

## Chapter 6

# IGMP Configuration Guidelines

To configure the Internet Group Management Protocol (IGMP), include the `igmp` statement:

```
igmp {
  interface interface-name {
    disable;
    static {
      group group {
        source source;
      }
    }
    version version;
  }
  query-interval seconds;
  query-last-member-interval seconds;
  query-response-interval seconds;
  robust-count number;
  traceoptions {
    file name <replace> <size size> <files number> <no-stamp>
      <(world-readable | no-world-readable)>;
    flag flag <flag-modifier> <disable>;
  }
}
```

You can include this statement at the following hierarchy levels:

[edit protocols]

[edit logical-routers *logical-router-name* protocols]

For an overview of logical routers and a detailed example of logical router configuration, see the logical routers chapter of the *JUNOS Feature Guide*.

By default, IGMP is automatically enabled on all broadcast interfaces on which you configure the Distance Vector Multicast Routing Protocol (DVMRP) or Protocol Independent Multicast (PIM).

This chapter describes the following tasks for configuring IGMP:

Minimum IGMP Configuration on page 48

Enabling IGMP on page 48

Modifying the IGMP Host-Query Message Interval on page 49

Modifying the IGMP Query Response Interval on page 49

Modifying the Last-Member Query Interval on page 50

Modifying the Robustness Variable on page 50

Changing the IGMP Version on page 51

Enabling IGMP Static Group Membership on page 51

Tracing IGMP Protocol Traffic on page 52

Disabling IGMP on page 53

## Minimum IGMP Configuration

---

IGMP is automatically enabled on all broadcast interfaces when you configure PIM or DVMRP. All IGMP configuration statements are optional.

## Enabling IGMP

---

IGMP is automatically enabled on all broadcast interfaces when you configure PIM or DVMRP.

Optionally, you can specify the interface or interfaces on which to enable IGMP. If you do not specify any interfaces, IGMP is enabled on all broadcast interfaces. To enable IGMP explicitly, include the `igmp` statement:

```
igmp {
  interface interface-name;
}
```

You can include this statement at the following hierarchy levels:

[edit protocols]

[edit logical-routers *logical-router-name* protocols]

For information about specifying interface names, see the *JUNOS Network Interfaces and Class of Service Configuration Guide*.

## Modifying the IGMP Host-Query Message Interval

---

The IGMP querier router periodically sends general host-query messages. These messages solicit group membership information and are sent to the all-systems multicast group address, 224.0.0.1.

By default, host-query messages are sent every 125 seconds. You can change this interface to change the number of IGMP messages sent on the subnet.

To modify this interval, include the query-interval statement:

```
query-interval seconds;
```

You can include this statement at the following hierarchy levels:

```
[edit protocols igmp]
```

```
[edit logical-routers logical-router-name protocols igmp]
```

The query interval value can be from 1 through 1024 seconds.

## Modifying the IGMP Query Response Interval

---

The query response interval is the maximum amount of time that can elapse between when the querier router sends a host-query message and when it receives a response from a host. Varying this interval allows you to adjust the burst peaks of IGMP messages on the subnet.

By default, the query response interval is 10 seconds. To modify this interval, include the query-response-interval statement:

```
query-response-interval seconds;
```

You can include this statement at the following hierarchy levels:

```
[edit protocols igmp]
```

```
[edit logical-routers logical-router-name protocols igmp]
```

The query response interval can be from 1 through 1024 seconds. It must be less than the host-query message interval.

## Modifying the Last-Member Query Interval

---

The last-member query interval is the maximum amount of time between group-specific query messages, including those sent in response to leave-group messages. You can lower this interval to reduce the amount of time it takes a router to detect the loss of the last member of a group.

The default last-member query interval is 1 second. To modify this interval, include the `query-last-member-interval` statement:

```
query-last-member-interval seconds;
```

You can include this statement at the following hierarchy levels:

```
[edit protocols igmp]
```

```
[edit logical-routers logical-router-name protocols igmp]
```

The last-member query interval can be from 1 through 1024 seconds.

## Modifying the Robustness Variable

---

The IGMP robustness variable provides fine-tuning to allow for expected packet loss on a subnet. The value of the robustness variable is used in calculating the following IGMP message intervals:

**Group member interval**—Amount of time that must pass before a multicast router decides that there are no more members of a group on a network. This interval is calculated as follows:  $(\text{robustness variable} \times \text{query-interval}) + (1 \times \text{query-response-interval})$ .

**Other querier present interval**—Amount of time that must pass before a multicast router decides that there is no longer another multicast router that is the querier. This interval is calculated as follows:  $(\text{robustness variable} \times \text{query-interval}) + (0.5 \times \text{query-response-interval})$ .

**Last-member query count**—Number of group-specific queries sent before the router assumes there are no local members of a group. The default number is the value of the robustness variable.

By default, the robustness variable is set to 2. You might want to increase this value if you expect a subnet to lose packets. To change the value of the robustness variable, include the `robust-count` statement:

```
robust-count number;
```

You can include this statement at the following hierarchy levels:

```
[edit protocols igmp]
```

```
[edit logical-routers logical-router-name protocols igmp]
```

The number can be from 2 through 10.

## Changing the IGMP Version

---

By default, the router runs IGMP version 2. To change to version 3 (for source-specific multicast [SSM] functionality), include the version statement:

```
version 3;
```

You can include this statement at the following hierarchy levels:

```
[edit protocols igmp interface interface-name]
```

```
[edit logical-routers logical-router-name protocols igmp interface interface-name]
```

To enable SSM functionality, you must configure version 3 on the host and the host's directly connected router.

**NOTE:** Routers running different versions of IGMP negotiate the lowest common version of IGMP that is supported by hosts on their subnet and operate in that version.

If you have already configured the router to use IGMP version 1 and then configure it to use IGMP version 2, the router continues to use IGMP version 1 for up to 6 minutes and then uses IGMP version 2.

## Enabling IGMP Static Group Membership

---

You can create IGMP static group membership to test multicast forwarding without a receiver host. When you enable IGMP static group membership, data is forwarded to an interface without receiving membership reports from host members.

When you configure static IGMP group entries on point-to-point links that connect routers to a rendezvous point (RP), the static IGMP group entries do not generate join messages toward the RP.

To configure IGMP static membership, include the static statement. Then specify the group, or the group and its source or sources:

```
static {
  group group {
    source source;
  }
}
```

**NOTE:** You must specify a unique address for each group.

You can include this statement at the following hierarchy levels:

```
[edit protocols igmp interface interface-name]
```

```
[edit logical-routers logical-router-name protocols igmp interface interface-name]
```

**Example: IGMP Static Group Membership**

Configure IGMP static membership on the interface where the data is to be forwarded, and specify the groups 239.255.0.1 and 232.1.1.1 with the sources 10.1.1.1 and 10.1.1.2:

```
[edit]
protocols {
  igmp {
    interface ge-1/1/1.0 {
      static {
        group 239.255.0.1;
        group 232.1.1.1 {
          source 10.1.1.1;
          source 10.1.1.2;
        }
      }
    }
  }
}
```

**Tracing IGMP Protocol Traffic**

To trace IGMP protocol traffic, specify options to the traceoptions statement at the [edit routing-options] or [edit logical-routers *logical-router-name* routing-options] hierarchy level. Options applied at the routing options level trace all packets, and options applied at the protocol level trace only IGMP traffic.

You can specify IGMP-specific options by including the traceoptions statement:

```
traceoptions {
  file name <replace> <size size> <files number> <no-stamp>
    <(world-readable | no-world-readable)>;
  flag flag <flag-modifier> <disable>;
}
```

You can include this statement at the following hierarchy levels:

```
[edit protocols igmp]
```

```
[edit logical-routers logical-router-name protocols igmp]
```

You can specify the following IGMP-specific options in the IGMP flag statement:

leave—Trace leave-group messages (for IGMP version 2 only).

mtrace—Trace mtrace packets. Use the mtrace command to troubleshoot the software.

packets—Trace all IGMP packets.

query—Trace IGMP membership query messages, including general and group-specific queries.

report—Trace membership report messages.

To trace the paths of multicast packets, use the `mtrace` command, as described in the *JUNOS Protocols, Class of Service, and Systems Basics Management Command Reference*.

For information about tracing and global tracing options, see the *JUNOS Routing Protocols Configuration Guide*.

### Example: Tracing IGMP Protocol Traffic

Trace only unusual or abnormal operations to the file `routing-log`, and trace all IGMP packets to the file `igmp-log`:

```
[edit]
routing-options {
  traceoptions {
    file routing-log;
    flag errors;
  }
}
protocols {
  igmp {
    traceoptions {
      file igmp-log;
      flag packets;
    }
  }
}
```

## Disabling IGMP

---

To disable IGMP on an interface, include the `disable` statement:

```
disable;
```

You can include this statement at the following hierarchy levels:

```
[edit protocols igmp interface interface-name]
```

```
[edit logical-routers logical-router-name protocols igmp interface interface-name]
```
