

Modernize and update your network with the SRX Series and Juniper Security Services

SRX Series Features: Firewall, VPN, AppSecure, User Role-Based Authentication, NAT, IPS, UTM, Threat Intelligence, and Advanced Threat Protection

### Next-Generation Firewall Services

Juniper Next-Generation Firewall Services provide an array of cyber defenses to reduce your attack surface in challenging environments. With the SRX firewall at the foundation, NGFW Services include: AppSecure for deep application visibility; best-in-class antivirus, antispam, Web filtering, and content filtering features; Intrusion Prevention System (IPS) for comprehensive threat detection and protection; and, user firewall service to restrict application usage on a per-user basis.

### SECURITY SERVICES

### Juniper Networks Virtual Firewall — vSRX

The vSRX, handling speeds up to 100 Gbps, is the industry’s fastest virtual firewall. It delivers core firewall, networking, advanced security, and automated lifecycle management for enterprises and service providers. The vSRX supports Juniper Contrail, OpenContrail, and various third-party software-defined networking (SDN) solutions while integrating with cloud orchestration tools such as OpenStack to provide scalable, secure protection across private, public, and hybrid clouds.

### VIRTUAL PLATFORM

### Security Director with Policy Enforcer

Junos Space Security Director provides security policy management through an intuitive, centralized interface that offers enforcement across emerging and traditional risk vectors. Policy Enforcer, a key Security Director capability, integrates with Sky Advanced Threat Prevention, orchestrating security workflows to protect both perimeter-oriented traffic and lateral threat propagation within the network. Security Director integrates custom third-party off-premises threat feeds into the SDSN framework for automated incident response.

### SECURITY MANAGEMENT

### Sky Advanced Threat Prevention

Sky ATP is a cloud-based service integrated with the SRX Series to deliver an anti-malware solution that adapts to the ever-changing threat landscape. Sky ATP protects against sophisticated zero-day attacks and unknown threats by analyzing ingress and egress traffic for malware and indicators of compromise. Sky ATP consolidates known threat information from in-house logging, cloud feeds from command and control (C&C) – both Geo-IP and third party via REST API – and unknown threats from sandboxing, machine learning, and deception.

### CLOUD-BASED THREAT INTELLIGENCE

### Juniper Secure Analytics (JSA)

JSA Series Secure Analytics combine, analyze, and manage an unparalleled set of surveillance data – network behavior, security events, vulnerability profiles, and threat information with security information and event management (SIEM) system – scaled to match business operations from a single console. Choose from the JSA3800, JSA5800, JSA7500, or the JSA Virtual Appliance.

### ANALYTICS

### Automation, Programmability, Telemetry

Junos OS automation simplifies complex configurations and reduces potential configuration errors by enlisting all the on-box and off-box requirements, including advanced customizations and integration with third party tools. Automation also supports software upgrades, testing, fault remediation, configuration management and service provisioning.

### AUTOMATION
