

## Terminal Services Overview

---

You can use the Terminal Services feature to enable a terminal emulation session on a Windows terminal server, Citrix NFuse server, or Citrix Metaframe server. You can also use this feature to deliver the terminal services through the Secure Access device, eliminating the need to use another Web server to host the clients.

**NOTE:** The device supports several mechanisms for intermediating traffic between a Citrix server and client, including the Terminal Services, JSAM, WSAM, Network Connect, and hosted Java applets features.
