

Configuring Instance Export (NSM Procedure)

Current configurations that use routing table groups define a policy to select routes in an IGP export policy. However, no policy controls the export process itself. You can configure the instance export policy to control the export process. The policy model supports both interinstance route export and IGP export.

To configure an instance export policy in NSM:

1. In the navigation tree, select **Device Manager > Devices** .
2. In the **Devices** list, double click the device to select it.
3. Click the **Configuration** tab.
4. In the configuration tree, expand **Routing Options**.
5. Select **Instance Export** and specify the export policies for routes being exported from a routing instance.
6. Click one:
 - **OK**—To save the changes.
 - **Cancel**—To cancel the modifications.
 - **Apply**—To apply the routing option settings.

NOTE: After you make changes to a device configuration, you must push that updated device configuration to the physical security device for those changes to take effect. You can update multiple devices at one time. See the *Updating Devices* section in the *Network and Security Manager Administration Guide* for more information.
