

Role-Based Administration

The NSM role-based administration (RBA) feature enables you to define strategic roles for your administrators, delegate management tasks, and enhance existing permission structures using task-based functions.

Use NSM to create a secure environment that reflects your current administrator roles and responsibilities. By specifying the exact tasks your NSM administrators can perform within a domain, you minimize the probability of errors and security violations and enable a clear audit trail for every management event.

For more detailed information about role-based administration, including using role-based administration more effectively and configuring role-based administration, see “Configuring Role-Based Administration” in the *Network and Security Manager Administration Guide*.
