Revision History

The information in this document is current as of the date on the title page.

YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at http://www.juniper.net/support/eula.html. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at http://www.juniper.net/techpubs/.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at http://www.juniper.net/books.

Documentation Conventions

Table 1 on page xvi defines notice icons used in this documentation.

### Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- **Online feedback rating system**—On any page at the Juniper Networks Technical Documentation site at [http://www.juniper.net/techpubs/index.html](http://www.juniper.net/techpubs/index.html), simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at [https://www.juniper.net/cgi-bin/docbugreport/](https://www.juniper.net/cgi-bin/docbugreport/).

- **E-mail**—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

### Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

• Product warranties—For product warranty information, visit http://www.juniper.net/support/warranty/.
• JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

• Find CSC offerings: http://www.juniper.net/customers/support/
• Search for known bugs: http://www2.juniper.net/kb/
• Find product documentation: http://www.juniper.net/techpubs/
• Find solutions and answer questions using our Knowledge Base: http://kb.juniper.net/
• Download the latest versions of software and review release notes: http://www.juniper.net/customers/csc/software/
• Search technical bulletins for relevant hardware and software notifications: http://kb.juniper.net/InfoCenter/
• Join and participate in the Juniper Networks Community Forum: http://www.juniper.net/company/communities/
• Open a case online in the CSC Case Management tool: http://www.juniper.net/cm/

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: https://tools.juniper.net/SerialNumberEntitlementSearch/

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

• Use the Case Management tool in the CSC at http://www.juniper.net/cm/.
• Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see http://www.juniper.net/support/requesting-support.html.
CHAPTER 1

Introduction to Service Automation

- Service Automation Overview on page 19

Service Automation Overview

This guide is the complete user guide for Service Automation and provides information about using AI-Scripts, Junos Space Service Now, and Junos Space Service Insight. This guide describes the features of Service Now and Service Insight typically available for devices running Junos OS. These features may look or behave slightly differently based on the specific hardware platform running Junos OS being managed. For additional information about using Service Automation with specific hardware platforms running Junos OS, refer to Service Automation User Guide Addenda - Master List.

Juniper Networks Service Automation is an end-to-end solution designed to streamline operations and enable proactive network management for Junos OS devices. This solution leverages the Junos OS embedded technology to maximize uptime and minimize downtime while streamlining operations and reducing operational expenses.

The solution consists of Advanced Insight Scripts (AI-Scripts), Junos Space Service Now and Service Insight applications, and Juniper Support Systems (JSS). AI-Scripts are installed on devices running Junos OS. Junos Space Service Now and Service Insight applications form the user interface, and JSS allows for delivery of relevant knowledge and insight to enable a transformed support experience.

All Juniper Networks customers can take advantage of the Service Automation capabilities as a deliverable of the Juniper Care and Juniper Care Plus programs. Juniper Networks partners can take advantage of the Service Automation capabilities through the Operate Specialist program. For more details, see http://www.juniper.net/us/en/products-services/technical-services/.

Service Automation comprises the following three components:

- Advanced Insight-Scripts (AI-Scripts):

  AI-Scripts are installed on devices running Junos OS. An AI-Script in an AI-Scripts bundle corresponds to a predefined event such as hardware failure, memory leakage, or output voltage overload and is executed when the predefined event occurs on the device in which the script is installed. When executed, the AI-Script collects data about the predefined event and device configuration, bundles the data in a structured format...
called Juniper Message Bundle (JMB), and stores the JMB at a defined location on the device.

AI-Scripts work in two modes—reactive and proactive. In reactive mode, an AI-Script collects and stores data when a predefined event occurs on the device. In proactive mode, an AI-Script collects and stores data about vital system functions of a device at predefined intervals for monitoring purposes.

- **Service Now and Service Insight:**

  Service Now accesses the JMB generated by an AI-Script from the device, creates an incident for the event in the Service Now database, and notifies the network operator about the event. Service Now can be configured to submit the incident and the associated JMB to Juniper Support Systems (JSS) automatically.

  Service Insight receives alerts called proactive bug notifications (PBNs) from JSS and notifies the network operator about impending problems in the network. Service Insight also receives alerts for devices and services nearing End of Life (EOL) from JSS.

- **JSS:**

  JSS comprises knowledge repositories, such as the End-of-Life (EOL) or End-of-Service (EOS) database, and the Juniper Customer Relationship Manager (CRM), Juniper Contracts systems, and bugs database.

  For customers with a Juniper Care Plus Service contract, JSS sends alerts about devices and services nearing EOL agreements. While resolving an issue received from a customer, JSS analyzes the nature of the issue and sends PBNs to warn other customers about similar issues that can impact devices in their network.

  *Figure 1 on page 21* represents the Service Automation solution.

PART 1

Al-Scripts

• Al-Scripts Overview on page 25
• Installing Al-Scripts on page 31
CHAPTER 2

AI-Scripts Overview

- AI-Scripts Overview on page 25

Advanced Insight Scripts (AI-Scripts) provide the intelligence that devices need to automatically detect and report hardware and software failure or other functional abnormalities to ensure maximum network uptime. AI-Scripts are imported into Service Now in the form of script bundles. For information about adding script bundles to Service Now, see “Adding a Script Bundle to Service Now” on page 130.

When AI-Scripts are installed on a device, the device is said to be AI-Scripts-enabled. An AI-Scripts-enabled device can automatically detect any defined event, such as failure to allocate memory for a process or failure of a hardware when it occurs, and report the event to the network operator. When an event occurs, AI-Scripts generate data about the event, package the data in a structured format called a Juniper Message Bundle (JMB), and store the JMB at a defined location on the device from where Service Now accesses the data for resolution.

This section contains the following topics:

- Working Modes of AI-Scripts on page 25
- Events Detected by AI-Scripts on page 26
- JMB Contents on page 26

Working Modes of AI-Scripts

AI-Scripts work in the following modes to generate a JMB:

- Reactive mode: In reactive mode, the AI-Scripts collect data from the device when a predefined event, such as failure to allocate memory for a process or failure of a hardware, occurs on the device and store the data at a predefined location on the device from where Service Now accesses it for analysis and resolution. The JMB generated in this mode is known as an event JMB or eJMB.

- Proactive mode: In proactive mode, the AI-Scripts periodically collect data on vital system functions and store the data at a predefined location on the device. This data is accessed by Service Now to monitor the device and to predict and prevent risks.
related to the device. The JMB generated in this mode is known as an informational JMB or iJMB.

Apart from event and informational JMBs, AI-Scripts also generate JMBs in response to an event triggered by a user. These JMBs are known as on-demand incident JMBs. When you submit an on-demand incident on the device by using Service Now, Service Now generates an on-demand incident JMB by executing preconfigured CLIs on the device.

Events Detected by AI-Scripts

AI-Scripts detect the following types of events:

- Common software events, including daemon and Packet Forwarding Engine crashes
- Common hardware events, such as PIC alarms
- Hardware platform-specific events, such ASIC issues

JMB Contents

A JMB has the following structure:

- Manifest: The JMB manifest contains a summary of the information primarily needed for creating and submitting a case with JSS for an event. Table 2 on page 26 lists the elements present in a JMB manifest.

Table 2: Elements in the Manifest Section of a JMB

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Event-ID</td>
<td>Specifies the ID of the event in response to which the JMB is generated.</td>
</tr>
<tr>
<td></td>
<td>Host Event-ID is represented in the following format:</td>

</table>

- Trend data: Trend data provide information about the hardware and software operating parameters such as CPU and memory utilization of the Routing Engine and traffic statistics of the Packet Forwarding Engine of the device.

  Trend data are provided for the following:

  - Routing Engine
  - Flexible PIC Concentrators
  - Packet Forwarding Engine
  - Switch Control Board (SCB)
  - Routing protocol process (RPD)
  - Kernel

- Attachment: The files and data in a JMB depend on the type of the event that triggered the JMB. This section provides the output of specific Junos OS commands executed to retrieve data and log files pertaining to the event. Some commands are standard—that is, they are executed for every platform. Some commands are executed specific to a platform. The following commands are common to all platforms:

  - `show system processes extensive`
  - `show pfe statistics error`
  - `show system boot-messages`
  - `show system virtual-memory`
  - `show system buffer`
  - `show system queues`
  - `show system statistics`
  - `show task io`
• show configuration
• show chassis hardware

The JMBs generated by AI-Scripts Release 3.7 and earlier contain outputs of all executed Junos OS commands in a single file. The JMBs generated by AI-Scripts Release 4.0 contain links that you can click to view or download the output of the executed Junos OS commands as shown in Figure 2 on page 29.

Figure 2: Attachment Section in JMB Generated by AI-Scripts Release 4.0

• Deleting a Script Bundle from Service Now on page 131
Installing AI-Scripts

AI-Scripts can be installed on a device running Junos OS in the following two ways:

- **Automatically (recommended):** Using the Junos Space Script Management feature, AI-Scripts can be installed on multiple devices simultaneously. For more information about automatically installing AI-Scripts, see “Adding a Script Bundle to Service Now” on page 130.

- **Manually:** AI-Scripts can be installed manually on one device at a time. For more information about manually installing AI-Scripts to devices, see “Manually Installing AI-Scripts on Devices” on page 33.

AI-Scripts System Requirements

AI-Scripts can be installed and run on devices running Junos OS Release 9.3 or later. For the latest AI-Scripts information, see the AI-Scripts Release Notes.

NOTE: The nocopy, un-link option is not valid when installing AI-Scripts on EX Series devices because the package is automatically deleted from the copied location of the device.

**Downloading AI-Scripts Install Packages and Release Notes**

AI-Scripts are released in AI-Scripts install packages. AI-Scripts install packages are available for download from the AI-Scripts download site. Download also the Advanced Insight Scripts (AI-Scripts) Release Notes.

To download an AI-Scripts install package:

1. Open a Web browser and go to the following location:
2. Log in to the Juniper Networks authentication system using the username and password provided by Juniper Networks. To download the software, you must have a service contract and an access account. If you do not have an access account, complete the registration form at the Juniper Networks website, https://www.juniper.net/registration/Register.jsp.

3. Download the AI-Scripts install package.

If you are installing an AI-Scripts manually, move AI-Scripts Install Package to the /var/sw/pkg directory on the device. If you do not move the AI-Scripts install package to the device, you have to use FTP or Secure Copy Protocol (SCP) in conjunction with the request system scripts add command.

If you are installing AI-Scripts automatically on a group of devices, download AI-Scripts install Package to the same server as the Junos Space Network Management Platform software.

**AI-Scripts Install Package Versioning**

AI-Scripts install packages are versioned as follows:

jais-\(m.n\)Zx.x-signed.tgz

For example:

jais-1.0R1.5-signed.tgz

where,

- \(m.n\) are two integers that represent the software release number; \(m\) denotes the major release number and \(n\) the minor release number.
- \(Z\) is a capital letter that indicates the type of software release. In most cases, it is R, to indicate that this is a released software. If you are involved in testing prereleased software, this letter might be B for beta-level software.
- \(x.x\) is the software build number and spin number.

The AI-Scripts files in the install package are compressed into a tgz tarball file.

Each AI-Scripts install package supports up to 3 previous years of Junos OS software releases.

The **show version** CLI operational command displays the version of the AI-Scripts install package that is installed on a device.

The JMB contains the output of the **show version** CLI command to indicate the version of the AI-Scripts install package installed on a device.

Refer to the **AI-Scripts Release Notes** for the current release information.
AI-Scripts Install Locations on Devices

AI-Scripts are installed on a device hard disk at the following location:

/var/db/scripts/

AI-Scripts are installed on a device flash drive at the following location:

/config/scripts

NOTE: If you configure the load-scripts-from-flash option, the system reads event-scripts from /config/scripts/ directory. Otherwise, the system reads AI-Scripts from the /var/db/scripts/ directory. The /var/run/scripts directory always points to the correct scripts directory.

Automatically Installing AI-Scripts Bundles

You can optionally use Service Now to install AI-Scripts bundles (also known as AI-Scripts install packages) on devices as long as there is a Junos Space Network Management Platform (Junos Space) installation. Service Now communicates with Junos Space to install AI-Scripts bundles on Junos OS devices managed by Junos Space Network Management Platform. For information about using Service Now to install AI-Scripts bundles, see “Adding a Script Bundle to Service Now” on page 130.

If you do not want to use Service Now to install AI-Scripts bundles, you can manually configure and install AI-Scripts bundles to each device separately.

Manually Installing AI-Scripts on Devices

AI-Scripts can be installed on Junos OS devices manually using CLI mode. For manual installation of AI-Scripts on devices, you require the same login credentials that you use to discover devices in Junos Space.

To install AI-Scripts manually:

1. Copy the AI-Scripts install package (example: jais-2.1R2.0-signed.tgz) to the Junos OS device using SCP or FTP.

2. From configuration mode, execute the following commands:
   
   set groups juniper-ais system scripts commit allow-transients

   set groups juniper-ais system scripts commit file jais-activate-scripts.slax optional

   set groups juniper-ais event-options destinations juniper-aim archive-sites /var/tmp/

3. Install the AI-Scripts bundle install package in CLI mode using the command

   request system scripts add <full-path>/jais-2.1R2.0-signed.tgz.

   The AI-Scripts install package is installed on the device.
NOTE: When you install AI-Scripts in the Juniper Networks QFX3000 device, ensure that you install the events scripts only on the controller. The controller installs AI-Scripts on the node devices and enables all the events.

Junos Space Service Now Overview

Junos Space Service Now is an application that runs on the Junos Space Network Management Platform to automate fault management and accelerate issue resolution. This application significantly reduces the resolution time by automating support processes and using device diagnostics for fault monitoring and case automation. Your contract with Juniper Networks determines whether Service Now operates in standalone mode, partner proxy mode, end customer mode, or offline mode. These modes in turn determine which tasks are enabled and disabled in Service Now. For information about Service Now modes, see “Service Now Modes” on page 49.

Service Now receives information about events, such as a process crash, an ASIC error, or a fan failure, when they occur on a device from AI-Scripts installed on the device. AI-Scripts detect an event on the device on which they are installed and automatically collect diagnostic data for the event and package the data into an XML file called Juniper Message Bundle (JMB).

AI-Scripts operate in the following modes to generate a JMB:

- **Reactive mode:** In reactive mode, the AI-Scripts collect data from the device when a predefined event, such as failure to allocate memory for a process or failure of a hardware, occurs on the device and store the data at a predefined location on the device from where Service Now accesses it for analysis and resolution. The JMB generated in this mode is known as an event JMB or eJMB. An eJMB usually includes the device identity, the problem event, log files, and core files. This information is securely transferred to the Junos Space Platform. Service Now creates an incident in response to the event and the received JMB. Service Now then notifies users about the new incident by sending an e-mail or an SNMP trap.

- **Proactive mode:** In proactive mode, the AI-Scripts periodically collect data on vital system functions and store the data at a predefined location on the device. This data is accessed by Service Now to monitor the device and to predict and prevent risks related to the device. The JMB generated in this mode is known as an informational JMB or iJMB.

Apart from event and informational JMBs, AI-Scripts also generate JMBs in response to an event triggered by a user. These JMBs are known as on-demand incident JMBs. When you submit an on-demand incident on the device by using Service Now, Service Now generates an on-demand incident JMB by executing preconfigured CLIs on the device.

Service Now categorizes the JMBs that do not comply with the defined standard data structure or that contain unexpected data elements as error JMBs. Service Now displays the error JMBs on the JMB Errors page. From the JMB Errors page, you can view and download the error JMBs.
In response to a JMB collected from a device, Service Now creates an incident and notifies users about the incident by sending an e-mail or an SNMP trap. You can submit the incident to Juniper Support Systems (JSS), after reviewing the information provided in the JMB, to create a Juniper Networks Technical Assistance Center (JTAC) case. You can also configure Service Now to submit an incident automatically to JSS as soon as the incident is created. Service Now provides an option to filter the device configuration information from a JMB before you share the information with JSS or a Service Now partner (if Service Now is operating in end customer mode).

JSS sends updates to Service Now for you to track the status of the case.

Apart from submitting JMBs to obtain resolutions, you can use Service Now to perform the following tasks:

- Assign an owner (user) to a reported incident.
- Keep users informed about changes made to the incident.
- Set up notification policies for users who need to be kept informed about changes to incidents that affect them.
- Update the incident status.
- Delete JMBs from the Service Now database.
- Export data in the incident and information messages to HTML or CSV format and store the data on the local file system.

To submit incidents, share JMBs, and open support cases with JSS, you must first configure an organization in Service Now. An organization represents a unique Clarify site ID in JSS that is used to identify customers while providing technical support. To add multiple organizations and devices to Service Now, you need to obtain a technical support contract with the level of service that you require. After you have a valid contract, you can submit incidents and JMBs to JSS for support. Without a valid contract, Service Now runs in demo mode and supports one organization and five devices for 60 days. In this mode, you cannot connect with JSS or open technical support cases with JTAC.

If you are a Juniper Networks partner or a direct customer with multiple distinct networks, you can use multiple Service Now organizations to keep customers or networks separate.

For Service Now to monitor and detect events on devices, you must discover the devices by using the Junos Space Network Management Platform, add the devices to Service Now, and then install AI-Scripts on the devices. You can categorize the devices into device groups to manage the devices as a single entity. For example, you can install or remove AI-Scripts simultaneously on all devices in a device group. By associating an organization with one or more device groups, you can maintain groups of devices with similar attributes or uses.

In addition to monitoring and managing devices, organizations, and device groups, you can use SNMP for detecting events that occur on a device. SNMP servers act as destinations where traps are sent when a notification policy is triggered. From Service Now Release 14.1 and Service Insight Release 14.1, Service Now and Service Insight use the proxy server configured on the Junos Space Platform to facilitate communication.
The Service Now dashboard displays the gadgets and workspaces that the user can use to perform various tasks. For more information about the Service Now dashboard, see “Service Now Dashboard Overview” on page 51.

From the Release 14.1 of Junos Space Platform, Service Now, and Service Insight, Service Now and Service Insight are available as hot-pluggable applications. This makes it possible for you to install, upgrade, and uninstall Service Now and Service Insight applications independently of the Junos Space Platform. See the installing, Upgrading, and Uninstalling Junos Space Service Now section of the Service Automation Quick Start Guide for information about installing, upgrading, and uninstalling Service Now and Service Insight.

To install, upgrade, and uninstall Service Now from a Junos Space server, you need Junos Space administrator privileges. You can install, remove, or upgrade Service Now even while Junos Space and Junos Space applications are still running.

With different Service Now user privileges, you can perform the following tasks:

- Add devices to Service Now from the Junos Space Platform.
- Add or delete a script bundle to or from Service Now.
- Install or remove Al-Scripts on or from devices.
- Add, modify, or delete devices and device groups.
- Associate devices with device groups.
- Add, modify, or delete an organization.
- Submit incidents as test cases.
- Test the connection of an organization with JSS.
- Export device data in CSV and Excel formats.
- View information about devices that risk the chance of exposure to events present in a script bundle.
- Export inventory information in CSV and Excel formats.
- Configure global settings: SNMP server and core file upload.
- Share information with Juniper Networks about Service Now incidents and devices.
- Assign an owner, notify users, update status of incidents, and delete incidents.
- View and delete iJMBs, and export device data into HTML format.
- Assign an owner, notify users, and delete an information message.
- View, download, and delete error JMBs.
- Create, edit, and delete a notification policy.

Service Now Domain Overview

A device is assigned to a domain in the Junos Space Network Management Platform. When the device is added to Service Now, the device continues to belong to the domain to which it is assigned in the Junos Space Network Management Platform. Service Now objects such as incidents, device snapshots, error JMBs, and support cases that are related to the device are assigned to the same domain as the device.

When you log in to Service Now, objects such as organization, script bundle, SNMP configuration, and Email template, which are assigned to the domain that you are currently in, and the objects in the system domain are visible to you. If you are assigned to more than one domain, you can access the other domains and objects in those domains by selecting the domains from the Login as username in list. Only the domains to which you are assigned are listed. A super user can access all domains.

Objects that you create when you are logged in to a certain domain are assigned to that domain. However, if you have administrative privileges, you can assign the objects to another domain. For information about changing the domain of an object, refer to “Assigning a Service Now Object to Another Domain” on page 43.

Objects such as script bundles, SNMP configurations, and Email templates that are used by objects in all domains are assigned to the system domain. Objects assigned to the system domain are visible in all domains.

You cannot modify the domain of Service Now devices and the objects such as incidents, error JMBs, device snapshots, and support cases related to the Service Now devices. However, you can modify the domain of devices of end customers. The devices of end customers are, by default, present in the domain assigned to them by the connected member.

When the device is assigned to a domain, objects such as technical or end-customer support cases that are not assigned to any device belong to the domain assigned to the organization associated with the device. Table 3 on page 42 lists Service Now objects and their default domains.

Assigning a Service Now Object to Another Domain

If you are assigned to multiple domains, you can assign an object from the domain that you are currently in to another domain to which you are assigned. All objects except objects in the system domain can be assigned to another domain.

To assign a Service Now object to another domain:

1. From the Service Now navigation tree, select the object.
   The object’s landing page appears.
2. On the landing page, select the object’s instance that you want to assign to another domain.
   You can also select multiple instances of the object to assign to another domain.
3. From the Actions menu, select Assign object to domain. Alternatively, right-click the object and select Assign object to domain.
   The Assign to Domain dialog box appears.
4. Under Assign selected items to domain, select the domain and click Assign.
   The Assign to Domain dialog box closes and the object is not listed on the object’s page.
5. From the Login as username in list, select the domain to which you assigned the object.
   The Service Now GUI is refreshed.
6. Using the Service Now navigation tree, open the object’s page and check whether the object is listed on the page.

Installing, Upgrading, and Uninstalling Junos Space Service Now and Junos Space Service Insight Applications

From Release 14.1 of Junos Space Network Management Platform, Junos Space Service Now, and Junos Space Service Insight, Junos Space Service Now and Junos Space Service insight are available as hot-pluggable applications. This makes it possible for you to install, upgrade, and uninstall Service Now and Service Insight independently of the Junos Space Platform.

CAUTION: If Service Now and Service Insight are already installed on a Junos Space server, do not uninstall them to install or upgrade them to a later version. Uninstalling deletes all the Service Now and Service Insight data from the Junos Space server.
This topic contains the following sections:

- Uploading a Service Now Image File to Junos Space server on page 44
- Installing Junos Space Service Now and Junos Space Service Insight on page 45
- Upgrading Junos Space Service Now and Junos Space Service Insight on page 46
- Uninstalling Junos Space Service Now and Junos Space Service Insight on page 47

Uploading a Service Now Image File to Junos Space server

Before you upgrade or install Service Now and Service Insight, you must upload the required Service Now image file to a Junos Space server.

To upload a Service Now image file to a Junos Space server:

1. Download the Service Now image file from the Juniper Networks support site at http://www.juniper.net/support/downloads/space.html to your local file system.
2. Log in to the Junos Space Platform with the default username and password (super/juniper123).
3. From the navigation tree, select Administration > Applications. The Applications page appears.
4. On the top-left corner of the Applications page, click the Add Applications icon:

   ![Add Applications icon]

   The Add Application page appears.
5. On the Add Application page, perform one of the following tasks:
   - Upload the Service Now image file by using HTTP.
     a. Click Upload via HTTP.
     The Upload Software via HTTP dialog box appears.
     b. Type the name of the Service Now image file or click Browse to navigate to the location where the Service Now image file is located on the local file system.
     c. Click Upload.

   **NOTE:** Upload the Service Now image file by using SCP if you receive the following message:
   
   File size is too big, use scp to upload this file.
   
   - Upload the Service Now image file by using SCP.
     a. Click the Upload via SCP button.
     The Upload Software via SCP dialog box appears.
     b. Enter the following details for the image file to be uploaded by using SCP:
• Username: Enter your username for the local file system.
• Password: Enter your password for the local file system.
• Confirm Password: Retype your password.
• Machine IP: Enter the host IP address of the local file system.
• Software File Path: Specify the file path to access the Service Now image file on the local file system.

c. Click Upload.

The process of uploading the Service Now image file to the Junos Space server begins and the Upload Application Job Information dialog box appears.

6. In the Upload Application Job Information dialog box, click the Job ID link.

The Job Management page is displayed. This page displays the progress of the upload job.

7. After the upload job is complete, go to Administration > Applications on the navigation tree to verify the upload.

The Applications page appears.

8. Click the Add Application icon.

The Add Application page appears. The uploaded Service Now image file should be listed on this page.

Installing Junos Space Service Now and Junos Space Service Insight

Before you install Junos Space Service Now and Junos Space Service Insight:

• Ensure that the versions of Service Now and Service Insight that you want to install are compatible with the version of the Junos Space Network Management Platform installed on the Junos Space Server. For information about the compatibility of the Service Now and Service Insight with Junos Space Platform, refer to http://kb.juniper.net/InfoCenter/index?page=content&id=KB27572.

If the installed Junos Space Platform version is earlier than the compatible version, upgrade the Junos Space Platform to a compatible version first and then upgrade the Service Now and Service Insight applications. For information about upgrading the Junos Space Platform, refer to How Do I Upgrade Junos Space?

• Upload the Service Now image file to a Junos Space server. See “Uploading a Service Now Image File to Junos Space server” on page 44 for information about uploading an image file to the Junos Space server.

CAUTION: If Service Now and Service Insight are already installed on the Junos Space server, do not uninstall them to install another version of Service Now and Service Insight. Uninstalling the applications deletes all Service Now and Service Insight data from the Junos Space server.
To install Service Now and Service Insight applications:

1. Log in to the Junos Space Platform with the default username and password (super/juniper123).

2. From the navigation tree, select Administration > Applications.
   
   The Applications page appears.

3. On the top-left corner of the Applications page, click the Add Applications icon:

   The Add Application page appears.

4. On the Add Application page, perform one of the following tasks:
   
   • If Service Now Release 14.1 is listed, select Service Now Release 14.1 and then click Install.

   • If Service Now Release 14.1 is not listed, upload the Service Now Release 14.1 image file to the Junos Space server.

   To upload the Service Now Release 14.1 image file to the Junos Space server, see “Uploading a Service Now Image File to Junos Space server” on page 44.

   A job is created for the installation process and the Application Management Job Information dialog box appears.

5. In the Application Management Job Information dialog box, click the Job ID link. The Job Management page is displayed. This page displays the progress of the upload job.

6. After the installation job is complete, log out of Junos Space and log in to access Service Now or Service Insight.

Upgrading Junos Space Service Now and Junos Space Service Insight

You can upgrade Junos Space Service Now and Junos Space Service Insight to up to two releases later than the currently installed release. For example, you can upgrade to Service Now Release 14.1 and Service Insight Release 14.1 from the following releases:

• Service Now Release 13.3 and Service Insight Release 13.3
• Service Now Release 13.1 and Service Insight Release 13.1

Service Insight is bundled with the Service Now image file and is upgraded along with Service Now.

CAUTION: Do not uninstall the installed versions of Service Now and Service Insight for upgrading to later versions. Uninstalling the applications deletes all Service Now and Service Insight data from the Junos Space server.

Before you upgrade Junos Space Service Now and Junos Space Service Insight:
Ensure that versions of Service Now and Service Insight to which you want to upgrade are compatible with the Junos Space Platform version installed on the Junos Space server. For information about compatibility of Service Now and Service Insight with Junos Space Platform, refer to http://kb.juniper.net/InfoCenter/index?page=content&id=KB27572.

If the installed Junos Space Platform version is earlier than the compatible version, upgrade the Junos Space Platform to a compatible release first and then upgrade the Service Now and Service Insight applications. For information about upgrading the Junos Space Platform, refer to How Do I Upgrade Junos Space?

Upload the Service Now image file to the Junos Space server. See “Uploading a Service Now Image File to Junos Space server” on page 44 for information about uploading a Service Now image file to a Junos Space server.

To upgrade Junos Space Service Now and Junos Space Service Insight applications:

1. Log in to the Junos Space Platform with the default username and password (super/juniper123).
2. From the navigation tree, select Administration > Applications.
   The Applications page appears.
3. On the Applications page, click Service Now and select Actions > Upgrade Application. Alternatively, right-click Service Now and select Upgrade Application.
   The Upgrade Application page appears displaying all the previously uploaded versions of Service Now.
4. On the Upgrade Application page, perform one of the following tasks:
   - If the Service Now release to which you want to upgrade is listed, select the Service Now release to which you want to upgrade and click Upgrade.
   - If the Service Now release to which you want to upgrade is not listed, upload the Service Now image file to the Junos Space server and then click Upgrade.
   To upload a Service Now image file to the Junos Space server, see “Uploading a Service Now Image File to Junos Space server” on page 44.
   A job is created for the upgrade process and the Application Management Job Information dialog box appears.
5. In the Application Management Job Information dialog box, click the Job ID link. The Job Management page is displayed. This page displays the progress of the upload job.
6. After the upgrade job is complete, navigate to Administration > Applications.
   The Applications page lists the upgraded releases of Service Now and Service Insight.

**Uninstalling Junos Space Service Now and Junos Space Service Insight**

When you uninstall Junos Space Service Now operating in end customer mode, the corresponding connected member in the Service Now partner is deactivated—that is, the connection status of the connected member appears as Deactivated on the Organization Details page of the Service Now partner.
When you uninstall Service Now, Junos Space Service Insight is uninstalled along with Service Now; Service Insight is uninstalled first followed by Service Now.

**NOTE:** Before uninstalling the Service Now and Service Insight applications, ensure that you removed devices that have AI-Scripts installed on them from Service Now. Otherwise, the uninstallation of Service Now and Service Insight fails.

To uninstall Service Now and Service Insight applications:

1. Log in to the Junos Space Platform with the default username and password (super/juniper123).
2. From the navigation tree, select **Administration > Applications**. The Applications page appears.
3. On the Applications page, click **Service Now** and select **Actions > Uninstall Application**. Alternatively, right-click Service Now and select **Uninstall Application**. The progress of the uninstallation process is displayed. After the uninstallation is complete, Service Now and Service Insight applications are not listed on the Applications page.

### Service Now MIBs

- Service Now MIBs on page 48

**Service Now MIBs**

Service Now supports Juniper Networks enterprise-specific management information bases (MIBs). These MIBs define the traps that Service Now sends to a remote network management system. The sent traps correspond to the trigger specified for a notification policy. For information about creating a notification policy in Service Now, see “Creating and Editing a Notification Policy” on page 195.

Using Service Now notifications, you can configure Service Now to send SNMP traps to one or more of your SNMP servers. To enable an SNMP server to receive traps from Service Now, load the following MIBs in the order listed below:

1. jnx-smi.mib
2. jnx-ai-manager.mib

To download these MIB files:

- From the Application Chooser, select **Service Now**. The dashboard appears, which displays the **Service Now Notices** box.
- In the **Service Now Notices** box, click the **click here** link provided in the **To download Service Now Mibs click here** statement.
The Technical Documentation page opens. The Service Now MIBs are stored by release versions in this page.

- Click the respective version to download the required MIB files.

### Related Documentation

- Adding an SNMP Server on page 138
- Junos Space Service Now Overview on page 38

### Service Now Modes

- Service Now Modes on page 49

#### Service Now Modes

- Overview on page 49

**Overview**

Depending on your contract with Juniper Networks, Service Now operates in Standard, End Customer, and Partner Proxy modes. Service Now enables and disables certain features based on its mode of operation.

---

**NOTE:** Service Now and Service Insight should be run in the same server group of a JBoss EAP domain as the Junos Space Network Management Platform. Operating Service Now, Service Insight, and Junos Space Network Management Platform in different server groups is not supported.

For information on running Junos Space applications in server groups, refer to *Junos Space Network Management Platform User Guide*.

---

- Demo mode—Service Now operates in demo mode from the time you install Junos Space and until you create a Service Now organization and validate the organization's connection with JSS.

  In this mode, Service Now supports a single organization and up to five devices. The connection between Service Now and Juniper Support Services (JSS) is disabled, preventing the creation of technical support cases.

- Offline mode—You can accept a standalone or Partner Proxy license file and activate the Junos Space Platform and Service Now application without having to connect to the Juniper Support Service (JSS). You can perform all Service Now tasks except submit cases, create auto submit policies, view exposure, or view cases in Case Manager. You do not have the option to work in offline mode if Service Now is already in the end customer mode.

- Standard mode—in standard mode, you can add multiple Service Now organizations and devices. Service Now is connected to JSS which enables JSS to provide support for the incidents and device snapshots that you submit.
- End customer mode—Service Now can be operated in the end customer mode by customers such as service providers and enterprises who want to manage their networks. In this mode, Service Now and JSS communicate through a Juniper Networks partner's Service Now application. A partner manages multiple customers using a secure HTTPS connection that is established between the customer and the partner's Service Now applications.

The partner provides credentials to a customer to create an organization. The customer creates an organization using the credentials, and submits incidents to the partner. The partner submits the cases to JSS and sends case updates back to the customer. JSS validates the customer only when an iJMB or incident is submitted to it.

Standard mode and end customer mode have similar functions; however, in the end customer mode, you can create only one organization and you submit cases to the partner instead of the JSS.

- Partner Proxy mode—Service Now can be operated in the partner proxy mode by a qualified Juniper Networks partner. A Juniper Networks partner manages Service Now applications of multiple customers. A secure HTTPS connection is made between the Service Now applications of every customer and the partner, as well as between the partner and JSS. The partner receives JMBs from the customers and can either submit the JMBs to JSS on behalf of the customers or handle the cases without JSS support.

In this mode, a partner can add multiple organizations and device groups and associate every customer with an organization. In the JSS, each organization is associated with a Site ID and cases from customers are opened with Juniper Networks under the site ID associated with the customer’s organization. When you add a connected member, a default device group is created. You cannot delete this device group manually; however, it is automatically deleted when the connected member is deleted.

To connect to an end-customer, a Service Now partner uses a self-signed security certificate. Although this method of identification is not trusted, this certificate is automatically accepted to ensure that the communication between the partner and the customer is encrypted.

For Juniper Care Plus customers, Service Now enables Service Insight (SI) application in standalone or partner proxy mode.

Table 4 on page 50 lists the tasks that are enabled for the Service Now modes.

### Service Now Dashboard and Workspaces Overview

- Service Now Dashboard Overview on page 51

### Service Now Dashboard Overview

The Service Now dashboard displays notifications and graphs about platforms and devices with most incidents. You can view the Service Now dashboard by selecting Service Now from the Application Chooser.

The Service Now dashboard includes:
- Service Now Workspaces on page 51
- Dashboard Gadgets on page 53

### Service Now Workspaces

Apart from the Service Central and Administration workspaces, Service Now also provides shortcuts to the Devices and Jobs workspaces by including them in the Service Now navigation tree.
For more details, refer to the section Job Management and Device Discovery Overview from the Junos Space Network Management Platform User Guide.

You can perform the following tasks from the Jobs workspace:

- View status of all scheduled, running, canceled, and completed jobs
- Retrieve details about the execution of a specific job
- View statistics about the average execution times for jobs, types of jobs that are run, and success rate
- Cancel a scheduled job or in-progress job when the job is stalled and is preventing other jobs from starting
- Archive old jobs and purge them from the Junos Space Network Management Platform database
- Retry a job on failed devices on Service Now and Service Insight. The action Retry on Failed Devices is available for the following jobs:
  - Failed event profile installation
  - Failed event profile un-install
  - Failed create on-demand incident job

For retrying jobs on failed devices, see Retrying a Job on Failed Devices from the Junos Space Network Management Platform user Guide.

Table 5 on page 52 lists the tasks that can be performed using the Service Now workspaces.

| Administration | • Add devices to Service Now from the Junos Space platform.  
| | • Add or delete an event profile or a script bundle.  
| | • Add and delete devices and device groups.  
| | • Install or remove AI-Scripts on devices.  
| | • Associate devices with device groups.  
| | • Add, modify, or delete an organization.  
| | • Add connected members and view messages assigned to them (enabled if you are a Juniper Networks partner and working in partner-proxy mode).  
| | • Create organizations in test mode and test the connectivity between the organization and JSS.  
| | • Export device data in CSV and Excel formats.  
| | • Export inventory information in CSV format.  
| | • Configure the global settings (SNMP server and core file upload).  
| | • A client can associate address location to devices, and a user can associate a device location or a ship-to-address to a device.  
| | • Modify E-mail templates. |

Dashboard Gadgets

The Service Now dashboard displays gadgets (graphs and charts) with information that is updated automatically. You can move the gadgets on the dashboard and change their sizes. These changes persist even after you log out of the system. The gadgets displayed on the Service Now dashboard are:

- Platforms with Most Incidents on page 53
- Devices with the Most Incidents on page 54
- Service Now Notices (Upgrade and Contract Notice) on page 55

Platforms with Most Incidents

This gadget graphically displays the platforms with the most incidents and the percentage of incidents detected on them. Clicking the elements within the graph takes you to the Incidents page, where incidents are filtered to display only the incidents that occurred on the platform that you clicked.

For example, when you click the ACX1100 element in the Platforms with most incidents gadget (as shown in Figure 3 on page 54), the Incidents page displays only those incidents that are detected on the ACX1100 router.
Devices with the Most Incidents

This gadget displays the devices with the most incidents graphically, along with the number of incidents detected on them. Clicking the elements within the graph takes you to the Incidents page, where incidents are filtered by the device category. You see only the incidents that affect the device that you selected. You can filter the incidents on the Manage Incidents page according to your selection on this graph. To do this, click the Devices bar of your choice in the graph to take you to the Manage Incidents page, which displays only those incidents that affect the device that you selected.

As shown in Figure 4 on page 54, clicking antlia, which is represented by the yellow bar of the graph, displays the Incidents page where incidents are filtered to display only those incidents that occurred on antlia.
**Service Now Notices (Upgrade and Contract Notice)**

This gadget notifies you about the tasks that you need to execute after a Junos Space upgrade. It also informs you about your contract with Juniper Networks.

**Service Now Inventory Pages**

- Filtering Inventory Pages on Service Now and Service Insight on page 55

**Filtering Inventory Pages on Service Now and Service Insight**

All the inventory pages provide column based filtering so that you can filter data by a specific column. The filters are present in the drop-down list of the columns. The drop-down list has an input field where you can enter the filter criteria. On applying the filters, the table contents display values that match the applied filter criteria.

Depending on the table, different columns can be filtered on. Table 6 on page 56 lists the tables that permit filtering.

User Roles

- Junos Space Service Now User Roles on page 58

Junos Space Service Now User Roles

The Junos Space administrator creates users and assigns roles (permissions) that allow you to access and perform different tasks. You cannot view the tasks that you do not have access to. While Junos Space allows creating users with custom permissions, it also has a set of predefined user roles. These predefined roles cannot be modified or deleted. Table 7 on page 59 lists the predefined roles available in Junos Space Service Now:
<table>
<thead>
<tr>
<th>Role</th>
<th>Workspace</th>
<th>Task groups and Tasks</th>
</tr>
</thead>
</table>
| Service Now Admin     | Administration | • Global Settings: configure an FTP server for uploading core files, manage SNMP traps  
|                       |             | • Address Group: create address groups, associate address groups with devices, modify address groups, delete address groups, assign address groups to domains  
|                       |             | • Device Groups: create device groups, modify device groups, set a device group as the default device group, associate address groups with device groups, assign device groups to domains, delete device groups  
|                       |             | • Service Now Devices: add devices to Service Now, export device inventory information, associate devices with auto submit policies, associate devices with device groups, check FTP server configuration, configure RSI and log file collection on devices, create on-demand incidents, associate devices to address groups, export device information, install event profiles on devices, request Return Materials Authorisation (RMA), uninstall event profile from devices, view exposure of devices to known events, view incidents generated on Service Now, assign the Service Now devices to domains, delete devices from Service Now  
|                       |             | • Email Templates: modify default content of an Email template, restore the modified content of an Email template to its default content  
|                       |             | • Event Profiles: add script bundles to Service Now, set a script bundle as the default script bundle in Service Now, delete script bundles, add event profile to Service Now, push an event profiles to devices, clone event profiles, set an event profile as the default profile, view events included in event profiles, view devices associated with event profiles, assign event profiles to domains, delete event profiles from Service Now  
|                       |             | • Auto Submit Policy: create auto submit policies, export incident reports, modify auto submit policies, change the dampening status of auto submit policies, assign auto submit policies to a domain, delete auto submit policies  
|                       |             | • Organization: add an organization to Service Now, add connected members to organizations, check connection status of Service Now with Juniper Support System (JSS) or with Service Now partner, modify organizations, associate address groups with organizations, delete organizations, update core file upload configuration, view information messages received from JSS, assign organizations to domains  
| Service Central       |             | • Information: view JMBs, export JMBs to HTML, delete JMBs, assign messages received from JSS to connected members, assign ownership to messages, delete messages, flag messages to users, scan devices for impact based on messages received from JSS  
|                       |             | • JMB Errors: download error JMBs, delete error JMBs  
|                       |             | • Incidents: create auto submit policies, view end customer cases in Case Manager, update end customer cases, export JMB to HTML, export incident summaries to Excel, assign an owner to incidents, view end customer cases, flag incidents to users, submit cases to JSS or Service Now partner, view cases in case manager, view KB articles related to an incident, delete incidents, view tech support cases in Case Manager, update tech support cases, upload core files to JSS, view JMB associated with an incident  
|                       |             | • Notifications: create notifications, edit notification filters and actions, copy notifications, delete notifications, enable or disable notifications, assign notifications to domains  |

CHAPTER 5

Using the Service Now Getting Started Assistant

- Service Now Getting Started Assistant Usage Overview on page 61

Service Now Getting Started Assistant Usage Overview

- Service Now Getting Started Assistant Usage Overview on page 61

The Getting Started assistant is a section in the Junos Space sidebar that guides you through the tasks that you can perform as part of the initial setup for every application. It appears when you log in to Junos Space and the Show Getting Started on Startup check box is selected.

To use the Service Now Getting Started assistant, navigate to Service Now, click the Help icon, expand the Getting Started assistant, and click the Initial Setup link. The Getting Started assistant displays five required steps and one optional step.

Every step in the Getting Started assistant contains a task link, and alongside the task links are help icons that provide information about the individual tasks. To execute the steps, click the task links of every step. The inventory page displays the page where you can execute the tasks.

By default, the Getting Started assistant guides you through the steps required to set up standard mode for Service Now.

The following steps are required:

1. Review Global Settings.
   See “Configuring Global Settings” on page 132.

2. Create an Organization.
   See “Adding an Organization” on page 83.

3. Add Devices to Junos Space.
   See the Discovering Devices section of the Junos Space Network Management Platform User Guide.

4. Create a Device Group.
See “Creating a Device Group” on page 91.

5. Install Scripts using Service Now Devices.
   See “Installing an Event Profile on the Devices by Using Service Now” on page 99.

The following step is optional:

- Add a New Script Bundle.
  See “Adding a Script Bundle to Service Now” on page 130.

To activate Service Now in end-customer and partner-proxy modes, see the Activating the End-Customer and Partner-Proxy Modes section in “Service Now Modes” on page 49.

Trouble Ticket APIs Supported by Service Now

• Trouble Ticket APIs Overview on page 63
• Profiles Used by Service Now on page 64
• Setting up Java Based Web Service Client on page 64
• Accessing a Web Service on page 70
• Trouble Ticket APIs Supported by Service Now on page 71
• Error Messages Displayed by OSS/J Client on page 72
• Trouble Ticket Attributes Supported by Service Now on page 74
• Trouble Ticket Events Supported by Service Now on page 76

Trouble Ticket APIs Overview

Service Now supports trouble ticket APIs that allow you to perform the following functions:

• Create, query, close, or cancel trouble tickets (single/multiple)
• Change the values of trouble tickets (single/multiple)
• Obtain notification regarding ticket changes

The Operation Support Systems for Java (OSS/J) delivers standards-based interface implementations (OSS/J APIs) and design guidelines for the development of component-based OSS systems. The web service technology is used to expose the standard set of APIs defined under JSR91 of OSS/J. The OSS/J module is integrated into Service Now. For more details, refer to the JSR 91 specification at http://www.tmforum.org/OSSTroubleTicketAPI/4110/home.html.

The version of the trouble ticket supported by Service Now is TroubleTicket_x790/v0-5.

Related Documentation

• Junos Space Service Now Overview on page 38
• Trouble Ticket APIs Supported by Service Now on page 71
• Trouble Ticket Attributes Supported by Service Now on page 74
• Trouble Ticket Events Supported by Service Now on page 76
Profiles Used by Service Now

A profile in OSS through Java is equivalent to an interaction pattern. A profile describes how a client can interact with the OSS/J application.

Currently, Service Now supports the Web Services style interaction profile (WSIP) for displaying trouble ticket APIs to clients. The reason for choosing Web Services is its ability to enable different systems to communicate at the protocol level without requiring any specific agreement on middleware, software libraries, programming languages, component models, application server platforms, processors or operating systems.

WSIP relies on well established standards such as SOAP (Simple Object Access Protocol) and WSDL (Web Services Description Language).

Setting up Java Based Web Service Client

To set up a Java based web service client:

1. Download the WSDL and XSD files from Service Now server https://IP address/aimOSSTroubleTicketService/OSSJWSDLFile?baseURL=https://[IP Address]/aimOSSTroubleTicketService/JVTTroubleTicketWS, where IP address is the IP address of the Service Now host.

2. Download the OSSJWSDLAndXSDFiles.zip file containing the WSDL and XSD files. Extract the zip files to the required location.

   The zip file contains the following files:
   
   - JVTTroubleTicketSession.wsdl
   - WS-BaseNotification.wsdl
• WS-Resource.wsdl
• License.xml
• xsd/notification/b-2.xsd
• xsd/notification/bf-2.xsd
• xsd/notification/r-2.xsd
• xsd/notification/t-1.xsd
• xsd/notification/ws-addr.xsd
• troubleTicket/OSSJ-Common-v1-5.xsd
• troubleTicket/OSSJ-Common-CBEBi-v1-5.xsd
• troubleTicket/OSSJ-Common-CBECore-v1-5.xsd
• troubleTicket/OSSJ-Common-CBEDatatypes-v1-5.xsd
• troubleTicket/OSSJ-Common-CBELocation-v1-5.xsd
• troubleTicket/OSSJ-Common-CBEParty-v1-5.xsd
• troubleTicket/OSSJ-Common-SharedAlarm-v1-5.xsd
• troubleTicket/OSSJ-TroubleTicket-CBETrouble-v1-2.xsd
• troubleTicket/OSSJ-TroubleTicket-v1-2.xsd
• troubleTicket/OSSJ-TroubleTicket_x790-v0-5.xsd

3. In a windows system, select START > RUN to open the command prompt. Type cmd in the Run dialog box, and then press OK. Navigate to the location where the zip file has been extracted.

4. Navigate to the location where the zip file is extracted and run the following command to generate the service Now OSS/J web service client binaries: 

   \texttt{wsimport –d \[LOCATION\_FOR\_CLIENT\_BINARIES\] JVTTroubleTicketSession.wsdl}

   where \texttt{LOCATION\_FOR\_CLIENT\_BINARIES} is the location to generate the web service client.

Example– OSSJTroubleTicketClient.java:

   \begin{verbatim}
   import java.lang.reflect.Field;
   import java.lang.reflect.InvocationTargetException;
   import java.lang.reflect.Method;
   import java.security.SecureRandom;
   import java.security.cert.X509Certificate;
   import java.util.ArrayList;
   import java.util.List;
   import javax.net.ssl.HostnameVerifier;
   import javax.net.ssl.HttpsURLConnection;
   import javax.net.ssl.SSLContext;
   import javax.net.ssl.TrustManager;
   import javax.xml.bind.JAXBElement;

Accessing a Web Service

Access to a Web Service (WS) or a OSS/J Trouble Ticket (TT) API requires authentication. An OSS/J Client has to use a user name and password of Junos Space server when making calls through the OSS/J TT API to create and modify tickets on the trouble ticket management system.

The procedure to access web service is as follows:

1. The OSS/J client adds the authentication details in the SOAP header of a WS request.
2. The client requests are intercepted by JAX-WS handlers at WS server for getting authenticated.
3. JAX-WS handler parse the SOAP header to get the authentication details.
4. The username and password are authenticated by making REST call to Junos Space. If the authentication is successful, the web service request is forwarded to JVT profile to invoke the appropriate internal rest call to Service Now API.
5. The SOAPFault exception is thrown if authentication fails.

The Web Service messages comply with the WS_SECURITY standard. A dedicated security header defines properties for user and password that must be added.

Soap Header Template

```xml
<soapenv:Header>
  <wsse:Security soapenv:mustUnderstand="0"
  xmlns:wsse="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd"> <wsse:UsernameToken
  wsse:id="UsernameToken-14327075"
  xmlns:wsse="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-utility-1.0.xsd"> <wsse:Username>
  ***</wsse:Username> <wsse:Password
  Type="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-username-token-profile-1.0#PasswordText">***</wsse:Password>
  </wsse:UsernameToken></wsse:Security>
</soapenv:Header>
```

Trouble Ticket APIs Supported by Service Now

The client provides operations (getting, creating, changing or canceling/closing tickets) to manage and retrieve trouble tickets from the trouble ticket management system.

The following list of APIs from JSR91 specification are implemented in Service Now.

- createTroubleTicketByValue
- tryCreateTroubleTicketsByValues
- getTroubleTicketByKey
- getTroubleTicketsByKeys
- setTroubleTicketByValue
- trySetTroubleTicketsByValues
- trySetTroubleTicketsByKeys
- tryCancelTroubleTicketsByKeys
- tryCloseTroubleTicketsByKeys
- cancelTroubleTicketByKey
- closeTroubleTicketByKey
- getTroubleTicketTypes
- getEventTypes
- getEventDescriptor
- getManagedEntityType
- getSupportedOptionalOperations

The following table describes the trouble ticket APIs.

<table>
<thead>
<tr>
<th>Trouble Ticket API</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>createTroubleTicketByValue</td>
<td>Creates a single trouble ticket</td>
</tr>
<tr>
<td>tryCreateTroubleTicketsByValues</td>
<td>Creates multiple trouble tickets</td>
</tr>
<tr>
<td>getTroubleTicketByKey</td>
<td>Obtains a single trouble ticket using the given key and returns only the requested attributes</td>
</tr>
<tr>
<td>getTroubleTicketsByKeys</td>
<td>Obtains multiple trouble tickets using the given keys and returns only the requested attributes</td>
</tr>
<tr>
<td>setTroubleTicketByValue</td>
<td>Updates a single trouble ticket using the given value</td>
</tr>
<tr>
<td>trySetTroubleTicketsByValues</td>
<td>Best effort update of multiple trouble ticket items by the given values</td>
</tr>
</tbody>
</table>
Table 8: Trouble Ticket APIs Supported by Service Now (continued)

Trouble Ticket Attributes Supported by Service Now

The following table lists the attributes supported by Service Now.
### Table 10: Supported Trouble Ticket Attributes

<table>
<thead>
<tr>
<th>Trouble Ticket Attribute</th>
<th>Description</th>
<th>Access Right Provided to an External System</th>
</tr>
</thead>
<tbody>
<tr>
<td>troubleTicketKey</td>
<td>Unique key to identify a trouble ticket.</td>
<td>Read access</td>
</tr>
<tr>
<td>additionalTroubleInfoList</td>
<td>Describes the reported trouble. It is represented by a set of graphic strings.</td>
<td>Read/write/access</td>
</tr>
<tr>
<td>attachmentData</td>
<td>Contains filename and data. The size of the data can be 6 MB (maximum) per attachment Base64 encoded. Attachments can be updated/added through update/create trouble ticket. If file name is not displayed, it is derived from the data. It will be assumed the name of the file in the attachment data will be the name of the file. If the attachment data has no file name, the attachment data will be given an arbitrary file name as attachment_1 and so on.</td>
<td>Only upload access</td>
</tr>
<tr>
<td>closeOutNarr</td>
<td>Provides additional information regarding the trouble report closure.</td>
<td>Read/write access</td>
</tr>
<tr>
<td>relatedTroubleTicketKeyList</td>
<td>Provides a list of related TRs.</td>
<td>Read access</td>
</tr>
<tr>
<td>troubleDescription</td>
<td>Provides a summary of the PR.</td>
<td>Write access is provided only at the first attempt. For all subsequent updates, only read access is provided.</td>
</tr>
<tr>
<td>baseState</td>
<td>Indicates the state of a ticket/case.</td>
<td>Read/write access</td>
</tr>
<tr>
<td>baseStatus</td>
<td>Indicates the status of a ticket/case</td>
<td>Read/write access</td>
</tr>
<tr>
<td>troubleDetectionTime</td>
<td>Indicates when the trouble was detected.</td>
<td>Read/write access</td>
</tr>
<tr>
<td>cancelRequestedByCustomer</td>
<td>Indicates whether the customer has requested to cancel the case. Cancellation request is not permitted if the case is already cleared or closed. The case is closed when a cancellation request is granted.</td>
<td>Write access</td>
</tr>
<tr>
<td>closeOutVerification</td>
<td>Indicates whether the customer has verified the resolution, denied the resolution, or taken no action.</td>
<td>Write access</td>
</tr>
<tr>
<td>customerTroubleNum</td>
<td>Specifies the internal number assigned to the customer (example, the number that is assigned by a customer’s trouble administration system). It allows the customer to access the TTR with this internal number.</td>
<td>Read/write access</td>
</tr>
</tbody>
</table>
Table 10: Supported Trouble Ticket Attributes (continued)

<table>
<thead>
<tr>
<th>Trouble Ticket Attribute</th>
<th>Description</th>
<th>Access Right Provided to an External System</th>
</tr>
</thead>
<tbody>
<tr>
<td>basePreferredPriority</td>
<td>Specifies the urgency of the resolution required by the customer. Its value can be undefined, minor, major, or serious.</td>
<td>Read/write access</td>
</tr>
<tr>
<td>SuspectObjectList</td>
<td>Provides the list of objects that may be the underlying cause of the trouble. This list should be used to pass the device serial number.</td>
<td>Read/write access</td>
</tr>
</tbody>
</table>

Trouble Ticket Events Supported by Service Now

You can track a trouble ticket or a trouble ticket item that is created, modified or deleted, by means of notifications. Service Now supports the WS-BaseNotification (a standard defined by OASIS) to receive events (notifications).

To receive events through a Web Service, you need to subscribe to the server-side web service. The server-side web service implements administration tasks to manage the subscription. The client-side service implements methods to receive events.

The JSR91 standard events implemented by Service Now are described as follows:

- **TroubleTicketCreateEvent**—The trouble ticket management system publishes this event when a trouble ticket is created. This event must be the first event published for a specific trouble ticket.
  
  **Supported attributes**: The trouble ticket must contain all the attributes listed in table “Trouble Ticket Attributes Supported by Service Now” on page 74. The trouble ticket must contain a value for the trouble ticket key to identify the trouble ticket.

- **TroubleTicketAttributeValueChangeEvent**—The trouble ticket management system publishes this event when the value of a trouble ticket attribute is modified. This includes update, closure or cancellation of a trouble ticket as well as changes during the execution of a trouble ticket.
Supported attributes: This event includes all the attributes listed in “Trouble Ticket Attributes Supported by Service Now” on page 74. This event is published when a trouble ticket item is associated to or disassociated from a trouble ticket and also when the baseState or the baseStatus attributes are modified. This event must contain a value for the troubleTicketValue attribute and the value must contains all new values of the modified attributes. Attributes that are not changed are not populated.

- **TroubleTicketStatusChangeEvent**—The trouble ticket management system publishes this event when the status of a trouble ticket is changed. When the status of the trouble ticket changes, both TroubleTicketAttributeValueChangeEvent and TroubleTicketStatusChangeEvent are published. This event is published when the values of the baseState and the baseStatus attributes are modified.

  Supported attributes: The event contains the mandatory attribute troubleTicketKey that holds the key value of the affected trouble ticket, and the baseState and the baseStatus attributes that hold the state value of the new trouble ticket.

- **TroubleTicketCloseOutEvent**—The trouble ticket management system publishes this event when a trouble ticket is closed.

  Supported attributes: This event extends the event type TroubleTicketStatusChangeEvent and thus contains the same attributes used in TroubleTicketStatusChangeEvent, and is used in the same method as TroubleTicketStatusChangeEvent. The mandatory attributes baseState and baseStatus contain the new values. The other attribute value of a trouble ticket contains the history information of the closed trouble ticket. This includes the change of state due to a closed or an updated operation as well as changes during the execution of a trouble ticket implementation.

Administration Overview

You can use Service Now to monitor and manage a device with the help of AI-Scripts that are installed on the device. When AI-Scripts are installed on a device, the device is considered AI-Scripts-enabled and can automatically detect and report incidents and informational JMBs to Service Now.

You can also add devices that are part of the Junos Space platform to Service Now and group them under organizations. An organization is defined by a unique site ID that acts as a customer record in Juniper Networks CRM systems. After creating an organization, you can test its connectivity with JSS and even run it in test mode. Juniper Support Systems (JSS) provides support for the incidents and iJMBs that you submit. This support depends on your service contract level, such as J-Care Efficiency, Continuity, or Agility.

If you are a Juniper Networks partner or a direct customer with multiple distinct networks, you can use multiple Service Now organizations to keep customers or networks separate. Service Now organizations are defined by the site ID (used when opening support cases) under devices and users.

By associating an organization with one or more device groups, you can maintain groups of devices with similar attributes and control a user’s access to devices. Device groups also help you automatically install AI-Scripts on several devices at the same time.
Some administration tasks, such as adding connected members and viewing messages assigned to them, are enabled only when Service Now mode is activated. For more information about Service Now modes, see “Service Now Modes” on page 49.

The Administration workspace enables you to perform the following tasks:

- Add devices to Service Now from the Junos Space platform.
- Add or delete an event profile or a script bundle.
- Add and delete devices and device groups.
- Install or remove AI-Scripts on devices.
- Associate devices with device groups.
- Add, modify, or delete organizations.
- Add connected members and view messages assigned to them (enabled if you are a Juniper Networks partner and running Service Now in the partner proxy mode).
- Run organizations in test mode and test organization connectivity to JSS.
- Export device data in CSV and Excel formats.
- Export inventory information in CSV format.
- Configure the global settings (SNMP server and core file upload).

Organizations Overview

An organization in Service Now represents a unique Clarify site ID in Juniper Support Systems (JSS). JSS uses Clarify Site IDs to identify customers when providing technical support. You can manage multiple sites (each with its own Clarify site ID) using multiple organizations defined in Service Now with just one Service Now installation. This is done by dividing the network into multiple logical customer sites. To communicate with JSS, a Service Now organization requires a site ID, login name, and password. The login name must be a contact associated with the site ID.

Device groups are used to group devices within an organization. By associating an organization with one or more device groups, you can maintain groups of devices with similar attributes or uses. Using device groups, you can control the access that users have over devices. See “Device Groups Overview” on page 91.

For more information about creating device groups, see “Creating a Device Group” on page 91.

While you configure organizations to run Service Now in a preproduction environment, you can avoid the processing of production incident cases by running an organization in test mode. In this mode, the synopsis of the incident is appended with [Test] so that JSS recognizes it as a test case and does not process it.

Service Now organizations are displayed in the Organizations page in the tabular format as shown in Figure 5 on page 81.

Figure 5: Manage Organizations Page

Table 11 on page 82 describes the fields displayed in the tabular view of the Manage Organizations page and in the Organizations Details dialog box.
### Table 11: Organization Column Descriptions

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the organization.</td>
</tr>
<tr>
<td>Site ID</td>
<td>Identifier for the Customer Site in the JSS Clarify system.</td>
</tr>
<tr>
<td>Submit Cases As</td>
<td>Specifies if the cases from a production environment should be submitted to JSS as a real case or a test case. The synopsis of a test case sent to JSS is appended with [Test Mode]. When Service Now is in offline mode, this column is empty.</td>
</tr>
<tr>
<td>User Name</td>
<td>User name to identify the user for communications with the JSS while creating cases or checking for updates. You do not need to enter a user name or password if Service Now is in the offline mode.</td>
</tr>
<tr>
<td>Connection Status</td>
<td>Status of the connection between the organizations and JSS.</td>
</tr>
<tr>
<td>JMB Filter Level</td>
<td>Filter for device configuration information in a JMB to be shared with JSS.</td>
</tr>
</tbody>
</table>

(Only visible in the Detail Summary dialog box, which opens when you double-click the organization)

In the Organizations menu, you can:
- Add an organization
- Add a connected member
- Modify organization parameters
- Test an organization
- Test connectivity to JSS
- Delete an organization
- Associate address group
- Update core-file upload configuration

**NOTE:** This action is available only for connected member in partner proxy mode.

**Related Documentation**

- Adding a Connected Member to Service Now Configured in Partner Proxy Mode on page 85
- Modifying Organization Parameters on page 87
Adding an Organization

An organization in Service Now represents a unique Clarify site ID in Juniper Support Systems (JSS). Clarify Site IDs identify customers when JSS provides technical support. You can use multiple organizations defined in Service Now to manage multiple sites (each with its own Clarify site ID) with only one Service Now installation. This is done by dividing the network into multiple logical customer sites. To communicate with JSS, a Service Now organization requires a site ID, login name, and password. While creating an organization, you can specify the device configuration information in JMBs that you want to share with JSS.

To add a Service Now organization in partner proxy mode:

1. From the Service Now navigation tree, select **Administration > Organizations > Add Organization**.

   The **Add Organization** dialog box appears.

   **Figure 6: Add Organization Dialog Box**

   ![Add Organization Dialog Box](image)

2. Enter the organization parameters in the provided fields.
   
   For a detailed description of these fields, see Table 12 on page 84.

   **NOTE:** In the offline mode, the Add Organization page displays only the Name and the JMB Filter Level fields.
3. Click Submit.
   This action verifies and saves the organization parameters and returns to the Organization page.

To add a Service Now organization in end customer mode:

1. From the Service Now navigation tree, select Administration > Organizations > Add Organization.
   The Add Organization dialog box appears.

2. Enter the organization parameters in the provided fields.
   For a detailed description of these fields, see Table 12 on page 84.

3. Click Submit.
   This action verifies and saves the organization parameters and returns to the Organization page.

**NOTE:** In end customer mode, you can add only one organization.

**Table 12** on page 84 defines the Add Organization dialog box fields.

**Table 12: Organization Credentials Page Field Descriptions**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Privileges</th>
<th>Range/Length</th>
<th>Default</th>

Adding a Connected Member to Service Now Configured in Partner Proxy Mode

Junos Space Service Now that is configured to run in partner proxy mode can manage multiple end customers over a secure HTTPS connection. In the Service Now partner application, end customers are referred to as connected members. For a Service Now partner to communicate with an end customer, the Service Now application at the end-customer location should be activated in end customer mode. For information about end customer mode, see “Service Now Modes” on page 49.

**NOTE:** A connected member can be added to a Service Now partner only after a valid organization is created in Service Now at the end-customer location.
To add a connected member to Service Now configured in partner proxy mode:

1. From the Service Now navigation tree, select **Administration > Organization > Add Member**.

   The **Add Member** dialog box appears.

   **Figure 7: Add Member Dialog Box**

   ![Add Member Dialog Box](image)

2. Enter a name for the connected member.
   The name must contain only alphanumeric characters (a-z, A-Z, 0-9). It cannot contain special characters such as underscores (_), spaces, or hyphens (-). The maximum number of characters allowed is 64.

3. Enter a username for the connected member. The customer should use this username when submitting cases to the Juniper Networks partner. The username must be in the **user@example.com** format.

4. Enter a password for the username.

5. Enter the same password again to confirm.

6. On the JMB Filter Level drop-down menu, select one of the following values to specify the device configuration information in a JMB that can be shared with the Juniper Networks partner and JSS:

   - **Do not send**—Does not send any device configuration information
   - **Send all information except configuration**—Sends all device information except the device configuration information
   - **Send all information with IP Addresses overwritten**—Sends all the device information; however, the IP addresses associated with the device are overwritten with x
   - **Send all information**—Sends all the device information
   - **Only send list of features used**—Sends only the device configuration information

7. If you select the **Override Address** check box for an autosubmit policy, the Service Now partner sends a Return Materials Authorization (RMA) incident of the end customer to JSS by using the ship-to address associated with the device by the Service Now partner. If you do not select the **Override Address** check box, the ship-to address
configured by the end customer is associated with a device when the Service Now partner submits an RMA case to JSS on behalf of the end customer.

8. Click Submit.
   The connected member is created and displayed on the Organizations page.

- Organizations Overview on page 81

### Modifying Organization Parameters

Using Service Now, you can modify the parameters of an organization.

**NOTE:** You cannot edit the name of the connected member and the organization associated with it. For more information about connected members, see “Service Now Modes” on page 49.

To modify the parameters of an organization:

1. From the Service Now navigation tree, select Administration > Organizations.
   The Organizations page appears.
2. Select the organization whose parameters you want to modify.
3. Click Modify Organization from either the Actions list or the right-click menu.
   The Modify Organization appears.
4. Make changes to the organization parameters.
5. Click Submit.
   The changes are saved in the Service Now database. To view these changes, view the details of the organization in the Organizations page.

**Related Documentation**
- Organizations Overview on page 81
- Deleting an Organization on page 87
- Running an Organization in Test Mode on page 90

### Deleting an Organization

As a Service Now administrator, you can use the Service Now Organizations page to delete organizations.

**NOTE:** You cannot delete an organization without first deleting its associated connected members.
To delete an organization:

1. From the Service Now navigation tree, select Administration > Organizations.
   The Organizations page appears.
2. Select the organization that you want to delete.
3. Click Delete Organization from the Actions list or the right-click menu.
   The Delete Organizations dialog box appears asking you to confirm the deletion.
4. Click Delete.
   The selected organization is deleted from the Service Now database and no longer appears in the Organizations page.

NOTE: When you delete an organization, you also automatically delete its associated device groups.

Test the Connection to JSS

From the Organizations page, you can test the connection of every organization with Juniper Support Systems (JSS).

To test an organization’s connectivity with JSS:

1. From the Service Now navigation tree, select Administration > Organizations.
   The Organizations page appears.
2. Select the organization whose connection to JSS you want to test.
3. Click Check Status from either the Actions list or the right-click menu.
   The Test Connection dialog box displays the result of the test connection to JSS, as a success or a failure.

Figure 8: Test Connection Dialog Box
In case of a failure, a description appears stating the reason for the connection failure.

4. Click Close to return to the Organizations page.

NOTE: You cannot check the connectivity status when Service Now works in the offline mode.

Viewing Messages Assigned to a Connected Member

Using Service Now, you can view the list of messages that are assigned to a customer (connected member). This action is available only when Service Now operates in the partner-proxy mode and when you select a connected member in the Organizations page.

To view the messages assigned to a connected member:

1. From the Service Now navigation tree, select Administration > Organizations. The Organizations page displays the list of organizations and connected members.
2. Select the connected member whose list of assigned messages you want to view.
3. Right-click your selection and select View Messages from either the Actions list or the right-click menu.

As shown in Figure 9 on page 89, the Messages assigned to Connected Member page displays the list of messages assigned to the selected connected member.

Figure 9: Messages Assigned to Connected Member Page

4. To view the details of the messages, click the title of the message.

The Message Details dialog box displays information such as the organization that the message is sent to, site ID, title, issue date, summary, instructions, keywords, relevance, owner, and the users that the message was flagged to.

5. Click OK to return to the Organizations page.

Running an Organization in Test Mode

While configuring an organization, you can enable test mode so that you can submit cases as test cases and avoid the processing of production incident cases. In this mode, the synopsis of the incident that is submitted to JSS is appended with [Test ].

To run an organization in test mode:

1. From the Service Now navigation tree, select Administration > Organizations. The Organizations page appears.
2. Select the organization that you want to place in test mode, and select Modify Organization from either the Actions list or the right-click menu.
   The Modify Connected Member dialog box displays the parameters of the selected organization.
3. Select Test Cases from the Submit Cases as list.
4. Click Submit.
   This action ensures that incidents that are submitted to JSS are considered as test cases.

- Modifying Organization Parameters on page 87

Updating Core File Upload Configuration

You can update the core file configuration for a connected member in partner proxy mode. This feature is enabled only for a connected member. If this feature is not enabled, you can use the default setting to upload core files. For more details, see “Uploading Core Files Generated for Events” on page 142.

To change the core file configuration for a connected member:

1. From the Service Now navigation tree, select Administration > Organization. The Organizations page is displayed.
2. Select the organization whose configuration you want to change.
3. Click Update Core File Upload Configuration from either the Actions list or the right-click menu.
   The Modify Core File Upload Configuration for Connected Member dialog box appears.
4. Fill in the required parameters in the displayed fields, and click Submit.
   The configuration is successfully changed.
Device Groups

You can use Service Now to group network elements and manage multiple devices in a single entity called a device group. You use device groups to group devices within an organization. By associating an organization with one or more device groups, you can maintain groups of devices with similar attributes or uses. You can associate one or more devices with every device group.

Only users with Service Now administrator privileges can configure device groups.

From the Device Groups page in Service Now, you can perform the following tasks:

- Create a device group and add devices to it
- Modify device groups
- Delete device groups
- Associate address groups
- Set default device group

Creating a Device Group

You use device groups to group devices within an organization. Only users with Service Now administrator privileges can create device groups and add devices to them. All the new devices are associated to a device group by default.

Creating a new Service Now Organization in Standard mode:

- When a new organization is created, Service Now automatically creates a device group and associates it with the organization.
You can edit and delete device groups that Service Now creates for the organization.

Creating a New Service Now Organization in Partner Proxy Mode:

- When a new organization is created, Service Now automatically creates a default device group and associates it with the organization.
- The default device group is generated by Service Now for the first organization created by the customer.
- Devices added by customer are automatically added to the default device group.
- Administrators can edit but not delete the default device group.

To create a device group:

1. From the Service Now navigation tree, select Administration > Device Groups > Create Device Group.

   The Create Device Group page appears.

   Figure 10: Create Device Group Page

2. Enter a name for the device group within the Name field. The name must contain only alphanumeric characters (a-z, A-Z, 0-9). It cannot contain special characters such as underscores (_), spaces, or hyphens (-). The maximum number of characters allowed is 64.

3. In the Organizations list, select an organization for this device group.

   If you want to add a new organization, click New Organization. See "Adding an Organization" on page 83.
4. Select the devices that you want to add to this device group.

5. Click Add.

   The selected devices are added to the device group. To verify if the devices are added, you can view the details of the device group in the Device Groups page.

### Related Documentation
- Device Groups Overview on page 91
- Modifying Device Groups on page 93

#### Modifying Device Groups

To modify a device group:

1. From the Service Now navigation tree, select Administration > Device Groups.

   The Device Group page lists the existing device groups.

2. Select the device group whose parameters you want to modify, and select Modify Device Group from either the Actions list or the right-click menu.

   The Edit Device Group page appears and displays the parameters of the selected device group.

3. Modify the fields as necessary.

   For Service Now running in partner-proxy mode, you can set any device group as the default while modifying the device group. This is done by selecting the Set as Default check box. However, if the user does not select the Set as Default check box, an error message appears stating Please set other device group as the default device group before unselecting this device group as the default.

   Use the Device Groups navigation drawer on the right-hand side of the screen to add or delete devices from the selected device group.

4. Click Finish.

   The changes are submitted and new values are replaced in the Service Now database. The Device Group page appears.

### Related Documentation
- Device Groups Overview on page 91
- Deleting Device Groups on page 93
- Creating a Device Group on page 91

#### Deleting Device Groups

If you have Service Now administrator privileges, you can delete device groups.

To delete a device group:

1. From the Service Now navigation tree, select Administration > Device Groups.

   The Device Group page lists the existing device groups.
2. Select the device group that you want to delete, and select **Delete Device Group** from either the **Actions** list or the right-click menu.

   The **Delete Device Group** dialog box prompts you to confirm the deletion.

3. Click **Delete**.

   The selected device group is deleted from the Service Now database and no longer appears on the Device Group page.

**Junos Space Service Now Devices Overview**

For Junos Space Service Now to monitor and detect events on devices, you must discover the devices using the Junos Space Network Management Platform, add the devices to Service Now, and then install AI-Scripts on the devices.

You can view only those devices discovered by the Junos Space Platform for which you have permission (based on the role-based access control [RBAC] policy). When you add a device to Service Now, you receive informational JMB (iJMBs) and event JMBs (eJMBs) that help you monitor and resolve issues on the device.

You can group multiple devices into a single device group so that you can manage these devices as a single entity; for example, you can install or uninstall AI-Scripts on all the devices in a device group in a single operation. When the devices in a group stop sending iJMBs, Service Now uses the directive file (.directive) to generate the JMBs for the devices.
The directive file contains commands required to generate iJMBs. For information about iJMBs, see “Device Snapshots Overview” on page 188.

You can view Service Now devices on the Service Now devices page. Table 13 on page 95 describes the attributes of Service Now devices.

### Table 13: Service Now Devices Field Descriptions

</tr>
</tbody>
</table>

To receive on-demand updates about your Service Now contract, click the **Refresh** button on the Device Details page.

The icon, if displayed in the row of a device on the Service Now Devices page, indicates one of the following scenarios:

- There is a mismatch between the versions of AI-Scripts installed on a device and AI-Scripts bundle present on Service Now.

  This icon is also displayed when Service Now does not have an AI-Scripts bundle uploaded, but the device has AI-Scripts installed on it.

  If you place the cursor on the icon, the tool tip displays the following message:

  **There is a mismatch of the AI-Scripts installed on routing engine, on device.**

  For example:

  **There is a mismatch of AI-Scripts installed on 'fpc0' of device ex-4200-sn1.**

  For a device with dual Routing Engines, **routing engine** indicates the Routing Engine on which the version of AI-Scripts installed is different from the AI-Scripts bundle present on Service Now. If the version of AI-Scripts installed on both the Routing Engines is different from the AI-Scripts bundle present on Service Now, the following message is displayed:

  **There is a mismatch of the AI-Scripts installed on routing engine 1, routing engine 2, on device.**

  For example:

  **There is a mismatch of AI-Scripts installed on 're0', 're1' of device mx-104-sn.**
There can be a mismatch between the versions of AI-Scripts installed on a device and Service Now for the following reasons:

- Service Now is unaware of the AI-Scripts version installed on a device—for example, when you add a device to Service Now that already has AI-Scripts installed on it.
- After installing AI-Scripts on a device by using Service Now, you can manually delete AI-Scripts from the device.
- One or more JMB files, attachments, and log files are not deleted from a device after these files are copied from the device to Service Now.

If you place the cursor on the icon, a tool tip displays the following message:

**one or more files (JMB/Attachments/Logs) could not be deleted from the device.**

These files contain the _ais_ string in their names and must be deleted manually from the `/var/tmp` directory of the device.

From the Service Now Devices page, you can perform the following tasks:

- Add devices from the Junos Space Platform.
- Install event profiles on the devices.
- Remove event profiles from the devices.
- Export device data in CSV and Excel formats.
- Export inventory information in CSV format.
- Modify the autosubmit policy.
- Delete devices.
- View information about the devices that are susceptible to known issues.
- Associate devices with a device group.
- Associate devices with an address group.
- View the incidents for the devices supported by Service Now.
- Generate on-demand incidents.
- Request RMA incidents.
- Verify the connection between the devices and the FTP server.

- Exporting Inventory Information in CSV Format on page 103
- Viewing Exposure on page 104
- Modifying Device Groups on page 93
Adding Devices from the Junos Space Platform

You can add devices that are a part of the Junos Space Network Management Platform to the Service Now application. While you add these devices, you can also assign them to a device group and also install AI-Scripts on them.

**NOTE:** Devices that are discovered and added to the Junos Space platform are automatically added to the Service Now application. However, if Service Now is in demo mode, only the first five devices are added.

To add devices from the Junos Space platform to Service Now:

1. From the Service Now navigation tree, select **Administration > Service Now Devices > Add Devices**.

   The Select Devices to Add to Service Now and Click Submit page displays the devices that have not been added to Service Now.

   **Figure 11: Select Devices to Add to Service Now and Click Submit Page**

   ![Select Devices to Add to Service Now and Click Submit Page](image)

2. Select the devices that you want to add.

3. Click **Submit**.
The Add Service Now Device(s) page appears.

4. Click **Apply profiles to added device(s) (manually)** to go to the Install Event Profile page. For more information on installing profiles, see “Installing an Event Profile on the Devices by Using Service Now” on page 99.

The devices are added to Service Now and displayed on the Service Now Devices page. The device **Status** column displays **Imported**.

---

- Installing an Event Profile on the Devices by Using Service Now on page 99
- Modifying Auto Submit Policy on page 115

---

**Installing an Event Profile on the Devices by Using Service Now**

An event profile defines a set of event scripts selected from an AI-Scripts bundle for which Juniper Message Bundles (JMBs) are generated to notify users about an event when the event occurs on a device running Junos OS. When you install an event profile on Juniper Networks devices, the event scripts provide the information needed to automatically detect and report problem (incident) and information events, thus ensuring maximum network uptime.

Service Now uses the Device Management Interface (DMI) to install and remove AI-Scripts on devices. DMI is an extension to the NETCONF network management protocol.

When you install event profiles on individual systems (chassis) with dual Routing Engines, Service Now installs the event profiles on both primary and backup Routing Engines.

---

**NOTE:** While operating in partner proxy mode, you cannot install event profiles on a connected member’s device.

---

The **icon** appears on the device Inventory Landing Page if the versions of the AI-Scripts installed on a Routing Engine and Service Now are different. For a dual Routing Engine, the icon also indicates that the version of the AI-Scripts installed on the primary and backup Routing Engines are different. If you place the cursor on the icon, the tool tip displays the following message:

There is a mismatch of the AI-Scripts installed on **routing engine** on **device**.

To install an event profile on devices:

1. From the Service Now taskbar, select **Administration > Service Now Devices**.
   
   The Service Now Devices page appears.

2. Select the device on which you want to install the event profile. If you have selected one or more devices for installing the event profile, the Install Event Profile action is active even if the devices are not associated with an organization or Device Group.

3. Click **Install Event Profile** from either the **Actions** list or the right-click menu.
The Install Event Profile dialog box appears as shown in Figure 12 on page 100.

Figure 12: Install Event Profile Dialog Box

4. Select the appropriate Device Group from the Add to Device Group field. A user can choose a device group before installing event profile. All the selected devices get associated to the selected device group.

5. Select an event profile from the Use Profile field.

6. (Optional) If you do not want to save a copy of the event profile after it is installed on the device, select the Never store Script Bundle files on device (if selected roll-back option will not be available) check box.

7. (Optional) If you want to remove the script bundle from the device after it is installed, select the Remove Script Bundle files after successful install check box.

NOTE: The two optional options are not available during the installation of AI scripts on the QFX3000-M, QFX3000-G and EX with Dual RE devices.

8. (Optional) If you want to schedule a time for installation, select the Schedule at a later time check box, and specify the Date and time for the installation. The installation process begins automatically at the time you specify.

9. Click Submit.

10. (Optional) If you want to add devices on which you want to install the selected event profile, select the Install Event Profiles on new Devices check box, and select the devices.

11. Click Finish.
The **Save Event Profile** dialog box appears.

12. Click one of the following links based on the required results.

<table>
<thead>
<tr>
<th>Link</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply this profile to original set of devices</td>
<td>The Potential Exposure to Known Issues page displays information about the selected set of devices. A bang (!) icon is placed next to devices, associated with the event profile, that risk the chance of exposure.</td>
</tr>
</tbody>
</table>

**Figure 13: Potential Exposure to Known Issues Page**

- **a.** (Optional) To export device data in an Excel format, click **Export Devices with Exposure to Excel**.
- **b.** (Optional) To view a device’s exposure to known issues, click the respective link displayed in the **Exposure** column. The View Exposure page appears and displays the known issues associated with the respective device. Click **Return to Potential Exposure** to continue.
- **c.** Click **Continue**.
  
  A confirmation pop-up box procedures the final procedure of devices on which the selected event profile must be installed.
  
  You can remove devices from the procedure by clearing the check boxes of the devices you want to delete.

- **d.** Click **Install**.
  
  The selected event profile is installed on the devices with which it is associated, and the Service Now Devices page appears.
  
  To view the status of the event profile installation task, click the job ID link and the Jobs page displays the status of the job. Double-click the job to view information about each step of the installation.

<table>
<thead>
<tr>
<th>Link</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply this profile to devices manually</td>
<td>You can select devices manually on which you want to install the event profile. Select the devices and click <strong>OK</strong>. The <strong>Job Information</strong> dialog box displays the job ID. To view the status of the event profile installation task, click the job ID link and the Jobs page displays the status of the job. Double-click the job to view information about each step of the installation. Click <strong>OK</strong> to return to the Event Profiles page.</td>
</tr>
</tbody>
</table>
### Uninstalling Event Profiles from the Devices

You can use Service Now to uninstall event profiles from devices. You cannot uninstall event profiles from devices that do not have proper login credentials. Service Now uses Device Management Interface (DMI) to install and remove event profiles on devices. DMI is an extension to the NETCONF network management protocol.

**NOTE:** While operating in partner-proxy mode, you cannot uninstall event profiles from a connected member’s device.

To uninstall event profiles from devices:

1. From the Service Now navigation tree, select Administration > Service Now Devices.
   
   The Service Now Devices page appears.

2. Select the devices from which you want to uninstall event profiles, and select Uninstall Event Profile from either the Actions list or the right-click menu.
   
   A message appears asking you to confirm the deletion.

3. Click Submit.
   
   Event profiles are uninstalled from the selected devices.

   To view the status of this task, click the job ID link. The Jobs page displays the status of the job. Double-click the job to view each step of the uninstallation.

### Exporting Device Data in CSV and Excel Formats

You can export Service Now device data to CSV and Excel file formats. A CSV file is a plaintext file that stores each data record separated by a comma. The XML file contains the hardware components installed in the selected device.
To export the device data in CSV and Excel format:

1. From the Service Now navigation tree, select Administration > Service Now Devices.
   The Service Now Devices page appears.

2. Select the device whose data you want to export, and select Export Devices from either the Actions list or the right-click menu.
   The Export Devices dialog box is displayed.

3. Export the device information:
   - click the Export Devices in CSV Format to export the device data in CSV format.
   - click the Export Devices in Excel Format to export the device data in Excel format.

   - Modifying Auto Submit Policy on page 115

Exporting Inventory Information in CSV Format

You can export a customer’s device inventory information to CSV and Excel file formats. A CSV file is a plain text file that stores each data record separated by a comma.

To export the inventory information:

1. From the Service Now navigation tree, select Administration > Service Now Devices.
   The Service Now Devices page appears.

2. Select the device whose data you want to export.

3. Select Export Inventory Information either from the Actions list or the right-click menu.
   The Export Inventory Information dialog box is displayed.

4. Export the inventory information:
   - click the Export Inventory Information in CSV format link to export the inventory information to a CSV file.
   - click the Export Inventory Information in Excel format link to export the inventory information to an Excel file.

   The Export Inventory Job Status dialog box appears and shows the job status.

5. After the job is complete, click the Download link to either open or save the CSV or Excel file.

   The following inventory information are listed: device name, item, model number, part number, serial number, location, ship to address, EOL status, EOL replacement part, EOL date, and description.
NOTE: The device inventory of end-customer devices takes one day to be reflected in the mode.

- Viewing Exposure on page 104

Viewing Exposure

The Service Now Devices page displays a bang (!) icon next to an organization with devices that are susceptible to known issues.

Using Service Now, you can view details of these exposed devices. The details include the device name, Junos OS version, script bundle, and associated information messages as well as a link to the problem report (PR) and a description of the problem.

NOTE: This feature is not available if Service Now is in offline mode.

To view information about the devices that are susceptible to known issues:

1. From the Service Now taskbar, select Administration > Service Now Devices.

   The Service Now Devices page appears.

2. Select the device that is susceptible (with the (!) icon) and click View Exposure from either the Actions list or the right-click menu.

   The View Exposure page appears and displays the device name, product, version, PR, and PR synopsis.

3. Click Return to Device View to go back to the Service Now Devices page.

Generating On-Demand Incidents

Using Service Now, you can create Juniper Message Bundles (JMBs) for specific devices without having to wait for an event to trigger an incident. These JMBs are called on-demand incident JMBs. You can choose to generate on-demand JMBs by using scripts
or remote commands run by Service Now. If you are using remote commands run by Service Now, the JMBs are constructed using the `directive.rc` file preloaded in Service Now. When you submit an on-demand incident to the device, Service Now calls an on-demand incident profile, which triggers an event and generates the incident. These profiles are predefined by Juniper Networks and contain information such as the type of incident and the remote procedure calls (RPCs) used to trigger the incident.

Service Now automatically submits these JMBs to the Juniper Support Systems (JSS) for creating a case. To avoid submitting incidents automatically, clear the **Automatically Submit Cases** check box on the On-demand Incident dialog box.

![NOTE:](image)

- To create an on-demand incident, AI-Scripts Release 3.2 R1 or later must be installed on the device.
- You cannot create on-demand incidents for Juniper Networks QFX3000 Series and EX-XRE200 devices.

To generate on-demand incidents:

1. From the Service Now navigation tree, select **Administration > Service Now Devices**. The Service Now Devices page appears.
2. On the Service Now Devices page, select the device for which you want to generate an on-demand incident.
3. From the Actions menu, select **Create On-Demand Incident**. Alternatively, right-click the device and select **Create On-Demand Incident**.

   You can create on-demand incidents for up to five devices simultaneously.

   The On-demand Incident dialog box appears as shown in **Figure 14 on page 106**.
4. (Optional) At the top of the On-demand Incident dialog box, clear the **Automatically Submit Case** check box to avoid submitting incidents to JSS automatically.

5. (Optional) Select **Use Service Now to Generate Incident** to generate on-demand JMBs by using the Off-Box feature.

   If you select this option, the Incidents page within Service Central displays the incident type as Off-Box for on-demand incidents.

6. Under Email List, click the **Enter Email Id** check box to enter an e-mail ID in the user@example.com format.

7. (Optional) To add or delete multiple e-mail IDs, use the Add Email or Delete buttons respectively.

8. Select how updates about the case should be received from the **Follow Up Method** list. The available options are—Email Full Text Update, Email Secure Web Link, and Phone Call.
9. Select the priority of the case from the **Priority** list. The available options are—Critical, High, Medium, and Low. The default priority is Low.

10. In the **Synopsis** field, enter a synopsis of the on-demand incident.

   The maximum number of characters allowed in the Synopsis field is 1028 characters.

   **NOTE:** The values for the fields listed in steps 6 through 9 are already defined on the basis of the incident that is generated by the selected profile. You can modify these values if needed.

11. In the **Problem Description** field, enter a description of the RMA incident.

   The maximum number of characters allowed in the Problem Description field is 1028 characters.

12. (Optional) If you want to schedule generating the on-demand incident at a later time, select the **Schedule at a later time** check box and enter the date and time for the schedule.

13. Click **Submit**.

   A Job Information dialog box that appears displays the job ID as a link.

   You can click the job ID link to go to the create on-demand incident job on the Jobs page. Double-click the job to open the Create On-demand Incident Status dialog box (shown in Figure 15 on page 107), which displays information about the job such as the profile used in the incident, hostname of the device running Junos OS, job status, and reason for the incident.

**Figure 15: Create On-demand Incident Status Dialog Box**

### Related Documentation

Collecting RSI and System Log Files

Service Now provides the Configure File Collections option to configure the interval during which a Request Support Information (RSI) command can be executed on a device to gather device configuration information. For example, you can set the RSI command to be executed every two hours. When you configure an interval for collecting RSI, Service Now executes the RSI command only once during the configured interval to collect RSI. For events that occur after RSI is collected, RSI is not collected if the event occurs within the configured interval.

The following example illustrates how RSI is collected from a device.
In this example, the following considerations are made:

• Configured interval for collecting RSI: 1hr
• Time at which RSI was last executed: 1:00 PM

<table>
<thead>
<tr>
<th>Time of Event</th>
<th>RSI Executed</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:30 PM</td>
<td>No</td>
<td>RSI is not collected at 1:30 PM as one hour has not yet elapsed since RSI was last collected at 1:00 PM.</td>
</tr>
<tr>
<td>1:59 PM</td>
<td>No</td>
<td>RSI is not collected at 1:59 PM as one hour has not yet elapsed since RSI was last collected at 1:00 PM.</td>
</tr>
<tr>
<td>2:00 PM</td>
<td>Yes</td>
<td>RSI is collected at 2:00 PM as one hour has elapsed since RSI was last collected at 1:00 PM.</td>
</tr>
<tr>
<td>2:01 PM</td>
<td>No</td>
<td>RSI is not collected at 2:01 PM as one hour has not yet elapsed since RSI was last collected at 1:00 PM.</td>
</tr>
<tr>
<td>4:30 PM</td>
<td>Yes</td>
<td>RSI is collected at 4:30 PM as two-and-a-half hours have elapsed since RSI was last collected at 2:00 PM. The configured interval to collect RSI is 1hr.</td>
</tr>
<tr>
<td>4:35 PM</td>
<td>No</td>
<td>RSI is not collected at 4:35 PM as one hour has not yet elapsed since RSI was last collected at 4:30 PM.</td>
</tr>
<tr>
<td>5:30 PM</td>
<td>Yes</td>
<td>RSI is collected at 5:30 PM as one hour has elapsed since RSI was last collected at 4:30 PM.</td>
</tr>
</tbody>
</table>
NOTE: The icon, if present in the device row (next to the device's organization), indicates that while copying a JMB from the device to Service Now, one or more JMB files, such as attachments or log files, are not deleted from the device.

If you place the cursor on the icon, the files that are not deleted appear. You must manually delete these files from the device.

NOTE: From AI-Scripts Release 4.0 onward, the Attachment section of a JMB contains commands executed in response to an event and links that you can click to view or download the command output.

To configure the interval for collecting RSI and system log files:

1. In the Service Now navigation tree, select Administration > Service Now Devices.
   The Service Now Devices page appears.
2. On the Service Now Devices page, select the device for which you want to collect RSI and system log files.
3. From the Actions menu, select Configure File Collection. Alternatively, right-click the device and select Configure File Collection.
   The Configure File Collections dialog box appears as shown in Figure 16 on page 110.
4. In the RSI section of the Configure File Collections dialog box, select one of the following:

- **Do not change settings** to leave the settings for collecting RSI as is. This option is selected by default.

Using this dialog box, you can choose to configure the interval for collecting only the RSI or log files. If you want to configure collecting only the log files without changing the configuration for collecting RSI files, select this option.

For all devices, by default, Service Now is configured to collect RSI every five minutes. However, the following exceptions apply:

- Service Now is configured to collect RSI every 15 minutes for SRX1400, SRX3400, SRX3600, SRX5600, and SRX5800 devices.
- Service Now is configured to not collect RSI for the following devices:
  - ACX Series—ACX1000 and ACX1100
  - EX Series—EX2200 and EX3300
SRX Series—SRX100, SRX110, SRX210, SRX220, SRX240, SRX550, and SRX650

- **Use default setting** to collect RSI from the device for an event if five minutes have passed since RSI was last collected from that device.
- **Do not collect** if you do not want to collect RSI for any event that occurs on the device.
- **Always collect** to always collect RSI for all events that occur on the device.
- **Minimum interval between RSI collection** to configure the minimum time interval for collecting RSI between consecutive events. If you select this option, select the time interval from the drop-down list provided below this option.

5. In the Log Files section of the Configure File Collections dialog box, select one of the following:

- **Do not change settings** to leave the settings for collecting system log files as is. This option is selected by default.
  
  Using this dialog box, you can choose to configure the interval for collecting only the RSI or system log files. If you want to configure collecting only RSI without changing the configuration for collecting system log files, select this option. By default, Service Now is configured to collect system log files for every event.

- **Use default setting** to collect system log files for every event that occurs on the device.

- **Do not collect** if you do not want to collect system log files for any event that occurs on the device.

- **Always collect** to collect system log files for every event that occurs on the device.

6. (Optional) If you want to schedule this configuration for a later time, select the **Schedule 'Collection of Files' changes to be updated on device(s) at specified time:** check box and select a date and time for the schedule from the list.

7. Click **Submit**.

A job is created to save the configuration and the job ID is displayed in the Job Information dialog box.

8. In the Job Information dialog box, click the job ID link to view the status of the job.

- AI-Scripts Overview

**Requesting RMA Incidents**

You can use the Off-Box feature in Service Now to request Return Materials Authorization (RMA) incidents for a device. With the Off-Box feature, Service Now generates RMA incidents using the preloaded `directive.rc` file. Currently, this feature is not supported on devices that are not associated with a device group. If Service Now operates in partner proxy mode, this feature is disabled for devices belonging to connected members.
To request an RMA incident for a device:

1. From the Service Now navigation tree, select Administration > Service Now Devices.
   The Service Now Devices page appears.

2. On the Service Now Devices page, select the device for which you want to request an RMA incident.

3. From the Actions menu, select Request RMA. Alternatively, right-click the device and select Request RMA.

   NOTE: Currently, Service Now supports requesting RMA incidents for only one device at a time.

   The Request RMA page appears as shown in Figure 17 on page 112.

Figure 17: Request RMA page

4. (Optional) At the top of the Request RMA page, clear the Automatically Submit Case check box if you do not want to submit RMA incidents automatically to Juniper Support Systems (JSS).

5. Under Email List, click the Enter Email Id check box to enter an e-mail ID in the user@example.com format.

6. (Optional) To add or delete e-mail IDs, use the Add Email or Delete buttons respectively.

7. From the Follow Up Method list, select the mode for receiving updates about the case.
   The available options are—Email Full Text Update, Email Secure Web Link, and Phone Call.
8. From the **Priority** list, select the priority of the case.
   The available options are—Critical, High, Medium, and Low. The default priority is Low.
9. In the **Synopsis** field, enter a synopsis of the RMA incident.
   The maximum number of characters allowed in the Synopsis field is 1028 characters.
10. In the **Problem Description** field, enter a description of the RMA incident.
    The maximum number of characters allowed in the Problem Description field is 1028 characters.
11. Select the address group from the **Address Groups** list.
    The Address Groups list lists all the address groups configured in Service Now and None. None indicates that no address group is associated with this request.
12. Enter the address in the **Ship-to Address** field to which the device components or parts must be shipped.
13. Click the **Select Device Components** link.
    The Device Physical Inventory Components page that appears displays the device parts with an option to select device parts or components. You can select and add device parts or components to be included in the Request RMA Parts field.
14. (Optional) If you want to schedule generating the on-demand incident at a later time, select the **Schedule at a later time** check box and enter the date and time for the schedule.
15. Click **Submit**.
    The selected parts are populated in the **Request RMA Parts** field. You can verify the contents and then create the incident.

### Deleting a Device from Junos Space Service Now

When you delete a device from Junos Space Service Now, the device is deleted from Junos Space Service Now along with its related incidents and JMBs only from the Service Now database. The device is not deleted from the Junos Space Platform.

To uninstall AI-Scripts from a device, you should first delete the device from Service Now before deleting the device from the Junos Space Platform. When you delete a device that has AI-Scripts installed on it from Service Now, the AI-Scripts are automatically uninstalled from the device.

**NOTE:** If you uninstall a device from the Junos Space Platform first, you need to manually uninstall AI-Scripts from the device.
To delete a device from Service Now:

1. From the Service Now navigation tree, select **Administration** > **Service Now Devices**.
   The Service Now Devices page lists the Service Now devices.

2. Select one or more devices that you want to delete, and click **Delete** on the **Actions** menu. Alternatively, right-click the device and select **Delete**.
   The **Delete Devices** dialog box prompts you to confirm the deletion.

3. Select the **Delete device(s) even if AI-Scripts un-installation fails** check box to delete the device from Service Now even if the uninstallation of AI-Scripts fails on the device.
   If you do not select this option, the device is not deleted from Service Now if the uninstallation of AI-Scripts fails on the device.

4. Click **Delete**.
   The selected device is deleted from the Service Now database and is no longer displayed on the Service Now Devices page.

**Related Documentation**

**Associating Devices with a Device Group**

Using Service Now, you can associate devices with device groups which are associated with Service Now organizations. Associating devices with device groups helps you group devices under different site IDs.

If Service Now is configured to work in the Partner Proxy mode, you can combine devices that are directly managed by Service Now and devices from a connected member in a single Service Now device group. Alternately, you can create a device group for each connected member and associate them to Service Now organizations dedicated to each connected member. This kind of grouping enables you to track and organize technical support cases for a single end-customer using different organizations (site IDs).

To associate devices with device group:

1. From the Service Now taskbar, select **Administration** > **Service Now Devices**.
   The Service Now Devices page lists the Service Now devices.

2. Select the device that you want to associate with a device group and select **Associate Device Groups** from either the **Actions** list or the right-click menu.
   The **Associate Device Groups** dialog box appears.
3. From the Device Group list, select the device group that you want to associate with the selected device.

4. Click Submit.

The device is associated with the selected device group. You can verify the changes on the Service Now Devices page, in the Device Group column.

- Modifying Device Groups on page 93
- Modifying Auto Submit Policy on page 115

**Modifying Auto Submit Policy**

Auto submit policies enable devices to submit incidents that occur on them to JSS automatically. To assign auto submit policies to devices, you must first create them. For information on creating auto submit policies, see “Creating an Auto Submit Policy” on page 144.

To modify an auto submit policy:

1. From the Service Now navigation tree, select Administration > Service Now Devices. The Service Now Devices page appears.

2. Select the devices for which you want to assign auto submit policies, and select Modify Auto Submit Policy from either the Actions list or the right-click menu.

The Modify Auto Submit Policy dialog box appears and displays all the available auto submit policies and selected devices.
3. Select the auto submit policies that you want to assign to the selected devices.

4. To assign auto submit policies to selected devices, click Add.

   To remove an assigned policy from the devices, select the policy and click Remove.

   The Service Now Devices page appears. The Quick View area displays the policies a device is assigned with and the policy status (enabled or disabled).

5. (Optional) To verify your changes, navigate to Administration > Auto Submit Policy and view the list of devices to which the selected auto submit policies are assigned.

Viewing Incidents

You can use Service Now to view the incidents that occur on the devices.

To view incidents:

1. From the Service Now navigation tree, select Administration > Service Now Devices.
   The Service Now Devices page lists the Service Now devices.

2. Select a device to view the incidents that are detected on it.
NOTE: Currently, Service Now allows you to select only one device at a time.

3. Select **View incidents** from either the **Actions** list or the right-click menu. The Incidents page displays the incidents detected for the selected device.

**Verifying the Connection Between the Devices and the FTP Server**

Service Now uploads core files from devices to FTP server. Using service now, you can verify the connection between the devices and the FTP server. This feature is disabled for end-customer devices and also uploading to SFTP server is not supported.

To verify the connection between the device and the FTP server:

1. From the Service Now navigation tree, select **Administration** > **Service Now devices**. The Service Now Devices page appears.
2. Select the device for which you need to verify the FTP connection, and select **Check FTP Server** from either the **Actions** list or the right-click menu. The Check FTP Server Access dialog box appears.
3. Select the device, and click **Submit**. The Alert dialog box appears with the Job ID. Click the **job ID** to go to the Job Management page and monitor the connectivity status.

Event Profiles Overview

An event profile is a set of event scripts, selected from an AI-Scripts bundle that you want to install on Service Now devices.

To create an event profile, you need an AI-Scripts bundle from which you can select the event scripts that you want to include in an event profile. The set of event scripts in an event profile can be updated using the latest AI-Scripts bundle.

The latest AI-Scripts bundle is pre-loaded with Service Now and hence when you install Service Now, the latest AI-Scripts bundle is displayed on the Script Bundles page. You can also download other AI-Scripts bundles from the Juniper Networks software download site and upload them to Service Now (see “Adding a Script Bundle to Service Now” on page 130).

Service Now has a default event profile and an AI-Scripts bundle. The default event profile is always associated with an AI-Scripts bundle. For new Service Now installs or upgrades, the default event profile is associated with the preloaded AI-Scripts bundle.

After installing or upgrading Service Now, you can add additional AI-Scripts bundles and set any AI-Scripts bundle and event profile as the default. The default AI-Scripts bundle is automatically selected while creating a new event profile and the default event profile is automatically selected while installing an event profile on devices.

NOTE: Read the KB article, http://kb.juniper.net/KB19155, before installing AI-Scripts on devices.

Service Now allows you to clone an existing event profile by modifying its name, description, the associated AI-Scripts bundle, set of included event scripts, and event script priorities. Cloning an event profile allows you to make changes without losing the original event profile. After you make your modifications, you can save the cloned event profile and install it on devices on which the original event profile is installed. You can also install the new event profile on any other devices. The priority of event scripts determine the priority shown in the JMBs generated for a Service Now event. After you install event profiles on devices, you can filter and display only those devices on which a specific event profile is installed. Service Now also enables you to export event data that is specific to an event profile to Excel format and delete event profiles that are not associated with devices.

In Service Now, event profiles are displayed on the Event Profiles page (Figure 19 on page 119). The tabular view of the Event Profiles page displays information
about the event profile including the total number of incidents generated per event in the event profile, the total number of active events, the total number of inactive events, the number of devices on which the event profile is installed, most active events, least active events, and inactive events. The default event profile is indicated by a unique icon as shown in Figure 19 on page 119, Base_Profile_3_7R1_2 is the default event profile.

Figure 19: View Event Profiles Page

Using the Event Profiles workspace, you can perform the following tasks:

- Add an event profile
- Push an event profile to devices
- Display devices associated with an event profile
- Set an event profile as default
- Export events data to Excel format
- View an event profile
- Clone an event profile
- Delete event profiles

Adding an Event Profile

An event profile is a set of scripts that are selected from an AI-Scripts bundle. Using event profiles, you can specify the event scripts you want to install on the devices. To add an event profile, you can use the default AI-Scripts bundle that is available when you install Service Now, or upload and use a new AI-Scripts bundle (see "Adding a Script Bundle to Service Now" on page 130).
After you add an AI-Scripts bundle to Service Now, to be able to install the AI-Scripts bundle on the devices, you must create an event profile using this AI-Scripts bundle.

To add an event profile:

1. From the Service Now navigation tree, select **Administration > Event Profiles > Add Event Profile**.

   The Add Event Profile page appears as shown in **Figure 20 on page 120**.

**Figure 20: Add Event Profile Page**

For a description of the fields displayed on this page, see **Table 14 on page 120**.

**Table 14: Add Event Profile Page Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profile Name</td>
<td>Enter a name of the event profile. The name can contain alphanumeric characters, underscore, hyphens and space. The maximum number of characters allowed is 255.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the event profile. The maximum number of characters allowed is 255.</td>
</tr>
<tr>
<td>Script Bundle</td>
<td>Lists the AI-Scripts bundles that are available in Service Now. This consists of the default AI-Scripts bundle that is available with Service Now and the ones that you upload.</td>
</tr>
<tr>

<td>3. High</td>
</tr>
<tr>
<td></td>
<td>4. Critical</td>
</tr>
<tr>
<td>KB Article</td>
<td>Provides a link to knowledge base where you can find information such as cause and solution for the event.</td>
</tr>
<tr>
<td>RMA Event</td>
<td>Specifies if this is an RMA event or not.</td>
</tr>
</tbody>
</table>

2. Enter an event profile name.
3. (Optional) Enter a description for the event profile.
4. Select a script bundle from the Script Bundle list.
   By default, the script bundle that is set as the default is automatically selected and you can modify this selection if required.
5. (Optional) To add a new script bundle, click Add Script Bundle (see “Adding a Script Bundle to Service Now” on page 130).
6. (Optional) To look for specific events, use the Find Events field.
7. Click Submit.
   An event profile is created with your specifications and the Save Event Profile dialog box appears.
Click one of the following links based on the required results.

<table>
<thead>
<tr>
<th>Link</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply this profile to original set of devices</td>
<td>The Potential Exposure to Known Issues page appears and displays information about the selected set of devices. A bang (!) icon is placed next to devices that risk the chance of exposure.</td>
</tr>
</tbody>
</table>

**Figure 21: Potential Exposure to Known Issues Page**

1. (Optional) To export device data in an Excel format, click **Export Devices with Exposure to Excel**.
2. (Optional) To view a device's exposure to known issues, click the respective link displayed in the **Exposure** column. The View Exposure page appears and displays the known issues associated with the respective device. Click **Return to Potential Exposure** to continue.
3. Click **Continue**.
   - A confirmation pop-up box lists the final list of devices on which the selected event profile must be installed.
   - You can remove devices from the list by clearing the check boxes of the devices you want to delete.
4. Click **Install**.
   - The selected event profile is installed on the devices with which it is associated, and the Service Now Devices page appears.

**Apply this profile to devices manually**

The Push to Devices page appears. Here you can select Service Now devices on which you want to install the event profile.

For more information, see “Pushing an Event Profile to Devices” on page 126.

**Return to the Profiles Page**

The event profile installation task is canceled, and the Event Profiles page appears.

Cloning an Event Profile

Service Now enables you to clone an existing event profile and modify its priority to create another event profile. After you clone an event profile, you can redeploy the event profile, or deploy the event profile on new devices. When you create a clone of an event profile, the event profile name is appended with Copy of.

NOTE: Editing an event profile is similar to cloning an event profile. You cannot directly edit an event profile.

To clone an event profile:

1. From the Service Now taskbar, select Administration > Event Profiles. The Event Profiles page appears.
2. Select the event profile that you want to clone, and select Clone from either the Actions list or the right-click menu.

   The Clone Event Profile dialog box displays the attributes of the event profile that you have selected.
3. Select the events that you want to include in the cloned event profile.
4. (Optional) To search for specific events, enter the name of the event in the Find Events field.
5. (Optional) Click the Priority field to modify the event priority. The values are:

   1. Low
   2. Medium
   3. High
   4. Critical
6. Click Submit. The event profile is created and the Save Event Profile dialog box appears.

7. Click one of the following links based on the required results.

<table>
<thead>
<tr>

Deleting Event Profiles

Using Service Now, you can delete multiple event profiles. You can delete an event profile only if it is not associated with a device.

NOTE: When you delete a default event profile, the latest created profile is automatically set as the default.

To delete event profiles:

1. From the Service Now taskbar, select Administration > Event Profiles.
   The Event Profiles page appears.
2. Select the event profiles that you want to delete, and select Delete from either the Actions list or the right-click menu.
   The Delete Event Profiles dialog box displays the list of selected event profiles.
3. Click Delete to confirm.
   The selected event profiles are deleted. Verify the deletion by To verify, you can check the list of event profiles displayed on the Event Profiles page.
4. Check the Event Profiles page to verify the deletion.

Viewing an Event Profile

Using Service Now, you can view an event profile’s name, its description, and the scripts that are associated with it.

To view the event scripts that are part of an event profile:

1. From the Service Now taskbar, select Administration > Event Profiles.
   The Event Profiles page appears.
2. Select the event profile whose details you want to view, and select View Events from either the Actions list or the right-click menu.
   The View Events page displays the event profile’s name, its description, and the scripts that are associated with it. The event script details includes the names of the event scripts, types, subtypes, priorities, link to knowledge base about the event, if the event is a RMA event occurrences in the last 90 days, the total number of occurrences till date, the number of unique devices, and the number of top devices.
3. Click **OK** to return to the Event Profiles page.

**Related Documentation**
- Exporting Events Data in Excel Format on page 129

- Pushing an Event Profile to Devices on page 126

**Pushing an Event Profile to Devices**

An event profile is a set of event scripts that are selected from an AI-Scripts bundle. When you push an event profile onto Juniper Networks devices, these event scripts are installed on the devices. The event scripts automatically detect and report problems (incident) that occur on the device and also provide monitoring information. Service Now uses Device Management Interface (DMI) to install and remove event profiles on devices. DMI is an extension to the NETCONF network management protocol.

When you install event profiles on individual systems (chassis) with dual Routing Engines, Service Now installs the event profiles on both the primary and backup Routing Engines.

**NOTE:** While operating in partner-proxy mode, you cannot install event profiles to a connected member’s device.

To install an event profile on devices:

1. From the Service Now taskbar, select **Administration > Event Profiles**.
   
The Event Profiles page appears.

2. Select the event profile that you want to push to devices, and select **Push to devices** from either the **Actions** list or the right-click menu.
   
The **Push to Devices** dialog box appears (see **Figure 22** on page 126).

**Figure 22: Push to Devices Dialog Box**
NOTE: You can install event profiles only on devices for which you can specify correct login credentials and that belong to a device group.

3. Select the devices on which you want to install the event profile.

4. (Optional) If you do not want to save a copy of the event profile after it is installed on the device, select the **Never store Script Bundle files on device (if selected roll-back option will not be available)** check box.

5. (Optional) If you want to remove the script bundle from the device after it is installed, select the **Remove Script Bundle files after successful install** check box.

6. (Optional) If you want to schedule a time for installation, select the **Schedule at a later time** check box, and specify the **Date and time** for the installation. The installation process begins automatically at the time you specify.

7. Click **Submit**.
   
The Potential Exposure when Event Profile is Installed on Devices page appears and displays information about the selected set of devices. A bang (!) icon is placed next to devices that are susceptible to the events in the event profile.

8. (Optional) To export device data in an Excel format, click **Export Devices with Exposure to Excel**.

9. (Optional) To view the events to which the device is susceptible, click the respective link displayed in the **Exposure** column. The View Exposure page appears and displays the known issues associated for the respective device.

10. Click **Return to Potential Exposure** to continue.

11. To proceed with the installation, Click **Continue**.

   The Install Event Profile dialog box appears. You can remove devices from the list by clearing their respective check boxes.
12. Click **Install**.

   The event profile installation task is performed when scheduled and the **Job Information** dialog box displays the job ID.

   To view the status of this task, click the **job ID** link. The Jobs page displays the status of the job. The **Device Details** dialog box also displays the status of script installation on the selected devices.

   If you have installed the event profile on a dual Routing Engine, the results displayed on the Jobs page shows the status for both the primary Routing Engine and the backup Routing Engine. A **Failed** status indicates that the installation failed on either of the Routing Engines.

13. Click **OK**.

   The View Event Profiles page appears.

- Viewing Exposure on page 104

**Displaying Devices Associated with an Event Profile**

Using Service Now, you can view only those devices that are associated to a specific event profile. This task is disabled when you select an event profile that is not associated to any device.

To display devices associated to an event profile:

1. From the Service Now taskbar, select **Administration > Event Profiles**.

   The Event Profiles page appears.

2. Select the event profile to view the devices associated with it, and select **Show Associated Devices** from either the **Actions** list or the right-click menu.

   The Service Now Devices page displays only the devices that are associated with the event profile that you selected.

**Related Documentation**

Setting an Event Profile as Default

Service Now allows you to set an event profile as the default. When you select devices on which you want to install an event profile, the default event profile is automatically selected as the event profile that must be installed. The default event profile is represented by a unique icon on the View Event Profiles page. If you delete the default event profile, the latest event profile created is automatically set as the default.

To set an event profile as the default:

1. From the Service Now taskbar, select Administration > Event Profiles. The Event Profiles page appears.
2. Select the event profile that you want to set as the default, and select Set as Default Profile from either the Actions list or the right-click menu.
   The Set As Default Profile dialog box prompts you for confirmation.
3. Click Confirm. The selected event profile is set as the default and is automatically selected as the event profile that must be installed when you select devices in the Service Now Devices page for installing event profile. The default event profile (for example, Base_Profile_3_7R1_2 in Figure 24 on page 129) shows the default event profile indicated by a unique icon.

Figure 24: View Event Profiles Page

Exporting Events Data in Excel Format

Service Now enables you to export data such as the number of times a particular event occurred in the devices in the last 7 days, 30 days, 365 days, events that never occurred, and the day on which new events occurred to an Excel file and save it on your local file system.

To export events data to an Excel file:

1. From the Service Now navigation tree, select Administration > Event Profiles. The Event Profiles page appears.
2. Double-click the event profile whose event activity you want to export to an Excel file.
The **Event Profile Detail** dialog box displays details about the event activity that are associated to the event profile that you selected.

3. Click the **Export events to Excel** link.
   The browser dialog box allows you to open or save the Excel file.

4. To open the Excel file, select **Open with**.
   To save the Excel file, select **Save File** and navigate to the folder in your local file system. Click **Save** in the browser dialog box to save the Excel file.

5. Click **OK**.
   The event activity information that appears in the Event Profile Detail dialog box is contained in five separate worksheets in the Excel file.

### Adding a Script Bundle to Service Now

The Script Bundles page provides a central point for managing script bundles (also known as AI-Scripts install packages) downloaded from the Juniper Networks software download site. The script bundles must be stored locally to the system running the Service Now application. You need Service Now Administrator privileges to add a script bundle.

After you add a script bundle to Service Now, to be able to install the script bundle on devices, you must first create an event profile using this script bundle. See “Adding an Event Profile” on page 119.

To add a script bundle:

1. From the Service Now taskbar, select **Administration > Event Profiles > Script Bundles > Add Script Bundle**.
   The Add Script Bundle page appears as shown in Figure 25 on page 130.

**Figure 25: Add Script Bundle Dialog Box**

![Script Bundle page](image)

2. Click **Browse**.
   The File Upload window appears.
3. Locate the script bundle and click **Upload**.

   The selected script bundle is uploaded to Service Now and appears on the Script Bundles page.

**Setting a Script Bundle as Default**

Service Now allows you to set a script bundle as the default. When you create an event profile, the default script bundle is automatically selected as the script bundle from which you select event scripts to associate with the event profile. The default script bundle is represented by a unique icon on the Script Bundles page. If you delete the default script bundle, the latest uploaded script bundle is automatically set as the default.

To set a script bundle as the default:

1. From the Service Now navigation tree, select **Administration** > **Script Bundles**.

   The Script Bundles page lists the available script bundles.

2. Select the script bundle that you want to set as the default, and select **Set as Default Bundle** from either the **Actions** list or the right-click menu.

   The Set as Default Bundle dialog box prompts you to confirm.

3. Click **Confirm**.

   The selected script bundle is set as the default and is represented by a unique icon on the Script Bundles page.

**Deleting a Script Bundle from Service Now**

With Service Now Administrator privileges, you can delete script bundles.

**NOTE:** You cannot delete the pre-loaded script bundle that is available with Service Now.

To delete a script bundle:

1. From the Service Now navigation tree, select **Administration** > **Event Profiles** > **Script Bundles**.
The Script Bundles page lists the available script bundles.

2. Select the script bundle that you want to delete, and select **Delete Script Bundles** from either the **Actions** list or the right-click menu.

The Delete AI-Scripts dialog box prompts you to confirm the deletion.

3. Click **Delete**.

Service Now deletes the script bundle from the database and returns to the Script Bundles page.

**Configuring Global Settings**

You can use global settings of Service Now to perform the following tasks:

- Connect to Juniper Support Systems (JSS) and verify the connection status.
- Connect to a Service Now partner and verify the connection status if Service Now is operating in end customer mode.
- Share information with Juniper Networks about Service Now incidents and Service Now devices.

**NOTE:** You must have Service Now Administrator privileges to configure global settings.

For more information about standard, partner proxy, and end customer modes, see “Service Now Modes” on page 49.

Using the Service Now Global Settings page, a Service Now end customer can connect to a Service Now partner. When the Service Now application of an end customer connects to a Service Now partner, Junos Space uses a self-signed security certificate. Although, Junos Space does not trust this method of identification, it automatically accepts the certificate to ensure that the communication between the partner and the end customer is encrypted. As an end customer, after you connect to the Service Now partner, you enter
end customer mode. After Service Now begins to operate in end customer mode, you cannot revert to standard or partner proxy mode.

After you connect to the Service Now application, you can add an organization using the credentials provided by the partner. For information about adding an organization, see “Adding an Organization” on page 83. After the connection of the organization is validated, you can submit incidents and iJMBs to open cases with the Service Now partner.

If you select the Share Service Now Profile Information option on the Global Settings page, you can periodically send data related to incident activities, devices under management, event policies, and Junos Space operations to JSS. Service Now uploads the data in an XML file and sends the XML file to JSS by using MetadataUploadRequest. These files are uploaded to JSS once a week.

Information about the following elements is collected in the XML file.

- Fabric nodes
- Application summaries
- Devices
- Organization
- Event profiles
- Incidents

Adding an SNMP Server

You can specify a destination for SNMP traps to be sent when a Service Now notification policy is triggered. SNMP traps are sent to these destination only when the notification policy specifies this action. In Service Now > Administration > Global Settings > SNMP Configuration, the specified trap destinations are displayed.

To add and manage SNMP servers, you must have Service Now administration privileges.

To add an SNMP server:

1. From the Service Now navigation tree, select Administration > Global Settings > SNMP Configuration.
   The SNMP Servers page appears.
2. Click Add.
   The Add SNMP Server dialog box appears.
3. Enter a name for the SNMP server. The name must begin with an alphanumeric character. Underscore (_), hyphen (-) and space are allowed. The maximum number of characters allowed is 64.
4. In the SNMP Server field, enter the IP address or host name of the network management station where Service Now SNMP traps are sent. Do not use special characters.
5. Enter the UDP port number.
   The User Datagram Protocol (UDP) port is a mechanism whereby a computer can simultaneously support multiple communication sessions with other computers and programs on the network. A port directs the request to a particular service that can be found at that IP address. The default UDP Port number is 162.
6. Enter a community string using only alphanumeric characters.
A community string is a password that allows access to a network device. It defines the community of people that can access the SNMP information on the device.

7. Select the protocol version from the list that specifies the SNMP versions.
8. Click **Add**.

The specified SNMP server is added to the Service Now database.

### Loading MIBs

When using an MIB browser or other SNMP trap receivers such as HP OpenView to monitor the devices with SNMP, the following MIB files must be loaded. The `jnx-smi.mib` file must be loaded first:

1. `jnx-smi.mib`
2. `jnx-ai-manager.mib`

### Related Documentation

- Configuring Global Settings on page 132
- Editing and Deleting an SNMP Server on page 139

---

**Editing and Deleting an SNMP Server**

SNMP servers are the destination for SNMP traps to be sent when a Service Now notification policy is triggered. You can modify the parameters of these SNMP servers and also delete them.

#### Editing an SNMP Server

To edit an SNMP server:

1. From the Service Now navigation tree, select **Administration** > **Global Settings** > **SNMP Configuration**.
   
   The SNMP Servers page appears.
2. Select the SNMP server whose parameters you want to modify.
3. Click **Edit**.
   
   The **Edit SNMP** dialog box appears.
4. Make the desired changes to the parameters.
5. Click **Save**.
   
   The changes are saved in the Service Now database. To verify, you can view the changes on the SNMP Servers page.

#### Deleting an SNMP Server

To delete an SNMP server:

1. From the Service Now taskbar, select **Administration** > **Global Settings** > **SNMP Configuration**.
The SNMP Servers page appears.

2. Select the SNMP server that you want to delete.
3. Click **Delete**.

The selected SNMP server is deleted from the Service Now database and is no longer displayed on the SNMP Servers page.

### Managing SNMP Traps

Service Now users can choose to enable or disable an SNMP trap attribute to be added for a notification. To manage SNMP traps, you must have Service Now administration privileges.
To Manage SNMP traps, from the Service Now navigation tree, select Administration > Global Settings > SNMP Configuration > Manage SNMP Traps. The SNMP Traps Attributes page appears.

This page displays all the available trap attributes and also the notifications in which these trap attributes are sent. See Figure 27 on page 141.

Figure 27: SNMP Trap Attribute Page

Notifications related to Service Insight are shown in this page only if Service Insight is enabled.

Viewing Proxy Server Settings Configured on the Junos Space Platform

From Junos Space Service Now Release 14.1 and Junos Space Service Insight Release 14.1, Service Now and Service Insight use the proxy server configured on the Junos Space Network Management Platform to facilitate communication.

NOTE: When upgrading to Service Now Release 14.1, the proxy server configured on Service Now is migrated to the Junos Space Platform if no proxy server is configured on the Junos Space Platform. If a proxy server is already configured on the Junos Space Platform, Service Now uses the proxy server configured on the Junos Space Platform.
To view the proxy server settings that Service Now and Service Insight use, navigate to Network Management Platform > Administration > Proxy Servers from the navigation tree. The Proxy Server page lists the configured proxy server.

Uploading Core Files Generated for Events

You can configure Service Now to upload core files that are generated for an event or that are related to an event (A core file is generated when there is a system problem). Core files correspond to events. You can upload specific core files either when a case is submitted for an event or after the case is opened for the event.

To upload core files:

1. From the Service Now navigation tree, select Administration > Global Settings > Core File Upload Configuration.
   The Core File Upload Configuration dialog box appears.
2. Select the upload preference from the Core File Upload Preference drop-down list.
   The available options are:
   - Anonymous FTP directly from device: This option enables you to upload core files directly from the router to Juniper FTP server
   - Disabled-Core Files uploaded manually: This option enables you to manually upload the core files for a case
   - Secure FTP upload through Service Now: This option enables you to upload core files directly from the router to Juniper SFTP server through Service Now
   - Both FTP & SFTP: If this option is selected, Service Now tries to upload core files from the device to the FTP server. If this fails, then Service Now tries to upload the core files to SFTP server

   NOTE: If you select this option, the credentials for FTP and SFTP servers are automatically populated.

3. Enter the required parameters in the respective fields.
4. Click Submit.
NOTE: For Service Now in the end-customer mode, these fields are disabled. In the end-customer mode, the values for all the fields are retrieved from the partner. The Update Credentials field will be available to update the credentials from the partner.

5. Click **Check SFTP Server** to verify the connectivity of the SFTP server.

- Changing the Status of Auto Submit Policies on page 150
- Changing the Status of Dampening on page 151

**Auto Submit Policy Overview**

An auto submit policy is a policy that you create to enable Service Now to submit incidents to Juniper Support Services (JSS) automatically. While using Service Now in end-customer mode, auto submit policies allow Service Now to submit incidents automatically to the Service Now of Juniper Networks partner. When incidents are submitted to JSS, technical support cases are created with Juniper Networks and the status of the incidents are updated on the Incidents page in Service Now. When incidents are submitted automatically, they are filtered based on the JMB Filter Level setting of the Service Now organization to which the device belongs. These cases can be created from the Manage Incidents and the Create Auto Submit Policy pages.

As a Service Now customer, you can dampen incidents. Dampening prevents cases to be submitted for the same incident if the incident occurs within a configurable time period called dampening period. Dampening policy is assigned to individual events. This is applicable to duplicate incidents (same errors, error messages and devices) if Auto Submit Policy is activated. You can select a dampening period for which alerts are dampened for the same incidents and for the same device(s), device Group or organization.

Service Now uses the event ID and synopsis on the incident to dampen an incident. Whenever an event occurs on a device, Service Now checks if an auto submit policy is
defined for that device. If an auto submit policy is defined, Service Now checks for the dampening status on the policy. If the dampening status is enabled, Service Now gets the user defined dampening interval for the event reported on a device. If a dampening interval is found, Service Now checks when the last incident was created for an event ID and synopsis. If the last incident occurred before the defined dampening interval or if it had occurred during the defined dampening interval but is in closed state, a new incident is created; otherwise incident is not created. Event RMA is always dampened.

To view auto submit policies, select Administration > Auto Submit Policy, from the Service Now taskbar. The Auto Submit Policy page appears as shown in Figure 28 on page 144.

Figure 28: Auto Submit Policy Page

You can perform the following tasks from the View Auto Submit Policy page

- Change the status of auto submit policies
- Export incidents report
- Delete auto submit policies
- Modify an auto submit policy
- Change dampening status

Related Documentation

- Adding an SNMP Server on page 138
- Creating and Editing a Notification Policy on page 195

Creating an Auto Submit Policy

An auto submit policy enables incidents that are generated on Service Now to be submitted to JSS automatically, creating a Tech Support Case. Although events with priority P1 can be included in auto submit policies, they do not get automatically submitted to JSS. Therefore, P1 events must be submitted manually and JTAC should be called immediately.
To create an auto submit policy:

1. From the Service Now navigation tree, select Administration > Auto Submit Policy > Create Auto Submit Policy.
   The Choose devices to include in Auto Submit Policy page appears as shown in Figure 29 on page 145.

![Figure 29: Auto Submit Policy Creation Page](image)

2. In the Policy Name field, enter a name for the policy. The name can contain only alphanumeric (a-z, A-Z, 0-9), underscores (_), and hyphens (-). The maximum number of characters allowed is 255.

3. Select the devices for which you want to create an auto submit policy.
   - To filter devices by their organization, in the show list, select By Device Group and select an Organization in the Organization field. A new list displays devices filtered organizations or device groups.
   - To filter devices by device group, in the show list, select By Device Group and select a Device Group from the Device Group field. A new list displays devices filtered organizations or device groups.

A list is displayed by filtering the devices based on the selected organization or device group.

4. Select the devices for which you want to assign the auto submit policy.
   (Optional) To display the list of selected devices to which you want to assign the auto submit policy:
   a. Click the Show Selected Devices link.
      The Selected Devices dialog box displays the list of devices that you selected.
   b. Verify the list and click Close to return to the previous page.

5. Click Next.
   The Choose events to include in Auto Submit Policy page appears.
6. Select the **Select All Events Across Pages** check box to include all the listed events to the auto submit policy. You can also manually select the events that you want to include in the auto submit policy. Events with priority P1 are not available for selection. Do not include events that are inactive for the devices selected in Step 4. You can easily identify these events by looking at the icons that are used to represent them (see Table 18 on page 146).

To find events, type the event name in the **Find event** field and then select the event. As you type an event name, all the events with names beginning with the text that you entered are displayed in the list. For example, as shown in Figure 30 on page 146, when you type **audi** in the **Find event** field, all events with names beginning with audi are listed.

**Table 18: Icons That Represent the Event Types and Their Descriptions**

<table>
<thead>
<tr>
<th>Event Icons</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="icon" /></td>
<td>Event is inactive for all the selected devices. Do not include this event in the auto submit policy.</td>
</tr>
<tr>
<td><img src="image" alt="icon" /></td>
<td>Event is inactive for some of the selected devices.</td>
</tr>
<tr>
<td><img src="image" alt="icon" /></td>
<td>Event is active for all the selected devices.</td>
</tr>
<tr>
<td><img src="image" alt="icon" /></td>
<td>Event is, by default, priority P1 for one or more selected devices. Although these events can be included in the auto submit policies, they do not get automatically submitted to JSS. You can open a case for these events only by contacting JSS directly over phone.</td>
</tr>
</tbody>
</table>
7. (Optional) To display the list of selected events that you want to include in the auto submit policy:
   a. Click the Show Selected Events link. The Selected Events dialog box displays the events that you selected.
   b. Verify the list and click Close to return to the Choose events to include in Auto Submit Policy page.

8. Click the Duplicate Incident Dampening link to set the dampening interval for the selected events. The Duplicate Incident Dampening dialog box appears.

9. Choose a dampening interval from the Dampen Incidents for drop-down list.
   - None creates an incident in Service Now for each occurrence of the selected events on the selected devices.
   - Always: After the first occurrence of the selected events on the selected devices, no incident is created for the events in Service Now. An incident is created on the first occurrence of the event. No incident is created for a selected event on a selected device until the incident is closed or deleted.
     Always does not create incidents after the first occurrence of the selected events on the selected devices. An incident is created for the first occurrence of the selected events on the selected devices. The next incident is created only after the existing incident for the event is closed or deleted.
   - Dampening intervals of 1hr, 2hr, 3hr, etc. does not create incidents in Service Now for the specified time duration after the first occurrence of a selected event in a selected device.

10. Click Next. The Submit Case Options page appears.

11. Click the Enter Email Id field to enter an e-mail IDs in the format user@example.com. To add, or delete multiple e-mail IDs, use the Add Email and Delete buttons.

12. Click Modify to modify the site ID or username details of organization.
    The Make Selection to Change Site ID or Use dialog box appears.
    - To modify the site ID, click Default Org, and select the site ID from the Site ID list.
    - To modify the user name, click User Name, and enter the username and password of the selected Site ID or organization in their respective fields. After your user credentials are validated, click Get Sites to select a site ID specific to the new user.

13. Click OK. The Summary of Auto Case Policy to be created page lists the details such as the selected events, the devices on which they occurred, the event synopsis, and the dampening status.
    The Submit Case Options page appears again.

14. Select the Upload Core Files check box if you want the auto submit policy to upload core files to service for the selected events.
15. Select the **Delete Core Files from Router after Uploading** check box if you want to delete core files from the device after uploading it to Service Now.

16. In the **Follow Up Method** list, select the method that you would like to use to follow up on the case. The available options are Email Full Text Update, Email Secure Web Link, and Phone Call.

17. In the **Priority** field, select the priority of the case. The available options are Critical, High, Medium, and Low. The default priority is Low.

18. In the **Add Comments to Synopsis** and **Add Comments to Description** fields, enter a synopsis and description for the case.

   When submitting on-demand or off-box incidents, you can edit the auto-generated synopsis and description. The maximum number of characters allowed for the synopsis and the description are 255 and 1,028 respectively.

19. Click **OK**.

The auto submit policy is created and listed in the View Auto Submit Policy page. When the selected events occur on the devices with auto submit policy, incidents are automatically submitted to Juniper Support Services (JSS) and a Tech Support Case is created. By default, auto submit policies are enabled. To disable auto submit policies, see “Changing the Status of Auto Submit Policies” on page 150.

- Administration Overview on page 79
- Modifying Auto Submit Policy on page 115

**Modifying an Auto Submit Policy**

Junos Space enables you to modify the events and devices that are specified in an auto submit policy.

To modify an auto submit policy:

1. From the Service Now navigation tree, select **Administration > Auto Submit Policy**. The Auto Submit Policy page appears.

2. Select the auto submit policy that you want to modify and select **Modify Auto Submit Policy** from either the **Actions** list or the right-click menu.

   The details of the selected auto submit policy are displayed in an editable format.

3. Make your modifications to the events and devices for which the incidents must be automatically submitted to JSS.

4. Click **Save**.

   Your changes are saved and the auto submit policy is listed in the Auto Submit Policy page with your modifications.
Deleting Auto Submit Policies

To delete auto submit policies:

1. From the Service Now navigation tree, select Administration > Auto Submit Policy. The Auto Submit Policy page appears.

2. Select the auto submit policies that you want to delete, and select Delete from either the Actions list or the right-click menu.
   The Delete Policies dialog box appears.

3. Click Delete to confirm.
   The selected auto submit policies are deleted and removed from the View Auto Submit Policy page.

Exporting an Incidents Report

To export information about incidents stored in auto submit policies:

1. From the Service Now navigation tree, select Administration > Auto Submit Policy. The Auto Submit Policy page appears.

2. Select the auto submit policies that you want to export to an Excel file, and click Export Incidents Report from either the Actions list or the right-click menu.
   The Export Incidents Report dialog box is displayed.

3. Click the Click here to download Incidents for Auto submit Policy above link to generate the Excel file.
   - To open the Excel file, select Open with and click Open.
   - To save the Excel file on your local file system, select Save File, navigate to the folder where you want to save the Excel file, and click OK.
     Detailed information about the selected auto submit policies appears in an Excel spreadsheet.
Changing the Status of Auto Submit Policies

Incidents can be submitted to JSS only when an auto submit policy is enabled. To enable or disable an auto submit policy:

To change the status of auto submit policies:

1. From the Service Now navigation tree, select Administration > Auto Submit Policy. The Auto Submit Policy page appears.
2. Select the auto submit policies for which status need to be enabled and select Change Status from either the Actions list or the right-click menu.

The Change Auto Submit Policy Status dialog box displays the current status of the selected auto submit policies. See Figure 31 on page 150.

Figure 31: Change Auto Submit Policy Status Page

(Optional) Click the Schedule at a later time check box and specify a date and time to enable the auto submit policy.

3. Click Change Status.

The action is initiated and a Jobs dialog box displays the Job ID. Click the link to view the Jobs page where you can view the status of this action.

4. After the job is complete, click OK.

The Quick View of the auto submit policy is displayed in the Auto Submit Policy page. Table 19 on page 151.

Changing the Status of Dampening

The Change dampening status on View Auto Submit Policy page enables you to change the dampening status for an auto submit policy. You can select one or multiple auto submit policies and change their dampening status (from Enabled to Disabled or vice versa).

The incidents are dampened only if the dampening status of a policy is enabled.

To change the dampening status:
1. From the Service Now navigation tree, select Administration > Auto Submit Policy. The Auto Submit Policy page appears
2. Select the auto submit policies whose dampening status needs to be changed.
3. Select Change dampening status from either the Actions list or the right-click menu.

The Change Auto Submit Policy Dampening Status dialog box appears showing the selected Auto submit policies. See Figure 32 on page 152.

Copyright © 2014, Juniper Networks, Inc.
4. Click **Change Status**. The dampening status of the policy is changed.

Address Group Overview

Using Service Now, a client can associate address location to devices, and a user can associate a device location or a ship-to-address to a device. The ship-to-address is used by service now to inform the logistics team of Juniper where to ship a particular part in case an RMA case is opened.

Partner proxy users can use the partner address instead of customer address when submitting cases to Juniper. This can be done through a setting at the connected member and when submitting a case manually. For an auto submit case policy, the partner address can be used if this feature is selected by the partner. Otherwise the end-customer address must be used. If the partner uses the partner address, both partner address and customer address must be shown for the device. However, only the partner address is shown when submitting an incident to Juniper.

Service Now also provides the functionality wherein a client can update notes to an already opened CRM case with juniper.

In Service Now, a set of already defined address groups are listed in the View Address Group page. The tabular view of the View address Group pages provides details about the address group and the devices.

You can perform the following tasks from the View Address Group page:

- Create a new address group
- Modify an existing address group
- Delete an address group
- Associate address group to a set of devices

A user has the option to associate devices to any of the address groups defined in the system. Devices can also be associated to an address group subtypes (Location, Ship-to, and Both) from the organization ILP, device group ILP, and devices ILP. A user can choose to associate address group on the corresponding ILP.

- Associating Devices with an Address Group From an Address Group ILP on page 155

### Associating Devices with an Address Group From an Address Group ILP

Using Service Now, you can associate devices with address groups from an address group ILP.

To associate a device with an address group from address group ILP:

1. From the Service Now navigation tree, select **Administration > Address Group**.

   The Address Group page appears.

2. Select the address group that needs to be associated with a device, and select **Associate Devices** from either the **Actions** list or the right-click menu. The Associate Address Group to Devices page appears. See Figure 33 on page 155.

**Figure 33: Associate Address Group to Devices Page**

You can associate devices to this address group in any of the following subtypes: Location, Ship-to or Both. These subtypes of the address group represent the device location or ship-to address of a device. In case of an RMA event, the ship-to address is used by logistics team of Juniper to ship the defective part to the customer directly, without manual intervention. A device can have only one location or ship-to address associated to it. You can click **Location** to associate a device to a location. Repeat the same procedure for Ship-to and Both. Clicking on the left hand side menu alone results
in displaying the already associated devices for this subtype. If you associate a device to both Ship-to and Location on an address group, all the previous associated links to the device are removed and the latest changes are effective.

You can assign an address to a device as its location, ship-to or both. In case of an RMA event, the ship-to address is used by the logistics team of Juniper to ship the defective parts for the device. A device can have only one location and ship-to address.

3. The address group must be assigned to the devices as the address of their location, shipping address or the address for both the location and shipping.
   - To assign the address group as the address of a device location, under Select Address Types, click Location.
   - To assign the address group as the shipping address for a device, under Select Address Types, click Ship-to.
   - To assign the address group as the address for both shipping and location, under Select Address Types, click Both.

4. In the Associate or remove devices from section, click the Plus icon.
   The Select Devices page appears listing all the devices present in service now. If required, filter the devices.
   - To filter by organization, in the Show list, select By Organization and select the Organization from the Organization list.
   - To filter by Device Group, in the Show list, select By Device Group and select the Device Group from the Device Group list
   - To filter by name of device, in the search field, enter the first few characters of the device name

5. Select the devices from the device list to assign the address group and click Submit. The address group is assigned as the address of the selected devices’ location, shipping address or the address for both shipping and location as specified in Step 3 and the Associate Address Group to Devices page is displayed.

6. To remove a device association from one of the subtypes, click on the subtype link on the left. The devices associated to the selected subtype are listed. Select a list of devices on the right and then click on the cross button on the right.

7. The Disassociate Devices window appears. Click Remove. The devices are removed from this address group subtype (Location, Ship-to or Both).

Devices can also be associated to an address group sub types through organization ILP, device group ILP and devices ILP.

Associating Devices with an Address Group From an Organization ILP

Using Service Now, you can associate devices to address groups from organization ILP.

To associate a device to an address group from organization ILP:

1. From the Service Now navigation tree, select **Administration > Organizations**. The Organizations page appears.

2. Select the address group that needs to be associated with a device, and select **Associate Address Group** from either the **Actions** list or the right-click menu. The Associate Devices to Address Group page appears.

3. Select the address group/Address group subtype [i.e. Location and Ship to Address] from the combo box and click **Submit**. All the selected devices are associated to the new address group/address subtype. This page lists the devices present under the selected organization. The Location and Ship-to Address fields show address group names if the devices already have an association present in the system.

Associating Devices with an Address Group from a Device Group ILP

Using Service Now, you can associate devices to address groups from device group ILP.
To associate a device to an address group from device group ILP:

1. From the Service Now taskbar, select Administration > Device Groups. The Device Groups page appears.

2. Select the device that needs to be associated with an address group, and select **Associate Address Group** from either Actions or the right-click menu.

   The Associate Devices to Address Group page appears. This page lists the devices present under this selected device group. The Location and Ship-to Address fields will show address group names if the devices already have an association present in the system. See Figure 35 on page 158.

   **Figure 35: Associate Devices to Address Group Page**

3. Select the devices in the device group to be associated with the address group. Selecting the check box to the left of **Hostname** selects all the devices.

4. In the **Location** and **Ship-to Address** fields, select the location and ship-to address of the devices.

5. Click **Submit**.
   
   All the selected devices will get associated to the new address group and address type.

E-mail Templates
- E-mail Templates Overview on page 160
- Viewing E-mail Templates on page 161
- Modifying E-mail Templates on page 161
E-mail Templates Overview

You can use Service Now to send notification for an event through e-mail. Service Now has default e-mail templates whose contents can be modified. However, you cannot modify or delete the default template files. As an administrator, you can update or configure the e-mail content sent to the users during notification.

E-mail templates provide the format for sending e-mail notifications for events to users. There is a default E-mail template for various situations such as for sending notifications listing the devices for which technical support contract licenses are to be expired in 60 days or for sending notifications listing the devices that are sending device snapshots.

These templates can be modified. Service Now provides default e-mail templates for which cannot be deleted or modified.

Service Now displays two types of templates: license specific and generic e-mail templates. The display of templates is based on the installation of Service Now. If Service Now is installed in standalone mode, only standalone related templates are displayed. If Service Now is installed in partner mode, only partner related templates are displayed.

Figure 36: E-mail Templates Page

From the e-mail templates page in Service Now, you can perform the following tasks:

- View e-mail templates
- Modify e-mail templates

Related Documentation:
- Viewing E-mail Templates on page 161
- Modifying E-mail Templates on page 161
**Viewing E-mail Templates**

The E-mail templates page in Service Now helps you manage e-mail templates.

To view e-mail templates:

1. From the Service Now navigation tree, select **Administration > Email Templates**.
   
   The E-mail Templates page appears.

2. Double click the required template from the list.
   
   The Email Template Details page appears. The Email Template Details page includes the following information:
   
   - Name of the incident
   - Date and time when the template content was last updated
   - Description of the template
   - Subject of the e-mail template
   - Template contents that can be modified

**Related Documentation**

- E-mail Templates Overview on page 160
- Modifying E-mail Templates on page 161

**Modifying E-mail Templates**

Using Service Now, you can modify the contents of the e-mail templates. An e-mail template for an End customer contains $ variables and static content. $ variables cannot be modified but can be removed. All other static content can be modified on a template.

To modify an e-mail template:

1. From the Service Now navigation tree, select **Administration > Email Templates**.
   
   The Email Templates page appears.

2. Select the e-mail template whose content you want to modify and select **Modify** from either the **Actions** list or the right-click menu.

   If a template contains HTML table, then the Template contents field is followed by table columns in a grid separately. You can remove a column from the template by clearing the check box for that column. The column can be added again by selecting it again.

Service Central Overview

The Service Central workspace enables you to manage incidents, information messages, device snapshots, notifications, and error JMBs. Incidents are problem events that are detected in a device and sent to the Service Now application. When an event occurs on a device, AI-Scripts installed on the device create files called Juniper Message Bundles (JMBs) that contain comprehensive information about the device identity, the problem event, and diagnostics. The JMB file is then transferred securely from the device to Service Now. Service Now searches for new incidents and displays the incidents on the Incidents page within Service Central.

The Service Central workspace provides the following three gadgets:

- Incident severities—provides a graphical representation of the incidents generated and their severity.
- Incident priorities—provides a graphical representation of the incidents generated and their severity.
- My Incidents—provides a graphical representation of the incidents created new, flagged to you, or owned and changed by you.

Clicking the bar on the graph takes you to the respective incidents.
After viewing an incident, you can use the Incidents menu on the Service Now navigation tree to submit a case to the Juniper Support Systems (JSS). You can also notify other users about the incident, assign a user as an owner of the incident, and delete the incident from the device.

In addition to reporting incidents, AI-Scripts also send device information regularly to Service Now in the form of Information Juniper Message Bundles (iJMBs). The iJMBs are then processed and displayed on the Device Snapshots page. You can upload these iJMBs to JSS, where they are processed and analyzed to provide preventive analysis and alerts. You can view the content of these iJMBs and export them to HTML format.

In certain cases, when devices stop sending device information, Service Now generates the iJMBs for all the devices associated to a device group. These iJMBs are generated based on the commands available in directive file pre-loaded in Service Now. The content of these iJMBs is the same as AI-Scripts generated iJMBs. Service Now administrator receives a message when Service Now generates iJMBs automatically for one or more devices.

A JMB is considered erroneous if it does not comply with the standard data structure that Service Now requires or if it contains data elements that Service Now does not accept. Service Now identifies these JMBs and displays them on the JMB Errors page from where they can be viewed and downloaded.

You can use a notification policy to specify the events for which you want to receive a notification. The options are New Incident Detected, Case Submitted, Case Status Updated, and Intelligence Update Received. Notification policies define other characteristics (filters) that you can use to fine tune the conditions under which you
receive a notification. You can even define the events that trigger the notification, the filters that further specify the trigger events, and the actions that you want Service Now to take after the event is triggered.

Some tasks within the Service Central workspace, such as assigning messages to a connected member and updating an end-customer case, are enabled only when Service Now operates in the end-customer mode. For more information about the Service Now modes, see “Service Now Modes” on page 49.

The Service Central page graphically displays information about the severity and priority of incidents and the incidents you created.

Using Service Central, you can perform the following tasks:

- Assign a user to own and manage incidents, notify users about the incidents, update the status of the incidents, and delete incidents.
- View and delete iJMBs, and export device data to HTML format.
- Assign messages to end-customers (enabled if Service Now is operating in the partner-proxy mode).
- Update customer cases (enabled if Service Now is operating in the partner-proxy mode).
- View, download, and delete JMBs with errors.
- View Knowledge Base articles associated with incidents.
- View information about devices that are susceptible to known issues.
- Generate JMBs on demand.
- Assign an owner, flag to users, and delete an information message.
- Create, edit, and delete a notification policy.

Incidents

- Incidents Overview on page 166
- Assigning an Incident Owner on page 168
- Flagging an Incident to a User on page 169
Incidents Overview

An incident is the occurrence of a defined event in a device. When an incident, such as a process crash, an application-specific integrated circuit (ASIC) error, or a fan failure occurs on an AI-Scripts-enabled device, the AI-Scripts builds a Juniper Message Bundles (JMBs) file with the incident data which is accessed by Service Now.

A JMB file is an XML file that contains diagnostic information about the device and other information specific to the condition that triggered the incident. The incident contains information such as hostname, time stamp of the incident, synopsis, description, chassis serial number of the device, and the severity and priority of the incident.

These JMB files are securely transferred from the device to the Service Now application. After a JMB is generated, it is stored at a defined location in the device from where Service Now accesses it and display it in the Incidents page.

Service Now uses Device Management Interface (DMI), which is an extension to the NETCONF network management protocol, to access JMBs from devices. The Incidents page provides a user interface to view incidents chronologically, by organization name, and by device group. The Quick view of this page helps you differentiate incidents with various icons. These icons indicate incident priority levels and also whether the incidents are submitted to JSS. See Service Now Icons and Inventory Pages.

From the Incidents workspace, you can navigate to the View Tech Support Cases and View End-Customer Cases pages. The View Tech Support Cases page displays the technical support cases that you can open with JSS. You can open these cases only after you create an organization and the organization’s site ID is validated. Site IDs denote the customer identity used in the Juniper Technical Assistance Center (JTAC) Clarify trouble ticketing system.

To stay updated of the events that occur in Service Now, you can create notification policies that instantly notify you of an event in the form of e-mails or SNMP traps.

The incidents are displayed in a table as follows: You can select the parameters to display and sort them in the ascending or descending order.

- Incident ID
- Organization
• Device group
• Defect type
• Platform type
• Incident type

NOTE:
• The incident type Event-RMA indicates that an RMA event is detected on the Service Now managed devices.
• The incident type Event (low end) indicates that the JMB generated on a device is a low impact JMB. User can manually collect troubleshooting data and update case through Case Manager or Service Now.
• The incident type Request RMA indicates that an RMA incident is detected on Service Now managed devices.

• Time of occurrence
• Owner
• Submission status
• Incidents that are flagged to you

You can perform the following tasks from the Incidents page:

• Submit an incident to create a JTAC case
• Flag the incident to another user
• Assign the incident to another user
• Delete an incident
• View the details of a Juniper Message Bundle (JMB)
• View a Knowledge Base (KB) article pertaining to the incident
• View a case in the Juniper Networks Case Manager
• Remove a flag from the incident
• Add an e-mail address to the mailing list of an incident
• View technical support cases
• Upload core files

NOTE: Junos OS devices may not provide specific time zones for incidents, and hence Service Now may display an incorrect time of occurrence for incidents. For example, when the time zone is EST, Service Now uses US EST by default, while the time zone can also be AEST (Australian EST).
Assigning an Incident Owner

You can assign a user to own and manage an incident. The owner tracks the progress of the related case and the updates from JSS.

To assign an incident to a Service Now user:

1. From the Service Now navigation tree, select Service Central > Incidents. The Incidents page appears.
2. Select the incident to which you want to assign an owner, and select Assign Ownership from either the Actions list or the right-click menu. The Assign Ownership dialog box appears.
3. Enter the login ID of the user to whom you want to assign the incident. If required, click the search icon to display the list of available users.
4. Select the Email Incident to Assigned Owner check box to send an e-mail notification to the assigned owners of the incident. This option is selected by default.
5. Click Submit.
The incident is assigned to the specified user. See “Viewing Device Snapshot Details or iJMBs” on page 190.

Flagging an Incident to a User

You can flag an incident to a user who might be affected by the incident or needs to be aware of updates to it. When changes are made to this incident, the user receives an e-mail. If an incident is flagged to you, the Flag column of that incident in the Incidents table displays Yes; if not, it displays No.

To flag an incident to a user:

1. From the Service Now navigation tree, select Service Central > Incidents.
   
The Incidents table appears.
2. Select the incident that you want to flag to a user, and select Flag to Users from either the Actions list or the right-click menu.
   
The Flag to Users dialog box appears and displays the names of Service Now users.
3. Select the user or users to whom you want to flag the incident.
4. Select the Email Incident to Flagged Users check box to send an e-mail notification to all the flagged users.
   
   This option is selected by default.
5. Click Submit. The incident is flagged to the selected users.

Related Documentation

- Assigning an Incident Owner on page 168
- Deleting an Incident on page 172
- Viewing Knowledge Base Articles Associated with an Incident on page 179
- Checking Incident Status Updates on page 170
Checking Incident Status Updates

In Service Now, incidents are the occurrence of a predefined problem in a device. Information about these incidents is sent to the Service Now application. Service Now routinely checks for new incidents. The Manage Incidents page displays the incidents chronologically by organization name and device group.

You can use the Incidents page to submit an incident to JSS for creating a case. The submission status of the incident appears in the Status column on the Incidents page. After you submit the incidents, the status is Submitted. When JSS creates the case, the status changes to Created and the Case ID appears. Further updates to the incident change the incident's status to Updated.

Service Now provides three ways to check incident status.

- Using Junos Space logs. The Junos Space log of an incident displays a list of the status changes.

- Using notification policies. You can create a notification policy to notify users whenever the status of an incident is updated. For more information about creating notification policies, see “Creating and Editing a Notification Policy” on page 195.

- Using the Service Central page. The My Incidents graph on the Service Central page displays the number of incidents whose status has changed since you last logged in. It also displays other information such as the number of incidents that were flagged to you, the number of incidents that you own, and the number of new incidents that were added since your last logged in.

To view the Service Central page, select Service Central from the Service Now navigation tree.
Exporting Incident Data

You can export JMB data along with its attachments as HTML files and save them on your local file system. A JMB is exported as a zipped folder. Logs are not exported. The view of the exported JMB file is the same as of the View JMB page in Service Now. However, the option to download the attachments and log files is not available for an exported JMB file.

You can export JMBs in the following two formats—HTML and Excel.

To export incident data in HTML format:

1. From the Service Now navigation tree, select Service Central > Incidents.
   The Incidents page appears.
2. On the Incidents page, select the incident whose details you want to export.
3. From the Actions menu, select Export JMB to HTML. Alternatively, right-click an incident and select Export JMB to HTML.
   The Export JMB to HTML dialog box displays links to the original and filtered JMBs, as shown in Figure 38 on page 171.

   **Figure 38: Export JMB to HTML Dialog Box**

   ![Export JMB to HTML Dialog Box](image)

4. Click the Original JMB or Filtered JMB link to save the original or filtered JMB file as an HTML file.

To export an incident data as an Excel file:

1. From the Service Now navigation tree, select Service Central > Incidents.
   The Incidents page appears.
2. On the Incidents page, select the incident whose details you want to export.
3. From the Actions menu, select Export Incident Summary to Excel. Alternatively, right-click the incident and select Export Incident Summary to Excel.
The Export Incident Summary to Excel dialog box displays the Export the selected Incident to Excel link.

4. Click the Export the selected Incident to Excel link to save the incident data in Excel format.

Deleting an Incident

After reviewing the incident information, you can use the Incidents page to delete incidents from Service Now. This action deletes the incident both from the Service Now database and from the Incidents table.

To delete an incident:

1. From the Service Now navigation tree, select Service Central > Incidents.
   The Incidents table appears.
2. Select the incident that you want to delete.
3. Click Delete.
   The selected incidents are removed from the Incidents table and the Service Now database.

- Viewing Knowledge Base Articles Associated with an Incident on page 179
- Submitting an Incident to Juniper Support Systems on page 173
- Viewing Incident Details on page 177
Submitting an Incident to Juniper Support Systems

After viewing the incident information, you can use the Incidents page to submit the incident to Juniper Support Systems (JSS) for creating a case. You can submit multiple incidents to JSS simultaneously. The status of a submitted incident appears in the Status column of the Incidents page. After you submit the incident, the status is displayed as Submitted.

NOTE: The Submitted status is displayed in red if an error or exception has occurred while submitting the incident to JSS. If you place the cursor on Submitted, a tool tip displays the error message.

An error or exception can occur while submitting an incident when there is an issue with Customer Relationship Manager (CRM) in JSS; for example, CRM is down for maintenance. The Submitted status is automatically displayed in black when the CRM becomes functional.

When a case is created by JSS, the status changes to Created and a case ID is generated for the incident.

Before an incident is submitted from Service Now to JSS, the synopsis of the incident is tagged in the Service Now database to indicate whether it is an on-demand or a Return Materials Authorization (RMA) incident generated by AI-Scripts or Service Now. The synopsis of an incident generated by an event on the device is not tagged. An incident is submitted to JSS with one of the following tags:

- **AIS On Demand** for on-demand incidents generated by AI-Scripts
- **On Demand** for on-demand incidents generated by Service Now
- **Express RMA** for RMA incidents detected by AI-Scripts
- **On Demand RMA** for on-demand RMA incidents generated by Service Now

You can submit incidents to JSS as soon as a JMB is received from the device, without downloading attachments from the JMB. Then Service Now automatically uploads the JMB attachments to the related case.

To submit an incident to JSS:

1. From the Service Now navigation tree, select **Service Central > Incidents**. The Incidents page appears.
2. On the Incidents page, select the incident that you want to submit to JSS.
3. From the Actions menu, select **Submit Case**. Alternatively, right-click the incident and select **Submit Case**.
Figure 39 on page 174 displays the Submit Case Options page cropped up to the Add Comments to the Description field.

**NOTE:** The Submit Case action is disabled when you select an incident that is already submitted.

Figure 39: Submit Case Options Page

4. Under Email List, click the **Enter Email Id** field to enter an e-mail ID in the user@example.com format.

5. (Optional) To add multiple e-mail IDs or delete them, use the **Add Email** and **Delete** buttons, respectively.

6. (Optional) Click **Modify** to modify the existing site ID or username.

   The Make Selection to Change Site ID or User dialog box appears.

   The site ID can be modified in two ways:

   - For the same username:
     a. Click **Default Org**.
     b. Select a site ID from the Site ID list
• For a new user:
  a. In the **Username** field, enter the username to log in to the organization.

     The username is provided by Juniper Networks or a Juniper Networks partner.

  b. In the **Password** field, enter the password to log in to the organization.

     The password is provided by Juniper Networks or a Juniper Networks partner.

  c. Click the **Get Sites** link.

     The Site ID list displays a list of site IDs.

  d. Select the required site ID.

7. (Optional) In the Make Selection to Change Site ID dialog box, select the **Save As Default User For Incident Submission** check box if you want the new site ID to be set as the default site ID. This new site ID and username are displayed by default when you log in next time to submit new incidents.

8. Click **OK** to save the changes and go back to the Submit Case Options page. Click **Cancel** if you do not want to implement the changes.

9. (RMA incident only) If you are submitting an RMA incident, on the Submit Case Options page, you must select an **Address Group**.

    The **Ship-to Address** field is populated automatically based on the selected address group.

    By default, in case of standard, partner proxy, or end customer modes, the Address Group field displays the address group values present in the system. The values displayed in the Address Group and Ship-to Address fields are determined by the following:

    • In end customer and standard modes, the value displayed in the Address Group and Ship-to Address fields depend on the association between the device and address group. If a user has associated the device with an address group before the incident took place, then the value is preselected in the Address Group field. In case a user associates the device with an address group after the incident took place, then the Location and Ship-to Address fields display None. You can select any other address group present in the system to create a CRM case with JSS or the Juniper Networks partner.

    • In partner proxy mode, the Address Group and Ship-to Address fields are prepopulated with the address group sent by the customer and the address group present in the system for opening a case. The Juniper Networks partner has the option of changing this value by selecting an address group present in the partner system.

    • If the Juniper Networks partner has associated an address with the end-customer device, then that address is displayed in the Address Group and Ship-to Address fields instead of the customer address.

    • If no device is associated the address group, the value displayed in the Address Group field is None.
The address group selected on the Submit Case page is submitted as the shipping address to the Juniper Networks partner or JSS.

10. Select the method for follow up on the case from the Follow Up Method list. The available options are Email Full Text Update, Email Secure Web Link, and Phone Call.

11. Enter a customer tracking number in the Customer Tracking Number field.

The customer tracking number can be any random number that you provide to track your case.

**NOTE:** Steps 4 through 11 are applicable only when you run ServiceNow in partner proxy or standard modes.

12. Select the priority of the case from the Priority list.

The available options are Critical, High, Medium, and Low. The default priority is Medium.

13. (Optional) Add your comments in the Add Comments to Synopsis field.

If you are submitting On-demand or Off-Box incidents to JSS, you can edit the default content in the Synopsis field.

14. (Optional) Add your comments in the Add Comments to Description field.

Ensure that your comments contain fewer than 1028 characters.

In partner proxy mode, a table listing core files for the incident is displayed below the Add Comments to Description field.

The columns in the table are described as follows:

- Core Files—Complete path to the core file, including the name of the core file
- Core File Size (in bytes)—Size of the core file, in bytes

15. Select one or more core files to upload. The core files are uploaded after the case is created for the incident.

16. (Optional) To delete core files from the router after you have uploaded the core files, select the Delete Core Files from Router after Uploading check box.

17. (Optional) To view the hardware components in the device, click the Select Device Components link next to the Synopsis field.

The Device Physical Inventory Components page appears.

18. Select the device components for which you want to request RMA incidents and click Submit.

19. In the Problem Description field, enter information about the device components (part number, version, part description, part serial number, and so on).

20. Click Submit.

A Job Information dialog box that appears displays the job ID.
Click the job ID to go to the Job Management page. You can monitor the status of the job from this page.

The Incidents page appears.

22. On the Incidents page, click the RMA incident that you requested and select Submit Case from the Actions menu. Alternatively, right-click the RMA incident and select Submit Case.

The Submit Case Options page appears.

23. Verify the information on the page and click Save to save your settings in the Service Now database and go back to the Incidents page.

24. Click Submit to submit the selected incident to JSS.

The Incidents page appears. The Incidents page displays the submission status in the Status column as Submitted.

When a case is created for the incident in JSS, the status of the incident changes to Created and a case ID is generated.

Viewing Incident Details

An incident is generated in Service Now when an event occurs on a device running Junos OS. An incident includes the following information:

- Incident details: Provides information about the event for which the incident is created—the device on which the event occurred, IP address of the device, the Junos OS version installed on the device, the time of the event, the link to the Knowledge Base for the event, and so on.
- Case details: Provides information about the case generated in Juniper Support Systems (JSS) for the incident—the case ID, site ID, synopsis of the incident, whether the incident was auto submitted to JSS; if auto submitted, the auto submit policy used to auto submit, filter level defined for sharing information with JSS and so on.
• Core file details: Provides information about the core files generated for the event—the path to the core file on the device, the size of the core file in bytes, the time the core file was generated, whether the core file is uploaded to JSS and deleted from the device after copying it to Service Now.

NOTE: For an end customer Service Now, core files are uploaded to the Service Now partner instead of JSS. The core files are uploaded to JSS from Service Now partner.

• Attachment details: Provides information about the attachments generated for the event—the path to the attachment files on the device, the size of the attachment file in bytes, the command used to generate the attachment file, whether the attachment is copied to Service Now and uploaded to JSS.

• Log file details: Provides information about the log files generated for the event—the path to the log file on the device, the size of the log file in bytes, whether the log file is copied to Service Now and uploaded to JSS.

To view incident details:

1. From the Service Now navigation tree, select Service Central > Incidents. The Incidents page appears.

2. Double click on an incident to view its details. The Incident Detail page appears.

NOTE: If the selected incident type is Event (low end), the Problem Description field in the Incidents Detail page highlights the low end JMB with the note section that contains the following information: This incident is based on a "low impact" JMB. A low impact JMB was generated to preserve system resources on the network node. Low impact JMBs do not include all the troubleshooting information found in a traditional JMB. A list of command output recommended for this event, but not contained in the low impact JMB, is listed below. If you open a case with this incident you can attach the recommended command output to the case by clicking the Incident and then the "view in case manager" action in Service Now.

AI-Scripts adds this content when generating event based JMBs or eJMBs.

The Incident Detail page displays the following tabs: Incident Details, Case Details, Core File Details, Attachment Details, and Log File Details as shown in Figure 40 on page 179. The End-Customer Case Details tab appears in the partner proxy mode for end customer incidents.
You can retrieve required information from the tabs.

Viewing Knowledge Base Articles Associated with an Incident

Knowledge Base provides information about the causes and solutions for a problem. Using Service Now you can view Knowledge Base (KB) articles associated with an incident.

To view the KB article associated with an incident:

1. From the Service Now navigation tree, select Service Central > Incidents. The Incidents table appears.
2. Select an incident to view the KB article associated with it, and select View KB Article from either the Actions list or the right-click menu.
A new window takes you to the Juniper Networks Knowledge Base article page where you can log in and view the KB article.

**NOTE:** This action is disabled for incidents that do not have any associated Knowledge Base (KB) articles.

### Viewing a Case in the Case Manager

You can view the details of a submitted case in the Juniper Networks Case Manager. To view case details in the Case Manager, you must first have a user ID and password for the Juniper Networks Customer Support Center (CSC). You can request the user ID and password at [http://www.juniper.net/customers/support/](http://www.juniper.net/customers/support/) or by contacting Juniper Networks Customer Care.

**NOTE:** This feature is not available if Service Now is in offline mode.

To view a case in the Case Manager:

1. From the Service Now navigation tree, select **Service Central** > **Incidents**. The Incidents page appears.
2. Select the incident whose details you want to view in the Case Manager, and select **View Case in Case Manager** from either the **Actions** list or the right-click menu. The Juniper Networks Login page appears.
3. Enter your username and password and click **Login**.

**NOTE:** If the **View Case in Case Manager** link is not enabled, verify if the case is created.
The JSS Case Manager displays the case details.

NOTE: You can also view the details of the submitted cases in the Case Manager from the View Tech Support Cases page. To view case details, go to Service Central > Incidents > View Tech Support Cases.

Updating an End-Customer Case

In Partner Proxy mode, you can create a case for the incident you receive from an end-customer’s device and also update the case.

NOTE: This action is enabled only when Service Now operates in partner-proxy mode and when the state of the selected case is open.

To update an end-customer case:

1. From the Service Now navigation tree, select Service Central > Incidents. The Incidents page displays the list of incidents.
2. Select the end-customer incident for which you want to create a case, and select End-Customer Case from either the Actions list or the right-click menu.

The End-Customer Case dialog box appears as shown in Figure 41 on page 182.
This **End-Customer Case** action is enabled only if you select an end-customer incident.

3. Modify the case details as necessary.

4. Click **Submit**.

   The case is updated and sent to the Service Now end-customer.

### Uploading Core Files for Incidents

Using Service Now, you can upload core files generated for an event to JSS. This function is supported under the following conditions:

- Case should be created for the incident
- At least one core file should be available for upload
If there are no core files available for the incident or if all the core files are uploaded, then this action is disabled in **Incidents**.

To upload core files:

1. From the Service Now navigation tree, select **Service Central > Incidents**. The **Incidents** page appears.
2. Select the incident whose core files you need to upload, and select **Upload Core Files** from either the **Actions** list or the right-click menu.

   **NOTE:** This action is available only if the incident has any core file to be uploaded. In addition, this action is disabled in the offline and the demo modes.

   The **Core File Uploader** dialog box appears with a list of core files.
3. Select the core files that you want to upload, and click **Submit**.
4. If you need to delete the core files from router after uploading, select the **Delete Core Files from Router after Uploading** check box.

**Messages Overview**

Service Now polls JSS regularly for information messages for every configured organization. These information messages are displayed on the Service Now Messages page. Using Service Now, you can assign an owner to an information message and flag
You can perform the following tasks in the Information Messages tab:

- Assign an owner to an information message
- Assign messages to connected members
- Flag an information message to users
- Delete information messages
- Scan for affected devices

Assigning Ownership

You can assign an owner to every information message for managing any follow up task pertaining to the message.

To assign an owner to an information message:

1. From the Service Now navigation tree, select Service Central > Information > Messages.
   The Messages page appears.
2. Select the information message to which you want to assign an owner, and select Assign Ownership from either the Actions list or the right-click menu.
   The Assign Ownership dialog box appears.
3. Enter the login ID of the new owner in the Enter the Login ID of User field.
4. Select the Email Message to Assigned Owner check box to send an e-mail notification to the assigned owners of the message. This option is selected by default.
5. Click Submit.
   The specified user is assigned ownership of the selected information message.

- Viewing Messages Assigned to a Connected Member on page 89
Flagging a Message to Users

You can flag an information message to a Junos Space user who you think needs to keep track of the information message or who needs to be notified when it is changed.

To flag an information message to a user:

1. From the Service Now navigation tree, select Service Central > Information > Messages. The Messages page appears.
2. Select the information message that you want to flag to a user, and select Flag to Users from either the Actions list or the right-click menu. The Flag to Users dialog box lists the available users.
3. Select one or more users who must be notified of the selected information message.
4. Select the Email Message to Flagged Users check box to send an e-mail notification to all the flagged users of the message. This option is selected by default.
5. Click Submit.

The specified users are notified of the selected information message and the Flag column of that information message displays Yes.

Deleting a Message

You can delete information messages from the Service Now database that Service Now collects and that are displayed on the Messages page.

To delete an information message:

1. From the Service Now navigation tree, select Service Central > Information > Messages. The Messages page appears.
2. Select the information message that you want to delete, and select Delete from either the Actions list or the right-click menu.
3. Click **Delete** again to confirm the deletion.

The selected information messages are deleted from the Service Now database and they no longer appear on the Messages page.

### Scanning a Message for Impact

You can use Service Now to view the devices impacted by the vulnerabilities described in the information message.

To scan iJMBs and view the impacted devices:

1. From the Service Now navigation tree, select **Service Central > Information > Messages**.

   The Messages page appears.

2. Select the message that you want to scan for impact, and select **Scan for Impact** from either the **Actions** list or the right-click menu.

   The Scan for Impact Results page displays the list of devices that are impacted by the selected message. If no devices are impacted by the selected message, the following message appears:

   **No impacted devices found.**

### Assigning a Message to a Connected Member

Service Now polls JSS regularly to receive messages for every configured organization. As a Service Now partner, you can assign multiple messages to a connected member.
NOTE: This action is available only when Service Now operates in partner-proxy mode. For more information about standard, partner-proxy, and end-customer modes, see “Service Now Modes” on page 49.

After a message is assigned to a connected member, it cannot be deleted.

To assign a message to a connected member:

1. From the Service Now navigation tree, select Service Central > Information > Messages. The Messages page displays the list of information messages received.

2. Select the message that you want to assign to a connected member, and select Assign Message to End-Customer from either the Actions list or the right-click menu.

As shown in Figure 42 on page 187, the Choose Connected Members dialog box displays the list of connected members. It also displays the connected members to whom the message is already assigned along with the status (if any).

Figure 42: Choose Connected Members Dialog Box

3. Select the connected member to whom this message must be assigned.

4. Click Submit.

The selected message is assigned to the connected member. To verify this action, select Administration > Organization to navigate to the Organizations page, and list
the messages assigned to any connected member. See “Viewing Messages Assigned to a Connected Member” on page 89.

Device Snapshots Overview

Service Now periodically collects and displays Information Juniper Message Bundles (iJMBs) that contain information about devices. iJMBs are also called device snapshots. They are processed and displayed on the Device Snapshot page in the Service Now application. You can upload these device snapshots to JSS where they are added to the Customer Intelligence Database (CIDB) and then processed and analyzed to provide preventive measures.

You can filter the configuration content from device snapshots that are sent to JSS by setting the JMB Filter Level while creating the organization (See “Adding an Organization” on page 83) and then track the status of the device snapshot submission to JSS. You can also stop device snapshots from being sent to JSS.

After you install AI-Scripts on a device, device snapshots are sent from each device to Service Now and from Service Now to JSS every 7 days. The configuration information in a device snapshot that is shared with JSS depends on the JMB Filter Level settings made while creating the organization to which the devices belongs.

The device snapshots that are received by Service Now and yet to be submitted to JSS are stored with the status Initial. After the 7 days elapse, the latest device snapshot sent from the device is submitted to JSS. This means that when a device sends multiple device snapshots to Service Now, only the most recent device snapshot is submitted to JSS and the remaining device snapshots are denoted with the status Skipped. Device snapshots are denoted with the Initial status for several reasons. To know why a device snapshot is not submitted to JSS, you can hover over its Status in the tabular view of the Device Snapshot page. The Status field also displays additional information such as the reasons for not loading information JMBs and messages for errors that might have occurred while loading the JMB.

Devices that have stopped sending iJMBs (device snapshots) to Service Now for more than two weeks are also detected and graphically displayed on the Administration page. To list these devices, you can click the Devices Not Sending Snapshots bar of the Devices
Not Sending Device Snapshots graph. These devices are displayed on the Service Now Devices page where you can view their details and export them to HTML format. The Quick View of the Device Snapshots page uses different icons to help you identify snapshots that are successfully uploaded to JSS and the device snapshots that could not be uploaded to JSS. For a description of these icons, see Service Now Icons and Inventory Pages.

Service Now generates iJMBs automatically for all devices associated to a device group when the devices stop sending iJMBs. The iJMBs are generated based on the commands available in a directive file pre-loaded in Service Now. The behavior of these iJMBs is the same as the iJMBs generated by event scripts. The Service Now administrator receives a message when Service Now generates iJMBs automatically for one or more devices.

Service Now generates iJMBs automatically if:

- Service Now detects that a Junos upgrade has occurred but an event profile is reinstalled, or if Service Now detects that the device has not sent an iJMB for some time
- an event profile was never installed on a device, but the device is associated to a device group in Service Now

If an event profile is installed on the device and an iJMB is received from the device, then Service Now stops creating iJMBs for the device. If the notification policy Switch over enabled for IJMB is enabled, the administrator is notified by an e-mail or an SNMP Trap when Service Now generates iJMBs for one or more devices. If the notification policy Switch over enabled for IJMB is not enabled, only e-mails are sent to the administrator when Service Now generates iJMBs. No SNMP traps are sent.

You can perform the following tasks using the Information Device Snapshots tab:

- Export device data in HTML format
- Delete a device snapshot
- View device snapshot details

Related Documentation

- Viewing Device Snapshot Details or iJMBs on page 190
- Messages Overview on page 183

Exporting Device Data to HTML

You can store the device data that Service Now collects and displays on the Device Snapshots page and export it to HTML format.

To export device data to HTML format:

1. From the Service Now navigation tree, select Service Central > Information > Device Snapshots.
The Device Snapshots page displays the device snapshots received.

2. Select the organization whose data you want to export, and select Export to HTML from either the Actions list or the right-click menu.

The Export JMB to HTML dialog box displays links to the original and filtered versions of the JMB.

3. Click the displayed link to save the iJMB as an HTML file.

Deleting Device Snapshots

You can take device data that Service Now collects and displays on the Device Snapshots page and delete it from the Service Now database.

To delete an iJMB:

1. From the Service Now navigation tree, select Service Central > Information > Device Snapshots.

   The Device Snapshots page appears.

2. Select the organization whose device information you want to delete, and select Delete from either the Actions list or the right-click menu.

3. Click Delete again to confirm the deletion.

   The iJMBs from the selected organizations are deleted from the Service Now database and they no longer appear on the Device Snapshots page.

Viewing Device Snapshot Details or iJMBs

When Service Now receives informational JMBs or iJMBs, only selected information from the JMBs appears on the Device Snapshots page. However, you can view the entire contents of the JMB on the View JMB page.

Service Now displays the JMBs generated by AI-Scripts Release 3.7 and earlier on a single page. For JMBs generated by AI-Scripts Release 4.0 and later, the View JMB page has a right and a left pane. The left pane lists the sections of a JMB. Clicking a section displays
the contents of the section in the right pane. When the View JMB page opens, by default, the Manifest section opens as shown in Figure 43 on page 191. You can click the links in the Attachments and Logs sections to view or download attachments and system log files.

Figure 43: Juniper Message Bundle

To view details of a JMB:

1. From the Service Now navigation tree, select Service Central > Information > Device Snapshots.

   The Device Snapshots page appears.

2. On the Device Snapshots page, select the device for which you want to view an iJMB.

3. From the Actions menu, select View JMB. Alternatively, right-click the device and select View JMB.

   The View JMB dialog box displays links to the original and the filtered JMBs as shown in Figure 44 on page 191. The information in the filtered JMB is classified by the settings on your Global Settings page.

Figure 44: View JMB Dialog Box

4. Click the Original JMB or Filtered JMB link to view the JMB details.
Clicking Original JMB displays the JMB as received from the device. Clicking Filtered JMB displays the JMB after filtering data as configured in the filter criteria.

**JMB Errors**

- JMBs with Errors on page 192

**JMBs with Errors**

Service Now considers a Juniper Message Bundle (JMB) as erroneous if it does not comply with the standard data structure that Service Now accepts or if the Manifest section of the JMB is incorrect. From AI-Scripts Release 4.0, an incomplete Trend Data section or an incomplete attachment in the Attachment section in the JMB is ignored.

Service Now identifies the JMBs with errors and displays them on the JMB Errors page. You can download up to five JMB files at a time and also delete them from the Service Now database. We recommend that you open a case with JSS for JMBs with errors.

Refer to the following topics to download or delete JMBs with errors:
- Downloading JMBs with Errors on page 192
- Deleting JMBs with Errors on page 193

**Downloading JMBs with Errors**

When you download a JMB, it is saved as a zip file. You can download up to five JMBs with errors at a time.

To download JMBs with errors:

1. From the Service Now navigation tree, select **Service Central > JMB Errors**. The JMB Errors page appears.
2. On the JMB Errors page, select the JMBs that you want to download.
3. From the Actions menu, select **Download JMB Errors**. Alternatively, right-click the selected JMBs and select **Download JMB Errors**. The Download JMB Errors dialog box appears as shown in Figure 45 on page 193.
4. Click the **Click here to download JMB Error files** link to save the selected JMBs with errors.

   Your browser opens a dialog box prompting you to open or save the zip file.

5. Select **Save** to save the file on your local system.

6. Click **OK**.

   A dialog box appears to allow you to browse the location where you want to save the file.

7. Click **Save**.

   The file is saved on your local system.

**Deleting JMBs with Errors**

You can delete multiple JMBs with errors at the same time.

To delete JMBs with errors:

1. From the Service Now navigation tree, select **Service Central** > **Incidents** > **JMB Errors**.

   The JMB Errors page appears.

2. On the JMB Errors page, select one or more JMBs that you want to delete.

3. From the Actions menu, select **Delete**. Alternatively, right-click and select **Delete**.

   The Delete Error JMB dialog box prompts you to confirm the deletion.

4. Click **Delete**.

   The selected JMBs with errors are deleted from the Service Now database and they no longer appear on the JMB Errors page.

Notification Policies Overview

Service Now sends a notification to users when a specific event occurs. Notification policies define the parameters for these notifications. A notification policy specifies the events for which you want Service Now to send a notification. It also specifies the actions a user must take for that event.

You must specify the following parameters when you create a notification policy:

- Trigger—the event that causes Service Now to send notification.
- Filters—Specify filters for the events that cause Service Now to send a notification.
- Actions—Specify the action (or actions) that must be taken after the specified event occurs. These events can be filtered by priority, device name, serial number, and so on. Different filters are supported for incident and information trigger types.

The Notifications page displays the notification policies chronologically by name, owner, status, and trigger. For more information about the Notifications table columns, see Table 20 on page 194.

</tr>
</tbody>
</table>

NOTE:

- If Ship-to Address Missing For Device is configured, Service Now sends notification when RMA cases are submitted without any address getting associated to it.

- New Incident Detected is the only option available when Service Now is in offline mode.

- If Switch over enabled for IJMB is configured, Service Now automatically generates IJMBs for the device (associated to a device group) that do not send IJMBs.

- Connected Member Device Added/Removed is a notification trigger added if Service Now operates in the partner proxy mode Service Now to notify when devices are added or removed by a connected member.

Creating and Editing a Notification Policy

Notification policies specify when you want Service Now to send notifications about an event and the recipients of the notifications. You can define the events that trigger the notification, the filters that further specify the trigger events, and the actions that you want Service Now to take after the event is triggered.
To create a notification policy:

1. From the Service Now navigation tree, select **Service Central** > **Notifications** > **Create Notifications**.
   
   The Create Notifications page appears as shown in **Figure 46 on page 196**.

**Figure 46: Create Notifications Page**

2. Enter a notification policy name, and select a trigger.
   
   The name must be unique and can contain alphanumeric characters, space, hyphen (-), and underscore (_). The maximum number of characters allowed is 64.

3. Expand the Apply Filters section, if not already expanded, and enter the filter parameters.
   
   Different filters are supported for incident and information trigger types.

4. Enter the e-mail IDs of users to whom the notification must be sent.
   
   For more information about the fields in the **Create Notifications** dialog box, see **Table 21 on page 197**.

5. Specify the destinations where SNMP traps can be sent when an event occurs in the **Send SNMP Traps to** section.
   
   For more information about the fields in the **Create Notifications** dialog box, see **Table 21 on page 197**.

6. Select the **Send JMB file as attachment in mail** check box if the JMB is to be attached to the notification e-mail.

7. Click **Add**.
The notification policy is created and displayed on the Notifications page.

You can also copy an existing notification policy and modify its attributes to create another notification policy.

**NOTE:** While copying a notification policy, you cannot edit the Trigger field.

To copy a notification policy:

1. From the Service Now navigation tree, select **Service Central > Notifications**.
   The Notifications page appears.
2. Select the notification policy that you want to copy, and select **Copy** from either the **Actions** list or the right-click menu.
   The Copy Notifications page appears.
3. Make your modifications.
4. Click **Make a Copy**.
   A notification policy is created with the settings that you specified and listed in the Notifications page.

To modify a notification policy:

1. From the Service Now navigation tree, select **Service Central > Notifications**.
   The Notifications page appears.
2. Select the notification policy that you want to edit, and select **Edit filters and Actions** from either the **Actions** list or the right-click menu.
   The Edit Notifications page appears.
3. Edit the desired fields. For more information, see Table 21 on page 197.

<tr>
<td>Device Name</td>
<td>Enter a value in the <strong>Device Name</strong> field.</td>
<td>255 characters</td>
<td>Blank</td>
</tr>
<tr>
<td>Serial Number</td>
<td>Enter a value in the <strong>Serial Number</strong> field.</td>
<td>255 characters</td>
<td>Blank</td>
</tr>
<tr>
<td>Has the words</td>
<td>Enter a value in the <strong>Has the words</strong> field.</td>
<td>255 characters</td>
<td>Blank</td>
</tr>
<tr>
<td>Does not have</td>
<td>Enter a value in the <strong>Doesn’t have</strong> field.</td>
<td>255 characters</td>
<td>Blank</td>
</tr>
</tbody>
</table>

Filter Parameters for New Intelligence Update Triggers:

Service Now sends a notification if the priority of the incident matches the entered value.

Service Now sends a notification if the organization of the device the incident occurred on matches the entered value.

Service Now sends a notification if the device group the incident occurred on matches the entered value.

Service Now sends a notification if the name of the device the incident occurred on matches the entered value.

Service Now sends a notification if the specified words match any of the fields in the incident or the information message.

Service Now sends a notification if the specified words do not match any of the fields in the incident or the information message.

- Deleting a Notification Policy on page 202
Enabling or Disabling a Notification Policy

Notification policies specify the events for which Service Now sends notifications, as well as the actions that Service Now takes in response to these events. They define the events that trigger the notification, the filters that further specify the trigger events, and the actions that you want Service Now to take after the event is triggered.

To enable a notification policy:

1. From the Service Now navigation tree, select **Service Central > Notifications**.
   The Notifications page appears.
2. Select the notification policies that you want to enable or disable, and select **Enable/Disable** from either the **Actions** list or the right-click menu.
   The **Change Reaction Policies Status** dialog box appears and displays the name and status of the selected incident.
3. Click **Change Status** to confirm your action.
   The status of the notification policy is changed.

Deleting a Notification Policy

A notification policy specifies the events for which Service Now sends notifications, and the actions that Service Now takes in response to these events. It defines the events that trigger the notification, the filters that further specify the trigger events, and the actions that you want Service Now to take after the event is triggered.

To delete a notification policy:

1. From the Service Now navigation tree, select **Service Central > Notifications**.
   The Notifications page appears.
2. Select the notification policy that you want to delete, and select **Delete** from either the **Actions** list or the right-click menu.
   The **Confirm Deletion of Notification Policies** dialog box displays the name of the notification policy and its owner.
3. Click **Delete**.
   This action deletes the selected notification policies from the Service Now database and from the Notifications page.

Service Insight Overview

Service Insight is an application that helps in accelerating operational analysis and managing the exposure to known issues. Using Service Insight, you can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now. To enable Service Insight, you must add a valid organization in the Service Now application. See the “Adding an Organization” on page 83 section in the Junos® Space Service Now User Guide.

Service Insight identifies the devices available for EOL reports and enables you to generate EOL reports that provide detailed device EOL information about EOL devices, such as the number of devices with EOL parts, EOL announce date, number of EOL announce parts, End Of Engineering SW date, number of End Of Engineering SW parts, End Of Engineering HW date, number of End Of Engineering HW parts, End Of Support date, number of End Of Support parts, top-level assembly parts, circuit assembly parts, PSN numbers, and replacement numbers. See “Exposure Analyzer Overview” on page 216.

Service Insight provides Proactive Bug Notifications (PBNs) as a proactive measure to alert you about known issues that can impact the devices in your network. It is an effective means of communicating the information collected while helping one customer fix issues to another customer who could face similar issues in future. Using this information, which was collected when issues were reported to Juniper Networks, Service Insight identifies devices on your network with similar conditions. PBNs associated with devices on your network are matched and displayed on the Manage PBNs page. These PBNs keep you aware of the possible impacts and also of ways to fix the issue. PBNs also consist of workarounds that suggest temporary fixes and instructions that you can follow to protect your network. See “Targeted PBNs Overview” on page 229.

Juniper Care Plus customers are entitled to receive PBNs that are managed by the Advanced Services (AS) team. Juniper Care customers are entitled to receive only auto
PBNs. Auto PBNs are PBNs that are generated automatically by the system. They are not managed by the AS team. Customers who do not have JCare Plus license are considered as JCare customers.

Service Insight receives updates about EOL and PBN information. It also enables you to send notifications about these updates to multiple users and manage these notifications. You can define the events that trigger a notification, the filters that further specify the trigger events, and also the actions that you want Service Insight to take after the notification is triggered. See “Notifications Overview” on page 233.

Service Insight uses two timers, one that runs every midnight, and another that runs every hour. The hourly timer initiates the processing of pending EOL requests. This timer schedules when JSS must send these requests to the corresponding devices. When large number of devices is added to Service Insight, JSS sends these requests in batches. The timer that runs every midnight updates the EOL and PBN data by sending requests to JSS and processing the responses that are received from JSS. This timer also initiates the synchronization process between Service Now and Service Insight which enables Service Insight to display the changes that were made to devices in Service Now. When you execute device related actions in Service Now while either one of these timers is running, Service Insight takes an hour to display the changes corresponding to these actions.

- Service Insight Dashboard Overview on page 208
- Dashboard Gadgets on page 209

Service Insight Dashboard Overview

The Service Insight dashboard displays notifications and graphically illustrates the number of devices per device group and the number of devices not sending device snapshots. You can access the Service Insight dashboard by selecting Service Insight from the Application Switcher.

The Service Insight dashboard includes:

- Service Insight Workspaces on page 208

Service Insight Workspaces

Apart from the Insight Central and Administration workspaces, Service Insight also provides shortcuts to the Devices and Jobs workspaces by including them in the Service Insight navigation tree. Table 22 on page 209 lists the tasks that can be performed using the Service Insight workspaces.
Table 22: Service Insight Workspaces

Dashboard Gadgets

The dashboard displays gadgets with information that is updated automatically and instantaneously. You can move gadgets on the dashboard and change their sizes. These changes persist even after you log back in to the system. The gadgets displayed on the Service Insight dashboard are:

• New EOL Matches on page 209
• Recent PBNs on page 210
• PBN Severity on page 210
• Service Insight Notices on page 211

New EOL Matches

The New EOL Matches gadget graphically displays the EOL matches found for the devices on the previous day, the previous week, and the past month. Clicking a bar within the graph takes you to the Exposure Analyzer page which displays the devices for which the EOL matches are found.
For example, when you click the green bar of the **New EOL Matches** gadget (as shown in the following figure), the **Exposure Analyzer** page displays only the two devices for which EOL notifications were received last month.

![New EOL Matches](image)

**Recent PBNs**

The **Recent PBNs** gadget graphically displays the devices for which PBNs were received the previous day, the previous week, and the past month. Clicking the bars within the graph takes you to the **Manage PBNs** page which lists the devices for which the PBNs are found.

For example, when you click the green bar of the **Recent PBNs** gadget (as shown in the following figure), the **Manage PBNs** page lists only those three devices for which PBNs were received last month.

![Recent PBNs](image)

**PBN Severity**

The **PBN Severity** gadget graphically displays the severity levels of the received PBNs. Clicking a bar within the graph takes you to the **Manage PBNs** page which lists the PBNs.
For example, when you click the green bar of the **PBN Severity** gadget (as shown in the following figure), the **Manage PBNs** page displays only the PBNs with Minor severity level that were received.

![PBN Severity](image)

**Service Insight Notices**

The **Service Insight Notices** gadget provides the following links:

- EOL product information and announcement: [http://www.juniper.net/alerts/](http://www.juniper.net/alerts/)
- EOS information: [https://www.juniper.net/support/eol/](https://www.juniper.net/support/eol/)

**Related Documentation**

- Insight Central Overview on page 215
- Service Insight Domain Overview on page 211

**Service Insight Domain Overview**

When you access Service Insight, only the EOL report, PBN report, and notification objects that are assigned to the domain that you are currently in are visible to you. If you are assigned to more than one domain, you can access those domains and the objects in them by selecting the domains from the **Login as username** in list on the banner of the Junos Space GUI. Only the domains to which you are assigned are listed in the **Login as username** in list. A super user can access all domains.

EOL report, PBN report, and notification objects that you create when you are logged in to a certain domain are assigned to that domain. If needed, you can assign these objects to another domain. For information about assigning an object to another domain, see “Assigning a Service Insight Object to Another Domain” on page 212.

Targeted PBN objects, used by objects in all domains, are assigned to the system domain. Objects assigned to the system domain are visible on all domains and cannot be assigned to another domain. Table 23 on page 212 lists Service Insight objects and their default domains.
Table 23: Service Insight Objects and Their Default Domains

Assigning a Service Insight Object to Another Domain

If you are assigned to multiple domains, you can assign a Service Insight object from the domain that you are currently logged in to another domain to which you are assigned. All objects except objects in the system domain can be assigned to another domain.

To assign a Service Insight object to another domain:

1. From the Service Insight navigation tree, select the object.
   The object’s page appears.
2. On the object’s page, select the object’s instance that you want to assign to another domain.
   You can select multiple instances of the object to assign to another domain.
3. From the Actions menu, select Assign object to domain. Alternatively, right-click the object and select Assign object to domain.
   The Assign to Domain dialog box appears.
4. Under Assign selected items to domain, select the domain and click Assign.
   The Assign to Domain dialog box closes and the object is not listed on the object’s inventory landing page.
5. To verify that the object is assigned to the correct domain, from the Login as username in list, select the domain to which you assigned the object.
   The Service Insight GUI is refreshed.
6. Using the Service Insight navigation tree, open the object’s inventory landing page and check whether the object is listed on the page.

User Roles

Service Insight User Roles

The Junos Space administrator creates users and assigns roles (permissions) that allow you to access and perform different tasks. You cannot view the tasks that you do not have access to. While Junos Space allows creating users with custom permissions, it also has a set of predefined user roles. These predefined roles cannot be modified or deleted. See Table 24 on page 213 for the list of predefined user roles available in Service Insight. All the roles are applicable in the Insight Central workspace of the Service Insight application.

Insight Central Overview

- Insight Central Overview on page 215

Insight Central is a Service Insight workspace where you can manage devices for which End Of Life (EOL) reports are received, manage the EOL reports and the Proactive Bug Notifications (PBNs). The Exposure Analyzer page within Insight Central displays devices and the available number of EOL parts for these devices, and also displays, for each device, the number of PBNs received. Using the Insight Central workspace, you can also send and manage notifications about EOL and PBN updates to multiple users. You can define the events that trigger a notification, the filters that further specify the trigger events, and also the actions that you want Service Insight to take after the notification is triggered.

To access the Insight Central workspace, you must first enable the Service Insight application. Juniper Care and Juniper Care Plus customers have access to Service Insight. The functionality of Service Insight is dependent on the information sent from Service Now. To enable Service Insight, you must add a valid organization in the Service Now application. See “Adding an Organization” on page 83.

The Insight Central landing page (as shown in Figure 47 on page 216) graphically displays information about devices and their milestones, EOL reports, PBN reports, the devices with most PBN matches, new PBNs, PBNs owned by you, and the PBNs that are flagged to you.

Exposure Analyzer

- Exposure Analyzer on page 216

Exposure Analyzer Overview

Service Insight lists devices and any End of Life (EOL) reports or Proactive Bug Notifications (PBNs) that are received for the devices (see Figure 48 on page 217). The Quick View area of Exposure Analyzer page displays the devices (showing details such as number of EOL parts and number of matching PBNs) with specific icons. Table 25 on page 217 describes these icons. Table 26 on page 218 describes the fields on the Exposure Analyzer page and the Device Details page.

Using Exposure Analyzer, you can generate EOL reports and PBN reports for a particular device. The reports are exported in Excel format. An EOL report includes the following
items: devices with End of Life announce parts, serial number of the device, model number of the device, top level assembly part for the device, End of Sale date, and End of Service date, Last Hardware Engineering Support date, Last Software Engineering Support date for the devices that you select. A PBN report includes the following items: Device Name, Device Serial Number, Product, Junos Version, Device Group, Connected Member, Organization, PBN Title, Juniper ID, PBN Description, PBN Customer Impact, PBN Work Around, and PBN URL. EOL reports and PBN reports are exported in Excel format.

Service Insight uses two timers, one that runs every midnight, and another that runs every hour. The hourly timer initiates the processing of pending EOL requests. This timer schedules when JSS sends these requests to the corresponding devices. When large number of devices are added to Service Insight, JSS sends these requests in batches. The timer that runs every midnight updates the EOL and PBN data by sending requests to JSS and processing the responses that are received from JSS. This timer also initiates the synchronization process between Service Now and Service Insight which enables Service Insight to display the changes that were made to devices in Service Now. When you execute device related actions in Service Now while either one of these timers is running, Service Insight takes an hour to display the changes corresponding to these actions on the Exposure Analyzer page.

Generating EOL Reports

Devices with End of Life (EOL) information are identified and displayed on the Exposure Analyzer page. Using Service Insight, you can generate EOL reports for these devices in an Excel file. EOL reports provide information such as the number of devices with EOL parts, EOL announce date, number of EOL announce parts, Last Software Engineering Support date, number of Last Software Engineering Support parts, Last Hardware Engineering Support date, number of Last Hardware Engineering Support parts, End of Sale date, End of Service date, top-level assembly parts, circuit assembly parts, PSN...
numbers, and replacement numbers. You can also schedule a time for generating the EOL reports.

To generate EOL reports:

1. From the Service Insight navigation tree, select Insight Central > Exposure Analyzer. The list of devices appears.
2. Select one or more devices for which you want to generate the EOL report.
3. Select Generate EOL Reports either from the Actions list or the right-click menu. The Generate EOL Report dialog box appears.
4. Enter a name for the EOL report.
   The name can contain alphanumeric characters (a–z, A–Z, 0–9), space, underscore (_), and hyphen (-).
5. Enter the e-mail address of the user to whom the EOL report must be sent.
   To add and delete users who must receive the e-mail, use the Add Email and Delete buttons. By default, the Send Email To list contains the e-mail address of the logged-in user.
6. To schedule a time for generating the report, select the Schedule at a later time check box and set the date and time for the EOL report to be generated.
7. Select Repeat and schedule an interval for regenerating the EOL report.
   The report generated for the first time has the name given by the user and for all the other successive reports, the report name is appended with timestamp.
8. Click Submit.
   The Job Information dialog box displays a job ID link for the generated report.
9. Click the job ID link.
   The Jobs page displays the details of the generated EOL report. The report includes the schedule for the generation of successive PBN reports if the Repeat option is configured.
10. If you want to cancel the scheduled job for generating the next EOL report, select Cancel Job either from the Actions list or the right-click menu.

Generating PBN Reports

Service Insight provides Proactive Bug Notifications (PBNs) as a proactive measure to alert about known issues that can impact the devices in the network. You can also set the scheduling time for generating PBN reports such that they are generated on a set schedule. Devices with PBN information are identified and displayed on the Exposure Analyzer page. Using Service Insight, you can generate PBN reports for these devices in an Excel file. A PBN report includes the following items: Device Name, Device Serial Number, Product, Junos Version, Device Group, Connected Member, Organization, PBN
To generate PBN reports:

1. From the Service Insight navigation tree, select **Insight Central > Exposure Analyzer**. The list of devices appears.
2. Select one or more devices for which you want to generate the PBN report.
3. Select **Generate PBN Reports** from either the **Actions** list or the right-click menu. The **Generate PBN Report** dialog box appears.
4. Enter a name for the PBN report.
   - The name can contain alphanumeric characters (a–z, A–Z, 0–9), space, underscore (_), and hyphen (-).
5. Select **All devices** if you want the PBN report to be generated for all the devices or select **Selected devices shown below** if you want the PBN reports to be generated for only the selected devices in the page.
6. Enter the e-mail address of the user to whom the PBN report must be sent.
   - To add and delete users who must receive the e-mail, use the **Add Email** and **Delete** buttons, respectively. By default, the **Send Email To** list contains the e-mail address of the logged-in user.
7. To schedule a time for generating the report, select the **Schedule at a later time** check box and set the date and time for the PBN report to be generated.
8. Select **Repeat** and schedule an interval for regenerating the PBN report.
   - The report generated for the first time has the name given by the user and for all the other successive reports, the report name is appended with timestamp.
9. Click **Submit** after selecting the required options.
   - The Job Information dialog box displays a job ID link for the generated report.
10. Click the job ID link.
    - The Jobs page displays the details of the generated PBN report. The report includes the schedule for the generation of successive PBN reports if the Repeat option is configured.
    - The generated report can be saved or downloaded as an Excel sheet. The saved report can be viewed in PBN reports page. If you do not want to save the report in Service Insight, select **Do not save this report on Service Insight** at the top of the page.
11. If you want to cancel the scheduled job for generating the next PBN report, select **Cancel Job** either from the **Actions** list or the right-click menu.

**Related Documentation**
- PBN Reports Overview on page 226
Showing Matching PBNs

Using Service Insight, you can view the list of PBNs that are associated with one device or up to ten devices simultaneously.

To view PBNs for a device:

1. From the Service Insight navigation tree, select **Insight Central > Exposure Analyzer**. The list of devices appears.

2. Select the devices for which PBNs are to be viewed. You can select up to ten devices.

3. Right-click your selection or use the **Actions** list and select **Show Matching PBNs**. The Manage PNBs page displays the list of PBNs that are associated with the device that you selected.

Exporting EOL Reports

You can export the information in an EOL report to an Excel file and save it on your local file system. The EOL report includes the following information:

- Product: The device with parts for which EOL is announced.
- Serial#: Serial number of the device chassis. with parts for which EOL is announced.
- Device: The host name of the device.
- PSN#: The product specification notification for the part
- EOL Model#: The model number of the part for which EOL is announced.
- Top Level Assembly#: The top level assembly part number of the part for which EOL is announced.
- Circuit Assembly Part#: The circuit assembly part number of the part for which EOL is announced.
- EOL Announce Date: The date when Juniper Networks announced the end of life of a product.
- End of Sale Date: The end of sale date of a part specifies the last day to buy a product, order a new service contract, or add the part to an existing support contract. After the end of sale date, parts and services are removed from price lists.
- Last Software Engineering Date: The last software engineering support date of a part specifies the last date till which new (that is, non-maintenance) software releases will support the product. After this date, new software releases will not support the product. Maintenance releases of the major software releases issued prior to this date will support the product within the current software EOL guidelines.
- Last Hardware Engineering Date: The last hardware engineering support date for a part specifies the last day the hardware engineering in Juniper Networks will support the part.
- End of Service Date: The end of service date of a part specifies the last date to receive contracted service (including hardware and software bug fixes, and logistics replacement or repair services) for the part.
- Replacement#: The model number of the part with which the EOL part existing in the device can be replaced.
To export EOL reports:

1. From the Service Insight navigation tree, select **Insight Central > EOL Reports**. The **EOL Reports** page appears.
2. Select the report that you want to export to the Excel file.
3. Select **Export EOL Reports** from either the **Actions** list or the right-click menu. The **Export EOL Report** appears.
4. Click the **Click here to download EOL reports** link and save the file to your local file system.

### Regenerating EOL Reports

Using Service Insight, you can regenerate an EOL report to get the latest EOL information.

To regenerate EOL reports:

1. From the Service Insight navigation tree, select **Insight Central > EOL Reports**. The EOL Reports page is displayed.
2. Select the EOL report that you want to regenerate.
3. Select **Regenerate EOL Reports** from either the **Actions** list or the right-click menu.
The Regenerate EOL Report dialog box displays the name of the EOL report, the device name with which the EOL report is associated, and the e-mail addresses specified. See Figure 50 on page 225.

Figure 50: Regenerate EOL Report Dialog Box

4. (Optional) To modify the list of e-mail addresses of users to whom the EOL report must be sent, use the Add Email and Delete buttons.

5. (Optional) To schedule a time for regenerating the report, select the Schedule at a later time check box and specify the date and time when you want the EOL report to be regenerated.

6. Click Submit.
   The Job Information dialog box displays a Job ID link. Click this link to view the status of this action on the Jobs page.

You can perform the following tasks using the PBN Reports page:

- Exporting PBN Reports on page 227
- Regenerating PBN Reports on page 227
- Deleting PBN Reports on page 227
Exporting PBN Reports

You can export the information in a PBN report to an Excel file and save it on your local file system. The PBN report includes information such as the Device Name, Device Serial Number, Product, Junos Version, Device Group, Connected Member, Organization, PBN Title, Juniper ID, PBN Description, PBN Customer Impact, PBN Work Around, PBN URL.

To export PBN reports:

1. From the Service Insight navigation tree, select Insight Central > PBN Reports. The PBN Reports page appears.
2. Select the report that you want to export to an Excel file.
3. Select Export PBN Reports from either the Actions list or the right-click menu. The Export PBN Report dialog box appears.
4. Click the Click here to download PBN reports link and save the file to your local file system.

Deleting PBN Reports

You can delete multiple PBN reports from the PBN Reports page. Deleted PBN reports cannot be recovered.

To delete PBN reports:

1. From the Service Insight navigation tree, select Insight Central > PBN Reports. The PBN reports are displayed.
2. Select one or more PBN reports that you want to delete.
3. Select Delete from the Action list or the right-click menu. The Delete PBN Reports dialog box displays the names of the selected PBN reports.
4. Click Delete. The selected PBN reports are deleted from the database and are no longer displayed on the PBN Reports page.

Regenerating PBN Reports

Using Service Insight, you can regenerate an PBN report to get the latest PBN information.
To regenerate PBN reports:

1. From the Service Insight navigation tree, select Insight Central > PBN Reports.
   
The PBN reports are displayed.

2. Select the PBN report that you want to regenerate.

3. Right-click your selection or use the Actions list and Select Regenerate PBN Reports from either the Actions list of the right-click menu.
   
The Regenerate PBN Report dialog box displays the name of the PBN report, the device name with which the PBN report is associated, and the e-mail addresses specified. See Figure 52 on page 228.

Figure 52: Regenerate PBN Report Dialog Box

4. (Optional) To modify the list of e-mail addresses of users to whom the PBN report must be sent, use the Add Email and Delete buttons.
5. (Optional) To schedule a time for regenerating the report, select the Schedule at a later time check box and specify the date and time when you want the PBN report to be regenerated.

6. Click Submit. The Job Information dialog box displays a Job ID link. Click this link to view the status of this action on the Manage Jobs page.

Targeted PBNs Overview

Service Insight provides Proactive Bug Notifications (PBNs) as a proactive measure to alert you about known issues that can impact the devices in your network. It is an effective means of communicating the information collected while helping one customer fix issues to another customer who could face similar issues in future.

Using this information, which was collected when issues were reported to Juniper Networks, Service Insight identifies devices on your network with similar conditions. When devices are identified on your network to have the similar configuration as those devices on which issues were found, the PBNs associated with these devices are displayed on the Manage PBNs page. These PBNs keep you aware of the possible impacts and also of ways to fix the issue. PBNs also contain workarounds that suggest temporary fixes and instructions that you can follow to protect your network. Service Insight checks for new PBNs and updates the existing PBNs every 24 hours.

Using The Manage PBNs page, you can scan PBNs to display only those devices that are impacted by the vulnerabilities described by the selected PBN, flag PBNs to users, assign owners to the PBNs, e-mail the PBNs to users, and delete them. You can also create notifications that will alert users when new PBNs arrive or when a new PBN match is found.

Table 29 on page 230 describes the fields displayed on the Manage PBNs page and the PBNs detail summary view.

Scanning PBNs for Impact
You can use Service Insight to identify the devices that could be impacted by the vulnerabilities described in a PBN.
To scan PBNs and view the impacted devices:

1. From the Service Insight taskbar, select Insight Central > Targeted PBNs. The Manage PBNs page displays the list of PBNs.
2. Select the PBN that you want to scan for impact.
3. Right-click your selection or use the Actions list and Select Scan for Impact. The Scan for Impact Results page displays the list of devices that the vulnerabilities described in the selected PBN could impact.
4. Click Confirm to scan the PBNs. The Job Information page displays the schedule status of the selected PBNs. To view the details, click the Job ID. The scan details appear on the Job Management page.

Related Documentation

- Assigning PBN Ownership on page 232

Flagging PBNs to Users

You can flag PBNs to Junos Space users who you think need to keep track of the PBNs or who need to receive them.

To flag a PBN to a user:

1. From the Service Insight navigation tree, select Insight Central > Targeted PBNs. The Manage PBNs page displays the list of PBNs.
2. Select the PBN that you want to flag to the user.
3. From the Actions list or the right-click menu, select Flag to Users. The Flag to Users dialog box displays the list of users who have permissions to view, assign ownership, or delete PBNs.
4. Select the users to whom the PBN must be flagged.
5. Select the Email PBN to Flagged Users check box to send an e-mail notification to all the newly flagged users. This option is selected by default.
6. Click Submit. The specified users receive notification about the selected PBN.

To verify that the specified users have been notified of the selected PBN, double-click the PBN and view the Flagged to Users field of the PBN in the PBN Details dialog box.

Related Documentation

- Assigning PBN Ownership on page 232
Assigning PBN Ownership

You can assign a PBN to a Junos Space user who needs to be notified of the PBN and is responsible for the PBN.

To assign ownership of a PBN:

1. From the Service Insight navigation tree, select Insight Central > Targeted PBNs. The Manage PBNs page displays the list of PBNs.
2. Select the PBN to which you want to assign an owner.
3. Right-click your selection or use the Actions list, select Assign Ownership. The Assign Ownership dialog box appears.
4. Enter the login ID of the user who would own the selected PBN.
5. Select the Email PBN to Assigned Owner check box to send an e-mail notification to the assigned owner. This option is selected by default.
6. Click Submit. The selected PBN is assigned to the specified user.

To verify that the selected PBN is assigned to the specified user, double-click the PBN on the Targeted PBNs page and view the Owner field of the PBN in the PBN Details dialog box.

Deleting PBNs

You can delete PBNs that are displayed on the Manage PBNs page.

To delete PBNs:

1. From the Service Insight navigation tree, select Insight Central > Targeted PBNs. The Manage PBNs page displays the list of PBNs.
2. Select the PBNs that you want to delete.
3. Right-click your selection or use the Actions list and select Delete. The Delete PBNs dialog box displays a list of the selected PBNs.
4. Click Delete to confirm. The selected PBNs are deleted from the Service Insight database and no longer listed in the Targeted PBNs page.

Related Documentation

- Assigning PBN Ownership on page 232
E-Mailing PBNs

Using Junos Space, you can e-mail PBN details to multiple users.

To e-mail PBN details:

1. From the Service Insight navigation tree, select Insight Central > Targeted PBNs. The Manage PBNs page displays the list of PBNs.
2. Select the PBN that you want to e-mail to users.
3. Right-click your selection or use the Actions list and select Email. The Email PBN Details dialog box appears.
4. Use the Add Email and Delete buttons to add and delete e-mail IDs of users to whom the selected PBN details need to be sent. By default, the e-mail ID of the logged-in user is added to the Send Email To list of users.
5. (Optional) To schedule a time for e-mailing the selected PBNs, select the Schedule at a later time check box and specify the date and time when you want the PBNs to be e-mailed.
6. Click Submit. The selected PBNs are e-mailed to the specified users.

Notifications Overview

In Service Insight, you can create notifications to alert users when a specific event occurs. You can also specify the actions that Service Insight must take when an event is triggered.
Specify the following parameters when you create a notification:

- **Trigger**—Specify the event that causes Service Insight to send the notification. The types of triggers are:
  - New EOL Match—an e-mail notification is sent when an EOL announcement is received and one or more devices are affected by the announcement.
  - New PBN Arrival—an e-mail notification is sent when a new PBN is received and matches one or more devices.
  - New PBN Match—an e-mail notification is sent when a PBN affects one or more devices.

- **Filters**—Specify additional details about the event that cause Service Insight to send a notification.

- **Actions**—Specify the action (or actions) that must be taken after a specified event is triggered. These events can be filtered by public tags (applied on devices listed on the Exposure Analyzer page), device name, and serial number.

The Notifications page enables you to manage these notifications. This page displays the notifications chronologically by name, owner, status, and trigger. Table 30 on page 234 provides more information about the fields on the **Manage Notifications** page.

**Table 30: Manage Notifications Page Fields Description**

**Creating and Copying a Notification**

You can specify when you want Service Insight to send notifications, and also the recipients of the notification. You can define the events that trigger the notification, the filters that further specify the trigger events, and the actions that you want Service Insight
to take after the event is triggered. Service Insight enables you to create and copy notifications:

- Creating a Notification on page 235
- Copying a Notification on page 235

**Creating a Notification**

To create a notification policy:

1. From the Service Insight navigation tree, select **Insight Central > Notifications > Create Notifications**.
   The *Create Notifications* dialog box appears. For descriptions about the fields on this page see Table 31 on page 235.

2. Enter a name for the notification and select a trigger.

3. (Optional) Specify filters, such as the tags included, device name, and serial number. When you select the **New PBN Arrival** or **New PBN Match** trigger, you are allowed to specify two additional filters. These two filters allow you to filter the PBNs based on the words that it has or does not have.

4. Enter the e-mail IDs of the recipients of the notification using the **Add Email** button.

5. Click **Add**.
   The notification is created and displayed on the **Notifications** page.

**Copying a Notification**

To copy a notification:

1. From the Service Insight navigation tree, select **Insight Central > Notifications**.
   The *Manage Notifications* page displays the notifications. For descriptions about the fields on this page see Table 31 on page 235.

2. Select the notification whose attributes you want to copy to create another notification.

3. Right-click your selection or use the **Actions** list and select **Copy**.
   The *Notifications* dialog box displays the attributes of the selected notification.

4. Make your modifications to the name, applied filters, and the actions. The trigger field cannot be modified. By default, the word Copy is added as a prefix to the name of the notification.

5. Click **Copy**.
   The notification is created and listed in the Notifications page.

Editing the Filters and Actions of a Notification

You can edit notification parameters, such as the applied filters, and the actions that a notification takes.

To edit a notification:

1. From the Service Insight navigation tree, select Insight Central > Notifications.
   The Manage Notifications page displays the notifications.
2. Select the notification whose filters and actions you want to edit.
3. Right-click your selection or use the Actions list and select Edit Filters and Actions.
   The Notifications dialog box displays the parameters specified for the notification.
4. Make your modifications and click Save to save your changes.
   To verify that your changes are saved, view the details of the notification on the Notifications page.

- Enabling and Disabling Notifications on page 237

Enabling and Disabling Notifications

You can change the functional status of a notification from enabled to disabled, and vice versa. When you create a notification, by default, the notification is in the enabled status where it performs its functions normally. Although the notifications that you disable are inactive and do not perform the specified actions, they are listed on the Manage Notifications page and can be enabled whenever required.

When a public tag that is set as a filter level for a notification is deleted, the notification continues to be displayed on the Manage Notifications page with its status changed to Disabled. You are notified of this change when the notification is triggered.

To enable or disable a notification:

1. From the Service Insight navigation tree, select Insight Central > Notifications.
   The Manage Notifications page displays the notifications.
2. Select the notifications whose status you want to modify.
3. Right-click your selection or use the Actions list and select Enable/Disable.
   The Change Notification Status dialog box displays the list of notifications and the changed functional status.
4. Click Change Status to confirm.
   The status of the selected notifications is modified.
Deleting Notifications

You can delete multiple notifications from the Manage Notifications page.

To delete notifications:

1. From the Service Insight navigation tree, select Insight Central > Notifications. The Manage Notifications page displays the notifications.
2. Select the notifications that you want to delete.
3. Right-click your selection or use the Actions list and select Delete. The Delete Notification dialog box displays the list of selected notifications.
4. Click Delete to confirm. The selected notifications are deleted from the Service Insight database. To verify that the selected notifications are deleted, view the notifications displayed on the Manage Notifications page.

Juniper Support Systems (JSS) uses the Juniper Networks Knowledge Base (KB), engineering expertise, and specialized tools to resolve incident cases. It also uses proactive analysis information that it receives from internal product knowledge, the KB, and the customer's network to provide intelligence updates. JSS receives information from the devices in the network and sends this information, in the form of updates and alerts, to Service Now.

All communication between Service Now and JSS occurs over a secure channel, and each transaction is authenticated and verified by JSS.

This topic describes JSS event messages along with the Juniper Networks recommended course of action for each event. For warnings with no listed actions, the message is informational only.

### LIC-1001

**System Log Message**
Current date is within 60 days beyond expiry. Requests still processed. SKU: xxx has expired

**Description**
Even though the current date is less than 60 days after the license expired, requests are still being processed.

**Type**
Warning

**Action**
Contact Juniper Networks or a Juniper Networks Partner for license renewal.
