

Overview of the NSM Topology Manager

The Network and Security Manager (NSM) Topology Manager is a tool provided in the NSM user interface (UI) to discover and manage the physical topology of a network of devices connected to a Juniper Networks EX-series switch. These include networking devices such as the J-series, M-series, MX-series, and EX-series, as well as ScreenOS and IDP devices, IP phones, desktops, printers, and servers. The Topology Manager also provides details about connections between a device and the EX-series switch.

For more information about the Topology Manager, see the *Network and Security Manager Administration Guide*.
