

## What's New in Juniper Networks Secure Access SSL VPN Version 6.3

This document describes the new features available in Version 6.3 of the Secure Access SSL VPN product line. This document assumes familiarity with the Juniper's IVE platform and the features of earlier releases up to version 6.2.

### ***Central Management of Policies and Secure Access SSL VPN appliances via Juniper's Network and Security Manager (NSM)***

Juniper Networks' Secure Access SSL VPN version 6.3 adds the ability to centrally manage and configure all SA appliances in an enterprise network from a single console - via Juniper's Network and Security Manager (NSM), Juniper's enterprise management product line. Juniper NSM - in conjunction with Juniper's Secure Access SSL VPN platforms and UAC's Infranet Controller- enables organizations to create common configuration templates that can be shared between the Secure Access SSL VPN (remote access control) and UAC (LAN access control) deployments.

#### **Benefits:**

The interoperability between SA and NSM reduces ongoing administration time and costs by consolidating device management into a single console with shared policies. It also allows customers to more quickly and easily deploy a global SA solution. And, it reduces policy configuration time for remote access (via Juniper's Secure Access SSL VPN platforms) and LAN access (via Juniper UAC's Infranet Controller devices).

#### **Availability:**

Available on Secure Access 2000, 2500, 4000, 4000 (FIPS), 4500, 6000, 6000 (FIPS), and 6500 devices when used in conjunction with NSM.

### ***Enhanced User Experience for Windows File Access Single Sign-On***

To prevent potential user account lock out with using system credentials due to number of retries while using Windows File Access through the SA device, administrators now have the flexibility to choose whether to prompt the end users for credentials or to use the credentials that were used to login to the SA device when accessing Windows Files through the Core Access method.

#### **Customer Benefits**

Enhances the end user experience and loss of productivity due to user account lock-outs.

#### **Availability**

Available on all Secure Access devices.
