

Chapter 14

Configuring Ethernet Modules

This chapter describes how to configure the following Ethernet modules:

FE-2

FE-8

GE

This chapter contains the following sections:

Overview on page 174

References on page 174

Configuration Tasks on page 174

Configuring Ethernet Modules on page 175

Overview

The Fast Ethernet (FE) and Gigabit Ethernet (GE) modules support the routing of IP packets and quality of service (QoS) classification. These modules use Address Resolution Protocol (ARP) to obtain media access control (MAC) addresses for outgoing Ethernet frames. Ethernet line modules pair with I/O modules to provide particular capabilities and connections.

For complete module details, see Table 42 and the *E-series Module Guide*.

Table 42: Ethernet Line Modules and I/O Modules

Line Module	I/O Module	Description	NMC-RX Software Reference Name
FE-2	FE-2	2-port module that supports 10/100 Base-T operation	FE-2 port
GE/FE	FE-8	8-port module that supports 10/100 Base-T operation	FE-8 port
GE/FE	GE SFP	1-port module that supports 1000 Base-SX, 1000 Base-LH, and 1000 Base-ZX operation NOTE: The GE SFP I/O module uses a range of simple form-factor pluggable transceivers (SFPs) to support different modes and cable lengths.	GE-1 port
GE/FE	GE	1-port module that supports 1000 Base-LX and 1000 Base-SX operation NOTE: Assembly is superseded by a newer assembly; however, assembly is supported by current software.	GE-1 port

Configuration Tasks

Typically, you configure Ethernet modules in the following order. Some steps may not apply for a particular module.

1. Set the parameters that provide basic identification and status information about the module.
2. Set the line interface parameters.
3. Create the interface stacking by choosing one of following options:

IP interface with IP addresses and/or PPPoE stacking

Fast Ethernet or Gigabit Ethernet subinterfaces with IP interfaces or PPPoE stacking

VLAN stacking

Configuring Ethernet Modules

You can configure the admin status of a module only by enabling or disabling it.

To change the admin status:

1. In the Instance Explorer list, select the module that you want to configure.
2. Right-click, and select Configure.

The Module Config tab appears in the work area.

3. Set the admin status (Table 43).

Table 43: Module Configuration Parameters

Field	Description
Module Type	Module type (cannot edit)
Admin Status	Enabled—Module is running Disabled—Module is not in operation
Serial Number	Ten-digit identification number (S/N) on the face plate of the module. This value is automatically retrieved from the device, and you cannot edit it.
IOA Serial Number	Ten-digit identification number (S/N) on the face plate of the input/output adapter. This number is automatically retrieved from the device, and you cannot edit it.

4. Click Save.

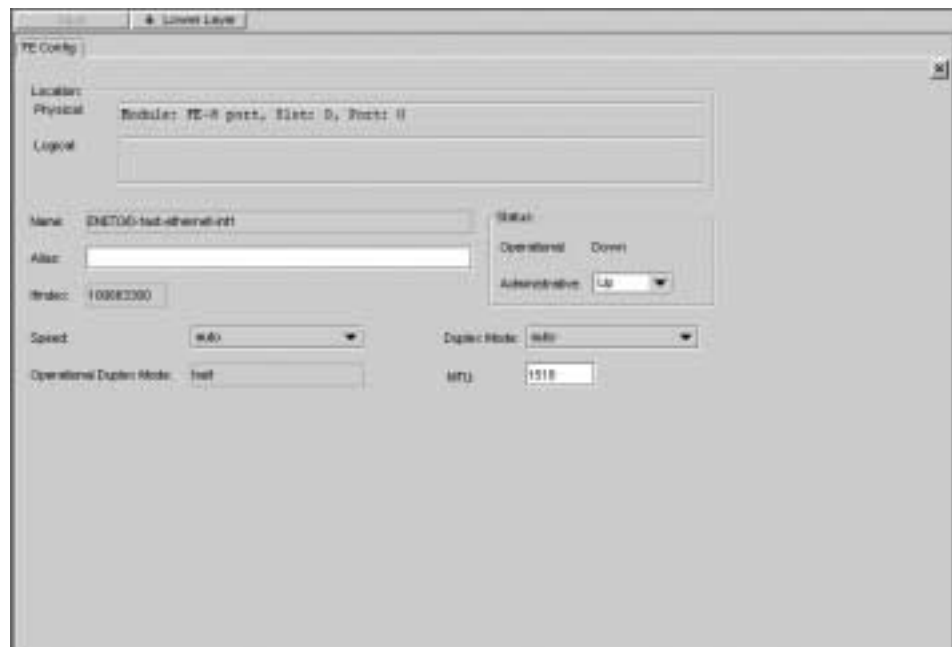

Configuring a Line Interface

There are two line interfaces (0, 1) for the FE-2 module, eight line interfaces (0-7) for the FE-8 module, and one line interface (0) for the GE module.

To configure a line interface:

1. In the Instance Explorer, select the line interface that you want to configure.
2. Right-click, and select Configure.

The Config tab (either FE Config or GE Config) appears in the work area.

3. Set the parameters (Table 44).

Table 44: Line Interface Parameters

Field	Description
Name	Identifies the interface; generated automatically
Alias	Description of the interface; 0–15 characters; default: blank
IfIndex	Identifies the interface on the particular line interface; generated automatically
Operational	Current operational status of the interface
Administrative	Desired status of the interface: Up/Down; default: Up
Speed	Specifies the line speed for a Fast Ethernet or Gigabit Ethernet interface: auto—Automatically specifies that the system negotiates the line speed with the remote device 10—Specifies that the device uses a line speed of 10 Mbps (FE only) 100—Specifies that the device uses a line speed of 100 Mbps (FE only) 1000—Specifies that the device uses a line speed of 1000 Mbps (GE only)
Operational Duplex Mode	Specifies the current operational duplex mode for the Ethernet interface
Duplex Mode	Specifies the duplex mode for a Fast Ethernet or Gigabit Ethernet interface: auto—Automatically specifies that the system negotiates duplex mode with the remote device half—Specifies that the device uses half-duplex (FE only) full—Specifies that the device uses full-duplex on the interface
MTU	Maximum transmission unit; range 64–9188; default 1518

4. Click Save.

NOTE: When you set the duplex mode to a value other than “auto,” you must simultaneously set the corresponding speed parameter to a value other than “auto.” Therefore, the operational duplex mode can be different from the administrative duplex mode.
