

Configuring Source Routing (NSM Procedure)

You can configure source routing to specify IP addresses of the devices along the path, that you want an IP packet to take on its way to its destination.

To configure source routing in NSM:

1. In the navigation tree, select **Device Manager > Devices**.
2. In the **Devices** list, double-click the device to select it.
3. Click the **Configuration** tab.
4. In the configuration tree, expand **Routing Options**.
5. Select **Source Routing**.
6. Enter the parameters as specified in Table 1.
7. Click one:
 - **OK**—To save the changes.
 - **Cancel**—To cancel the modifications.
 - **Apply**—To apply the routing option settings.

NOTE: After you make changes to a device configuration, you must push that updated device configuration to the physical security device for those changes to take effect. You can update multiple devices at one time. See the *Updating Devices* section in the *Network and Security Manager Administration Guide* for more information.

Table 1: Source Routing Fields

Option	Function	Your Action
Comment	Specifies the comment for the source routing configuration.	Enter the comment.
Ip	Specifies the IPv4 addressing family for source routing.	Select the check box.
Ipv6	Specifies the IPv6 addressing family for source routing.	Select the check box.
