

What's New in Juniper's SSL VPN Version 6.1

This application note describes the new features available in Version 6.1 of the Secure Access SSL VPN product line. This document assumes familiarity with the Juniper's IVE platform and the features of earlier releases up to version 6.0.

The document is organized into five sections, each describing a different functional area.

- I. Endpoint Security
- II. Enterprise Mobility
- III. Network Connect
- IV. Terminal Services
- V. Streamlined Manageability

- I. **Endpoint Security** – In order to keep pace with newer operating systems, this release includes support for Secure Virtual Workspace (SVW) on Windows Vista, which had previously not been supported in 6.0.

This is the only client enhancement in the 6.1 release, as the primary goal is to support the new 2500, 4500 and 6500 platforms. SA2500, SA400 and SA6500 products have this version as the factory image and may not be downgraded to support previous versions. Those who are not specifically requiring production support for SVW on Windows Vista will not benefit by running this release.

Customer Benefits

- Further solidifies the Secure Access platform as the standard for remote access across an entire enterprise, regardless of the types of devices that must be supported.

Availability

- SA700, SA2000, SA4000, SA6000, SA2500, SA4500, SA6500. Please note that the older SA1000, SA3000 and SA5000 systems are not supported on version 6.1 or higher, even though the admin interface will report them as being of the SA2000, SA4000 or SA6000 series.

- II. **Enterprise Mobility** – N/A

- III. **Network Connect** – N/A.

- IV. **Terminal Services** – N/A

- V. **Streamlined Management** – N/A
