldp Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the `traceroute mpls ldp` *fec* command.	all levels
ttl	Time to live value of the labeled packet.	none specified
Label	Outgoing label used for forwarding the packet along the label-switched paths.	none specified
Protocol	Signaling protocol used. For this command, it is LDP.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is **null**.	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	**detail**
Parent	Address of the previous hop. Parent value for the first hop is **null**.	**detail**
Return Code	Return code for reporting the result of processing the echo request by the receiver.	**detail**

Table 1917: traceroute mpls ldp Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Response time	Time for the echo request to reach the receiver.	**detail**
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is **none**.	**detail**
Label Stack	Label stack used to forward the packet.	**detail**

Sample Output

Release Information

Command introduced in Junos OS Release 8.4.

traceroute mpls rsvp

IN THIS SECTION

- Syntax | 31093
- Description | 31093
- Options | 31093
- Required Privilege Level | 31094
- Output Fields | 31094
- Sample Output | 31096
- Release Information | 31098

Syntax

```
traceroute mpls <rsvp> lsp-name
<detail>
<egress>
<exp>
<logical-system>
<multipoint>
<no-resolve>
<retries>
<source source-address>
<ttl>
```

Description

Trace route to a remote host for an MPLS LSP signaled by RSVP. Use `traceroute mpls rsvp` as a debugging tool to locate MPLS label-switched path (LSP) forwarding issues in a network. (Currently supported for IPv4 packets only.)

Options

lsp-name	Specify the name of the LSP to be traced.
detail	(Optional) Display detailed output.
egress	(Optional) Request that a specific point-to-multipoint egress node reply to the trace route. The trace route would follow the associated sub-LSP to the egress node.
exp	(Optional) Specify the class of service to use when sending probes. The range of values is 0 through 7. The default value is 7.
logical-system	(Optional) Specify the name of the logical system for the traceroute attempt.
multipoint	(Optional) Perform a trace route on a point-to-multipoint LSP.
no-resolve	(Optional) Specify not to resolve the hostname that corresponds to the IP address.
retries	(Optional) Specify the number of times to resend probe. The range of values is 1 through 9. The default value is 3.

source ***source-address***	(Optional) Specify the source address of the outgoing traceroute packets.
ttl	(Optional) Specify the number of hops to follow before forcing the trace route to quit.

Required Privilege Level

network

Output Fields

Table 1918 on page 31094 describes the output fields for the `traceroute mpls rsvp` *`lsp-name`* and `traceroute mpls rsvp` *`lsp-name`* `detail` commands. Output fields are listed in the approximate order in which they appear.

Table 1918: traceroute mpls rsvp Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the `traceroute mpls rsvp` *`lsp-name`* command.	all levels
ttl	Time-to-live value of the labeled packet.	none specified
Label	MPLS label used to forward the packets along the LSP.	none specified
Protocol	Signaling protocol used. For this command, it is RSVP-TE.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is null.	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). Displays `Success` if the trace to a hop is successful or `Egress` if the trace has reached the last router on the path.	none specified

Table 1918: traceroute mpls rsvp Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	`detail`
Parent	Address of the previous hop. Parent value for the first hop is null.	`detail`
Return Code	Return code for reporting the result of processing the echo request by the receiver.	`detail`
Sender timestamp	Displays the timestamp when the MPLS echo request is sent to the next hop.	`detail`
Receiver timestamp	Timestamp when the echo request from the previous hop is received and acknowledged with an echo response by the next hop.	`detail`
Response time	Time for the echo request to reach the receiver.	`detail`
MTU	Size of the largest packet that includes the label stack forwarded to the next hop.	`detail`
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is none.	`detail`
Label stack	Label stack used to forward the packet.	`detail`
Path	Displays the sub-lsp path number for this traceroute, the interface used, and the destination address.	all levels

Release Information

Command introduced in Junos OS Release 9.2.

`egress`, `multipoint`, and `ttl` options added in Junos OS Release 11.2.

traceroute mpls segment-routing isis

IN THIS SECTION

- Syntax | 31098
- Description | 31099
- Options | 31099
- Required Privilege Level | 31100
- Output Fields | 31101
- Sample Output | 31102
- Release Information | 31105

Syntax

```
traceroute mpls segment-routing isis fec
algorithm algorithm-id
<destination ip-address>
<detail>
<exp exp>
```

```
<fanout fanout-number>
<logical-system logical-system-name>
<no-resolve>
<paths maximum-paths>
<pipe-mode>
<retries retries-number>
<routing-instance routing-instance-name>
<source ip-address>
<ttl value>
<update>
<wait seconds>
```

Description

Trace route to a remote host for a segment routing label-switched path added by the ISIS protocol. Use `traceroute mpls segment-routing isis` as a debugging tool to locate MPLS label-switched path forwarding issues in a network.

Options

algorithm *algorithm-id* — (Optional) Specify the flexible algorithm identifier. The range of values is `0` through `255`. The default value is `0` which means no algorithm is configured. The *algorithm-id* in conjunction with the prefix is used to distinguish labelled SR paths.

fec — Specify the IP address and optional prefix of the forwarding equivalence class (FEC).

destination *ip-address* — (Optional) Specify the destination address to use when sending probes.

- **Values:** The destination IP address must be within the 127.0.0.0/8 IP address space for Operation, Administration, and Maintenance (OAM) packets.

detail — (Optional) Display detailed output.

exp *exp* — (Optional) Specify the class-of-service to use when sending probes.

- **Range:** 0 through 7
- **Default:** 7

fanout *fanout-number* — (Optional) Specify the maximum number of nexthops to search per node.

- **Range:** 1 through 16
- **Default:** 16

logical-system (Optional) Specify the name of the logical system for the traceroute attempt.

no-resolve (Optional) Specify not to resolve the hostname that corresponds to the IP address.

paths *maximum-paths* (Optional) Specify the maximum number of paths to search.

- **Range:** 1 through 255
- **Default:** 16

retries *retries-number* (Optional) Specify the number of times to resend probe values.

- **Range:** 1 through 9
- **Default:** 3

routing-instance *routing-instance-name* (Optional) Specify the name of the routing instance for the traceroute attempt.

source *source-address* (Optional) Specify the source address of the outgoing traceroute packets.

ttl *value* (Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

- **Range:** 1 through 125
- **Default:** 64

wait *seconds* (Optional) Specify the number of seconds to wait before resending a probe.

- **Range:** 5 through 15
- **Default:** 10

Required Privilege Level

network

Output Fields

Table 1919 on page 31101 describes the output fields for the `traceroute mpls segment-routing isis` *`fec`* command and the `traceroute mpls segment-routing isis` *`fec`* `detail` commands. Output fields are listed in the approximate order in which they appear.

Table 1919: traceroute mpls ldp Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the `traceroute mpls ldp` *`fec`* command.	all levels
ttl	Time to live value of the labeled packet.	none specified
Label	Outgoing label used for forwarding the packet along the label-switched paths.	none specified
Protocol	Signaling protocol used. For this command, it is LDP.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is **null**.	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	**detail**
Parent	Address of the previous hop. Parent value for the first hop is **null**.	**detail**
Return Code	Return code for reporting the result of processing the echo request by the receiver.	**detail**
Response time	Time for the echo request to reach the receiver.	**detail**

Table 1919: traceroute mpls ldp Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is **none**.	**detail**
Label Stack	Label stack used to forward the packet.	**detail**

<wait seconds>
```

Description

Trace route to a remote host for a segment routing label-switched path added by the ISIS protocol. Use `traceroute mpls segment-routing isisp` as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

Options

algorithm ***algorithm-id*** (Optional) Specify the flexible algorithm identifier. The range of values is `0` through `255`. The default value is `0` which means no algorithm is configured. The *algorithm-id* in conjunction with the prefix is used to distinguish labelled SR paths.

fec Specify the IP address and optional prefix of the forwarding equivalence class (FEC).

destination ***ip-address*** (Optional) Specify the destination address to use when sending probes.

- **Values:** The destination IP address must be within the 127.0.0.0/8 IP address space for Operation, Administration, and Maintenance (OAM) packets.

detail (Optional) Display detailed output.

exp ***exp*** (Optional) Specify the class-of-service to use when sending probes.

- **Range:** 0 through 7
- **Default:** 7

fanout ***fanout-number*** (Optional) Specify the maximum number of nexthops to search per node.

- **Range:** 1 through 16
- **Default:** 16

logical-system (Optional) Specify the name of the logical system for the traceroute attempt.

no-resolve (Optional) Specify not to resolve the hostname that corresponds to the IP address.

paths *maximum-paths* (Optional) Specify the maximum number of paths to search.

- **Range:** 1 through 255
- **Default:** 16

retries *retries-number* (Optional) Specify the number of times to resend probe values.

- **Range:** 1 through 9
- **Default:** 3

routing-instance *routing-instance-name* (Optional) Specify the name of the routing instance for the traceroute attempt.

source *source-address* (Optional) Specify the source address of the outgoing traceroute packets.

ttl *value* (Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

- **Range:** 1 through 125
- **Default:** 64

wait *seconds* (Optional) Specify the number of seconds to wait before resending a probe.

- **Range:** 5 through 15
- **Default:** 10

Required Privilege Level

network

Output Fields

Table 1920 on page 31108 describes the output fields for the `traceroute mpls segment-routing isis` *`fec`* command and the `traceroute mpls segment-routing isis` *`fec`* `detail` commands. Output fields are listed in the approximate order in which they appear.

Table 1920: traceroute mpls ldp Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the `traceroute mpls ldp` *`fec`* command.	all levels
ttl	Time to live value of the labeled packet.	none specified
Label	Outgoing label used for forwarding the packet along the label-switched paths.	none specified
Protocol	Signaling protocol used. For this command, it is LDP.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is **null**.	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	**detail**
Parent	Address of the previous hop. Parent value for the first hop is **null**.	**detail**
Return Code	Return code for reporting the result of processing the echo request by the receiver.	**detail**
Response time	Time for the echo request to reach the receiver.	**detail**

Table 1920: traceroute mpls ldp Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is **none**.	**detail**
Label Stack	Label stack used to forward the packet.	**detail**

source | tunnel-source) >
```

Description

Trace route to a remote host for a segment routing label-switched path added by segment routing traffic-engineered (SPRING-TE) tunnel. Use `traceroute mpls segment-routing spring-te` as a debugging tool to locate MPLS label-switched path forwarding issues in a network.

Options

egress-ip Specify to trace to or install IP address to use when sending probes.

active	Specify to use the forwarding path or nexthops from the RIB table.
color	Specify the color identifier for the tunnel end-point. • **Range:** 1 through 4294967295
detail	(Optional) Display detailed output.
exp *exp*	(Optional) Specify the class of service to use when sending probes. • **Range:** 0 through 7
logical-system *logical-system-name*	(Optional) Specify the name of the logical system for the traceroute attempt.
no-resolve	Specify not to attempt to print addresses symbolically.
retries *retries-number*	(Optional) Specify the number of times to resend probe values. • **Range:** 1 through 9
routing-instance *routing-instance-name*	(Optional) Specify the name of the routing instance for the trace route attempt.
secondary	Specify to use configured secondary segment list for the given segment routing path.
segment-list	Specify the segment list to use when sending probes.
skip-fec-validation	Specify to skip forwarding equivalence class (FEC) validation or use NIL FEC.
source *source-address*	(Optional) Specify the source address of the outgoing traceroute packets.
ttl *value*	(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds. • **Range:** 1 through 255
tunnel-source	Specify the source protocol used to create tunnel.

label-stack

Specify the label stack for traceroute packets. This option works only if you do a minimum configuration of `source-packet-routing` at the `[edit protocols]` hierarchy level.

detail
(Optional) Display detailed output.

egress
Specify the egress IP address.

labels
Specify the labels in label stack.

- **Range:** 16 through 1048575

logical-system *logical-system-name*
(Optional) Specify the name of the logical system for the traceroute attempt.

nexthop-address *address*
Specify the nexthop IP address for the traceroute packet.

`nexthop-interface` *`interface`*
Specify the outgoing interface for the traceroute packet.

no-resolve
Specify not to attempt to print addresses symbolically.

source-routing-path

Specify the trace source path routing to use when sending probes.

lsp-name
Specify the source path routing name.

active
Specify to use the forwarding path or nexthops from the RIB table.

color
Specify the color identifier for the tunnel end-point.

- **Range:** 1 through 4294967295

detail
(Optional) Display detailed output.

egress-ip
Specify to trace to or install IP address to use when sending probes.

exp *exp*
(Optional) Specify the class of service to use when sending probes.

- **Range:** 0 through 7

logical-system *logical-system-name*
(Optional) Specify the name of the logical system for the traceroute attempt.

no-resolve
Specify not to attempt to print addresses symbolically.

retries *retries-number*
(Optional) Specify the number of times to resend probe values.

- **Range:** 1 through 9

secondary Specify to use configured secondary segment list for the given segment routing path.

segment-list Specify the segment list to use when sending probes.

skip-fec-validation Specify to skip forwarding equivalence class (FEC) validation or use NIL FEC.

source ***source-address*** (Optional) Specify the source address of the outgoing traceroute packets.

ttl ***value*** (Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

- **Range:** 1 through 255

Additional Information

NOTE: With `segment-list` option, valid `tunnel-source` (source protocol used to create tunnel) is only static.

NOTE: `segment-list` option is not present when `tunnel-source` is BGP-SR-TE since BGP-SR-TE does not have named segment list.

NOTE: With `source-routing-path` name, valid `tunnel-source` are PCEP and static.

NOTE: With `tunnel-source` as PCEP, `secondary` option is not valid as PCEP always sends one primary LSP.

NOTE: FEC validation is performed for `traceroute mpls segment-routing spring-te` by default.

NOTE: FEC validation is supported when segment-routing traffic-engineering (SR-TE) tunnel has IGP labels (OSPF and IS-IS) only. For all the other labels (for example, static, ldp, rsvp, etc.), you can use `skip-fec-validation` option.

NOTE: For a combination of `egress-ip` and `color` options, valid `tunnel-source` are static and BGP-SR-TE.

NOTE: `traceroute mpls segment-routing spring-te` command with `label-stack` option is supported in operational mode only. It is not supported in configuration mode.

NOTE: Parallel SID, binding SID, LDP over SR-TE is not supported.

NOTE: In case of `traceroute mpls segment-routing spring-te`, the PFE supports only 16 ECMP paths. If there more than 16 ECMP paths to the SR-TE LSP, traceroute is done up to a maximum of 16 hops.

Required Privilege Level

network

Output Fields

Table 1921 on page 31115 describes the output fields for the `traceroute mpls segment-routing spring-te` command. Output fields are listed in the approximate order in which they appear.

Table 1921: traceroute mpls spring-te Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the `traceroute mpls segment-routing spring-te` command.	all levels
ttl	Time to live value of the labeled packet.	none specified

Table 1921: traceroute mpls spring-te Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Label	Outgoing label used for forwarding the packet along the label-switched paths.	none specified
Protocol	Signaling protocol used. For this command, it is LDP.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is **null**.	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	**detail**
Parent	Address of the previous hop. Parent value for the first hop is **null**.	**detail**
Return Code	Return code for reporting the result of processing the echo request by the receiver.	**detail**
Response time	Time for the echo request to reach the receiver.	**detail**
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is **none**.	**detail**
Label Stack	Label stack used to forward the packet.	**detail**

Sample Output

traceroute mpls segment-routing spring-te

```
user@host> traceroute mpls segment-routing spring-te
Possible completions:

Release Information

Command introduced in Junos OS Release 20.2R1.

traceroute mpls segment-routing static egress-ip

IN THIS SECTION

- Syntax | 31122
- Description | 31122
- Options | 31122
- Additional Information | 31124
- Required Privilege Level | 31125
- Output Fields | 31125
- Sample Output | 31126
- Release Information | 31128

Syntax

```
traceroute mpls segment-routing static egress-ip
<egress-ip ( destination |  detail | exp | fanout | logical-system | no-resolve | retries |
routing-instance | source | ttl | wait) >
```

```
traceroute mpls segment-routing spring-te label-stack
<label-stack ( destination | detail | egress | exp | fanout | labels | logical-system | nexthop-
address | nexthop-interface | no-resolve | paths | retries | source | ttl | wait) >
```

Description

Use `traceroute mpls segment-routing static` as a debugging tool to locate MPLS label-switched path forwarding issues for prpd programmed network.

Options

egress-ip Specify to trace to or install IP address to use when sending probes.

destination Specify the destination address to use when sending probes.

detail (Optional) Display detailed output.

exp *exp* (Optional) Specify the class of service to use when sending probes.

- **Range:** 0 through 7

fanout*fanout* (Optional) Specify the maximum number of nexthops to search per node.

- **Range:** 1 through 64

logical-system *logical-system-name* (Optional) Specify the name of the logical system for the traceroute attempt.

no-resolve (Optional) Specify not to attempt to print addresses symbolically.

paths *paths* (Optional) Specify maximum number of paths to traverse.

- **Range:** 1 through 255

retries *retries-number* (Optional) Specify the number of times to resend probe values.

- **Range:** 1 through 9

source *source-address* (Optional) Specify the source address of the outgoing traceroute packets.

ttl *value* (Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

- **Range:** 1 through 255

wait*wait* (Optional) Specify the number of seconds to wait before resending the outgoing traceroute packets.

- **Range:** 5 through 15

label-stack Specify the label stack for traceroute packets.

detail (Optional) Display detailed output.

egress (Optional) Specify the egress IP address.

labels (Optional) Specify the labels in label stack.

- **Range:** 16 through 1048575

logical-system *logical-system-name*	(Optional) Specify the name of the logical system for the traceroute attempt.
nexthop-address *address*	(Optional) Specify the nexthop IP address for the traceroute packet.
nexthop-interface *interface*	(Optional) Specify the outgoing interface for the traceroute packet.
no-resolve	(Optional) Specify not to attempt to print addresses symbolically.
retries *retries-number*	(Optional) Specify the number of times to resend probe values. • **Range:** 1 through 9
source *source-address*	(Optional) Specify the source address of the outgoing traceroute packets.
ttl *value*	(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds. • **Range:** 1 through 255
wait *value*	(Optional) Specify the number of seconds to wait before resending probe. • **Range:** 5 through 15

Additional Information

NOTE: NIL FEC validation is supported. The FEC validation for SWAN ping and traceroute command is not supported.

NOTE: `traceroute mpls segment-routing spring-te` command with `label-stack` option is supported in operational mode only. It is not supported in configuration mode.

NOTE: Traceroute with label-stack option can be executed only once at a time

NOTE: In case of `traceroute mpls segment-routing spring-te`, the Packet Forwarding Engine supports only 16 ECMP paths. If there more than 16 ECMP paths to the LSP, you can perform traceroute to a maximum of 16 paths.

NOTE: Traceroute with `label-stack` option displays FEC stack sent as SPRING-TE. SPRING-TE implicitly means NIL FEC.

Required Privilege Level

network

Output Fields

The following table describes the output fields for the `traceroute mpls segment-routing static` command. Output fields are listed in the approximate order in which they appear.

Table 1922: traceroute mpls segment-routing static Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the `traceroute mpls segment-routing static` command.	all levels
ttl	Time to live value of the labeled packet.	none specified
Label	Outgoing label used for forwarding the packet along the label-switched paths.	none specified
Protocol	Signaling protocol used. For this command, it is static.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is **null**.	none specified

Table 1922: traceroute mpls segment-routing static Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	none specified
Previous Hop	Address of the previous hop in the label-switched path.	**detail**
FEC-Stack-Sent	FEC stack used to forward the packet.	**detail**

Sample Output

traceroute mpls segment-routing static ?

```
user@host> traceroute mpls segment-routing static ?
Possible completions:
     egress-ip                  To/Install IP address to use when sending probes
```

traceroute mpls segment-routing static (egress-ip)

Release Information

Command introduced in Junos OS Release 22.4R1.

traceroute overlay

IN THIS SECTION

- Syntax | 31129
- Description | 31129
- Options | 31130
- Required Privilege Level | 31132
- Output Fields | 31132

Sample Output | 31133
Release Information | 31134

Syntax

```
traceroute overlay
<tunnel-type>
vni vni
tunnel-src source-ip-address
tunnel-dst destination-ip-address
<mac mac-address>
<ttl value>
<hash source-udp-port>
<hash-input-interface input-interface>
<hash-source-mac source-mac-address>
<hash-destination-mac destination-mac-address>
<hash-source-address source-IP-address>
<hash-destination-address destination-IP-address>
<hash-vlan vlan-id>
<hash-protocol protocol-id>
<hash-source-port source-layer4-port>
<hash-destination-port destination-layer4-port>
```

Description

Display the route that packets take between two Virtual Extensible LAN (VXLAN) tunnel endpoints (VTEPs) and within the context of a VXLAN overlay segment. Use `traceroute overlay` as an isolation and debugging tool to locate points of failure within an overlay VXLAN tunnel. The output is useful for diagnosing a point of failure in the path from the device to the destination host, and for addressing network traffic latency and throughput problems.

NOTE: The `traceroute overlay` command is not supported for IPv6.

NOTE: The `traceroute overlay` command is not supported when there are multiple virtual-switch routing instances.

Options

tunnel-type

(Optional) Specify the overlay tunnel type used in a virtualized environment such as: VXLAN, Network Virtualization using Generic Routing Encapsulation (NVGRE), MPLS over User Datagram Protocol (UDP), and MPLS over General Routing Encapsulation (GRE) tunnels.

> **NOTE**: Only VXLAN overlay tunnel types are supported.

vni *vni*

Specify the VNI of the VXLAN overlay segment.

- **Range:** 1 through 16,777,215

tunnel-src *source-ip-address*

Specify the IP address of the source entity at end of the tunnel, such as the source VTEP.

tunnel-dst *destination-ip-address*

Specify the IP address of the destination entity at the end of the tunnel, such as the remote VTEP.

mac *mac-address*

(Optional) Include the physical or hardware address on the end host you are trying to reach.

ttl *value*

(Optional) Time-to-live (TTL) value to include as the maximum number of hops in the traceroute request.

For MX Series routers, the range of values is **0** through **255**. The default value is **255**.

- **Range:** (QFX Series, EX9200 switches) 1 through 255
- **Default:** 255

hash *source-udp-port*

(Optional) Specify the UDP source port. The range of values is **1** through **65,535**. Usage of this parameter will override all other hash-* parameters used to calculate the UDP source port.

hash-source-mac *source-mac-address*

(Optional) Specify the MAC address of the source end host.

> **NOTE**: The hash parameters provide values that correspond to a particular data flow that the `traceroute overlay` command debugs. Based on the values that you specify, the system calculates a VXLAN UDP header source port hash, which is included in the VXLAN UDP header of the overlay ping and traceroute packets.

Including the calculated hash in the VXLAN header enables the overlay ping and traceroute packets to emulate data packets in the flow that you are troubleshooting.

When using the hash parameters, we recommend that you specify a value for each parameter. The exception to this guideline is the hash-vlan parameter, which you do not have to use if the source endpoint is not a member of a VLAN. This practice ensures that the overlay ping and traceroute processes are successful and that the output for each command is accurate. If you do not specify a value for one or more of the hash parameters, the system sends an OAM request that might include incorrect hash values and generates a warning message.

Hash computation supports TCP and UDP protocols only.

hash-destination-mac *destination-mac-address*
(Optional) Specify the MAC address of the destination end host.

hash-source-address *source-IP-address*
(Optional) Specify the IP address of the source end host.

hash-destination-address *destination-IP-address*
(Optional) Specify the IP address of the destination end host.

hash-vlan *vlan-id*
(Optional, QFX Series switches only) Specify the VLAN ID of the end host.

- **Range:** 1 through 4094

hash-input-interface *interface-name*
(Optional, QFX Series switches only) Specify the ingress interface of the flow on the Juniper Networks device.

hash-protocol *protocol-id*
(Optional) Specify the TCP/UDP IP protocol ID of the end host.

- **Range:** 1 through 255

hash-source-port *source-layer4-port*
(Optional) Specify the Layer 4 source port of the end host.

- **Range:** 1 through 65,535

hash-destination-port *destination-layer4-port*
(Optional) Specify the Layer 4 destination port of the end host.

- **Range:** 1 through 65,535

Required Privilege Level

network

Output Fields

Use the `traceroute overlay` command to determine overlay segments within a VXLAN tunnel. The output is useful for diagnosing a point of failure in the path from the device to the destination host, and for addressing network traffic latency and throughput problems.

Table 1923 on page 31132 lists the output fields for the `traceroute overlay` command. Output fields are listed in the approximate order in which they appear.

Table 1923: traceroute overlay Output Fields

Field Name	Field Description
vni	The VNI of the VXLAN overlay segment.
tunnel src ip	The IP address of the source end of the tunnel.
tunnel dst ip	The IP address of the destination end of the tunnel.
mac address	The physical or hardware address of the end host you are trying to reach.
ttl	TTL value for the maximum number of hops in the traceroute request.
hash-parameters	The hash parameters provide the input interface, source MAC address, destination MAC address, source IP address, destination IP address, and the VLAN ID of the two end hosts within an overlay segment. Hash parameters enable platform-specific hash computation to use as the source port in the outer UDP header.
ttl	Number of hops remaining in the traceroute message. The TTL is decremented at each hop.
Address	The sending IPv4 address.

Table 1923: traceroute overlay Output Fields *(Continued)*

Field Name	Field Description
Sender Timestamp	Timestamp in microseconds when hop was sent.
Receiver Timestamp	Timestamp in microseconds when hop was received.
Response Time	Time in microseconds for traceroute to respond.

Sample Output

run traceroute overlay

```
user@host> traceroute overlay tunnel-type vxlan vni 100 tunnel-src 192.0.2.10 tunnel-dst

traceroute srv6 spring-te micro-sids-stack

IN THIS SECTION

- Syntax | 31134
- Description | 31135
- Options | 31135
- Required Privilege Level | 31136
- Release Information | 31136

Syntax

```
traceroute srv6 spring-te micro-sids-stack usids ipv6addr nexthop-interface nexthop-interface
nexthop-address ipv6addr
```

```
<logical-system>
<retries>
<source ipv6addr>
<tos>
<no-resolve>
<routing-instance routing-instance>
<ttl>
<wait>
<probe-icmp>
```

Description

Performs hop-by-hop path tracing over an SRv6 SPRING-TE path using a user-defined stack of micro Segment Identifiers (uSIDs). The command provides visibility into the SRv6 forwarding path and aids in fault localization.

Traceroute over micro-SID stacks enables operational verification of intermediate hops and behavior across an SRv6 TE path.

Options

logical-system	(Optional) Name of logical system.
usids	Sequence of micro Segment Identifiers defining the segment stack - [usid0 ... usidn(top)].
nexthop-interface	Interface used to send traffic to the next-hop.
nexthop-address	Destination IPv6 next-hop address.
retries	(Optional) Number of times to resend probe.
source	(Optional) Source IPv6 address to use when sending probes.
tos	(Optional) IPv6 type-of-service value.
no-resolve	(Optional) Don't attempt to print addresses symbolically.
routing-instance	(Optional) Name of routing instance for traceroute attempt.
ttl	(Optional) Maximum time-to-live value.
wait	(Optional) Number of seconds to wait before resending probe.

probe-icmp (Optional) Use ICMP echo request for probes.

Required Privilege Level

network

Release Information

Command introduced in Junos OS Release 23.4R1.

traceroute srv6

IN THIS SECTION

- Syntax | 31136
- Description | 31138
- Options | 31138
- Required Privilege Level | 31139
- Output Fields | 31139
- Sample Output | 31140
- Release Information | 31141

Syntax

```
root@host> traceroute srv6 isis ?
Possible completions:
  <host>               IPv6 loopback address or SRv6 SID of remote host
  logical-system       Name of logical system
  no-resolve           Don't attempt to print addresses symbolically
  probe-icmp           Use ICMP echo request for probes
  retries              Number of times to resend probe (1..9)
  routing-instance     Name of routing instance for traceroute attempt
  source               Source IPv6 address to use when sending probes
```

```
  tos                   IPv6 type-of-service value (0..255)
  ttl                   Maximum time-to-live value (1..255)
  wait                  Number of seconds to wait before resending probe (5..15)
```

```
route@host> traceroute srv6 spring-te sids-stack ?
Possible completions:
  logical-system       Name of logical system
  nexthop-address      Nexthop IP address for the traceroute packet
  nexthop-interface    Outgoing interface for the traceroute packet
  no-resolve           Don't attempt to print addresses symbolically
  probe-icmp           Use ICMP echo request for probes
  retries              Number of times to resend probe (1..9)
  routing-instance     Name of routing instance for traceroute attempt
+ sids                 SRv6 SIDs in srv6-stack - [sid0 sid1 sid2 ... sidn(top)]
  source               Source IPv6 address to use when sending probes
  tos                  IPv6 type-of-service value (0..255)
  ttl                  Maximum time-to-live value (1..255)
  wait                 Number of seconds to wait before resending probe (5..15)
```

```
root@host> traceroute srv6 spring-te sids-stack sids [sidvalue] nexthop-address <nh-addr>
nexthop-interface <if-name> ?
Possible completions:
  <[Enter]>            Execute this command
  logical-system       Name of logical system
  no-resolve           Don't attempt to print addresses symbolically
  probe-icmp           Use ICMP echo request for probes
  retries              Number of times to resend probe (1..9)
  routing-instance     Name of routing instance for traceroute attempt
+ sids                 SRv6 SIDs in srv6-stack - [sid0 sid1 sid2 ... sidn(top)]
  source               Source IPv6 address to use when sending probes
  tos                  IPv6 type-of-service value (0..255)
  ttl                  Maximum time-to-live value (1..255)
  wait                 Number of seconds to wait before resending probe (5..15)
  |                    Pipe through a command
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

An SRv6 segment is a 128-bit value Segment Identifier (SID) often used as a shorter reference for SRv6 Segment. Traceroute to a SID is used for hop-by-hop fault localization and to trace path to a SID.

Options

logical-system	(Optional) Specify the name of the logical system for the traceroute attempt.
no-resolve	(Optional) Indicates not to attempt to print addresses symbolically.
probe-icmp	(Optional) ICMP echo request for probes.
retries *retries-number*	(Optional) Specify the number of times to resend probe values. • **Range:** 1 through 9 • **Default:** 3
routing-instance *routing-instance-name*	(Optional) Specify the name of the routing instance for the traceroute attempt.
source *source-address*	(Optional) Specify the source IPv6 address to use when sending probes. .
tos *value*	(Optional) Specify the IPv6 type-of-service value. • **Range:** 0 through 225
ttl *value*	(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds. • **Range:** 1 through 125 • **Default:** 64

wait *seconds*	(Optional) Specify the number of seconds to wait before resending a probe. • **Range:** 5 through 15 • **Default:** 10
nexthop-address *address*	Specify the nexthop IP address for the traceroute packet.
nexthop-interface *interface-name*	Specify the outgoing interface for the traceroute packet. .
sids *interface-name*	Specify the SRv6 SIDs in srv6-stack - [sid0 sid1 sid2 ... sidn(top)]. .

network

Output Fields

"traceroute srv6" on page 31136 describes the output fields for the `traceroute srv6 isis` command and the `traceroute srv6 spring-te sids-stack` commands. Output fields are listed in the approximate order in which they appear.

Table 1924: Output Fields for traceroute srv6 spring-te sids-stack

Field Name	Field Description
host	IPv6 loopback address or SRv6 SID of remote host.
source	Source address used when you send probes.
tos	Value for IPv6 type-of-service.
wait	Number of seconds to wait before resending probe.
destination address	destination-address for the traceroute packet.
ttl	Maximum time to live value.

Table 1924: Output Fields for traceroute srv6 spring-te sids-stack *(Continued)*

Field Name	Field Description
retries	Number of times to resend the probe.
Source address	Source IP address for traceroute attempt.
depth	Time to live value of the packet.
probe address	Address of the next-hop.
round trip time	Total time for a packet to travel from source to destination and back to source again.
status	Return code for reporting the result of processing the echo request by the receiver.
DA	Destination address to trace.
SRH	Updated Segment routing header.

Sample Output

Output for ISIS SRv6

```
user@router>traceroute srv6 isis 3000::1
traceroute to destination 3000::1, from source abcd::128:207:222:159, 64 hops max, retries 3

 1   ::10.1.1.1   3.543 ms   1.871 ms   2.793 ms
     DA: 3000::1
 2   ::20.1.1.2   2.610 ms   2.847 ms   2.462 ms
     DA: 3000::1
 3   ::30.1.1.3   4.639 ms   4.044 ms   4.303 ms
     DA: 3000::1

Traceroute status: Success
```

Output for SRv6 spring-te sids-stack

```
user@router>traceroute srv6 spring-te sids-stack sids [4000::1 3000::1] nexthop-interface
ge-0/0/0.0 nexthop-address ::10.1.1.1
traceroute to destination 4000::1, from source abcd::128:207:222:159, 64 hops max, retries 3

 1   ::10.1.1.1   2.702 ms   1.617 ms   1.481 ms
     DA: 3000::1
     SRH: (4000::1, 3000::1, SL = 1)
 2   ::20.1.1.2   2.345 ms   2.226 ms   2.381 ms
     DA: 3000::1
     SRH: (4000::1, 3000::1, SL = 1)
 3   ::30.1.1.3   3.448 ms   2.951 ms   3.079 ms
     DA: 3000::1
     SRH: (4000::1, 3000::1, SL = 1)
 4   ::30.1.1.2   2.911 ms   2.864 ms   3.212 ms
     DA: 4000::1
 5   ::20.1.1.1   4.349 ms   3.455 ms   3.921 ms
     DA: 4000::1

Traceroute status: Success
```

Release Information

Command introduced in Junos OS Release 22.3R1.

```

Description

Display the route that packets take to a specified network host. Use `traceroute` as a debugging tool to locate points of failure in a network.

> **NOTE**: The Junos OS Evolved `traceroute` command parses data in the same way as the Linux `traceroute` command, so the output is different compared to Junos OS. See the "Sample Output" on page 31146 section for more details.

Options

host	IP address or name of remote host.
as-number-lookup	(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.
bypass-routing	(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.

ce-ip *IPv4 or IPv6 address*	(MX Series routers with MPC and MIC interfaces only) (Optional) Check the route to a customer edge (CE) IP address in a virtual private LAN service (VPLS) and Ethernet VPN (EVPN) network.
clns	(Optional) Trace the route belonging to Connectionless Network Service (CLNS).
ethernet *host*	(Optional) Trace the route to an Ethernet host using unicast MAC address.
extension	(Optional) Trace ICMP extensions
gateway *address*	(Optional) Address of a router or switch through which the route transits.
inet | inet6	(Optional) Trace the route belonging to IPv4 or IPv6, respectively.
interface *interface-name*	(Junos OS only) (Optional) Name of the interface over which to send packets.
logical-system (all | *logical-system-name***)**	(Optional) This option is not supported for Junos OS Evolved Release 18.3R1. Perform this operation on all logical systems or on a particular logical system.
tenant *tenant-name*	(Optional) Name of a particular tenant system for traceroute attempt.
monitor *host*	(Optional) Display real-time monitoring information for the specified host.
mpls (ldp *FEC address* **| rsvp** *label-switched-path name***)**	(Optional) See `traceroute mpls ldp` and `traceroute mpls rsvp`.
next-hop	The next-hop through which to send packets to a destination.
no-resolve	(Optional) Do not attempt to determine the hostname that corresponds to the IP address.
overlay	(Optional) Traceroute overlay path.
port	(Optional) Base port number to use in traceroute probes.
propagate-ttl	(Optional) On the PE routing device, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only. Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the `no-proagate-ttl` configuration statement.

> **NOTE**: Using `propagate-ttl` with `traceroute` on the CE router does not show hop-by-hop information.

routing-instance *routing-instance-name*	(Optional) Name of the routing instance for the traceroute attempt.
source *source-address*	(Optional) Source address of the outgoing traceroute packets.
tos *value*	(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is `0` through `255`.
ttl *value*	(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is `0` through `128`.
wait *seconds*	(Optional) Maximum time to wait for a response to the traceroute request.

The remaining statements are explained separately. See CLI Explorer.

network

Output Fields

Table 1925 on page 31145 describes the output fields for the `traceroute` command. Output fields are listed in the approximate order in which they appear.

Table 1925: traceroute Output Fields

Field Name	Field Description
`traceroute to`	IP address of the receiver.
`hops max`	Maximum number of hops allowed.
`byte packets`	Size of packets being sent.
`number-of-hops`	Number of hops from the source to the named router or switch.

Table 1925: traceroute Output Fields *(Continued)*

Field Name	Field Description
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.
Round trip time	Average round-trip time, in milliseconds (ms).

Sample Output

traceroute

```
user@host> traceroute santacruz
traceroute to host1.example.com (10.156.169.254), 30 hops max, 40 byte packets
 1  blue23 (10.168.1.254)    2.370 ms  2.853 ms  0.367 ms
 2  red14  (10.168.255.250)  0.778 ms  2.937 ms  0.446 ms
 3  yellow (10.156.169.254)  7.737 ms  89.905 ms  0.834 ms

traceroute (Junos OS Evolved, Through an MPLS LSP)

The Junos OS Evolved `traceroute` command parses MPLS data in the same way as the Linux `traceroute` command: L=label, E=exp_use, S=stack_bottom, and T=TTL. In the example below, `T=1/L=16` indicates the TTL with label 16.

```
user@host> traceroute 192.0.2.50 ttl 255
traceroute to 192.0.2.50 (192.0.2.50), 255 hops max, 60 byte packets

tracing

IN THIS SECTION

- Syntax | 31149
- Hierarchy Level | 31150
- Description | 31150
- Options | 31150
- Required Privilege Level | 31150
- Release Information | 31150

Syntax

```
tracing {
    destination-override syslog host ip-address;
}
```

Hierarchy Level

```
[edit system]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure the router to enable remote tracing to a specified host IP address. The default setting is disabled.

The following processes are supported:

- chassisd—Chassis-control process
- eventd—Event-processing process
- cosd—Class-of-service process
- spd—Adaptive-services process

You can use the `no-remote-trace` statement, under the `[edit system process-name traceoptions]` hierarchy, to disable remote tracing.

Options

`destination-override syslog host` *`ip-address`*—Overrides the global config under `system tracing` and has no effect if `system tracing` is not configured.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

[edit protocols mpls label-switched-path lsp-name secondary path-name oam performance-monitoring
querier delay]
```

Description

Configure traffic class specific options.

Specify the traffic classes for which loss measurement has to be performed. This parameter takes one of the *tc-all|tc-0|tc-1|tc-2|tc-3|tc-4|tc-5|tc-6|tc-7|tc-none* traffic-class values. For each traffic class, you can configure the respective parameters.

To enable traffic-class parameters, configure the `traffic-class-statistics` configuration statement under the `[edit protocol mpls statistic]` hierarchy level.

Options

average-sample-size *sample size* (Optional) Specify the number of samples used for calculating the average of various metrics.

- **Default:** 5
- **Range:** 1 through 30

padding-size *size* (Optional) Specify the delay-measurement message length, which is used to calculate the delay experienced by messages of different sizes.

- **Default:** 0
- **Range:** 1 through 1500

query-interval *milliseconds* Specify the minimum transmit interval, which signifies how often the loss measurement message is generated from the querier.

- **Default:** 10 seconds
- **Range:** 1000 through 4294967295 milliseconds

rtt-delay-threshold *rtt threshold value* Specify the round-trip delay threshold value.

- **Range:** 1 through 4294967295 microseconds

twcd-delay-threshold *twcd threshold value* Specify the two-way channel delay threshold value.

- **Range:** 1 through 4294967295 microseconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

Syntax

```
traffic-class traffic-class-value;
```

Hierarchy Level

```
[edit interfaces gre-interface name unit unit number  tunnel ]
[edit logical-systems logical-system-name interfaces gre-interface-name unit unit number  tunnel]
```

Description

Configure a static ToS/Traffic Class value in the IPv4/IPv6 header, respectively, of a GRE tunnel. This can be useful, for example, when you want to apply a different classification to port-mirrored traffic than the source traffic.

This setting overrides ToS reflection set by copying the inner IP header's ToS value to the outer IP packet header.

> **NOTE**: If rewrite rules are configured on the egress WAN interface, those rewrite rules will overwrite this setting. Therefore the `traffic-class` setting only makes sense when no rewrite rules are configured.

Options

traffic-class-value

The value represents the entire 8-bit differentiated services (DS) field in the IP header, and should be chosen based on the desired DSCP/IP precedence value. For example, if a DSCP value of `111000` is desired, then configure the `traffic-class` value to be `224` (corresponding to `111000 00`).

}
```

Hierarchy Level

```
[edit class-of-service interfaces interface-name ]
```

Description

Associate traffic class maps with an interface.

Options

`dscp`—DSCP traffic class map; applies to both IPv4 and IPv6 traffic.

`exp`—MPLS EXP traffic class map.

`ieee-802.1`—IEEE 802.1 traffic class map.

`ieee-802.1ad`—IEEE 802.1ad traffic class map.

`inet-precedence`—IPv4 precedence traffic class map.

`traffic-class-map-name`—Name of the input priority map.

`vlan-tag inner`—Traffic class map based on the inner VLAN tag to be associated with an interface. By default, the outer VLAN tag is associated with an interface.

`vlan-tag outer`—Traffic class map based on the outer VLAN tag to be associated with an interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

    }
}
```

Hierarchy Level

```
[edit class-of-service]
```

Description

Define the traffic class map for a packet on the basis of the CoS code points.

Traffic class map is a user-configurable input priority map that helps prioritize and classify traffic entering a Packet Forwarding Engine during ingress oversubscription. You can define traffic class maps for a packet on the basis of the following CoS code points:

- Differentiated Services code point (DSCP) for IP DiffServ
- IP precedence bits
- MPLS EXP bits
- IEEE 802.1 bits
- IEEE 802.1ad drop eligible indicator (DEI) bits

You can associate the code point values to one of the following traffic classes:

- Real-time
- Network control
- Best-effort

Options

`dscp`—DSCP traffic class map. Applies to both IPv4 and IPv6 traffic.

`exp`—MPLS EXP traffic class map.

`ieee-802.1`—IEEE 802.1 traffic class map.

`ieee-802.1ad`—IEEE 802.1ad traffic class map.

`inet-precedence`—IPv4 precedence traffic class map.

`traffic-class-map-name`—Name of the input priority map.

`traffic-class best-effort`—Map code points to a best-effort traffic class.

`traffic-class network-control`—Map code points to a network control traffic class.

`traffic-class real-time`—Map code points to a real-time traffic class.

`code-points` *[code-point-alias | code-point-value]*—List of code point aliases and bit strings.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

Description

ACX Series Routers

Configure traffic-shaping profiles.

NOTE: For CoS on ACX6360-OR, see the documentation for the PTX1000.

EX Series (Except EX4600), M Series, MX Series, T Series, and PTX Series Routers

For Gigabit Ethernet IQ, Channelized IQ PICs, FRF.15 and FRF.16 LSQ interfaces, Enhanced Queuing (EQ) DPCs, and PTX Series routers only, configure traffic shaping and scheduling profiles. For Enhanced EQ PICs, EQ DPCs, and PTX Series routers only, you can include the `excess-rate` statement.

QFX Series QFabric, OCX1100, EX4600, NFX Series

Configure traffic shaping and scheduling profiles for forwarding class sets (priority groups) to implement enhanced transmission selection (ETS) or for logical interfaces.

Options

profile-name—Name of the traffic-control profile. This name is also used to specify an output traffic control profile.

The remaining statements are explained separately. See CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement was introduced in Junos OS Release 7.6 (EX series, M series, MX series, T series, and PTX series devices).

Statement was introduced in Junos OS Release 11.1 for the QFX Series.

Statement was introduced in Junos OS Release 12.3 for ACX series routers.

Statement was introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

traffic-engineering {
    <advertise-unnumbered-interfaces>;
    <credibility-protocol-preference>;
    ignore-lsp-metrics;
    multicast-rpf-routes;
    no-topology;
    l3-unicast-topology;
    shortcuts {
        lsp-metric-into-summary;
    }
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols (ospf | ospf3)],
[edit protocols (ospf | ospf3)]
```

Description

Enable the OSPF traffic engineering features.

Default

Traffic engineering support is disabled.

Options

`advertise-unnumbered-interfaces`—(Optional) (OSPFv2 only) Include the link-local identifier in the link-local traffic-engineering link-state advertisement. This statement must be included on both ends of an unnumbered link to allow an ingress LER to update the link in its traffic engineering database and use it for CSPF calculations. The link-local identifier is then used by RSVP to signal unnumbered interfaces as defined in RFC 3477.

`credibility-protocol-preference`—(Optional) (OSPFv2 only) Use the configured preference value for OSPF routes to calculate the traffic engineering database credibility value used to select IGP routes. Use this statement to override the default behavior, in which the traffic engineering database prefers IS-IS routes even if OSPF routes are configured with a lower, that is, preferred, preference value. For example, OSPF routes have a default preference value of 10, whereas IS-IS Level 1 routes have a default preference value of 15. When protocol preference is enabled, the credibility value is determined by deducting the protocol preference value from a base value of 512. Using default protocol preference values, OSPF has a credibility value of 502, whereas IS-IS has a credibility value of 497. Because the traffic engineering database prefers IGP routes with the highest credibility value, OSPF routes are now preferred.

`ignore-lsp-metrics`—(Optional) Ignore RSVP LSP metrics in OSPF traffic engineering shortcut calculations.

`multicast-rpf-routes`—(Optional) (OSPFv2 only) Install routes for multicast RPF checks into the inet.2 routing table. The inet.2 routing table consists of unicast routes used for multicast RPF lookup. RPF is an antispoofing mechanism used to check whether the packet is coming in on an interface that is also sending data back to the packet source.

> **NOTE**: You must enable OSPF traffic engineering shortcuts to use the `multicast-rpf-routes` statement. You must not allow LSP advertisements into OSPF when configuring the `multicast-rpf-routes` statement.

`no-topology`—(Optional) (OSPFv2 only) Disable the dissemination of the link-state topology information.

`l3-unicast-topology`—Download IGP topology information into the traffic engineering database (TED). In Junos OS, the IGPs install topology information into a database called the traffic engineering database. The traffic engineering database contains the aggregated topology information. The IGP routes are installed by the traffic engineering database on behalf of the corresponding IGP into a user-visible routing table called lsdist.0, subject to route policies.

The remaining statements are explained separately. See CLI Explorer.

CAUTION: When the OSPF traffic engineering configuration is considerably modified, the routing table entries are deleted and the routing table is recreated. Changes to configuration that can cause this behavior include enabling or disabling:

- Traffic engineering shortcuts
- IGP shortcuts
- LDP tunneling
- Multiprotocol LSP
- Advertise summary metrics
- Multicast RPF routes

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Description

Configure traffic engineering properties for IS-IS.

IS-IS always performs shortest-path-first (SPF) calculations to determine next hops. For prefixes reachable through a particular next hop, IS-IS places that next hop for that prefix in the inet.0 routing table. In addition, for routers running MPLS, IS-IS installs the prefix for IPv4 routes in the inet.3 routing table as well. The inet.3 table, which is present on the ingress router, contains the host address of each MPLS label-switched path (LSP) egress router. BGP uses this routing table to resolve next-hop addresses.

If you enable IS-IS traffic engineering shortcuts and if there is a label-switched path to a point along the path to that prefix, IS-IS installs the prefix in the inet.3 routing table and uses the LSP as a next hop. The net result is that for BGP egress routers for which there is no LSP, BGP automatically uses an LSP along the path to reach the egress router.

In Junos OS Release 9.3 and later, IS-IS traffic engineering shortcuts support IPv6 routes. LSPs to be used for shortcuts continue to be signaled using IPv4. However, by default, shortcut routes calculated through IPv6 routes are added to the inet6.3 routing table. The default behavior is for only BGP to use LSPs in its calculations. If you configure MPLS so that both BGP and interior gateway protocols use LSPs for forwarding traffic, shortcut routes calculated through IPv6 are added to the inet6.0 routing table. IS-IS ensures that the IPv6 routes running over the IPv4 MPLS LSP are correctly de-encapsulated at the tunnel egress by pushing an extra IPv6 explicit null label between the IPv6 payload and the IPv4 transport label.

RSVP LSPs with a higher preference than IS-IS routes are not considered during the computation of traffic engineering shortcuts.

To configure IS-IS so that it uses LSPs as shortcuts when installing information in the inet.3 or inet6.3 routing table, include the following statements:

```
family inet {
    shortcuts {
        multicast-rpf-routes;
    }
}
family inet6 {
    shortcuts;
}
```

For IPv4 traffic, include the `inet` statement. For IPv6 traffic, include the `inet6` statement.

To configure IPv4 MPLS or IPv6 MPLS shortcuts explicitly for segment routing, include the `inet-mpls` statement for IPv4 MPLS traffic and the `inet6-mpls` statement for IPv6 MPLS traffic.

To configure load balancing across multiple LSPs, include the `multipath` statement.

When traffic engineering shortcuts are used, RSVP first looks at the `metric2` value, which is derived from the IGP cost. After this, RSVP considers the LSP metric value. So, if a certain path changes for an LSP and the cost changes, not all LSPs are used to load- balance the network.

When a route with an improved metric is added to the IS-IS internal routing table, IS-IS flushes all next-hop information (including LSP next-hop information) for a route. This is undesirable, because certain equal-cost multipath (ECMP) combinations can be lost during route calculation. To override this default behavior for load balancing, include the `lsp-equal-cost` statement to retain the equal cost path information in the routing table.

```
multipath {
    lsp-equal-cost;
}
```

Because the inet.3 routing table is present only on ingress routers, you can configure LSP shortcuts only on these routers.

Default

IS-IS traffic engineering support is enabled.

By default, IS-IS supports traffic engineering by exchanging basic information with the traffic engineering database. To disable this support, and to disable IS-IS shortcuts if they are configured, include the `disable` statement.

Options

advertisement Advertise TE parameters even if RSVP is not turned on.

credibility-protocol-preference Specify that IS-IS should use the configured protocol preference for IGP routes to determine the traffic engineering database credibility value. By default, the traffic engineering database prefers IS-IS routes even when the routes of another IGP are configured with a lower, that is, more preferred value. Use this statement to override this default behavior.

The traffic engineering database assigns a credibility value to each IGP and prefers the routes of the IGP with the highest credibility value. In Junos OS Release 9.4 and later, you can configure IS-IS to take protocol preference into account to determine the traffic engineering database credibility value. When protocol preference is used to determine the credibility value, IS-IS routes are not automatically preferred by the

traffic engineering database, depending on your configuration. For example, OSPF routes have a default preference value of 10, whereas IS-IS Level 1 routes have a default preference value of 15. When protocol preference is enabled, the credibility value is determined by deducting the protocol preference value from a base value of 512. Using default protocol preference values, OSPF has a credibility value of 502, whereas IS-IS has a credibility value of 497. Because the traffic engineering database prefers IGP routes with the highest credibility value, OSPF routes are now preferred.

NOTE: This feature is also supported for OSPFv2.

disable

At the `[edit protocols isis traffic-engineering]` hierarchy level, disable IS-IS support for traffic engineering. By default, IS-IS support for traffic engineering is enabled.

ignore-lsp-metrics

Ignore the metrics for RSVP label-switched paths (LSPs) in IS-IS traffic engineering shortcut calculations or when you configure LDP over RSVP LSPs. If you are using RSVP for traffic engineering, you can run LDP simultaneously to eliminate the distribution of external routes in the core. The LSPs established by LDP are tunneled through the LSPs established by RSVP. LDP effectively treats the traffic-engineered LSPs as single hops. Ignoring the metric of RSVP LSPs avoids mutual dependency between IS-IS and RSVP, eliminating the time period when the RSVP metric used for tunneling traffic is not up to date.

ipv6

Configure IS-IS traffic engineering to store IPv6 information in the traffic engineering database (TED) in addition to IPv4 addresses. BGP-LS distributes this information as routes from the TED to the lsdist.0 routing table using the TED import policies. These routes are advertised to BGP-TE peers as network layer reachability information (NLRI) with IPv6 router ID type, length, and value (TLV).

multipath

Enable load balancing for multiple LSPs.

lsp-equal-cost

Configure LSPs to be retained as equal cost paths for load balancing when a better route metric is added to the routing table.

When a route with an improved metric is added to the IS-IS internal routing table, IS-IS flushes all next-hop information (including LSP next-hop information) for a route. This is undesirable, because certain equal-cost multipath (ECMP) path combinations can be lost during route calculation. To override this default IS-IS behavior, include the `lsp-equal-cost` statement for load balancing, so that the equal cost path information is retained in the routing table.

l3-unicast-topology

Download IGP topology information into the traffic engineering database (TED). In Junos OS, the IGPs install topology information into a database called the traffic engineering database. The traffic engineering database contains the aggregated topology information. The IGP routes are installed by the traffic engineering database on behalf of the corresponding IGP into a user-visible routing table called lsdist.0, subject to route policies.

> **NOTE**: In earlier Junos releases the `l3-unicast-topology` option was referred to as `igp-topology`. The `igp-topology` syntax is deprecated.

tunnel-source-protocol

Enable SR-TE tunnel support.

shortcuts

Configure IS-IS to use MPLS label-switched paths (LSPs) as next hops if possible when installing routing information into the inet.3 or inet6.3 routing table. Internal gateway protocol (IGP) shortcuts allow the IGP to install prefixes in inet.3 or inet6.3. It is only necessary to enable IGP shortcuts on the ingress router because that is the router performing the shortest-path-first (SPF) calculations.

It is important to understand how IGP shortcuts affect the protocol and routing table relationship. The IGP performs SPF calculations to subnets downstream of LSP egress points, but the results of these calculations are entered into the inet.3 table only. At the same time, the IGP performs its traditional SPF calculations and enters the results of these calculations into the inet.0 table. The result is that although the IGP is making entries into the inet.3 table, BGP is still the only protocol with visibility into that table for the purposes of route resolution. Therefore, forwarding to AS-internal destinations still uses the inet.0 IGP routes, and the LSPs are only used for BGP next-hop resolution. If you want the LSPs to be used for IGP next-hop resolution, you must configure `traffic-engineering bgp-igp`.

multicast-rpf-routes

Install unicast IPv4 routes into the multicast routing table (inet.2) for multicast reverse-path-forwarding (RPF) checks. Traffic engineering shortcuts must be enabled. IPv4 multicast topology must not be enabled. Label-switched paths (LSPs) must not be advertised into IS-IS.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for the `family` statement introduced in Junos OS Release 9.3.

Support for the `credibility-protocol-preference` statement introduced in Junos OS Release 9.4.

Support for the `multipath` statement introduced in Junos OS Release 9.6.

Support for the `lsp-equal-cost` statement introduced in Junos OS Release 9.6.

Support for `inet-mpls` and `inet6-mpls` statements introduced in Junos OS Release 17.2 for MX Series, PTX Series, QFX5100 switches, and QFX10000 line switches.

Support for `inet-mpls` and `inet6-mpls` statements introduced in Junos OS Release 17.3 for QFX5110 and QFX5200 switches.

Support for `igp-topology` statement introduced in Junos OS Release 17.4R1 for MX Series, and PTX Series. The `igp-topology` syntax is now deprecated. Current Junos releases use the `l3-unicast-topology` statement.

`ipv6` option introduced in Junos OS Release 20.4R1.

```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

Description

Select whether MPLS performs traffic engineering on BGP destinations only or on both BGP and IGP destinations. Affects only LSPs originating from this routing device, not transit or egress LSPs.

Default

`bgp`

Options

`bgp`—On BGP destinations only. Ingress routes are installed in the inet.3 routing table.

`bgp-igp`—On both BGP and IGP destinations. Ingress routes are installed in the inet.0 routing table. If IGP shortcuts are enabled, the shortcut routes are automatically installed in the inet.0 routing table.

`bgp-igp-both-ribs`—On both BGP and IGP destinations. Ingress routes are installed in the inet.0 and inet.3 routing tables. This option is used to support VPNs.

`mpls-forwarding`—On both BGP and IGP destinations. Use ingress routes for forwarding only, not for routing.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

```

Description

Enable CoS queuing, scheduling, and shaping.

> **NOTE**: Committing changes to `traffic-manager` automatically restarts any necessary components (PICs, DPCs, or FPCs).

Options

`buffer-monitor-enable`

Enable port buffer monitoring. Buffer utilization data is collected in one-second intervals and compared with the data from the previous interval. The larger value is kept to keep track of peak buffer occupancy for each queue or priority group.

When this option is enabled, running the command **show interfaces priority-group *interface-name* buffer-occupancy** or **show interfaces queue *interface-name* buffer-occupancy** displays the peak buffer occupancy for the priority group or queues since the last time the command was run. This peak value is reset each time the command is executed.

`queue-threshold`

Enable monitoring of Fabric and WAN queues. When the `fabric-queue` statement is configured, an SNMP trap is generated whenever the fabric power utilization exceeds the configured threshold value.

When `wan-queue` is configured, an SNMP trap is generated whenever the WAN queue depth exceeds the configured threshold value.

`egress-shaping-overhead` *`number`*

When traffic management (queueing and scheduling) is configured on the egress side, the number of CoS shaping overhead bytes to add to the packets on the egress interface.

Replace *`number`* with a value from `-63` through `192` bytes.

For vSRX Virtual Firewall, replace *`number`* with a value from `-62` through `192` bytes.

> **NOTE**: The L2 headers (DA/SA + VLAN tags) are automatically a part of the shaping calculation.

ingress-shaping-overhead *number*

When L2TP session shaping is configured, the number of CoS shaping overhead bytes to add to the packets on the ingress side of the L2TP tunnel to determine the shaped session packet length.

When session shaping is not configured and traffic management (queueing and scheduling) is configured on the ingress side, the number of CoS shaping overhead bytes to add to the packets on the ingress interface.

Replace *number* with a value from `-63` through `192` bytes.

mode

Configure CoS traffic manager mode of operation. This option has the following suboptions:

- `egress-only`—Enable CoS queuing and scheduling on the egress side for the PIC that houses the interface. This is the default mode.

  > **NOTE**: If ingress packet drops are observed at a high rate for a PIC, configure the `traffic-manager` statement to work in the `egress-only` mode.

- `ingress-and-egress`—Enable CoS queueing and scheduling on both the egress and ingress sides for the PIC.

  > **NOTE**:
  >
  > - For EQ DPCs, you must configure the `traffic-manager` statement with `ingress-and-egress` mode to enable ingress CoS on the EQ DPC.
  > - EQ DPCs have 250 ms of buffering, with only egress queueing (default mode). When `ingress-and-egress` is configured, the buffer is partitioned as 50 ms for the ingress direction and 200 ms for the egress direction.

enhanced-priority-mode

Enable the enhanced priority mode. When you enable the enhanced priority mode, the scheduler supports four additional per-priority shaping rates and two additional excess priorities at the interface and interface set level. The four additional per-priority shaping rates are: Guaranteed Strict-high, Guaranteed Medium-low, Excess medium-high, and Excess medium-low. The two additional excess priorities are: Excess-rate Medium- high and Excess-rate Medium-low. This is the default mode for PTX Series routers.

no-enhanced-priority-mode

Disable the enhanced priority mode. This is the default mode for MX Series routers.

> **NOTE**: The line card reboots when you enable or disable the enhanced priority mode feature.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

    protocol protocol_name/protocol_id;
    source-port low-high;
    destination-port low-high;
                      }
}
```

Hierarchy Level

```
[edit security ipsec vpn vpn-name]
```

Description

A traffic selector is an agreement between IKE peers to permit traffic through a tunnel, if the traffic matches a specified pair of local IP address range, remote IP address range, source port range, destination port range, and protocol. This functionality is supported only for IKEv2.

In the Junos OS Releases earlier to 21.1R1, we support one pair of local IP prefix and remote IP prefix per IPsec tunnel for traffic filtering through IPsec tunnel. From Junos OS Release 21.1R1 onwards, you can configure multiple sets of local IP prefix, remote IP prefix, source port range, destination port range, and protocol for traffic selection.

This means, multiple sets of IP address ranges, port ranges, and protocols can be part of same traffic selector as defined in RFC 7296. In this functionality, concept of term is introduced within the traffic-selectors. Each term defines a set of local IP range, remote IP range, source port range, destination port range, and protocol. All the terms combined will be part of single IPsec SA. The terms in a single traffic selector can have both IPv4 and IPv6 address. Hence a single IPsec SA has both IPv4 and IPv6 as both local and remote IP addresses. A maximum of 200 terms are supported in each traffic selector.

When you configure multiple traffic selectors, each traffic selector leads to a separate negotiation that results in the multiple IPsec tunnels. But, if you configure multiple terms under one traffic selector, this configuration results in single IPsec SA negotiation with multiple IP prefixes, ports, and protocols.

It is mandatory to configure at least one local IP prefix and one remote IP prefix for a traffic selector. Other parameters are optional.

If multiple traffic selectors have overlapping routes, a tie breaker of routing metric is used for the forwarding decision.

To install the required Junos package for supporting this functionality on your SRX Series Firewall, use the command `request system software add optional://junos-ike.tgz`.

For backward compatibility, we support configuring IP prefixes directly under the [`edit security ipsec vpn` *`vpn-name`* `traffic-selector` *`traffic-selector-name`*] hierarchy.

Use [`edit security ipsec vpn` *`vpn-name`* `traffic-selector` *`traffic-selector-name`* `term` *`term-name`*] hierarchy level to configure multiple sets of IP address ranges, port ranges, and protocols for the same traffic selector as defined in RFC 7296.

You should not configure same values for different traffic selectors for the same IKE gateway. This is not a valid traffic selector configuration. If you configure multiple traffic selectors with the same values, then depending on the peer configuration there might be unintended high CPU utilization.

Options

local-ip ***ip-address/netmask*** A local IP address or a local subnetwork protected by the local VPN device.

remote-ip *ip-address/netmask*

A remote IP address or a remote subnetwork protected by the peer VPN device.

preference *pref_value*

Local preference value of the traffic selector for a particular `ipsec vpn` *vpn-name* that overrides the value specified at global scope.

- **Range:** 0-4294967295.
- **Default:** 5.

term *term_name*

Define a set of local IP range, remote IP range, source port range, destination port range, and protocol. All the terms combined will be part of single IPsec SA. A maximum of 200 terms are supported in each traffic selector. It is optional to configure this parameter.

protocol *protocol_name/protocol_id*

Transport protocol list for a traffic selector for an IPsec tunnel. It is optional to configure this parameter. In case protocol is not configured, then 'any' protocol is assumed to be configured.

- **Range:** Protocol id can range from 0 to 255.

source-port *low-high*

Source port range from lower to higher range port numbers. It is optional to configure this parameter. If no port is configured but only protocol is configured, port 'any' will be assumed for source port ranges for that protocol.

- **Range:** 1 to 65535

destination-port *low-high*

Destination port range from lower to higher range port numbers. It is optional to configure this parameter. If no port is configured but only protocol is configured, port 'any' will be assumed for destination port ranges for that protocol.

- **Range:** 1 to 65535

metric *metric_value*

Tie breaker when multiple traffic selectors have overlapping routes, to decide the most preferred path. It is optional to configure this parameter.

description *description_value*

Traffic selector description. It is optional to configure this parameter. It is optional to configure this parameter.

- **Range:** 0 to 80 characters

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X46-D10.

`term`, `protocol`, `source-port`, `destination-port`, `metric`, and `description` options introduced in Junos OS Release 21.1R1.

`preference` *`pref_value`* option introduced in Junos OS Release 22.2R1.

```

Description

Enable traffic measuring on the SPRING link. RSVP-TE needs to measure the bandwidth utilized by SPRING and estimate the available bandwidth at its disposal for traffic engineering. Traffic statistics are collected at a configured interval. The average of the measured SPRING bandwidth is reported to RSVP

only when a set threshold is breached. RSVP then passes on this information to the IGP for reallocation of bandwidth.

Options

auto-bandwidth ***auto-bandwidth***	Specify the name of auto bandwidth.
statistics-granularity ***per-interface***	Specify the interface where you need to measure traffic statistics of SPRING traffic.

Required Privilege Level

routing—To view this statement in the configuration.

Description

LDP traffic statistics display the amount of traffic passed through a router for a particular FEC.

Options

`file` *`filename`*—Name of the file to receive the output of the LDP statistics operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

`files` *`number`*—(Optional) Maximum number of LDP statistics files. When a statistics file named *`ldp-stat`* reaches its maximum size, it is renamed *`ldp-stat`*`.0`, then *`ldp-stat`*`.1`, and so on, until the maximum number of LDP statistics files is reached. Then the oldest file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

If you specify a maximum number of files, you also must include the `size` statement to specify the maximum file size.

`interval` *`seconds`*—(Optional) Specify the interval at which the statistics are polled and written to the file.

- **Default:** 300 seconds (5 minutes)

`no-penultimate-hop`—(Optional) Do not collect traffic statistics on the penultimate hop router.

`no-world-readable`—(Optional) Prevent all users from reading the log file.

`size` *`size`*—(Optional) Maximum size of each statistics file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a statistics file named *`ldp-stat`* reaches this size, it is renamed *`ldp-stat`*`.0`. When *`ldp-stat`* again reaches this size, *`ldp-stat`*`.0` is renamed *`ldp-stat`*`.1` and *`ldp-stat`* is renamed *`ldp-stat`*`.0`. This renaming scheme continues until the maximum number of statistics files is reached. Then the oldest statistics file is overwritten.

- **Syntax:** *`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

If you specify a maximum file size, you also must also include the `files` statement to specify the maximum number of files.

`world-readable`—(Optional) Enable log file access for all users.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Collecting LDP Statistics

traffic-statistics (Services Analytics)

IN THIS SECTION

- Syntax | 31214
- Hierarchy Level | 31214
- Description | 31214

- Default | 31214
- Options | 31214
- Required Privilege Level | 31216
- Release Information | 31216

Syntax

```
traffic-statistics {
    file filename {
        files number-of-files;
        size size;
    }
    interval interval;
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Enable the logging of traffic statistics in a local file. This statement does not enable traffic statistics monitoring.

To enable the monitoring of traffic statistics, configure the `traffic-statistics` configuration statement at the `[edit services analytics interfaces]` hierarchy level.

Default

This feature is disabled by default.

Options

file ***filename*** Specify a filename for storing the traffic statistics in the JavaScript Object Notification (JSON) format. The file is stored in the **/var/log/** directory of your device.

If you do not specify a filename, the data is not stored in a file.

files *number-of-files*

Specify the number of files to store locally. After the number files with the maximum file size is reached, the system starts over and writes the data to the first file.

- **Range:** 2 to 1,000 files.

interval *interval*

Configure the polling interval in seconds.

> **NOTE**: You can configure the polling interval for traffic statistics globally for all interfaces only. Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.

- Range:
  - Junos OS Release 13.2X51-D10 or later—2 to 300 seconds (2 seconds to 5 minutes)
  - Junos OS Release 13.2X50-D15—1 to 300 seconds (1 second to 5 minutes)

> **NOTE**: In Junos OS Release 13.2X51-D10 or later, if you configured an interval of less than 2 seconds, the following warning messages appear during the commit process:
>
> `Traffic statistics polling interval can not be less than 2 seconds`, and
>
> `Setting Traffic statistics polling interval to 2 seconds.`
>
> These messages do not stop the commit operation, but the interval is automatically set to 2 seconds.

- Default:
  - Junos OS Release 13.2X50-D15—1 second
  - Junos OS Release 13.2X51-D10 or later—2 seconds

size *size*

Configure the file size in megabytes (MB).

- **Syntax:** *xm* to specify MB.
- **Range:** 10 to 4095 MB

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Network Analytics Overview

traffic-statistics-labeled-path

IN THIS SECTION

- Syntax | 31216
- Hierarchy Level | 31217
- Description | 31217
- Options | 31217
- Required Privilege Level | 31217
- Release Information | 31217

Syntax

```
traffic-statistics-labeled-path {
    file filename <files files>     <size size> <(world-readable | no-world-readable)>;
    interval seconds;
}
```

Hierarchy Level

```
[edit logical-systems name protocols bgp],
[edit logical-systems name routing-instances name protocols bgp],
[edit protocols bgp],
[edit routing-instances name protocols bgp]
```

Description

Enable collection of periodic ingress labeled statistics for BGP label-switched paths in a network configured with segment routing. The traffic statistics are collected at a specified time interval and saved in a specified file. To collect traffic statistics of labeled unicast IPv4 and IPv6 families for specific BGP groups, configure the `labeled-path` option under the family or BGP group level at `[edit logical-systems logical-system-name protocols bgp group group-name family (inet | inet6) labeled-unicast]` hierarchy level.

Options

file *filename* Specify a filename to collect traffic statistics.

interval Specify a time interval in seconds to collect traffic statistics.

- **Range:** `60` through `65535` seconds.

size (Optional) Specify the size of the file that records traffic statistics.

- **Range:** `10240` through `4294967295`

world readable | world unreadable (Optional) Specify whether the traffic statistics log file is accessible to everyone or not.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.1R1.

Configuring Transfer Logs

transient-filter

IN THIS SECTION

- Syntax | 31225
- Hierarchy Level | 31225
- Description | 31226
- Required Privilege Level | 31226
- Release Information | 31226

Syntax

```
transient-filter transient filter name
```

Hierarchy Level

```
[edit firewall family firewall family name filter parent filter name]
```

Description

Configure a transient firewall filter for a parent firewall filter.

When the parent firewall filter is modified, the make-before-break (MBB) process of the system reprograms the modified parent firewall filter in the hardware. Depending on the size of the parent firewall filter, this process may take time. In the interim, the transient firewall filter is used in lieu of the parent firewall filter. The transient filter is expected to have a smaller memory footprint. After the MBB operation completes, the parent firewall filter resumes operation.

A transient firewall filter can only be paired with one parent firewall filter. The transient firewall filter is implicitly bound to the same interface as its parent firewall filter. A transient firewall filter cannot be configured as an interface specific firewall filter. Transient firewall filters can also be configured for fast-lookup parent firewall filters.

A transient firewall filter should be configured under the same firewall filter family as its parent firewall filter. During the modification of a parent firewall filter, any firewall filter statistics that is generated, will be attributed to the transient firewall filter. After the modification completes, the firewall filter statistics are retained and made available to the modified parent firewall filter when it resumes operation.

Deletion of the parent firewall filter will not delete its transient firewall filter. Instead, the transient firewall filter is dissociated with the parent firewall filter, and treated as any regular firewall filter, and its counters will be reset. A transient firewall filter cannot be deleted if it is associated with a parent firewall filter. A parent firewall filter with a transient firewall filter can be bound on ports, VLANs, and layer 3 interfaces in ingress or egress directions.

If a firewall filter is part of a filter-chain, input-list or output-list, it cannot be made a transient firewall filter. However, the parent firewall filter can be part of a firewall filter chain, input-list or output-list. Transient firewall filters are supported on loopback interfaces in the ingress direction. Transient filters are not supported on management interfaces. A transient firewall filter can only be a non-interface specific filter, whereas its parent firewall filter can be interface specific or non-interface specific firewall filter. If firewall filters of an input-list or output-list have associated transient firewall filters, then a consolidated transient firewall filter is created.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Syntax

```
transit {
    (all | no-all);
    (l2vpn | no-l2vpn);
    (l3vpn | no-l3vpn);
    (labeled-bgp | no-labeled-bgp);
    (ldp | no-ldp);
    (ldp-p2mp | no-ldp-p2mp);
    lsp-statistics-from-route;
    (rsvp | no-rsvp);
    (rsvp-p2mp | no-rsvp-p2mp);
    (static | no-static);
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options forwarding-table chained-composite-
next-hop],
[edit routing-options forwarding-table chained-composite-next-hop]
```

> **NOTE**: The `[edit logical-systems]` hierarchy level is not supported on the QFX10000 switches.

Description

Allows you to configure the chained composite next hops transit configuration options for devices handling transit traffic in the network. This statement and the associated functionality is available only on PTX Packet Transport Routers, QFX10000 switches, and MX204, MX480, MX960, MX10003, and VMX routers.

Default

All of the `transit` statement options are enabled on PTX transport routers and QFX10000 switches. However, you can disable any of the statements with a **no** option.

Starting in Junos OS Release 14.1, the `transit l3vpn` statement is enabled by default on PTX Series Packet Transport Routers only.

Options

all | no-all Enable or disable chained composite next-hops for all of the possible packet transit protocols and applications. The `all | no-all` statements do not apply to the `lsp-statistics-from-route` statement.

l2vpn | no-l2vpn Enable or disable chained composite next-hops for Layer 2 VPNs.

l3vpn | no-l3vpn Enable or disable chained composite next-hops for Layer 3 VPNs.

labeled-bgp | no-labeled-bgp Enable or disable chained composite next-hops for labeled BGP.

ldp | no-ldp Enable or disable chained composite next-hops for LDP.

ldp-p2mp | no-ldp-p2mp Enable or disable chained composite next-hops for LDP-signaled P2MP LSPs.

> **NOTE**: The `ldp-p2mp` and `rsvp-p2mp` statements are not supported on MX series routers.
>
> On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the `ldp-p2mp` and `rsvp-p2mp`

statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current primary logical system to fail at the time of a Routing Engine switchover.

lsp-statistics-from-route Enable LSP statistics collection from the route.

rsvp | no-rsvp Enable or disable chained composite next-hops for RSVP.

rsvp-p2mp | no-rsvp-p2mp Enable or disable chained composite next-hops for RSVP-signaled P2MP LSPs.

> **NOTE**: The `ldp-p2mp` and `rsvp-p2mp` statements are not supported on MX series routers.
>
> On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the `rsvp-p2mp` and `ldp-p2mp` statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current primary logical system to fail at the time of a Routing Engine switchover.

static | no-static Chained composite next hops are enabled for transit static LSPs by default. You can also disable this functionality for transit static LSPs.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

[edit class-of-service]
```

Description

For an Enhanced IQ PIC or Multiservices PIC, specify the input translation tables. You must also apply the translation table to a logical interface on the Enhanced IQ PIC or Multiservices PIC.

Default

If you do not include this statement, the ToS bit values in received packet headers are not changed by the PIC.

Options

`to-dscp-from-dscp`—(Optional) Translate incoming IPv4 DSCP values to new values. You must also configure and apply a DSCP classifier.

`to-dscp-ipv6-from-dscp-ipv6`—(Optional) Translate incoming IPv6 DSCP values to new values. You must also configure and apply an IPv6 DSCP classifier.

`to-inet-precedence-from-inet-precedence`—(Optional) Translate incoming INET precedence values to new values.

`to-exp-from-exp`—(Optional) Translate incoming MPLS EXP values to new values.

`table-name`—The name of the translation table.

`value`—The bit string to which to translate the incoming bit value.

`value(s)`—The bit string(s) from which the incoming bit value(s) are translated.

`*`—(Optional) This translation matches all bit patterns not explicitly listed.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

```

Hierarchy Level

```
[edit services nat rule rule-name term term-name then translated]
```

Description

Specify the NAT translation types. To identify the interface cards and Junos OS releases that support each translations type, see *Carrier-Grade NAT Feature Comparison for Junos Address Aware by Type of Interface Card*.

Options

basic-nat44	Translate the source address statically (IPv4 to IPv4).
basic-nat66	Translate the source address statically (IPv6 to IPv6).
basic-nat-pt	Translate the addresses of IPv6 hosts as they originate sessions to the IPv4 hosts in the external domain. The `basic-nat-pt` option is always implemented with DNS ALG.
deterministic-napt44	Translate as deterministic NAPT44.
deterministic-napt64	Translate as deterministic NAPT64.
dnat-44	Translate the destination address statically (IPv4 to IPv4).
dynamic-nat44	Translate only the source address by dynamically choosing the NAT address from the source address pool.
napt-44	Translate the transport identifier of the IPv4 private network to a single IPv4 external address.
napt-66	Translate the transport identifier of the IPv6 private network to a single IPv6 external address.
napt-pt	Bind addresses in an IPv6 network with addresses in an IPv4 network and vice versa to provide transparent routing for the datagrams traversing between the address realms.
nptv6	Translate the source address prefix in a stateless manner (IPv6 to IPv6).
stateful-nat464	Implement 464XLAT Provider-Side Translater (PLAT) address translation for source IP addresses and IPv6 prefix removal translation for destination IPv4 addresses.

stateful-nat64 Implement dynamic address and port translation for source IP addresses (IPv6-to-IPv4) and prefix removal translation for the destination IP addresses (IPv6-to-IPv4).

twice-basic-nat-44 Translate the source and destination addresses statically (IPv4 to IPv4).

> **NOTE**: Starting with Junos OS Release 15.1R1, the twice NAT functionality (`twice-basic-nat-44`, `twice-dynamic-nat-44`, and `twice-dynamic-napt-44` options) is supported on MX Series routers with MS-MPCs and MS-MICs.

twice-dynamic-nat-44 Translate the source address by dynamically choosing the NAT address from the source address pool. Translate the destination address statically.

twice-dynamic-napt-44 Translate the transport identifier of the IPv4 private network to a single IPv4 external address. Translate the destination address statically.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

The following options introduced in Junos OS Release 11.2, replacing all previous options.

- `basic-nat44`
- `basic-nat66`
- `basic-nat-pt`
- `dnat-44`
- `dynamic-nat44`
- `napt-44`
- `napt-66`
- `napt-pt`

- `stateful-nat64`

`deterministic-napt44` option introduced in Junos OS Release 12.1.

`deterministic-napt64` option introduced in Junos OS Release 17.4R1.

`nptv6` option introduced in Junos OS Release 15.1

`stateful-nat464` option introduced in Junos OS Release 17.1R1.

`twice-basic-nat-44` option introduced in Junos OS Release 11.4.

`twice-dynamic-nat-44` option introduced in Junos OS Release 11.4.

`twice-napt-44` option introduced in Junos OS Release 11.4.

Syntax

```
translation-vni vni (1..16777214);
```

Hierarchy Level

```
[edit routing-instances routing-instance-name vlans vlan-name vxlan]
[edit routing-instances routing-instance-name vxlan]
[edit vlans vlan-name vxlan]
```

Description

Configure a VXLAN network identifier (VNI) to which a Juniper Networks switch will translate a VNI in a packet that it is forwarding. The Juniper Networks switch translates the VNI while it is forwarding traffic in the following seamless EVPN-VXLAN stitching use cases:

- From one EVPN-VXLAN point of delivery (POD) to another within a data center.
- From one EVPN-VXLAN data center to another. This use case is also known as data center interconnect (DCI).

In these use cases, a Juniper Networks device that supports the seamless EVPN-VXLAN stitching feature can serve as either a spine or super spine device that interconnects the PODs or data centers through an EVPN-VXLAN WAN network.

When configuring the interconnection, you can set up a single routing instance of type `virtual-switch` or `evpn` on each spine or super spine device. Or, you can use the default switching instance.

The type of instance that you use determines the hierarchy level at which you must include the `translation-vni` configuration statement. Table 1926 on page 31244 outlines the instance types and the hierarchy levels at which you must include `translation-vni` for each type.

Table 1926: Interconnection Instance Types and Hierarchy Levels at Which to Include translation-vni Configuration Statement

Instance Types	Hierarchy Levels
Routing instance of type `virtual-switch`	`[edit routing-instances routing-instance-name vlans vlan-name vxlan]`
Routing instance of type `evpn`	`[edit routing-instances routing-instance-name vxlan]`
Default switching instance	`[edit vlans vlan-name vxlan]`

The Juniper Networks switch translates the VNI only if you have included the translated VNI in the interconnected VNI list. For information about configuring this list, see "interconnected-vni-list" on page 9206.

To understand how VNI translation works, Data Centers 1 and 2 are interconnected through an EVPN-VXLAN WAN network. In this topology, Super Spine 1 connects Data Center 1 and the WAN network, and Super Spine 2 connects Data Center 2 and the WAN network.

A routing instance named `evpn-vxlan` is configured on both Super Spines 1 and 2. In this routing instance, VLAN 100 is configured on each super spine device. However, the VNI mapped to VLAN 100 is different on each super spine device.

Table 1927 on page 31245 provides a summary of the VNI-related attributes configured on each super spine device.

Table 1927: Summary of VNI-Related Configurations on Super Spines 1 and 2

VNI-Related Configurable Attributes	Super Spine 1 evpn-vxlan Routing Instance Configuration	Super Spine 2 evpn-vxlan Routing Instance Configuration
VLAN ID	100	100
VNI	100	300
Translated VNI	200	200
Interconnected VNI List	Includes VNI 200	Includes VNI 200

As shown in Table 1927 on page 31245, Super Spine 1 maps VNI 100 to VLAN 100, and Super Spine 2 maps VNI 300 to VLAN 100. Both super spine devices include VNI 200 in their interconnected VNI lists. As a result, when the super spine devices forward VLAN 100 traffic to the WAN network, the VNI is translated to 200.

Options

vni Numeric value that represents the VNI to which the VNI in a packet is translated.

- **Range:** 1through 16777214

```

Description

Specify the transmit interval for the `bfd-liveness-detection` statement. The negotiated transmit interval for a peer is the interval between the sending of BFD packets to peers. The receive interval for a peer is the minimum time that it requires between packets sent from its peer; the receive interval is not negotiated between peers. To determine the transmit interval, each peer compares its configured minimum transmit interval with its peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.

Options

minimum-interval *milliseconds*

Configure the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement at this hierarchy level, you can configure the minimum transmit interval using the `minimum-interval` statement at the `bfd-liveness-detection` hierarchy level.

> **NOTE**: The threshold value specified in the `threshold` statement must be greater than the value specified in the `minimum-interval` statement for the `transmit-interval` statement.

- **Range:** 1 through 255,000 milliseconds

threshold *milliseconds*

Specify the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent.

- **Range:** 0 through 4,294,967,295 (2^{32} – 1)

> **NOTE**: The threshold value specified in the `threshold` statement must be greater than the value specified in the `minimum-interval` statement for the `transmit-interval` statement.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.2.

Support for BFD authentication introduced in Junos OS Release 9.6.

transmit-interval (MACsec for MX Series)

IN THIS SECTION

- Syntax | 31255
- Hierarchy Level | 31255
- Description | 31255
- Default | 31256
- Options | 31256
- Required Privilege Level | 31256
- Release Information | 31256

Syntax

```
transmit-interval interval;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name mka]
```

Description

Specifies the transmit interval for MACsec Key Agreement (MKA) protocol data units (PDUs).

The MKA transmit interval setting sets the frequency for how often the MKA PDU is sent to the directly connected device to maintain MACsec on a point-to-point Ethernet link. A lower *interval* increases bandwidth overhead on the link; a higher *interval* optimizes the MKA protocol data unit exchange process.

The transmit interval settings must be identical on both ends of the link when MACsec using static connectivity association key (CAK) security mode is enabled.

We recommend increasing the interval to 6000 milliseconds in high-traffic and large scale configuration load environments.

Default

The default transmit interval is 2000 milliseconds.

Options

interval Specifies the transmit interval, in milliseconds.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

transmit-rate (Dynamic Schedulers)

IN THIS SECTION

- Syntax | 31261
- Hierarchy Level | 31262
- Description | 31262
- Default | 31262
- Options | 31262
- Required Privilege Level | 31262
- Release Information | 31263

Syntax

```
transmit-rate (rate | percent percentage | remainder | percent percentage $junos-cos-scheduler-
tx) <exact | rate-limit>;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name class-of-service schedulers scheduler-name]
```

Description

Specify the transmit rate or percentage for a scheduler in a dynamic profile.

Default

If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are 95, 0, 0, 5, 0, 0, 0, and 0 percent.

Options

rate—Transmission rate, in bps. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

- **Range:** 3200 through 6,400,000,000,000 bps

`percent` *percentage*—Percentage of transmission capacity. A percentage of zero drops all packets in the queue.

- **Range:** 0 through 100 percent

`remainder`—Use remaining rate available.

`$junos-cos-scheduler-tx`—Junos predefined variable that is replaced with the transmission rate obtained from the RADIUS server when a subscriber authenticates over the interface to which the dynamic profile is attached.

`exact`—(Optional) Enforce the exact transmission rate. Under sustained congestion, a rate-controlled queue that goes into negative credit fills up and eventually drops packets. Make sure this value never exceeds the rate-controlled amount.

`rate-limit`—(Optional) Limit the transmission rate to the rate-controlled amount during congestion. In contrast to the `exact` option, when there is no congestion, the scheduler with the `rate-limit` option shares unused bandwidth above the rate-controlled amount.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

The `$junos-cos-scheduler-tx` predefined variable introduced in Junos OS Release 9.4.

Description

Specify the transmit rate or percentage for a scheduler.

Default

If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are 95, 0, 0, 5, 0, 0, 0, and 0 percent, respectively.

> **NOTE**: On PTX10008 and PTX10016 routers, the default scheduler transmission rate is set to 25 percent for strict-high queues if you do not set the transmission rate for the schedulers for strict-high queues.

Options

`exact`
(Optional) Enforce the exact transmission rate. Under sustained congestion, a rate-controlled queue that goes into negative credit fills up and eventually drops packets. This value should never exceed the rate-controlled amount. For PTX Series routers, this option is allowed only on the non-strict-high (high, medium-high, medium-low, or low) queues.

`percent` *`percentage`*
Percentage of transmission capacity. A percentage of zero drops all packets in the queue unless additional bandwidth is available from other queues.

- **Range:** 0 through 100 percent for M, MX and T Series routers and EX Series switches; 1 through 100 percent for PTX Series routers

> **NOTE**:
>
> - On M Series Multiservice Edge Routers, for interfaces configured on 4-port E1 and 4-port T1 PICs only, you can configure a *percentage* value only from 11 through 100. These two PICs do not support transmission rates less than 11 percent.
> - The configuration of the `transmit-rate percent 0 exact` statement at the [`edit class-of-service schedules` *`scheduler-name`*] hierarchy is ineffective on T4000 routers with Type 5 FPC.
> - On MIC and MPC interfaces on MX Series routers, when the transmit rate is configured as a percentage and **exact** or **rate-limit** is enabled on a queue, the shaping rate of the parent node is used to compute the transmit rate. If **exact** or **rate-limit** is not configured, the guaranteed rate of the parent node is used to compute the transmit rate.

- On PTX Series routers, unconfigured interfaces are equivalent to `percent 0`. This means the system offers no guaranteed rate on the interface, and the queue will always be scheduled in the excess priority.

rate Transmission rate, in bps. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

- **Range:** 3200 through 6,400,000,000,000 bps

> **NOTE**: For all MX Series interfaces, the rate can be from 65,535 through 6,400,000,000,000 bps.

`rate-limit` (Optional) Limit the transmission rate to the rate-controlled amount by applying a policing action to the queue. Packets are hard-dropped when traffic exceeds the specified maximum transmission rate.

> **NOTE**: For PTX Series routers, this option is allowed only on the strict-high queue. We recommend that you configure rate limit on strict-high queues because the other queues may not meet their guaranteed bandwidths. The `rate-limit` option cannot rate limit the queue if strict-priority scheduling is configured with the "strict-priority-scheduler" on page 29762 statement.

> **NOTE**: The configuration of the `rate-limit` statement is supported on T4000 routers only with a Type 5 FPC.

`remainder` ***percentage*** Use the remaining rate available.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`rate-limit` option introduced in Junos OS Release 8.3. Applied to the Multiservices PICs in Junos OS Release 9.4.

QFX5100, EX4600, QFX3500, and QFX3600, Switches, QFabric Systems

```
transmit-rate (rate | percent percentage);
```

QFX10000 Switches

```
transmit-rate (rate | percent percentage) <exact>;
```

Hierarchy Level

```
[edit class-of-service schedulers scheduler-name]
```

Description

On QFX5100, EX4600, QFX3500, and QFX3600 switches, and on QFabric systems, the transmit rate specifies the minimum guaranteed transmission rate or percentage for a queue (forwarding class) scheduler. The queue transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share on switches that support enhanced transmission selection (ETS) hierarchical scheduling.

On QFX10000 switches, the transmit rate specifies the minimum guaranteed transmission rate or percentage for a queue (forwarding class) scheduler. The queue transmit rate also determines the amount of excess (extra) port bandwidth the queue can share if you do not explicitly configure an excess rate in the scheduler. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share on switches that support enhanced transmission selection (ETS) hierarchical scheduling.

On QFX10000 switch strict-high priority queues, the transmit rate limits the amount of traffic the switch treats as strict-high priority traffic. Traffic up to the transmit rate receives strict-high priority treatment. The switch treats traffic that exceeds the transmit rate as best-effort traffic that receives an excess bandwidth sharing weight of “1”; you cannot configure an excess rate on a strict-high priority queue, and unlike queues with other scheduling priorities, the switch does not use the transmit rate to determine extra bandwidth sharing for strict-high priority queues.

CAUTION: We strongly recommend that you configure a transmit rate on strict-high priority queues to limit the amount of traffic the switch treats as strict-high priority traffic on those queues. This is especially important if you configure more than one strict-high priority queue on a port. To prevent a strict-high priority queue from starving the other queues on a port, we recommend that you always configure a transmit rate, even if you only configure one strict-high priority queue.

NOTE: For ETS, the `transmit-rate` setting works only if you also configure the "guaranteed-rate" on page 8305 in the traffic control profile that is attached to the forwarding class set to which the queue belongs. If you do not configure the guaranteed rate, the minimum guaranteed rate for individual queues that you set using the `transmit-rate` statement does not work. The sum of all queue transmit rates in a forwarding class set should not exceed the traffic control profile guaranteed rate.

NOTE: On QFX5100, EX4600, QFX3500, and QFX3600 switches, and on QFabric systems, you cannot configure a transmit rate for a strict-high priority queue. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has a strict-high priority queue. To prevent strict-high priority queues from consuming all of the available bandwidth on these switches, we recommend that you configure a shaping rate to set a maximum amount of bandwidth for strict-high priority queues.

NOTE: For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.

Default

On QFX5100, EX4600, QFX3500, and QFX3600 switches, and on QFabric systems, if you do not configure the transmit rate, the default scheduler transmission rate and buffer size percentages for queues 0 through 11 are:

Table 1928: Default Transmit Rates for QFX5100, EX4600, QFX3500, and QFX3600 Switches, and QFabric Systems

Queue Number	Default Minimum Guaranteed Bandwidth (Transmit Rate)
0 (best-effort)	5 %
1	0
2	0
3 (fcoe)	35 %
4 (no-loss)	35 %
5	0

Table 1928: Default Transmit Rates for QFX5100, EX4600, QFX3500, and QFX3600 Switches, and QFabric Systems *(Continued)*

Queue Number	Default Minimum Guaranteed Bandwidth (Transmit Rate)
6	0
7 (network control)	5 %
8 (mcast)	20 %
9	0
10	0
11	0

On QFX10000 switches, if you do not configure the transmit rate, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are:

Table 1929: Default Transmit Rates for QFX10000 Switches

Queue Number	Default Minimum Guaranteed Bandwidth (Transmit Rate)
0 (best-effort)	15 %
1	0
2	0
3 (fcoe)	35 %
4 (no-loss)	35 %
5	0

Table 1929: Default Transmit Rates for QFX10000 Switches *(Continued)*

Queue Number	Default Minimum Guaranteed Bandwidth (Transmit Rate)
6	0
7 (network control)	15 %

Configure schedulers if you want to change the minimum guaranteed bandwidth and other queue characteristics.

Options

rate—Minimum transmission rate for the queue, in bps. You can specify a value in bits-per-second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), m (1,000,000), or `g` (1,000,000,000).

- **Range:** 1000 through 10,000,000,000 bps on 10-Gigabit interfaces, 1000 through 40,000,000,000 bps on 40-Gigabit interfaces.

`percent` *percentage*—Minimum percentage of transmission capacity allocated to the queue.

- **Range:** 1 through 100 percent

`exact`—(QFX10000 switches only) Shape queues that are not strict-high priority queues to the transmit rate so that the transmit rate is the maximum bandwidth limit. Traffic that exceeds the exact transmit rate is dropped. You cannot set an excess rate on queues configured as `transmit-rate` *(rate | percentage)* `exact` because the purpose of setting an exact transmit rate is to set a maximum bandwidth (shaping rate) on the traffic.

> **NOTE**: On QFX10000 switches, oversubscribing all 8 queues configured with the `transmit rate exact` (shaping) statement at the `[edit class-of-service schedulers` *scheduler-name*`]` hierarchy level might result in less than 100 percent utilization of port bandwidth.

Required Privilege Level

interfaces—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Exact option introduced in Junos OS Release 15.1X53-D10 for the QFX Series.

            }
        }
    }
```

Hierarchy Level

```
[edit services web-proxy]
```

Description

Configure transparent web proxy profile.

Use the Transparent web proxy feature on an SRX Series Firewall to route traffic through an external proxy or bypass it for certain applications. Configure a profile with proxy details and bypassed applications to send traffic directly to the target webserver when needed.

> **NOTE**: Starting in Junos OS Release 25.2R1, we've renamed the secure web proxy as transparent web proxy. If you are using Junos OS version before Junos OS 25.2R1, you can continue to use Secure Web proxy. See "secure-proxy" on page 17039.

Options

profile *name*	Name of the transparent web proxy profile.
drop-on-dns-error	Drop the web proxy session on DNS error.

dynamic-web-application	Dynamic web application. Specify dynamic applications such as MS Office or Google to exempt that application traffic from the external proxy server.
dynamic-web-application-group	Dynamic web application group. Dynamic applications is is a grouping of dynamic applications, which you can speify to exempt that application traffic from the external proxy server.
proxy-address name	Name of the external proxy server.
ip *ip-address*	IP address of the external proxy server.
port *port-number*	Port number of the external proxy server.

Required Privilege Level

[edit protocols ldp],
[edit protocols ldp interface interface-name],
[edit routing-instances routing-instance-name protocols ldp interface interface-name]
```

Description

Enables you to configure the IP address used to specify the TCP session for the LDP session. Routers must first establish a TCP session between one another before they can establish an LDP session. The TCP session enables the routers to exchange the label advertisements needed for the LDP session. To establish the TCP session, each router must learn the other router's transport address. The transport address is an IP address used to identify the TCP session over which the LDP session will run.

Default

`router-id`

Options

address Use the specified IP address as the transport address for the LDP session.

interface Use the first IP address on the interface as the transport address for any LDP sessions to neighbors that can be reached over that interface. You cannot specify the `interface` option when there are multiple parallel links to the same LDP neighbor, because the LDP specification requires that the same transport address be advertised on all interfaces to the

same neighbor. If LDP detects multiple parallel links to the same neighbor, it disables interfaces to that neighbor one by one until the condition is cleared, either by disconnecting the neighbor on an interface or by specifying the `router-id` option.

router-id Use router identifier as the transport address. Unless otherwise configured, the router identifier is the loopback address.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

address option introduced in Junos OS Release 19.1R1 for all platforms.

```
[edit routing-options]
```

Release Information

Statement introduced in Junos OS Release 21.2R1.

Description

Specify the transport layer options.

Options

any-class Specify the predefined transport class that collects tunnels of all transport classes.

- `color` *`color`*—This is a 32bit color value mapping to any transport class. This auto derives the mapping community.

auto-create Auto create on color discovery.

best-effort Specify the best effort transport class.

- `color` *`color`*—This is a 32bit color value mapping to any transport class. This auto derives the mapping community.

fallback Service routes resolution fallback. Service routes typically resolves over inet.3.

- `none`—Resolve associated service-routes using the specified transport class tunnel only.

name Specify the transport layer that collects tunnels with similar characteristics.

- *`name`*—Specify the transport class name.
- `color` *`color`*—This is a 32bit color value mapping to any transport class. This auto derives the mapping community.
- `tunnel-egress`—Specify the endpoint origination of the egress tunnel.
  - `end-point` *`endpoint-addr`*—Configure the egress tunnel endpoint by specifying the address.
    - `import [`*`import ...`*`]`—Apply the import policy to set the attributes.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

MPLS Traffic Engineering Configuration

transport-class

IN THIS SECTION

- Syntax | 31295
- Hierarchy Level | 31295
- Description | 31295
- Release Information | 31296

Syntax

```
transport-class color;
```

Hierarchy Level

```
[edit logical-systems name routing-instances name provider-tunnel ingress-replication],
[edit logical-systems name tenants name routing-instances name provider-tunnel ingress-
replication],
[edit routing-instances name provider-tunnel ingress-replication],
[edit tenants name routing-instances name provider-tunnel ingress-replication]
```

Description

By setting the transport-class for a specific LSP, you determine which RSVP tunnels are placed into corresponding colored inet.3 tables.

NOTE: A maximum of 3 transport-class color tables are supported.

A maximum of 9000 LSPs are supported per transport-class.

A maximum of 9000 ingress replication provider tunnels are supported with 3 colored tables.

A maximum of 3 VRFs can be mapped to 3 colored tables.

Release Information

Statement introduced in Junos OS Release 24.4R1.

transport-monitoring

IN THIS SECTION

- Syntax | 31296
- Hierarchy Level | 31296
- Description | 31297
- Required Privilege Level | 31297
- Release Information | 31297

Syntax

```
transport-monitoring;
```

Hierarchy Level

```
[edit interfaces]
```

Description

Monitor the performance and state of packet transport for OTN and optics modules. The following statistics are monitored:

- Packet transport for ninety-six 15–minute intervals for the current 24 hours.
- Cumulative data of the current 24 hours.
- Cumulative data of the previous 24 hours.

If this statement is configured, transport monitoring related information is shown in the output of `show interface transport` command and corresponding MIBs are available. If this option is disabled, an error is shown in the output and corresponding MIBs are not available.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

trap (Security IKE)

IN THIS SECTION

- Syntax | 31299
- Hierarchy Level | 31299
- Description | 31299
- Default | 31299
- Required Privilege Level | 31300
- Release Information | 31300

Syntax

```
trap {
    ipsec-tunnel-down ;
    peer-down ;
}
```

Hierarchy Level

```
[edit security ike trap]
```

Description

ipsec-tunnel-down— By enabling the `ipsec-tunnel-down` option, the traps are generated for IPsec tunnel going down only when the associated peer IKE SA is up.

peer-down—By enabling the `peer-down` option, the traps are generated when peer goes down. Traps for the corresponding IPsec tunnels going down for the peer are not generated.

Default

- `peer-down`—Disabled

- `ipsec-tunnel-down`—Disabled

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

trap

IN THIS SECTION

- Syntax | **31302**
- Hierarchy Level | **31303**
- Description | **31303**
- Options | **31303**
- Required Privilege Level | **31303**
- Release Information | **31303**

Syntax

```
trap {
    interval trap interval;
}
```

Hierarchy Level

```
[edit security screen trap],
[edit tenants tenant-name security screen]
```

Description

Traps are unsolicited messages sent from an SNMP agent to remote network management systems or trap receivers. Many enterprises use SNMP traps as part of a fault-monitoring solution, in addition to system logging. In Junos OS, SNMP traps are not forwarded by default. You can use the SNMP traps by configuring a `trap-group`.

You can create and name a group of one or more types of SNMP traps and then define which systems receive the group of SNMP traps. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name.

Options

interval

Configure the trap interval.

- **Range:** 1 through 3600 seconds
- **Default:** 2 seconds

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D20.

The `tenant` option is introduced in Junos OS Release 18.3R1.

trap-group

IN THIS SECTION

- Options | 31305
- Required Privilege Level | 31305
- Release Information | 31305

Syntax: MX, M, T, ACX and PTX Series routers, OCX1100, EX and QFX Series Switches and SRX and vSRX Virtual Firewall firewalls

```
trap-group group-name {
    categories {
        category;
    }
    destination-port port-number;
    routing-instance instance;
    targets {
        address;
    }
    version (all | v1 | v2);
}
```

Syntax: QFX and EX Series Switches and OCX1100

```
trap-group group-name {
    categories {
        category;
    }
    destination-port port-number;
```

```
    targets {
        address;
    }
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.

Options

group-name—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

trap-options

IN THIS SECTION

Syntax: MX, M, T, ACX and PTX Series Routers, EX Series Switches and SRX Firewalls | 31306

- QFX Series Switches, EX4600, OCX1100 | **31306**
- Hierarchy Level | **31307**
- Description | **31307**
- Default | **31307**
- Options | **31307**
- Required Privilege Level | **31307**
- Release Information | **31307**

Syntax: MX, M, T, ACX and PTX Series Routers, EX Series Switches and SRX Firewalls

```
trap-options {
    agent-address outgoing-interface;
    context-oid;
    enterprise-oid;
    logical-system logical-system-name {
        routing-instance routing-instance-name {
            source-address address;
        }
    }
    routing-instance routing-instance-name {
        source-address address;
    }
}
```

QFX Series Switches, EX4600, OCX1100

```
trap-options {
    agent-address outgoing-interface;
    source-address address;
    routing-instance routing-instance-name {
        source-address address;
    }
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.

Default

Disabled

Options

context-oid Add context oid in varbind of all traps originating from non-default logical system and routing instance. If your network management system is not able to handle prefixes such as `<routing-instance name>@<trap-group-name>` or `<logical-system name>/<routing-instance name>@<trap-group-name>`, setting the `context-oid` configuration statement will send only the `<trap-group-name>` and add `<logical-system name>/<routing-instance name>` as an additional varbind.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`context-oid` option introduced in Junos OS Release 17.1.

traps (Dynamic Profiles and Interfaces)

IN THIS SECTION

- Syntax | 31308
- Hierarchy Level (ACX Series, MX Series, T Series, M Series, SRX Series, EX Series) | 31308
- Hierarchy Level (QFX Series, EX4600) | 31308
- Description | 31309
- Required Privilege Level | 31309
- Release Information | 31309

Syntax

```
(traps | no-traps);
```

Hierarchy Level (ACX Series, MX Series, T Series, M Series, SRX Series, EX Series)

```
[edit dynamic-profiles profile-name interfaces interface-name],
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit interfaces interface-range name],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Hierarchy Level (QFX Series, EX4600)

```
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit interfaces interface-range interface-range-name]
```

Description

Enable or disable the sending of Simple Network Management Protocol (SNMP) notifications when the state of the connection changes.

(Enhanced subscriber management for MX Series routers) To enable SNMP notifications, you must first configure the `interface-mib` statement at the `[edit dynamic-profiles` *`profile-name`* `interfaces` *`interface-name`*`]` hierarchy level. If `interface-mib` is not configured, the `traps` statement has no effect.

> **BEST PRACTICE**: To achieve maximum performance when enhanced subscriber management is enabled, we recommend that you *not* enable SNMP notifications on all dynamic subscriber interfaces.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Support at the `[edit dynamic-profiles` *`profile-name`* `interfaces` *`interface-name`*`]` hierarchy level introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

traps (RPM and TWAMP)

IN THIS SECTION

- Syntax | 31310
- Hierarchy Level (Junos OS) | 31310
- Hierarchy Level (Junos OS Evolved) | 31310
- Description | 31311
- Options | 31311
- Additional Information | 31312
- Required Privilege Level | 31312
- Release Information | 31313

Syntax

```
traps traps;
```

Hierarchy Level (Junos OS)

```
[edit services rpm probe owner test test-name],
[edit services rpm twamp client control-connection control-client-name],
[edit services rpm twamp client control-connection control-client-name test-session session-name]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rpm owner test test-name],
[edit services monitoring twamp client control-connection control-client-name],
[edit services monitoring twamp client control-connection control-client-name test-session session-
name]
```

Description

Set the trap bit to generate SNMP traps for probes. Traps are sent if the configured threshold is met or exceeded. For TWAMP, you can configure both control-connection and test-session traps for managed clients, but only test-session traps for light clients. See SNMP MIB Explorer to learn more about the SNMP MIB objects that Juniper supports.

Default: no traps are generated

Options

traps Specify one or more SNMP traps. The options are configured per test session, except for the `control-connection-closed` and the `test-iteration-done` options. These options are configured only for TWAMP, and only per control connection. The following options are supported:

- `control-connection-closed`—(TWAMP control-connection only) Generate traps when the control connection is closed.
- `egress-jitter-exceeded`—Generate traps when the jitter in egress time threshold is met or exceeded. (MIB object jnxPingEgressJitterThresholdExceeded)
- `egress-std-dev-exceeded`—(Junos OS only) Generate traps when the egress time standard deviation threshold is met or exceeded. (MIB object jnxPingEgressStdDevThresholdExceeded)
- `egress-time-exceeded`—Generate traps when the maximum egress time threshold is met or exceeded. (MIB object jnxPingEgressThresholdExceeded)
- `ingress-jitter-exceeded`—Generate traps when the jitter in ingress time threshold is met or exceeded. (MIB object jnxPingIngressJitterThresholdExceeded)
- `ingress-std-dev-exceeded`—(Junos OS only) Generate traps when the ingress time standard deviation threshold is met or exceeded. (MIB object jnxPingIngressStddevThresholdExceeded)
- `ingress-time-exceeded`—Generate traps when the maximum ingress time threshold is met or exceeded. (MIB object jnxPingIngressThresholdExceeded)
- `jitter-exceeded`—Generate traps when the jitter in round-trip time threshold is met or exceeded. (MIB object jnxPingRttJitterThresholdExceeded)
- `max-rtt-threshold`—(Junos OS only) Generate traps when the maximum round trip time threshold at the end of the test is met or exceeded. (MIB object jnxPingMaxRttThresholdExceeded)

- `probe-failure`—Generate traps when successive probe loss thresholds are crossed. (MIB object pingProbeFailed)
- `rtt-exceeded`—Generate traps when the maximum round-trip time threshold is met or exceeded. (MIB object jnxPingRttThresholdExceeded)
- `std-dev-exceeded`—(Junos OS only) Generate traps when the round-trip time standard deviation threshold is met or exceeded. (MIB object jnxPingRttStdDevThresholdExceeded)
- `test-completion`—Generate traps when a test is completed. (MIB object pingTestCompleted)
- `test-failure`—Generate traps when the total probe loss threshold is met or exceeded. (MIB object pingTestFailed)
- `test-iteration-done`—(TWAMP control-connection only) Generate traps when all test sessions under control connections complete one test iteration.

NOTE: To generate RPM traps, you must configure the `remote-operations` SNMP trap category by including the `categories` statement at the `[edit snmp trap-group` *`trap-group-name`*`]` hierarchy level.

Additional Information

(Junos OS Evolved only) The Juniper PING MIB does not support the following notifications, because the corresponding thresholds are not configurable for Junos OS Evolved and hence the traps are never generated:

- jnxPingRttStdDevThresholdExceeded
- jnxPingEgressStdDevThresholdExceeded
- jnxPingIngressStddevThresholdExceeded
- jnxPingMaxRttThresholdExceeded

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the [`edit services rpm twamp client control-connection` *`control-client-name`*] and [`edit services rpm twamp client control-connection` *`control-client-name`* `test-session` *`session-name`*] hierarchy levels introduced in Junos OS Release 15.1 for MX Series routers.

Support at the [`edit services monitoring rpm owner test` *`test-name`*] hierarchy level introduced in Junos OS Evolved Release 21.2R1 for PTX Series routers.

Support at the [edit services monitoring twamp client control-connection *control-client-name*] and [edit services monitoring twamp client control-connection *control-client-name* test-session *session-name*] hierarchy levels introduced in Junos OS Evolved Release 21.3R1 for PTX Series routers.

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Enable tricolor marking.

Options

percent *percentage*—Size of the shared buffer as a percentage of the buffer allocated to the shared buffer pool.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS 11.4 .

```

Description

For IPv4 packets on M320, MX Series, T Series routers with Enhanced II Flexible PIC Concentrators (FPCs), and EX Series switches, enable tricolor marking (TCM), as defined in RFC 2698.

Default

If you do not include this statement, tricolor marking is not enabled and the medium packet loss priority (PLP) is not configurable.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring and Applying Tricolor Marking Policers

trickling

IN THIS SECTION

- Syntax | 31319
- Hierarchy Level | 31319
- Description | 31319
- Options | 31320
- Required Privilege Level | 31320
- Release Information | 31320

Syntax

```
trickling {
    timeout value;
}
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus juniper-express-engine profile profile-name]
[edit security utm feature-profile anti-virus kaspersky-lab-engine profile profile-name]
[edit security utm feature-profile anti-virus sophos-engine profile profile-name]
```

Description

HTTP trickling is a mechanism used to prevent the HTTP client or server from timing-out during a file transfer or during antivirus scanning. HTTP Trickling is time-based and there is only one parameter to configure for this feature, which is the timeout Interval. By default, trickling is disabled.

> **WARNING**: When you enable the trickling option, keep in mind that trickling might send part of a file to the client during its antivirus scan. It is therefore possible that some of the content could be received by the client before the file has been fully scanned.

Options

value—Timeout interval in seconds.

- **Range:** 0 through 600 seconds

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5. Statement updated for Sophos support in Junos OS Release 11.1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1X49-D10	The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards.

trigger (CoS)

IN THIS SECTION

- Syntax | 31321
- Hierarchy Level | 31321

- Description | **31324**
- Default | **31325**
- Options | **31325**
- Required Privilege Level | **31325**
- Release Information | **31325**

Syntax

```
trigger (on | after | until) event-count;
```

Hierarchy Level

```
[edit event-options policy policy-name within seconds]
```

Description

Configure an event policy to trigger when an event or set of events occurs *event-count* times within a specified time period.

Default

If you do not include this statement, the policy is executed on receipt of the first configured event.

Options

after *event-count*	The policy is executed when the number of matching events received equals *event-count* + 1.
on *event-count*	The policy is executed when the number of matching events received equals *event-count*.
until *event-count*	The policy is executed each time a matching event is received and stops being executed when the number of matching events received equals *event-count*.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Syntax

```
trigger trigger-identifier (hold-time hold-time-value | ignore);
```

Hierarchy Level

```
[edit interfaces interface-name otn-options]
```

Description

Specify defect triggers.

Default

By default, triggers are ignored.

Options

trigger-identifier—(For M Series, MX Series, SRX Series, and T Series routers only) Trigger identifier. It can be one of the following:

- `oc-lof`—Optical channel Loss of Frame defect trigger.
- `oc-lom`—Optical channel Loss of Multiframe defect trigger.
- `oc-los`—Optical channel Loss of Signal defect trigger.
- `oc-wavelength-lock`—Optical channel Wavelength Lock defect trigger.
- `odu-ais`—Optical channel data unit (ODU) Alarm Indication Signal defect trigger.
- `odu-bbe-th`—ODU Background Block Error Threshold defect trigger.

- `odu-bdi`—ODU Backward Defect Indication defect trigger.
- `odu-bei`—(MX Series routers only) ODU Backward Error Indication defect trigger.
- `odu-es-th`—ODU Errored Seconds Threshold defect trigger.
- `odu-iae`—(MX Series routers only) ODU Incoming Alignment Error defect trigger.
- `odu-lck`—ODU Locked defect trigger.
- `odu-oci`—ODU Open Connection Indication defect trigger.
- `odu-sd`—ODU Signal Degrade defect trigger.
- `odu-ses-th`—ODU Severely Errored Seconds Threshold defect trigger.
- `odu-tca-es`—(MX Series routers only) ODU Errored Seconds Threshold crossing defect trigger.
- `odu-tca-ses`—(MX Series routers only) ODU Severely Errored Seconds Threshold crossing defect trigger.
- `odu-tca-uas`—(MX Series routers only) ODU Unavailable Seconds Threshold crossing defect trigger.
- `odu-ttim`—ODU Trail Trace Identifier Mismatch defect trigger.
- `opu-ptim`—(MX Series routers only) Payload Type Identifier Mismatch defect trigger.
- `odu-uas-th`—ODU Unavailable Seconds Threshold defect trigger.
- `opu-ptm`—Optical Channel Payload (OPU) Payload Type Mismatch defect trigger.
- `otu-ais`—Optical Channel Transport Unit (OTU) Alarm Indication Signal defect trigger.
- `otu-bbe-th`—OTU Background Block Error Threshold defect trigger.
- `otu-bdi`—OTU Backward Defect Indication defect trigger.
- `otu-es-th`—OTU Errored Seconds Threshold defect trigger.
- `otu-fec-deg`—OTU FEC Degrade defect trigger.
- `otu-fec-exe`—OTU FEC Excessive Error defect trigger.
- `otu-iae`—OTU Incoming Alignment defect trigger.
- `otu-sd`—OTU Signal Degrade defect trigger.
- `otu-ses-th`—OTU Severely Errored Seconds Threshold defect trigger.
- `otu-tca-es`—(MX Series routers only) OTU Errored Seconds Threshold crossing defect trigger.

- `otu-tca-ses`—(MX Series routers only) OTU Severely Errored Seconds Threshold crossing defect trigger.
- `otu-tca-uas`—(MX Series routers only) OTU Unavailable Seconds Threshold crossing defect trigger.
- `otu-ttim`—OTU Trail Trace Identifier Mismatch defect trigger.
- `otu-uas-th`—OTU Unavailable Seconds Threshold defect trigger.

trigger-identifier—(For PTX Series routers only) Trigger identifier. It can be one of the following:

- `oc-lof`—Optical channel Loss of Frame defect trigger.
- `oc-lom`—Optical channel Loss of Multiframe defect trigger.
- `oc-los`—Optical channel Loss of Signal defect trigger.
- `oc-tsf`—Optical channel TOE security functionality (TSF) defect trigger.
- `oc-wavelength-lock`—Optical channel Wavelength Lock defect trigger.
- `odu-ais`—ODU Alarm Indication Signal defect trigger.
- `odu-bdi`—ODU Backward Defect Indication defect trigger.
- `odu-bei`—ODU Backward Error Indication defect trigger.
- `odu-iae`—ODU IAE defect trigger.
- `odu-lck`—ODU Locked defect trigger.
- `odu-oci`—ODU Open Connection Indication defect trigger.
- `odu-sd`—ODU Signal Degrade defect trigger.
- `odu-tca-bbe`—ODU Background Block Error Threshold crossing defect trigger.
- `odu-tca-bbe-fe`—ODU far-end Background Block Error (BEI) Threshold crossing defect trigger.
- `odu-tca-es`—ODU Errored Seconds Threshold crossing defect trigger.
- `odu-tca-es-fe`—ODU far-end Errored Seconds Threshold crossing defect trigger.
- `odu-tca-ses`—ODU Severely Errored Seconds Threshold crossing defect trigger.
- `odu-tca-ses-fe`—ODU far-end Severely Errored Seconds Threshold crossing defect trigger.
- `odu-tca-uas`—ODU Unavailable Seconds Threshold crossing defect trigger.
- `odu-tca-uas-fe`—ODU far-end Unavailable Seconds Threshold crossing defect trigger.
- `odu-ttim`—ODU Trail Trace Identifier Mismatch defect trigger.

- `opu-ptim`—Payload Type Identifier Mismatch defect trigger.
- `otu-ais`—OTU Alarm Indication Signal defect trigger.
- `otu-bdi`—OTU Backward Defect Indication defect trigger.
- `otu-fec-deg`—OTU FEC Degrade defect trigger.
- `otu-fec-exe`—OTU FEC Excessive Error defect trigger.
- `otu-iae`—OTU Incoming Alignment defect trigger.
- `otu-sd`—OTU Signal Degrade defect trigger.
- `otu-tca-bbe`—OTU Background Block Error Threshold crossing defect trigger.
- `otu-tca-bbe-fe`—OTU far-end Background Block Error (BEI) Threshold crossing defect trigger.
- `otu-tca-es`—OTU Errored Seconds Threshold crossing defect trigger.
- `otu-tca-es-fe`—OTU far-end Errored Seconds Threshold crossing defect trigger.
- `otu-tca-ses`—OTU Severely Errored Seconds Threshold crossing defect trigger.
- `otu-tca-ses-fe`—OTU far-end Severely Errored Seconds Threshold crossing defect trigger.
- `otu-tca-uas`—OTU Unavailable Seconds Threshold crossing defect trigger.
- `otu-tca-uas-fe`—OTU far-end Unavailable Seconds Threshold crossing defect trigger.
- `otu-ttim`—OTU Trail Trace Identifier Mismatch defect trigger.

hold-time *hold-time-value*—Hold time value. It can be one of the following:

- `down`—Delay before marking interface down when defect occurs (1..65534 milliseconds).
- `up`—Delay before marking interface up when defect is absent (1..65534 milliseconds).

> **NOTE**: The trigger hold time value alone does not mark an interface to be up when the defect is absent or mark an interface to be down when the defect occurs. The hold time value only impacts the alarm reporting time. To mark an interface up or down, you must also configure the physical interface hold time at the `[edit interfaces` *`interface-name`* `hierarchy level]`.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

- Release Information | 31332

Syntax

```
trigger-type  (session-close | volume);
```

Hierarchy Level

```
[edit services lrf profile profile-name template template-name]
```

Description

Configure the type of trigger that causes the generation of data records and transmission to the collector. You can only configure one type of trigger.

Default

If you do not include the `trigger-type` statement, the default trigger is `session-close`.

Options

session-close Use the closing of the data session to cause the generation of data records and transmission to the collector.

volume Use a data volume limit to cause the generation of data records and transmission to the collector. The data volume limit value is configured in the LRF rule.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

- Release Information | 31334

Syntax

```
trio-flow-offload minimum-bytes minimum-bytes;
```

Hierarchy Level

```
[edit interfaces interface-name services-options]
```

Description

Enable any plug-in or daemon on a PIC to generate a request to off-load flows to the Packet Forwarding Engine. This command is available on MX Series routers with Modular Port Concentrators (MPCs) and Modular Interface Cards (MICs).

NOTE: This feature is not supported for Broadband Edge subscribers (given that service PIC off load is not available with aggregate Ethernet (AE).

Options

minimum-bytes—Minimum number of bytes that trigger offloading. When this option is omitted, offloading is triggered when both the forward and reverse flows of the session have begun, meaning that at least one packet has flowed in each direction.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

ttl (RPM probe)

IN THIS SECTION

- Syntax | 31346
- Hierarchy Level (Junos OS) | 31346
- Hierarchy Level (Junos OS Evolved) | 31346
- Description | 31346
- Options | 31347
- Required Privilege Level | 31348
- Release Information | 31348

Syntax

```
ttl hop-count;
```

Hierarchy Level (Junos OS)

```
[edit services rpm bgp],
[edit services rpm probe owner test test-name]
```

Hierarchy Level (Junos OS Evolved)

```
[edit services monitoring rpm owner name test name]
```

Description

Specify the maximum hop count (TTL) for all types of probes (IPv4 and IPv6) in real-time performance monitoring (RPM) and Two-Way Active Management Protocol (TWAMP). This can be useful when it is necessary to restrict the scope of the RPM probes so a probe does not unintentionally monitor an alternative path to the destination (such as may occur after a BGP re-routing). Another example is to

monitor direct reachability by specifying a TTL of 1. Probes that exceed the number set for TTL are discarded.

The TTL configuration is supported on Routing Engine-based RPM, Multiservices Modular PIC Concentrator (MS-MPC) and Multiservices Modular Interfaces Card (MS-MIC)-based RPM, and Two-Way Active Management Protocol (TWAMP).

You can set a TTL value for the probe types listed below.

Software time stamping:

- icmp-ping, and icmp-ping-timestamp
- icmp6-ping (Junos OS only)
- udp-ping, and udp-ping-timestamp
- tcp-ping (Junos OS only)
- http-get, and http-metadata-get (Junos OS only)
- BGP neighbor monitoring using TCP/UDP (Junos OS only)

Hardware time stamping:

- icmp-ping and icmp-ping-timestamp
- udp-ping and udp-ping-timestamp

MS-MPC-PIC based probes (delegate):

- icmp-ping, icmp-ping-timestamp, and icmp6-ping (Junos OS only),

MS-MPC-PIC hardware timestamp:

- icmp-ping and icmp-ping-timestamp
- udp-ping and udp-ping-timestamp

TWAMP probe:

- inline TWAMP client

Options

hop-count—Prior to Junos OS Release 18.2R1, for RPM, the RPM client always sent a TTL of 64 to the RPM server under the IPv4 or IPv6 header. For TWAMP clients, the TTL was 255 sent in the IPv4 header. In Junos OS Release 18.2R1 and later, you can specify the TTL you want for RPM and TWAMP probes.

- **Range:** 1 through 255 for both RPM and TWAMP
- **Default:** 64

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1 for MX Series routers.

Statement introduced in Junos OS Evolved Release 20.1R1.

Syntax

```
tunable-value protocol-value;
```

Hierarchy Level

```
[edit security idp sensor-configuration detector protocol-name protocol-name tunable-name
tunable-name]
```

Description

Specify the value of the tunable parameter to enable or disable the protocol detector for each of the services.

Options

tunable-value—Integer representing a selected option for the switch specified in `tunable-name`. The range of values depends on the options defined for the specified switch.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2. Support.

tunables

IN THIS SECTION

- Syntax | 31354
- Hierarchy Level | 31354
- Description | 31354
- Options | 31354
- Required Privilege Level | 31355
- Release Information | 31355

Syntax

```
tunables {
    drop-on-zone-mismatch;
    enable-logging;
    max-route-change value;
    no-l3l4-app-lookup
}
```

Hierarchy Level

```
[edit security advance-policy-based-routing]
```

Description

Configure the advanced policy-based (APBR) routing options to streamline the traffic handling.

You can streamline the traffic handling with APBR such as limiting the number of times a route can change for a session, terminating the session if there is a mismatch between zones when APBR is being applied in the middle of the session, and enabling logging to record events that occur on the device.

Fine-tuning the APBR configuration is required to avoid the possible issues such as excessive transitions due to route changes.

Options

drop-on-zone-mismatch
Terminate the session instead of instead of allowing traffic to traverse through the same route bypassing APBR.

enable-logging
Enable logging to record events that occur on the device for APBR-related operations.

max-route-change *value*
Configure the threshold for limiting the number of times a route can change for a session.

- **Range:** 0-5
- **Default:** 1

no-l3l4-app-lookup Disable Layer 3 and Layer 4 custom application lookup in APBR. Starting in Junos OS Release 20.2R1, APBR supports Layer 3 and Layer 4 custom applications. You can manually disable Layer 3 and Layer 4 custom application lookup by including the `no-l3l4-app-lookup option`.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D110.

```

Description

Define dynamic tunnel attributes for transporting IPv4 traffic over an IPv6 network. You can configure multiple tunnels and specify different attributes for each tunnel. Service providers with IPv6 infrastructure can configure individual tunnels for each customer to route IPv4 traffic.

Options

name	Specify a dynamic tunnel name. You can have multiple tunnels configured with different attributes.
dynamic-tunnel-anchor-pfe	Specify a dynamic tunnel anchor PFE name of format pfe-x/y/z.
dynamic-tunnel-anti-spoof	Enable or disable anti-spoofing check.

- Values:
  - `off`—Disable anti-spoofing check
  - `on`—Enable anti-spoofing check.
  - **Default:** Dynamic tunnel anti-spoof is enabled by default.

dynamic-tunnel-mtu Specify the dynamic tunnel maximum transmission unit (MTU) value

- **Range:** `296` through `9232`

dynamic-tunnel-source-prefix Specify the tunnel source address

dynamic-tunnel-type Specify the tunnel type

- Values:
  - `V4oV6`— Tunnel type is IPv4 over IPv6

dynamic-tunnel-reassembly Enable IPV6 fragment reassembly for forwarding Ipv4 traffic

Required Privilege Level

routing—To view this statement in the configuration.

relay],
[edit protocols amt relay],
[edit routing-instances routing-instance-name protocols amt relay]
```

Description

List one or more tunnel-capable Automatic Multicast Tunneling (AMT) PICs to be used for creating multicast tunnel (**ud**) interfaces. Creating an AMT PIC list enables you to control the load-balancing implementation.

Tunnel-capable PICs include DPC and MPC.

The physical position of the PIC in the routing device determines the multicast tunnel interface name.

Default

Multicast tunnel interfaces are created on all available tunnel-capable AMT PICs, based on a round-robin algorithm.

Options

ud-*fpc/pic/port*—Interface that is automatically generated when a tunnel-capable PIC is installed in the routing device.

> **NOTE**: Each **tunnel-devices** statement keyword is optional. By default, all configured tunnel devices are used. The keyword selects the subset of configured tunnel devices.
>
> Tunnel devices must be configured on MX Series routers. They are not automatically available like M Series routers that have dedicated PICs. On MX Series routers, the tunnel device port is the next highest number after the physical ports – a PIC created with the `tunnel-services` statement at the `[edit chassis fpc slot-number pic number]` hierarchy level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Syntax

```
tunnel-devices [ mt-fpc/pic/port ];
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name protocols pim],
[edit routing-instances instance-name protocols pim]
```

Description

List one or more tunnel-capable PICs to be used for creating multicast tunnel (**mt**) interfaces. Creating a PIC list enables you to control the load-balancing implementation.

Tunnel-capable PICs include:

- Adaptive Services PIC
- Multiservices PIC or Multiservices DPC
- Tunnel Services PIC

- On MX Series routers, a PIC created with the `tunnel-services` statement at the [`edit chassis fpc` *`slot-number`* `pic` *`number`*] hierarchy level.

The physical position of the PIC in the routing device determines the multicast tunnel interface name. For example, if you have an Adaptive Services PIC installed in FPC slot 0 and PIC slot 0, the corresponding multicast tunnel interface name is **mt-0/0/0**. The same is true for Tunnel Services PICs, Multiservices PICs, and Multiservices DPCs.

Default

Multicast tunnel interfaces are created on all available tunnel-capable PICs, based on a round-robin algorithm.

Options

mt-*fpc/pic/port*—Interface that is automatically generated when a tunnel-capable PIC is installed in the routing device.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

Load Balancing Multicast Tunnel Interfaces Among Available PICs

tunnel-end-point

IN THIS SECTION

Syntax | 31376

- Hierarchy Level | 31376
- Description | 31376
- Options | 31378
- Required Privilege Level | 31379
- Release Information | 31379

Syntax

```
tunnel-end-point tunnel-name {
    gre {
        key authentication key;
    }
    ipv4 {
        destination-address destination-host-address;
        source-address source-host-address;
    }
    ipv6 {
        destination-address destination-host-address;
        source-address source-host-address;
    }
}
```

Hierarchy Level

```
[edit firewall]
```

Description

The `tunnel-end-point` command enables line-rate, filter-based, GRE tunneling of IPv4 and IPv6 payloads across IPv4 networks for MX Series routers running Trio-based FPCs (including MX80, MX104 and MX204). Filter-based tunneling encapsulates the original passenger protocol packet in an outer packet header. For example, for filter-based tunneling across IPv4 networks, the header adds 24 bytes or 28 bytes of overhead, including 20 bytes of IPv4 header. Either IPv4 or IPv6 traffic can be the transport protocol. For outgoing packets that match the configured filter term, the original packet are

encapsulated inside an IP+GRE header as specified by the tunnel definition. IP lookup is performed on the outer header, and the packets are forwarded accordingly.

The route lookup for GRE encapsulated traffic is supported on the default routing instance only. GRE encapsulation is not supported for logical systems, or for MPLS traffic.

When an subnet range is configured for either the IPv4 or IPv6 option, traffic between hosts in the range is load balanced.

Note that the device must be enabled for `enhanced-mode` to support the use of GRE tunnel templates, which allows you to define tunnel attributes.

To use the feature with PTX Series routers, install a PTX Series router as an *encapsulator*, that is, an ingress PE router where you can reference a tunnel template name in an type `inet` or `inet6` ingress firewall filter by configuring the encapsulate terminating action.

Configure the tunnel end points as shown here (for IPv4):

- `set firewall tunnel-end-point` *`tunnel-name`* `ipv4 source-address` *`source-host-address`*
- `set firewall tunnel-end-point` *`tunnel-name`* `ipv4 destination-address` *`destination-host-address`*
- `set firewall tunnel-end-point` *`tunnel-name`* `ipv4 destination-address` *`destination-host-address`*

Note that the maximum number of /25 IPv4 or /123 IPv6 subnets allowed for a tunnel-endpoint destination addresses is 64.

An interface-specific encapsulating output filter action is also required. It triggers the Packet Forwarding Engine to use information in the specified tunnel template to encapsulate matching packets and forward the resulting GRE packets. GRE encapsulation is supported only for outgoing IPv4 unicast and IPv6 unicast traffic.

Configure the tunnel end points as shown here (for IPv4):

- `set firewall family` *`inet`* `filter` *`filter-name`* `term` *`term-name`* `then encapsulate` *`tunnel-name`*

For the GRE decapsulation with PTX Series routers, use a PTX3000 or PTX5000 router with third generation FPCs that is running Junos OS Release 16.1R2 or later and configure the firewall filter at the hierarchy level shown here:

- `set firewall family` *`inet`* `filter` *`filter-name`* `term` *`term-name`* `then decapsulate gre`

Egress sampling is supported on GRE encapsulated packets, but note that output filter match conditions only work on the contents of ingress packets.

The route lookup for GRE encapsulated traffic is supported on the default routing instance only. GRE encapsulation is supported for ingress IPv4 unicast and IPv6 unicast traffic. It is not supported for logical systems, or for MPLS traffic.

When defining the tunnel end point, or the prefix list, be sure to specify the /32 route. Multiple tunnel end point source-address are not supported.

- A maximum of 1024 tunnel templates is supported. You can configure or change up to 512 tunnel templates at a time
- A maximum of 64 tunnel end point destination addresses are supported in a given tunnel template. When more than one destination IP address exists, the one used for the outer header is based on a hash that is computed on the input packet from the input interface.

Options

gre

- Encapsulation protocol. Options include `gre` and `gre-in-udp`.

You must also specify whether the tunnel is IPv4 or IPv6. A IPv4 example using GRE follows.

```
tunnel-end-point name {
    ipv4 {
        source-address 10.255.1.1;
        destination-address 10.255.2.0/25;
    }
    gre {
        key 9;
    }
}
```

- `key` *`number`*—An integer value that uniquely identifies a GRE IPv4 tunnel if multiple traffic flows share the same *`source-address`* and *`destination-address`* pair. Range: 1 through 0xFFFFFFFF (4,294,967,295 decimal). If a tunnel definition specifies GRE IPv4 tunneling using a key, the system includes the key in the GRE header whenever a Packet Forwarding Engine is instructed to use that tunnel definition to encapsulate a packet.

gre-in-udp

For MX Series routers; specify if the tunnel is **gre-in-udp**.

- *`destination-port number`*—An integer value that uniquely identifies the UDP destination port. Range: 1 through 65535.
- *`key number`*—An integer value that uniquely identifies the **gre-in-udp** tunnel if multiple traffic flows share the same `destination-port` and `source-port`. Range: 1 through

0xFFFFFFFF (4,294,967,295 decimal). If you include a key in the tunnel definition to encapsulate packets, the key used is the one in the GRE header.

- *source-port number*—An integer value that uniquely identifies the UDP source port. Range: 1 through 65535.

ipv4 The IP network protocol used to transport encapsulated passenger protocol packets; IPv4 transports IPv4 packets encapsulated using filter-based GRE. The default prefix length is 32; the supported range is from 25 to 32. When specified, traffic is load-balanced to the hosts on this subnet.

ipv6 The IP network protocol used to transport encapsulated passenger protocol packets; IPv6 transports IPv6 packets encapsulated using filter-based GRE. The default prefix length is 128; the supported range is from 121 to 128. When specified, traffic is load-balanced to the hosts on this subnet.

source-address IP address of the encapsulator (the local ingress PE router). Multiple tunnel end point source-address are not supported.

destination-address IP address or address range of the decapsulator (the remote egress PE router). For both IPv4 and IPv6, a maximum of 64 /25 IPv4 or /123 IPv6 subnets can be configured for the end point destination address.

```

Description

You can enforce per-VNI egress rate limits on VXLAN `tunnel-initiated` traffic using a filter with the `vxlan tunnel-initiated` match qualifier and the `egress profile1` filter profile. This configuration targets VXLAN traffic and preserves locally switched or routed flows while it helps prevent congestion, mitigate denial-of-service (DoS) risk, and prioritize critical services. The VLAN and VNI have a one-to-one mapping, allowing traffic policing per VNI to be treated as per VLAN and applied to the VLAN's egress. However, the VXLAN VNI rate limiting feature does not support rate limiting layer 3 (L3) multicast traffic, L3 unicast traffic, or Type-5 tunnel-initiated traffic.

Create the filter using `set firewall family ethernet-switching filter` *`filter-name`* `term` *`term-name`* `from vxlan tunnel-initiated` and `traffic-type known-unicast` for unicast traffic or `traffic-type-except known-unicast` for BUM traffic.

Enable the egress VLAN ACL filter using the `set system packet-forwarding-options firewall profiles ethernet-switching egress profile1` configuration.

Set two-color or three-color policers with the `discard` action and attach the filters per VLAN with `set routing-instances` *`instance-name`* `vlans` *`vlan-name`* `forwarding-options filter output` *`filter-name`*.

You use `show firewall` to view policer statistics.

            });
        }
    }
```

Hierarchy Level

```
[edit security]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure security inspection for EVPN-VXLAN tunnel traffic. Configure an outer policy for the outer header and an inner policy for the inner header.

When a packet matches a security policy, the firewall decapsulates the packet to get the inner header. The tunnel inspection profile is applied to the permitted traffic. With the inner packet content and the applied tunnel inspection profile, the device performs a policy lookup and then performs stateful inspection of the inner session traffic.

Options

- `inspection-profile` *`profile-name`*—Configure a tunnel inspection profile to connect the outer policy and inner policy.
- `trace-option`—Trace options for Network Security tunnel-inspection. Configure trace option for tunnel inspection.
- `vni` *`vni-name`*—Define VXLAN network identifier (VNI). VXLAN network identifier (VNI) used to uniquely identify the VXLAN.
- `no-remote-trace`—Disable remote tracing

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

tunnel family (inet | inet6) mdt],
[edit routing-instances routing-instance-name protocols pim mdt],
[edit routing-instances routing-instance-name provider-tunnel family (inet | inet6) mdt]
```

Description

Limit the number of data MDTs created in this VRF instance. If the limit is 0, then no data MDTs are created for this VRF instance.

Options

limit—Maximum number of data MDTs for this VRF instance.

- **Range: 0** through **1024**
- **Default: 0** (No data MDTs are created for this VRF instance.)

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4. In Junos OS Release 17.3R1, the `mdt` hierarchy was moved from `provider-tunnel` to the `provider-tunnel family inet` and `provider-tunnel family inet6` hierarchies as part of an upgrade to add IPv6 support for default MDT in Rosen 7, and data MDT for Rosen 6 and Rosen 7. The `provider-tunnel mdt` hierarchy is now hidden for backward compatibility with existing scripts.

tunnel-mtu (Services IPsec VPN)

IN THIS SECTION

- Syntax | 31391
- Hierarchy Level | 31391
- Description | 31391
- Options | 31391
- Required Privilege Level | 31392
- Release Information | 31392

Syntax

```
tunnel-mtu bytes;
```

Hierarchy Level

```
[edit services ipsec-vpn rule rule-name term term-name then]
```

Description

Maximum transmission unit (MTU) size for IPsec tunnels. This defines the maximum size of an IP packet, including the IPsec overhead.

Options

bytes—MTU size.

- **Default:** 1500 bytes
- **Range:** 256 through 9192 bytes

> **NOTE**: Clear the **IPsec SA** in **tunnel-mtu** to accommodate Jumbo frames larger than 1500 bytes.

> **NOTE**:
> Validation checks have been introduced to restrict the configuration of tunnel MTU for HA link encryption tunnels in a Multinode High Availability setup. This check ensures that the end-to-end MTU for HA links using IPv6 encryption meets the minimum requirement of 2000 bytes.
>
> For example, if your configuration includes the following stanza, and MTU is less than 2000 bytes, you'll receive a commit check error:
>
> ```
> user@host# set security ipsec vpn L3HA_IPSEC_VPN tunnel-mtu <bytes>
> ```
>
> Validation restricts tunnel MTU configuration to ensure HA links with IPv6 encryption meet the minimum 2000-byte MTU requirement for reliable high availability operations.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

tunnel-mtu (Services Service Set)

IN THIS SECTION

Syntax | 31393

- Hierarchy Level | 31393
- Description | 31393
- Options | 31393
- Required Privilege Level | 31394
- Release Information | 31394

Syntax

```
tunnel-mtu bytes;
```

Hierarchy Level

```
[edit services service-set service-set-name ipsec-vpn-options]
```

Description

Maximum transmission unit (MTU) size for IPsec tunnels. This statement is useful for dynamic endpoint tunnels for which you cannot configure the `tunnel-mtu` statement at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level.

For static IPsec tunnels, this statement sets the tunnel MTU value for all the tunnels within this service set. If you need a specific value for a particular tunnel, then set the `tunnel-mtu` statement at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level.

> **NOTE**: The `tunnel-mtu` setting at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level overrides the value specified at the `[edit services service-set service-set-name ipsec-vpn-options]` hierarchy level.

Options

bytes—MTU size.

- **Default:** 1500 bytes
- **Range:** 256 through 9192 bytes

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Next Gen Services Overview

tunnel-observation

IN THIS SECTION

- Syntax | 31396
- Hierarchy Level | 31396
- Description | 31396

- Options | 31396
- Required Privilege Level | 31397
- Release Information | 31397

Syntax

```
tunnel-observation [ipv4 | ipv6 | mpls-over-udp];
```

Hierarchy Level

```
[edit services flow-monitoring version9 template template-name]
[edit services flow-monitoring version-ipfix template template-name]
```

Description

Specify the types of MPLS flows on which to enable inline flow monitoring. If you do not configure a `tunnel-observation` type, then plain MPLS flow records are created.

You can configure multiple values for `tunnel-observation`. Flows are created for only the deepest match. For example, if you configure both `ipv4` and `mpls-over-udp` and the traffic type is MPLS-over-UDP, flows are created for MPLS-over-UDP. If you configure `ipv4` but *do not* configure `mpls-over-udp` and the traffic type is MPLS-over-UDP, flows are created for MPLS-IPv4.

If the MPLS traffic type does *not* match any of the `tunnel-observation` values, then plain MPLS flows are created.

If you do not configure `tunnel-observation`, plain MPLS flows are created.

If the `tunnel-observation` statement is added or deleted, or if the configured value is changed, all flows related to the old template will be deleted and replaced by new flows using the changed template.

Options

ipv4 Enable flow monitoring for MPLS-IPv4 traffic. You must also configure `mpls-template` at the `[edit services flow-monitoring (version9 | version-ipfix) template template-name]` hierarchy level.

ipv6 Enable flow monitoring for MPLS-IPv6 traffic. You must also configure `mpls-template` at the `[edit services flow-monitoring (version9 | version-ipfix) template *template-name*]` hierarchy level. If you are running inline flow monitoring on a Lookup (LU) card on an MX Series router, you must also configure `use-extended-flow-memory` at the `[edit chassis fpc *slot-number* inline-services]` hierarchy level to create MPLS-IPv6 flow records.

mpls-over-udp (PTX Series only) Enable flow monitoring for MPLS-over-UDP traffic. Monitoring looks past the tunnel header to report the inner payload of the packets. For an MPLS-over-UDP flow that is carried between IPv4 endpoints, you must also configure `ipv4-template` at the `[edit services flow-monitoring (version9 | version-ipfix) template *template-name*]` hierarchy level. For an MPLS-over-UDP flow that is encapsulated in an RSVP-TE LSP, you must also configure `mpls-ipvx-template` in Junos OS Release 18.1 or `mpls-template` starting in Junos OS 18.2R1 at the `[edit services flow-monitoring (version 9 | version-ipfix) template *template-name*]` hierarchy level.

Required Privilege Level

- Release Information | 31405

Syntax

```
tunnel-queuing;
```

Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number]
```

Description

Enable class-of-service (CoS) queuing for generic routing encapsulation (GRE) and IP-IP tunnels.

NOTE: The `tunnel-queuing` option is not supported in chassis cluster mode.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement modified in Release 9.0 of Junos OS.

tunnel-routing-instance

IN THIS SECTION

- Syntax | 31406
- Hierarchy Level | 31406
- Description | 31406
- Options | 31406

- Required Privilege Level | 31406
- Release Information | 31406

Syntax

```
tunnel-routing-instance {
    routing-instance routing-instance;
}
```

Hierarchy Level

```
[edit interfaces interface name unit name tunnel encapsulation gre]
```

Description

Indicates that the tunnel lookup is done with Layer 3 VPN.

Options

routing-instance Routing instance to which tunnel-route belongs or the default routing instance.

Required Privilege Level

interface

Release Information

Statement introduced in Junos OS Evolved Release 20.2R1.

tunnel-services (Chassis)

IN THIS SECTION

- Syntax | 31407
- Hierarchy Level | 31407
- Description | 31407
- Options | 31408
- Required Privilege Level | 31408
- Release Information | 31408

Syntax

```
tunnel-services {
    bandwidth bandwidth-value;
    multicast;
    tunnel-only;
}
```

Hierarchy Level

```
[edit chassis fpc slot-number pic number]
```

Description

For MX Series 5G Universal Routing Platforms, configure the amount of bandwidth for tunnel services.

For ACX Series routers, configure the amount of bandwidth for tunnel services. Only bandwidths of 1 Gbps and 10 Gbps are supported for ACX routers.

For M7i, M10i, M120, M320, T Series and TX Matrix routers with IQ2 PICs and IQ2E PICs, configure support for per unit scheduling for GRE tunnels. You can specify the IQ2 and IQ2E PICs to work exclusively in tunnel mode or as a regular PIC. The default setting uses IQ2 and IQ2E PICs as a regular PIC. If you do not configure the `tunnel-only` option, the IQ2 and IQ2 PICs operate as regular PICs. For

M7i, M10i, M120, M320, T Series and TX Matrix routers with IQ2 PICs and IQ2E PICs, you can use the `tunnel-only` option to specify that an IQ2 or IQ2E PIC work in tunnel mode only.

> **NOTE**: Bandwidth rates of 20 gigabits per second and 40 gigabits per second require use of an MX Series router with the 100-Gigabit Ethernet Modular Port Concentrator (MPC) and the 100-Gigabit CFP MIC.

> **NOTE**: On MX80 routers and MX Series routers with Trio-based FPCs, when ingress queuing is enabled for a PIC, tunnel services and inline services are not supported on the same PIC.

Options

`bandwidth`—Bandwidth reserved for tunnel services.

`tunnel-only` (Optional)—For M7i, M10i, M120, M320, T Series and TX Matrix routers with IQ2 PICs and IQ2E PICs, specify that an IQ2 or IQ2E PIC work in tunnel mode only.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.2.

`multicast` option introduced in Junos OS Evolved Release 25.4R1EVO.

tunnel-services (Routing Instances VPLS)

IN THIS SECTION

- Syntax | 31409
- Hierarchy Level | 31409
- Description | 31409
- Options | 31410
- Required Privilege Level | 31410
- Release Information | 31410

Syntax

```
tunnel-services {
    devices device-names;
    primary primary-device-name;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
vpls],
[edit routing-instances routing-instance-name protocols vpls]
```

Description

Specify that traffic for particular VPLS routing instances be forwarded to specific virtual tunnel (VT) interfaces, allowing you to load-balance VPLS traffic among all the available VT interfaces on the router.

NOTE: In the VPLS documentation, the word *router* in terms such as *PE router* is used to refer to any device that provides routing functions.

Options

devices ***device-names***—Specify the VT interfaces acceptable for use by the VPLS routing instance. If you do not configure this option, all VT interfaces available to the router can be used for de-encapsulating traffic for this instance.

primary ***primary-device-name***—Specify the primary VT interface to be used by the VPLS routing instance. The VT interface specified is used to de-encapsulate all VPLS traffic from the MPLS core network for this routing instance. If the VT interface specified is unavailable, then one of the other acceptable VT interfaces is used for handling the VPLS traffic. If you do not configure this option, any acceptable VT interface can be used to de-encapsulate VPLS traffic from the core.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Release Information | 31412

Syntax

```
tunnel-services {
    devices device-names;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

Description

Enable ultimate-hop popping on point-to-multipoint LSPs. The Junos OS selects one of the available virtual tunnel (VT) interfaces to de-encapsulate the egress traffic. By default, the selection process is performed automatically.

Default

Ultimate-hop popping is disabled.

Options

`devices` *`device-names`*—Specify which VT interfaces are used to handle the RSVP traffic.

- **Range:** 0 to 8 devices

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.1.

RELATED DOCUMENTATION

Enabling Ultimate-Hop Popping on Point-to-Multipoint LSPs

tunnel-source

IN THIS SECTION

- Syntax | 31412
- Hierarchy Level | 31413
- Description | 31413

tunnel-termination

IN THIS SECTION

- Syntax | 31418
- Hierarchy Level | 31419
- Description | 31419
- Required Privilege Level | 31419
- Release Information | 31419

Syntax

```
tunnel-termination;
```

Hierarchy Level

```
[edit interfaces fti number unit logical-unit-number tunnel encapsulation ( gre | ipip | udp )],
[edit interfaces interface-name family inet],
[edit forwarding-options]
```

Description

Enables the tunnel to terminate on the tunnel underlay interface configured at the `[edit interfaces interface-name family inet]` hierarchy level.

On a flexible tunnel interface (FTI), enables tunnel termination for GRE, IPIP , or UDP decapsulation.

> **NOTE**: Starting in Junos OS Evolved Release 20.3R1, this statement is optional. If the statement is configured, the router can perform decapsulation of packets only. When the statement is not configured, you can configure encapsulation and decapsulation on the FTI.

> **NOTE**: For the Junos OS Evolved Release 20.1R2, you have to configure the `tunnel-termination` option for IP-IP decapsulation mandatorily. In Junos OS Evolved Release 20.4R1, when tunnel-termination is configured, the router functions in decap-only mode and the understanding of source address and destination address is swapped.

When configured at the [edit forwarding-options] hierarchy level, the `tunnel-termination` option enables the termination of tunnels on all interfaces at the global level. This option is disabled by default. It is mandatory to enable this option for EVPN-VXLAN deployments.

Required Privilege Level

interface

Release Information

Statement introduced in Junos OS Evolved Release 20.2R1.

Statement introduced for IPIP tunnels in Junos OS Evolved Release 20.4R1.

Statement introduced for UDP tunnels in Junos OS Evolved Release 21.1R1.

Statement introduced at the [edit forwarding-options] hierarchy level in Junos OS Evolved Release 21.4R2.

Statement introduced in Junos OS Evolved 24.2R1 for ACX Series routers (GRE tunnels)

tunnel-timeout

IN THIS SECTION

- Syntax | 31420
- Hierarchy Level | 31420
- Description | 31420
- Options | 31420
- Required Privilege Level | 31421
- Release Information | 31421

Syntax

```
tunnel-timeout seconds;
```

Hierarchy Level

```
[edit services l2tp tunnel-group name]
```

Description

Specify the maximum downtime for an L2TP tunnel, after which the tunnel is terminated because the connection is presumed to have been lost.

Options

seconds—Interval after which the tunnel is terminated if no data can be sent.

- **Default:** 120 seconds

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

twamp (Security ALG)

IN THIS SECTION

- Syntax | 31421
- Hierarchy Level | 31422
- Description | 31422
- Options | 31422
- Required Privilege Level | 31422
- Release Information | 31423

Syntax

```
alg {
    twamp {
        traceoptions {
            flag {
```

```
                all extensive;
            }
        }
    }
}
```

Hierarchy Level

```
[edit security]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Specify the Two-Way Active Measurement Protocol (TWAMP) Application Layer Gateway (ALG) on the device. The TWAMP ALG extracts the IP addresses and the port details from messages between the control client and the TWAMP server and performs IP translation and gate opening to permits the test sessions. The TWAMP ALG also performs the message sanity check. By default, the TWAMP ALG is disabled. To enable, you need to configure the TWAMP ALG at `[edit security alg twamp]` hierarchy level.

Options

twamp Configure the TWAMP ALG.

traceoptions Define the tracing operations for the TWAMP ALG. The TWAMP ALG trace options helps to monitor traffic flow into and out of the NFX Series and SRX Series devices.

flag Configure the TWAMP ALG trace flags.

all Trace with all flags enabled.

Required Privilege Level

system—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1.

Description

Configure the Two-Way Active Measurement Protocol (TWAMP) client or server settings on MX Series routers, ACX routers, EX4300 Switches, PTX Series routers, EX9200 Series switches, and QFX10000 Series switches.

TWAMP is an open protocol for measurement of two-way metrics. The host that initiates the TCP connection takes the roles of the control-client and (in the two-host implementation) the session-sender. Such a device is also called the TWAMP client. The host that acknowledges the TCP connection accepts the roles of a server and (in the two-host implementation) and the session-reflector. Such a device is also called the TWAMP server. The TWAMP-Test messages are exchanged between the session-sender and the session-reflector, and the TWAMP-Control messages are exchanged between the control-client and the server.

The following addresses cannot be used for the `client-list` source IP address used for probes:

- 0.0.0.0
- 127.0.0.0/8 (loopback)
- 224.0.0.0/4 (multicast)
- 255.255.255.255 (broadcast)

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Junos OS Evolved syntax and hierarchy level introduced in Junos OS Evolved 20.3R1 for PTX10003 routers.

Support for the rest of the PTX10000 Series routers added in Junos OS Evolved Release 21.1R1.

`control-type` and `light` options added in Junos OS Release 21.1R1.

`traps` option added in Junos OS Evolved Release 21.3R1.

`source-address` option and the `local-link` sub-option of the `target-address` option for TWAMP Light test sessions introduced in Junos OS Release 21.4R1.

The `local-link` sub-option of the `target` option for TWAMP Light test sessions introduced in Junos OS Evolved Release 22.3R1.

The `inline-timestamping` suboption of the `offload-type` option introduced in Junos OS Evolved Release 22.4R1.

`offload-type` and `stateful-sequence` options for light and managed servers introduced in Junos OS Evolved Release 23.4R1.

`source-routing` option introduced in Junos OS Evolved Release 24.4R1 and in Junos OS Release 25.4R1.

`offload-type` option for servers and test sessions introduced in Junos OS Release 25.4R1.

two-rate {
    (color-aware | color-blind);
    committed-information-rate bps;
    committed-burst-size bytes;
    peak-information-rate bps;
    peak-burst-size bytes;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall three-color-policer name],
[edit firewall three-color-policer policer-name],
[edit logical-systems logical-system-name firewall three-color-policer policer-name]
```

Description

Configure a two-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), peak information rate (PIR), and peak burst size (PBS).

Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the PIR or the PBS are assigned medium-high loss priority (yellow). Packets that exceed the PIR and the PBS are assigned high loss priority (red).

Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Logical systems support introduced in Junos OS Release 9.3.

Support at the `[edit dynamic-profiles ... three-color-policer name` hierarchy levels introduced in Junos OS Release 11.4.

tx-address-change (L2TP LAC)

IN THIS SECTION

- Syntax | 31433
- Hierarchy Level | 31433
- Description | 31433
- Default | 31433
- Options | 31433
- Required Privilege Level | 31434
- Release Information | 31434

Syntax

```
tx-address-change (accept | ignore | ignore-ip-address | ignore-udp-port | reject | reject-ip-address | reject-udp-port);
```

Hierarchy Level

```
[edit services l2tp tunnel]
```

Description

Configure whether the LAC accepts, ignores, or rejects requests from an LNS to change the destination IP address, UDP port, or both.

When configured to ignore change requests, the LAC continues to send packets to the original address or port, but accepts packets from the new address or port.

When configured to reject change requests, the LAC sends a StopCCN message to the original address or port and then terminates the connection to that LNS. This method has precedence over the ignore configuration.

Default

The LAC accepts IP address or UDP port change requests from the LNS.

Options

accept	Accept all change requests for IP address or UDP port.
ignore	Ignore all change requests for IP address or UDP port.
ignore-ip-address	Ignore a change request for IP address, but accept a change request for UDP port.
ignore-udp-port	Ignore a change request for UDP port, but accept a change request for IP address.
reject	Reject all change requests for IP address or UDP port.
reject-ip-address	Reject a change request for IP address, but accept a change request for UDP port.
reject-udp-port	Reject a change request for UDP port, but accept a change request for IP address.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

`reject`, `reject-ip-address`, and `reject-udp-port` options added in Junos OS Release 16.1.

L2TP LAC Subscriber Configuration

tx-buffers

IN THIS SECTION

- Syntax | 31434
- Hierarchy Level | 31435
- Description | 31435
- Default | 31435
- Options | 31435
- Required Privilege Level | 31435
- Release Information | 31436

Syntax

```
tx-buffers (on | off);
```

Hierarchy Level

```
[edit interfaces interface-name ether-options configured-flow-control]
```

Description

Enable or disable an interface to respond to received Ethernet PAUSE messages. If you enable the transmit buffers to respond to PAUSE messages, when the interface receives a PAUSE message from the connected peer, the interface stops transmitting frames on the entire link. When the receive buffer on the connected peer empties below a certain threshold, the peer interface sends a message to the paused interface to resume sending frames.

Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the `tx-buffers` statement with the `rx-buffers` statement to configure asymmetric Ethernet PAUSE on an interface. (Use the `flow-control` statement to enable symmetric PAUSE and the `no-flow-control` statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)

> **NOTE**: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).
>
> Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

Default

Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.

Options

`on | off`—Enable or disable an interface to respond to an Ethernet PAUSE message.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

tx-connect-speed-method (L2TP LAC)

IN THIS SECTION

- Syntax | 31436
- Hierarchy Level | 31437
- Description | 31437
- Options | 31437
- Required Privilege Level | 31439
- Release Information | 31439

Syntax

```
tx-connect-speed-method method;
```

Hierarchy Level

```
[edit services l2tp]
```

Description

Specify the method that determines how to derive the connect speed values sent from the LAC to the LNS.

When the session is being established, the speeds are included in the Incoming-Call-Connected (ICCN) message. The transmit speed is conveyed in AVP 24 (Tx-Connect-Speed) and the receive speed is conveyed in AVP 38 (Rx-Connect-Speed). Both values are in bits per seconds (bps). The LAC typically uses the `static` or `pppoe-ia-tags` method, because values for other configured methods are not available when the session is being established.

When connect speed updates are configured, the LAC sends the updated values for each session to the LNS in Connect-Speed-Update-Notification (CSUN) messages. The updated speeds are conveyed in the Connect Speed Update AVP (97).

When connection speed values are not available from the configured method, the LAC falls back to another source for the values. See *L2TP Subscriber Access Lines and Connection Speeds* for tables describing the LAC fallback behavior by Junos OS release.

Options

method Method used to derive the connection speed values.

- `actual`—(Junos OS Releases 15.1, 16.1, 16.2, 17.1) The speed is derived from the CoS effective shaping rate that is enforced on the level 3 node based on local policy. In the supported releases, `actual` is the default method and has the highest preference among all configured methods.

  This method is not available starting in Junos OS Release 17.2. However, it is configurable in the Tunnel-Tx-Speed-Method VSA (26-94). If you do so, it is translated to the `service-profile` method.

- `ancp`—The speed is derived from the configured ANCP value for the underlying interface. This value results from a user-defined percentage correction to the values received from the access node; this is configured per subscriber access line. The percentage accounts for encapsulation differences between, the router, the access loop, and the Layer 1 transport overhead. The initial rate sent to the LNS is the ANCP value reported at the time the ICCN

is sent. The ANCP value is not available for the ICCN message and falls over to another method. You can change the configured correction after a subscriber has logged in, but those changes do not affect the actual rate used by the LNS for that subscriber.

- `none`—This method prevents the LAC from sending AVP 24 and AVP 38 to the LNS. This option also overrides the Juniper Networks RADIUS VSAs, Tx-Connect-Speed (26-162) and Rx-Connect-Speed (26-163).

- `pppoe-ia-tags`—The speed is derived from the PPPoE IA tags received by the LAC from the DSLAM. This speed value is transmitted when a subscriber logs in and it cannot subsequently be changed. The value of Actual-Data-Rate-Downstream (VSA 26-129) is used for AVP 24. The value of Actual-Data-Rate-Upstream (VSA 26-130) is used for AVP 38; it is sent only when the values differ.

  > **NOTE**: This speed derived from the IA tags does not apply to subscribers that are already logged in; it is effective only for subscribers that log in after this setting has been saved.

- `service-profile`—(Junos OS Releases 17.2 and higher) The downstream (Tx) speed is derived from the actual CoS that is enforced on the L3 node based on local policy. The upstream (Rx) speed is the value configured in the dynamic service profile; no adjustment is made to this value. The service-profile value is not available for the ICCN message and falls over to another method.

  The `service-profile` method is supported only when the `effective shaping-rate` statement is included at the `[edit chassis]` hierarchy level. If it is not, the commit check fails. If the method is received from RADIUS in VSA 26-94, a system log message is generated instead, because no commit check is performed in this case.

- `static`—(Junos OS Releases 13.3, 14.1, and 14.2; Junos OS Releases 17.2 and higher) The speed is derived from the configured static Layer 2 speed. For Ethernet VLANs, this is the recommended (advisory) shaping rate configured on the PPPoE logical interface underlying the subscriber interface. If the advisory shaping rate is not configured on the underlying interface, then the actual speed of the underlying physical port is used. In the supported releases, `static` is the default method.

  In Junos OS Releases 15.1, 16.1, 16.2, and 17.2, the `static` method is configurable for backward compatibility, but it is not supported. If you configure this method in the CLI or in the Tunnel-Tx-Speed-Method VSA (26-94), the LAC falls back to the port speed of the subscriber access interface.

> **NOTE**: For ge and xe interfaces, the port speed value is set to 1,000,000,000 and for ae interfaces, the port speed value is set to 0. The value is sent in both AVP 24 and AVP 38.

- Default:
  - `static` (Starting in Junos OS Release 17.2)
  - `actual` (Junos OS Releases 15.1, 16.1, 16.2, 17.1)
  - `static` (Junos OS Releases 13.3, 14.1, and 14.2)

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Options **ancp**, **pppoe-ia-tag**, and **static** introduced in Junos OS Release 13.1.

Option `static` deprecated in Junos OS Release 15.1.

Options **actual** and **none** added in Junos OS Release 15.1.

Option `actual` deprecated in Junos OS Release 17.2.

Option `service-profile` added in Junos OS Release 17.2.

Option `static` undeprecated in Junos OS Release 17.2.

Syntax

```
type (message | protocol-only);
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus juniper-express-engine profile profile-name
notification-options fallback-block]
[edit security utm feature-profile anti-virus kaspersky-lab-engine profile profile-name
notification-options fallback-block]
[edit security utm feature-profile anti-virus sophos-engine profile profile-name notification-
options fallback-block]
```

Description

You can configure notifications for both fallback blocking and fallback nonblocking actions. With protocol-only notifications, a protocol-specific error code may be returned to the client.

Options

- message—Send a generic notification.
- protocol-only—Send a protocol-specific notification.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5. Support for Sophos engine added in Junos OS Release 11.1 .

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1X49-D10	The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards.

type (Security IDP Dynamic Attack Group)

IN THIS SECTION

- Syntax | 31457
- Hierarchy Level | 31458
- Description | 31458
- Options | 31458
- Required Privilege Level | 31458
- Release Information | 31458

Syntax

```
type {
    values [anomaly signature];
}
```

Hierarchy Level

```
[edit security idp dynamic-attack-group dynamic-attack-group-name filters]
```

Description

Specify an attack type filter to add attack objects based on the type of attack object (signature or protocol anomaly).

Options

`values`—Name of the attack type filter.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

type (Security IDP ICMP Headers)

IN THIS SECTION

- Syntax | 31459
- Hierarchy Level | 31459
- Description | 31459
- Options | 31459
- Required Privilege Level | 31459
- Release Information | 31459

Syntax

```
type {
    match (equal | greater-than | less-than | not-equal);
    value type-value;
}
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type signature protocol icmp]
```

Description

Specify the primary code that identifies the function of the request/reply.

Options

`match` (`equal` | `greater-than` | `less-than` | `not-equal`)—Match an operand.

`value` *`type-value`*—Match a decimal value.

- **Range:** 0 through 255

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

type (Security Virus Detection)

IN THIS SECTION

- Syntax | 31460
- Hierarchy Level | 31460
- Description | 31460
- Options | 31461
- Required Privilege Level | 31461
- Release Information | 31461

Syntax

```
type (message | protocol-only);
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus juniper-express-engine profile profile-name
notification-options virus-detection]
[edit security utm feature-profile anti-virus kaspersky-lab-engine profile profile-name
notification-options virus-detection]
[edit security utm feature-profile anti-virus sophos-engine profile profile-name notification-
options virus-detection]
```

Description

When content is blocked because a virus is found or a scan error occurs, the client generally still receives a successful response code but with modified content (file replacement) containing a warning message. But with protocol-only notifications, a protocol-specific error code might be returned to the client.

Options

- message—Send a generic notification.
- protocol-only—Send a protocol-specific notification.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5. Support for Sophos engine added in Junos OS Release 11.1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1X49-D10	The Express and Kaspersky Antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards.

type (Security Web Filtering)

IN THIS SECTION

- Syntax | 31462
- Hierarchy Level | 31462
- Description | 31462
- Options | 31462
- Required Privilege Level | 31462

Release Information | 31463

Syntax

```
type (juniper-enhanced | juniper-local | surf-control-integrated | websense-redirect) | ng-
juniper;
```

Hierarchy Level

```
[edit security utm default-configuration web-filtering]
[edit security utm feature-profile web-filtering]
```

Description

Define the type of Web filtering solution or URL filtering solution used by the device.

Options

- **juniper-enhanced**—Enable Enhanced Web Filtering on the device.
- **juniper-local** —Enable Juniper Networks local URL filtering on the device.
- **surf-control-integrated**—Enable integrated Web filtering on the device.
- **websense-redirect**—Redirect the URL to the Websense server.
- **ng-juniper**—Enable Juniper NextGen Web filtering on the device.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The surf-control-integrated feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, command introduced in Junos OS Release 9.5.

Command introduced in Junos OS Release 11.4 .

The `[edit security utm default-configuration web-filtering]` hierarchy level is introduced in Junos OS Release 18.2R1.

The ng-juniper option is introduced in Junos OS Release 23.4R1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1X49-D10	The surf-control-integrated feature is not supported from Junos OS Release 15.1X49-D10 onwards.

type (SNMP v3)

IN THIS SECTION

- Syntax | 31463
- Hierarchy Level | 31464
- Description | 31464
- Options | 31464
- Required Privilege Level | 31464
- Release Information | 31464

Syntax

```
type (inform | trap);
```

Hierarchy Level

```
[edit snmp v3 notify name]
```

Description

Configure the type of SNMP notification.

Options

`inform`—Defines the type of notification as an inform. SNMP informs are confirmed notifications.

`trap`—Defines the type of notification as a trap. SNMP traps are unconfirmed notifications.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`inform` option added in Junos OS Release 7.4.

type (Tunnel Profile)

IN THIS SECTION

- Syntax | 31465
- Hierarchy Level | 31465
- Description | 31465
- Default | 31465
- Options | 31465
- Required Privilege Level | 31465

Release Information | 31465

Syntax

```
type tunnel-type;
```

Hierarchy Level

```
[edit access tunnel-profile profile-name tunnel tunnel-id]
```

Description

Specify the tunnel type (protocol).

Default

`l2tp`

Options

tunnel-type—Tunnel protocol type. The only value currently available is `l2tp`.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

RELATED DOCUMENTATION

L2TP LAC Tunneling for Subscribers

type

IN THIS SECTION

- Syntax | 31466
- Hierarchy Level | 31466
- Description | 31466
- Options | 31466
- Required Privilege Level | 31467
- Release Information | 31467

Syntax

```
type {
    linux-container | virtual-machine;
    }
```

Hierarchy Level

```
[edit virtual-network-functions]
```

Description

Type of the VNF.

Options

linux-container The VNF type is Linux container.

virtual-machine The VNF type is virtual machine.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X53-D40.

type

IN THIS SECTION

- Syntax | 31467
- Hierarchy Level | 31468
- Description | 31468
- Options | 31468
- Required Privilege Level | 31468
- Release Information | 31468

Syntax

```
type type;
```

Hierarchy Level

```
[edit services application-identification application application-name],
[edit services application-identification nested-application name]
```

Description

Define type of application, such as HTTP or FTP.

Options

type—Application type. This is a mandatory value and has a maximum length of 32 characters.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

RELATED DOCUMENTATION

type-of-service

IN THIS SECTION

- Syntax | **31469**
- Hierarchy Level | **31469**

- Description | 31469
- Options | 31469
- Required Privilege Level | 31469
- Release Information | 31470

Syntax

```
type-of-service service-type;
```

Hierarchy Level

```
[edit services application-identification application application-name]
```

Description

Define the type of service by service objective. There is no default value.

Options

The following *service-type* options are available:

- `maximize-reliability`—Service designed for maximum reliability in packet transmission.
- `maximize-throughput`—Service designed for maximum throughput.
- `minimize-delay`—Service designed for minimum delay in packet transmission.
- `minimize-monetary-cost`—Service designed for minimum monetary cost.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

uac-policy (Application Services)

IN THIS SECTION

- Syntax | 31476
- Hierarchy Level | 31476
- Description | 31477
- Options | 31477
- Required Privilege Level | 31477
- Release Information | 31477

Syntax

```
uac-policy {
    captive-portal captive-portal;
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
application-services]
```

Description

Enable Unified Access Control (UAC) for the security policy. This statement is required when you are configuring the SRX Series Firewall to act as a Junos OS Enforcer in a UAC deployment. When deployed as a Junos OS Enforcer, the SRX Series Firewall enforces the policies that are defined on the UAC's IC Series UAC Appliance .

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.4.

RELATED DOCUMENTATION

Understanding User Role Firewalls

Example: Configuring a User Role Firewall on an SRX Series Device

uac-service

IN THIS SECTION

- Syntax | 31478
- Hierarchy Level | 31478
- Description | 31478
- Options | 31478
- Required Privilege Level | 31478

Release Information | 31479

Syntax

```
uac-service {
    command binary-file-path;
    disable;
    failover (alternate-media | other-routing-engine);
}
```

Hierarchy Level

```
[edit system processes]
```

Description

Specify the unified access control daemon process.

Options

- `command` *`binary-file-path`*—Path to the binary process.
- `disable`—Disable the unified access control daemon process.
- `failover`—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.
  - `alternate-media`—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.
  - `other-routing-engine`—Instruct the secondary Routing Engine to take primary role if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Firewall User Authentication Overview

ucode-imem-remap

IN THIS SECTION

- Syntax | 31479
- Hierarchy Level | 31479
- Description | 31480
- Required Privilege Level | 31480
- Release Information | 31480

Syntax

```
ucode-imem-remap;
```

Hierarchy Level

```
[edit chassis feb slot number]
```

Description

M120 routers with a single type-1 FPC mapped to an FEB support a microcode remap feature to resolve microcode overflow resulting in bad PIC combinations.

You can enable the microcode remap by using the `ucode-imem-remap` statement at the [**edit chassis feb slot *number***] hierarchy level. The default microcode map will continue to be available if the `ucode-imem-remap` statement is not configured.

> **NOTE**: On M120 routers, the FEB is automatically restarted once the `ucode-imem-remap` statement is configured and committed.

Required Privilege Level

interfaces—To view this statement in the configuration.

interfaces-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4R2.

udp (FTI)

IN THIS SECTION

- Syntax | 31481
- Hierarchy Level | 31481
- Description | 31481
- Required Privilege Level | 31481
- Release Information | 31481

Syntax

```
udp {
    destination {
        address ipv4_address;
    }
    source {
        address ipv4_address;
        interface interface;
    }
}
```

Hierarchy Level

```
[edit interfaces name unit name tunnel encapsulation]
```

Description

Enable UDP encapsulation with IPv4 on FTI logical interfaces.

Required Privilege Level

interface

Release Information

Statement introduced in Junos OS Release 19.3R1.

RELATED DOCUMENTATION

Flexible Tunnel Interfaces Overview

udp (Security IDP Protocol Binding)

IN THIS SECTION

- Syntax | 31482
- Hierarchy Level | 31482
- Description | 31482
- Options | 31482
- Required Privilege Level | 31483
- Release Information | 31483

Syntax

```
udp {
    minimum-port port-number <maximum-port port-number>;
}
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type chain protocol-binding],

[edit security idp custom-attack attack-name attack-type signature protocol-binding]
```

Description

Allow IDP to match the attack for specified UDP ports.

Options

- `minimum-port` *`port-number`*—Minimum port in the port range.
- **Range:** 0 through 65,535
- `maximum-port` *`port-number`*—Maximum port in the port range.

- **Range:** 0 through 65,535

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Statement introduced in Junos OS Release 9.3.

udp (Security Screen)

IN THIS SECTION

- Syntax | 31485
- Hierarchy Level | 31485
- Description | 31485
- Options | 31485

Required Privilege Level | 31485
Release Information | 31486

Syntax

```
udp {
    flood {
        threshold number;
    }
    port-scan {
        threshold number;
    }
    udp-sweep {
        threshold threshold number;
    }
}
```

Hierarchy Level

```
[edit security screen ids-option screen-name]
```

Description

Specify the number of packets allowed per second to the same destination IP address/port pair. When the number of packets exceeds this value within any 1-second period, the device generates an alarm and drops subsequent packets for the remainder of that second.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

udp-encapsulation

IN THIS SECTION

- Syntax | 31488
- Hierarchy Level | 31488
- Description | 31488
- Options | 31489
- Required Privilege Level | 31489
- Release Information | 31489

Syntax

```
udp-encapsulation {
    <udp-dest-port destination-port>;
}
```

Hierarchy Level

```
[edit services service-set service-set-name ipsec-vpn-options]
```

Description

Enable multiple path forwarding of IPsec traffic by adding a UDP header to the IPsec encapsulation of packets. Doing this increases the throughput of IPsec traffic. If you do not enable UDP encapsulation, all the IPsec traffic follows a single forward path rather than using multiple available paths.

Options

udp-dest-port *destination-port*

(Optional) Use the specified UDP destination port for the UDP header that is appended to the ESP encapsulation.

- **Range:** 1025 through 65536. Do not use 4500.
- **Default:** If you do not include the `udp-dest-port` statement, the default UDP destination port is 4565.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

udp-sweep

IN THIS SECTION

- Syntax | 31491
- Hierarchy Level | 31491
- Description | 31491
- Options | 31492
- Required Privilege Level | 31492
- Release Information | 31492

Syntax

```
udp-sweep {
    threshold number;
}
```

Hierarchy Level

```
[edit security screen ids-option screen-name udp]
```

Description

Configure the device to detect and prevent UDP sweep attack. In a UDP sweep attack, an attacker sends UDP packets to the target device. If the device responds to those packets, the attacker gets an indication that a port in the target device is open, which makes the port vulnerable to attack. If a remote host sends UDP packets to 10 addresses in 0.005 seconds (5000 microseconds), then the device flags this as an UDP sweep attack.

If the `alarm-without-drop` option is not set, the device rejects the eleventh and all further UDP packets from that host for the remainder of the specified threshold period.

Options

`threshold` *number*—Maximum number of microseconds during which up to 10 UDP packets from the same host are allowed into the device. More than 10 requests from a host during this period triggers an UDP Sweep attack response on the device during the remainder of the second.

- **Range:** 1000 through 1,000,000 microseconds
- **Default:** 5000 microseconds

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

ultimate-hop-popping (Protocols IS-IS)

IN THIS SECTION

Syntax | 31498

- Hierarchy Level | 31498
- Description | 31498
- Required Privilege Level | 31498
- Release Information | 31498

Syntax

```
ultimate-hop-popping;
```

Hierarchy Level

```
[edit logical-systems name protocols isis source-packet-routing],
[edit logical-systems name routing-instances name protocols isis source-packet-routing],
[edit protocols isis source-packet-routing],
[edit routing-instances name protocols isis source-packet-routing],
```

Description

Enable ultimate hop popping for IS-IS. IS-IS advertises a node SID with the P bit set for no penultimate–hop–popping (PHP) in all prefix SID advertisements.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 25.4R1.

ultimate-hop-popping

IN THIS SECTION

- Syntax | 31499
- Hierarchy Level | 31499
- Description | 31499
- Default | 31500
- Required Privilege Level | 31500
- Release Information | 31500

Syntax

```
ultimate-hop-popping;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switched-path label-switched-path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path label-switched-path-name]
```

Description

Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.

Be aware of the following platform requirements and restrictions:

- UHP LSPs using VT interfaces—Supported on all M Series, MX Series, T Series, and TX Matrix routers.

- UHP LSPs using LSI interfaces—Supported on MX 3D Series routers only.
- UHP LSP requirements for the egress PE device—For M Series and T Series routers, a VT interface is needed.
- UHP LSPs and Layer 3 VPNs—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only.
- UHP LSPs and VPLS—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the "no-tunnel-services" on page 12096 statement at the `[edit routing-instances routing-instance-name protocols vpls]` hierarchy level.

Default

Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

ultrahigh-power

IN THIS SECTION

- Syntax | 31501
- Hierarchy Level | 31501
- Description | 31501
- Default | 31501
- Required Privilege Level | 31502
- Release Information | 31502

Syntax

```
ultrahigh-power;
```

Hierarchy Level

```
[edit poe interface (all | interface-name)]
```

Description

Configure a four-pair PoE port to deliver up to 95 W of power. The four-pair PoE standard allows for power to be delivered over all four pairs of wires in a standard CAT5/6 RJ-45 Ethernet cable.

When you configure the four-pair PoE port with the `ultrahigh-power` option, the port provides up to 95 W of power, even if the powered device does not consume that amount of power.

Default

By default the PoE port operates in two-pair mode and provides power up to 30 W in accordance with the IEEE 802.3at PoE+ standard.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1.

- Syntax | 31502
- Hierarchy Level | 31502
- Description | 31503
- Default | 31503
- Required Privilege Level | 31503
- Release Information | 31503

Syntax

```
unattended-boot;
```

Hierarchy Level

```
[edit system]
```

Description

Set the switch to unattended mode for U-Boot to prevent unauthorized access to the system before the JUNOS OS login prompt appears. In unattended mode, access to the loader CLI is blocked, as well as recovery mechanisms such as password recovery by using single-user mode and booting the switch by using a USB flash drive. In order to access the CLI in U-Boot mode, the user must enter a boot-loader password that has been previously configured.

> **NOTE**: If the root password is lost while the switch is in unattended mode, the switch must be reset to the factory default configuration using the LCD panel. For more information see *Reverting to the Default Factory Configuration for the EX Series Switch*.

Default

Unattended mode is not enabled by default.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X51-D20.

unconditional-src-learn

IN THIS SECTION

- Syntax | **31504**

- Hierarchy Level | 31504
- Description | 31504
- Required Privilege Level | 31504
- Release Information | 31504

Syntax

```
unconditional-src-learn;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family inet]
```

Description

Enables the router to learn IP addresses from nonvalidated sources when proxy Address Resolution Protocol (ARP) is configured.

CAUTION: By default, the router learns IP addresses from validated sources only. When this statement is configured and proxy ARP is enabled on an unnumbered interface, the router responds to ARP requests from any IP address, which might lead to exploitable information disclosure. An attacker can poison the ARP cache and create a fake forwarding table entry for an IP address, effectively creating a denial of service for that subscriber or interface. Therefore, exercise caution when configuring this statement.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4R16.

Syntax

```
underlying-interface underlying-interface-name;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces demux0 interface-name unit unit logical-unit-number
demux-options]
```

Description

Configure the underlying interface on which the demultiplexing (demux) interface is running.

> **CAUTION**: Before you make any changes to the underlying interface for a demux0 interface, you must ensure that no subscribers are currently present on that underlying interface. If any subscribers are present, you must remove them before you make changes.

Options

underlying-interface-name—Either the specific name of the interface on which the DHCP discover packet arrives or one of the following interface variables:

- `$junos-underlying-interface` when configuring dynamic IP demux interfaces.
- `$junos-interface-ifd-name` when configuring dynamic VLAN demux interfaces.

The variable is used to specify the underlying interface when a new demux interface is dynamically created. The variable is dynamically replaced with the underlying interface that DHCP supplies when the subscriber logs in.

> **NOTE**: Logical demux interfaces are currently supported on Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, or aggregated Ethernet interfaces.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

(Optional) MAC address of the destination fabric maintenance endpoint (FMEP) that is configured in the flow specification.

destination-mac-mask *destination-mac-mask*

(Optional) MAC address range mask for the destination FMEP that is configured in the flow specification. You cannot configure the `destination-mac-mask` parameter unless you also configure the `destination-mac` parameter.

The masked bits denote the range that needs to be generated. The other bits obtain their values from the corresponding source or destination MAC address parameter. The mask must be contiguous.

- **Values:** Maximum of 6 contiguous masked bits, or a mask range of 64

ethertype *ethertype*

Valid Ethernet type other than the IPv4 Ethertype.

- **Values:** 2 bytes in decimal or hexadecimal notation

source-mac *source-mac-address*

(Optional) MAC address of the source FMEP or interface that is configured in the flow specification.

source-mac-mask *source-mac-mask*

(Optional) MAC address range mask for the source FMEP that is configured in the flow specification. You cannot configure the `source-mac-mask` parameter unless you also configure the `source-mac` parameter.

The masked bits denote the range that needs to be generated. The other bits obtain their values from the corresponding source or destination MAC address parameter. The mask must be contiguous.

- **Values:** Maximum of 6 contiguous masked bits, or a mask range of 64

}
```

Hierarchy Level

```
[edit protocols oam fabric flow-specs flow-specification-name]
```

Description

Configure unicast parameters for the Ethernet IPv4 protocol type in the internal fabric monitoring flow specifications.

Options

destination-ip *destination-ip-address*

Unicast IPv4 address of the destination fabric maintenance endpoint (FMEP) that is configured in the fabric maintenance association (FMA).

- **Syntax:** Dotted decimal notation without the prefix

destination-l4-port *destination-l4-port-number*

L4 TCP or UDP port for the destination fabric maintenance endpoint (FMEP).

- **Values:** 2-byte decimal or hexadecimal notation

ip-proto *protocol*

IPv4 protocol type.

- **Values:** 1-byte value in decimal or hexadecimal notation

destination-ip-mask *destination-ip-mask*

IPv4 address range mask for the destination FMEP that is configured in the flow specification.

The masked bits denote the range that needs to be generated. The other bits obtain their values from the corresponding source or destination IPv4 address parameter. The mask must be contiguous.

- **Syntax:** Dotted decimal notation without the prefix
- **Values:** Maximum of 6 contiguous masked bits, or a mask range of 64

source-ip *source-ip-address*

Unicast IPv4 address of the source fabric maintenance endpoint (FMEP) that is configured in the fabric maintenance association (FMA).

- **Syntax:** Dotted decimal notation without the prefix

source-l4-port *source-l4-port-number*

TCP or UDP port for the source fabric maintenance endpoint (FMEP).

- **Values:** 2-byte decimal or hexadecimal notation

source-ip-mask *source-ip-mask*

IPv4 address range mask for the source FMEP that is configured in the flow specification.

The masked bits denote the range that needs to be generated. The other bits obtain their values from the corresponding source or destination IPv4 address parameter. The mask must be contiguous.

- **Syntax:** Dotted decimal notation without the prefix

unicast-in-lpm

IN THIS SECTION

- Syntax | **31522**
- Hierarchy Level | **31522**
- Description | **31522**
- Required Privilege Level | **31522**
- Release Information | **31523**

Syntax

```
unicast-in-lpm;
```

Hierarchy Level

```
[edit chassis forwarding-options lpm-profile]
```

Description

For the Unified Forwarding Table feature, specify to store all unicast IPv4 and IPv6 entries with prefixes with lengths equal to or less than 64 in the table for longest prefix match (LPM) entries, thereby freeing up space in the Layer 3 host table. Only unicast entries can be moved to the LPM table. Multicast entries must be stored in the Layer 3 host table.

You can also configure this statement in conjunction with the "prefix-65-127-disable" on page 13606 statement, which allocates no memory for IPv6 prefixes with lengths in the range /65 through /127. Together, these two statements allocate more space for unicast IPv4 and IPv6 entries with prefix lengths equal to or less than 64.

NOTE: On QFX5110 switches running Junos OS Release 18.1R1 and higher, the `unicast-in-lpm` and `prefix-65-127-disable` statements cannot be configured at the same time.

NOTE: This statement is supported only on the `lpm-profile`.

NOTE: Starting in Junos OS Release 25.2R1, the host table utilization on QFX5200-32C switches is limited at 80% when the lpm-profile is used. The host table and the LPM table share the host routes. Therefore, the total route table utilization capacity available for both LPM and host routes is reduced.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1x53-D30.

    }
    transport (ipv4 | ipv6);
}
```

Hierarchy Level

```
[edit protocols ptp client interface interface-name]
```

Description

Configure the timeReceiver in unicast mode. You can set this option when PTP unicast mode of messaging is needed.

Options

announce-timeout-value

The announce timeout value for announce interval messages.

- **Range:** 3 through 10
- **Default:** 3

grantor

Specify that the selected interface port can be grantor. The grantor attribute enables the port to allow for the grant-port property and can provide PTP message services. It allows the port to accept and handle unicast negotiation requests.

Priority value Priority value.

- **Range:** 1 through 255
- **Default:** 128

master-only Specify the timeTransmitter only option. When you set the master-only option, it is not possible to set the interface port as a timeReceiver clock.

transport Encapsulation for PTP packet transport

- Values:
  - ipv4—Use IPv4 as transport
  - ipv6—Use IPv6 as transport

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

- Required Privilege Level | 31527
- Release Information | 31527

Syntax

```
unicast-negotiation;
```

Hierarchy Level

```
[edit protocols ptp]
```

Description

Configure unicast negotiation. Unicast negotiation is a method by which the announce, synchronization, and delay response packet rates are negotiated between the timeTransmitter and the timeReceiver before a PTP session is established.

For G.8275.2 profile, a maximum of `-3` can be set for announce, and `-4` can be set for synchronization, and delay response packet rates. However, for G.8275.2 profile, these options are non-configurable.

> **NOTE**:
> When unicast negotiation is enabled, you cannot commit any packet rate–related configuration.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

unicast-reverse-path (active-paths | feasible-paths);
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options forwarding-table],
[edit routing-instances routing-instance-name instance-type name routing-options forwarding-
table],
[edit routing-options forwarding-table]
```

Description

Control the operation of unicast reverse-path-forwarding check. This statement enables the RPF check to be used when routing is asymmetrical.

Options

`active-paths`—Consider only active paths during the unicast reverse-path check.

`feasible-paths`—Consider all feasible paths during the unicast reverse-path check.

- **Default:** If you omit the `unicast-reverse-path` statement, only the active paths to a particular destination are considered.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for routing instances added in Junos OS Release 8.3.

> **NOTE**: This feature is not supported on the EX4300 switch, even though it is available on the device.

- Required Privilege Level | 31535
- Release Information | 31535

Syntax

```
unidirectional-session-refreshing;
```

Hierarchy Level

```
[edit security zones security-zone]
```

Description

Use unidirectional session refreshing on a zone to enable two options for a session. Refresh a session by any packet from any directions. This is a default behavior. Refresh a session by only the packets in the initial direction.

> **NOTE**: USR (Unidirectional Session Refresh) is skipped for PPTP and IKE ALG data sessions in cases where USR is enabled on only one security zone, but data traffic originates from the opposite zone. For instance, if USR is enabled on the "Trust" zone but disabled on the "Untrust" zone, then for a PPTP ALG data session originating from the "Untrust" zone (where traffic flows unidirectionally from public to private), USR will be skipped.

unified-access-policy (Protocols)

IN THIS SECTION

- Syntax | 31538
- Hierarchy Level | 31538
- Description | 31538
- Options | 31538

Required Privilege Level | 31539
Release Information | 31539

Syntax

```
unified-access-policy {
      interface name [inter-switch-link];
      key key;
      mac multicast-mac-address;
      robust-count count;
      source-mac source-mac-address;
      }
```

Hierarchy Level

```
[edit protocols]
```

Description

Configure unified access policy. Unified access policy extends Group-Based Policy (GBP) support to Mist access points (APs). This allows wireless clients to participate in GBP microsegmentation alongside wired clients in a network.

Options

interface Name of the interface to enable for unified access policy. The named interface receives and transmits GBP messages from and to Mist APs.

interface inter-switch link Configures the specified interface to be a unified access policy inter-switch link. The named interface receives and transmits GBP messages from and to other switches that are enabled for unified access policy.

key Secret key to sign GBP messages.

mac Multicast MAC address for GBP messages. When the switch receives an Ethernet multicast frame that matches this multicast MAC address, the switch passes the frame up the stack for GBP message parsing and processing, You typically don't need to configure this address. The supplied default works under most situations.

robust-count Number of times that the switch sends out the same GBP lookup message before giving up. This is the total number of times and includes the initial sending and any subsequent resending due to lack of response.

source-mac Source MAC address for GBP lookup messages. When the switch wants to discover the GBP tag associated with the received Ethernet frame, the switch sends a GBP lookup message with the configured MAC address as the source MAC address. Configure this only in a multi-homing scenario.

> **NOTE**: Adding or removing interfaces (in the interface or interface inter-switch link options) will flush all MAC address entries from the MAC address table for the specified interfaces.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Microsegmentation Using Group-Based Policies

unified-policy max-lookups

IN THIS SECTION

- Syntax | 31540
- Hierarchy Level | 31540
- Description | 31540
- Default | 31540
- Required Privilege Level | 31540

Release Information | 31541

Syntax

```
unified-policy max-lookups max-lookups-number;
```

Hierarchy Level

```
[edit logical-systems name security policies],
[edit logical-systems name tenants name security policies],
[edit security policies]
[edit tenants tenant-name security policies]
```

Description

Configure maximum number of policy lookups, when micro-applications reach the *transaction final* state, during the dynamic application classification process.

Application classification with micro-applications does not reach the *final match* state because the micro-application keeps changing for the session. When the micro-application changes from one transaction to another, a policy lookup is attempted unlimited number of times. The *final match* state for the application is required for the policy lookup and for processing the policy. You can limit the number of transactions for the micro application by configuring the `unified-policy max-lookups` statement.

Setting the value of `unified-policy max-lookups` as 0 indicates unlimited number of policy lookups.

Range: 0 through 25

Default

The default value for `unified-policy max-lookups` is 2.

Required Privilege Level

        output filter-name;
    }
}
vlan-id number;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces demux0]
```

Description

Configure a dynamic logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

Options

logical-unit-number—Either the specific unit number of the interface or the unit number variable (`$junos-interface-unit`). The variable is used to specify the unit of the interface when a new demux interface is dynamically created. The static unit number variable is dynamically replaced with the unit number that DHCP supplies when the subscriber logs in.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

RELATED DOCUMENTATION

Configuring Dynamic Subscriber Interfaces Using IP Demux Interfaces in Dynamic Profiles

unit (Dynamic Interface Sets)

IN THIS SECTION

- Hierarchy Level | 31552
- Description | 31552

- Options | 31552
- Required Privilege Level | 31553
- Release Information | 31553

Syntax

```
unit logical-unit-number {
    advisory-options {
        downstream-rate rate;
        upstream-rate rate;
    }
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-set interface-set-name interface interface-name]
```

Description

Apply the logical interface unit to the interface set.

Options

logical-unit-number—One of the following options:

- `$junos-underlying-interface-unit`—For static VLANs, the unit number variable. The static unit number variable is dynamically replaced with the client unit number when the client session begins. The client unit number is specified by the DHCP when it accesses the subscriber network.
- `$junos-interface-unit`—For dynamic demux and dynamic PPPoE interfaces, the unit number variable. The static unit number variable is dynamically replaced with the client unit number when the client session begins. The client unit number is specified by the DHCP or PPP when it accesses the subscriber network.
- *value*—Specific unit number of the interface you want to assign to the dynamic-profile

- **Range:** 0 through 1,073,741,823.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces pp0]
```

Description

In a dynamic profile, configure a logical unit number for the dynamic PPPoE logical interface. You must configure a logical interface to be able to use the router.

Options

logical-unit-number—Variable used to specify the unit number when the PPPoE logical interface is dynamically created. In the `unit` *logical-unit-number* statement for dynamic PPPoE logical interfaces, you must use the predefined variable `$junos-interface-unit` in place of *logical-unit-number*. The `$junos-interface-unit` predefined variable is dynamically replaced with the unit number supplied by the router when the subscriber logs in.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

Hierarchy Level

```
[edit interfaces interface-name],
[edit logical-systems logical-system-name interfaces interface-name],
[edit interfaces interface-set interface-set-name interface interface-name]
```

Description

Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

Options

logical-unit-number Number of the logical unit. **Range:** 0 through 1,073,741,823 for demux, PPPoE, and pseudowire static interfaces. 0 through 16,385 for all other static interface types.

interface-tag *name* (Junos OS Evolved) Specify the interface tag name. To initiate a DHCP session over a static IFL, you must also configure interface tag under the `[edit interfaces interface name auto-configure static-vlan-identity]` hierarchy. See "interface-tag (Junos OS Evolved)" on page 29695.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Range increased for static pseudowire interfaces to 1,073,741,823 in Junos OS Release 18.3R1.

unknown-message (Security H323 ALG)

IN THIS SECTION

- Syntax | 31588
- Hierarchy Level | 31588
- Description | 31588
- Options | 31589
- Required Privilege Level | 31589
- Release Information | 31589

Syntax

```
unknown-message {
    permit-nat-applied;
    permit-routed;
}
```

Hierarchy Level

```
[edit logical-systems name security alg h323 application-screen],
[edit logical-systems name tenants name security alg h323 application-screen],
[edit security alg h323 application-screen],
[edit services alg h323 application-screen],
[edit tenants name security alg h323 application-screen]
```

Description

Specify how the SRX Series Firewall handles the unidentified H.323 messages. By default, SRX Series Firewall drops unknown messages. Permitting unknown messages can compromise security and is not recommended. However, in a secure test or production environment, this statement is useful to resolve interoperability issues with disparate vendor equipment. By permitting unknown H.323 (unsupported) messages, you can get your network operational. Later, you can analyze your VoIP traffic to determine why the device dropped the messages.

This statement applies only to received packets identified as supported VoIP packets. SRX Series Firewall always drops unidentified packets and passes the identified packets without processing.

Options

- `permit-nat-applied`—Permits unknown messages to pass if the session is in NAT mode.
- `permit-routed`—Permit unknown messages on routed packets. Sessions in Transparent mode are treated as Route mode.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

unnumbered-address (Dynamic Profiles)

IN THIS SECTION

- Syntax | 31600
- Hierarchy Level | 31600
- Description | 31601
- Options | 31601
- Required Privilege Level | 31602
- Release Information | 31602

Syntax

```
unnumbered-address interface-name <preferred-source-address address>;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number family
family],
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family family]
```

Description

For Ethernet interfaces, enable the local address to be derived from the specified interface. Configuring unnumbered Ethernet interfaces enables IP processing on the interface without assigning an explicit IP address to the interface. To configure unnumbered address dynamically, include the `$junos-loopback-interface-address` predefined variable.

You can configure unnumbered address support on Ethernet interfaces for IPv4 and IPv6 address families.

Options

interface-name

Name of the interface from which the local address is derived. The specified interface must have a logical unit number, a configured IP address, and must not be an unnumbered interface. This value can be a specific interface name or the `$junos-loopback-interface` predefined variable.

When defining the `unnumbered-address` statement using a static interface, keep the following in mind:

- If you choose to include the `routing-instance` statement at the `[edit dynamic-profiles]` hierarchy level, that statement must be configured with a dynamic value by using the `$junos-routing-instance` predefined variable. In addition, whatever static unnumbered interface you specify must belong to that routing instance; otherwise, the profile instantiation fails.
- If you choose to not include the `routing-instance` statement at the `[edit dynamic-profiles]` hierarchy level, the unnumbered-address statement uses the default routing instance. The use of the default routing instance requires that the unnumbered interface be configured statically and that it reside in the default routing instance.

> **NOTE**: When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the `$junos-routing-instance` predefined variable, you must not configure a preferred source address, whether with the `$junos-preferred-source-address` predefined variable, the `$junos-preferred-source-ipv6-address` predefined variable, or the `preferred-source-address` statement. Configuring the preferred source address in this circumstance causes a commit failure.

When defining the `unnumbered-address` statement using the `$junos-loopback-interface` predefined variable, keep the following in mind:

- To use the `$junos-loopback-interface` predefined variable, the dynamic profile must also contain the `routing-instance` statement configured with the `$junos-routing-instance` predefined variable at the [edit dynamic-profiles] hierarchy level.
- The applied loopback interface is based on the dynamically obtained routing instance of the subscriber.

address (Optional) Secondary IP address of the donor interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. This value can be a static IP address, the `$junos-preferred-source-address` predefined variable for the inet family, or the `$junos-preferred-source-ipv6-address` predefined variable for the inet6 family.

When defining the `preferred-source-address` value using a static IP address, keep the following in mind:

- The unnumbered interface must be statically configured.
- The IP address specified as the `preferred-source-address` must be configured in the specified unnumbered interface.

When defining the `preferred-source-address` value using the `$junos-preferred-source-address` or the `$junos-preferred-source-ipv6-address` predefined variables, keep the following in mind:

- You must configure the `unnumbered-address` statement using the `$junos-loopback-interface` predefined variable.
- You must configure the `routing-instance` statement using the `$junos-routing-instance` predefined variable at the `[edit dynamic-profiles]` hierarchy level.
- The preferred source address chosen is based on the dynamically applied loopback address which is in turn derived from the dynamically obtained routing instance of the subscriber. The configured loopback address with the closest network match to the user IP address is selected as the preferred source address.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Support for the `$junos-preferred-source-address` and `$junos-preferred-source-ipv6-address` predefined variables introduced in Junos OS Release 9.6.

Support for the `$junos-loopback-interface` predefined variable introduced in Junos OS Release 9.6.

MPLS Pseudowire Subscriber Logical Interfaces

untrusted (VLAN)

IN THIS SECTION

- Syntax | 31610
- Hierarchy Level | 31610
- Description | 31610
- Required Privilege Level | 31611
- Release Information | 31611

Syntax

```
untrusted;
```

Hierarchy Level

```
[edit vlans vlan-name forwarding-options dhcp-security group group-name overrides]
```

Description

Configure a trunk interface as untrusted for DHCP security. Trunk interfaces are trusted by default and all packets are allowed. You can override this default behavior and set a trunk interface as untrusted in order to support DHCP security features on the interface. DHCP snooping, DHCPv6 snooping, dynamic ARP inspection (DAI), and IPv6 neighbor discovery inspection are supported on trunk ports in untrusted mode.

NOTE: On EX Series switches other than the EX9200, IP source guard and IPv6 source guard are not supported on untrusted trunk ports.

Configuring a trunk port as untrusted is useful in deployments where multiple DHCP clients are aggregated onto one interface on the access device. In this scenario, the interface is configured as a trunk interface with one or more VLANs. A DHCP client attached to a trunk interface might start acting as a DHCP server. Trusted ports allow DHCP servers to provide IP addresses and other information to requesting devices, which makes the network vulnerable to a rogue DHCP server attack.

An unauthorized DHCP server might also assign itself as the default gateway device for the network. An attacker can then sniff the network traffic and perpetrate a man-in-the-middle attack—that is, it misdirects traffic intended for a legitimate network device to a device of its choice. To mitigate this problem, you can configure the interface to which the unauthorized server is connected as untrusted, which blocks all ingress DHCP server messages from that interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Description

(PTX10003-80C and PTX10003-160C routers) While setting port 0 to 400-Gigabit Ethernet mode (using QSFP56-DD-400GBASE-LR8 optics), the total bandwidth (speed x `number-of-subports`) of port 1 has to be less than 100G and port 2 has to configured as 'unused'. When using port 4 as 400G, port 3 has to be configured with total bandwidth and port 2 has to be configured 'unused'. Similarly, with port 5, 9 using 400G, port 6, 8 respectively has to be configured for less than 100G and port 7 should be configured as 'unused'. That is, when a port is configured in 400-Gigabit ethernet mode, you cannot configure speed of the adjacent port to be more then 100-Gbps, and the middle port (2 between 0~4 or 7 between 5~9) must be set to unused. To set a particular port to unused port, use `unused` CLI command.

You cannot use port 1,3,6 and/or 7 of the same logical PIC.

(JNP10K-LC1201 on PTX10008 routers) To disable the specified physical port in a PIC. If you disable a port, no interfaces (channelized or non-channelized) are created for the port, irrespective of the port profile configuration configured on the port.

The `edit chassis` hierarchy is available in 20.2R1 Release on PTX10001-36MR. From 20.3R1 onwards you must use only the `edit interface`*`interface-name`* hierarchy.

[edit routing-instances routing-instance-name protocols rip group group-name],
```

```
[edit routing-instances routing-instance-name protocols rip  group group-name neighbor neighbor-name]
```

Description

Configure the interval at which routes learned by RIP are sent to neighbors. This timer controls the interval between routing updates. This timer is set to 30 seconds, by default, with a small random amount of time added when the timer is reset. This added time prevents congestion that can happen if all routing devices update their neighbors simultaneously.

Options

seconds—Estimated time to wait before making updates to the routing table.

- **Range:** 10 through 60 seconds
- **Default:** 30 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.6.

update-interval (Service Accounting)

IN THIS SECTION

- Syntax | 31620
- Hierarchy Level | 31620
- Description | 31621
- Default | 31621
- Options | 31621
- Required Privilege Level | 31621
- Release Information | 31621

Syntax

```
update-interval minutes;
```

Hierarchy Level

```
[edit access profile profile-name service accounting]
```

Description

Enable service interim accounting updates and configure the amount of time that the router waits before sending a new service accounting update.

> **NOTE**: An update interval value configured in the RADIUS attribute, Service-Interim-Acct-Interval (VSA 26-140), takes precedence over the value configured with this statement. In turn, the value configured with this statement takes precedence over the "interval" on page 9601 value configured at the `[edit accounting-options flat-file-profile profile-name]` hierarchy level.

Default

No updates

Options

minutes—Amount of time between updates, in minutes. All values are rounded up to the next higher multiple of 10. For example, the values 811 through 819 are all accepted by the CLI, but are all rounded up to 820.

- **Range:** 10 through 1440 minutes

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2R1.

update-interval

IN THIS SECTION

- Syntax | 31622
- Hierarchy Level | 31622
- Description | 31622
- Default | 31623
- Options | 31623
- Required Privilege Level | 31623
- Release Information | 31623

Syntax

```
update-interval minutes;
```

Hierarchy Level

```
[edit access profile profile-name accounting]
```

Description

Enable interim accounting updates and configure the amount of time that the router or switch waits before sending a new accounting update.

Interim accounting updates are included in the exchange of messages between the client and the accounting server. In RADIUS accounting, the client is the network access server (NAS), which can be the router or switch. The NAS sends Accounting-Request messages to the server, which acknowledges receipt of the requests with Accounting-Response messages. Interim accounting updates are sent in Accounting-Request packets with the Acct-Status-Type attribute set to Interim-Update.

When a user is authenticated, the authentication server issues an Access-Accept message in response to a successful Access-Request message. The interval between interim updates can be configured directly on the server using the Acct-Interim-Interval attribute of the Access-Accept message. However,

if the update interval is configured on the NAS using `update-interval`, then the system prefers the attributes returned by RADIUS and overrides the locally configured values.

> **NOTE**: All information in an interim update message is cumulative from the beginning of the session, not from the last interim update message.

Default

No interim updates are sent from the client to the accounting server.

Options

minutes—Amount of time between updates, in minutes. All values are rounded to the next higher multiple of 10. For example, the values 811 through 819 are all accepted by the CLI, but are all rounded up to 820.

- **Range:** 10 through 1440 minutes

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

update-rate-limit

IN THIS SECTION

- Syntax | 31624
- Hierarchy Level | 31624
- Description | 31624
- Options | 31624
- Required Privilege Level | 31625
- Release Information | 31625

Syntax

```
update-rate-limit updates-per-minute;
```

Hierarchy Level

```
[edit protocols pcep]
```

Description

Specify the number of updates per minute that the Path Computation Client (PCC) can receive at maximum. Updates above this limit are ignored by the PCC.

Options

updates-per-minute Number of updates per minute that the PCC can receive at maximum.

- **Range:** 1 through 16384
- **Default:** 0 (disabled or no limit)

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

Support for PTX Series added in Junos OS Release 14.2.

Support for QFX Series switches added in Junos OS Release 16.1R3.

Support for ACX Series added in Junos OS Release 17.1R1.

update-response-timeout (PCRF Partition)

IN THIS SECTION

- Syntax | 31625
- Hierarchy Level | 31626
- Description | 31626
- Options | 31626
- Required Privilege Level | 31626
- Release Information | 31626

Syntax

```
update-response-timeout seconds;
```

Hierarchy Level

```
[edit access pcrf partition partition-name]
```

Description

Configure the amount of time in seconds before a Policy and Charging Rule Function (PCRF) partition stops attempting to send an updated rule report response using a CCR-GX-U message. Use this statement if you added or deleted rules in either the subscriber login using a CCA-GX-I message, or the reauthorization request using a RAR-GX-U message, and configured rule reporting,

The last rule report may be preempted by the subscriber logging out too soon. Use this statement to control the amount of time to allow the system to send the last rule report.

Options

seconds Number of seconds to wait before a PCRF partition stops attempting to send an updated rule report response using a CCR-GX-U message.

- **Default:** 300
- **Range:** 0 through 86,400 seconds (24 hours)

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

update-router-advertisement

IN THIS SECTION

- Syntax | 31627
- Hierarchy Level | 31627
- Description | 31627
- Options | 31628
- Required Privilege Level | 31628
- Release Information | 31628

Syntax

```
update-router-advertisement (interface interface-name);
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family dhcpv6-client]
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family inet6 dhcpv6-client]
[edit tenants tenant-name interfaces interface-name unit logical-unit-number family inet6 dhcpv6-
client]
```

Description

Specify the interface used to delegate prefixes.

Options

interface ***interface-name***	Interface on which to delegate prefixes

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

The `logical-systems` and `tenant` options are introduced in Junos OS Release 18.4R1.

update-server (dhcp-client)

IN THIS SECTION

- Syntax | **31628**
- Hierarchy Level | **31629**
- Description | **31629**
- Required Privilege Level | **31629**
- Release Information | **31629**

Syntax

```
update-server;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family dhcp-client]
```

Description

Propagate DHCP options to a local DHCP server.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10.

Starting with Junos OS Release 17.3R1, on all SRX Series Firewalls and vSRX Virtual Firewall instances, the CLI option `dhcp-clinet` at `[edit interfaces interface-name unit logical-unit-number family inet]` hierarchy is changed to `dhcp` to keep consistent with other Junos platforms. There is no change in the functionality with the changed CLI option `dhcp`.

update-server (dhcpv6-client)

IN THIS SECTION

- Syntax | 31630

update-threading

IN THIS SECTION

- Syntax | 31632
- Hierarchy Level | 31632
- Description | 31632
- Options | 31633
- Required Privilege Level | 31633
- Release Information | 31634

Syntax

```
update-threading {
    number-of-threads;
     group-split-size;
        }
    }
```

Hierarchy Level

```
[edit system processes routing bgp]
```

Description

Enables BGP update thread. If you configure update-threading on a Routing Engine, RPD creates update threads.

NOTE:

- Sharding requires Update/IO thread. If `rib-sharding` is configured and `update-threading` is not configured, the commit check fails.
- RPD would restart automatically when rib-sharding or update-threading configuration is changed.

Options

number of threads

`number of threads`—the number of update threads created. If you configure update-threading on a Routing Engine, RPD creates update threads. By default, the number of update threads created is same as the number of CPU cores on the Routing Engine. Optionally, you can specify the number-of-threads you want to create.

- **Range:** 1-128 threads

group-split-size

`group-split-size`—the large groups are divided into fragments based on the configuration of the `group-split-size` (The size here is the number of peers). The feature is enabled only after a `group-split-size` number is provided, until then the feature remains disabled (since the split size would be 0). The objective of the feature is to share the load with different threads since multiple threads are always available to process. This `group-split-size` statement defines the size that we are using to split the peer group.

You can adjust the `group-split-size` value according to the requirement. There are two general tips for finding a reasonable group-split-size:

- Do not make it too large so that the system is not evenly distributed. For example, when we have one group of 1000 peers and 10 available threads, setting split-size to 100 is better than 200 because it allows the system to utilize all 10 threads for 100 peers per thread compared to only 5 will be used for 200 peers per thread.
- Do not make it too small so that it takes the unnecessary overhead of splitting groups. For example, if we have 10 groups (each group contains 103 peers) and 10 available threads, setting split-size to 103 will be better than 100 because splitting a group of 103 to 100 and 3 will give us unnecessary overhead.
- **Preferred Size Value:** 0 - 2000.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.4R1.

`group-split-size` statement introduced in Junos OS Release 21.4R1.

Support for NSR with sharding introduced in Junos OS Release 22.2.

update-threshold

IN THIS SECTION

- Syntax | 31634
- Hierarchy Level | 31634
- Description | 31635
- Options | 31635
- Required Privilege Level | 31635
- Release Information | 31635

Syntax

```
update-threshold {
    threshold-percent;
     adaptive
    threshold-value threshold-value;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name]
```

Description

Adjust the threshold at which a change in bandwidth triggers an interior gateway protocol (IGP) update.

Options

threshold-percent

Specify the percentage change in reserved bandwidth to trigger IGP update.

- **Default:** 10 percent
- **Range:** 0.001 through 20 percent

threshold-value ***threshold-value***

Specify the change in reserved bandwidth to trigger IGP update. (is capped at 20% of link bandwidth).

If the threshold-value is configured to greater than 20% of bandwidth on that link, the threshold-value is capped at 20% of bandwidth.

For instance, if bandwidth on an interface is 1Gbps, and the `threshold-value` is configured greater than 200Mbps, the `threshold-value` is capped at 200Mbps. The *threshold-percent* is displayed as 20.000% and the `threshold-value` as 200Mbps.

> **NOTE**: The two options, *threshold-percent* and `threshold-value`, are mutually exclusive. You can configure only one option at a given point in time to generate an IGP update for lower bandwidth reservations. As a result, when one option is configured, the other option is calculated and displayed on the CLI.
> For instance, on a link of 1Gbps, if the *threshold-percent* is configured to 5%, the `threshold-value` is calculated and displayed as 50Mbps. Similarly, if the `threshold-value` is configured to 50m, then the *threshold-percent* is calculated and displayed as 5%.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`threshold-value` option introduced in Junos OS Release 19.4R1 on all platforms.

RELATED DOCUMENTATION

Configuring the RSVP Update Threshold on an Interface

update-threshold-max-reservable

IN THIS SECTION

- Syntax | 31636
- Hierarchy Level | 31636
- Description | 31636
- Default | 31637
- Options | 31637
- Required Privilege Level | 31637
- Release Information | 31637

Syntax

```
update-threshold-max-reservable update-threshold-max-reservable;
```

Hierarchy Level

```
[edit logical-systems name protocols rsvp interface],
[edit logical-systems name routing-instances name protocols rsvp interface],
[edit protocols rsvp interface],
[edit routing-instances name protocols rsvp interface]
```

Description

Configure a threshold in bits per second. When SPRING bandwidth utilization exceeds this threshold, Resource Reservation Protocol (RSVP) reports this event to IGP and preempts the labeled switched paths (LSPs). If this threshold is not exceeded, RSVP does not make any changes to the bandwidth allocation.

However, if the `local-bw-override-threshold` statement is configured along with the `update-threshold-max-reservable` statement, RSVP modifies local unreserved bandwidths even if the threshold is not exceeded. This change does not report the new maximum reservable bandwidth and local unreserved bandwidth to IGP until the threshold configuration crosses.

Note that the changes are not applied by modifying the `subscription` *`percentage`* at the `[edit protocols rsvp interface` *`interface-name`*`]` hierarchy level.

Default

The default value is `0`.

Options

update-threshold-max-reservable

Specify a threshold value for maximum SPRING bandwidth utilization in bits per second.

- **Range:** 0 through 100000

percent *percent*

Specify a bandwidth utilization change threshold in percentage beyond which RSVP triggers IGP updates. When the change in bandwidth utilization from previously advertised value is more than the percentage configured, RSVP informs IGP about the max reservable bandwidth change.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.3R1.

`percent` option introduced in Junos OS Release 17.4R1 for MX Series and PTX Series.

    fpcs (slot-number | [list-of-slot-numbers]);
    member member-id {
        fpcs (slot-number | [list-of-slot-numbers]);
    }
}
```

Hierarchy Level

```
[edit chassis nssu]
```

Description

Assign a name to a line-card upgrade group being created for nonstop software upgrade (NSSU).

To reduce the time an NSSU takes, you can configure line-card upgrade groups on an EX6200 or EX8200 switch with redundant Routing Engines; EX8200 Virtual Chassis; EX4650 Virtual Chassis; QFX3500, QFX3600, and QFX5100 Virtual Chassis; and QFX5100 Virtual Chassis Fabric (VCF).

NSSU upgrades the groups in the order that they appear in the configuration (in other words, in the order you configure them). If you do not define any line-card upgrade groups, NSSU upgrades line cards or members of a Virtual Chassis or VCF one at a time in ascending order by slot or member number.

Options

group-name	Name of the upgrade group.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

upgrade-groups (Junos Fusion)

IN THIS SECTION

- Syntax | 31640
- Hierarchy Level | 31640
- Description | 31640
- Default | 31641
- Options | 31641
- Required Privilege Level | 31641
- Release Information | 31641

Syntax

```
upgrade-groups upgrade-group-name {
    satellite [slot-id | range | all];
}
```

Hierarchy Level

```
[edit chassis satellite-management]
```

Description

Create and name a satellite software upgrade group for a Junos Fusion, or specify an existing satellite software upgrade group to configure.

A satellite software upgrade group is a group of satellite devices that are designated to upgrade to the same satellite software version using the same satellite software package. One Junos Fusion can contain multiple software upgrade groups, and multiple software upgrade groups should be configured in most Junos Fusions to avoid network downtimes during satellite software installations.

The two most common methods of installing satellite software in a Junos Fusion—autoconverting a device into a satellite device when it is cabled into an aggregation device and manually converting a device that is cabled into an aggregation device into a satellite device—require a configured satellite software upgrade group.

Software upgrade groups are configured and managed from the aggregation device.

To associate a satellite software package with a satellite software upgrade group, use the **request system software add *package-name* upgrade-group *upgrade-group-name*** command.

This statement is entered on an aggregation device in a Junos Fusion. Software upgrade groups are configured and managed from the aggregation device.

The software upgrade group configurations must match exactly—including the same *package-name* and *upgrade-group-name*—in every Junos Fusion with dual aggregation devices to avoid satellite device downtime.

All satellite devices in a satellite device cluster are associated with a single satellite software upgrade group, which is automatically created when a satellite device cluster becomes part of a Junos Fusion. The satellite software upgrade group is named after the satellite device cluster name, and ensures that all satellite devices in the cluster run the same version of satellite software. See Understanding Software

in a Junos Fusion Enterprise for additional information on software management for a satellite device cluster.

Default

No satellite software upgrade groups are present, by default.

A satellite software upgrade group with the name of the satellite device cluster is created automatically when a satellite device cluster is created.

Options

upgrade-group-name Specifies the user-defined name for the satellite software upgrade group.

The remaining statements are explained separately.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

upgrade-mode

IN THIS SECTION

- Syntax | 31642
- Hierarchy Level | 31642
- Description | 31642
- Options | 31642
- Required Privilege Level | 31643
- Release Information | 31643

Syntax

```
upgrade-mode (3d-fabric | default | t4000);
```

Hierarchy Level

```
[edit chassis fabric],
[edit chassis member name fabric]
```

Description

Configures upgrade mode for SIBs and forces them to operate in the same mode until the upgrade is complete. Upgrade mode is used so that two different types of SIBs can be installed in an operational router or routing matrix. After you upgrade the SIBs delete the `upgrade-mode` statement from the configuration. See the hardware installation guide for your router for more information about upgrading SIBs in an operational router or routing matrix.

Options

3d-fabric Enables the TX Matrix Plus router to upgrade to a TX Matrix Plus router with 3D SIBs. On the SFC, enables setting proper support for mixed SIBs (TXP-F13 SIB and TXP-F13-3D SIB). On the T640 or T1600 or T4000 routers in a routing matrix enables support for mixed SIBs

(TXP-T1600 SIB and TXP-3D-LCC SIBs on the T1600 router and SIB-I-T4000 and TXP-3D-LCC SIBs on the T4000 router).

default Enables support for mixed SIBs when upgrading SIBs in the PTX3000 and PTX5000 routers.

t4000 Enables support for mixed SIBs when upgrading to SIB-I-T4000 SIBs in a T640 or T1600.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

}
```

Hierarchy Level

```
[edit chassis satellite-management]
[edit chassis satellite-management fpc slot-id]
```

Description

Enables uplink failure detection in a Junos Fusion.

The uplink failure detection feature on a Junos Fusion enables satellite devices to detect link failures on the uplink interfaces used to connect to aggregation devices. When uplink failure detection detects uplink failure on a satellite device, all of the device's extended ports (which connect to host devices) are shut down. Shutting down the extended ports allows downstream host devices to more quickly identify and adapt to the outage. For example, when a host device is connected to two satellite devices, and uplink failure detection shuts down the extended ports on one satellite device, the host device can more quickly recognize the uplink failure and redirect traffic through the other, active satellite device.

You can configure uplink failure detection in a Junos Fusion for a single satellite device using the **fpc *slot-id*** option. If uplink failure detection is enabled without specifying the **fpc *slot-id*** option, uplink failure detection is enabled for all cascade ports on the aggregation device.

If you enable uplink failure detection without the `candidate-uplink-policy` substatement, the default uplink failure detection settings are applied. To configure non-default uplink failure detection settings, include the `candidate-uplink-policy` substatement. Candidate uplink policies are configured under `[edit policy-options satellite-policies candidate-uplink-port-policy]`.

Default

Uplink failure detection is disabled.

Options

The remaining statements are explained separately.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2R3.

```

Hierarchy Level

```
[edit policy-options satellite-policies candidate-uplink-port-profile profile-name]
[edit policy-options satellite-policies candidate-uplink-port-profile profile-name term term-
name from]
```

Description

In Junos Fusion configuration, assign an uplink port group to a candidate uplink port policy.

An uplink port group defines a set of candidate uplink ports that are assigned to satellite devices to which the candidate uplink port group is assigned.

> **CAUTION**: The physically connected uplink ports on a satellite device must be defined as candidate uplink ports in the Junos Fusion configuration. If the uplink ports on a satellite device are not configured as candidate uplink ports, uplink failure detection cannot be enabled on the device, and a system log message is generated.

Uplink port groups are defined under `[edit policy-options satellite-policies port-group-alias]`.

Default

Each satellite device model has a set of default uplink ports (see *Overview of Uplink Failure Detection on a Junos Fusion*). You only need to assign an uplink port group to a satellite device if you do not want to use the default uplink ports.

Options

group-name	The name of the port group to assign.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2R3.

[edit routing-instances routing-instance-name routing-options multicast pim-to-mld-proxy],
[edit routing-options multicast pim-to-igmp-proxy],
[edit routing-options multicast pim-to-mld-proxy]
```

Description

Configure at least one, but not more than two, upstream interfaces on the rendezvous point (RP) routing device that resides between a customer edge–facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain. The RP routing device translates PIM join or prune messages into corresponding IGMP report or leave messages (if you include the `pim-to-igmp-proxy` statement), or into corresponding MLD report or leave messages (if you include the `pim-to-mld-proxy` statement). The routing device then proxies the IGMP or MLD report or leave messages to one or both upstream interfaces to forward IPv4 multicast traffic (for IGMP) or IPv6 multicast traffic (for MLD) across the PIM domains.

Options

interface-names—Names of one or two upstream interfaces to which the RP routing device proxies IGMP or MLD report or leave messages for transmission of multicast traffic across PIM domains. You can specify a maximum of two upstream interfaces on the RP routing device. To configure a set of two

upstream interfaces, specify the full interface names, including all physical and logical address components, within square brackets ([ ]).

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

$junos-interface-ifd-name advisory-options],
[edit interfaces demux0 unit logical-unit-number advisory-options],
[edit interfaces interface-name logical-unit-number advisory-options]
```

Description

Specify a recommended shaping rate to be applied to upstream traffic on an interface.

For ANCP interfaces, this configured rate is used as the default value for the Juniper VSA Upstream-Calculated-Qos-Rate (26-142) when the router has not received and processed the attributes from the access node.

For L2TP, the rate is configured on an underlying PPPoE logical interface for a subscriber on an MX Series router acting as a LAC. When the subscriber is tunneled, this rate, referred to as speed for L2TP, is sent to the LNS in the ICCN message as AVP 38.

Options

rate—Traffic rate in bits per second.

- **Range:** 1000 through 4,294,967,295 bits per second

Required Privilege Level

```

Description

Configure URL feed object. The URL feed object reduces your effort to add multiple URLs into a single URL pattern. The URL feed enables you to create a URL pattern automatically.

To create a URL pattern automatically, you need to create a URL feed file on the HTTP server. You should add the URLs that need to be added in the URL pattern to this file. When you configure the URL feed on your security device, the system downloads the file from the HTTP server and creates a URL pattern as follows:

1. The system validates the list of URLs based on the existing validation criteria used for URL pattern.
2. The system creates a URL pattern with `_feed` as suffix to the URL feed name.

   For example, if the URL feed name is `juniper`, then the system creates the URL pattern name as `juniper_feed`.
3. The system adds only the URLs that have a valid syntax and ignores the URLs with invalid syntax.
4. The system periodically downloads the file from the HTTP server based on the `update-interval` time you configure. There may be five minutes delay in the timer functionality.
5. The system maintains a hash to check for any updates to the URL list in the downloaded file. The system skips the file validation and URL pattern updates if the hash matches with the previous file.
6. The system does not automatically download the file and update the URL pattern if you configure `no-autoupdate`.

Limitations of URL Feed

- Files on the HTTP server should be in plain text format.
- File should contain only one URL in one line.
- Number of URLs in a file should not exceed the limit of the corresponding platform. See Table 1930 on page 31675.
- The URL length should not be more than 249 characters.
- The URL should not have invalid syntax.
- Deletion of a URL feed does not delete corresponding URL pattern and corresponding custom URL category.
- The system prioritizes the URL pattern that created automatically using URL feed over the URL pattern that you created manually using CLI.

- The file size should not be more than 512 KB.

Table 1930: Number of URLs Supported in One URL Pattern

Platforms	Number of URLs Supported
cSRX	1000
vSRX	1000
SRX300, SRX320, SRX340, SRX345, and SRX380	1000
SRX1500, SRX1600,SRX4200, SRX4600, and SPC3	1000
SRX5400, SRX5600, and SRX5800	1500

Options

url-feed *name* — Configure the name of the URL feed object

interval — Interval in hours for auto-updating list

- **Default:** 24
- **Range:** 1 through 168

no-autoupdate — Disable automatic update for URL feed pattern

proxy-profile — Proxy profile

routing-instance — Routing instance name

url — Configure the HTTPS server file URL that contains the list of URLs

url-filter-profile

IN THIS SECTION

- Syntax | 31678
- Hierarchy Level | 31679
- Description | 31679
- Options | 31679
- Required Privilege Level | 31679
- Release Information | 31679

Syntax

```
url-filter-profile profile-name;
```

Hierarchy Level

```
[edit services service-set service-set-name]
```

Description

Specify the URL filter profile that the service set uses. The URL filter profile specifies how to filter access to disallowed URLs, and is configured at the `[edit services url-filter]` hierarchy level.

NOTE: You must also configure the `next-hop-service` statement with this statement.

NOTE: Starting in Junos OS Release 18.3R1, the `url-filter-profile` statement is deprecated and has been replaced by the `web-filter-profile` statement. The `url-filter-profile` statement is supported for backward compatibility.

Options

profile-name	Name of the URL filter profile.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2.

        }
```

```
    }
    url-filter-database filename
}
```

Hierarchy Level

```
[edit services web-filter profile profile-name]
```

Description

Configure a URL filter template.

Options

template-name	Name of the URL filter template.
client-interfaces [*client-interface-name1 client-interface-name2* **]**	The list of client-facing logical interfaces (uplink) on which the URL filtering is configured. This option is mandatory.
disable-url-filtering	Disables the filtering of HTTP traffic that contains an embedded IP address (for example, http:/10.1.1.1) belonging to a disallowed domain name in the URL filter database.
dns-resolution-interval *minutes*	DNS resolution time interval in minutes. • **Default:** 1440 • **Range:** 60 through 1440 minutes.
dns-resolution-rate *seconds*	Number of DNS queries per second sent out from the system before initiating further DNS queries. • **Default:** 50 • **Range:** 50 through 100.
dns-retries *number*	Number of retries for a DNS query in case query fails or times out. • **Default:** 3 • **Range:** 1 through 5.

`dns-routing-instance` *`dns-routing-instance-name`*	The VRF on which the DNS server is reachable. This option is mandatory. You can use the default routing instance inet.0 or a defined routing instance.
`dns-server [` *`ip-address1 ip-address2 ip-address3`* `]`	One or more IP (IPv4 or IPv6) addresses of DNS servers to which the DNS queries are sent out. This option is mandatory.
`dns-source-interface` *`loopback-interface-name`*	The loopback interface for which source IP address is picked for sending DNS queries. This option is mandatory.
`routing-instance` *`routing-instance-name`*	The VRF on which URL filtering feature is configured. This option is mandatory. You can use the default routing instance inet.0 or a defined routing instance.
`server-interfaces [` *`server-interface-name1 server-interface-name2`* `]`	Server-facing interfaces to which traffic is destined. This option is mandatory. The list of server-facing logical interfaces (downlink) on which the URL filtering is configured. This option is mandatory.
`url-filter-database` *`filename`*	The filename of the URL filter database. The file should be placed in the **/var/db/url-filterd** directory, but indicate just the filename here and not the full path.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1 on MX Series.

Statement introduced in Junos OS Release 20.1R1.

Configuring URL Filtering

url-pattern

IN THIS SECTION

- Syntax | 31683
- Hierarchy Level | 31683
- Description | 31683
- Options | 31685
- Required Privilege Level | 31685
- Release Information | 31686

Syntax

```
url-pattern object-name {
    value [value];
}
```

Hierarchy Level

```
[edit security utm custom-objects]
```

Description

Use URL pattern lists to create custom URL category lists. These are lists of patterns that bypass scanning.

WARNING: Custom category does not take precedence over predefined categories when it has the same name as one of the predefined categories. We do not recommend having a custom category name be the same as the predefined category name.

Starting in Junos OS Release 20.4R1, the URL filtering supports the regular expression format given in Table 1931 on page 31684.

Table 1931: Regular Expression Format

Syntax	Pattern Format	Description	Example

Asterisk (*) in domain name	Pattern = [*].sub-domain..sub-domain	Asterisk should be at the head only.
		
		Match 0-N words in domain name.
			`*.juniper.net`
			
			`*.net`

Caret (^) in domain name	Pattern = [^]..[^].sub-domain.[^]..[^].sub-domain.[^]..[^]	Caret could be at any place.
		
		Match one word in domain name.
			`^.google.^.^`
			
			`a.^.b`

Question Mark (?) in domain name	Pattern = sub-domain.sub-domain.sub-do[?][?]	Question mark should be at the tail only.
		
		Match one character in domain name.
			`dev.local?`
			
			`www.yahoo.??`

All wildcard	Pattern = *, or *.*, or *.*.*	Special pattern. Match all URLs.	Same as pattern.

Prefix in URL path	Pattern = <domain-name>/[prefix]	Match the longest prefix in the URL path.	`<domain>/watch?`
			
			`<domain>/news/`

Keywords in URL path	Pattern = <domain-name>/[prefix][*token][*token][*token]	Match keywords in URL path.
		
		Support 0-3 tokens.
			`<domain>/pub/*/crypto/*.gz`
			
			`<domain>/video?*key1*key`

The system validate the URL patterns when you commit the configuration. If you configure an invalid pattern, the system shows a popup warning with the first bad character in (). For example, the pattern `a.*.com` shows a warning message `Pattern a.(*).com not supported`. You cannot use IP ranges and subnets to define URL pattern.

Starting in Junos OS Release 20.4R1, we have introduced a golden match for multiple URL patterns. When you configure multiple patterns for one domain, sometimes a specific URL could match multiple patterns, then the URL filtering module selects the best out of these patterns, which is the golden

match. For the selection of the golden match, the URL filtering module prioritizes the URL pattern in the following sequence:

1. Select the best domain name pattern to match.
2. Within the same domain name pattern, select the longest prefix match of the URL path.
3. Within the same domain name pattern and same URL path prefix, keyword match will take the priority.

For example, if you configure the following four patterns:

1. Pattern 1 = finance.abc.com/gb/chinainternet/
2. Pattern 2 = finance.abc.^/gb/chinamkt/
3. Pattern 3 = finance.abc.^/gb/chinamkt/*.shtml
4. Pattern 4 = *.abc.com/gb/chinamkt/chinamkt_cn

For the URL https://finance.abc.com/gb/chinamkt/chinamkt_cn/sinacn/2020-03-29/doc-ifzuwpay8845719.shtml, the golden match section will be as follows:

1. URL filtering module considers all the four patterns as a potential match in the domain name match stage, and the priority order is:

   finance.abc.com > finance.abc.^ > *.abc.com.

2. Within the same domain name pattern, the URL filtering module considers the longest prefix match of the URL path.

   - Pattern 1 does not match the URL path and the URL filtering module skips pattern 1.
   - Pattern 2 and pattern 3 have the same prefix in the URL path. Hence, the keywords match controls the golden match selection. Finally, the URL filtering module prefers pattern 3 that has the longest keywords match as the golden match.

Options

- *object-name*—Name of the URL list object.
- `value` *value*—Value of the URL list object. You can configure multiple values separated by spaces and enclosed in square brackets.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

use-extended-flow-memory

IN THIS SECTION

- Syntax | 31695
- Hierarchy Level | 31695
- Description | 31695
- Required Privilege Level | 31695

Release Information | 31696

Syntax

```
use-extended-flow-memory;
```

Hierarchy Level

```
[edit chassis fpc slot-number inline-services]
```

Description

Configure the service to extended flow memory. This service provides more scale in flows for inline services sampling.

The new configuration `set chassis fpc slot slot-number inline-services use-extended-flow-memory` allows you to configure table to operate in side band mode with side band memory. This configuration is applicable only on a Lookup (LU) platform. It is not applicable for XL line card because XL has dedicated DMEM memory to hold 64M flow entries.

If you are configuring inline flow monitoring of MPLS-IPv6 flows on an LU platform, you must configure `use-extended-flow-memory` to get MPLS-IPv6 flow records. If you do not configure `use-extended-flow-memory` on an LU platform, plain MPLS flow records are created.

> **NOTE**: This configuration is supported only on LU platforms. The LU platform line cards are MPC1E, MPC2E, MPC3E, MPC4E, and MPC 3D 16x10GE. Exceptions to the MPC2E and MPC3E series line card are MPC2E-NG and MPC3E-NG that use XL platform.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

[edit ethernet-switching-options secure-access-port vlan (all | vlan-name) dhcp-option82 remote-id],
[edit forwarding-options helpers bootp dhcp-option82 remote-id],
[edit forwarding-options helpers bootp interface interface-name dhcp-option82 remote-id]
```

Hierarchy Level (For MX Series Platforms)

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security option-82circuit-id]
```

Description

Use the interface description rather than the interface name (which is the default value) in the circuit ID or remote ID value in the DHCP option 82 information.

The textual description is configured using the `description` statement at the `[edit interfaces interface-name]` hierarchy level. If you specify that the textual description be used and no description is configured for the interface, DHCP relay defaults to using the Layer 2 interface name. When you use the interface description rather than the interface name, the interface description has to be specified under interface unit ("set interfaces ge-0/0/0 unit 0 description "client"). If you do not do this, then the interface name is used.

Options

device Use the device interface description. Only available for MX Series platform configuration.

logical Use the logical interface description. Only available for MX Series platform configuration.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Hierarchy level `[edit vlans vlan-name forwarding-options dhcp-security]` introduced in Junos OS Release 13.2X50-D10. (See Using the Enhanced Layer 2 Software CLI for information about ELS.)

Hierarchy level `[edit bridge-domains bridge domain name forwarding-options dhcp-security]` introduced in Junos OS Release 14.1 for the MX Series.

(circuit-id | remote-id)],
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options option-18],
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options option-37]
```

Description

Use the textual interface description instead of the interface identifier in the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or in the DHCPv6 option 18 (Relay Agent Interface ID) or option 37 (Relay Agent Remote ID) information in DHCP packets that the DHCP relay agent sends to a DHCP server.

> **NOTE**: For integrated routing and bridging (IRB) interfaces, the option 82 field must be able to uniquely identify the incoming interface based on either the Agent Circuit ID or Agent Remote ID. You can modify the information in the textual interface description to match the raw IFD (physical interface without a subunit) name and configure the option 82 field to use the interface description.

The textual description is configured using the `description` statement at the `[edit interfaces interface-name]` hierarchy level. If you specify that the textual description be used and no description is configured for the interface, DHCP relay defaults to using the Layer 2 interface name. When you use the interface description rather than the interface name, the interface description has to be specified under interface unit ("set interfaces ge-0/0/0 unit 0 description "client"). If you do not do this, then the interface name is used.

In the case of integrated routing and bridging (IRB) interfaces, the textual description of the Layer 2 interface is used instead of the IRB interface. If there is no description configured, the Layer 2 logical interface name is used. To include the IRB interface description instead of the Layer 2 interface description, configure the `use-interface-description` and the `no-vlan-interface-name` statements. If no description is configured for the IRB interface, DHCP relay defaults to using the IRB interface name.

> **NOTE**: The `use-interface-description` statement is mutually exclusive with the `use-vlan-id` statement.

If you specify the textual interface description, rather than accepting the default syntax, the identification is for packets returned from the server, and only for instances where that identification would be required by the DHCP relay, such as a stateless pass-through.

> **NOTE**: By default, DHCP relay accepts a maximum of 253 ASCII characters. If the textual interface description exceeds 253 characters, DHCP relay drops the packet, which results in the DHCP client failing to bind.

Options

`logical`—Use the textual description that is configured for the logical interface.

`device`—Use the textual description that is configured for the device interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

Support at the `[edit ... dhcpv6]` hierarchy levels introduced in Junos OS Release 11.4.

Support at the `[edit ... relay-agent-remote-id]` and `[edit ... remote-id]` hierarchy levels introduced in Junos OS Release 14.1.

Support at the `[edit vlans vlan-name dhcp-security dhcpv6-options option-18]` and `[edit vlans vlan-name dhcp-security dhcpv6-options option-37]` hierarchy levels introduced in Junos OS Release 14.1X53-D10 for EX Series switches.

[edit routing-instances routing-instance-name forwarding-options dhcp-relay dhcpv6 ... (relay-agent-interface-id |relay-agent-remote-id)]
```

Description

For the `relay-agent-interface-id` statement, specify that in dual-stack environments, the DHCPv6 relay agent uses an Interface-ID option (option 18) that is based on the DHCPv4 relay agent information option (option 82). When you include this statement, the DHCPv6 relay agent checks for the option 82 Agent Circuit-ID suboption (suboption 1) and inserts it into the outgoing RELAY-FORW message.

For the `relay-agent-remote-id` statement, specify that in dual-stack environments, the DHCPv6 relay agent uses a Remote-ID option (option 37) that is based on the DHCPv4 relay agent information option (option 82). When you include this statement, the DHCPv6 relay agent checks for the option 82 Remote-ID suboption (suboption 2) and inserts it into the outgoing RELAY-FORW message.

Options

strict (Optional) The router drops Solicit messages that do not include a DHCPv4 Remote-ID (option 82 suboption 2). If you do not specify the `strict` keyword, the router sends the RELAY-FORW message without adding option 37.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Support at the `[...relay-agent-remote-id]` hierarchy level introduced in Junos OS Release 15.1.

        use-p2mp-lsp;
    }
}
```

Hierarchy Level

```
[edit routing-instances instance name igmp-snooping-options]
```

Description

Point-to-multipoint LSP for IGMP snooping enables multicast data traffic in the core to take the point-to-multipoint path. The effect is a reduction in the amount of traffic generated on the PE router when sending multicast packets for multiple VPLS sessions because it avoids the need to send multiple parallel streams when forwarding multicast traffic to PE routers participating in the VPLS. Note that the options configured for IGMP snooping are applied on a per-routing-instance so all IGMP snooping routes in the same instance will use the same mode, point to multipoint or pseudowire.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

```

Description

Calculate post-convergence MPLS fast reroute (FRR) backup next hops for the OSPF protocol using segment routing (SR). Junos OS allows you to control the maximum number of equal-cost multipath (ECMP) backup paths installed for a given destination. Junos OS also allows you to control the maximum number of labels in the installed backup paths. Configure the `use-source-packet-routing` statement at `[edit protocols ospf backup-spf-options]` hierarchy level to allow the backup paths to be available for inet.0 routing table along with inet.3 routing table.

Options

maximum-backup-paths

Set the maximum number of equal-cost post-convergence backup paths to be installed.

- **Default:** 1
- **Range:** `1-8`

maximum-labels

Set the maximum number of labels used to construct a post-convergence backup path. If the backup path for a particular prefix requires more labels than the configured maximum labels, then the backup path for that particular prefix is not installed.

> **NOTE**: If the `maximum-labels` option is not configured, then the maximum number of labels used to construct a post-convergence backup path is 3.

- **Default:** 3
- **Range:** `2-5`

[edit protocols isis backup-spf-options],
[edit routing-instances name protocols isis backup-spf-options]
```

Description

Calculate post-convergence MPLS fast reroute (FRR) backup next hops for the IS-IS protocol using segment routing (SR). Topology-independent loop-free alternate (TI-LFA) provides protection against link failure, node failure, and fate-sharing failures. By default, Junos OS provides link protection. Junos OS allows you to control the maximum number of equal-cost multipath (ECMP) backup paths installed for a given destination. Junos OS also allows you to control the maximum number of labels in the installed backup paths. Configure the `use-source-packet-routing` statement at `[edit protocols isis backup-spf-options]` hierarchy level to allow the backup paths to be available for inet.0 routing table along with inet.3 routing table.

Options

maximum-backup-paths

Set the maximum number of equal-cost post-convergence backup paths to be installed. For remote LFA, the IS-IS protocol installs only one backup path. The maximum backup path range allows you to install multiple backup paths

- **Default:** 1
- **Range:** `1-8`

maximum-labels

Set the maximum number of labels used to construct a post-convergence backup path. If the backup path for a particular prefix requires more number of labels than the configured maximum labels then the backup path for that particular prefix is not installed.

> **NOTE**: If the `maximum-labels` option is not configured, then the number of labels that gets pushed stops at 3.

- **Default:** 3
- **Range:** `2-5`

Required Privilege Level

[edit forwarding-options helpers bootp interface  interface-name dhcp-option82-circuit-id]
```

Hierarchy Level (For MX Series Platforms)

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security option-82 circuit-id]
```

Description

Use the VLAN ID rather than the VLAN name (the default) in the circuit ID or remote ID value in the DHCP option 82 information.

> **NOTE**: The `use-vlan-id` statement is mutually exclusive with the `use-interface-description` and `no-vlan-interface-name` statements.

The `use-vlan-id` statement only applies to interfaces in a bridge domain. The format of the Agent Circuit ID or Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces is as follows:

```
(fe | ge)-fpc/pic/port.subunit:svlan_id-vlan_id
```

> **NOTE**: The *subunit* is required and used to differentiate the interface for remote systems, and *svlan_id-vlan_id* represents the VLANs associated with the bridge domain.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Hierarchy level `[edit vlans vlan-name forwarding-options dhcp-security]` introduced in Junos OS Release 13.2X50-D10. (See Using the Enhanced Layer 2 Software CLI for information about ELS.)

Hierarchy level `[edit bridge-domains bridge-domain-name forwarding-options dhcp-security]` introduced in Junos OS Release 14.1 for the MX Series.

> **NOTE**: The EX Series switches that support the `use-vlan-id` statement are the EX4300, EX4600, and EX9200 switches.

```

Description

Configure access permission for individual users. Starting in Junos OS Release 18.3, the `ssh-dsa` hostkey algorithm is deprecated— rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.

Options

authentication Specify one or more authentication methods that a user can use to log in to the router or switch. You can assign multiple authentication methods to a single user.

encrypted-password Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.

> **CAUTION**: Do not use the `encrypted-password` option unless the password is *already* encrypted, and you are entering the encrypted version of the password.
>
> If you accidentally configure the `encrypted-password` statement with a plain-text password or with blank quotation marks (" "), you will not be able to log in to the device as this user.

- **Range:** You cannot configure a blank password for `encrypted-password` using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

plain-text-password
Specify a plain text password for the user through a password prompt. The plain text password will be automatically encrypted as soon as you configure it. Plain-text passwords are hidden and marked as `## SECRET-DATA` in the configuration.

load-key-file
Load SSH public keys from a previously-generated named file at a specified URL location or local path. The file contains one or more SSH keys that are copied into the configuration when the command is issued.

no-public-keys
Disables ssh public key authentication for the user specified. If the no-public-keys statement is specified at the [edit system services ssh] hierarchy level, public key authentication is disabled for all users on the device.

ssh-ecdsa *public-key*
SSH version 2 authentication. Specify the ECDSA public key. You can specify one or more public keys for each user.

from *host-list*
Specify a pattern-list of allowed hosts.

ssh-ed25519 *public-key*
SSH version 2 authentication. Specify the ED25519 public key. You can specify one or more public keys for each user.

from *host-list*
Specify a pattern-list of allowed hosts.

ssh-rsa *public-key*
SSH version 2 authentication. Specify the RSA public key. You can specify one or more public keys for each user.

from *host-list* Specify a pattern-list of allowed hosts.

class *class-name* Assign a user to a login class. You must assign each user to a login class. Specify one of the classes defined at the `[edit system login class]` hierarchy level.

cli Set the CLI prompt specified for a specified login user or specified login class. The prompt set for the login user has precedence.

prompt *prompt* Specify the prompt string you want to see displayed in the CLI prompt.

full-name *complete-name* Specify the user's complete name. If the name contains spaces, enclose it in quotation marks. Do not include colons or commas.

uid *uid-value* Numeric identifier associated with the user account, either assigned by an administrator or assigned automatically when you commit the user configuration. It is used by applications that request numeric identifiers, such as some RADIUS queries, or secure applications, such as flow-tap monitoring. This value must be unique on the router or switch.

- **Default:** If you do not assign a UID to a user, the software assigns one when you commit the configuration, preferring the lowest available number.
- **Range:** 100 through 64000

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement `no-public-keys` introduced in Junos OS Release 15.1.

Statement `cli` introduced in Junos OS 17.3.

```
user username;
```

Hierarchy Level

```
[edit snmp v3 usm local-engine],
[edit snmp v3 usm remote-engine engine-id]
```

Description

Specify a user associated with an SNMPv3 group on a local or remote SNMP engine.

Options

username—SNMPv3 user-based security model (USM) username.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

user (System Logging)

IN THIS SECTION

- Syntax | 31733
- Hierarchy Level | 31733
- Description | 31734
- Options | 31734
- Required Privilege Level | 31734
- Release Information | 31734

Syntax

```
user (username | *) {
    facility severity;
    match "regular-expression";
    match-strings string-name;
}
```

Hierarchy Level

```
[edit system syslog]
```

Description

Configure the logging of system messages to user terminals.

Options

***** (the asterisk)—Log messages to the terminal sessions of all users who are currently logged in.

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see *System Logging Facilities and Message Severity Levels*.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities the specified level and higher are logged. For a list of the severities, see *System Logging Facilities and Message Severity Levels*.

username—Junos OS login name of the user whose terminal session is to receive system log messages. To log messages to more than one user's terminal session, include more than one **user** statement.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Syntax

```
user {
    user-name;
    password password;
}
```

Hierarchy Level

```
[edit system services webapi (System Services)]
```

Description

Configure the Web API process (webapi) username and password for the account.

The Web API process, acting as an HTTP server, allows the Aruba ClearPass Policy Manager (CPPM), acting as a client, to send POST request messages to HTTP server. The CPPM, which is the authentication source for this feature, sends to the SRX Series Firewall user authentication and identity information.

Options

user-name Specify the user name for the integrated ClearPass authentication and enforcement feature Web API process (webapi) user.

password Specify the password for the integrated ClearPass authentication and enforcement feature Web API process (webapi) user.

- **Range:** 1 through 128 characters.

Required Privilege Level

1. system—To view this statement in the configuration.
2. system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

user-defined-option-82

IN THIS SECTION

- Syntax | 31736
- Hierarchy Level | 31737
- Description | 31737
- Required Privilege Level | 31737
- Release Information | 31738

Syntax

```
user-defined-option-82 string;
```

Hierarchy Level

```
[edit forwarding-options dhcp-relay group group-name interface interface-name overrides user-defined-option82 string],
[edit forwarding-options dhcp-relay group group-name overrides user-defined-option82 string],
[edit forwarding-options dhcp-relay overrides user-defined-option82 string]
```

Description

Configure a custom text string to use as the interface description in the DHCP option 82 Agent Circuit ID (suboption 1) information. This text string is defined independently of the interface description that is configured using the `description` statement at the `[edit interfaces interface-name]` hierarchy level.

The custom text string is configured using the `user-defined-option-82` statement at the following hierarchy levels:

- To configure a custom string on an interface level:

  ```
  [edit forwarding-options dhcp-relay group group-name interface interface-name overrides user-defined-option82 string]
  ```

- To configure a custom string at the group level:

  ```
  [edit forwarding-options dhcp-relay group group-name overrides user-defined-option82 string]
  ```

- To configure a custom string globally:

  ```
  [edit forwarding-options dhcp-relay overrides user-defined-option82 string]
  ```

You can define a custom string up to 251 characters in length. To include the custom string in the DHCP option 82 Agent Circuit ID, you must configure the `user-defined` statement at the `[edit forwarding-options dhcp-relay group group-name relay-option-82 circuit-id]` hierarchy level.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
21.2R1	Starting with Junos OS Release 21.2R1, QFX Series switches support the `user-defined-option-82` CLI statement in a stateless DHCP relay configuration. You can configure stateless DHCP relay using the `forward-only` CLI statement at the [`edit forwarding-options dhcp-relay`] hierarchy level.

user-firewall

IN THIS SECTION

- Syntax | 31740
- Hierarchy Level | 31740
- Description | 31740
- Options | 31741
- Required Privilege Level | 31741
- Release Information | 31741

Syntax

```
user-firewall {
    access-profile profile-name;
    auth-only-browser;
    auth-user-agent;
    domain domain-name;
    ssl-termination-profile profile-name;
    web-redirect;
    web-redirect-to-https;
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication]
```

Description

Configure user role firewall authentication, and map the source IP address to the username and its associated roles (groups). The mapped data is written to the firewall authentication table for later retrieval by the user role firewall. The user role firewall uses the username and role information to determine whether to permit or deny a user's session or traffic.

For SAML-based firewall authentication, you can configure any of the following methods:

- `access-profile`, either `web-redirect` or `web-redrect-to-https` commands
- `access-profile`, both `web-redirect` and `web-redrect-to-https` commands

under `set security policies from-zone` *`zone-name`* `to-zone` *`zone-name`* `policy` *`policy-name`* `then permit firewall-authentication user-firewall` hierarchy level.

The system supports SAML-based firewall authentication only with push-to-identity-management. Configure push-to-identity-management.

Options

access-profile ***profile-name***	Specify the name of the access profile to be used for authentication.
domain ***domain-name***	Specify the name of the domain where firewall authentication occurs in the event that the Windows Management Instrumentation client (WMIC) is not available to get IP-to-user mapping for the integrated user firewall feature. The maximum length is 65 bytes.
ssl-termination-profile ***profile-name***	For HTTPS traffic, specify the name of the SSL termination profile used for SSL offloading.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10. Support for the **domain** keyword added in Junos OS Release 12.1X47-D10.

user-group-mapping

IN THIS SECTION

- Syntax | 31742
- Hierarchy Level | 31743
- Description | 31743
- Options | 31743
- Required Privilege Level | 31744
- Release Information | 31744

Syntax

```
user-group-mapping {
    ldap {
        address ip-address {
            port port;
        }
        authentication-algorithm {
            simple;
        }
        base base;
        ssl;
        user username {
            password password;
        }
    }
}
```

Hierarchy Level

```
[edit services user-identification active-directory-access domain]
```

Description

Configure the SRX Series Firewall to connect to an LDAP server, so that the server can provide the SRX Series with user-to-group mappings. These mappings are used to implement the integrated user firewall feature. The domain controller acts as the LDAP server in typical customer scenarios.

Most of this statement is optional, because the default communication method is LDAP and most arguments have default values. Only the LDAP keyword and the base are required.

Options

ldap Required. LDAP is the protocol used to access the LDAP server to get user-to-group mappings.

- **address *ip-address*** Optional. Specify the IP address of the LDAP server. If no address is specified, the system uses one of the configured Active Directory domain controllers.
  - **port *port*** Optional. Specify the port number of the LDAP server. If no port number is specified, the system uses port 389 for plaintext or port 636 for encrypted text.
- **authentication-algorithm** Optional. Specify the algorithm used while the SRX Series communicates with the LDAP server.
  - **simple** Configure simple (plaintext) authentication method.
- **base *base*** Required. LDAP base distinguished name (DN).
- **ssl** Optional. Enable Secure Sockets Layer (SSL) to ensure secure transmission with the LDAP server. Disabled by default, which means that the password is sent in plaintext.
- **user *username*** Optional. Username of the LDAP account. If no username is specified, the system will use the configured domain controller's username.

password *password*	Optional. Specify the password for the account. If no password is specified, the system uses the configured domain controller's password.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X47-D10.

            traceoptions {
                file <filename> <files files> <match match> <size size> <(world-readable | no-
world-readable)>;
                flag name;
                level (all | error | info | notice | verbose | warning);
                no-remote-trace;
            }
        }
    }
```

Hierarchy Level

```
[edit services]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure the integrated user firewall feature, including access to the Active Directory domain and domain controller, IP address-to-user mapping, and user-to-group mapping. One or two Active Directories are allowed under one domain. The IP address-to-user mapping and user-to-group mapping are configured per domain.

Options

authentication-entry-timeout *minutes*

Timeout interval starting from the Active Directory/domain controller login time, the last active session, or the last successful probe. A setting of 0 means the authentication does not need a timeout. We recommend that you configure a setting of 0 when you disable on-demand-probe to prevent someone from accessing the Internet without logging in again.

- **Range:** 10 through 1440 minutes
- **Default:** 30 minutes

filter

Optional. Range of IP addresses that needs to be monitored or not monitored.

include *address* — Include IP address or range. Maximum of 20 addresses.

exclude *address* — Exclude IP address or range. Maximum of 20 addresses.

no-on-demand-probe

Do not use traffic to discover user. Default is disabled.

wmi-timeout *seconds*

(Optional) Configures the number of seconds that the domain PC has to respond to the SRX Series device's query through WMI/DCOM.

- If the PC responds within that timeframe to the WMI query, the SRX creates an authentication entry for this PC.
- If the PC does not respond within that timeframe, the WMI query failed. In the case of a failed query, if the SRX had an authentication entry about the queried PC before the WMI query, that authentication entry is deleted. If the SRX had no authentication entry before the WMI query, the SRX does not create an authentication entry.
- **Range:** 3 through 120 seconds
- **Default:** 10 seconds

identity-context-profile

Configure identity context profile in firewall policy to control network access.

identity-management

Configure identity management to collect identity information.

logical-domain-identity-management	Configures the logical domain identity management.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X47-D10.

`logical-domain-identity-management` option introduced in Junos OS Release 19.3R1.

user-name (Event Policy)

IN THIS SECTION

- Syntax | 31755
- Hierarchy Level | 31756
- Description | 31756
- Default | 31756
- Options | 31756
- Required Privilege Level | 31756
- Release Information | 31757

Syntax

```
user-name username;
```

Hierarchy Level

```
[edit event-options policy policy-name then change-configuration],
[edit event-options policy policy-name then event-script filename],
[edit event-options policy policy-name then execute-commands],
[edit event-options policy policy-name then upload filename (filename | committed) destination
destination-name]
```

Description

Associate a user with an action in an event policy. The event policy action is executed under the privileges of the associated user. You can configure the `user-name` statement for the following actions:

- Changing the configuration
- Executing a SLAX or XSLT event script
- Executing commands
- Uploading a file

> **NOTE**: When you configure the `user-name` statement for event scripts, it applies to only SLAX and XSLT scripts. To execute a local Python event script under the access privileges of a specific user, configure the `python-script-user` *`username`* statement at the `[edit event-options event-script file` *`filename`*`]` hierarchy level. If you do not configure the `python-script-user` statement for a Python event script, the device executes the script using the access privileges of the generic, unprivileged system account `nobody`.

Default

If you do not configure a user for an event policy action, actions that support this statement are executed as user `root`.

Options

username Username that is configured at the `[edit system login]` hierarchy level.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Support at the `[edit event-options policy policy-name then change-configuration]` hierarchy level introduced in Junos OS Release 12.1.

user-name-include (OCS Partition)

IN THIS SECTION

Syntax | 31759

- Hierarchy Level | 31759
- Description | 31759
- Options | 31759
- Required Privilege Level | 31760
- Release Information | 31761

Syntax

```
user-name-include{
    base-interface-name;
    delimiter delimiter-character;
    domain-name my-domain;
    interface-name;
    mac-address;
    nas-port-id;
    origin-host;
    origin-realm;
    user-name;
    user-prefix pref;
}
```

Hierarchy Level

```
[edit access ocs partition partition-name]
```

Description

Configure the username identification to be used in an Online Charging Function (OCS) partition. You can configure a data string to include the following options.

Options

base-interface-name Use the physical or underlying interface name. If both the underlying interface and the client application perform authentication, authorization, and provisioning, the

identification attributes in the server requests enable the AAA or PCRF server to make an association between the two entities.

delimiter *delimiter-character*
Use the specified character as the delimiter between the concatenated components of the `user-name-include` statement. You cannot use the semicolon (;) as a delimiter.

- **Default:** @

domain-name *my-domain*
Use the specified domain name that is concatenated with the `user-name-include` statement during the subscriber identification process.

interface-name
Use the interface name that is concatenated with the `user-name-include` statement during the subscriber identification process; for example, demux0.

mac-address
Use the client hardware address (chaddr) from the incoming packet that is concatenated with the `user-name-include` statement during the subscriber identification process.

nas-port-id
Use the NAS-Port-ID (RADIUS attribute 87), which identifies the physical interface that subscriber management uses to identify users that is concatenated with the `user-name-include` statement during the subscriber identification process. By default, the NAS-Port-ID includes the interface-description value that describes the physical interface.

origin-host
Use the name of the host that originates the Diameter message that is concatenated with the `user-name-include` statement during the subscriber identification process. Supplied as the value of Origin-Host AVP for all messages sent by the Diameter master instance.

origin-realm
Use the realm of the host that originates the Diameter message that is concatenated with the `user-name-include` statement during the subscriber identification process. Supplied as the value of Origin-Realm AVP for all messages sent by the Diameter master instance.

user-name
(Included in the `user-name-include` statement by default) Use the username that is concatenated with the `user-name-include` statement during the subscriber identification process.

user-prefix *prefix*
Use the specified user prefix that is concatenated with the `user-name-include` statement during the subscriber identification process.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

user-query (Services User Identification)

IN THIS SECTION

- Syntax | 31772
- Hierarchy Level | 31772
- Description | 31772

- Options | 31773
- Required Privilege Level | 31775
- Release Information | 31775

Syntax

```
user-query {
    ca-certificate ca-certificate;
    client-id client-id;
    client-secret client-secret;
    delay-query-time seconds;
    query-api query-api;
    token-api token-api;
    web-server (Services) {
        server-name;
        address address;
        connect-method (http | https);
        port port;
    }
}
```

Hierarchy Level

```
[edit services user-identification authentication-source (Services User Identification ClearPass)
aruba-clearpass]
```

Description

ca-certificate- Configures the Integrated ClearPass Authentication and Enforcement feature user query function configuration. User query enables the SRX Series Firewall to query the ClearPass Policy Manager (CPPM) for authentication and identity information for an individual user under certain circumstance when it does not receive that information from the CPPM though the Web API POST requests.

client-id- Configures the client ID that the SRX Series Firewall requires to obtain an access token for the Integrated ClearPass Authentication and Enforcement user query function. The client ID must be consistent with the API client configured on the CPPM.

client-secret- Configures the client secret used with the client ID that the SRX Series Firewall requires to obtain an access token for the Integrated ClearPass Authentication and Enforcement user query function. The client secret must be consistent with the client secret configured on the CPPM.

delay-query-time- If the CPPM does not send to the SRX Series Firewall authentication and identity information for a particular user, then the SRX Series Firewall can request that information for the user if you configure the user query function.

query-api - Configure `query-api` to specify the path of the URL that the SRX Series Firewall uses to query the ClearPass Policy Manager (CPPM) webserver for authentication and identity information for an individual user. For the SRX Series Firewall to be able to make a request, you must have configured it to obtain an access token.

token-api - Configure the token API that is used in generating the URL for acquiring an access token. The token API is combined with the connection method and the IP address of the ClearPass webserver to produce the complete URL used for acquiring an access token.

Options

ca-certificate

Specify the certificate file that the SRX Series Firewall uses to verify the Clearpass server's certificate for the SSL connection that is used for the user query function. As the ClearPass administrator, you must export the server's certificate from the CPPM and import it to the SRX Series Firewall. Afterward, you must configure the ca-certificate path and the certificate filename on the SRX Series Firewall. Here is an example:

```
'/var/tmp/RADIUSServerCertificate.crt'
```

client-id

The ClearPass endpoint API requires use of OAuth (RFC 6749) to authenticate and authorize the SRX Series Firewall access. The SRX Series Firewall uses the Client Credentials grant type access token, which is one of the two types that ClearPass supports.

If it is configured, the user query function allows the SRX Series Firewall to query the CPPM for authentication and identity information about individual users when it does not receive this information from the CPPM through the SRX Series Web API process (webapi).

client-secret

Client secret for OAuth2 grant.

delay-query-time

Delay time to send user query (0~60sec) (seconds). The amount of time for the SRX Series Firewall to delay before sending queries to the Aruba ClearPass Policy Manager (CPPM) for authentication and identity information for individual users.

Delays can occur from when the CPPM initially posts user authentication information to the SRX Series Firewall to when the SRX Series Firewall updates its ClearPass authentication table with that information. In its transit, the user identity information must first pass through the CPPM device's control plane and the control plane of the SRX Series Firewall.

During that period, traffic might arrive at the SRX Series Firewall that is generated by an access request from a user whose authentication and identity information is in transit from the CPPM to the SRX Series Firewall. Rather than allow the SRX Series Firewall to respond automatically by sending a user query request *immediately*, you can set the delay time parameter specifying in seconds how long the SRX Series Firewall should wait before sending the request.

After the delay timeout expires, the SRX Series Firewall sends the query to the CPPM and creates a pending entry for the user in the Routing Engine authentication table. During this period, any arriving traffic matches the default policy whose action on the traffic you can configure.

- **Default:** 15
- **Range:** 0 through 60

query-api

The integrated ClearPass authentication and enforcement user query function supplements the Web API process (webapi) by allowing the SRX Series Firewall to obtain from the CPPM authentication information for an individual user whose information does not already exist in the SRX Series ClearPass authentication table.

Consider the following `query-api` example:

```
api/v1/insight/endpoint/ip/$IP$
```

The SRX Series Firewall generates the complete URL for the user query request by combining the query-api string with the connection method (HTTPS) and the CPPM webserver IP address ({$server}).

```
https://{$server}/api/v1/insight/endpoint/ip/$IP$
```

In this example, the SRX Series Firewall replaces the variables with the following values resulting in a specific URL request for the individual user:

```
https://203.0.113.76/api/v1/insight/endpoint/ip/192.0.2.98
```

Under normal circumstances, the ClearPass webserver sends user authentication information to the SRX Series Firewall in POST request messages and the SRX Series Firewall writes that information to its ClearPass authentication table. When the SRX Series Firewall receives an access request from a user, it searches its ClearPass authentication table for an entry for that user.

It can happen that the SRX Series Firewall might not have received authentication for a user from the CPPM because the user has not yet been authenticated by the CPPM. For example, the user might have joined the network through an access layer not on a managed switch or WLAN. When the CPPM receives the user query from the SRX Series Firewall, it authenticates the user and returns the authentication information to the device.

token-api API of acquiring token for OAuth2 authentication.

For example, if the token API is oauth, the connection method is HTTPS, and the IP address of the ClearPass webserver is 192.0.2.199, the complete URL for acquiring an access token would be https://192.0.2.199/api/oauth. This is a required parameter. There is no default value.

The SRX Series Firewall user query function requires an access token to be able to query the ClearPass webserver. If the user query function is configured, the SRX Series Firewall can request from the ClearPass webserver user authentication and identity information for an individual user.

[edit system services dhcp-local-server dual-stack-group group-name authentication]
```

Description

Configure the username that the router or switch passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router (or switch) accesses the local authentication service only and does not use external authentication services, such as RADIUS.

The following statements are not supported in the DHCPv6 hierarchy levels:

- **option-60**
- **option-82**

The following statements are supported in the DHCPv6 hierarchy levels only:

- **relay-agent-interface-id**
- **relay-agent-remote-id**
- **relay-agent-subscriber-id**

Options

vlan-tags Include the subscriber session VLAN tags in the username for interactions with an external authority. Both single-tagged and double-tagged VLANs are supported: The tags are added in the format *`outer-vlan-tag-inner-vlan-tag`*. The outer tag is always included; the inner tag is included for double-tagged VLANs.

Use this option instead of the `interface-name` option when the outer VLAN tag is unique across the system and you do not need the underlying physical interface name to be part of the format.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

`vlan-tags` option added in Junos OS Release 18.3R1 on MX Series routers.

    vlan-tags;
}
```

Hierarchy Level

```
[edit interfaces interface-name auto-configure vlan-ranges authentication],
[edit interfaces interface-name auto-configure stacked-vlan-ranges authentication]
```

Description

Configure the username that the router passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router accesses the local authentication service only and does not use external authentication services, such as RADIUS.

The username takes the format *user-prefix mac-address circuit-type circuit-id remote-id option-82 interface-name domain-name radius-realm*. By default, each component is separated by a period (.), but you can specify a different delimiter with the `delimiter` statement.

Options

vlan-tags Include the subscriber session VLAN tags in the username for interactions with an external authority. Both single-tagged and double-tagged VLANs are supported: The tags are added in the format *`outer-vlan-tag-inner-vlan-tag`*. The outer tag is always included; the inner tag is included for double-tagged VLANs.

You can use this option instead of the `interface-name` option when the outer VLAN tag is unique across the system and you do not need the underlying physical interface name to be part of the format.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

username-include (Local Authentication)

IN THIS SECTION

- Syntax | 31789
- Hierarchy Level | 31789
- Description | 31789
- Options | 31790
- Required Privilege Level | 31790
- Release Information | 31790

Syntax

```
username-include {
    circuit-id;
    delimiter character;
    domain-name name;
    mac-address;
    remote-id;
}
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces $junos-interface-ifd-name unit $junos-interface-unit ppp-options local-authentication]
```

Description

Configure a local username that authd can use to request authentication for terminated PPP subscribers. This enables the external RADIUS server to pass implementation-specific configuration for successfully authenticated subscribers. Local authentication supports CPEs that do not negotiate authentication protocols in the same dynamic profile as CPEs that use only PAP or CHAP authentication.

The username takes the following format when you use the default delimiter:

```
mac-address.circuit-id.remote-id@domain-name
```

Options

circuit-id Include the agent circuit identifier (ACI) in the local username.

delimiter *character* Specify the character that separates components that make up the concatenated username.

- **Default:** Period (.)

domain-name *name* Specify the domain name that ends the local username created for the subscribers. The username is sent to RADIUS in the Access-Request message. The string can include the following characters: a through z, A through Z, 0 through 9, “-“, or “.”.

mac-address Include the MAC address from the client PDU in the local username.

remote-id Include the agent remote identifier (ARI) in the local username.

Required Privilege Level

interface

Release Information

Statement introduced in Junos OS Release 18.2R1.

authentication],
[edit routing-instances routing-instances-name system services static-subscribers group group-
```

```
name  authentication],
[edit system services static-subscribers authentication],
[edit system services static-subscribers group group-name authentication]
```

Description

Specify the information included in the username created for all static subscribers or for static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.

Options

delimiter *delimiter-character*

Specify the delimiter character that separates the different fields configured for the username. You can specify only a single character as the delimiter.

- **Default:** The default delimiter is a period (.).

vlan-tags

Include the VLAN tags (VLAN IDs) for the interface. For single-tagged VLANs, the field is encoded as *outer-tag*. For stacked VLANs, the field is encoded as *outer-tag-inner-tag*. For IP demux interfaces configured for static subscribers, the VLAN tags configured on the underlying interface are used.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

The Content Security default configuration is used in two scenarios.

- **Content Security default configuration for unified policies**—For security policies that enable Content Security with no custom Content Security policy defined, the default Content Security policy will be used.
- **Content Security default configuration for existing Content Security policies**—For existing security policies that have a Content Security policy enabled, the default Content Security policy will NOT be used.

Options

`default-configuration`	Global default Content Security configurations.
`anti-spam`	Configure the default Content Security configuration for antispam feature profile.
`anti-virus`	Configure the default Content Security configuration for antivirus feature profile.
`content-filtering`	Configure the default Content Security configuration for content filtering feature profile.
`web-filtering`	Configure the default Content Security configuration for Web filtering feature profile.

utm-policy	Configure a Content Security policy for antivirus, antispam, content filtering, traffic options, and Web filtering protocols and attach this policy to a security profile to implement it.
traceoptions	Define tracing operations for Content Security features.
feature-profile	Configure Content Security features, antivirus, antispam, content filtering, and Web filtering by creating feature profiles.
application-proxy	Application proxy settings.
custom-objects	Configure custom objects before configuring Content Security feature-profile features. Custom category does not take precedence over predefined categories when it has the same name as one of the predefined categories. It is not recommended to have a custom category name be the same as the predefined category name.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Starting in Junos OS Release 21.4R1, the rule-set and rules configurations introduced under the `[edit security utm utm-policy <utm-policy-name> content-filtering]` hierarchy level can be used from `[edit security utm default-configuration content-filtering` hierarchy.

Content filtering options based on mime-type, content-type, and protocol command is not supported. After you upgrade to Junos OS Release 21.4R1, previously existing file extension based content filtering options under the `[edit security utm utm-policy <utm-policy-name> content-filtering]` hierarchy are no more available for configuration.

Junos OS Release 21.4R1 allows you to use legacy functionality if you don't want to migrate to this modern functionality. You will be allowed to use the legacy configurations but all the legacy configuration knobs are deprecated and are hidden. Also, you will receive system logs and error message warnings when you use all the legacy deprecated knobs.

Statement introduced in Junos OS Release 18.2R1.

uuid (Applications)

IN THIS SECTION

- Syntax | 31806
- Hierarchy Level | 31806
- Description | 31806
- Options | 31806
- Required Privilege Level | 31807
- Release Information | 31807

Syntax

```
uuid hex-value;
```

Hierarchy Level

```
[edit applications application  application-name  term  term-name]
```

Description

Specify the Universal Unique Identifier (UUID) for objects. DCE RPC services are mainly used by Microsoft applications. The ALG uses well-known TCP port 135 for port mapping services and uses the Universal Unique Identifier (UUID) instead of the program number to identify protocols. The main application-based DCE RPC is the Microsoft Exchange Protocol.

Support for stateful firewall and NAT services requires that you configure the DCE RPC port map ALG on TCP port 135. The DCE RPC ALG uses the TCP protocol with application-specific UUIDs.

Options

`uuid` *`hex-value`* —Specify the universal unique identifier (UUID) for objects.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 8.5.

uuid

IN THIS SECTION

- Syntax | 31807
- Hierarchy Level | 31807
- Description | 31807
- Options | 31808
- Required Privilege Level | 31808
- Release Information | 31808

Syntax

```
uuid hex-value;
```

Hierarchy Level

```
[edit applications application application-name]
```

Description

Specify the Universal Unique Identifier (UUID) for DCE RPC objects.

Options

hex-value—Hexadecimal value.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

        }
    }
}
```

Hierarchy Level

```
[edit snmp]
```

Options

username is the name that identifies the SNMPv3 user.

target-parameters-name is the name associated with the message processing and security parameters that are used in sending notifications to a particular management target.

When you configure SNMP trap notifications for subscriber secure policy on MX Series routers, you must configure the parameters as follows:

- Message-processing model: `v3`
- Security level: `privacy`
- Security model: `usm`

target-address-name is the string that identifies the target address.

tag-name defines the target addresses to which this notification is sent. This notification is sent to all the target-addresses that have this tag in their tag list. The *tag-name* is not included in the notification.

`trap` is the type of notification.

name is the name assigned to the notification.

profile-name is the name assigned to the notify filter.

oid is the object identifier. All MIB objects represented by this statement have the specified OID as a prefix. You can specify it either by a sequence of dotted integers or by a subtree name.

- `include`—Include the subtree of MIB objects represented by the specified OID.
- `exclude`—Exclude the subtree of MIB objects represented by the specified OID.

authentication-password is the password used to generate the key used for authentication.

SNMPv3 has specific requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Description

Configure SNMPv3.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

v4address

IN THIS SECTION

- Syntax | 31819

v6rd

IN THIS SECTION

- Syntax | 31825
- Hierarchy Level | 31825
- Description | 31825
- Options | 31826
- Required Privilege Level | 31826
- Release Information | 31826

Syntax

```
v6rd v6rd-softwire-concentator {
    ipv4-prefix ipv4-prefix;
    v6rd-prefix ipv6-prefix;
    mtu-v4 mtu-v4;
    softwire-address ipv4-address;
}
```

Hierarchy Level

```
[edit services softwire softwire-concentrator]
[edit services softwires softwire-types
```

Description

Configure settings for a 6rd concentrator used to process IPv6 packets encapsulated in IPv4 packets.

The `v6rd` statement is supported only on the MS-DPC, MS-100, MS-400, and MS-500 line cards. The `v6rd` statement is *not* supported on MS-MPCs and MS-MICs.

Options

ipv4-prefix—IPv4 prefix of the customer edge (CE) network

ipv6-prefix—IPv6 prefix of the 6rd domain.

mtu-v4— Maximum transmission unit (MTU), in bytes (576 through 9192), for IPv6 packets encapsulated into IPv4. If the final length is greater than the configured value, the IPv4 packet will be dropped.

address—IPv4 address of a softwire concentrator. This is an IPv4 address independent of any interface and on a different prefix.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

Support added in Junos OS release 20.2R1 for the v6rd concentrator at the `[edit services softwires softwire-types` edit hierarchy for Next Gen Services on MX240, MX480, and MX860 routers.

```
[edit logical-systems logical-system-name routing-instances instance-name routing-options],
[edit logical-systems logical-system-name routing-options],
[edit routing-instances instance-name routing-options],
[edit routing-options]
```

Description

CAUTION: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure resource public key infrastructure (RPKI) BGP route validation.

Options

notification-rib [*notification-rib* ...]; Specify the routing tables that are notified when the validation state changes.

When validation policies are used for BGP peers in routing instances, the policy engine tries to lookup within the local Validated Route Payload (VRP) database of that particular routing instance. If the RPKI session is not in that routing instance, then it falls back to the VRP database of the default routing instance. Modification of VRP records in the fall back VRP database will not be picked up by the non-default routing instance. As a result, routing table entries of the default and non-default routing instances will differ.

To offset this, configure the `notification-rib` option in the default routing instance to ensure that the modifications to the default routing instance trigger a re-evaluation of the routing tables for the specified routing instance.

Junos OS Release 22.3R1 introduced support for named validation databases in addition to the default VRP database.

To specify a named validation database, use the `validation-state (invalid | valid)` option at the `[edit routing-options validation database` *`database-name`* `static record` *`destination`* `maximum-length` *`prefix-length`* `origin-autonomous-system` *`as-number]`* hierarchy level.

To specify a target route-validation database for a validation session, use the database `database-name` option at the `[edit routing-options validation group` *`group-name`* `session]` hierarchy level.

As a result, we no longer need to configure notification-ribs explicitly. They are created internally to track which VRP databases are being consulted by which routing-instances.

The remaining statements are explained separately. See CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

variable (SNMP RMON)

IN THIS SECTION

- Syntax | 31836
- Hierarchy Level | 31836
- Description | 31836
- Options | 31836
- Required Privilege Level | 31836
- Release Information | 31836

Syntax

```
variable oid-variable;
```

Hierarchy Level

```
[edit snmp rmon alarm index]
```

Description

Set the object identifier (OID) of the MIB object (also called variable) to be monitored when you configure an SNMP RMON alarm. If the value of the monitored variable exceeds the configured rising threshold or falling threshold, an alarm is triggered and a corresponding event may be generated.

Options

oid-variable—OID of the MIB variable that is being monitored. The OID can be a dotted decimal (for example, `1.3.6.1.2.1.2.1.2.2.1.10.1`). Alternatively, use the MIB object name (for example, `ifInOctets.1`).

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

- Description | 31837
- Options | 31838
- Required Privilege Level | 31838
- Release Information | 31838

Syntax

```
variables variable-name {
    default-value default-value;
    equals expression;
    mandatory;
    uid;
    uid-reference;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name]
```

Description

Configure user-defined variables in a dynamic service profile. The values that the system uses for these variables are provided by the RADIUS server and applied when the subscriber authenticates. You can configure default values that are used when RADIUS does not return a value. Alternatively, you can specify that the profile fails if RADIUS does not return a value for a variable.

NOTE: Do not use this statement in a dynamic client profile.

Options

variable-name—Name of the variable.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Syntax

```
vc-port {
    lag-hash (packet-based | source-port-based);
}
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

Enable hashing of link aggregation group (LAG) network traffic over a dedicated trunk port within a Virtual Chassis, and select how the traffic within the dedicated trunk port is hashed.

> **BEST PRACTICE**: Do not configure this statement unless you have a compelling reason to configure it. Configuration of this statement is optional and is only useful in a few types of network setups.

Default

source-port-based

Options

lag-hash Select how to direct LAG traffic through the dedicated trunk port using either of the following options:

- **packet-based** Hashes all incoming LAG network traffic on the dedicated trunk port based on the packet.
- **source-port-based** Hashes all incoming LAG network traffic on the dedicated trunk port based on the source.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

vci

IN THIS SECTION

- Syntax | 31843
- Hierarchy Level | 31843
- Description | 31843
- Options | 31844
- Required Privilege Level | 31844

```
vci vpi-identifier.vci-identifier;
```

Hierarchy Level

```
[edit interfaces at-fpc/pic/port unit logical-unit-number],
[edit interfaces at-fpc/pic/port unit logical-unit-number family family address address
multipoint-destination address],
[edit logical-systems logical-system-name interfaces at-fpc/pic/port unit logical-unit-number],
[edit logical-systems logical-system-name interfaces at-fpc/pic/port unit logical-unit-number
family family address address multipoint-destination address]
```

Description

For ATM point-to-point logical interfaces only, configure the virtual circuit identifier (VCI) and virtual path identifier (VPI).

To configure a VPI for a point-to-multipoint interface, specify the VPI in the multipoint-destination statement.

VCIs 0 through 31 are reserved for specific ATM values designated by the ATM Forum.

Options

vci-identifier—ATM virtual circuit identifier. Unless you configure the interface to use promiscuous mode, this value cannot exceed the highest-numbered VC configured for the interface with the `maximum-vcs` option of the `vpi` statement.

- **Range:** 0 through 4089 or 0 through 65,535 with promiscuous mode, with VCIs 0 through 31 reserved.

vpi-identifier—ATM virtual path identifier.

- **Range:** 0 through 255
- **Default:** 0

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

vcp-no-hold-time

IN THIS SECTION

- Syntax | 31845
- Hierarchy Level | 31845
- Description | 31845

- Default | 31846
- Required Privilege Level | 31846
- Release Information | 31846

Syntax

```
vcp-no-hold-time;
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

Disable the Virtual Chassis port (VCP) holddown timer for all VCPs in the Virtual Chassis or Virtual Chassis Fabric (VCF).

The VCP holddown timer is an internal mechanism that delays a Virtual Chassis reconvergence for several seconds when a VCP becomes inactive. The purpose of this delay is to provide the VCP time to return online without having to reconverge the Virtual Chassis to adjust to the inactive VCP. All traffic to the VCP is dropped while the VCP is inactive. If the VCP remains down for a time that exceeds the VCP holddown timer, a Virtual Chassis reconvergence occurs.

This statement disables the holddown timer only in an EX4300 Virtual Chassis or a mixed Virtual Chassis that contains EX4300 switches in releases in the Junos OS 13.2X50 release train. In releases after that, the `vcp-no-hold-time` option is no longer needed and has no effect because the holddown timer is replaced by a planned PFE restart for actions that affect Virtual Chassis reconvergence. Switches and releases that don't support the holddown timer might allow you to configure this statement, but the configuration posts a warning message saying the statement has no effect. The option will be deprecated in an upcoming release and will no longer appear in the CLI.

When this statement is enabled, the VCP holddown timer is disabled and the Virtual Chassis reconvergence occurs when a VCP becomes inactive. The period of time where traffic is dropped waiting for the VCP to return online is avoided.

We recommend enabling this statement after a Virtual Chassis is operational. We recommend disabling this statement when you are adding or removing member switches from your Virtual Chassis.

The VCP holddown timer cannot be viewed and is not user-configurable. You can only control whether the VCP holddown timer is enabled or disabled by configuring this statement.

> **NOTE**: In an EX4300 Virtual Chassis running a Junos OS 13.2X50 release, you should enable the `vcp-no-hold-time` statement before performing a software upgrade using NSSU. If you do not enable the `vcp-no-hold-time` statement, the Virtual Chassis may split during the upgrade. A split Virtual Chassis can cause disruptions to your network, and you may have to manually reconfigure your Virtual Chassis after the NSSU if the split and merge feature was disabled. For more information about a split Virtual Chassis, see *Understanding Split and Merge in a Virtual Chassis*.

Default

The VCP holddown timer is enabled by default on all devices that support this statement.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X50-D10.

vdsl2-bytes

IN THIS SECTION

- Syntax | 31848
- Hierarchy Level | 31848
- Description | 31849
- Options | 31849
- Required Privilege Level | 31849
- Release Information | 31849

Syntax

```
vdsl2-bytes bytes;
```

Hierarchy Level

```
[edit protocols ancp qos-adjust]
```

Description

Adjust the number of frame overhead bytes by the specified number of bytes in the actual downstream rate reported in the ANCP Port Up message for a VDSL2 access line. The ANCP agent reports the adjusted value to CoS. The adjusted value accounts for the traffic encapsulation overhead.

> **NOTE**: Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the `vdsl2-overhead-bytes` option of the `access-line` statement at the `[edit system]` hierarchy level. The ANCP agent ignores the `vdsl2-bytes` statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the `access-line` statement.

Options

bytes Number of bytes added to or subtracted from the actual downstream frame overhead.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

Required Privilege Level

```

Description

Configure the match criteria when you use the DHCP vendor class identifier option (option 60) in DHCP client packets to forward client traffic to specific DHCP servers. The extended DHCP relay agent compares the option 60 vendor-specific strings received in DHCP client packets against the match criteria that you specify. If there is a match, you can define certain actions for the associated DHCP client packets.

The `vendor-option` statement enables you to specify either an exact, left-to-right match (with the `equals` statement) or a partial match (with the `starts-with` statement), and configure either an ASCII match string (with the `ascii` statement) or a hexadecimal match string (with the `hexadecimal` statement).

You can configure an unlimited number of match strings. Match strings do not support the use of wildcard attributes.

Options

equals—Exact, left-to-right match of the ASCII or hexadecimal match string with the option 60 string.

starts-with—Partial match of the ASCII or hexadecimal match string with the option 60 string. The option 60 string can contain a superset of the ASCII or hexadecimal match string, provided that the leftmost characters of the option 60 string entirely match the characters in the configured match string. When you use the `starts-with` statement, the longest match rule applies; that is, the router matches the string “test123” before it matches the string “test”.

ascii *match-string*—ASCII match string of 1 through 255 alphanumeric characters.

hexadecimal *match-hex*—Hexadecimal match string of 1 through 255 hexadecimal characters (0 through 9, a through f, A through F).

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in JUNOS Release 9.0.

vendor-specific (DHCP Relay Agent)

IN THIS SECTION

- Syntax | 31869
- Hierarchy Level | 31869

- Description | 31869
- Required Privilege Level | 31870
- Release Information | 31870

Syntax

```
vendor-specific {
    host-name;
    location;
}
```

Hierarchy Level

```
[edit forwarding-options dhcp-relay relay-option-82],
[edit forwarding-options dhcp-relay group group-name relay-option-82]
```

Description

Add vendor-specific information to the option-82, suboption 9 field of DHCPv4 control messages on server-facing interfaces. The vendor-specific information can be a hostname, a location (such as a unique connection identifier), or both. The hostname can be a string of characters such as **Juniper-AB-1**. The location should be specified as interface, VLAN ID, and if applicable, stacked VLAN ID. For example, **<ifd-name>:<vlan>** (ae0:100) or **<ifd-name>:<svlan> -<vlan>** (ae0:100-10).

Junos OS automatically adds the remaining vendor-specific information as per RFC 4243. The enterprise ID is 2636. The hostname is option-data 1, and the location is option-data 2. The DHCPv4 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.

This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query a single entity to track and troubleshoot subscriber IP information and network attachment points.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Command introduced in Junos OS Release 16.2.

vendor-support

IN THIS SECTION

- Syntax | 31870
- Hierarchy Level | 31870

verify-path

IN THIS SECTION

- Syntax | 31872
- Hierarchy Level | 31872
- Description | 31872
- Options | 31873
- Required Privilege Level | 31873
- Release Information | 31873

Syntax

```
verify-path {
    destination-ip ip-address;
    packet-size bytes;
}
```

Hierarchy Level

```
[edit security ipsec vpn vpn-name vpn-monitor]
```

Description

Verify the IPsec datapath before the secure tunnel (st0) interface is activated and route(s) associated with the interface are installed in the Junos OS forwarding table. This configuration is useful in network topologies where there is a transit firewall located between the VPN tunnel endpoints, and where IPsec data traffic that uses active routes for an established VPN tunnel on the st0 interface might be blocked by the transit firewall.

When this option is configured, the source interface and destination IP addresses that can be configured for VPN monitor operation are not used for IPsec datapath verification. The source for the ICMP requests in the IPsec datapath verification is the local tunnel endpoint.

When IPsec datapath verification is configured, the following actions occur:

1. Upon the establishment of the VPN tunnel, an ICMP request is sent to the peer tunnel endpoint to verify the IPsec datapath.

   The peer tunnel endpoint must be reachable by VPN monitor ICMP requests and must be able to respond to the ICMP request. While the datapath verification is in progress, "`V`" is displayed in the VPN Monitoring field in the `show security ipsec security-association detail` command output.

2. The `st0` interface is activated only when a response is received from the peer.

   The `show interface st0.x` command output shows the st0 interface status during and after the datapath verification: `Link-Layer-Down` before the verification finishes and `Up` after the verification finishes successfully.

3. If no ICMP response is received from the peer, another ICMP request is sent at the configured VPN monitor interval (the default is 10 seconds) until the VPN monitor threshold (the default is 10 times) is reached.

If the verification does not succeed, the KMD_VPN_DOWN_ALARM_USER system log entry indicates the reason as a VPN monitoring verify-path error. The error is logged under tunnel events in the `show security ipsec security-association detail` command output. The `show security ipsec tunnel-events-statistics` command displays the number of times the error occurred.

VPN monitor `interval` and `threshold` values are configured with `vpn-monitor-options` at the [`edit security ipsec`] hierarchy level.

4. If no ICMP response is received from the peer after the VPN monitor threshold is reached, the established VPN tunnel is brought down and the VPN tunnel is renegotiated.

Options

destination-ip *ip-address*

Original, untranslated IP address of the peer tunnel endpoint that is behind a NAT device. This IP address must not be the NAT translated IP address. This option is required if the peer tunnel endpoint is behind a NAT device. The verify-path ICMP request is sent to this IP address so that the peer can generate an ICMP response.

packet-size *bytes*

(Optional) The size of the packet that is used to verify an IPsec datapath before the st0 interface is brought up.

The packet size must be lower than the path maximum transmission unit (PMTU) minus tunnel overhead. The packet used for IPsec datapath verification must not be fragmented.

- **Range:** 64 to 1350 bytes
- **Default:** 64 bytes

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D70.

`packet-size` option added in Junos OS Release 15.1X49-D120.

Support for `verify-path` option with IPsec VPN running IKED process is introduced in Junos OS Release 23.4R1.

[edit routing-instances routing-instance-name protocols pim interface (Protocols PIM) interface-
name],
[edit routing-instances routing-instance-name protocols pim rp static address address]
```

Description

Starting in Junos OS Release 16.1, it is no longer necessary to specify a PIM version. PIMv1 is being obsoleted so the version choice is moot.

Options

version—PIM version number.

- **Range:** See the Description, above.
- **Default:** PIMv2 for both rendezvous point (RP) mode (at the `[edit protocols pim rp static address address]` hierarchy level). and interface mode (at the `[edit protocols pim interface interface-name]` hierarchy level).

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement deprecated (hidden) in Junos OS Release 16.1 for later removal.

version-3

IN THIS SECTION

- Syntax | 31903
- Hierarchy Level | 31903
- Description | 31903
- Default | 31904
- Required Privilege Level | 31904
- Release Information | 31904

Syntax

```
version-3;
```

Hierarchy Level

```
[edit protocols vrrp]
```

Description

Enable Virtual Router Redundancy Protocol version 3 (VRRPv3).

NOTE:

- Even though the `version-3` statement can be configured only at the `[edit protocols vrrp]` hierarchy level, VRRPv3 is enabled on all the configured logical systems as well.
- When enabling VRRPv3, you must ensure that VRRPv3 is enabled on all the VRRP routers in the network. This is because VRRPv3 does not interoperate with the previous versions of VRRP.

Default

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

version-alias (Dynamic Profiles)

IN THIS SECTION

- Syntax | 31905
- Hierarchy Level | 31905
- Description | 31905
- Options | 31905
- Required Privilege Level | 31906
- Release Information | 31906

Syntax

```
version-alias version-alias-string;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name]
```

Description

Configure an alias to identify a specific configuration variant of a base dynamic client profile. The version alias is a text description that lets you decide how to name different profile variants, so they have an identifier independent of the dynamic version name that is automatically created by the BNG.

The need for a version alias results from the practice of using a given base dynamic profile across multiple BNGs in a network. When you enable dynamic versioning, you can modify the base dynamic profile to provide specific capabilities to subscribers on different BNGs or to new subscribers on a given BNG. Dynamic versioning assigns a version name to each new variation in the base profile.

Consequently, the version name may vary for subscribers on one BNG or across multiple BNGs. In either case, RADIUS cannot determine which version of a profile is in use by any subscriber. This creates an operational challenge because RADIUS is unable to return corresponding attributes and VSAs in a CoA message that are compatible with that version of the profile.

When you configure a version alias for a dynamic client profile, the BNG sends the version alias to the RADIUS server during authentication. It is conveyed in the Juniper Networks client-profile-name VSA (26–4874–174). The version alias is an independent tag that enables you to track which profile variations are in use. Because RADIUS can tell apart the different profile versions, you can normalize the RADIUS back-end configuration for efficient use of CoA messages.

By default, the Client-Profile-Name VSA carries the name of the base dynamic profile. The version alias string is concatenated to the end of the profile name in the VSA, like this:

client-profile-name:*version-alias-string*

Options

version-alias-string	String that identifies a particular version of a dynamic profile. The maximum size of the string is 64 bytes.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.2R1.

view (Configuring a MIB View)

IN THIS SECTION

- Syntax | 31918
- Hierarchy Level | 31918
- Description | 31918
- Options | 31919
- Required Privilege Level | 31919
- Release Information | 31919

Syntax

```
view view-name {
    oid object-identifier <include | exclude>;
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The `view` statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the `view` statement at the `[edit snmp community community-name]` hierarchy level.

NOTE: To remove an OID completely, use the `delete view all oid oid-number` command but omit the `include` parameter.

Options

view-name—Name of the view.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit system services dhcp-local-server group group-name lease-time-validation],
[edit system services dhcp-local-server dhcpv6 group group-name lease-time-validation]
```

Description

Configure the action that the router performs when a DHCP lease-time violation occurs. The violation occurs when a third-party DHCP server or address-assignment pool offers a DHCP lease time that is less than the threshold specified by the `lease-time-threshold` statement.

Options

action Action taken by the router when a lease-time violation occurs.

- `drop`—(Optional) For DHCPv4 and DHCPv6 relay agent, the third-party lease is dropped and the client binding fails.
- `override-lease`—(Optional) For DHCPv4 and DHCPv6 local server, the third-party lease is overridden with the value specified by the `lease-time-threshold` statement and binds the client using the new value.
- `strict`—(Optional) For DHCPv4 and DHCPv6 local server, DHCP ignores the third-party lease and the client binding fails.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Syntax

```
virtual-gateway-address address;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family address address]
```

Description

Set the default IPv4 or IPv6 address for the gateway for end hosts. You eliminate the need to proxy for remote gateway IP addresses because you must configure the virtual gateway address using the same IP address as on all of the provider edge (PE) devices. This configuration internally generates the same Virtual Router Redundancy Protocol (VRRP) MAC. You can set a corresponding virtual gateway address

for each logical integrated routing and bridging (IRB) interface. A maximum of 64 PEs can have the same virtual gateway address.

To support pinging on the virtual gateway IP address, you must include both the `virtual-gateway-accept-data` statement and the `preferred` statement at the [`edit interfaces irb unit`] hierarchy of the preferred virtual gateway.

Options

address—virtual gateway address. You can't specify the addresses 0.0.0.0 (default route address) or 255.255.255.255 (broadcast IP address).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Description

Explicitly configure an IPv4 media access control (MAC) address for a default virtual gateway.

A Juniper Networks device creates a default virtual gateway when you specify a virtual gateway address (VGA) for an integrated routing and bridging (IRB) interface on the device. You use this option on a device that functions as a Layer 3 gateway in an EVPN-VXLAN or an EVPN-MPLS centrally-routed bridging (CRB) overlay fabric.Through its IRB interface, the default virtual gateway enables communication between non-virtualized hosts, virtual machines (VMs), and servers in different VXLANs, MPLS networks, or IP subnetworks.

When you configure a VGA for an IRB interface, the Layer 3 gateway automatically generates IPv4 MAC address 00:00:5e:00:01:01 for that particular virtual gateway. In this topic, we refer to the virtual gateway MAC address as a *virtual MAC*. The automatically generated virtual MAC is not included as the source MAC address in packets generated by the Layer 3 gateway. Instead, the device includes the MAC address for the IRB interface in:

- Data packets
- The source MAC address field in the outer Ethernet header of:
  - Address Resolution Protocol (ARP) replies
  - Neighbor advertisement packets

In this topic, we refer to the MAC address for the IRB interface as the *IRB MAC*. When an ARP reply includes the IRB MAC as the source MAC address instead of the virtual MAC, in CRB overlays you might see unknown unicast packet flooding throughout the domain.

If you explicitly configure a MAC address for a default virtual gateway, the configured virtual MAC overrides the automatically generated virtual MAC. That is, when the Layer 3 gateway sends data packets, ARP replies, and neighbor advertisement packets, the configured virtual MAC is in the outer Ethernet header of these packets. As a result, explicitly configuring the virtual MAC eliminates the possibility of flooding the domain with unknown unicast packets.

00

> **NOTE**: The MAC address range 02:00:00:00:00:00 through 02:00:00:00:00:FF is used for internal communication. Don't use addresses in this range for a manual virtual MAC assignment.

For more information about the flooding issue and its resolution, see *Understanding the MAC Addresses For a Default Virtual Gateway in an EVPN-VXLAN Overlay Network*.

Options

ipv4-mac-address	IPv4 MAC address for the default virtual gateway.

Description

Explicitly configure an IPv6 media access control (MAC) address for a default virtual gateway.

A Juniper Networks device creates a default virtual gateway when you specify a virtual gateway address (VGA) for an integrated routing and bridging (IRB) interface on the device. You use this option on a device that functions as a Layer 3 gateway in an EVPN-VXLAN or an EVPN-MPLS centrally-routed bridging (CRB) overlay fabric. Through its IRB interface, the default virtual gateway enables communication between non-virtualized hosts, virtual machines (VMs), and servers in different VXLANs, MPLS networks, or IP subnetworks.

When you configure a VGA for an IRB interface, the Layer 3 gateway automatically generates IPv6 MAC address 00:00:5E:00:02:01 for that particular virtual gateway. In this topic, we refer to the virtual gateway MAC address as a *virtual MAC*. The automatically generated virtual MAC is not included as the

source MAC address in packets generated by the Layer 3 gateway. Instead, the device includes the MAC address for the IRB interface in:

- Data packets
- The source MAC address field in the outer Ethernet header of:
  - Address Resolution Protocol (ARP) replies
  - Neighbor advertisement packets

In this topic, we refer to the MAC address for the IRB interface as the *IRB MAC*. When an ARP reply includes the IRB MAC as the source MAC address instead of the virtual MAC, in CRB overlays you might see unknown unicast packet flooding throughout the domain.

If you explicitly configure a MAC address for a default virtual gateway, the configured virtual MAC overrides the automatically generated virtual MAC. That is, when the Layer 3 gateway sends data packets, ARP replies, and neighbor advertisement packets, the configured virtual MAC is in the outer Ethernet header of these packets. As a result, explicitly configuring the virtual MAC eliminates the possibility of flooding the domain with unknown-unicast packets.

> **NOTE**: The MAC address range 02:00:00:00:00:00 through 02:00:00:00:00:FF is used for internal communication. Don't use addresses in this range for a manual virtual MAC assignment.

For more information about the flooding issue and its resolution, see *Understanding the MAC Addresses For a Default Virtual Gateway in an EVPN-VXLAN Overlay Network*.

area area-id],
```

```
[edit protocols (ospf | ospf3) area area-id],
[edit routing-instances routing-instance-name protocols ospf area area-id]
```

Description

For backbone areas only, create a virtual link to use in place of an actual physical link. All area border routers and other routing devices on the backbone must be contiguous. If this is not possible and there is a break in OSPF connectivity, use virtual links to create connectivity to the OSPF backbone. When configuring virtual links, you must configure links on the two routing devices that form the end points of the link, and both of these routing devices must be area border routers. You cannot configure links through stub areas.

Options

neighbor-id *router-id*	IP address of the routing device at the remote end of the virtual link.
transit-area *area-id*	Area identifier of the area through which the virtual link transits. Virtual links are not allowed to transit the backbone area.
ipsec-sa *name*	Apply the named IPsec authentication to the OSPF interface or virtual link or to an OSPFv2 remote sham link.
keychain *keychain-name*—	For each keychain, you must specify a name.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

The option `keychain` *`keychain-name`* introduced in Junos OS and Junos OS Evolved Release 24.2R1.

virtual-link-local-address

IN THIS SECTION

- Syntax | 31950
- Hierarchy Level | 31950
- Description | 31950
- Options | 31951
- Required Privilege Level | 31951
- Release Information | 31951

Syntax

```
virtual-link-local-address ipv6-address;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
```

Description

Used to explicitly configure a virtual link-local address for a Virtual Router Redundancy Protocol (VRRP) IPv6 group. The virtual link-local address must be configured to be on a fe80::/64 subnet for proper operation. Early versions of the Junos OS required manual configuration of this parameter. In current Junos releases a virtual link local address is automatically created based on the interface's MAC address.

> **NOTE**: In current Junos releases you do *not* need to configure link-local addresses and virtual link-local addresses when configuring VRRP for IPv6. Junos OS automatically generates link-local addresses and virtual link-local addresses. However, if link local addresses and virtual link-local addresses are configured, Junos OS honors the explicitly configured addresses.

Options

ipv6-address—virtual link-local IPv6 address for VRRP for an IPv6 group.

- **Range:** 0 through 255

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

virtual-network-functions (Junos node slicing)

IN THIS SECTION

- Syntax | 31953
- Hierarchy Level | 31953
- Description | 31953
- Options | 31954
- Required Privilege Level | 31954
- Release Information | 31954

Syntax

```
virtual-network-functions vnf-name {
    base-config base-config ;
    chassis-type chassis-type;
    id id;
    resource-template resource-template;
}
```

Hierarchy Level

```
[edit ]
```

Description

Associate a GNF ID, base configuration, chassis type and resource template with the VNF.

The GNFs that are configured and committed will appear as auto-complete options in operational commands.

Options

vnf-name	Name of the VNF.
base-config *base-config*	Choose a base configuration for the VNF.
chassis-type *chassis-type*	Applicable only to Junos node slicing set up using external server model. Choose the type of the router chassis (for example, MX960) used as the base system (BSYS) in the node slicing setup.
id *id*	Assign a GNF ID. • **Range:** 1–10 • **Range:** 1-4 (for in-chassis model)
resource-template *resource-template*	Assign a resource template to the VNF. The server resource template defines the number of dedicated CPU cores and the size of DRAM to be assigned to a VNF.

    }
```

Description

Create an instance of a virtual network function (VNF) on platforms that run disaggregated Junos OS software.

NOTE:

- Creating a VNF instance fails if the resources required by the VNF are not available in the system.
- If you use init-descriptor to define a VNF by specifying and setting different values for the virtual CPU count or memory and later if you delete the virtual cpu count, the system restores the value to a default value of 1 for vCPU and 1GB for memory.
- You can enable the VNF options such virtual-cpu-hardware-virtualization (vmx), hugepages, image-type, and image-bus-type only when you define the VNF initially. You cannot enable or disable the VNF options after committing the VNF configuration. To enable or disable the VNF options, you must delete the VNF configuration and re-configure with the VNF options.

Options

virtual-network-functions *vnf-name*	Name of the VNF instance. It is mandatory to provide one of the options: init-descriptor or image.
file-path	Path of the source file.
number | range	Number or a range of physical CPUs. For example, 2 or 2...5.

interface-name	Name of the VNF interface, which can range from eth0 to eth9. You can configure eth0 and eth1 interfaces and can assign VLAN IDs. To configure eth0 and eth1 interfaces, you must configure `no-default-interfaces` option.
physical-interface-name	Name of the physical interface to which the VNF interface is attached.
vlan-id	SR-IOV virtual function to use to attach a VNF to a physical interface.
native-vlan-id	Virtual LAN identifier for untagged frames. For example, 1...4095
vlan-name	Name of the VLAN members.
size	Amount of memory allocated to a VNF in kilobytes. The default size is 1 GB.
device-name	Name of the storage device.
file-name	Name of the source file of the storage device.
peer-interface-name	Name of the virtual peer interfaces that is mapped to a physical interface.
management	VNF interface management configuration.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X53-D45.

                service-id service-id;
            }
        }
    }
}
```

Hierarchy Level

```
[edit security forwarding-options services-offload]
```

Description

Enable the firewall to process the control traffic on interfaces that carry real services. Use the statement on the firewall for the Connected Security Distributed Services (CSDS) architecture Express Path solution.

The interface on the router that connects to the firewall holds the load-balancing information required for the control traffic between the router and the firewall. On the firewall, create a source identification profile that includes the local IP address. You can also specify a local virtual router for the lo0 interface. Associate the profile to the designated interface and add the remote IP address. The firewall uses the incoming interface retrieve the tuple needed to exchange control packets between the firewall and the router.

Options

virtual-offload	Specify the option to use the virtual service-offload feature on the firewall.
interface *name*	Specify the virtual service-offload interface to associate with the source identity profile.
remote-ip *ip-address*	Specify the remote IP address.
source-identity *profile-name*	Bind the source identity profile.
source-identity profile-name *profile-name*	Specify the source identity profile name.
family	Specify the protocol family—inet, inet6.
local-ip *local-ip-address*	Specify the local IP address.
(Optional) local-virtual-router *local-virtual-router*	Specify the local virtual router instance.
service-id *service-id*	Specify the service-id. • **Values**: 1-250

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

- Hierarchy Level | 31963
- Description | 31963
- Options | 31963
- Required Privilege Level | 31964
- Release Information | 31964

Syntax

```
virtual-service virtual-service-name {
    address virtual-ip-address;
    group group-name;
    load-balance-method {
        hash {
            hash-key method;
        }
```

```
        random;
    }
    mode ( layer2-direct-server-return | direct-server-return | translated );
    <routing-instance routing-instance-name>;
    <routing-metric route-metric>;
    server-interface server-interface;
    service service-name {
        protocol (udp | tcp);
        server-listening-port port;
        virtual-port virtual-port;
    }
}
```

Hierarchy Level

```
[edit services traffic-load-balance instance instance-name]
```

Description

Configure a TLB virtual service.

Options

address *virtual-ip-address*
Address of the virtual service.

group *group-name*
Server group for the virtual service.

load-balance method hash hash-key *method*
Use a combination of these hash-key methods for the session distribution API:

- **dest-ip** — Hash on destination IP address.
- **proto** — Hash on protocol.
- **source-ip** — Hash on source IP address.

load-balance-method random
Use randomizing algorithm for session distribution.

mode (layer2-direct-server-return | direct-server-return | translated)
Traffic load balancer mode of operation:

- **direct-server-return** — Transparent mode Layer 3 direct server return.

layer2-direct-server-return	Transparent mode Layer 2 direct server return. Load balancing works by changing the Layer 2 MAC of packets; Layer 3 and higher level headers are not modified.
translated	The Packet Forwarding Engine performs stateless load balancing.

route-metric (Optional) Route metric

- **Range:** 1 through 255

routing-instance-name (Optional) Routing instance for the virtual service. Default is `inet.0`.

server-interface *server-interface* (Optional) The server-interface specified under the virtual-service, will be used instead of the values provided under the instance level.

service *service-name* Translated mode details. Packets destined to this virtual ip-address + virtual-port + protocol will be load balanced to the appropriate server. The destination IP address and port are replaced by the real services IP address and the server-listening-port (configured here).

protocol (udp | tcp)	Protocol.
server-listening-port *port*	Port number.
virtual-port *virtual-port*	Virtual port number.

virtual-ip–address Local address for the virtual service.

virtual-service-name Identifier for the virtual service.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

    query-response-interval seconds;
    robust-count number;
}
```

Hierarchy Level

```
[edit protocols igmp-snooping]
```

Description

Configure IGMP snooping parameters for a VLAN (or all VLANs if you use the `all` option, where supported).

On legacy EX Series switches, which do not support the Enhanced Layer 2 Software (ELS) configuration style, IGMP snooping is enabled by default on all VLANs, and this statement includes a `disable` option if you want to disable IGMP snooping selectively on some VLANs or disable it on all VLANs. Otherwise, IGMP snooping is enabled on the specified VLANs if you configure any statements and options in this hierarchy.

> **NOTE**: You cannot configure IGMP snooping on a secondary (private) VLAN (PVLAN). However, starting in Junos OS Release 18.3R1 on EX4300 switches and EX4300 Virtual Chassis, and Junos OS Release 19.2R1 on EX4300 multigigabit switches, enabling IGMP snooping on a primary VLAN implicitly enables IGMP snooping on its secondary VLANs. See *IGMP Snooping on Private VLANs (PVLANs)* for details.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type `?` after `vlan` or `vlans` on the command line in configuration mode. Note that only one VLAN is displayed for a VLAN range, and for IGMP snooping, secondary private VLANs are not listed.

Default

On devices that support the `all` option, by default, IGMP snooping options apply to all VLANs . For all other devices, you must specify the `vlan` statement with a VLAN name to enable IGMP snooping.

Options

- `all`—All VLANs on the switch. This option is available only on EX Series switches that do not support the ELS configuration style.
- `disable`—Disable IGMP snooping on all or specified VLANs. This option is available only on EX Series switches that do not support the ELS configuration style.
- *`vlan-name`*—Name of a VLAN. A VLAN name must be provided on switches that support ELS to enable IGMP snooping.

TIP: On devices that support the `all` option, when you configure IGMP snooping parameters using the `vlan all` statement, any VLAN that is not individually configured for IGMP snooping inherits the `vlan all` configuration. Any VLAN that is individually configured for IGMP snooping, on the other hand, inherits none of its configuration from `vlan all`. Any parameters that are not explicitly defined for the individual VLAN assume their default values, not the values specified in the `vlan all` configuration.

For example, in the following configuration:

```
protocols {
    igmp-snooping {
        vlan all {
            robust-count 8;
        }
        vlan employee {
            interface ge-0/0/8.0 {
                static {
                    group 239.0.10.3
```

```
                    }
                }
            }
        }
    }
```

all VLANs, except `employee`, have a robust count of 8. Because `employee` has been individually configured, its robust count value is not determined by the value set under `vlan all`. Instead, its robust count is the default value of 2.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Statement updated with enhanced `?` (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches.

- Release Information | 31984

Syntax

```
vlan (all | vlan-name) {
    disable;
    immediate-leave;
    interface ( all | interface-name) {
```

```
        group-limit  limit;
        host-only-interface;
        immediate-leave;
        multicast-router-interface;
        static {
            group ip-address {
                source ip-address;
            }
        }
    }
    qualified-vlan;
    query-intervalseconds;
    query-last-member-interval seconds;
    query-response-interval seconds;
    robust-count number;
    traceoptions {
        file filename <files number> <size size> <world-readable | no-world-readable>;
        flag flag <flag-modifier>;
    }
    version version;
}
```

Hierarchy Level

```
[edit protocols mld-snooping]
[edit routing-instances instance-name protocols mld-snooping]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure MLD snooping parameters for a VLAN.

When the **vlan** configuration statement is used without the `disable` statement, MLD snooping is enabled on the specified VLAN or on all VLANs.

Default

If the `vlan` statement is not included in the configuration, MLD snooping is disabled.

Options

all (All EX Series switches except EX9200) Configure MLD snooping parameters for all VLANs on the switch.

vlan-name Configure MLD snooping parameters for the specified VLAN.

TIP: When you configure MLD snooping parameters using the `vlan all` statement, any VLAN that is not individually configured for MLD snooping inherits the **vlan all** configuration. Any VLAN that is individually configured for MLD snooping, on the other hand, inherits none of its configuration from **vlan all**. Any parameters that are not explicitly defined for the individual VLAN assume their default values, not the values specified in the **vlan all** configuration.

For example, in the following configuration:

```
protocols {
    mld-snooping {
        vlan all {
            robust-count 8;
        }
        vlan employee {
            interface ge-0/0/8.0 {
                static {
                    group ff1e::1;
                }
            }
        }
    }
}
```

all VLANs, except **employee**, have a robust count of 8. Because **employee** has been individually configured, its robust count value is not determined by the value set under **vlan all**. Instead, its robust count is the default value of 2.

The remaining statements are explained separately. See CLI Explorer.

```

Description

Configure the VLANs for a Multiple Spanning Tree Instance (MSTI) or VSTP instance.

NOTE: When you configure VSTP with the `set prototocol vstp vlan all` command, vlan-id 1 is excluded to be compatible with Cisco PVST+. If you want vlan-id 1 to be included in VSTP, you must set it separately with the `set protocol vstp vlan 1` command.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type **?** after **vlan** or **vlans** in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options

vlan-name—Name of the VLAN.

vlan-id—The VLAN identifier associated with the MSTI.

vlan-id-range—Range of VLAN identifiers associated with the MSTI in the form ***minimum-vlan-id-maximum-vlan-id***. VLAN identifier ranges are not supported for VSTP.

- **Range:** 1 through 4096

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Statement updated with enhanced **?** (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches.

Support for logical systems added in Junos OS Release 9.6.

vlan (Port Mirroring)

IN THIS SECTION

- Syntax | 31989
- Hierarchy Level | 31989
- Description | 31989
- Options | 31990
- Required Privilege Level | 31990
- Release Information | 31990

Syntax

```
vlan (vlan-id | vlan-name) {
    No Link Title;
```

Hierarchy Level

For platforms without ELS:

```
[edit ethernet-switching-options analyzer name input ingress],
[edit ethernet-switching-options analyzer name output]
```

For platforms with ELS:

```
[edit forwarding-options analyzer name input (egress | ingress)],
[edit forwarding-options analyzer name output],
[edit forwarding-options port-mirroring instance name family ethernet-switching output]
```

Description

When used in an `input` statement, specifies that traffic entering or exiting a VLAN should be mirrored. (You can include this statement in an `ingress` statement or `egress` statement within the `input` statement. It

is not supported in an `egress` statement on all switches) When used in an `output` statement, specifies that mirrored traffic to be sent to a VLAN for remote monitoring.

On some switches, only one interface can be a member of the output (analyzer) VLAN. This limitation does not apply on the QFX10000 switch if traffic is mirrored on ingress. In this case, multiple QFX10000 interfaces can belong to the output VLAN, and traffic is mirrored to all of those interfaces. If traffic is mirrored on egress on a QFX10000 switch, only one interface can be a member of the analyzer VLAN.

Options

vlan-id—Numeric VLAN identifer.

vlan-name—Name of the VLAN.

`no-tag`—Specifies that remote mirrored packets are not tagged with the tag of the output (analyzer) VLAN.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Option`output vlan` added in Junos OS Release 12.1 for the QFX Series.

Option`no-tag` added in Junos OS Release 15.1X53-D10 for QFX10000 switches.

vlan (VSTP)

IN THIS SECTION

- Syntax | 31998
- EX Series | 31998
- Hierarchy Level | 31999
- Description | 31999
- Options | 31999
- Required Privilege Level | 32000
- Release Information | 32000

Syntax

```
vlan vlan-id {
    bridge-priority priority;
    forward-delay seconds;
    hello-time seconds;
    max-age seconds;
    interface interface-name {
        cost cost;
        edge;
        mode (p2p | shared);
        no-root-port;
        priority interface-priority;
    }
}
```

EX Series

```
vlan (all | vlan-id | vlan-name) {
    bridge-priority priority;
    forward-delay seconds;
    hello-time seconds;
    interface (all | interface-name) {
```

```
        bpdu-timeout-action {
                                        block;
                                        log;
        }
                                cost                            cost;
                                disable;
                                edge;

vlan-group

IN THIS SECTION

- Syntax | **32005**
- Hierarchy Level | **32005**
- Description | **32005**
- Required Privilege Level | **32006**
- Release Information | **32006**

Syntax

```
vlan-group group group-name {
vlan (vlan-id |vlan-group |all) {
}
```

Hierarchy Level

```
[edit protocols vstp]
```

Description

Configure VLAN group for Spanning Tree Protocol (VSTP). VSTP is used to prevent loops in Layer 2 networks on a per-VLAN basis.

BEST PRACTICE: Configure RSTP when you configure VSTP. RSTP overhead is minimal and this configuration ensures that a spanning-tree protocol is running on all VLANs on your switch, even when your switch is supporting more than the maximum number of allowed VSTP VLANs.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

vlan-groups

IN THIS SECTION

- Syntax | 32007
- Hierarchy Level | 32007
- Description | 32007
- Options | 32007
- Required Privilege Level | 32007
- Release Information | 32007

Syntax

```
vlan-groups vlan_group_name{
      vlan-id-list vlan_id_ist
}
```

Hierarchy Level

```
[edit vlans]
```

Description

Configure VLAN group on EX series switches. The 802.1X VLAN group feature uses a single wireless local area network (WLAN) that can support multiple VLANs. The client gets assigned to one of the configured VLANs.

The VLAN group name is added within the Tunnel-Private-Group-ID (defined as RADIUS attribute type 81, RFC 2868) and sent in the RADIUS response instead of a regular VLAN ID or VLAN Name when a supplicant is requesting 802.1X authentication through the RADIUS server. When the switch receives the VLAN group name, the switch assigns the endpoint to one of the VLANs in that group using the round-robin algorithm.

Options

vlan-id-list Specify the associated VLAN id.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.4R1.

802.1X Authentication

vlan-id (Dynamic Profiles)

IN THIS SECTION

- Syntax | 32008
- Hierarchy Level | 32008
- Description | 32008
- Options | 32009
- Required Privilege Level | 32009
- Release Information | 32009

Syntax

```
vlan-id (number | none);
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number]
```

Description

For VLAN demux, Fast Ethernet, Gigabit Ethernet, and Aggregated Ethernet interfaces only, bind a 802.1Q VLAN tag ID to a logical interface.

Options

number—A valid VLAN identifier. When used in the `dynamic-profiles` hierarchy, specify the `$junos-vlan-id` predefined variable to dynamically obtain the VLAN identifier.

`none`—Enable the use of untagged pseudo-wire frames on dynamic interfaces.

- For aggregated Ethernet, 4-port, 8-port, and 12-port Fast Ethernet PICs, and for management and internal Ethernet interfaces, 1 through 1023.
- For 48-port Fast Ethernet and Gigabit Ethernet PICs, 1 through 4094.
- VLAN ID 0 is reserved for tagging the priority of frames.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

VLAN demux interface support introduced in Junos OS Release 10.2.

vlan-id (Dynamic VLANs)

IN THIS SECTION

- Syntax | 32010
- Hierarchy Level | 32010
- Description | 32010
- Options | 32010

Required Privilege Level | 32010
Release Information | 32011

Syntax

```
vlan-id number;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number input-vlan-map],
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number output-vlan-map]
```

Description

For dynamic VLAN interfaces, specify the line VLAN identifiers to be rewritten at the input or output interface.

You cannot include the `vlan-id` statement with the `swap` statement, `swap-push` statement, `push-push` statement, or `push-swap` statement at the `[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number output-vlan-map]` hierarchy level. If you include any of those statements in the output VLAN map, the VLAN ID in the outgoing frame is rewritten to the `vlan-id` statement that you include at the `[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number]` hierarchy level.

Options

number A valid VLAN identifier. When used for input VLAN maps, you can specify the `$junos-vlan-map-id` predefined variable to dynamically obtain the VLAN identifier.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

Enabling VLAN Tagging

vlan-id inner-all

IN THIS SECTION

- Syntax | 32017
- Hierarchy Level | 32017
- Description | 32017
- Required Privilege Level | 32017
- Release Information | 32017

Syntax

```
vlan-id inner-all;
```

Hierarchy Level

```
[edit routing-instances instance_name]
```

Description

Enable qualified MAC learning on the second (inner) VLAN tag of an ingress 2-tagged packet, without removing the first (outer) tag implicitly. For a single vlan-tagged packet, qualified MAC learning happens on VLAN 4096. If the ingress packet has more than two tags, all tags beyond the second tag are treated as part of data.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Command introduced in Junos OS Release 17.4R1.

Syntax

```
vlan-id (all | none | number);
```

Hierarchy Level (VLANs and Bridge Domain VLANs)

For platforms without ELS:

```
[edit vlans vlan-name vlan-range]
```

For platforms without ELS and with ELS:

```
[edit vlans vlan-name]
```

For ELS platforms only:

```
[edit interfaces interface-name unit number],
[edit vlans vlan-name vlan-id-list],
[edit vlans vlan-name],
[edit logical-systems logical-system-name vlansvlan-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name vlansvlan-
name],
[edit routing-instances routing-instance-name vlans vlan--name]
```

CAUTION: When you want to change a traffic impacting option under a routing instance, use the following procedure.

1. Deactivate the routing instance configuration.
2. Change the traffic impacting option.
3. Reactivate the updated routing instance configuration.

For example, follow this procedure if you need to change settings such as:

- The `vlan-id` in an EVPN routing instance-- Changing the `vlan-id` on the fly, without first deactivating the associated EVPN routing instance would be catastrophic.
- The `service-type` in a MAC-VRF routing instance-- When you change the service type of a running instance, the device might incorrectly change the VLAN ID if it is not deactivated prior to making the change.

802.1Q Tagging

```
[edit vlans vlan-name]
```

VLAN ID to Rewrite

```
[edit interfaces interface-name unit logical-unit-number input-vlan-map],
[edit interfaces interface-name unit logical-unit-number output-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
output-vlan-map]
```

VLAN Tagging and Layer 3 Subinterfaces

```
[edit interfaces interface-name unit logical-unit-number]
```

Description

For VLANs, specify a VLAN identifier (VID) to include in the packets sent to and from the VLAN, or a VPLS routing instance.

> **NOTE**: When configuring a VLAN identifier for provider backbone bridge (PBB) routing instances, dual-tagged VIDs and the `none` option are not permitted.

For 10-Gigabit Ethernet and aggregated Ethernet interfaces only, bind an 802.1Q VLAN tag ID to a logical interface. Statement introduced in Junos OS Release 9.2 for EX Series switches.

> **NOTE**: The VLAN tag ID cannot be configured on logical interface unit 0. The logical unit number must be 1 or higher.

For 802.1Q tagging, configure an 802.1Q tag to apply to all traffic that originates on the VLAN.

The number zero is reserved for priority tagging and the number 4095 is also reserved.

For VLAN ID to Rewrite Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2, 10-Gigabit Ethernet LAN/WAN PIC, and IQ2-E interfaces and aggregated Ethernet using Gigabit Ethernet IQ interfaces, specify the line VLAN identifiers to be rewritten at the input or output interface.

You cannot include the `vlan-id` statement with the `swap` statement, `swap-push` statement, `push-push` statement, or `push-swap` statement at the `[edit interfaces interface-name unit logical-unit-number output-vlan-map]` hierarchy level. If you include any of those statements in the output VLAN map, the VLAN ID in the

outgoing frame is rewritten to the `vlan-id` statement that you include at the [`edit interfaces` *`interface-name`* `unit` *`logical-unit-number`*] hierarchy level.

Default

For 802.1Q Tagging on EX Series and SRX Series, If you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of **1**.

On a EX2300 switch, the maximum number of vlans supported is 2024. The vlans can be in the range of 1-4093.

On a EX3400 switch, the maximum number of vlans that can be created is 4093 including the default vlan with id 1. In a single `vlan-id-list` default `vlan1` is always inherited, so the valid configurable vlan range is 2-4093. You can use `vlan-id` up to and including 4094, but 4093 is the maximum number of vlans that can be configured.

For VLANs on a QFX3500 and QFX3500 switch, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of **1**. The number zero is reserved for priority tagging and the number 4093 is also reserved.

On a QFX5100 switch, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of **1**. The number zero is reserved for priority tagging and the number 4093 is also reserved.

> **NOTE**: You can only create up 4090 VLANs on a QFX5100 switch. If you create more than 4090 VLANs, the interfaces associated with the extra VLANs are not displayed in the `show vlans` command output. For example, if you create 4094 VLANs, the extra VLANs will not have interfaces associated with the VLANs. The order in which you configure the extra VLANs determines which interfaces are missing from the `show vlans` command output.

For VLAN tagging and Layer 3 subinterfaces, bind an 802.1Q VLAN tag ID to a logical interface.

> **NOTE**: The VLAN tag ID cannot be configured on logical interface unit **0**. The logical unit number must be **1** or higher.

Options

For VLANs:

`number`—A valid VLAN identifier. If you configure multiple VLANs with a valid VLAN identifier, you must specify a unique VLAN identifier for each. However, you can use the same VLAN identifier for VLANs

that belong to different virtual switches. Use this option to send single tagged frames with the specified VLAN identifier over VPLS VT interfaces.

> **NOTE**: If you specify a VLAN identifier, you cannot also use the `all` option. They are mutually exclusive.

`all`—Specify that the VLAN spans all the VLAN identifiers configured on the member logical interfaces.

> **NOTE**: You cannot specify the `all` option if you include a routing interface in the VLAN.

`none`—Specify to enable shared VLAN learning or to send untagged frames over VPLS VT interfaces.

> **NOTE**: Multichassis link aggregation (MC-LAG) does not support the `none` option with the `vlan-id` statement with VLANs.
>
> You cannot commit a configuration that uses the `none` option with the `vlan-id` statement with VLANs at the `[edit interfaces]` hierarchy level. You can only commit this configuration under the `set vlans` configuration knob at the `[edit vlans]` hierarchy level. For more information, see Bridging and VLANs.

For 802.1Q Tagging:

number—VLAN tag identifier

Range:

- - 1 through 4094 (all switches except EX8200 Virtual Chassis)
  - 1 through 4092 (EX8200 Virtual Chassis only)
- **Default:** 1

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Description

Binds a single-tag logical interface to a list of VLAN IDs. Configures a logical interface to receive and forward any tag frame whose VLAN ID tag matches the list of VLAN IDs you specify.

NOTE: When you create a circuit cross-connect (CCC) using VLAN-bundled single-tag logical interfaces on Layer 2 VPN routing instances, the circuit automatically uses `ethernet` encapsulation. For Layer 2 VPN, you need to include the `encapsulation-type` statement and specify the value `ethernet` at either of the following hierarchy levels:

- `[edit routing-instances routing-instance-name protocols l2vpn]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn]`

For more information about the `encapsulation-type` configuration statement and the Layer 2 encapsulation types `ethernet` and `ethernet-vlan`, see the Junos OS VPNs Library for Routing Devices.

Options

[*vlan-id vlan-id-vlan-id*]—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

- **Range:** 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

NOTE: Configuring `vlan-id-list` with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

1. **Inefficient**

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id-range 1-4094;
}
```

2. **Best Practice**

```
[edit interfaces interface-name]
unit 0;
```

Required Privilege Level

[edit routing-instances routing-instance-name bridge-domains bridge-domain-name],
[edit interfaces interface-name unit 0],
[edit interfaces interface-name unit logical-unit-number],
[edit vlans vlan-name]
```

Description

Specify a VLAN identifier list to use for a bridge domain or VLAN in trunk mode. VLAN identifier list can be used on C-VLAN interfaces in Q–in–Q tunneling for EX and QFX Series switches.

Specify the `trunk` option in the `interface-mode` statement to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the `vlan-id-list` statement to forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the `access` option to accept packets with no VLAN ID to forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the `vlan-id` statement.

This statement also enables you to bind a logical interface to a list of VLAN IDs, thereby configuring the logical interface to receive and forward a frame with a tag that matches the specified VLAN ID list.

WARNING:

On EX2000, EX3000, EX4000, and QFX5000 Series switches, if VLAN identifier list (`vlan-id-list`) is used for Q-in-Q tunnelling, you can apply no more than eight VLAN ID ranges to a physical interface, regardless of the number of logical interfaces or the number of VLAN ID lists configured. When more than eight VLAN ID ranges are configured and committed, only the first eight ranges are considered. Traffic will *not* be forwarded to the vlans specified in VLAN ID ranges nine and above.

In the example below, traffic will not be forwarded to the vlans specified in the range `170-180`.

```
user@host# show interfaces xe-0/0/44
flexible-vlan-tagging;
encapsulation flexible-ethernet-services;
unit 1 {
```

```
            encapsulation vlan-bridge;
            vlan-id-list [ 10-20 30-40 50-60 70-80];
            input-vlan-map push;
            output-vlan-map pop;
        }
        unit 2 {
            encapsulation vlan-bridge;
            vlan-id-list [ 90-100 110-120 130-140 150-160];
            input-vlan-map push;
            output-vlan-map pop;
        }
        unit 3 {
            encapsulation vlan-bridge;
            vlan-id-list 170-180;
            input-vlan-map push;
            output-vlan-map pop;
        }
```

NOTE: The total number or count of configured VLAN IDs for `vlan-id-range` and `vlan-id-list` must be less than or equal to 32 on the logical interface.

Options

`vlan-id-numbers`—Valid VLAN identifiers. You can combine individual numbers with range lists by including a hyphen.

- **Range:** 0 through 4095

NOTE: On EX Series switches and the QFX Series, the range is 0 through 4094.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

Support for logical systems added in Junos OS Release 9.6.

```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Description

Bind a range of VLAN IDs to a logical interface.

NOTE: The total number or count of configured VLAN IDs for `vlan-id-range` and `vlan-id-list` must be less than or equal to 32 on the logical interface.

Options

`number`—The first number is the lowest VLAN ID in the range the second number is the highest VLAN ID in the range.

- **Range:** 1 through 4094

NOTE: On SRX240, SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX650 devices, the VLAN range from 1 to 4094 on inet interfaces and the VLAN range from 1 to 3967 on Ethernet switching interfaces. On Ethernet switching interfaces, the VLAN range from 3968 to 4094 falls under the reserved VLAN address range, and the user is not allowed to configure VLANs in this range.

NOTE: Configuring `vlan-id-range` with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

vlan-id-start

IN THIS SECTION

- Syntax | 32035
- Hierarchy Level | 32035

- Description | 32035
- Options | 32035
- Required Privilege Level | 32035
- Release Information | 32035

Syntax

```
vlan-id-start S-VLAN-ID;
```

Hierarchy Level

```
[edit vlans vlan-name interfaces interface-name mapping-range C-VLAN-range (push | swap)]
```

Description

Configure an access interface to map a range of C-VLANs to a range of S-VLANs. Use this statement instead of using multiple `set vlans VLAN-name interface interface-name mapping (push | swap)` statements to configure Q-in-Q tunneling or VLAN translation on a per-VLAN basis. This statement sets the start of the S-VLAN range that the C-VLANs are mapped to. If you omit this option, mapping begins with the first ID in the range of S-VLAN IDs (which you configure using the `set vlans vlan-range`statement).

Options

None

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

vlan-isolation

IN THIS SECTION

- Syntax | 32036
- Hierarchy Level | 32036
- Description | 32036
- Required Privilege Level | 32037
- Release Information | 32037

Syntax

```
vlan-isolation;
```

Hierarchy Level

```
[edit chassis network-slices]
```

Description

Configure VLAN isolation. For the VLAN isolation configuration to take effect, you must configure the `set chassis network-slices vlan-isolation` CLI configuration statement on all the Routing Engines of the BSYS and GNFs, and then reboot the router.

On an MX without Junos Node Slicing enabled, all control traffic between the Routing Engine and the FPCs, as well as between the Routing Engines themselves, occur over an internal network. This network includes both the Routing Engines and all the FPCs. When you configure Junos node slicing, this internal network is shared by all the guest network function (GNF) Routing Engine pairs and their respective set of FPCs. The internal network has sufficient bandwidth to accommodate this traffic without additional configuration. However, if you want to isolate the internal traffic of each GNF from all others, use the `set chassis network-slices vlan-isolation` CLI configuration statement. This configuration assigns a separate internal VLAN for each GNF, resulting in all control traffic within each GNF being VLAN tagged and isolated from those of other GNFs.

NOTE:

- VLAN isolation is disabled by default.
- If you want to configure the sub line card feature, you must ensure that VLAN isolation is disabled. To disable VLAN isolation, delete the `set chassis network-slices vlan-isolation` configuration statement. See also: *Sub Line Card Overview*.

- Required Privilege Level | 32040
- Release Information | 32040

Syntax

```
vlan-prune;
```

Hierarchy Level

```
[edit vlans vlan-name]
```

Description

Prune the Virtual Chassis port (VCP) paths in a Virtual Chassis to ensure received broadcast, multicast, and unknown unicast traffic in a VLAN uses the shortest possible path through the Virtual Chassis to the egress VLAN interface.

By default, all broadcast, multicast, and unknown unicast traffic in a VLAN on an EX Series Virtual Chassis is broadcast to all member switches in the Virtual Chassis. This behavior unnecessarily consumes bandwidth within the Virtual Chassis because unneeded traffic is sent to all Virtual Chassis member switches.

Enabling this option allows you to conserve bandwidth within the Virtual Chassis. Broadcast, multicast, and unknown unicast traffic still enters and exits the Virtual Chassis within the same VLAN, without the added bandwidth consumption that results from broadcasting this traffic to all member switches.

Default

Disabled

    translate from-vlan-id to-vlan-id;
}
```

Hierarchy Level

```
[edit interfaces interface-name unit number family bridge ]
[edit interfaces interface-name unit number family ethernet-switching]
```

Description

Translate a VLAN ID (the *from-vlan-id*) in an incoming packet to another VLAN ID (the *to-vlan-id*) that you have configured on an interface. The device does the corresponding translation in reverse at egress.

You can configure VLAN translation with the `vlan-rewrite translate` statement as follows:

- Only on trunk mode interfaces.
- The *to-vlan-id* is a VLAN you configure on the device with the specified interface as a member of that VLAN.
- The *from-vlan-id* and *to-vlan-id* VLAN IDs can have values between 1 and 4094.

After you set up a VLAN mapping, the device accepts incoming packets tagged with *from-vlan-id* and translates that VLAN ID into the *to-vlan-id* to process the packet. We refer to the *to-vlan-id* as the *mapped VLAN value*.

The device also accepts packets with VLAN IDs for which you did not configure VLAN translation on an interface, and passes those through to the packet processing pipeline without translation.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Guidelines for Configuring Dynamic CoS for Subscriber Access

Applying a Rewrite Rule Definition to a Subscriber Interface in a Dynamic Profile

rewrite-rules

vlan-tag

IN THIS SECTION

- Syntax | 32053
- Hierarchy Level | 32053

- Description | 32053
- Default | 32053
- Options | 32053
- Required Privilege Level | 32053
- Release Information | 32054

Syntax

```
vlan-tag (outer | outer-and-inner);
```

Hierarchy Level

```
[edit class-of-service interfaces interface-name unit logical-unit-number rewrite-rules
ieee-802.1 (rewrite-name | default)]
```

Description

Apply this IEEE-802.1 rewrite rule to the outer VLAN tag or, if available, both outer and inner VLAN tags.

Default

If you do not include this statement, the rewrite rule applies to the outer VLAN tag only.

Options

`outer`—Apply the rewrite rule to the outer VLAN tag only.

`outer-and-inner`—Apply the rewrite rule to both the outer and inner VLAN tags.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.1.

RELATED DOCUMENTATION

Applying IEEE 802.1p Rewrite Rules to Dual VLAN Tags

vlan-tagging (Dynamic)

IN THIS SECTION

- Syntax | 32054
- Hierarchy Level | 32054
- Description | 32054
- Required Privilege Level | 32055
- Release Information | 32055

Syntax

```
vlan-tagging;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name],
[edit interfaces interface-name]
```

Description

For Fast Ethernet and Gigabit Ethernet interfaces and aggregated Ethernet interfaces configured for VPLS, enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface.

> **NOTE**: For Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet interfaces supporting VPLS, the Junos OS supports a subset of the IEEE 802.1Q standard for channelizing an Ethernet interface into multiple logical interfaces, allowing many hosts to be connected to the same Gigabit Ethernet switch, but preventing them from being in the same routing or bridging domain.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

```
[edit interfaces (QFX Series) interface-name ]
[edit interfaces (QFX Series) interface-range interface-range-name ]
```

SRX Series Interfaces

```
[edit interfaces interface ]
```

Description

For Fast Ethernet and Gigabit Ethernet interfaces, aggregated Ethernet interfaces configured for VPLS, and pseudowire subscriber interfaces, enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface.

> **NOTE**: For QFX Series configure VLAN identifier for untagged packets received on the physical interface of a trunk mode interface. Enable VLAN tagging. The platform receives and forwards single-tag frames with 802.1Q VLAN tags.
>
> On EX Series switches except for EX4300 and EX9200 switches, the `vlan-tagging` and `family ethernet-switching` statements cannot be configured on the same interface. Interfaces on EX2200, EX3200, EX3300, EX4200, and EX4500 switches are set to `family ethernet-switching` by the default factory configuration. EX6200 and EX8200 switch interfaces do not have a default `family` setting.

Default

VLAN tagging is disabled by default.

Options

`native-vlan-id`— (SRX Series)Configures a VLAN identifier for untagged packets. Enter a number from 0 through 4094.

> **NOTE**: The `native-vlan-id` can be configured only when either `flexible-vlan-tagging` mode or `interface-mode` trunk is configured.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

vlan-tags (Dual-Tagged Logical Interface)

IN THIS SECTION

- Syntax | 32058
- Hierarchy Level | 32059
- Description | 32059
- Options | 32059
- Required Privilege Level | 32060
- Release Information | 32060

Syntax

```
vlan-tags inner-list [vlan-id vlan-id-vlan-id ] outer <tpid.>vlan-id;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Description

(MX Series routers only) Binds a dual-tag logical interface to a list of VLAN IDs. Configures the logical interface to receive and forward any dual-tag frame whose inner VLAN ID tag matches the list of VLAN IDs you specify.

> **NOTE**: To create a circuit cross-connect (CCC) using VLAN-bundled dual-tag logical interfaces on Layer 2 VPN routing instances, you must include the `encapsulation-type` statement and specify the value `ethernet-vlan` at the one of the following hierarchy levels:
>
> - `[edit routing-instances routing-instance-name protocols l2vpn]`
> - `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn]`
>
> For more information about the `encapsulation-type` configuration statement and the Layer 2 encapsulation types `ethernet` and `ethernet-vlan`, see the Junos OS VPNs Library for Routing Devices.

Options

`inner-list [vlan-id vlan-id vlan-id-vlan-id]`—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

- **Range:** 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

`outer <tpid.>vlan-id`—An optional Tag Protocol ID (TPID) and a valid VLAN ID.

- **Range:** For TPID, specify a hexadecimal value in the format `0xnnnn`.
- **Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

> **NOTE**: Configuring `inner-list` with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN

IDs of inner tag (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1 through 4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

1. **Inefficient**

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-tags outer vid inner-list 1-4094;
}
```

2. **Best Practice**

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id vid;
}
```

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

Syntax

```
vlan-tags outer [tpid].vlan-id [inner [tpid].vlan-id];
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number]
```

Description

For Gigabit Ethernet IQ and IQE interfaces only, binds TPIDs and 802.1Q VLAN tag IDs to a logical interface. You must include the `stacked-vlan-tagging` statement at the `[edit interfaces interface-name]` hierarchy level.

NOTE: The `inner-range vid1-vid2` option is supported on IQE PICs only.

Options

inner [*tpid*].*vlan-id*

A TPID (optional) and a valid VLAN identifier in the format *tpid.vlan-id*. When used in the `dynamic-profiles` hierarchy, specify the `$junos-vlan-id` predefined variable to dynamically obtain the VLAN ID.

> **NOTE**: On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the `inner-range` *tpid*. *vid1–vid2* option with the `vlan-tags` statement for ISP-facing interfaces.

- **Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

outer [*tpid*].*vlan-id*

A TPID (optional) and a valid VLAN identifier in the format *tpid.vlan-id*. When used in the `dynamic-profiles` hierarchy, specify the `$junos-stacked-vlan-id` predefined variable.

- **Range:** For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Description

Bind TPIDs and 802.1Q VLAN tag IDs to a logical interface. TPID fields are used to identify the frame as an IEEE 802.1Q-tagged frame.

Options

inner *tpid.vlan-id*

A TPID and a valid VLAN identifier. TPID is a 16-bit field set to a value of 0x8100 in order to identify the frame as an IEEE 802.1Q-tagged frame.

- **Range:** (most routers) For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

inner-list *value*

List or a set of VLAN identifiers. You can configure a maximum of 32 inner-lists for an interface.

> **NOTE**: This is supported on MX Series routers with Trio-based FPCs.

inner-range *tpid. vid1-vid2*

Specify a TPID and a range of VLAN IDs where vid1 is the start of the range and vid2 is the end of the range.

> **NOTE**: On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the `inner-range` *tpid. vid1–vid2* option with the `vlan-tags` statement for ISP-facing interfaces.

- **Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

outer *tpid.vlan-id*

A TPID and a valid VLAN identifier.

- **Range:** (most routers) For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

> **NOTE**: Configuring `inner-range` with the entire vlan-id range consumes system resources and is not a best practice. The `inner-range` must be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1 through 4094), it has the same result as not specifying a range; however, it consumes Packet Forwarding Engine resources such as VLAN lookup table entries, and so on.
>

vlans (RA Guard)

IN THIS SECTION

- Syntax | 32069
- Hierarchy Level | 32069
- Description | 32069
- Required Privilege Level | 32070
- Release Information | 32070

Syntax

```
vlans (vlan-name | all) {
    policy policy-name (stateful | stateless);
}
```

Hierarchy Level

```
[edit forwarding-options access-security router-advertisement-guard]
```

Description

Configure IPv6 Router Advertisement (RA) guard on a VLAN. In an IPv6 deployment, RA guard protects against rogue RA messages generated either maliciously or unintentionally by unauthorized or improperly configured routers connecting to the network segment. An RA guard policy is used to validate incoming RA messages on the basis of whether they match the conditions defined in a policy.

Before you can configure RA guard on a VLAN, you must first configure a policy at the [`edit forwarding-options access-security router-advertisement-guard`] hierarchy level. The policy is then applied to the VLAN at the [`edit forwarding-options access-security router-advertisement-guard vlans` *`vlan-name`*] hierarchy level.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X53-D55.

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure VLAN properties.

On EX Series switches and SRX Series Firewalls (including vSRX Virtual Firewall), the following configuration guidelines apply:

- Only private VLAN (PVLAN) firewall filters can be used when the VLAN is enabled for Q-in-Q tunneling.
- An S-VLAN tag is added to the packet if the VLAN is Q-in-Q-tunneled and the packet is arriving from an access interface.
- You cannot use a firewall filter to assign an integrated routing and bridging (IRB) interface or a routed VLAN interface (RVI) to a VLAN.
- VLAN assignments performed using a firewall filter override all other VLAN assignments.

Default

If you use the default factory configuration, all switch interfaces become part of the VLAN **default**.

Options

vlan-name—Name of the VLAN. The name can include letters, numbers, hyphens (-), and periods (.) and can contain up to 255 characters long.

The remaining statements are explained separately. See CLI Explorer.

The remaining statements are described separately.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

Statements for private VLANs and Q-in-Q tunneling introduced in Junos OS Release 12.1 for the QFX Series switches.

vmhost management-if disable

IN THIS SECTION

Syntax | 32084

- Hierarchy Level | 32084
- Description | 32084
- Default | 32084
- Required Privilege Level | 32084
- Release Information | 32084

Syntax

```
vmhost management-if disable
```

Hierarchy Level

```
[edit vmhost]
```

Description

Disable the host interface eth0, which serves as the management port. You can the disable the interface if there are any issues associated with security or any hardware failures either at the local end or the remote end of the interface. if you disable the interface, the transmitter is turned off and the link partner experiences a link-down condition.

Default

The host interface eth0 which serves as the management port is enabled.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F6.

NOTE: The command is supported on the routers with RE-MX-X6, RE-MX-X8, and RE-PTX-X8 Routing Engines only.

RELATED DOCUMENTATION

- Description | 32086
- Default | 32086
- Options | 32086
- Required Privilege Level | 32086
- Release Information | 32086

Syntax

```
vmhost management-if link-mode (automatic | half-duplex | full-duplex)
```

Hierarchy Level

```
[edit vmhost]
```

Description

Configure the link mode of the host interface eth0, which serves as the management port as half-duplex or full-duplex. You can also manually select the link mode option as either half-duplex or full-duplex.

Default

The link partners auto-negotiate the speed and duplex link mode and select the highest common capability.

Options

automatic Autonegotiate the link mode of the management interface. if you set the link mode to `automatic`, you must also set the link speed to `automatic`.

half-duplex Set the link mode of the management interface to half-duplex.

full-duplex Set the link mode of the management interface to full-duplex.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F6.

> **NOTE**: The command is supported on the routers with RE-MX-X6, RE-MX-X8, and RE-PTX-X8 Routing Engines only.

vmhost management-if speed

IN THIS SECTION

- Syntax | 32087
- Hierarchy Level | 32087
- Description | 32087
- Default | 32087
- Options | 32088
- Required Privilege Level | 32088
- Release Information | 32088

Syntax

```
vmhost management-if speed { automatic | 10m | 100m | 1g }
```

Hierarchy Level

```
[edit vmhost]
```

Description

Configure the link speed of the host interface eth0, which serves as the management port. If you set the link speed as `10m` or `100m`, autonegotiation is turned off and the link speed is the speed that you specify.

Default

The link partners auto-negotiate the speed and duplex link mode and select the highest common capability.

Options

automatic Autonegotiate the link speed of the management interface. If you set the link speed as `automatic`, speed and link mode are auto-negotiated with the link partner.

10m Set the link speed of the management interface to 10Mbps.

100m Set the link speed of the management interface to 100Mbps

1g Set the link speed of the management interface to 1Gbps. If you set link speed to `1Gbps`, autonegotiation is enabled. However, the interface advertises only 1Gbps speed and full-duplex mode.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F6.

> **NOTE**: The command is supported on the routers with RE-MX-X6, RE-MX-X8, and RE-PTX-X8 Routing Engines only.

RELATED DOCUMENTATION

- vmhost management-if disable | 32083
- vmhost management-if link-mode | 32085
- show vmhost management-if | 28840

vmhost resize vjunos compact

IN THIS SECTION

- Syntax | 32089
- Hierarchy Level | 32089
- Description | 32089
- Required Privilege Level | 32089
- Release Information | 32089

Syntax

```
vmhost resize vjunos compact
```

Hierarchy Level

```
[edit]
```

Description

Reduce the routing engine resource footprint on MX Series router to accommodate GNF VMs within the Routing Engine in in-chassis Junos node slicing. Configuring the `vmhost resize vjunos compact` statement enables hyperthreading in Routing Engine CPU. The in-chassis Junos node slicing requires that hyperthreading be enabled.

Required Privilege Level

view-level—To view this statement in the configuration.

control-level—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.1R1.

vmhost

IN THIS SECTION

- Syntax | 32090

                level;
            }
        }
    }
}
```

Hierarchy Level

```
[edit]
```

Description

Configure VM host management properties. Set values in the `edit vmhost` hierarchy of the configuration.

Options

interfaces Configure interface properties of the host.

- management-if0 | management-if1—Configure the host's side management interface0 or interface1.

  family (inet|inet6) address— Configure IPv4 or IPv6 parameters.

  primary-only— Configure the IP address to be used when the Routing Engine is the current primary. The configured IP address is assigned to primary RE host when the Routing Engine is the current primary. It is recommended to set this option for platforms with dual Routing Engine architecture with VM host support.

  gateway— Configure gateway IP address.

in-band Enable external network access through one of the front panel revenue ports.

out-of-band Enable external network access through the front panel management interface.

management-if Configure management interface properties of the host.

- disable—Disable the host interface eth0, which serves as the management port
- link-mode (automatic | half-duplex | full-duplex)—Configure the link mode of the host interface eth0, which serves as the management port as half-duplex or full-duplex. You can also manually select the link mode option as either half-duplex or full-duplex.
- speed (automatic | 10m | 100m | 1g)—Configure the link speed of the host interface eth0, which serves as the management port. If you set the link speed as 10m or 100m, autonegotiation is turned off and the link speed is the speed that you specify.

no-auto-recovery Disable the automatic guest recovery by the host.

services Enable ssh access to the host and enable or disable root-login to the host from guest.

- ssh—Allow ssh access

  root-login—Configure host root access through ssh

  allow | deny—Allow or deny root access through ssh.

syslog Enable the remote syslog configuration from guest to host OS. Based on the severity configured on guest, the syslog information is logged onto the **/etc/syslog.conf** file on the host.

- host <host-name>—Host notified for remote syslog configuration.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F3.

in-band and out-of-band options introduced for NFX devices in Junos OS Release 24.2R1.

> **NOTE**: PTX3000 router supports the Routing and Control Board, RCBPTX.

vnf-license-supplement

IN THIS SECTION

Syntax | 32094

- Hierarchy Level | 32094
- Description | 32094
- Options | 32094
- Required Privilege Level | 32094
- Release Information | 32095

Syntax

```
vnf-license-supplement {
    vnf-id gnf-id
    license-supplement-string augmented-ssrn
}
```

Hierarchy Level

```
[edit system]
```

Description

Allocate a MAC address to a licensed guest network function (GNF). For more details, see *Assigning MAC Addresses to GNF*.

Options

vnf-id *gnf-id*

Specify the GNF ID that will be assigned the licensed MAC address range. Each license can only be assigned to a single GNF.

license-supplement-string *augmented-ssrn*

Specify the augmented software support reference number (SSRN) string, which contains the MAC address details. Example: `RTU00023003204-01-AABBCCDDEEFF-1100-01-ABCD`.

Required Privilege Level

Release Information

Statement introduced in Junos OS Release 19.2R1.

                native-vlan-id vlan-id;
            }
        }
    }
}
```

Hierarchy Level

```
[edit virtual-network-functions]
```

Description

Name of the virtual network function.

Options

interfaces Name of the interface. For example, em1.

no-autostart An option to disable auto-start of VNF on the VNF configuration commit.

pci-address An option to specify PCI address for the VNF interfaces.

mapping An option to map VNF interfaces on platforms running disaggregated Junos OS.

virtual-cpu An option to specify the number of virtual CPUs the VNF can use. By default, a VNF is assigned one virtual CPU, which is independent of any specific physical CPU.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X53-D45.

vni

IN THIS SECTION

- Syntax | 32098
- Hierarchy Level | 32098
- Description | 32098
- Options | 32099
- Required Privilege Level | 32099
- Release Information | 32099

Syntax

```
vni [0-16777214]
```

Hierarchy Level

```
[edit routing-instances routing-instance-name vlans vlan-name vxlan]
[edit vlans vlan-name vxlan]
```

Description

Assign a numeric value to identify a Virtual Extensible LAN (VXLAN). All members of a VXLAN must use the same VNI.

Options

vni Value to specify in the `vni` attribute.

- **Range:** 0 through 16,777,215

> **NOTE**: Starting in Junos OS Release 17.3R3-3, 18.1R3-S3, and 19.1R1, Junos OS supports a VNI value of 0.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1R2.

IN THIS SECTION

- Syntax | 32100
- Hierarchy Level | 32100
- Description | 32100
- Options | 32100
- Required Privilege Level | 32100

Release Information | 32100

Syntax

```
vni [0-16777214]
```

Hierarchy Level

```
[edit interfaces name unit name tunnel encapsulation vxlan-gpe]
```

Description

Assign a numeric value to identify a Virtual Extensible LAN (VXLAN). All members of a VXLAN must use the same virtual network identifier (VNI).

Options

vni Value to specify in the `vni` attribute.

- **Range:** For flexible tunnel interfaces, the range supported is 0 through 16,777,214 for all MX Series routers (except MX80).

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1.

IN THIS SECTION

- Syntax | **32101**
- Hierarchy Level | **32102**
- Description | **32102**
- Required Privilege Level | **32102**
- Release Information | **32102**

Syntax

```
vni-options vni vxlan-network-identifier {
    designated-forwarder-election-hold-time seconds;
    vrf-target {
        community;
        auto;
        import community-name;
        export community-name;
    }
}
```

Hierarchy Level

```
[edit protocols evpn]
[edit routing-instances routing-instance-name protocols evpn]
```

Description

Configure a designated forwarder election hold time and specific route targets (RTs) for each VXLAN network identifier (VNI).

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53-D30 .

vnid (EVPN)

IN THIS SECTION

- Syntax | **32103**
- Hierarchy Level | **32103**
- Description | **32103**

Required Privilege Level | 32103
Release Information | 32103

Syntax

```
vnid;
```

Hierarchy Level

```
[edit routing-instances routing-instance-name]
```

Description

Enables having the same MAC frames across multiple VXLAN segments without traffic crossover. Multicast in VXLAN is implemented as Layer 3 multicast, in which endpoints subscribe to groups. VNID is a 24-bit virtual network identifier that uniquely identifies the VXLAN segment.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

- Release Information | 32107

Syntax

```
voip {
```

```
    interface (all | [interface-name | access-ports]) {
        forwarding-class forwarding-class;
        vlan  vlan-name );
        voip-mac-exclusive;
    }
}
```

Hierarchy Level

For platforms with ELS:

```
[edit switch-options voip]
```

For platforms without ELS:

```
[edit ethernet-switching-options voip]
```

Description

Configure voice over IP (VoIP) on interfaces.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

Hierarchy level `[edit switch-options]` introduced in Junos OS Release 13.2X50-D10. (See *Using the Enhanced Layer 2 Software CLI* for information about ELS.)

Configuration option `voip-mac-exclusive` introduced in Junos OS Release 13.2X50-D10.

RELATED DOCUMENTATION

voip-mac-exclusive

IN THIS SECTION

- Syntax | 32108
- Hierarchy Level | 32108
- Description | 32108
- Default | 32109
- Required Privilege Level | 32109
- Release Information | 32109

Syntax

```
voip-mac-exclusive;
```

Hierarchy Level

```
[edit ethernet-switching-options secure-access-port interface (all | interface-name)],
[edit switch-options voip interface (all | interface-name)]
```

Description

NOTE: `[edit switch-options voip interface (all | interface-name)]` is not supported on ELS on switches that use Enhanced Layer 2 Software (ELS).

Restrict a VoIP client MAC address to be learned only in a configured VoIP VLAN.

If the `voip-exclusive-mac` statement is configured at the [`edit ethernet-switching-options secure-access-port interface` *`interface-name`*] hierarchy level for an interface in a VoIP VLAN, any MAC address learned on that interface for the VoIP VLAN is not learned on an interface for a data VLAN. If a MAC address has been learned on a data VLAN interface and then later, is learned on a VoIP VLAN with that same interface, the MAC address is removed from the data VLAN interface.

Default

A client MAC address is unrestricted and can be learned on both a VoIP VLAN and a data VLAN.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in JUNOS Release 13.2X50-D10.

vpi (Define Virtual Path)

IN THIS SECTION

- Syntax | 32111
- Hierarchy Level | 32112
- Description | 32112
- Options | 32112
- Required Privilege Level | 32112
- Release Information | 32112

Syntax

```
vpi vpi-identifier {
    maximum-vcs maximum-vcs;
    oam-liveness {
        up-count cells;
        down-count cells;
    }
    oam-period (disable | seconds);
    shaping {
        (cbr rate | rtvbr peak rate sustained rate burst length | vbr peak rate sustained rate
burst length);
        queue-length number;
    }
}
```

Hierarchy Level

```
[edit interfaces at-fpc/pic/port atm-options]
```

Description

For ATM interfaces, configure the virtual path (VP).

NOTE: Certain options apply only to specific platforms.

Options

vpi-identifier—ATM virtual path identifier. This is one of the VPIs that you define in the "vci" on page 31843 statement. (For a list of hierarchy levels at which you can include the `vci` statement, see "vci" on page 31843.)

- **Range:** 0 through 255

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure a virtual private LAN service (VPLS) routing instance.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Options

`service-type single`—Allows one vlan per routing instance.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`mac-flush` option introduced in Junos OS Release 10.0.

`hot-standby-vc-on`, `import-labeled-routes [ routing-instance-name ]`, and `interface interface` options introduced in Junos OS Release 15.1R2.

- Options | 32118
- Required Privilege Level | 32118
- Release Information | 32118

Syntax

```
vpls-flow-table-size units;
```

Hierarchy Level

```
[edit chassis fpc slot-number inline-services flow-table-size]
```

Description

Configure the size of the VPLS flow table in units of 256K entries.

NOTE: Any change in the configured size of the flow table size initiates an automatic reboot of the FPC.

NOTE: Starting with Junos OS Release 17.3R1, the maximum number of 256K flow entries that you can configure for IPv4 flow tables and IPv6 flow tables is 256 on MPC5Es and MPC6Es with with 4 GB DDR3 memory or higher. The maximum number of 256K flow entries that you can configure for IPv4 flow tables and IPv6 flow tables is 245 on MPC5Es and MPC6Es with DDR3 memory lower than 4 GB.

NOTE: The recommended flow table size is 4 so that it can scale up to 4x256K flows, which is 1M. You can configure more, however, the system will issue a warning message.

Options

units Number of 256K flow entries available for the VPLS flow table.

- **Range:** 1 through 245
- **Default:** 15 (3840K)

Required Privilege Level

interface—To view this statement in the configuration.

Configuring LDP Signaling for VPLS

vpls-id-list (protocols vpls mesh-group)

IN THIS SECTION

- Syntax | 32122
- Hierarchy Level | 32122
- Description | 32122

- Options | 32122
- Required Privilege Level | 32123
- Release Information | 32123

Syntax

```
vpls-id-list vc-id-numbers;
```

Hierarchy Level

```
[edit routing-instances routing-instance-name protocols vpls mesh-group mesh-group-name neighbor
address]
```

Description

The `vpls-id-list` option allows you to configure multiple pseudowires under LDP-VPLS neighbor by creating one pseudowire per virtual circuit id. This combination of neighbor and virtual circuit ID must be unique across the l2circuit and all local LDP-VPLS instances. The pseudowire will terminate in the specified mesh-group.

As with other pseudowires, the pseudowires created here will signal the remote PE via LDP label mapping message. For each pseudowire created under a neighbor, VPLS will create a VT/LSI interface and add both it and the and label route to the mpls.0 table. Note that you can create multiple pseudowires between the same pair of PEs in LDP-VPLS for a single routing instances only.

Enable `local-switching` along with `vpls-id-list` to allow local switching of traffic (including BUM traffic) between multiple pseudo wires. This can also eliminate the need to have a dedicated mesh-group for each LDP spoke pseudo wire (which has a limit of 14), and provide support for H-VPLS in EVP-LAN and EP-LAN topologies.

Options

vc-id-numbers—The virtual circuit ID for the PE pair. This ID can be any number in the range of 1 to 4294967295.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2 .

}
```

Hierarchy Level

```
[edit security ipsec]
```

Description

Configure an IPsec VPN. A VPN provides a means by which remote computers communicate securely across a public WAN suchas the Internet. A VPN connection can link two LANs (site-to-site VPN) or a remote dial-up user and a LAN. The traffictha flows between these two points passes through shared resources such as routers, switches, and othernetwork equipment that make up the public WAN. To secure VPN communication while passing throughthe WAN, the two participants create an IP Security (IPsec) tunnel. IPsec is a suite of related protocols for cryptographically securing communications at the IP Packet Layer.

Options

vpn-name Name of the VPN.

bind-interface Configure the tunnel interface to which the route-based virtual private network (VPN) is bound.

copy-outer-dscp Enable copying of Differentiated Services Code Point (DSCP) (outer DSCP+ECN) field from the outer IP header encrypted packet to the inner IP header plain text message

on the decryption path. The benefit in enabling this feature is that after IPsec decryption, clear text packets can follow the inner CoS (DSCP+ECN) rules.

distribution-profile

Specify a distribution-profile to distribute tunnels. The `distribution-profile` option is introduced to give the administrator an option to select which PICs in the chassis should handle tunnels associated with a certain VPN object. If the default profiles such as `default-spc3-profile` or `default-spc2-profile` are not selected, a new user-defined profile can be selected. In a profile, you need to mention the Flexible PIC Concentrator (FPC) slot and the PIC number. When such a profile is associated with a VPN object, all matching tunnels are distributed across these PIC's.

- Values:
  - default-spc2-profile—Default group for distributing tunnels on SPC2 only
  - default-spc3-profile—Default group for distributing tunnels on SPC3 only
  - distribution-profile-name—Name of the distribution profile.

df-bit

Specify how the device handles the Don't Fragment (DF) bit in the outer header.

On SRX5400, SRX5600, and SRX5800 devices, the DF-bit configuration for VPN only works if the original packet size is smaller than the st0 interface MTU, and larger than the external interface-ipsec overhead.

- Values:
  - `clear`—Clear (disable) the DF bit from the outer header. This is the default.
  - `copy`—Copy the DF bit to the outer header.
  - `set`—Set (enable) the DF bit in the outer header.

establish-tunnels

Specify when IKE is activated: immediately after VPN information is configured and configuration changes are committed, or only when data traffic flows. If this configuration is not specified, IKE is activated only when data traffic flows.

- Values:
  - `immediately`—IKE is activated immediately after VPN configuration changes are committed.

    Starting with Junos OS Release 15.1X49-D70, a warning message is displayed if you configure the `establish-tunnels immediately` option for an IKE gateway with

group-ike-id or shared-ike-id IKE user types (for example, with AutoVPN or a remote access VPN). The establish-tunnels immediately option is not appropriate for these VPNs because multiple VPN tunnels may be associated with a single VPN configuration. Committing the configuration will succeed, however the establish-tunnels immediately configuration is ignored. The state of the tunnel interface will be up all the time, which was not the case in previous releases when the establish-tunnels immediately option was configured.

- on-traffic—IKE is activated only when data traffic flows and must to be negotiated with the peer gateway. This is the default behavior.
- responder-only—Responds to IKE negotiations that are initiated by the peer gateway, but does not initiate IKE negotiations from the device. This option is required when another vendor's peer gateway expects the protocol and port values in the traffic selector from the initiating gateway. responder-only option added in Junos OS Release 19.1R1.

  This option is supported on unified iked process that is not enabled by default. Administrators must execute the request system software add optional://junos-ike.tgz command to load the junos-ike package.
- responder-only-no-rekey—Option does not establish any VPN tunnel from the device, so the VPN tunnel is initiated from the remote peer. An established tunnel does not start any rekeying from the device and relies on the remote peer to initiate this rekeying. If rekeying does not occur, then the tunnel is brought down after hard-lifetime expires.

  This option is supported on unified iked process that is not enabled by default. Administrators must execute the request system software add optional://junos-ike.tgz command to load the junos-ike package.

ike Define an IKE-keyed IPsec VPN.

manual Define a manual IPsec security association (SA).

multi-sa Negotiate multiple security association (SAs) based on configuration choice. Multiple SAs negotiates with the same traffic selector on the same IKE SA.

traffic-selector Configure multiple sets of local IP address prefix, remote IP address prefix, source port range, destination port range, and protocol as a traffic selector for an IPsec tunnel.

match-direction Direction for which the rule match is applied

- Values:
  - input—Match on input to interface
  - output—Match on output from interface

passive-mode-tunneling No active IP packet checks before IPSec encapsulation

tunnel-mtu Maximum transmit packet size

- **Range:** 256 through 9192

vpn-monitor Configure settings for VPN monitoring.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

Syntax

```
vpn-monitor {
    destination-ip ip-address;
    optimized;
    source-interface interface-name;
    verify-path {
        destination-ip ip-address;
        packet-size bytes;
    }
}
```

Hierarchy Level

```
[edit security ipsec vpn vpn-name]
```

Description

Configure settings for VPN monitoring.

Options

destination-ip Specify the destination of the Internet Control Message Protocol (ICMP) pings. If this statement is used, the device uses the peer's gateway address by default.

optimized Enables VPN monitoring optimization for the specific VPN tunnel.

When the administrator enables VPN monitoring optimization, the SRX Series Firewall sends ICMP echo requests (pings) only when there is an outgoing traffic and no incoming traffic from the configured peer, through the VPN tunnel. If there is an

incoming traffic through the VPN tunnel, the SRX Series Firewall considers the tunnel to be active and does not send pings to the peer.

VPN monitoring optimization saves resources on the SRX Series Firewall as ICMP echo requests are sent only when needed to determine peer liveliness. Also, ICMP echo requests can activate costly backup links that would otherwise not be used.

- Default: Disabled.

  If the administrator does not configure the option explicitly, the firewall sends VPN monitoring packet once every configured interval, also knows as always-send, by default. For more details, see Understanding VPN Monitoring.

source-interface

Specify the source interface for ICMP requests (VPN monitoring "hellos"). If no source interface is specified, the device automatically uses the local tunnel endpoint interface.

verification-path

Specify the verification path to verify the IPsec datapath before the secure tunnel (st0) interface is activated and route(s) associated with the interface are installed in the Junos OS forwarding table.

- `destination-ip` *`ip-address`*—Original, untranslated IP address of the peer tunnel endpoint that is behind a NAT device. This IP address must not be the NAT translated IP address. This option is required if the peer tunnel endpoint is behind a NAT device. The verify-path ICMP request is sent to this IP address so that the peer can generate an ICMP response.

- `packet-size` *`bytes`*—(Optional) The size of the packet that is used to verify an IPsec datapath before the st0 interface is brought up. The packet size must be lower than the path maximum transmission unit (PMTU) minus tunnel overhead. The packet used for IPsec datapath verification must not be fragmented. The range of the packet size is 64 to 1350 bytes and the default packet size value is 64 bytes

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Support for `verify-path` keyword and `destination-ip` added in Junos OS Release 15.1X49-D70.

Support for `packet-size` option added in Junos OS Release 15.1X49-D120.

Support for `vpn-monitor` and `verify-path` options with IPsec VPN running iked process is introduced in Junos OS Release 23.4R1.

options rib routing-table-name multipath],
```

```
[edit routing-instances routing-instance-name routing-options multipath],
[edit routing-instances routing-instance-name routing-options rib routing-table-name multipath]
```

Description

When the `vpn-unequal-cost` statement is configured, protocol-independent load balancing is applied to VPN routes that are equal to interior gateway protocol (IGP) metrics. If the `vpn-unequal-cost` statement is not configured, then protocol-independent load balancing is applied to VPN routes that are equal to the router identifier.

Options

`equal-external-internal`—Specifies that both external and internal BGP paths can be selected for multipath.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4. The `equal-external-internal` option was added for Junos OS Release 8.4.

- Release Information | 32144

Syntax

```
vpws-service-id {
    local service-id;
    remote serivce-id;
    source-packet-routing {
        srv6;
        locator locator-name {
            end-dx2-sid end-dx2-sid;
            micro-dx2-sid micro-sid-value;
            }
    }
}
```

Hierarchy Level

```
[edit routing-instances instance-name protocols evpn interface interface-name]
```

Description

Specify the local and remote Ethernet VPN (EVPN)-Virtual Private Wire Service (VPWS) service identifiers. These service identifiers are unique to an EVPN and are used to identify the endpoints of the EVPN-VPWS network. These endpoints are auto-discovered by BGP and are used to exchange the service labels (learned from the respective provider edge (PE) routers) that are used by auto-discovered routes per EVI route type. Depending on the mode of operation of the PE routers in the EVPN-VPWS network, these two endpoints of the can be colocated on the same PE router or on different PE routers.

Options

local

Unique local VPWS service identifier of the EVPN-VPWS network. This identifies the logical interface of the PE router forwarding traffic to the PE router with a remote VPWS service identifier in the EVPN-VPWS network.

- **Range:** 1 through 16,777,215

remote

Unique remote VPWS service identifier of the EVPN-VPWS network. This identifies the logical interface of the PE router receiving the traffic from the PE router with a local VPWS service identifier in the EVPN-VPWS network.

- **Range:** 1 through 16,777,215

srv6

Enable segment routing over IPv6.

locator *locator-name*

Specify a name to identify the locator.

end-dx2-sid *end-dx2-sid*

Specify the SID to enable endpoint decapsulation of EVPN-VPWS Layer 2 cross connect circuit.

micro-dx2-sid *micro-sid-value*

Enable micro-sid by specifying the value for micro-SID.

> **NOTE**: The micro-SID value must be in the static SID range of the local micro-SIDs. To display the range of local static SIDs in the local micro-SID, use the `show srv6 block` command.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

    }
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit routing-instances routing-instance-name]
```

Description

Explicitly enable IPv4 or IPv6 MVPN routes to be advertised from the VRF instance while preventing all other route types from being advertised.

If you configure the `vrf-advertise-selective` statement without any of its options, the router or switch has the same behavior as if you configured the `no-vrf-advertise` statement. All VPN routes are prevented from being advertised from a VRF routing instance to the remote PE routers. This behavior is useful for hub-and-spoke configurations, enabling you to configure a PE router to not advertise VPN routes from the primary (hub) instance. Instead, these routes are advertised from the secondary (downstream) instance.

The options are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

[edit routing-instances routing-instance-name]
[edit routing-instances routing-instance-name protocols evpn interconnect]
[edit routing-instances routing-instance-name protocols vpls mesh-group mesh-group-name]
[edit switch-options]
```

Description

Specify how the device exports routes from the routing table *routing-instance-name*.inet.0 to other devices. If the `instance-type` in the routing instance configuration is `vrf`, you must either:

- Include this statement to apply a routing export policy in the routing instance.

- Use the `vrf-target` statement with a *`community`* value. In that case, the device advertises all routes with a matching community value.

You can configure multiple export policies on the device.

Default

For instance-type `vrf`, we require you to configure the `vrf-export` or the `vrf-target` statement. The default action is to reject.

Options

`policy-names`—Names for the export policies.

Required Privilege Level

routing— To view this statement in the configuration.

routing-control— To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the following hierarchy levels introduced in Junos OS Release 20.3R1 on QFX Series switches: `[edit protocols evpn interconnect]` and `[edit routing-instances routing-instance-name protocols evpn interconnect]`.

[edit routing-instances routing-instance-name]
[edit routing-instances routing-instance-name protocols evpn interconnect]
[edit routing-instances routing-instance-name protocols vpls mesh-group mesh-group-name]
[edit switch-options]
```

Description

Specify how routes are imported into the routing table (*routing-instance-name*.inet.0) of the local device from the remote device.

You can configure multiple import policies on the device.

One of the following statements is required for importing routes:

- **vrf-target** - When you configure the `vrf-target community` statement without the `vrf-import` statement, by default the device accepts all routes matching the specified target community.
- **vrf-import** - When you configure the `vrf-import` statement instead of the `vrf-target` statement with a community value, there is no default action. The device imports only the routes accepted in the configured `vrf-import` policy statement.

Options

policy-names—Names for the import policies.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the following hierarchy levels introduced in Junos OS Release 20.3R1 on QFX Series switches: `[edit protocols evpn interconnect]` and `[edit routing-instances routing-instance-name protocols evpn interconnect]`.

vrf-propagate-ttl

IN THIS SECTION

- Syntax | 32155
- Hierarchy Level | 32155
- Description | 32155
- Default | 32155
- Required Privilege Level | 32155
- Release Information | 32155

Syntax

```
vrf-propagate-ttl;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit routing-instances routing-instance-name]
```

Description

Enable normal time-to-live (TTL) decrementing in a VRF routing instance. You configure this statement once per routing instance, and it affects only RSVP-signaled or LDP-signaled LSPs in the routing instance. When this router acts as an ingress router for an LSP, it pushes an MPLS copies the TTL value from the IP packet header. When the router acts as the penultimate router, it pops the MPLS header and writes the MPLS TTL into the IP packet.

Default

Normal TTL decrementing enabled; the TTL field value is decremented by 1 as the packet passes through each label-switched router in the LSP. This statement explicitly configures the default behavior for the VRF routing instance and is useful for overriding the `no-propagate-ttl` configured globally on the router at the `[edit protocols mpls]` hierarchy level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

vrf-table-label

IN THIS SECTION

- Syntax | 32156
- Hierarchy Level | 32156
- Description | 32156
- Options | 32157
- Required Privilege Level | 32157
- Release Information | 32157

Syntax

```
vrf-table-label {
    source-class-usage;
    static;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit routing-instances routing-instance-name]
```

Description

Map the inner label of a packet to a specific VPN routing and forwarding (VRF) instance. This allows the examination of the encapsulated IP header. The first lookup is done on the VPN label to determine which VRF instance to refer to, and the second lookup is done on the IP header to determine how to forward packets to the correct end hosts.

When you include the `vrf-table-label` statement in the configuration of a VRF routing instance, a label-switched interface (LSI) logical interface label is created and mapped to the VRF routing table. Any routes in the VRF routing table are advertised with the LSI logical interface label allocated for the VRF routing table. When packets destined for the VRF routing instance arrive on a core-facing interface, they

are treated as if the enclosed IP packet arrived on the LSI interface and are then forwarded and filtered based on the correct table.

All routes in a VRF routing instance configured with this option are advertised with one label allocated per VRF.

NOTE:

- The `vrf-table-label` statement is supported on PTX5000 and PTX3000 routers only when third-generation FPCs are installed on the router and `enhanced-ip` command is configured on the chassis.
- Starting in Junos OS Release 17.2, you can configure the `enhanced-ip` command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability. The `vrf-table-label` space is increased to at least 16,000, if the platform can support the scale.

Options

The remaining statements are explained separately.

- **Range:** 16 through 1,048,575 for static label value.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for the `source-class-usage` statement added in Junos OS Release 9.3.

Support for the `static` statement added in Junos OS Release 17.2.

```

Description

Specify a virtual routing and forwarding (VRF) target community. This value is a route target extended community.

The `vrf-target` statement simplifies configuring a route target by enabling you to configure the statements for route sharing in a routing instance at the `[edit routing-instances]` hierarchy level. In effect, this statement configures a single policy for import and a single policy for export to replace per routing instance policies for every community.

If you configure this statement with only the *community* option, the device generates default VRF import and export policies to import and export routes with the specified route target community. In this case, you can configure matching route targets for corresponding routing instances on different devices. Then those devices can share routes without requiring you to explicitly configure import and export routing policies.

You can explicitly specify import and export route target communities for the routing instance using the `import` or `export` options. Or, if you use the `auto` option, the device automatically derives the route target community value. For example, see *Auto-derived Route targets* for EVPN routing instances.

You can create more complex policies by explicitly configuring routing instance import and export policies using the "vrf-import" on page 32150 and "vrf-export" on page 32148 statements. With those statements, you define the extended community as a routing policy option using the "community (Policy Options)" on page 4698 statement, which includes a *community-name* and one or more community values.

If you don't configure matching route targets with default import and export policies for a routing instance on devices where you want to share routes, you must ensure that for each routing instance, you configure the export target on each device to match the import target on the other devices, and vice versa, as needed.

Options

community—Community name in the format `target:community-id`, where target is a required keyword followed by a colon, and community-id consists of two numbers (each in the range 0 through 65535) separated by another colon in the format *x*:*y*. The first number, *x*, is often (but not required to be) a related autonomous system (AS) number. See "community (Policy Options)" on page 4698 for more on defining communities (including route targets), and *Configuring EVPN Routing Instances* for more on configuring EVPN instances.

auto—Automatically derives the route target. The auto-derived route targets have higher precedence over manually configured route targets in vrf-target, vrf-export policies, and vrf-import policies.

> **NOTE**: Auto-derived route targets are supported only in virtual switch and EVPN routing instances.

`import` *`community`*—Accept routes from neighbor devices with the specified route target community.

`export` *`community`*—Advertise routes with the specified route target community to neighbor devices.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`auto option` added in Junos OS Release 19.1R1 for MX series.

Support at the following hierarchy levels introduced in Junos OS Release 20.3R1 on QFX Series switches: `[edit protocols evpn interconnect]` and `[edit routing-instances` *`routing-instance-name`* `protocols evpn interconnect]`.

```

Description

The Routing Engine performs one-by-one state change for subsequent VRRP groups. Every time there is a state change, and the new state for a particular VRRP group is primary, the Routing Engine generates appropriate VRRP announcement messages. When the first VRRP group detected by the Routing Engine changes state, and the new state is primary, the Routing Engine generates appropriate VRRP announcement messages. The Packet Forwarding Engine is informed about the state change, so that

hardware filters for that group are reprogrammed without delay. The new primary then sends gratuitous ARP message to the VRRP groups.

Options

group-id

VRRP group identifier. If you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the source-address-filter statement. MAC addresses ranging from 00:00:5e:00:53:00 through 00:00:5e:00:53:ff are reserved for VRRP, as defined in RFC 2338. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

> **NOTE**: Under certain circumstances, the group identifier that you enter must be different from any other group identifiers that you configured for logical units of this same physical interface. See *Configuring Basic VRRP Support* for more information.

- **Range:** `0` through `255`

family inet6 address address]
```

Description

Configure a Virtual Router Redundancy Protocol (VRRP) IPv6 group.

> **NOTE**: The group identifier that you enter must be different from any other group identifiers that you configured for logical units of this same physical interface.

Options

group-id—VRRP group identifier. If you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the `source-address-filter` statement. MAC addresses ranging from **00:00:5e:00:01:00** through **00:00:5e:00:01:ff** are reserved for VRRP, as defined in RFC 2338. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

- **Range:** 0 through 255

version vsi-instance instance-number;
```

Hierarchy Level

```
[edit policy-options]
```

Description

Define and apply the named VSI policy to the edge virtual bridging (EVB) configuration. For use with edge virtual bridging, each virtual machine (VM) on the server is uniquely identified by following four parameters, which are contained in a VSI policy:

- vsi-manager-id
- vsi-type
- vsi-version
- vsi-instance-id

The vsi-policy command manually configures these four parameters on the EX switch for the successful association of VM-VSI. VDP protocol helps determine the parameters defined for the virtual machines on the server and configure them on the switch. Use policy options to define the VM-VSI parameters. Configure a firewall filter for each of the VM profiles and use it in this statement.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Description

Configures VLAN Spanning Tree Protocol (VSTP). VSTP is used to prevent loops in Layer 2 networks on a per-VLAN basis.

You can have a maximum of 253 VSTP VLANs per switch.

If the number of VLANs on your switch exceeds the VSTP VLAN limit, you must use the `vlan` statement to specify which VLANs or VLAN groups use VSTP. You also cannot use the **vlan all** option to configure VSTP when your switch has more than the maximum allowed VSTP VLANs. To ensure all VLANs are running a spanning-tree protocol, run RSTP for networks with large numbers of VLANs .

> **NOTE**: When you configure VSTP with the `set protocol vstp vlan all` command, VLAN ID 1 is not set. If you want VLAN ID 1 to be included in the VSTP configuration on your switch, you must set it separately with the `set protocol vstp vlan 1` command.

> **NOTE**: Option `vlan all` is not supported in Junos OS Release 13.2X50.

> **BEST PRACTICE**: Configure RSTP when you configure VSTP. RSTP overhead is minimal and this configuration ensures that some spanning tree protocol is running on all VLANs on your switch, even when your switch has more than the maximum number of allowed VSTP VLANs.

By default, the chassis MAC address is advertised as the bridge address in the BPDU. If you want to change the bridge address advertised in the BPDU, you must configure the system identifier by using the system-identifier option.

The remaining statements are explained separately. See CLI Explorer.

Default

VSTP is not enabled by default.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

`bpdu-block-on-edge` statement added in Junos OS Release 9.4.

`bpdu-timeout-action` statement added in Junos OS Release 9.4.

Support for logical systems added in Junos OS Release 9.6.

Statement updated in Junos OS Release 15.1 for EX Series switches to support configuration of spanning tree parameters globally on all interfaces.

`system-identifier` statement added in Junos OS Release 11.3.

NOTE: You cannot disable spanning tree parameters globally on all interfaces.

vtep-source-interface

IN THIS SECTION

- Syntax | **32178**
- Hierarchy Level | **32178**
- Description | **32178**
- Options | **32178**
- Required Privilege Level | **32179**

Release Information | 32179

Syntax

```
vtep-source-interface
interface-name (inet | inet6 );
```

Hierarchy Level

```
[edit switch-options]
[edit routing-instances routing-instance-name]
```

Description

Configure a source interface for a Virtual Extensible LAN (VXLAN) tunnel. You must provide the name of a logical interface configured on the loopback interface.

If you specify an IPv4 address (`inet` option) as the VTEP source address, the VXLAN tunnel endpoint (VTEP) encapsulates VXLAN packets with an IPv4 outer header and tunnels the packets through an IPv4 underlay network.

If you specify an IPv6 address (`inet6` option) as the VTEP source address, the VTEP encapsulates VXLAN packets with an IPv6 outer header and tunnels the packets through an IPv6 underlay network.

Options

interface-name Loopback interface name.

inet IPv4 source address.

- `colored-tunnel-address`— Specify an IPv4 address as the VXLAN tunnel endpoint (VTEP) source address to set the EVPN routes with the colored-tunnel-address as the Protocol Next-hop (PNH). BGP advertises EVPN routes with the specified PNH.

inet6 IPv6 source address.

- `colored-tunnel-address`—Specify an IPv6 address as the the VXLAN tunnel endpoint (VTEP) source address to set the EVPN routes with the colored-tunnel-address as the Protocol Next-hop (PNH). BGP advertises EVPN routes with the specified PNH.

NOTE:

- Different colored-tunnel-addresses must be configured for MAC-VRFs of different colored fabrics. They cannot share the same `vtep` address.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53-D10.

Support at the `[edit routing-instances routing-instance-name]` hierarchy level introduced in Junos OS Release 17.3.

vulnerability-type {
    values [ values ];
}
```

Hierarchy Level

```
[edit security idp (Security) dynamic-attack-group name filters]
```

Description

Vulnerability type of attack.

Vulnerabilities are the intersection of three elements: a system susceptibility or flaw, attacker access to the flaw, and attacker capability to exploit the flaw. A security risk is often incorrectly classified as a vulnerability.

Using this field you can perform vulnerability scanning. Vulnerability scanning is an inspection of the potential points of exploit on a network to identify security issues. A vulnerability scan detects and classifies system weaknesses in a networks and predicts the effectiveness of countermeasures.

Options

values Values for vulnerability-type field (for example: buffer overflow, injection, use after free, Cross-site scripting (XSS), Remote Code Execution (RCE), and so on. Specifying the vulnerability type for IDP will indicate which applications are weak and therefore can be manipulated. The type of vulnerability is reported for fixing these vulnerabilities.

vxlan-disable-copy-tos-decap

IN THIS SECTION

- Syntax | 32183
- Hierarchy Level | 32183
- Description | 32183
- Default | 32184
- Required Privilege Level | 32184
- Release Information | 32184

Syntax

```
vxlan-disable-copy-tos-decap
```

Hierarchy Level

```
[edit forwarding-options]
```

Description

Disable copying the Type of Service (ToS) field from the outer IP header in a Virtual Extensible LAN (VXLAN) packet to the inner IP header when de-encapsulating the original packet. The ToS field includes values for differentiated services code points (DSCP) and explicit congestion notification (ECN).

In networks where you configure quality of service (QoS) options, traffic moving through the network might include a DSCP value in the ToS field of the IP header for classifying and policing packets. Similarly, network nodes might use the ECN bits in the ToS field of the IP header to enable end-to-end notification of network congestion so the sender can reduce the transmission rate before nodes must

start dropping packets. If you have VXLAN tunnels configured in your network, when encapsulating the original packet in the VXLAN header, some devices (such as the QFX5000 line of switches) copy the DSCP and ECN bits from the original packet's IP header (the inner IP header) to the VXLAN IP header (the outer IP header) by default. At the other end of the tunnel, the same types of devices de-encapsulate the packet and copy the outer IP DSCP and ECN bits back to the inner IP header.

However, some devices (such as the QFX10000 line of switches) don't have the ability to copy ToS field bits upon VXLAN encapsulation and de-encapsulation. As a result, you might see unexpected results if the devices on both ends of the tunnel don't consistently copy the ToS bits during encapsulation and de-encapsulation. For example, the decapsulating node might overwrite the inner IP header DSCP bits in a packet with 000000, which inadvertently lowers the priority of the packet to best effort.

To account for these differences in VXLAN encapsulation behavior, you can configure the `vxlan-disable-copy-tos-encap` statement to disable copying ToS field values from inner to outer IP headers during encapsulation. Similarly, you can configure the `vxlan-disable-copy-tos-decap` statement to disable copying ToS values from the outer IP header back to the inner IP header during de-encapsulation.

CAUTION: Committing either `vxlan-disable-copy-tos-encap` or `vxlan-disable-copy-tos-decap` restarts the FPC causing a disruption in traffic until the FPC recreates the interfaces and tunnels.

Default

Copying ToS bits during VXLAN tunnel de-encapsulation is enabled on supporting devices.

NOTE: Some platforms support copying and disabling copy of only the DSCP bits in the ToS field, and not the ECN bits. Other platforms (such as EX4650 and QFX5120 switches) support copying and disabling copy of both the DSCP and ECN bits. See Feature Explorer for specific platform and release version support details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to a configuration.

Release Information

Statement introduced in Junos OS Release 18.4R2 to disable copying the DSCP bits in the ToS field during VXLAN de-encapsulation.

Support added in Junos OS Release 21.1R1 for copying and disabling copy of ECN bits in the ToS field during VXLAN de-encapsulation.

Description

Disable copying the Type of Service (ToS) field from the IP header of a packet to the outer IP header of a Virtual Extensible LAN (VXLAN) packet when encapsulating the packet. The ToS field includes values for differentiated services code points (DSCP) and explicit congestion notification (ECN).

In networks where you configure quality of service (QoS) options, traffic moving through the network might include a DSCP value in the ToS field of the IP header for classifying and policing packets. Similarly, network nodes might use the ECN bits in the ToS field of the IP header to enable end-to-end notification of network congestion so the sender can reduce the transmission rate before nodes must start dropping packets. If you have VXLAN tunnels configured in your network, when encapsulating the original packet in the VXLAN header, some devices copy the DSCP and ECN bits from the original packet's IP header (the inner IP header) to the VXLAN IP header (the outer IP header) by default. At the other end of the tunnel, the same types of devices decapsulate the packet and copy the outer IP DSCP and ECN bits back to the inner IP header.

However, some devices (such as the QFX10000 line of switches) don't have the ability to copy ToS field bits upon VXLAN encapsulation and decapsulation. As a result, you might see unexpected results if the devices on both ends of the tunnel don't consistently copy the ToS bits during encapsulation and decapsulation. For example, the decapsulating node might overwrite the inner IP header DSCP bits in a packet with 000000, which inadvertently lowers the priority of the packet to best effort.

To account for these differences in VXLAN encapsulation behavior, you can configure the `vxlan-disable-copy-tos-encap` statement to disable copying ToS field values from inner to outer IP headers during encapsulation. Similarly, you can configure the `vxlan-disable-copy-tos-decap` statement to disable copying ToS values from the outer IP header back to the inner IP header during de-encapsulation.

NOTE: QFX5130 and QFX5700 switches do not require `vxlan-disable-copy-tos-encap`, as this is the default behavior for these switches.

CAUTION: Committing either `vxlan-disable-copy-tos-encap` or `vxlan-disable-copy-tos-decap` restarts the FPC causing a disruption in traffic until the FPC recreates the interfaces and tunnels.

Default

Copying ToS bits during VXLAN tunnel encapsulation is enabled on supporting devices.

NOTE: Some platforms support copying and disabling copy of only the DSCP bits in the ToS field, and not the ECN bits. Other platforms (such as EX4650 and QFX5120

switches) support copying and disabling copy of both the DSCP and ECN bits. See Feature Explorer for specific platform and release version support details.

Release Information

Statement introduced in Junos OS Release 18.4R2 to disable copying the DSCP bits in the ToS field during VXLAN encapsulation.

Support added in Junos OS Release 21.1R1 for copying and disabling copy of ECN bits in the ToS field during VXLAN encapsulation.

vxlan-extended

IN THIS SECTION

- Syntax | **32188**
- Hierarchy Level | **32188**
- Description | **32188**
- Required Privilege Level | **32188**
- Release Information | **32188**

Syntax

```
vxlan-extended;
```

Hierarchy Level

```
[edit system packet-forwarding-options system-profile]
```

Description

On ACX7100-32C, ACX7100-48L, and ACX7024 devices, you can use either an IPv4 or IPv6 underlay for a VXLAN configuration. To use an IPv6 underlay, enable the `vxlan-extended` system profile.

Before you enable the `vxlan-extended` system profile, remove any existing VXLAN configurations. After you enable the `vxlan-extended` statement, the packet forwarding engine (PFE) reboots. After the PFE comes back up, you can configure an underlay and overlay for the IPv6 VXLAN underlay. Once you have configured the IPv6 VXLAN underlay and overlay, your VXLAN deployment will be using an IPv6 underlay.

If you want to use an IPv4 underlay, enable the default system profile and remove the IPv6 VXLAN underlay configuration.

To enable the default system profile, issue the `delete system packet-forwarding-options system-profile vxlan-extended` command. Apply your underlay and overlay configuration for your IPv4 VXLAN underlay configuration. After the PFE reboots, your VXLAN deployment will be using an IPv4 underlay.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 23.4R1.

vxlan-gbp-l2-profile

IN THIS SECTION

- Syntax | 32189
- Hierarchy Level | 32189
- Description | 32189
- Required Privilege Level | 32190
- Release Information | 32190

Syntax

```
vxlan-gbp-l2-profile;
```

Hierarchy Level

```
[edit chassis forwarding-options]
```

Description

Enable `vxlan-gbp-l2-profile` on the tunnel termination endpoint in your EVPN-VXLAN deployment to support group-based policies. This setting tells the switch to allocate a share of its resources for L2/L3 group-based policies, whereas otherwise the resources would remain committed for use by all other flows.

The `vxlan-gbp-l2-profile` is suitable when running an edge device in a virtualized network comprised of multiple virtual-severs and VMs. You can also use this profile for direct reachability if the edge device needs more space in the mac-table.

NOTE: The `vxlan-gbp-l2-profile` is not applicable for the EX4100 switches.

Note that for switches in a virtual chassis, the device must be rebooted for this setting to apply; for stand-alone switches the packet forwarding engine (PFE) restarts.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.2R1 for supported EX4400, EX4650, and QFX5120 Series switches.

vxlan-gbp-l2-profile | **32189**

vxlan-gbp-mc-profile

IN THIS SECTION

- Syntax | 32192
- Hierarchy Level | 32192
- Description | 32192
- Required Privilege Level | 32193
- Release Information | 32193

Syntax

```
vxlan-gbp-mc-profile;
```

Hierarchy Level

```
[edit chassis forwarding-options]
```

Description

Enable the `vxlan-gbp-mc-profile` unified forwarding table (UFT) profile on the tunnel termination endpoint in your EVPN-VXLAN deployment to support multicast traffic flows and group-based policy (GBP) unicast traffic flows together.

GBP makes use of existing Layer 3 (L3) VXLAN network identifiers (VNI) and firewall filter policies to provide micro-segmentation at the device or tag level, independent of the underlying network topology. When you configure this profile, the device allocates shares of its UFT resources for both unicast traffic flows and multicast traffic flows to support GBP unicast traffic seamlessly with enhanced optimized intersubnet multicast (OISM) traffic.

OISM handles multicast traffic efficiently in an EVPN-VXLAN data center for multicast sources and receivers inside and outside the data center. OISM has two modes, regular mode and enhanced mode. We support only enhanced OISM mode with GBP, and only when you configure this GBP UFT profile.

See *GBP Profiles* for more on GBP profiles and configurations. See *Overview of Enhanced OISM* for details on how enhanced OISM works. You configure GBP and enhanced OISM together the same way you configure the features separately.

> **NOTE**: We don't assign GBP tags to multicast flows. Only unicast traffic carries the GBP tags in the VXLAN headers.

When you configure this profile:

- On a switch in a Virtual Chassis—You must reboot the switch to apply this setting.
- On a standalone switch—The packet forwarding engine (PFE) automatically restarts.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 24.2R2-S2.

- Hierarchy Level | 32194
- Description | 32194
- Default | 32195
- Required Privilege Level | 32195
- Release Information | 32195

Syntax

```
vxlan-gbp-profile
```

Hierarchy Level

```
[edit chassis forwarding-options]
```

Description

Enable `vxlan-gbp-profile` on the tunnel termination endpoint in your EVPN-VXLAN deployment to support group-based policies. This setting tells the switch to allocate a share of its resources for L2/L3 group-based policies, whereas otherwise the resources would remain committed for use by all other flows. Note that for switches in a virtual chassis, the device must be rebooted for this setting to apply; for stand-alone switches the packet forwarding engine (PFE) will be restarted.

Group-based policies (GBP) make use of existing layer 3 VXLAN network identifiers (VNI), in conjunction with firewall filter policies, to provide micro-segmentation at the level of device or tag, independent of the underlying network topology. For example, IoT devices typically only need access to specific applications on the network, so GBP can keep this traffic isolated by automatically applying security policies without the need for L2 or L3 lookups or ACLs. As such, GBP provides a new approach to network access control and security that is especially valuable for enterprise campuses. The `vxlan-gbp-profile` is suitable for a balanced configuration that contains a mix of L2 and L3 networks.

In addition to enabling `vxlan-gbp-profile` on the tunnel termination endpoint, you need to create firewall rules with match conditions for the endpoint devices you want to segregate. Do this on the switches in your topology that are deployed in the role of VXLAN gateway for the access layer.

Default

Not enabled

vxlan-gpe (FTI)

IN THIS SECTION

- Syntax | 32196
- Hierarchy Level | 32196
- Description | 32196
- Options | 32196
- Required Privilege Level | 32197
- Release Information | 32197

Syntax

```
vxlan-gpe {
    destination {
        address address;
    }
    destination-udp-port destination-udp-port;
    source {
        address address;
        interface interface;
    }
    source-udp-port-range {
        (min min-port-number| max max-port-number)
    }
tunnel-endpoint vxlan;
    vni vni;
}
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces name unit name tunnel encapsulation],
[edit interfaces name unit name tunnel encapsulation]
```

Description

Virtual Extensible LAN (VXLAN) is defined as an encapsulation format that encapsulates Ethernet frames in an outer UDP/IP transport. The `vxlan-gpe` encapsulation refers to the header `gpe` added to the encapsulation `vxlan` to extend the existing VXLAN protocol to provide support for multiprotocol encapsulation.

Options

destination-udp-port

Value to write to the destination-udp-port field.

- **Range:** 1 through 65,535

source-udp-port-range

Value to write to the source-udp-port-range field.

- **min** ***min-port-number*** **:** 1 through 65,535.
- **max** ***max-port-number*** **:** 1 through 65,535

min-port-number should be less than or equal to *max-port-number*

If you do not specify the source port range, it is randomly set (in the range 49152 – 65535) based on the hash value calculated using various packet headers field.

tunnel-endpoint Tunnel endpoint type.

- Values:
  - vxlan—To configure VXLAN tunnel endpoint.

vni Value to specify in the `vni` attribute.

- **Range:** 0 through 16,777,214

The remaining statements are explained separately. See CLI Explorer.

vxlan-stitching

IN THIS SECTION

- Syntax | 32199
- Hierarchy Level | 32199
- Description | 32200
- Options | 32200
- Default | 32200
- Required Privilege Level | 32200
- Release Information | 32201

Syntax

```
vxlan-stitching {
    control-word;
}
```

Hierarchy Level

```
[edit system packet-forwarding-options system-profile]
```

Description

You must configure `vxlan-stitching` on ACX devices to support Virtual Extensible LAN (VXLAN) data center interconnect (DCI) stitching features.

NOTE: The PFE will restart once this statement is applied.

Options

control-word

Enable this option on an ACX device operating as a DCI gateway (GW) when both of the following are true:

- Your MPLS network is using Ethernet VPN (EVPN-MPLS) for the overlay fabric.
- Your ACX DCI GW's peer device is using `control-word`. For example, you may be connecting across the DCI to a PTX, which only supports `control-word`.

Consider the following when configuring control-word support.

- control-word support is disabled by default on ACX devices. Only enable this option when control-word support is required.
- control-word support is enabled by default in MAC-VRF routing-instances.
- In EVPN-VXLAN to EVPN-MPLS networks, when the peer GW **doesn't** support control-word, configure the `vxlan-stitching` knob as described, and configure the `no-control-word` option in the `[edit routing-instances` *`instance-name`* `protocols evpn]` hierarchy.
- In EVPN-VXLAN to EVPN-MPLS networks, when the peer GW **does** support control-word, configure the `control-word` option in the `[edit system packet-forwarding-options system-profile vxlan-stitching` hierarchy.

Default

Stitching features are disabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 23.2R1.

Syntax

```
vxlan-tos-copy-filter
```

Hierarchy Level

```
[edit forwarding-options]
```

Description

Copy the Type of Service (ToS) field from the IP header of a packet to the outer IP header of a Virtual Extensible LAN (VXLAN) packet when encapsulating the packet. The ToS field includes values for differentiated services code points (DSCP) and explicit congestion notification (ECN).

Default

For QFX5000 Series switches, `vxlan-tos-copy-filter` is only required for QFX5130 and QFX5700 switches. ToS copy from the inner to outer VXLAN header is the default behavior in other QFX5000 Series switches.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

wait-for-acct-on-ack (Access Profile)

IN THIS SECTION

- Syntax | 32205
- Hierarchy Level | 32205
- Description | 32205
- Required Privilege Level | 32206
- Release Information | 32206

Syntax

```
wait-for-acct-on-ack;
```

Hierarchy Level

```
[edit access profile profile-name accounting]
```

Description

Configure the router's authd process to wait for an Acct-On-Ack response message from RADIUS before sending new authentication and accounting updates to the RADIUS server. This configuration ensures that when a new subscriber session starts, the authentication and accounting information for the new session does not get deleted when RADIUS clears previously existing session state information.

At subscriber session startup, the Junos OS authd process sends an Acct-On message to the RADIUS server and the new session starts authentication and accounting operations. However, in some service provider environments, upon receipt of the Acct-On message, the RADIUS server cleans up the previous session state and removes accounting statistics. In this scenario, the RADIUS server's cleanup operation can inadvertently delete the new session's authentication and accounting information, which might include customer billing information.

To ensure that the new session's authentication and accounting information is not deleted, you can include the `wait-for-acct-on-ack` statement to configure authd to wait for an Acct-On-Ack response

message from the RADIUS accounting server, so the RADIUS cleanup can finish before authd sends any new authentication and accounting updates.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

[edit chassis source interfaces (external-a | external-b | interface interface-name)],
[edit chassis source interfaces (external | interface interface-name)],
[edit chassis source interfaces (external-0/0 | external-1/0 | interface interface-name)]
```

Description

Configure the time in minutes for each port to be up before opening the Ethernet Synchronization Message Channel (ESMC) for messages. When a port's signal transitions out of the signal fail state, it must be fault-free for the wait-to-restore time before it is again considered by the clock selection process.

> **NOTE**: When you perform GRES on MX Series routers, you must execute the `clear synchronous-ethernet wait-to-restore` operational mode command on the new primary Routing Engine to clear the wait-to-restore timer on it. This is because the `clear synchronous-ethernet wait-to-restore` operational mode command clears the wait-to-restore timer only on the local Routing Engine.

Options

minutes Set the time for the port signal to be up before the port is opened to receive and transmit ESMC messages.

- **Range:** 0 through 12 minutes
- **Default:** 5 minutes

100-Gigabit Ethernet OTN Options Configuration Overview

watch-list

IN THIS SECTION

- Syntax | 32216
- Hierarchy Level | 32216
- Description | 32216
- Options | 32217
- Required Privilege Level | 32217
- Release Information | 32217

Syntax

```
watch-list {
    [ routes ];
}
```

Hierarchy Level

```
[edit interfaces dln unit logical-unit-number dialer-options]
```

Description

On J Series Services Routers with ISDN interfaces, configure an ISDN list of routes to watch. Used only for dialer watch.

Options

routes—IP prefix of a route. Specify one or more. The primary interface is considered up if there is at least one valid route for any of the addresses in the watch list to an interface other than the backup interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

watchdog (PSM)

IN THIS SECTION

- Syntax | 32217
- Hierarchy Level | 32218
- Description | 32218
- Options | 32218
- Required Privilege Level | 32218
- Platform-Specific Watchdog Behavior | 32219
- Release Information | 32219

Syntax

```
watchdog {
    timeout value;
    pat-frequency value;
}
```

Hierarchy Level

```
[edit chassis psm]
[edit chassis pem]
```

Description

Enable the power supply module (PSM) watchdog feature. Generally, Junos detects the thermal event health events and takes the required action as per user configuration. However, if a thermal health event causes Junos to go down, the PSM watchdog feature detects it and shuts down the router.

> **NOTE**: The PSM watchdog feature works only if all the online PSMs in the router support the feature.

Options

timeout *value*

Specify the watchdog timer in seconds. After the specified duration, the watchdog expires.

- **Range:** 600 through 900 seconds
- **Default:** 900 seconds

On Junos OS, timeout value is not significant since this value is programmed to watchdog reset counter. Instead, you can use the shutdown-timer option while configuring the thermal-health check feature.

pat-frequency *value*

Specify the frequency (in minutes) at which the software resets the watchdog counter. If the watchdog counter doesn't get reset because of reasons such as Routing Engine crash and system reboot, on watchdog timer expiry, the PSM turns off the output power.

- **Range:** 1 through 3 minutes
- **Default:** 1 minute

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Platform-Specific Watchdog Behavior

Use Feature Explorer to confirm platform, and release support for specific features.

Use the following table to review platform-specific behaviors for your platform:

Platform	Difference
QFX Series	• For QFX10K devices, please note that PEM firmware upgrade is required for the PSM watchdog feature. When you configure the watchdog feature on a PSM with outdated firmware, the system will raise a `Watchdog Not Supported` alarm.

Release Information

Statement introduced in Junos OS Release 20.1R1.

watchdog

IN THIS SECTION

- Syntax | **32220**
- Hierarchy Level | **32220**
- Description | **32220**
- Options | **32220**
- Required Privilege Level | **32220**
- Release Information | **32220**

Syntax

```
watchdog {
    disable;
    enable;
    timeout value;
}
```

Hierarchy Level

```
[edit system processes]
```

Description

Enable or disable the watchdog timer when Junos OS encounters a problem.

Options

- `disable`—Disable the watchdog timer.
- `enable`—Enable the watchdog timer.
- `timeout` *`value`*—Specify amount of time to wait in seconds.

  Range: 1 through 3600 seconds.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

watchdog-timeout

IN THIS SECTION

- Syntax | 32221
- Hierarchy Level | 32221
- Description | 32221
- Options | 32221
- Required Privilege Level | 32222
- Release Information | 32222

Syntax

```
watchdog-timeout seconds;
```

Hierarchy Level

```
[edit access diameter peer peer-name]
```

Description

Configure the amount of time to wait for a Device-Watchdog-Answer message.

Options

seconds Amount of time to wait.

- **Range:** 1 through 65,535 seconds
- **Default:** 30 seconds

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

diameter (Subscriber Aware Policy Control) | 5947

wavelength (IPLC)

IN THIS SECTION

- Syntax | 32222
- Hierarchy Level | 32223
- Description | 32223
- Default | 32223
- Options | 32223
- Required Privilege Level | 32227
- Release Information | 32227

Syntax

```
wavelength nm;
wss-express-in fpc-slot;
}
switch interface-name;
}
```

Hierarchy Level

```
[edit chassis fpc fpc-slot optical-options]
```

Description

Specify the wavelength in nanometers (nm) that you want to configure on the IPLC port.

Default

Options

nm Wavelength in nanometers. It can be one of the following listed for the central wavelength in Table 1:

Table 1932: IPLC Port Number, Wavelength, and Frequency Mapping

Frequency [THz]	Central Wavelength [nm]	Spacing	Present on IPLC Module	Label on IPLC Module	Present on IPLC Expansion Module	Label on IPLC Expansion Module

```

Description

For 10-Gigabit, 100-Gigabit, 400-Gigabit ZR, and 400-Gigabit ZR+ Ethernet DWDM interfaces only, configure full C-band ITU-Grid tunable optics.

Options

nm—Wavelength value. It can be one of the following:

> **NOTE**: All values are displayed. However, if you configure a value that is not supported by the device, an error message is displayed and the device is not tuned to the specified wavelength.

- `1528.38`—1528.38 nanometers (nm), corresponds to a 50-GHz grid
- `1528.77`—1528.77 nm, corresponds to 50-GHz and 100-GHz grids
- `1529.16`—1529.16 nm, corresponds to a 50-GHz grid
- `1529.55`—1529.55 nm, corresponds to 50-GHz and 100-GHz grids
- `1529.94`—1529.94 nm, corresponds to a 50-GHz grid
- `1530.33`—1530.33 nm, corresponds to 50-GHz and 100-GHz grids
- `1530.72`—1530.72 nm, corresponds to a 50-GHz grid
- `1531.12`—1531.12 nm, corresponds to 50-GHz and 100-GHz grids
- `1531.51`—1531.51 nm, corresponds to a 50-GHz grid
- `1531.90`—1531.90 nm, corresponds to 50-GHz and 100-GHz grids
- `1532.29`—1532.29 nm, corresponds to a 50-GHz grid
- `1532.68`—1532.68 nm, corresponds to 50-GHz and 100-GHz grids
- `1533.07`—1533.07 nm, corresponds to a 50-GHz grid
- `1533.47`—1533.47 nm, corresponds to 50-GHz and 100-GHz grids
- `1533.86`—1533.86 nm, corresponds to a 50-GHz grid
- `1534.25`—1534.25 nm, corresponds to 50-GHz and 100-GHz grids
- `1534.64`—1534.64 nm, corresponds to a 50-GHz grid
- `1535.04`—1535.04 nm, corresponds to 50-GHz and 100-GHz grids
- `1535.43`—1535.43 nm, corresponds to a 50-GHz grid
- `1535.82`—1535.82 nm, corresponds to 50-GHz and 100-GHz grids
- `1536.22`—1536.22 nm, corresponds to a 50-GHz grid
- `1536.61`—1536.61 nm, corresponds to 50-GHz and 100-GHz grids

- `1537.00`—1537.00 nm, corresponds to a 50-GHz grid
- `1537.40`—1537.40 nm, corresponds to 50-GHz and 100-GHz grids
- `1537.79`—1537.79 nm, corresponds to a 50-GHz grid
- `1538.19`—1538.19 nm, corresponds to 50-GHz and 100-GHz grids
- `1538.58`—1538.58 nm, corresponds to a 50-GHz grid
- `1538.98`—1538.98 nm, corresponds to 50-GHz and 100-GHz grids
- `1539.37`—1539.37 nm, corresponds to a 50-GHz grid
- `1539.77`—1539.77 nm, corresponds to 50-GHz and 100-GHz grids
- `1540.16`—1540.16 nm, corresponds to a 50-GHz grid
- `1540.56`—1540.56 nm, corresponds to 50-GHz and 100-GHz grids
- `1540.95`—1540.95 nm, corresponds to a 50-GHz grid
- `1541.35`—1541.35 nm, corresponds to 50-GHz and 100-GHz grids
- `1541.75`—1541.75 nm, corresponds to a 50-GHz grid
- `1542.14`—1542.14 nm, corresponds to 50-GHz and 100-GHz grids
- `1542.54`—1542.54 nm, corresponds to a 50-GHz grid
- `1542.94`—1542.94 nm, corresponds to 50-GHz and 100-GHz grids
- `1543.33`—1543.33 nm, corresponds to a 50-GHz grid
- `1543.73`—1543.73 nm, corresponds to 50-GHz and 100-GHz grids
- `1544.13`—1544.13 nm, corresponds to a 50-GHz grid
- `1544.53`—1544.53 nm, corresponds to 50-GHz and 100-GHz grids
- `1544.92`—1544.92 nm, corresponds to a 50-GHz grid
- `1545.32`—1545.32 nm, corresponds to 50-GHz and 100-GHz grids
- `1545.72`—1545.72 nm, corresponds to a 50-GHz grid
- `1546.12`—1546.12 nm, corresponds to 50-GHz and 100-GHz grids
- `1546.52`—1546.52 nm, corresponds to a 50-GHz grid
- `1546.92`—1546.92 nm, corresponds to 50-GHz and 100-GHz grids

- 1547.32—1547.32 nm, corresponds to a 50-GHz grid
- 1547.72—1547.72 nm, corresponds to 50-GHz and 100-GHz grids
- 1548.11—1548.11 nm, corresponds to a 50-GHz grid
- 1548.51—1548.51 nm, corresponds to 50-GHz and 100-GHz grids
- 1548.91—1548.91 nm, corresponds to a 50-GHz grid
- 1549.32—1549.32 nm, corresponds to 50-GHz and 100-GHz grids
- 1549.72—1549.72 nm, corresponds to a 50-GHz grid
- 1550.12—1550.12 nm, corresponds to 50-GHz and 100-GHz grids
- 1550.52—1550.52 nm, corresponds to a 50-GHz grid
- 1550.92—1550.92 nm, corresponds to 50-GHz and 100-GHz grids
- 1551.32—1551.32 nm, corresponds to a 50-GHz grid
- 1551.72—1551.72 nm, corresponds to 50-GHz and 100-GHz grids
- 1552.12—1552.12 nm, corresponds to a 50-GHz grid
- 1552.52—1552.52 nm, corresponds to 50-GHz and 100-GHz grids
- 1552.93—1552.93 nm, corresponds to a 50-GHz grid
- 1553.33—1554.33 nm, corresponds to 50-GHz and 100-GHz grids
- 1553.73—1554.73 nm, corresponds to a 50-GHz grid
- 1554.13—1554.13 nm, corresponds to 50-GHz and 100-GHz grids
- 1554.54—1554.54 nm, corresponds to a 50-GHz grid
- 1554.94—1554.94 nm, corresponds to 50-GHz and 100-GHz grids
- 1555.34—1555.34 nm, corresponds to a 50-GHz grid
- 1555.75—1555.75 nm, corresponds to 50-GHz and 100-GHz grids
- 1556.15—1556.15 nm, corresponds to a 50-GHz grid
- 1556.55—1556.55 nm, corresponds to 50-GHz and 100-GHz grids
- 1556.96—1556.96 nm, corresponds to a 50-GHz grid
- 1557.36—1557.36 nm, corresponds to 50-GHz and 100-GHz grids

- `1557.77`—1557.77 nm, corresponds to a 50-GHz grid
- `1558.17`—1558.17 nm, corresponds to 50-GHz and 100-GHz grids
- `1558.58`—1558.58 nm, corresponds to a 50-GHz grid
- `1558.98`—1558.98 nm, corresponds to 50-GHz and 100-GHz grids
- `1559.39`—1559.39 nm, corresponds to a 50-GHz grid
- `1559.79`—1559.79 nm, corresponds to 50-GHz and 100-GHz grids
- `1560.20`—1560.20 nm, corresponds to a 50-GHz grid
- `1560.61`—1560.61 nm, corresponds to 50-GHz and 100-GHz grids
- `1561.01`—1561.01 nm, corresponds to a 50-GHz grid
- `1561.42`—1561.42 nm, corresponds to 50-GHz and 100-GHz grids
- `1561.83`—1561.83 nm, corresponds to a 50-GHz grid
- `1562.23`—1562.23 nm, corresponds to 50-GHz and 100-GHz grids
- `1562.64`—1562.64 nm, corresponds to a 50-GHz grid
- `1563.05`—1563.05 nm, corresponds to 50-GHz and 100-GHz grids
- `1563.45`—1563.45 nm, corresponds to a 50-GHz grid
- `1563.86`—1563.86 nm, corresponds to 50-GHz and 100-GHz grids
- `1564.27`—1564.27 nm, corresponds to a 50-GHz grid
- `1564.68`—1564.68 nm, corresponds to 50-GHz and 100-GHz grids
- `1565.09`—1565.09 nm, corresponds to a 50-GHz grid
- `1565.50`—1565.50 nm, corresponds to 50-GHz and 100-GHz grids
- `1565.90`—1565.90 nm, corresponds to a 50-GHz grid
- `1566.31`—1566.31 nm, corresponds to 50-GHz and 100-GHz grids
- `1566.72`—1566.72 nm, corresponds to a 50-GHz grid
- `1567.13`—1567.13 nm, corresponds to 50-GHz and 100-GHz grids
- `1567.54`—1567.54 nm, corresponds to a 50-GHz grid
- `1567.95`—1567.95 nm, corresponds to 50-GHz and 100-GHz grids

- `1568.36`—1568.36 nm, corresponds to a 50-GHz grid
- `1568.77`—1568.77 nm, corresponds to 50-GHz and 100-GHz grids
- **Default:** `1550.12`—1550.12 nm, corresponds to 50-GHz and 100-GHz grids

Wavelength Options for 400ZR and 400G OpenZR+ Optics

Supported grid spacing are 100GHz, 75GHz and 6.25GHz currently. The grid selection is based on 100GHz>75GHz>6.25GHZ.

Example 1:

1528.77 1528.77 nm/196.10000 THz 6.25/75/100GHz spacing

1528.77 is part of the 100GHZ, 75GHz, and 6.25GHz grids. So, this wavelength is initialized in 100GHz grid.

Example 2:

1530.53 1530.53 nm/195.87500 THz 6.25/12.5/75GHz spacing

1530.53 is part of the 75GHz and 6.25GHz grids. So, this wavelength is initialized in 75GHz grid.

The wavelength can be one of the following:

```
1528.38              1528.38 nm/196.15040 THz 50Ghz spacing
1528.77              1528.77 nm/196.10000 THz 6.25/12.5/50/75/100GHz spacing
1528.82              1528.82 nm/196.09375 THz 6.25GHz spacing
1528.87              1528.87 nm/196.08750 THz 6.25/12.5GHz spacing
1528.92              1528.92 nm/196.08125 THz 6.25GHz spacing
1528.97              1528.97 nm/196.07500 THz 6.25/12.5GHz spacing
1529.02              1529.02 nm/196.06875 THz 6.25GHz spacing
1529.07              1529.07 nm/196.06250 THz 6.25/12.5GHz spacing
1529.11              1529.11 nm/196.05625 THz 6.25GHz spacing
1529.16              1529.16 nm/196.05000 THz 6.25/12.5/50GHz spacing
1529.21              1529.21 nm/196.04375 THz 6.25GHz spacing
1529.26              1529.26 nm/196.03750 THz 6.25/12.5GHz spacing
1529.31              1529.31 nm/196.03125 THz 6.25GHz spacing
1529.36              1529.36 nm/196.02500 THz 6.25/12.5/75GHz spacing
1529.41              1529.41 nm/196.01875 THz 6.25GHz spacing
1529.46              1529.46 nm/196.01250 THz 6.25/12.5GHz spacing
1529.50              1529.50 nm/196.00625 THz 6.25GHz spacing
1529.55              1529.55 nm/196.00000 THz 6.25/12.5/50/100GHz spacing
```

```
1529.60          1529.60 nm/195.99375 THz 6.25GHz spacing
1529.65          1529.65 nm/195.98750 THz 6.25/12.5GHz spacing
1529.70          1529.70 nm/195.98125 THz 6.25GHz spacing
1529.75          1529.75 nm/195.97500 THz 6.25/12.5GHz spacing
1529.80          1529.80 nm/195.96875 THz 6.25GHz spacing
1529.85          1529.85 nm/195.96250 THz 6.25/12.5GHz spacing
1529.89          1529.89 nm/195.95625 THz 6.25GHz spacing
1529.94          1529.94 nm/195.95000 THz 6.25/12.5/50/75GHz spacing
1529.99          1529.99 nm/195.94375 THz 6.25GHz spacing
1530.04          1530.04 nm/195.93750 THz 6.25/12.5GHz spacing
1530.09          1530.09 nm/195.93125 THz 6.25GHz spacing
1530.14          1530.14 nm/195.92500 THz 6.25/12.5GHz spacing
1530.19          1530.19 nm/195.91875 THz 6.25GHz spacing
1530.24          1530.24 nm/195.91250 THz 6.25/12.5GHz spacing
1530.29          1530.29 nm/195.90625 THz 6.25GHz spacing
1530.33          1530.33 nm/195.90000 THz 6.25/12.5/50/100GHz spacing
1530.38          1530.38 nm/195.89375 THz 6.25GHz spacing
1530.43          1530.43 nm/195.88750 THz 6.25/12.5GHz spacing
1530.48          1530.48 nm/195.88125 THz 6.25GHz spacing
1530.53          1530.53 nm/195.87500 THz 6.25/12.5/75GHz spacing
1530.58          1530.58 nm/195.86875 THz 6.25GHz spacing
1530.63          1530.63 nm/195.86250 THz 6.25/12.5GHz spacing
1530.68          1530.68 nm/195.85625 THz 6.25GHz spacing
1530.72          1530.72 nm/195.85000 THz 6.25/12.5/50GHz spacing
1530.77          1530.77 nm/195.84375 THz 6.25GHz spacing
1530.82          1530.82 nm/195.83750 THz 6.25/12.5GHz spacing
1530.87          1530.87 nm/195.83125 THz 6.25GHz spacing
1530.92          1530.92 nm/195.82500 THz 6.25/12.5GHz spacing
1530.97          1530.97 nm/195.81875 THz 6.25GHz spacing
1531.02          1531.02 nm/195.81250 THz 6.25/12.5GHz spacing
1531.07          1531.07 nm/195.80625 THz 6.25GHz spacing
1531.12          1531.12 nm/195.80000 THz 6.25/12.5/50/75/100GHz spacing
1531.16          1531.16 nm/195.79375 THz 6.25GHz spacing
1531.21          1531.21 nm/195.78750 THz 6.25/12.5GHz spacing
1531.26          1531.26 nm/195.78125 THz 6.25GHz spacing
1531.31          1531.31 nm/195.77500 THz 6.25/12.5GHz spacing
1531.36          1531.36 nm/195.76875 THz 6.25GHz spacing
1531.41          1531.41 nm/195.76250 THz 6.25/12.5GHz spacing
1531.46          1531.46 nm/195.75625 THz 6.25GHz spacing
1531.51          1531.51 nm/195.75000 THz 6.25/12.5/50GHz spacing
1531.56          1531.56 nm/195.74375 THz 6.25GHz spacing
1531.60          1531.60 nm/195.73750 THz 6.25/12.5GHz spacing
1531.65          1531.65 nm/195.73125 THz 6.25GHz spacing
```

```
1531.70             1531.70 nm/195.72500 THz 6.25/12.5/75GHz spacing
1531.75             1531.75 nm/195.71875 THz 6.25GHz spacing
1531.80             1531.80 nm/195.71250 THz 6.25/12.5GHz spacing
1531.85             1531.85 nm/195.70625 THz 6.25GHz spacing

Wavelength Options for 800G OpenZR+ Optics

Supported grid spacing are 100GHz, 75GHz, 50GHz, 12.5, and 6.25GHz.

The wavelength can be one of the following:

```
Possible completions:
  1528.38              1528.38 nm/196.15040 THz 50Ghz spacing
  1528.77              1528.77 nm/196.10000 THz 6.25/12.5/50/75/100GHz spacing
  1528.82              1528.82 nm/196.09375 THz 6.25GHz spacing
  1528.87              1528.87 nm/196.08750 THz 6.25/12.5GHz spacing
  1528.92              1528.92 nm/196.08125 THz 6.25GHz spacing
  1528.97              1528.97 nm/196.07500 THz 6.25/12.5GHz spacing
  1529.02              1529.02 nm/196.06875 THz 6.25GHz spacing
  1529.07              1529.07 nm/196.06250 THz 6.25/12.5GHz spacing
  1529.11              1529.11 nm/196.05625 THz 6.25GHz spacing
  1529.16              1529.16 nm/196.05000 THz 6.25/12.5/50GHz spacing
  1529.21              1529.21 nm/196.04375 THz 6.25GHz spacing
  1529.26              1529.26 nm/196.03750 THz 6.25/12.5GHz spacing
  1529.31              1529.31 nm/196.03125 THz 6.25GHz spacing
  1529.36              1529.36 nm/196.02500 THz 6.25/12.5/75GHz spacing
  1529.41              1529.41 nm/196.01875 THz 6.25GHz spacing
  1529.46              1529.46 nm/196.01250 THz 6.25/12.5GHz spacing
  1529.50              1529.50 nm/196.00625 THz 6.25GHz spacing
```

Required Privilege Level

Interface—To view this statement in the configuration.

Interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

web-authentication (Access Firewall-Authentication)

IN THIS SECTION

- Syntax | 32253
- Hierarchy Level | 32253
- Description | 32254
- Options | 32254
- Required Privilege Level | 32254
- Release Information | 32255

Syntax

```
web-authentication {
    banner {
        fail string;
        logout string;
        success string;
    }
    default-profile profile-name;
    logo file path;
    timeout seconds;
}
```

Hierarchy Level

```
[edit access firewall-authentication],
[edit logical-systems name tenants name access firewall-authentication],
[edit tenants name access firewall-authentication]
```

Description

Specify that users go through the Web authentication process. The user uses HTTP or HTTPS to access an IP address on the device that is enabled for Web authentication. In this scenario, the user does not use HTTP or HTTPS to access the IP address of the protected resource. The user is prompted for a username and password, which are verified by the device. Subsequent traffic from the user or host to the protected resource is allowed or denied based on the results of this authentication. This method of authentication differs from pass-through authentication in that users need to access the protected resource directly after accessing the Web authentication IP address and being authenticated.

Options

banner *success*;

Configure the banner that appears to users during the Web authentication process. The banner appears during login, after successful authentication, and after failed authentication.

default-profile *profile-name*

Specify the authentication profile to use if no profile is specified in a policy.

timeout *seconds*

Specify the `timeout` option in seconds.

If you do not specify a timeout value, and if the web authentication process takes more than 3 seconds, your browser may display `invalid username and password`, even though the username and password is correct. For example, when you type a username and password in a browser for authentication, SRX Series Firewall checks your account in the database, and after 3 seconds your web browser displays a message `invalid username and password`. However, after 10 seconds, SRX Series Firewall receives a response from the database that the user authentication is successful, but SRX Series Firewall could not notify you about successful authentication, due to 3 seconds timeout value. If you configure the timeout value from 5 through 60 seconds, then the browser waits for the SRX Series Firewall to respond for the specified time.

- **Default:** 3 seconds
- **Range:** 5 through 60 seconds

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

HTTPS for Web authentication is supported on SRX5400, SRX5600, and SRX5800 devices starting from Junos OS Release 12.1X44-D10 and on vSRX Virtual Firewall, SRX300, SRX320, SRX340, SRX345, SRX380, and SRX1500 Services Gateways starting from Junos OS Release 15.1X49-D40.

Option `timeout` introduced in Junos OS Release 15.1X49-D130.

web-authentication (Interfaces)

IN THIS SECTION

- Syntax | 32255
- Hierarchy Level | 32256
- Description | 32256
- Options | 32256
- Required Privilege Level | 32256
- Release Information | 32256

Syntax

```
web-authentication {
    http;
    https;
    redirect-to-https;
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family-name address]
```

Description

Enable the Web authentication process for firewall user authentication.

Options

`http`—Enable HTTP service.

`https`—Enable authentication through HTTPS.

`redirect-to-https`—Redirect Web authentication to HTTPS.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Support for `https` and `redirect-to-https` introduced for SRX5400, SRX5600, and SRX5800 Services Gateways starting from Junos OS Release 12.1X44-D10 and on vSRX Virtual Firewall, SRX300, SRX320, SRX340, SRX345, SRX380, SRX550, and SRX1500 Services Gateways starting from Junos OS Release 15.1X49-D40.

web-authentication

IN THIS SECTION

- Syntax | 32257
- Hierarchy Level | 32257
- Description | 32257
- Options | 32257
- Required Privilege Level | 32258
- Release Information | 32258

Syntax

```
web-authentication {
    client-match user-or-group-name;
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication]
```

Description

Specify that the policy allows access to users who have previously been authenticated by Web authentication. Web authentication must be enabled on one of the addresses on the interface to which the HTTP or HTTPS request is redirected.

Options

`client-match` *`user-or-group`* —(Optional) Username or user group name.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

HTTPS for Web authentication is supported on SRX5400, SRX5600, and SRX5800 devices starting from Junos OS Release 12.1X44-D10 and on vSRX Virtual Firewall, SRX300, SRX320, SRX340, SRX345, SRX380, SRX550M, and SRX1500 Services Gateways starting from Junos OS Release 15.1X49-D40.

        }
    }
}
```

Hierarchy Level

```
[edit services]
```

Description

Configure filtering of DNS requests for disallowed website domains. Filtering can result in either:

- Blocking access to the site by sending the client a DNS response that includes an IP address or domain name of a sinkhole server instead of the disallowed domain.
- Logging the DNS request and allowing access.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1 on MX Series.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

}
```

Hierarchy Level

```
[edit logical-systems logical-systems-name security utm feature-profile]
[edit tenants tenant-name security utm feature-profile]
```

Description

Configures the Content Security Web filtering feature for logical systems. The Web filtering allows you to manage Internet usage by preventing access to inappropriate Web content. The potential policies conflict check of the Web filtering feature is independent of the content filtering, antivirus, and antispam features. You can also configure the default Content Security configuration for Web filtering feature profile. If you do not configure any option in the Web filtering feature profile, the values configured in the default Content Security configuration are applied.

Options

juniper-enhanced Enables Enhanced Web Filtering (EWF) on the device.

`base-filter`	A base filter is an object that contains a category-action pair for all categories defined in the category file.
`block-message`	Juniper enhanced block message settings.
`category`	Select a custom URL category list you created (custom objects) for filtering against.
`custom-block-message`	Enter a custom message to be sent when HTTP requests are blocked.
`default`	Specify an action for the profile, for requests that experience internal errors in the Web filtering module.
`fallback-settings`	Fallback settings helps the system how to handle errors.
`no-safe-search`	Do not perform safe-search for Juniper enhanced protocol. Safe-search redirect supports HTTP only. Therefore it is not possible to generate a redirect response for HTTPS search URLs. Safe-search redirects can be disabled by using the CLI option `no-safe-search`.
`quarantine-custom-message`	Juniper enhanced quarantine custom message.
`quarantine-message`	Juniper enhanced quarantine message settings.
`server`	Set server parameters by entering the server name or IP address.
`site-reputation-action`	Specify the action to be taken depending on the site reputation returned for all types of URLs whether it is categorized or uncategorized.
`timeout`	Enter a timeout limit for requests. Once this limit is reached, fail mode settings are applied. • **Range:** 1 through 1800
`juniper-local`	Enables Juniper Networks local URL filtering on the device.
`block-message`	Juniper local block message settings.
`websense-redirect`	Web filtering websense redirect engine. Websense occasionally releases new EWF categories. EWF classifies websites into categories according to host, URL, or IP address and performs filtering based on the categories.
`type`	Type of Web filtering solution or URL filtering solution used by the device.

The remaining statements are explained separately. See CLI Explorer.

```
[edit security utm feature-profile]
[edit security utm default-configuration]
```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure Content Security web filtering features. You can also configure the default Content Security configuration for web filtering feature profile. If you do not configure any option in the web filtering feature profile, the values configured in the default Content Security configuration are applied. The default Content Security Web filtering configuration for HTTP is also applicable for the HTTPS sessions. Web filtering feature's potential policies conflict check is independent of the content filtering, antivirus, and antispam features.

Options

`http-persist`	Check all HTTP request in a connection. If `http-persist` option is enabled for clear text HTTP traffic, then Web filtering checks every HTTP request packet in the same session.
`http-reassemble`	Reassemble HTTP request segments. If http-reassemble option is enabled for clear text HTTP traffic, then Enhanced Web Filtering (EWF) reassembles the fragmented HTTP request to avoid evasion instead of packet-based inspection.
`juniper-enhanced`	Enable enhanced Web filtering on the device.
`base-filter`	A base filter is an object that contains a category-action pair for all categories defined in the category file.
`block-message`	Juniper enhanced block message settings.

`cache`	Set the cache parameters for Surf-Control-Integrated Web filtering and Enhanced Web Filtering.
`category`	Select a custom URL category list you created (custom objects) for filtering against.
`custom-block-message`	Enter a custom message to be sent when HTTP requests are blocked.
`default`	Specify an action for the profile, for requests that experience internal errors in the Web filtering module.
`fallback-settings`	Fallback settings tell the system how to handle errors.
`no-safe-search`	Do not perform safe-search for Juniper enhanced protocol. Safe-search redirect supports HTTP only. Therefore it is not possible to generate a redirect response for HTTPS search URLs. Safe-search redirects can be disabled by using the CLI option `no-safe-search`.
`quarantine-custom-message`	Juniper enhanced quarantine custom message.
`quarantine-message`	Juniper enhanced quarantine message settings.
`reputation`	Customize reputation level. The ThreatSeeker Cloud (TSC) provides site reputation information. Based on these reputations, you can choose a block or a permit action.
`server`	Set server parameters by entering the server name or IP address.
`site-reputation-action`	Specify the action to be taken depending on the site reputation returned for all types of URLs whether it is categorized or uncategorized.
`timeout`	Enter a timeout limit for requests. Once this limit is reached, fail mode settings are applied. • **Range:** 1 through 120
`juniper-local`	Enable Juniper Networks local URL filtering on the device.
`block-message`	Juniper local block message settings.
`traceoptions`	Trace options for Web filtering feature.
`url-blacklist`	This is a global blocklist category, blocking content for Web filtering.
`url-whitelist`	A URL allowlist is a unique custom list that you define in which all the URLs or IP addresses in that list for a specified category are always bypassed for filtering.

`websense-redirect`	Web filtering websense redirect engine. Websense occasionally releases new EWF categories. EWF classifies websites into categories according to host, URL, or IP address and performs filtering based on the categories.
`type`	Type of Web filtering solution or URL filtering solution used by the device.
`performance-mode`	Improves the performance by only analyzing the traffic requests on ports 80 and 443.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The surf-control-integrated feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level introduced in Junos OS Release 18.2R1.

The `performance-mode` statement introduced in Junos OS Release 22.2R1.

Monitoring Web Filtering Configurations

web-management (System Processes)

IN THIS SECTION

- Syntax | 32275
- Hierarchy Level | 32275

- Description | 32275
- Options | 32275
- Required Privilege Level | 32276
- Release Information | 32276

Syntax

```
web-management {
    disable;
    failover (alternate-media | other-routing-engine);
}
```

Hierarchy Level

```
[edit system processes]
```

Description

Specify the Web management process.

Options

- `disable`—Disable the Web management process.
- `failover`—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.
  - `alternate-media`—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.
  - `other-routing-engine`—Instruct the secondary Routing Engine to take primary role if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

```

Description

> **CAUTION**: Enabling tracing can adversely impact scale and performance and may increase security risk. We strongly recommend using the trace, tracing, or traceoptions commands only under the guidance of a JTAC support engineer. After collecting the debug information, immediately disable tracing to minimize risk and restore normal system performance.

Configure settings for HTTP or HTTPS access. HTTP access allows management of the device using the browser-based J-Web graphical user interface. HTTPS access allows secure management of the device using the J-Web interface. With HTTPS access, communication between the device's Web server and your browser is encrypted.

> **NOTE**: On SRX340, SRX345, and SRX380 devices, the factory-default configuration has a generic HTTP configuration. To use Gigabit Ethernet (ge) and fxp0 ports as management ports, you must use the **set system services web-management http interface** command to configure HTTP access for those interfaces. The Web management HTTP and HTTPS interfaces are changed to fxp0.0 and from ge-0/0/1.0 through ge-0/0/7.0.
>
> vSRX Virtual Firewall 3.0 on Hyper-V does not support the web management https configuration.

Options

control max-threads *max-threads*

Configure the maximum number of simultaneous threads to handle access requests.

- **Range:** 0 through 16

https

Configure the secure version of the HTTP service, HTTPS, which is encrypted.

management-url

Configure the URL path for Web management access.

traceoptions

Set the trace options.

- `file`—Configure the trace file information.
  - *filename*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory **/var/log**. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*— Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` *`maximum file-size`* option.

    Range: 2 through 1000 files

    Default: 10 files
- `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.

- `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

  Range: 10 KB through 1 GB

  Default: 128 KB

  If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` *`number`* option.

- `(world-readable | no-world-readable)`— By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `flag` *`flag`*—Specify which tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags.

  - `all`—Trace all areas.

  - `configuration`—Trace configuration.

  - `dynamic-vpn`—Trace dynamic VPN events.

  - `init`—Trace the daemon init process.

  - `mgd`—Trace MGD requests.

  - `webauth`—Trace Web authentication requests.

- `level` *`level`* —Specify the level of debugging output.

  - `all`—Match all levels.

  - `error`—Match error conditions.

  - `info`—Match informational messages.

  - `notice`—Match conditions that should be handled specially.

  - `verbose`—Match verbose messages.

  - `warning`—Match warning messages.

- `no-remote-trace`—Disable remote tracing.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for `https` introduced for SRX5400, SRX5600, and SRX5800 devices starting from Junos OS Release 12.1X44-D10 and on vSRX Virtual Firewall, SRX300, SRX320, SRX340, SRX345, SRX380, SRX550M, and SRX1500 devices starting from Junos OS Release 15.1X49-D40.

`virtual-domain` statement is introduced in Junos OS Release 23.1R1

[edit security policies from-zone zone-name to-zone zone-name  policy policy-name then permit
firewall-authentication pass-through]
[edit security policies from-zone zone-name to-zone zone-name  policy policy-name then permit
firewall-authentication user-firewall]
```

Description

Optionally, redirect HTTP requests to the device's internal webserver by sending a redirect HTTP response to the client system to reconnect to the webserver for user authentication. The interface on which the client's request arrived is the interface to which the request is redirected.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Starting with Junos OS Release 15.1X49-D70 and Junos OS Release 17.3R1, support for user-firewall added on SRX300, SRX320, SRX340, SRX345, SRX380, SRX1500, SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices and vSRX Virtual Firewall Services Gateways.

- Release Information | 32285

Syntax

```
web-redirect-to-https;
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication pass-through]
 [edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication user-firewall]
```

Description

Redirect unauthenticated HTTP requests to the internal HTTPS webserver of the device.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced on SRX5600 and SRX5800 Services Gateways starting from Junos OS Release 12.1X44-D10, and on vSRX Virtual Firewall, SRX300, SRX320, SRX340, SRX345, SRX380, and SRX1500 Services Gateways starting from Junos OS Release 15.1X49-D40.

Starting with Junos OS Release 15.1X49-D70 and Junos OS Release 17.3R1, support for `user-firewall` added on SRX300, SRX320, SRX340, SRX345, SRX380, SRX1500, SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices and vSRX Virtual Firewall Services Gateways.

web-server (Services)

IN THIS SECTION

- Syntax | 32286
- Hierarchy Level | 32286
- Description | 32286
- Options | 32287
- Required Privilege Level | 32287
- Release Information | 32288

Syntax

```
web-server {
    server-name;
    address address;
    connect-method (http | https);
    port port;
}
```

Hierarchy Level

```
[edit services user-identification authentication-source (Services User Identification ClearPass)
aruba-clearpass user-query (Services User Identification)]
```

Description

Specify the name of the webserver configuration on the SRX Series Firewall used for the user query integrated ClearPass authentication and enforcement function. The webserver is the ClearPass server to which the SRX Series Firewall connects to request authentication and identity information for an individual user.

When information for the individual user is not posted to the SRX Series Firewall by ClearPass through Web API POST request messages, the SRX Series Firewall can request this information from the ClearPass Policy Manager (CPPM) under certain circumstances. You must enable the user query function by configuring it.

address- Configure for the integrated ClearPass authentication and enforcement feature the address of the ClearPass webserver that the SRX Series Firewall communicates with. The SRX Series Firewall requests user authentication and identity information for an individual user from the ClearPass webserver whose address is configured. If you configure the user query function, the SRX Series Firewall can obtain this information for a specific user when it does not receive it from the ClearPass Policy Manager through Web API POST requests.

connect-method- Configure the application protocol used for the SRX Series Firewall connection to the ClearPass Policy Manager (CPPM) for user query requests. You identify the connection protocol as part of the configuration that identifies the CPPM server. The user query function allows the SRX Series Firewall to request from the CPPM user authentication and identity information for an individual user.

port- Configure the port on the Juniper Identity Management Service server that the SRX Series Firewall uses to connect to the server.

Options

server-name Specify the Web server name.

address Specify the IP address or hostname of web server.

http Configure HTTP as the connection protocol to use for the SRX Series integrated ClearPass authentication and enforcement feature's connection to the ClearPass Policy Manager (CPPM) webserver for individual user authentication queries. You can identify the connection protocol as part of the configuration that identifies the CPPM webserver (mutually exclusive with HTTPS).

If the SRX Series Firewalls does not find an authentication entry for a user in its local ClearPass authentication table, it can query the Aruba ClearPass webserver for this information.

https Configure HTTPS as the connection protocol used for the SRX Series connection to the ClearPass Policy Manager (CPPM) for user query requests. You identify the connection protocol as part of the configuration that identifies the CPPM webserver.

The integrated ClearPass authentication and enforcement user query function allows the SRX Series Firewall to request from the CPPM user authentication and identity information for an individual when the SRX Series ClearPass authentication table does not contain that information.

The http and https configuration assumes that aruba-clearpass is specified as the authentication source.

The Web API process, acting as an HTTP server, exposes to the Aruba ClearPass Policy Manager (CPPM) an API that allows the CPPM, acting as a client, to send POST request messages to it. The CPPM, which serves as the authentication source, initiates the session to the SRX Series Firewall and sends it user authentication and identity information.

- **Default:** https—The connect-method configuration is optional. If it is not configured, HTTPS is assumed.

port Specify the Web server port number.

- **Default:** 443
- **Range:** 1 through 65535

Required Privilege Level

1. services—To view this statement in the configuration.

2. services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

webapi (System Services)

IN THIS SECTION

- Syntax | 32288
- Hierarchy Level | 32289
- Description | 32289
- Options | 32289
- Required Privilege Level | 32290
- Release Information | 32290

Syntax

```
webapi {
    client (System Services) name;
    debug-level (System Services) (alert | crit | emerg | error | info | notice | warn);
    debug-log (System Services) file;
    http (System Services) {
        port port;
    }
    https (System Services) {
        certificate certificate;
        certificate-key certificate-key;
        default-certificate;
        pki-local-certificate pki-local-certificate;
        port port;
    }
    user (System Services){
        user-name;
```

```
        password password;
    }
}
```

Hierarchy Level

```
[edit system services]
```

Description

Configure Web API (webapi) to facilitate efficient transmission of user authentication and identity information from the CPPM to the SRX Series Firewall. The CPPM, which is the client in this relationship, initiates a session with the SRX Series Firewall Web API process, which is the server in this relationship. However, the CPPM can do this only if you have configured the Web API function on the SRX Series Firewall. For security reasons, the Web API process is not enabled by default.

The configuring statements are explained separately. See CLI Explorer.

Options

client Address of permitted HTTP/HTTPS request originator.

debug-level Debug level for webapi process.

- Values:
  - alert—Match alert messages
  - crit—Match critical messages
  - emerg—Match emergence messages
  - error—Match error messages
  - info—Match informational messages
  - notice—Match notice messages
  - warn—Match warning messages

debug-log Debug log for webapi process.

http Unencrypted HTTP connection settings.

> **NOTE**: In Junos OS FIPS mode, the `http` option is not supported.

https Encrypted HTTPS connection settings.

user Specify the User name.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

webapi-clear-text (Security)

IN THIS SECTION

- Syntax | 32290
- Hierarchy Level | 32291
- Description | 32291
- Required Privilege Level | 32291
- Release Information | 32291

Syntax

```
web-api-cleartext
```

Hierarchy Level

```
[edit security zones security-zone zone host-inbound-traffic system-services]
```

Description

Enable the Web API (webapi) service over HTTP host inbound traffic on TCP port 8080 for unencrypted data.

Required Privilege Level

1. security—To view this statement in the configuration.
2. security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

webapi-ssl (Security)

IN THIS SECTION

- Syntax | 32291
- Hierarchy Level | 32292
- Description | 32292
- Required Privilege Level | 32292
- Release Information | 32292

Syntax

```
webapi-ssl
```

Hierarchy Level

```
[edit security zones security-zone zone host-inbound-traffic system-services]
```

Description

Enable the Web API service over HTTPS host inbound traffic on TCP port 8443.

Required Privilege Level

security	To view this statement in the configuration.
security-control	To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

websense-redirect

IN THIS SECTION

- Syntax | 32293
- Hierarchy Level | 32293
- Description | 32293
- Options | 32294
- Required Privilege Level | 32294
- Release Information | 32294

Syntax

```
websense-redirect {
    profile profile-name {
        account value;
        custom-block-message value;
        fallback-settings {
            default (block | log-and-permit);
            server-connectivity (block | log-and-permit);
            timeout (block | log-and-permit);
            too-many-requests (block | log-and-permit);
        }
        server {
            host host-name;
            port number;
        }
        sockets value;
        timeout value;
        no-safe-search;
    }
}
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile web-filtering]
```

Description

Configure the Websense redirect engine features.

Starting with Junos OS Release 17.4R1, you can download and dynamically load new Enhanced Web Filtering (EWF) categories. The downloading and dynamic loading of the new EWF categories do not require a software upgrade. Websense occasionally releases new EWF categories. EWF classifies websites into categories according to host, URL, or IP address and performs filtering based on the categories.

The new categories do not affect the existing configurations. You can modify the existing configurations to make use of the new categories.

Options

no-safe-search	Disable the safe search function.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

`no-safe-search` option added in Junos OS Release 20.2R1.

weight (Security)

IN THIS SECTION

- Syntax | 32295
- Hierarchy Level | 32295
- Description | 32295
- Required Privilege Level | 32295
- Release Information | 32296

Syntax

```
weight (equal | firewall | idp);
```

Hierarchy Level

```
[edit security forwarding-process application-services maximize-idp-sessions]
```

Description

If you are deploying IDP policies, you can tune the device to increase IDP session capacity. By using the provided commands to change the way the system allocates resources, you can achieve a higher IDP session capacity.

Devices ship with an implicit default session capacity setting. This default value gives more weight to firewall sessions. You can manually override the default by using the `maximize-idp-sessions` command. The command allows you to choose between these weight values: `equal`, `firewall`, and `idp`. The following table displays the available session capacity weight and approximate throughput for each.

Table 1933: Session Capacity and Resulting Throughput

Weight Value	Firewall Capacity	IDP Capacity	Firewall Throughput	IDP Throughput
Default	1,000,000	256,000	10 Gbps	2.4 Gbps
`equal`	1,000,000	1,000,000	8.5 Gbps	2 Gbps
`firewall`	1,000,000	1,000,000	10 Gbps	2.4 Gbps
`idp`	1,000,000	1,000,000	5.5 Gbps	1.4 Gbps

This statement is supported on SRX1500, SRX 5800, SRX 5600, and SRX 5400 devices and vSRX Virtual Firewall.

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

weight (Targeted Subscribers)

IN THIS SECTION

- Syntax | 32296
- Hierarchy Level | 32296
- Description | 32297
- Options | 32297
- Required Privilege Level | 32297
- Release Information | 32297

Syntax

```
weight ($junos-interface-set-target-weight | weight-value);
```

Hierarchy Level

```
[edit interfaces interface-set interface-set-name targeted-options]
```

Description

Configure weight for targeted subscribers like PPPoe, demux, and conventional VLANs. The weight assigned is based on factors such as customer preference, CoS, or bandwidth requirement. The member links are then assigned based on the value of the weight. The value of the weight can range from 1 through 1000.

Options

weight ($junos-interface-set-target-weight | *weight-value*)

Specify the weight for targeted subscribers. Member links for logical interfaces of aggregated Ethernet logical interfaces are assigned based on the value of the weight . When a new VLAN is added to the same aggregated Ethernet bundle, then the primary member link selected for targeting is the one with the minimum primary load and the backup link selected for targeting is the one with the minimum overall load.

When you configure the $junos-interface-set-target-weight predefined variable, the weight value is sourced from VSA 26-214 in the RADIUS Access-Accept message when a dynamic subscriber is authenticated and applies to both the interface set and all its member interfaces; you must configured targeted distribution for both the interface set and its member interfaces. If the interface set is not explicitly configured and RADIUS VSA 26-214 is not received, then the interface set weight derives from the weight assigned to the first member interface that is authorized.

- **Range:** 1 through 1000

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.3.

`$junos-interface-set target-weight` option added in Junos OS Release 18.4R1.

weight

IN THIS SECTION

- Syntax | 32298
- Hierarchy Level | 32298
- Description | 32298
- Options | 32299
- Required Privilege Level | 32299
- Release Information | 32299

Syntax

```
weight number;
```

Hierarchy Level

```
[edit chassis cluster redundancy-group group-number interface-monitor interface ]
[edit chassis cluster redundancy-group group-number ip-monitoring IP-address]
```

Description

Specify the relative importance of the object to the operation of the redundancy group. This statement is primarily used with interface monitoring and IP address monitoring objects. The failure of an object—such as an interface—with a greater weight brings the group closer to failover. Every monitored object is assigned a weight.

- interface-monitor objects—If the object fails, its weight is deducted from the threshold of its redundancy group;
- ip-monitoring objects—If a monitored IP address becomes unreachable for any reason, the weight assigned to that monitored IP address is deducted from the redundancy group's global-threshold for IP address monitoring.

Every redundancy group has a default threshold of 255. If the threshold reaches 0, a failover is triggered. Failover is triggered even if the redundancy group is in manual failover mode and preemption is not enabled.

Options

number —Weight assigned to the interface or monitored IP address. A higher weight value indicates a greater importance.

- **Range:** 0 through 255

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 10.1.

weighted-load-balancing (L2TP LAC)

IN THIS SECTION

Syntax | 32300
Hierarchy Level | 32300

- Description | 32300
- Required Privilege Level | 32300
- Release Information | 32300

Syntax

```
weighted-load-balancing;
```

Hierarchy Level

```
[edit services l2tp]
```

Description

Specify that the router considers tunnel weight when selecting from among multiple tunnels that share the same preference level. A higher maximum session limit on a tunnel corresponds to a higher tunnel weight. A tunnel with a higher weight is more likely to be selected than a tunnel with a lower weight. The distribution of sessions across all tunnels in the preference level, on average, is proportional to the tunnel weight

Disabled by default. By default, tunnel selection within a preference level is strictly random. The **destination-equal-load-balancing** statement must be disabled to successfully enable this statement.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

[edit logical-systems logical-system-name security screen ids-option screen-name udp flood],
[edit security screen ids-option screen-name udp flood],
[edit tenants tenant-name security screen ids-option screen-name udp flood]
```

Description

Configure a list of IP addresses that are exempted from UDP flood detection, which occur during the UDP flood screen protection process. This list of exempted addresses is called an allowlist.

You can use this statement to configure an allowlist of IP addresses that bypass UDP flood detection.

> **NOTE**: This statement is not supported to create UDP flood screen allowlists on SRX5400, SRX5600, and SRX5800 devices.

Both IPv4 and IPv6 allowlists are supported. Addresses in an allowlist must be all IPv4 or all IPv6. In each allowlist, there can be up to 32 IP addresses.

Options

- `name` *`White-list name`*—The name of the allowlist.
- `address` *`address`*— The list of IP addresses. You can specify multiple addresses or address prefixes as a sequence of addresses separated by spaces and enclosed in square brackets. You can configure single address or subnet address.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

Support for UDP flood screen allowlist introduced in Junos OS Release 17.4.

`tenant` option added in Junos OS Release 18.3R1.

Support for UDP and TCP flood screen allowlists added in Junos OS Release 20.3R1 for Next Gen Services on MX240, MX480 and MX960 routers.

- Release Information | 32311

Syntax

```
whitelist [global-address-book-addresses];
```

Hierarchy Level

```
[edit services ssl proxy profile profile-name]
[edit services ssl termination profile profile-name]
```

Description

Specify the addresses exempted from the SSL proxy. This statement is supported on the SRX1500, SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices and vSRX Virtual Firewall.

You can selectively bypass SSL proxy processing for some sessions by configuring a allowlist. Typically, you might configure the allowlist to include trusted servers or domains with which you are very familiar. An allowlist include addresses that you want to exempt from undergoing SSL proxy processing.

To configure the allowlist, you need to specify the domain that you want to exempt in an address book and then configure the address in the SSL proxy profile.

Options

- *allowlist-address*—Specify address from the global address book.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

```

Description

Configure the predefined URL categories in SSL proxy profile to exempt from SSL inspection. The URL category identification is leveraged from the Web filtering categories obtained from the Content Security module.

Before you specify URL category list, you must create a web filtering profile with custom objects using custom URL category or use predefined list. Next apply the feature profile to the Content Security policy.

The following example uses a predefined profile, junos-wf-enhanced-default.

```
[edit]
user@host# set security utm feature-profile web-filtering type juniper-enhanced
user@host# set security utm utm-policy policy-name web-filtering http-profile junos-wf-enhanced-
default
```

Starting in Junos OS Release 17.4R1, you can use custom URL categories in SSL proxy profile.

Options

url-category-list

List of predefined or custom URL category.

The limits for URL categories in SSL forward proxy and SSL reverse proxy configurations is 800.

> **NOTE**: In the reverse proxy configuration, ensure combined size of server certificates and URL categories does not exceed 56,986 bytes. If the combined size exceeds the limit, the following error message is displayed during commit:
>
> ```
> ERROR: Maximum blob size (56986 bytes) exceeded...current blob size is
> 57014 bytes.
> 400 Server certs are taking 54400 bytes, and 27 URL categories are
> taking 1728 bytes.
> ```

This error provides a breakdown of memory usage, helping you adjust the configuration accordingly.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D80.

RELATED DOCUMENTATION

wildcard delete

IN THIS SECTION

- Syntax | 32313
- Description | 32314
- Options | 32314
- Required Privilege Level | 32314
- Release Information | 32314

Syntax

```
wildcard delete <statement-path> <identifier> <regular-expression>
```

Description

Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it.

Deleting a statement or an identifier effectively “unconfigures” or disables the functionality associated with that statement or identifier.

If you do not specify *statement-path* or *identifier*, the entire hierarchy starting at the current hierarchy level is removed.

Options

identifier	(Optional) Name of the statement or identifier to delete.
regular-expression	(Optional) The pattern based on which you want to delete multiple items. When you use the `wildcard` command to delete related configuration items, the *regular-expression* must be the final statement.
statement-path	(Optional) Path to an existing statement or identifier. Include this if the statement or identifier to be deleted is not at the current hierarchy level.

Required Privilege Level

configure—To enter configuration mode. Other required privilege levels depend on where the statement is located in the configuration hierarchy.

Release Information

Command introduced before Junos OS Release 7.4.

window-scale

IN THIS SECTION

- Syntax | 32322
- Hierarchy Level | 32322
- Description | 32322
- Options | 32323
- Required Privilege Level | 32323
- Release Information | 32323

Syntax

```
window-scale {
    match (equal | greater-than | less-than | not-equal);
    value window-scale-factor;
}
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type signature protocol tcp]
```

Description

Specify the scale factor that the session of the attack will use. The window scale extension expands the definition of the TCP window to 32 bits and then uses a scale factor to carry this 32-bit value in the 16-bit window field of the TCP header.

Options

- `match` (`equal` | `greater-than` | `less-than` | `not-equal`)—Match an operand.
- `value` *`window-scale-factor`*—Match the number of bytes.
- **Range:** 0 through 255

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

- Options | 32325
- Required Privilege Level | 32326

Release Information | 32326

Syntax

```
windows-logon {
    auto-dialog-open;
    disconnect-at-logoff;
    domain domain;
    eap-auth;
    flush-credential-at-logoff;
    lead-time-duration seconds;
    mode (automatic | manual);
}
```

Hierarchy Level

```
[edit security remote-access client-config]
```

Description

Define windows logon settings for the Juniper Secure Connect remote client device.

Options

auto-dialog-open	Automatically open dialog for connection establishment.
disconnect-at-logoff	Disconnect the session after logoff.
domain	Domain name for automatic windows logon.
eap-auth	EAP authentication method before the profile selection.
flush-credential-at-logoff	Flush cached credentials after logoff.
lead-time-duration	Lead time duration for domain logon in seconds.

- **Default:** 45 seconds
- **Range:** 0 through 120

mode

Set windows logon mode.

- Values:
  - automatic—Automatic Windows logon with configured credentials.
  - manual—Manual Windows logon.

Required Privilege Level

- Hierarchy Level | 32330
- Description | 32330
- Options | 32331
- Required Privilege Level | 32331
- Release Information | 32331

Syntax

```
wins-server {
    address;
}
```

Hierarchy Level

```
[edit system services dhcp],
[edit system services dhcp pool],
[edit system services dhcp static-binding]
```

Description

For J Series Services Routers and EX Series switches only. Specify one or more NetBIOS Name Servers. When a DHCP client is added to the network and assigned an IP address, the NetBIOS Name Server manages the Windows Internet Name Service (WINS) database that matches IP addresses (such as `192.168.1.3`) to Windows NetBIOS names (such as **\\Marketing**). List servers in order of preference.

Options

address—IPv4 address of the NetBIOS Name Server running WINS. To configure multiple servers, include multiple *address* options.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

wired-max-processes

IN THIS SECTION

- Syntax | 32331
- Hierarchy Level | 32332
- Description | 32332
- Options | 32332

- Release Information | 32336

Syntax

```
withdraw-priority (expedited | priority priority-queue-number (1-16));
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols bgp family family-name sub-family],
[edit logical-systems logical-system-name protocols bgp group group-name family family-name sub-family],
[edit protocols bgp family family-name sub-family],
[edit protocols bgp group group-name family family-name sub-family],
[edit protocols bgp group group-name neighbor neighbor-id family family-name]
```

Description

Within BGP route prioritization, the `withdraw-priority` statement allows you to set specific priority levels for BGP routes that are to be withdrawn. The `withdraw-priority` statement can be configured for BGP neighbors during BGP configuration, or for sub-families within the following address families:

- `evpn`
- `inet`
- `inet-mdt`
- `inet-mvpn`
- `inet-vpn`
- `inet6`
- `inet6-mvpn`
- `inet6-vpn`
- `iso-vpn`
- `l2vpn`
- `route-target`
- `traffic-engineering`

Required Privilege Level

                key (ascii | hex) key;
                wpa-version v2;
            }
        }
    }
}
```

Hierarchy Level

```
[edit wlan access-point name]
```

Description

Configure WLAN properties on SRX Series Firewalls.

Options

access-point name
Name of the wireless access point.

interface
Wireless LAN interface (wl-*x*/0/0) created for the access-point setting.

To support Mini-PIM in chassis cluster mode, you can configure two WLAN interfaces (wl-*x*/0/0) and (wl-*y*/0/0) on both nodes, then the WLAN configuration for access-point is pushed to the two wireless LAN interface cards on both the nodes.

description
Description of the access point and virtual access point (VAP). The maximum length is 64 characters.

country
The country code.

location
Location of the access point. The maximum number of characters you can use is 64.

channel number (auto | channel number)
Channel number of the radio. If you select `auto`, then the Mini-PIM chooses the channel automatically.

bandwidth

Radio 1 (5 GHz) supports bandwidth of 20MHz, 40MHz, and 80MHz, whereas Radio 2 (2.4 GHz) supports bandwidth of 20MHz and 40MHz. The default value is 20MHz for 2.4GHz and 40MHz for 5GHz.

radio modes (an | acn | gn | g)

Mode for the radio operation.

Radio 1 supports the following modes:

- **an** 802.11a and 802.11n clients operating in 5-GHz frequency can connect to the access point.

- **acn** 802.11a, 802.11b, 802.11n and 802.11ac clients operating in 5-GHz frequency can connect to the access point.

Radio 2 supports the following mode:

- **gn** 802.11g, 802.11b, and 802.11n clients operating in 2.4-GHz frequency can connect to the access point. This is the default mode for this radio.

  g 802.11g clients operating in 2.4-GHz frequency can connect to the access point supported from Junos OS Release 20.4R1.

- **radio-off** Radio is turned off.

- **transmit-power** The percentage of transmit power.

  NOTE: When you configure the transmit power, the Mini-PIM card will fix transmit power to the specified value set, in this case the power by rate functionality does not work. So it is recommended not to set transmit power to a specified value. When you do not configure the transmit power (do not fix the transmit power to a specified value), the power by rate functionality works. If you configure the transmit power percentage to 100, then it chooses the option "`auto`", the behavior is same as no transmit power configuration is done and power by rate functionality will work.

no-broadcast-ssid

Disable broadcast SSID. By default, the broadcast SSID is enabled.

maximum-stations	The number of maximum clients that can be connected to the virtual access point. The range is 1 through 127.
station-isolation	Isolate the clients connected to the same VAP.
security (none | wpa-enterprise | wpa-personal)	Security settings for the VAP. WPA enterprise is a Wi-Fi Alliance standard that uses RADIUS server authentication with AES-CCMP. This mode allows the use of high-security encryption along with centrally managed user authentication. WPA personal is a Wi-Fi Alliance standard that uses preshared key (PSK) authentication with AES-CCMP . Only WPA2 standards are supported on Wi-Fi Mini-PIM.
none	No security. The data transferred between clients and the access point is not encrypted. This method allows clients to associate with the access point without any authentication.
cipher-suites (ccmp)	Select the appropriate WPA cipher algorithm. The value is CCMP algorithms.
radius-server	IP address of the radius server.
radius-port	Port number of the RADIUSs server. The default value is 1812.
radius-key	Secret key of the RADIUS. The maximum number of characters you can use is 64.
key (ascii | hex)	WPA shared key. The range of key length is 8 through 63 for ASCII or 8 through 64 hexadecimal characters.
wpa-version (v2)	Version of the WPA version. Only supported value is WPA2.
upload-limit	Specify the upload rate limit. The range is from 256 Kbps through 1,048,576 Kbps.
download-limit	Specify the download rate limit. The range is from 256 Kbps through 1,048,576 Kbps.
ssid	SSID value for the virtual access point. The range is 2 through 32. SSID value can include only letters, numbers and five special characters—hyphen (-), underscore (_), at (@), hash (#), and period (.) in the value of the SSID.
vlan-id	VLAN ID for the virtual access point. The range is 1 through 4094. The default value is 1.
station-mac-filter (allow-list| deny-list)	Specify the MAC filter. You can set either allow the mac address list or deny it. The MAC address format is like xx:xx:xx:xx:xx:xx. The maximum number of the MAC addresses listed is 16.

[edit snmp v3 vacm access group group-name context-prefix context-prefix security-model (any |
usm | v1 | v2c) security-level  (authentication | none | privacy)]
```

Description

Associate the write view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).

Options

view-name—Name of the view for which the SNMP user group has write permission.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

wss-express-in (IPLC)

IN THIS SECTION

- Syntax | 32350
- Hierarchy Level | 32350
- Description | 32351
- Default | 32351
- Options | 32351
- Example | 32351
- Required Privilege Level | 32351
- Release Information | 32352

Syntax

```
wss-express-in ;
```

Hierarchy Level

```
[edit chassis fpc fpc-slot optical-options wavelength nm]
```

Description

Bypass the specified wavelength on this IPLC module. When you bypass a wavelength, it does not terminate at the local node, it is passed on to the next IPLC node. Use this statement to control and manage express traffic at intermediate, two-degree IPLC nodes.

> **NOTE**: Bypassing wavelengths is supported only on IPLC two-degree nodes running express traffic. For more information, see Configuring a Two-Degree Node for Express Traffic.

Default

Options

wss-express-in Bypass the specified wavelength.

> **NOTE**: You can bypass only wavelengths that are expressed-in at intermediate, two-degree IPLC nodes.

Example

Bypassing a wavelength is a two-step process:

1. Configure the two-degree IPLC node for express traffic. See Configuring a Two-Degree Node for Express Traffic.
2. Bypass the wavelength.

   For example, to bypass wavelength 1550.12 on the IPLC module in slot 2 of the two-degree IPLC node:

```
[edit]
user@host# set chassis fpc 2 optical-options wavelength 1550.12 wss-express-in
```

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Releases 15.1F6 and 17.1R1.

xnm-clear-text

IN THIS SECTION

- Syntax | 32359
- Hierarchy Level | 32359
- Description | 32360
- Options | 32360
- Required Privilege Level | 32360
- Release Information | 32360

Syntax

```
xnm-clear-text {
    connection-limit limit;
    rate-limit limit;
}
```

Hierarchy Level

```
[edit system services]
```

Description

Allow Junos XML protocol clear-text requests from remote systems to the local router.

> **NOTE**: Junos OS Evolved supports the `xnm-clear-text` statement starting in Junos OS Evolved release 23.4R1.

Options

connection-limit *limit*

Configure the maximum number of connections sessions for the xnm-clear-text service per protocol (either IPv6 or IPv4).

> **NOTE**: The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured `connection-limit` value if the system resources are limited.

- **Range:** 1 through 250 connections
- **Default:** 75 connections

rate-limit *limit*

Configure the maximum number of connections attempts per minute, per protocol (either IPv6 or IPv4) on an access service. For example, a rate limit of 10 allows 10 IPv6 xnm-clear-text session connection attempts per minute and 10 IPv4 xnm-clear-text session connection attempts per minute.

- **Range:** 1 through 250 connections
- **Default:** 150 connections

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring clear-text or SSL Service for Junos XML Protocol Client Applications

xnm-ssl

IN THIS SECTION

- Syntax | 32361
- Hierarchy Level | 32361
- Description | 32361
- Options | 32362
- Required Privilege Level | 32363
- Release Information | 32363

Syntax

```
xnm-ssl {
    connection-limit limit;
    local-certificate name;
    rate-limit limit;
    ssl-renegotiation ;
}
```

Hierarchy Level

```
[edit system services]
```

Description

Allow Junos XML protocol TLS requests from remote systems to the local router.

NOTE: Junos OS Evolved supports the `xnm-ssl` statement starting in Junos OS Evolved release 23.4R1. To use this feature on Junos OS Evolved devices you must first configure the following statement:

```
set interfaces lo0.0 family inet address 127.0.0.1/32
```

NOTE: When FIPS mode is enabled on a device, the `xnm-ssl` service does not support TLS 1.0. Additionally, on a device running Junos OS release 23.1R1, the `xnm-ssl` service only supports TLS 1.2 or later.

For a device in FIPS mode:

- Running Junos OS prior to release 23.1R1, clients can communicate with the `xnm-ssl` service using TLS 1.0 or later.
- Running Junos OS release 23.1R1 or later, clients can communicate with the `xnm-ssl` service using TLS 1.1 or later.

For a device in non-FIPS mode:

- Running Junos OS prior to release 15.1R8, clients can communicate with the `xnm-ssl` service using TLS 1.0 or later.
- Running Junos OS release 15.1R8 or later and prior to release 23.1R1, clients can communicate with the `xnm-ssl` service using TLS 1.1 or later.
- Running Junos OS release 23.1R1, clients can communicate with the `xnm-ssl` service using TLS 1.2 or later.

Options

connection-limit *limit*

Configure the maximum number of connections sessions for the ftp service per protocol (either IPv6 or IPv4).

NOTE: The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured `connection-limit` value if the system resources are limited.

- **Range:** 1 through 250 connections
- **Default:** 75 connections

local-certificate *name*

Import or reference a TLS certificate by specifying the name of the local certificate to use.

There is no default. The value for `local-certificate` should be the same as the name provided during the import of the certificate using the CLI configuration statement `local` at the `[edit security certificates]` hierarchy level.

rate-limit *limit*

Configure the maximum number of connections attempts per minute, per protocol (either IPv6 or IPv4) on an access service. For example, a rate limit of 10 allows 10 IPv6 ftp session connection attempts per minute and 10 IPv4 ftp session connection attempts per minute.

- **Range:** 1 through 250 connections
- **Default:** 150 connections

ssl-renegotiation

Enable TLS re-negotiation for `xnm-ssl` service.

- **Default:** Disabled

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`ssl-renegotiation` introduced in Junos OS Release 13.3.

xon (Input Congestion Notification)

IN THIS SECTION

- Syntax | 32364
- Hierarchy Level | 32364
- Description | 32364
- Options | 32365
- Required Privilege Level | 32365
- Release Information | 32365

Syntax

```
xon value;
```

Hierarchy Level

```
[edit class-of-service congestion-notification-profile profile-nam input dscp code-point code-point-bits]
[edit class-of-service congestion-notification-profile profile-name input ieee-802.1 code-point code-point-bits]
```

Description

Specifies XON threshold offset cells for resuming transmission from the dynamic shared buffer.

Each port can have lossy and lossless queues. You assign forwarding class sets (priority groups) to all the lossless queues at ingress. This enables transmitting priority-based flow control (PFC) frames in case of any congestion at the egress queues. Lossless priority groupgs (PGs) get their ingress buffers from the lossless service pool. The PGs dynamically access these buffers based on the alpha value configured. When the ingress shared occupancy reaches its limit, the corresponding PG transmits the PFC frames to the egress peer so that peer can stop transmitting packets. This limit is called XOFF and is not configurable.

The PFC XON threshold is the ingress port's PG shared buffer limit at which the ingress port's egress peer resumes transmitting packets after a brief PAUSE because of the PFC message sent by this ingress port.

> **WARNING**: You cannot configure the PFC XON threshold without configuring PFC for the congestion notification profile.

Options

`xon` *`value`* XON threshold offset cells for resuming transmission from the dynamic shared buffer.

Range: 0-100000

Default: 20

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved 22.3R1 for QFX5220 devices.

Syntax

```
yang-compliant;
```

Hierarchy Level

```
[edit system services netconf]
```

Description

Require that the NETCONF server return YANG-compatible configuration data that is consistent with the device's YANG schema and RFC 6020, *YANG - A Data Modeling Language for the Network Configuration Protocol (NETCONF)*.

NOTE: You must configure the `yang-compliant` statement to enable OpenDaylight (ODL) controllers to manage devices running Junos OS.

When you configure the `yang-compliant` statement, the `<get-config>` and `<get-configuration format="xml">` remote procedure calls (RPCs) include the following changes to their output:

- Suppress unsupported configuration statements that are not defined in the YANG schema for that device (`<undocumented>` elements). This does not suppress deprecated statements.
- Suppress configuration comments (`<junos:comment>` elements).
- Serialize list keys according to the YANG schema for configuration statements that define `choice-ident` and `choice-value` as keys.
- Emit YANG annotations encoded as per RFC 7952.

Table 1934 on page 32367 illustrates the changes in the `<get-config>` and `<get-configuration format="xml">` RPC output.

Table 1934: yang-compliant Changes to Configuration Output

Change	Default Output	yang-compliant Output

Configure how the device running Junos OS serves the native YANG modules.

Default

If you do not include the `yang-modules` statement, the device running Junos OS serves the family-specific YANG data models that are shipped with the device.

Options

device-specific Instruct the device to generate device-specific YANG data models instead of the family-specific YANG data models that are shipped with the device.

emit-anyxml-in-rpc-output

Instruct the device to generate YANG data models that use the `anyxml` statement in the Junos RPC output schemas. To configure this statement, you must also configure the `device-specific` statement.

> **NOTE**: Starting in Junos OS Release 23.1R1, the YANG data models for Junos RPCs replace the `anyxml` statement with accurate output schemas.

emit-extensions

Instruct the device to generate YANG data models that explicitly include Junos OS extension statements.

> **NOTE**: The device emits the `junos:command` extension statement starting in Junos OS Release 22.4R1 and Junos OS Evolved Release 22.4R1.

emit-family-ns-and-module-name

Instruct the device to generate YANG data models that use the original device family identifier in the module's name, namespace, and filename. To configure this statement, you must also configure the `device-specific` statement.

This statement is only applicable on devices where the default device family identifier changed from one release to the next.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.4R1.

`emit-anyxml-in-rpc-output` statement added in Junos OS Release 23.1R1.

`emit-family-ns-and-module-name` statement added in Junos OS Evolved Release 23.4R1.

- Syntax | 32371
- Hierarchy Level | 32371
- Description | 32371
- Options | 32371
- Required Privilege Level | 32372
- Release Information | 32372

Syntax

```
yellow-differential-delay milliseconds;
```

Hierarchy Level

```
[edit interfaces ls-fpc/pic/port:channel mlfr-uni-nni-bundle-options]
```

Description

For link services interfaces only, configure the yellow differential delay among bundle links to give warning when a link has a differential delay that exceeds the configured threshold.

Options

milliseconds—Yellow differential delay threshold.

- **Range:** 1 through 2000 milliseconds
- **Default:** 72 milliseconds

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

zone (System Security Profile)

IN THIS SECTION

- Syntax | 32373
- Hierarchy Level | 32373
- Description | 32373

- Options | 32373
- Required Privilege Level | 32374
- Release Information | 32374

Syntax

```
zone {
    maximum maximum;
    reserved reserved;
}
```

Hierarchy Level

```
[edit system security-profile]
```

Description

Specify the zones that user logical system administrators and primary logical system administrators can configure for their logical systems if the security profile is bound to the logical systems.

The primary administrator:

- uses security profiles to provision logical systems with resources.
- binds security profiles to user logical systems and the primary logical system.
- can configure more than one security profile, specifying different amounts of resource allocations in various profiles.

Only the primary administrator can create security profiles and bind them to logical systems.

Options

maximum A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows, it can utilize resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed

quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems compete for global resources.

- **Range:** 0 through 4000

reserved A reserved quota that guarantees that the resource amount specified is always available to the logical system.

- **Default:** 0

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

```

Hierarchy Level

```
[edit security]
```

Description

A zone is a collection of interfaces for security purposes. All interfaces in a zone are equivalent from a security point of view. Configure the following zones:

- Functional zone—Special-purpose zone, such as a management zone that can host dedicated management interfaces.
- Security zone—Most common type of zone that is used as a building block in policies.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

- Statement introduced in Junos OS Release 8.5.
- Support for wildcard addresses added in Junos OS Release 11.1.
- The `description` option added in Junos OS Release 12.1.
- The `vrf` option is added in Junos OS Release 25.4R1. This option allows you to define VRFs that are part of this zone.

Syntax

```
 | (compare | count |
display (changed | commit-scripts | detail | inheritance | json | merge | omit | set |
translation-scripts <configured-delta | translated-config | translated-delta> | xml) |
except pattern | find pattern | hold | last lines | match     pattern | no-more | refresh
interval |
request message (all | account@terminal)
resolve <full-names> | save filename | append filename | tee | trim columns )
```

Description

Filter the output of an operational mode or a configuration mode command.

Options

append *filename*

Append the output to a file.

compare (filename | rollback *n*)

Compare configuration changes with another configuration file. In operational mode, use the `show configuration` command. In configuration mode, use the `show` command.

compare | display xml

Compare configuration changes with the active configuration and display them in XML format. In operational mode, use the `show configuration` command. In configuration mode, use the `show` command.

count Display the number of lines in the output.

display Display additional information about the configuration contents.

- **changed** Tag changes with `junos:changed attribute` (XML only).
- **commit-scripts** (Configuration mode only) Display all statements that are in a configuration, including statements that were generated by transient changes.
- **detail** (Configuration mode only) Display configuration data detail.
- **inheritance <brief | default | no-comments | groups | terse>** (Configuration mode only) Display inherited configuration data and source group.
- **json** Display the output for operational commands and configuration data in JavaScript Object Notation (JSON) format.
- **merge** Use with the `show ephemeral-configuration` command to display the merged view of the static and ephemeral configuration databases in Junos OS Release 18.1 and earlier releases. Issuing the `show ephemeral-configuration | display merge` command displays the configuration data from all instances of the ephemeral configuration database merged with the complete post-inheritance configuration.

  Starting in Junos OS Release 18.2R1, to display the merged view of the static and ephemeral configuration databases, use the `show ephemeral-configuration merge` command instead.
- **omit** (Configuration mode only) Display configuration statements omitted by the `apply-flags omit` configuration statement.
- **set** Display the configuration as a series of configuration mode commands required to re-create the configuration.
- **translation-scripts** Display the configuration with YANG translation scripts applied.

  To view the complete post-inheritance configuration with the translated configuration data from all enabled YANG

translation scripts included in the output, append the `| display translation-scripts` filter to the `show configuration` command in operational mode or the `show` command in configuration mode.

You can also append one of several keywords to display different views of the configuration data corresponding to the non-native YANG data models:

- `configured-delta`—In configuration mode, compare the candidate and active configurations, and display configuration changes in the statements or hierarchies corresponding to non-native YANG data models before any translation is applied. The XML output displays the deleted content, followed by the new content in the syntax defined by the YANG data model.
- `translated-config`—In operational or configuration mode, display all non-native configuration data present in the committed or candidate configuration, respectively, after processing by all enabled translation scripts into Junos OS syntax.
- `translated-delta`—In configuration mode, compare the candidate and active configurations, and display configuration changes in the statements or hierarchies corresponding to non-native YANG data models after translation is applied. The XML output displays the deleted content, followed by the new content in Junos OS syntax.

xml (Operational mode only) Display the command output as Junos XML protocol (Extensible Markup Language [XML]) tags.

except *pattern* Ignore text matching a regular expression when searching the output. If the regular expression contains spaces, operators, or wildcard characters, enclose it in quotation marks.

find *pattern* Display the output starting at the first occurrence of text matching a regular expression. If the regular expression contains spaces, operators, or wildcard characters, enclose it in quotation marks (" ").

hold Hold text without exiting the `--More--` prompt.

last *lines*	Display the last number of lines you want to view from the end of the configuration. However, when the number of lines requested is less than the number of lines that the screen length setting permits you to display, Junos returns as many lines as permitted by the screen length setting.
match *pattern*	Search for text matching a regular expression. If the regular expression contains spaces, operators, or wildcard characters, enclose it in quotation marks.
no-more	Display output all at once rather than one screen at a time.
`resolve`	(Operational mode only) Convert IP addresses into Domain Name System (DNS) names. Truncates to fit original size unless `full-names is` specified. To prevent the names from being truncated, use the `full-names` option.
refresh *interval*	Refresh the display of the command according to the interval specified. The screen gets refreshed periodically to show you the current output of the command until you quit the command. The default refresh interval is one second. However, you can also explicitly specify a value from `1` through `604800` for the refresh interval.
request message (all | *account@terminal*)	Display command output on the terminal of a specific user logged in to your router, or on the terminals of all users logged in to your router.
save *filename*	Save the output to a file or URL.
tee	Allows you to both display the command output on screen and write it to a file. Unlike the UNIX `tee` command, if the file cannot be opened, just an error message is displayed.
trim *columns*	Trim specified number of columns from the start line. Only positive values are accepted. An error message appears if a negative value is given.

Required Privilege Level

view

Release Information

Command introduced before Junos OS Release 7.4.

`display commit-scripts` option added in Junos OS Release 7.4.

`tee` option added in Junos OS Release 14.1.

`display json` option added in Junos OS Release 14.2.

`compare | display xml` option added in Junos OS Release 15.1.

`display translation-scripts` option added in Junos OS Release 16.1.

`display merge` option added in Junos OS Release 16.2R2.

`display merge` option deprecated in Junos OS Release 18.2R1.
