

Infranet Controller Services and Device Configurations Supported in NSM

The Infranet Controller supports the following services in NSM:

- Inventory management service—Enables management of the Infranet Controllers software, hardware, and licensing details. Adding or deleting licenses and upgrading or downgrading software are not supported.
- Status monitoring service—Allows the Infranet Controller’s status to be obtained, including name, domain, OS version, synchronization status, connection details, and current alarms.
- Logging service—Allows the Infranet Controller’s logs to be obtained in a time-generated order. Logging configuration details that are set on the Infranet Controller will apply to NSM.
- XML-based configuration management service—Enables NSM to manage the configuration of the Infranet Controller. NSM uses the same XML schema as the Infranet Controller, so you can troubleshoot NSM using XML files downloaded from the Infranet Controller.

The following device configurations are not supported:

- Editing licensing information, although licenses can be viewed
- Creating clusters, joining nodes to clusters, or enabling or disabling cluster nodes
- Packaging log files or debug files for remote analysis
- Rebooting the Infranet Controller
