

Loading a Previous Configuration File (CLI Procedure)

You can return to a previously committed configuration file if you need to revert to a previous configuration or if you have lost management access to the switch. The EX-series switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

Syntax

rollback (number)

Options

- None — Return to the most recently saved configuration.
- Number — Configuration to return to.
 - Range: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
 - Default: 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number:

```
[edit]
user@switch# rollback number
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```
