    [edit protocols mpls static-label-switched-path lsp-name bypass],
    [edit protocols mpls static-label-switched-path lsp-name ingress]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Add a new label to the top of the label stack. This statement is used to configure static LSPs at ingress routers and to configure bypass LSPs for static LSPs.

Options

    out-label—Manually assigned outgoing label value.

Range: 0 through 1,048,575.

Required Privilege Level

    routing—To view this statement in the configuration.
    routing-control—To add this statement to the configuration.

Configuring the Ingress Router for Static LSPs | 604
random

Syntax

```
(random | least-fill | most-fill);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Configure the preferred path when several equal-cost candidate paths to a destination exist, and prefer the path with the highest available bandwidth (with the largest minimum available bandwidth ratio). The available bandwidth ratio of a link is the available bandwidth on a link divided by the maximum reservable bandwidth on the link.

- **least-fill**—Prefer the path with the most available bandwidth (with the largest available bandwidth ratio).
- **most-fill**—Prefer the path with the least available bandwidth (with the minimum available bandwidth ratio). The minimum available bandwidth ratio of a path is the smallest available bandwidth ratio belonging to any of the links in the path.
- **random**—Choose the path at random.

Default

random

Required Privilege Level

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**
Specify whether an LSP should actively record the path by sending the record route object (RRO) of an LSP. The RRO is used to record the path that the LSP traverses. It includes the IP address, router ID, and node ID of the routers in the path. Recording LSP path can be useful for diagnostics and loop detection.

**Default**
Recording LSP path is enabled by default when you have node or link protection configured on the device.

**Required Privilege Level**
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

remote-interface-switch

Syntax

remote-interface-switch connection-name {
  interface interface-name.unit-number;
  receive-lsp label-switched-path;
  transmit-lsp label-switched-path;
}

Hierarchy Level

[edit logical-systems logical-system-name protocols connections],
[edit protocols connections (MPLS)]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.5 for EX Series switches.

Description
Configure MPLS LSP tunnel cross-connects. This makes an association between a CCC interface and two LSPs, one for transmitting MPLS packets from the local provider edge switch to the remote provider edge switch and the other for receiving MPLS packets on the local provider edge switch from the remote provider edge switch.

Options

connection-name—Connection name.

interface interface-name.unit-number—Interface name. Include the logical portion of the name, which corresponds to the logical unit number of the CCC interface.

receive-lsp label-switched-path—Name of the LSP from the connection's source. This LSP name was specified by the label-switched-path statement on the remote provider edge switch in the protocols mpls stanza.

transmit-lsp label-switched-path—Name of the LSP to the connection's destination. This LSP name was specified by the label-switched-path statement on the local provider edge switch in the protocols mpls stanza.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
remote-site-id

Syntax

remote-site-id remote-site-ID;

Hierarchy Level

[edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn site site-name interface interface-name],
[edit routing-instances routing-instance-name protocols l2vpn site site-name interface interface-name]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for EX Series switches.

Description
Control the remote interface to which the interface should connect. If you do not explicitly configure the remote site ID, the order of the interfaces configured for the site determines the default value. This statement is optional.

Options
remote-site-ID—Identifier specifying the interface on the remote PE router the Layer 2 VPN routing instance connects to.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

retry-limit

Syntax

retry-limit number;

Hierarchy Level

[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name],

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Maximum number of times the ingress router tries to establish the primary path. This counter is reset each time a primary path is created successfully. When the limit is exceeded, no more connection attempts are made. Intervention is then required to restart the connection.

Options

number—Maximum number of tries to establish the primary path.

Range: 0 through 10,000

Default: 0 (The ingress node never stops trying to establish the primary path.)

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
BFD behavior modified in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Specify the amount of time (in seconds) that an LSP must wait before traffic reverts to a primary path. If during this time the primary path experiences any connectivity problem or stability problem, the timer is restarted.

If you have configured BFD on the LSP, the Junos OS waits until the BFD session is restored before starting the revert timer counter.

If you have configured a value of 0 seconds for the revert-timer statement and traffic is switched to the secondary path, the traffic remains on that path indefinitely. It is never switched back to the primary path unless you intervene.

Options

seconds—Time in seconds.

Range: 0 through 65,535 seconds

Default: 60 seconds

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**

Amount of time MPLS retains RSVP PathErr messages and considers them for CSPF computations. The more time you configure, the more time a source node (ingress of an RSVP LSP) can have to learn about the failures of its LSP by monitoring PathErr messages transmitted from downstream nodes.

Information from the PathErr messages is incorporated into subsequent LSP computations, which can improve the accuracy and speed of LSP setup. Some PathErr messages are also used to update traffic engineering database bandwidth information, reducing inconsistencies between the database and the network.

**Options**

- `seconds`—Amount of time MPLS retains RSVP PathErr messages and considers them for CSPF computations.

**Range:** 0 through 240 seconds

**Default:** 25 seconds

**Required Privilege Level**

- routing—to view this statement in the configuration.

**sampling (Protocols MPLS)**

**Syntax**

```plaintext
sampling {
    cut-off-threshold percentile;
    use-average-aggregate;
    use-percentile percentile;
}
```

**Hierarchy Level**

```plaintext
[edit protocols mpls container-label-switched-path lsp-name splitting-merging]
```

**Release Information**

Statement introduced in Junos OS Release 14.2.
Statement introduced in Junos OS Release 17.2R1 for the QFX Series switches.

**Description**

Configure traffic sampling. By default, sampling mode is set to **Max Aggregate** which means the system will compare each new sample with the previous sample. If the new sample is higher than the old sample, then the newer sample is considered **Sampled Aggregate bandwidth**

**Max Aggregate Example**

If normalization happens every 20min (T0, T20, T40,..) then if at time T0 the traffic rate is 185Gbps, and subsequently drops to 7.5Gbps at time T3, the max-aggregate sample for the current normalization window T0-T20 will be 185Gbps. When the current normalization window expires at time T20, we use the previous sampled max-aggregate of 185Gbps to calculate the split/merge activities of the next (or now current) normalization window between T20 – T40. If traffic remains at 7.5Gbps for this second normalization period, then at time T40 the max-aggregate sample of 7.5Gbps would then be used for split/merge activities. Even though traffic volumes dropped at time T3, LSP split/merge activities would not occur until time T40 which might be unexpected. This default behavior can be modified with use-average-aggregate or use-percentile to achieve alternative normalization behavior if desired.

**Options**

**cut-off-threshold percentile**—Specify the percentile value to be used as a cut-off threshold in removing outlier bandwidth samples. All the aggregate bandwidth samples determined as outliers are used for computing aggregate bandwidth used at the time of normalization.

**Default:** 0 percentile (the ingress considers all aggregate bandwidth samples for normalization.)

**Range:** 0 through 100
**use-average-aggregate**—Specify the ingress router to take average of the aggregate samples for normalization.

This option is mutually exclusive with the **use-percentile** configuration option.

**use-percentile percentile**—Specify the ingress router to compute and use the pth percentile from all the bandwidth samples, and use that for normalization.

This option is mutually exclusive with the **use-average-aggregate** configuration option.

**Range:** 0 through 100

```

**Release Information**

Statement introduced in Junos OS Release OS 18.1R1 for MX Series, PTX Series, and QFX Series.

**Description**

Static segment for segment routing. A static segment is identified by a unique name. This segment type is assigned a segment identifier (SID) which falls under a default range of 100000 through 1048575. The segment has label operation such as pop-and-forward for adjacency segment and swap-and-forward for prefix or node segment. For both types of label operation, the segment is assigned a next hop that specifies the remote IP address if the outgoing interface is a multi-access interface, or the name of the outgoing interface if the interface is a point-to-point interface. Static segment configuration is used to statically configure or provision the adjacency SIDs, node SIDs, and prefix SIDs on transit routers.

**Options**

- **pop**—Pop the SID label
- **swap**—Swap the SID label to this label
- **description**—Text description of label-switched path
- **next-hop**—IPv4 address or interface of next-hop router
- **sid-label**—Segment identifier (SID) label

The remaining statements are explained separately. See CLI Explorer.

- `dynamic` statement introduced in Junos OS Release 19.2R1 on all platforms.
- `compute, loose, and strict` statements introduced in Junos OS Release 19.1R1-S1 on MX Series routers.

#### Description

Specify an name to identify the segment routing list (used in traffic engineering policy) and the explicit path for source routing label switched path (LSPs) to traverse through traffic engineering segments. The segment list is essentially a stack of segment identifiers.

Starting in Junos OS release 19.1R1 for MX and PTX Series routers, you can enable a translation service to translate next-hop IP addresses into the corresponding segment identifier (SID) labels. The translation service keeps track of the node reached at each hop.

When configured, the `segment-list` of a segment routing traffic engineering (SR-TE) LSP accepts IP addresses for all the hops along the path. These IP addresses can be either the loopback address of a node, or the
IP address of a link, as identified by the **node-type**. When **auto-translation** is enabled, next hop IP addresses are automatically translated to corresponding SIDs using the translation service. A retry rate can be set for the retry timer at the **source-packet-routing** hierarchy level.

NOTE: The segment list enables BGP and static segment routing LSP to steer traffic based on segment routing policies. When a segment list is used by the protocol BGP, the BGP protocol validates these segment identifiers and selects valid segments for traffic engineering.
Options

<hop-name>—Indicates the next hop in the segment routing traffic engineering policy (SR-TE).

- **ip-address**—Specify the IP address of the hop. For a segment-list to be used by a non-colored segment routing LSP, the first hop must specify an IP address.

- **label**—Specify the SID label of the hop in a segment routing traffic engineering segment list. In static segment routing LSPs, the source routing path uses the segment list only if the second to Nth hop specifies segment identifiers (SID) labels.

  NOTE: The range is from 0 to 1,048,576 and is applies to BGP and static segment routing LSPs.

- **label-type**—Use with the option below to indicate that the specified address is the IP address of the node, for example, its loopback address, as opposed to that of a link.

  - **node**—Hops that have been specified as node are translated to a prefix SID, which can be either a node SID or an anycast SID depending on the type of hop IP address. IP addresses not identified as node are considered to be a link.

    NOTE: If the first hop is a node, for LSP resolution to work correctly, inherit-label-nexthops must be enabled at either source-packet-routing hierarchy level, or at the relevant segment-list hierarchy level.

- **loose | strict**—IP hops specified using router IDs in the sequence can be strict or loose hops. A strict hop must be directly connected to the previous node in the sequence. A loose hop is not necessarily directly connected to the previous node.

    NOTE: You can specify only router IDs as loose or strict hop constraints. Labels and other IP addresses are not supported as loose or strict hop constraints in Junos OS Release 19.2R1-S1.

- **auto-translate**—This option must be enabled before a given segment list can use IP addresses instead of SIDs for any hop other than the first hop. In addition, all hops in the segment list must have IP addresses. If any hops on the list have both an IP address and a label configured, the label will be retained. Link addresses are only translated into labels if the preceding node advertises an adjacency SID for the address (otherwise translation fails).
NOTE: In Junos OS Release 19.1R1, for auto-translate to work for OSPF, RSVP for segment routing must be enabled on all participating interfaces.

- **protected**—(Optional) Enable this option to ensure the adjacency SID is eligible to have a backup path, and that a B-flag is set in adjacency SID advertisements. Note that unless **mandatory** is also selected, the choice succeeds regardless.

- **mandatory**—(Optional) Enable this option to have translation fail if any unprotected links are found in the hop-list.

- **unprotected**—(Optional) Enable this option to ensure that no backup path is calculated for a specific adjacency SID, and that a B-flag is not set in adjacency SID advertisements. Note that unless **mandatory** is also selected, the choice succeeds regardless.

- **mandatory**—(Optional) Enable this option to have translation fail if any protected links are found in the hop-list.

**compute**—(Optional) Enable use of explicit paths specified in segment list for path computation.

**inherit-label-nexthops**—Inherit label next hops for first hop in this segment list that have both IP address and label configured in the first hop.

You can configure the **inherit-label-nexthops** statement globally or individually for each segment list.

The **inherit-label-nexthops** statement takes effect only when the segment list first hop has both IP address and SID label present.

If the **inherit-label-nexthops** is not configured at the [edit protocols source-packet-routing segment-list] hierarchy, and the first hop in the segment list has both IP address and label specified, the default behavior is to use the IP address.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Specify the conditions under which the path is selected to carry traffic. The `manual` and `unconditional` options are mutually exclusive.

Options

- **manual**—The path is selected for carrying traffic if it is up and stable for at least the revert timer window (potentially before the revert timer has elapsed). Traffic is sent to other working paths if the current path is down or degraded (receiving errors).

- **unconditional**—The path is always selected for carrying traffic, even if it is currently down or degraded (receiving errors).

Required Privilege Level

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

signal-bandwidth

Syntax

signal-bandwidth type;

Hierarchy Level

[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name lsp-attributes],
[edit protocols mpls label-switched-path lsp-name lsp-attributes]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Specify the bandwidth encoding of the signal used for path computation and admission control.

Options

type—Configure the type of bandwidth encoding used on the LSP. It can be any of the following values: 10gigether, ds1, ds3, e1, e3, ethernet, fastether, gigether, stm-1, stm-4, stm-16, stm-64, stm-256, sts-1, vt1-5, or vt2.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols bgp group group-name family inet-mdt],
[edit routing-instances routing-instance-name protocols bgp group group-name family inet-mvpn]

Release Information

Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 11.1 for EX Series switches.

Description

Enable signaling in BGP. For multicast distribution tree (MDT) subaddress family identifier (SAFI) NLRI signaling, configure signaling under the inet-mdt family. For multiprotocol BGP (MBGP) intra-AS NLRI signaling, configure signaling under the inet-mvpn family.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

site (Layer 2 Circuits)

Syntax

```text
site site-name {
  hot-standby;
  site-identifier identifier;
  site-preference preference-value {
    backup;
    primary;
  }
  interface interface-name {
    description text;
    remote-site-id remote-site-ID;
  }
}
```

Hierarchy Level

```text
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn],
[edit routing-instances routing-instance-name protocols l2vpn]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for EX Series switches.
**hot-standby** option introduced in Junos OS Release 14.2 for MX Series routers.

Description

Specify the site name, site identifier, and interfaces connecting to the site. Allows you to configure a remote site ID for remote sites.

Options

**hot-standby**—Turn on the protector behavior for the site. This keeps backup pseudowire in continuous standby mode and ready for traffic forwarding.

**site-identifier identifier**—Numerical identifier for the site used as a default reference for the remote site ID.

**site-name**—Name of the site.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—to view this statement in the configuration.

smart-optimize-timer

Syntax

smart-optimize-timer seconds;

Hierarchy Level

[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Enable the smart optimization timer. When you enable the smart optimization timer on a router, the Junos OS operates on the assumption that the original LSP path is preferable to any alternate or secondary path. When you enable the smart optimization timer and an LSP fails and its traffic is switched to an alternate path, the smart optimization timer starts and waits 3 minutes (this time is configurable). After 3 minutes have passed, the LSP is switched back to the original path. If the original path fails again and the LSP is switched to an alternate path again, the router waits 1 hour before attempting to switch the LSP back to its original path.

If you want to disable the smart optimizer, you can set it to zero. The smart-optimize-timer value in seconds indicates the time before which the LSP is switched back to its primary path in case the primary path becomes available. Otherwise, the time to wait is controlled by the optimize-timer, which is usually set to a high value. Some ISPs have the optimize-timer set to once a day. Sometimes after the smart optimizer causes the LSP to be placed back on its primary path, the primary path goes down again within 60 minutes. When this happens, the smart-optimize-timer is disabled automatically, and the optimize-timer (regular path optimization) goes into effect. This is to protect against a flapping link being used.

Default

The smart optimization timer is enabled by default.

Options

seconds—(Optional) Specify the number of seconds to wait before switching an LSP back to its original path. If you do not specify the number of seconds, the default value is used.

Range: 0 through 65,535 seconds

Default: 180 seconds

source-routing-path

Syntax

```
source-routing-path name {
  binding-sid binding-sid;
  color color;
  metric value;
  no-ingress;
  preference preference;
  primary name {
    weight weight;
  }
  secondary name {
    weight weight;
  }
  sr-preference sr-preference;
  to to;
}
```

Hierarchy Level

```
[edit logical-systems name protocols source-packet-routing],
[edit protocols source-packet-routing]
```

Release Information

Statement introduced in Junos OS Release 17.4R1 for MX Series and PTX Series with FPC-PTX-P1-A. The `metric`, `no-ingress`, and `secondary` statements are introduced in Junos OS Release 18.1R1 for MX Series.

Description

Configure a source routing label switched path (LSP) for steering traffic at an ingress router. Specify a binding segment identifier from the static label range. Configure other parameters such as color, weight, preference, and segment routing SR (SR) preference for traffic engineering.

Starting with Junos OS Release 18.1R1, static non-colored SR label switched paths (LSPs) for protocol SPRING-TE in an MPLS network. Configure parameters such as destination address, binding SIDs, primary segment, secondary segment, metric, and preference. These SR LSPs do not have a color associated with them. If an ingress route is not required for a non-colored SR LSP then the ingress route installation in inet.3 table can be disabled.

Options

name—Specify a name to identify a source routing path.
binding-sid—Specify the binding label to enable transit functionality for this tunnel. For a non-colored static SR LSP, the binding SID label of protocol SPRING-TE have, by default, a preference of 8 and a metric of 1.

NOTE: This is optional for MPLS networks.

Range: 16 through 1,048,576

color—Specify a color identifier for the tunnel end point.

NOTE: This is only for colored SR LSPs. For non-colored SR LSPs, you do not have to configure the color parameter.

metric—Specify metric for routes downloaded for the non-colored static SR tunnel.

Default:

NOTE: This is the default label range for static LSPs in MPLS networks. You can configure the label range at [edit protocols mpls label-range static label-range] hierarchy level.

1,000,000 through 1048575

Range:

NOTE: This range is for protocol BGP.

1 through 16777215

no-ingress—Disable ingress route that is not required for the non-colored static SR tunnel

preference—Specify the preference for routes downloaded for this tunnel.

primary—Specify a primary segment list for the configured source routing path.

The non-colored static SR LSP can have a maximum of 8 primary paths. In case of multiple operational primary paths, the PFE distributes the traffic over the paths based on the weight configured on the paths. If none of the paths have weights configured then the weights default to 1 making it an ECMP path. The paths become weighted ECMP if at least one of the paths have a non-zero weight. In both cases, when one or some of the paths fail, the PFE automatically re-balances the traffic over the remaining paths resulting in path protection.
**weight** *weight_value*—Specify a percentage of the bandwidth with respect to the sum of weights of all paths for the primary segment list. If forwarding interfaces are also configured with weighted ECMP, then Junos OS applies hierarchical weighted ECMP. If the weight percentage is not configured, then only IGP weights are applied on the forwarding interfaces.

**secondary**—Specify a secondary segment list for the configured non-colored static SR LSP.

**sr-preference**—Configure a preference for segment routing routes for traffic engineering. BGP chooses a higher preference over a lower preference value.

*Range*: 0 through 4,294,967,295

**to**—Specify the IP address of the tunnel end-point

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details..

source-routing-path-template

Syntax

```plaintext
source-routing-path-template name { 
bfd-liveness-detection;
ldp-tunneling;
metric metric;
no-ingress;
primary name {
    weight weight;
}
secondary name;
sr-preference sr-preference;
}
```

Hierarchy Level

```plaintext
[edit protocols source-packet-routing]
```

Release Information

Statement introduced in Junos OS Release 19.2R1 on all platforms.
bfd-liveness-detection and ldp-tunneling options introduced in Junos OS Release 19.4R1 on all platforms.

Description

Configure a source-routing-path-template for dynamic creation of segment routing label-switched paths (LSPs).

Options

name—Name of the source routing path.

ldp-tunneling—Allow LDP to use this LSP for tunneling. This configuration can be applied to PCE-initiated segment routing LSPs only.

metric—Metric for routes downloaded for this tunnel.
    Range: 1 through 16777215

no-ingress—Disable ingress functionality for this tunnel.

primary name—Configure a named identifier for the segment-list that describes the primary segment routing path along which the packet is to be routed. This segment list must have the dynamic statement enabled for dynamic creation of segment routing LSPs.

weight weight—(Optional) Specify the balance factor for this segment list in SR-TE tunnel.
If the forwarding interfaces have weights assigned by IGP, then hierarchical weighted ECMP is applied. When weight is not specified, only the IGP weights are applied on the forwarding interfaces.

**secondary name**—Configure a named identifier for the segment-list that describes the secondary segment routing path along which the packet is to be routed. This segment list must have the `dynamic` statement enabled for dynamic creation of segment routing LSPs.

**sr-preference**—Segment routing preference for the segment routing traffic engineered (SPRING-TE) routes. A greater value indicates higher preference.

The preference value of the routes programmed for the segment routing LSP is inherited from the `preference value` statement at the `[edit protocols source-packet-routing hierarchy level]`. When this value is not configured, the default preference value of 8 is used.

**Range:** 0 through 4294967295

splitting-merging

Syntax

splitting-merging {
    maximum-member-lsps number;
    maximum-signaling-bandwidth bps;
    merging-bandwidth bps;
    minimum-member-lsps number;
    minimum-signaling-bandwidth bps;
    normalization;
    sampling:
        splitting-bandwidth bps;
        splitting-merging-threshold percent;
    }

Hierarchy Level

[edit protocols mpls container-label-switched-path lsp-name]

Release Information
Statement introduced in Junos OS Release 14.2.
Statement introduced for QFX Series switches in Junos OS Release 15.1X53-D30.

Description
Perform splitting and merging.

Options

maximum-member-lsps number—Number of label-switched paths (LSPs) that a container LSP can have as member LSPs at maximum.
Default: 1

maximum-signaling-bandwidth bandwidth—Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at maximum after normalization. When maximum-signaling-bandwidth is not configured, the value is derived from the splitting-bandwidth.

When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the splitting-bandwidth.
Default: 1 bps

merging-bandwidth bandwidth—Amount of bandwidth in bits per second (bps) that is used for merging during normalization.
Default: 1 bps
**minimum-member-lsps number**—Number of LSPd that a container LSP can have as member LSPs at minimum.

Default: 64

**minimum-signaling-bandwidth bandwidth**—Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at minimum after normalization. When **minimum-signaling-bandwidth** is not configured, the value is derived from the **merging-bandwidth**.

When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the **merging-bandwidth**.

Default: 1 bps

**splitting-bandwidth bandwidth**—Amount of bandwidth in bits per second (bps) that can be used for splitting during normalization.

Default: 1 bps

**splitting-merging-threshold percent**—Percentage changes in aggregate bandwidth relevant for splitting and merging.

Default: 0%

The remaining statements are explained separately. See CLI Explorer.

spring-te (Dynamic Tunnels)

Syntax

```
spring-te {
    destination-networks name;
    source-routing-path-template name {
        (color [ color ... ] | color-any);
    }
}
```

Hierarchy Level

```
[edit routing-options dynamic-tunnels],
```

Release Information

Statement introduced in Junos OS Release 19.2R1 on all platforms.

Description

Enable next hop-based dynamic tunnel mode.

Options

- **source-routing-path-template template-name**—Configure template color mapping for segment routing traffic-engineered (SPRING-TE) dynamic LSP parameters.
- **color**—Specify set of color list to be mapped to corresponding SPRING-TE template.
  - When enabled, all templates should have color objects defined.
  - All destinations are assumed to be colored as well.
  - A color can be mapped to only one template at a given point in time.
  - Both the color and color-any statements can coexist. When the two statements are enabled together, preference is given to a specific color template than color-any.
  - A colored and non-colored destination cannot co-exist in the same SR-TE configuration.

- **color-any**—Enables mapping of any color to corresponding SPRING-TE template. Only one color-any template can be configured for one SR-TE LSP.

Required Privilege Level

statistics (Protocols MPLS)

Syntax

```
statistics {
    auto-bandwidth (MPLS Statistics);
    file filename <files number> <size size> <world-readable | no-world-readable>;
    interval seconds;
    no-transit-statistics;
    traffic-class-statistics;
    transit-statistics-polling;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
traffic-class-statistics option introduced in Junos OS Release 14.2.
Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.

Description

Enable MPLS statistics collection and reporting.

Options

file filename—(Optional) Name of the file to receive the output. We recommend that you place MPLS tracing output in the file mpls-stat in the /var/log directory.

files number—(Optional) Maximum number of trace files. When a trace file named file reaches its maximum size, it is renamed file.0, then file.1, and so on, until the maximum number of files is reached. Then, the oldest file is overwritten.

Range: 2 or more
Default: 2 files

If you specify a maximum number of files, you also must specify a maximum file size with the size option.

interval seconds—Interval at which to periodically collect statistics.

Range: 1 through 65,535
Default: 300 seconds

no-world-readable—(Optional) Prevent users from reading the log file.
size size—(Optional) Maximum size of each file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a file named file reaches this size, it is renamed file.0. When the file again reaches its maximum size, file.0 is renamed file.1 and file is renamed file.0. This renaming scheme continues until the maximum number of files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of files with the files option.

world-readable—(Optional) Enable users to read the log file.

Syntax: Syntax: \texttt{\textit{xk}} to specify KB, \texttt{\textit{xm}} to specify MB, or \texttt{\textit{wg}} to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

traffic-class-statistics—(Optional) Create counters that maintain data traffic statistics per traffic class at the ingress of all types of LSPs and egress of ultimate hop popping (UHP) point-to-point LSPs. These counters are not created by default and are required to be configured to perform traffic-class-scoped loss measurement.

transit-statistics-polling—(Optional) Enable the polling and display of MPLS statistics for LSPs transiting the router. By default, RSVP does not periodically poll for transit LSP statistics. You cannot configure this statement and the no-transit-statistics statement at the same time.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Remove the label at the top of the label stack and replace it with the specified label. Manually assigned incoming labels can have values from 1,000,000 through 1,048,575. This statement is used to configure static LSPs at transit routers.

Options

- **out-label**—Manually assigned outgoing label value.

Range: 0 through 1,048,575

Default: If you do not define the **out-label** option, the original label value remains unchanged.

Required Privilege Level

switch-away-lsps

Syntax

    switch-away-lsps;

Hierarchy Level

    [edit logical-systems logical-systems-name protocols mpls interface interface-name],
    [edit protocols mpls interface interface-name]

Release Information

Statement introduced in Junos OS Release 10.2.

Description

(MX Series routers only) Enable you to switch an LSP away from a network node using a bypass LSP. This feature could be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic. Configure this statement only after you have configured and committed the `always-mark-connection-protection-tlv` statement.

The `always-mark-connection-protection-tlv` statement marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. When you configure the `switch-away-lsps` statement, traffic is switched to the bypass LSP.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**

Specify the switching method for the LSP. The switching method can be one of the following values:

- **fiber**—Fiber switching
- **lambda**—Lambda switching
- **psc-1**—Packet switching
- **tdm**—Time-division multiplexing (TDM) switching

**Default**

psc-1

sync-active-path-bandwidth

Syntax

sync-active-path-bandwidth;

Hierarchy Level

[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name auto-bandwidth],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name (primary | secondary) path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name auto-bandwidth],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]

Release Information
Statement introduced in Junos OS Release 13.2.

Description
When you have a primary and a secondary path configuration, specify that a path needs to be signaled with the active-path bandwidth when the auto-bandwidth adjustment happens and that the secondary path synchronizes the bandwidth reservations to that of the primary path.

When a primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. If you include the `sync-active-path-bandwidth` statement, the secondary path releases the bandwidth it has reserved and adjusts its bandwidth after the primary path begins carrying traffic.

For example, suppose the active path is a secondary path with a reserved bandwidth of 10 GB as a result of the automatic bandwidth adjustment. Then suppose there is a switchover from the secondary path to the primary path. After some time the primary path reserves 5 GB as a result of a new automatic adjustment. Without the `sync-active-path-bandwidth` statement, the secondary path does not release the 10 GB after a switchover occurs. That bandwidth is wasted. If the `sync-active-path-bandwidth` is included in the configuration, the secondary path adjusts its bandwidth to 5 GB along with the primary path.

Default
When you have a primary and a secondary path configuration, and the primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. When the primary path comes back and the traffic switches over, the secondary path does not release its bandwidth reservations.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit protocols mpls diffserv-te]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Specify the traffic engineering class matrix for a multiclass LSP or a DiffServ-aware traffic engineering LSP.

Default

The default traffic engineering class matrix is:

```
<table>
<thead>
<tr>
<th>Layer</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>te-class-matrix {</td>
</tr>
<tr>
<td></td>
<td>te0 traffic-class ct0 priority 7;</td>

</tr>
<tr>
<td></td>
<td>te7 traffic-class ct3 priority 0;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>
```

If you define any of the traffic engineering classes, all the default values are dropped.

Options

- **ctnumber**—Specify the number of the class type. It can be one of four values: ct0, ct1, ct2, or ct3.
priority priority—Specify the priority of the class type. It can be one of eight values from 0 through 7.

tenumber—Specify the number of the traffic engineering class. It can be one of eight values: te0, te1, te2, te3, te4, te5, te6, or te7. You must configure the traffic engineering classes in order, starting with te0.

traffic-class—Specify the traffic class for the traffic engineering class.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
**ted-export** option introduced in Junos OS Release 14.2.
**ted-import** option introduced in Junos OS Release 14.2.
**lsp-history** option added in Junos OS Release 15.1.

Description

Configure MPLS tracing options at the protocol level or for a label-switched path.

To specify more than one tracing operation, include multiple **flag** statements.

Default

The default MPLS protocol-level tracing options are inherited from the routing protocols **traceoptions** statement included at the [edit routing-options] hierarchy level.

Options

- **filename**—Name of the file to receive the output of the tracing operation. All files are placed in the directory `/var/log`. We recommend that you place MPLS tracing output in the file `mpls-log`.

- **files number**—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  Range: 2 through 1000

  Default: 2 files

  If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.
flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.

MPLS Tracing Flags

- all—Trace all operations
- autobw-state—Automatic bandwidth events.
- connection—All circuit cross-connect (CCC) activity
- connection-detail—Detailed CCC activity
- cspf—CSPF computations
- cspf-link—Links visited during CSPF computations
- cspf-node—Nodes visited during CSPF computations
- error—MPLS error packets
- graceful-restart—Trace MPLS graceful restart events
- lsp-history—Trace LSP history events
- lsping—Trace lspping packets and return codes
- nsr-synchronization—Trace NSR synchronization events
- nsr-synchronization-detail—Trace NSR synchronization events in detail
- state—All LSP state transitions
- static—Trace static label-switched path
- ted-export—Trace leaking of entries from lsdist.0 table into the traffic engineering database
- ted-import—Trace leaking traffic engineering database entries into the lsdist.0 table
- timer—Timer usage

no-world-readable—(Optional) Allow only certain users to read the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches this size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: xk to specify KB, xm to specify MB, or xg to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

If you specify a maximum file size, you must also include the files statement to specify the maximum number of files.
world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level
routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

[edit protocols mpls label-switched-path lsp-name secondary path-name oam performance-monitoring querier delay]
```

Release Information

Statement introduced in Junos OS Release 15.1.

Description

Configure traffic class specific options.

Specify the traffic classes for which loss measurement has to be performed. This parameter takes one of the `tc-all|tc-0|tc-1|tc-2|tc-3|tc-4|tc-5|tc-6|tc-7|tc-none` traffic-class values. For each traffic class, you can configure the respective parameters.

To enable traffic-class parameters, configure the `traffic-class-statistics` configuration statement under the `[edit protocol mpls statistic] hierarchy level.

Options

- **average-sample-size sample size**—(Optional) Specify the number of samples used for calculating the average of various metrics.

  **Default:** 5
  **Range:** 1 through 30

- **padding-size size**—(Optional) Specify the delay-measurement message length, which is used to calculate the delay experienced by messages of different sizes.

  **Default:** 0
  **Range:** 1 through 1500
query-interval milliseconds—Specify the minimum transmit interval, which signifies how often the loss measurement message is generated from the querier.

Default: 10 seconds
Range: 1000 through 4294967295 milliseconds

rtt-delay-threshold rtt threshold value—Specify the round-trip delay threshold value.
Range: 1 through 4294967295 microseconds

twcd-delay-threshold twcd threshold value—Specify the two-way channel delay threshold value.
Range: 1 through 4294967295 microseconds

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traffic-engineering (Protocols MPLS)

Syntax

traffic-engineering (bgp | bgp-igp | bgp-igp-both-ribs | mpls-forwarding);

Hierarchy Level

[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Select whether MPLS performs traffic engineering on BGP destinations only or on both BGP and IGP destinations. Affects only LSPs originating from this routing device, not transit or egress LSPs.

Default

bgp

Options

bgp—On BGP destinations only. Ingress routes are installed in the inet.3 routing table.

bgp-igp—On both BGP and IGP destinations. Ingress routes are installed in the inet.0 routing table. If IGP shortcuts are enabled, the shortcut routes are automatically installed in the inet.0 routing table.

bgp-igp-both-ribs—On both BGP and IGP destinations. Ingress routes are installed in the inet.0 and inet.3 routing tables. This option is used to support VPNs.

mpls-forwarding—On both BGP and IGP destinations. Use ingress routes for forwarding only, not for routing.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traffic-engineering

Syntax

```
traffic-engineering {
    disable;
}
```

Hierarchy Level

```
[edit protocols ospf | isis]
```

Release Information

Statement introduced in Junos OS Release 9.5 for EX Series switches.

Description

Enable the traffic engineering features of the specified routing protocol.

Default

Traffic engineering is disabled.

Starting in Junos OS release 15.1, traffic engineering is enabled by default whenever the IS-IS protocol is enabled. You can disable it by including the `disable` statement at the `[edit protocols isis traffic-engineering]` hierarchy level. For the EX3300, EX4200, EX4500, EX4550, EX8200 and XRE200, you can disable traffic engineering starting in Junos OS release 15.1R7.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

**Release Information**

- Statement introduced in Junos OS Release 14.2.
- Statement introduced on QFX5100 switches in Junos OS Release 15.1
- Statement introduced on QFX10000 switches in Junos OS Release 17.1.

**Description**

Enable traffic engineering address family. This generates a multiprotocol address family indicator (AFI) and a subsequent address family identifier (SAFI) to be negotiated with the BGP peers.

The BGP network layer reachability information (NLRI) information is exchanged between the peers only when the traffic engineering AFI and SAFI are shared between them. If the peers do not agree on the use of the AFI and SAFI, the connection between the peers is terminated.

**Options**

- **unicast**—Include BGP-TE NLRI.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name protocols mpls label-switched-path label-switched-path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path label-switched-path-name]
```

**Release Information**

Statement introduced in Junos OS Release 12.3.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

**Description**

Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.

Be aware of the following platform requirements and restrictions:

- **UHP LSPs using VT interfaces**—Supported on all M Series, MX Series, T Series, and TX Matrix routers.
- **UHP LSPs using LSI interfaces**—Supported on MX 3D Series routers only.
- **UHP LSP requirements for the egress PE device**—For M Series and T Series routers, a VT interface is needed.
- **UHP LSPs and Layer 3 VPNs**—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only.
- **UHP LSPs and VPLS**—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the `no-tunnel-services` statement at the `[edit routing-instances routing-instance-name protocols vpls]` hierarchy level.

**Default**

Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.
**Required Privilege Level**

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Statement introduced before Junos OS Release 7.4.
Support for the `source-class-usage` statement added in Junos OS Release 9.3.
Statement introduced in Junos OS Release 11.1 for EX Series switches.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.
Statement introduced in Junos OS Release 15.1F5 and 16.1R2 for PTX5000 routers with third-generation FPCs installed.
Statement introduced in Junos OS Release 15.1F6 and 16.1R2 for PTX3000 routers with third-generation FPCs.
Statement introduced in Junos OS Release 16.1X65 and 17.2R1 for PTX1000 routers.
Statement introduced in cRPD Release 19.4R1.
Support for the `static` statement added in Junos OS Release 17.2.

Description

Map the inner label of a packet to a specific VPN routing and forwarding (VRF) instance. This allows the examination of the encapsulated IP header. The first lookup is done on the VPN label to determine which VRF instance to refer to, and the second lookup is done on the IP header to determine how to forward packets to the correct end hosts.

When you include the `vrf-table-label` statement in the configuration of a VRF routing instance, a label-switched interface (LSI) logical interface label is created and mapped to the VRF routing table. Any routes in the VRF routing table are advertised with the LSI logical interface label allocated for the VRF routing table. When packets destined for the VRF routing instance arrive on a core-facing interface, they are treated as if the enclosed IP packet arrived on the LSI interface and are then forwarded and filtered based on the correct table.

All routes in a VRF routing instance configured with this option are advertised with one label allocated per VRF.
NOTE:

- The `vrf-table-label` statement is supported on PTX5000 and PTX3000 routers only when third-generation FPCs are installed on the router and `enhanced-ip` command is configured on the chassis.

- Starting in Junos OS Release 17.2, you can configure the `enhanced-ip` command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability. The `vrf-table-label` space is increased to at least 16,000, if the platform can support the scale.

Options
The remaining statements are explained separately.

Range: 16 through 1,048,575 for static label value.

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

admin-group

Syntax

admin-group {
    exclude [ group-names ];
    include-all [ group-names ];
    include-any [ group-names ];
}

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection bypass bypass-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name]

Release Information
Statement introduced in Junos OS Release 9.2.

Description
Enable you to configure administrative groups for bypass label-switched paths (LSPs). You can configure administrative groups either globally for all bypass LSPs traversing an interface or for just a specific bypass LSP.

Options
exclude group-names—Specify the administrative groups to exclude for a bypass LSP.
include-all group-names—Specify the administrative groups whose links the bypass LSP must traverse.
include-any group-names—Specify the administrative groups whose links the bypass LSP can traverse.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

aggregate (Protocols RSVP)

Syntax

\[(aggregate | no-aggregate);\]

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp peer-interface peer-interface-name],
[edit protocols rsvp peer-interface peer-interface-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Control the use of RSVP aggregate messages on an interface or peer interface, as described below.

NOTE: Starting in Junos OS Release 15.2, the \texttt{aggregate} statement is deprecated at the \texttt{[edit protocols rsvp interface interface-name]} and \texttt{[edit logical-systems logical-system-name protocols rsvp interface interface-name]} hierarchy levels, as RSVP message aggregation is enabled by default.

- \texttt{aggregate}—Use RSVP aggregate messages.
- \texttt{no-aggregate}—Do not use RSVP aggregate messages.

Aggregate messages can pack multiple RSVP messages into a single transmission, thereby reducing network overhead and enhancing efficiency. The number of supportable sessions and processing overhead are significantly improved when aggregation is enabled.

Not all routers connected to a subnet need to support aggregation simultaneously. Each RSVP router negotiates its intention to use aggregate messages on a per-neighbor basis. Only when both routers agree are aggregate messages sent.

To have refresh reduction and reliable delivery, you must include the \texttt{aggregate} and \texttt{reliable} statements.

Default

Aggregation is enabled.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

authentication-key (Protocols RSVP)

Syntax

```plaintext
authentication-key key;
```

Hierarchy Level

```plaintext
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit logical-systems logical-system-name protocols rsvp peer-interface peer-interface-name],
[edit protocols rsvp],
[edit protocols rsvp interface interface-name],
[edit protocols rsvp peer-interface peer-interface-name]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Authentication key (password). Neighboring routers use the password to verify the authenticity of packets sent from this interface or peer interface. To authenticate node hellos or remote messages between the Point of Local Repair (PLR) to the Merge Point (MP), enable `authentication-key` at the [edit protocols rsvp] hierarchy level.

RSVP uses HMAC-MD5 authentication, which is defined in RFC 2104, HMAC: Keyed-Hashing for Message Authentication.

All routers that are connected to the same IP subnet must use the same authentication scheme and password.

Options

```plaintext
key—Authentication password. It can be 1 through 16 contiguous digits or letters. Separate decimal digits with periods. Separate hexadecimal digits with periods and precede the string with 0x. If you include spaces in the password, enclose the entire password in quotation marks (" ").
```

Required Privilege Level

[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**

For certain logical interfaces (such as Asynchronous Transfer Mode [ATM], Permanent Virtual Circuit [PVC], or Frame Relay), you cannot determine the correct bandwidth from the hardware. This statement enables you to specify the actual available bandwidth.

This statement also enables you to specify the bandwidth for a bypass label switched path (LSP). If you have configured multiple bypasses, this statement is mandatory and is applied to all of the bypass LSPs.

**Default**

The hardware raw bandwidth is used.

**Options**

- **bps**—Bandwidth in bits per second. You can specify this as an integer value. If you do so, count your zeros carefully, or you can use the abbreviations k (for a thousand), m (for a million), or g (for a billion [also called a thousand million]).

**Range:** Any positive integer

**Default:** 0 (no bandwidth is reserved)

**Required Privilege Level**

- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.
RELATED DOCUMENTATION

bypass (Signaled LSP)

Syntax

bypass bypass-name {
    bandwidth bps;
    description text;
    hop-limit number;
    no-cspf;
    path address <strict | loose>;
    priority setup-priority reservation-priority;
    subscription subscription-percentagе;
    to address;
}

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection]

Release Information

Statement introduced before Junos OS Release 7.4.
description option was added in Junos OS Release 10.4.
subscription subscription-percentage option introduced in Junos OS Release 19.2R1 on all platforms.

Description

Enables you to configure specific bandwidth and path constraints for a bypass LSP. It is possible to individually configure multiple bypass LSPs. If you do not configure the bypass LSPs individually, they all share the same path and bandwidth constraints.

If you specify the bandwidth, hop-limit, and path statements for the bypass LSP, these values take precedence over the values configured at the [edit protocols rsvp interface interface-name link-protection] hierarchy level. The other attributes (subscription, no-node-protection, and optimize-timer) are inherited from the general constraints.

Options

bypass-name—(Required) Specify a name for the bypass LSP. The name can be up to 64 characters.

description—Provides a textual description of the bypass LSP. Enclose any descriptive text that includes spaces in quotation marks (“ ”). Any descriptive text you include is displayed in the output of the show mpls lsp bypass detail command and has no effect on the operation of the bypass LSP. The description text can be no more than 80 characters in length.
subscription `subscription-percentage`—(Optional) Specify the subscription percentage per manual bypass LSP. The subscription percentage configured under a particular manual bypass LSP overrides the subscription percentage configured commonly for all manual bypass LSPs under an interface.

   **Range:** 0 through 65000

`to address`—(Required) Specify the address for the interface of the immediate next-hop node (for link protection) or the next-next-hop node (for node-link protection). The address specified determines whether this is a link protection bypass or a node-link protection bypass. On multiaccess networks (for example, a LAN), this address is also used to specify which next-hop node is being protected.

The remaining statements are explained separately. See CLI Explorer.

chained-composite-next-hop

Syntax

```yaml
chained-composite-next-hop {
  ingress;
  transit;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options forwarding-table],
[edit routing-options forwarding-table]
```

NOTE: The [edit logical-systems] hierarchy level is not supported on the QFX10000 switches.

Release Information

Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.
Statement introduced in Junos OS Release 15.1 for QFX10000 Series switches.

Description

Allows you to configure the chained composite next hops for devices handling ingress or transit traffic in the network.

Chained composite next hops help to facilitate the handling of large volumes of transit traffic in the core of large networks by allowing the router to process much larger volumes of routes. A chained composite next hop allows the router to direct sets of routes sharing the same destination to a common forwarding next hop, rather than having each route also include the destination. In the event that a network destination is changed, rather than having to update all of the routes sharing that destination with the new information, just the shared forwarding next hop is updated with the new information. The chained composite next hops continue to point to this forwarding next hop which now contains the new destination.

On platforms containing only MPCs, such as PTX Series Packet Transport Routers, the MX80 router, the MX2020 router, and the QFX10000 switches, chained composite next hops are enabled by default. On MX Series 5G Universal Routing Platforms containing both DPC and MPC FPCs and on T4000 Core Routers containing MPC and FPCs, chained composite next hops are disabled by default and need to be explicitly configured.
To explicitly configure chained composite next hops, include the `enhanced-ip` statement at the `[edit chassis network-services]` hierarchy level. However, take the following into consideration when enabling the `enhanced-ip` mode:

- Non-service DPCs do not work with enhanced network services mode options. Only MPCs, MS-DPCs, and MS-MPCs provide support for the `enhanced-ip` configuration.

- If you configure chained composite next hops on MX Series routers with both MPCs, and DPCs or DPCEs, the network services mode must be changed from `enhanced-ip` to `ethernet` for the DPC or DPCE to come online.

You can verify the FPC status in such cases, using the `show chassis fpc` command output, where the DPCs and DPCEs are marked as **FPC misconfiguration**.

**NOTE:**
- When chained composite next hops are enabled on a device, the BGP connections are reset.
- On MX Series routers with DPCs or DPCEs, only the `l3vpn` option is supported under the `ingress` configuration statement; all other configuration options and functionality are not supported.
- The `transit` statement and the associated functionality is supported only on PTX Packet Transport Routers and QFX10000 switches.
- On MX Series routers, removing the `chained-composite-next-hop` statement from a PE device configuration causes all IBGP sessions to be torn down and triggers the BGP session to flap as well. A similar change on a router configured as a route reflector does not have any effect, however.

The following is a sample system log message that is generated to record such an event:

```
```

- Starting with Junos OS Release 17.2, you cannot configure `chained-composite-next-hop ingress l3vpn extended-space` on a logical system.

The remaining statements are explained separately. See CLI Explorer.

**Default**

This statement is disabled by default.
Options

**ingress**—Enable or disable composite chained next hop for ingress traffic.

**transit**—(PTX and QFX10000) Enable or disable composite chained next hop for transit traffic. Starting in Junos OS Release 14.1, the **transit l3vpn** statement is enabled by default on PTX Series Packet Transport Routers only.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

class-of-service (Protocols RSVP)

Syntax

class-of-service cos-value;

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection bypass bypass-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Class-of-service (CoS) value given to all packets in the bypass LSP. You can specify a single CoS value for all the bypass LSPs traversing an interface. You can also configure CoS values for specific bypass LSPs traversing an interface.

The CoS value might affect the scheduling or queuing algorithm of traffic traveling along an LSP.

Options

  cos-value—CoS value. A higher value typically corresponds to a higher level of service.

  Range: 0 through 7

  Default: If you do not specify a CoS value, the IP precedence bits from the packet's IP header are used as the packet's CoS value.

Required Privilege Level

  routing—To view this statement in the configuration.
  routing-control—To add this statement to the configuration.

devices

Syntax

devices device-names;

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]

Release Information
Statement introduced in Junos OS Release 8.1.

Description
Specifies one of the virtual tunnel (VT) interfaces to de-encapsulate the egress traffic for ultimate-hop popping on point-to-multipoint LSPs. If no device is specified, the selection process is performed automatically.

Default
The device selection process is performed automatically if no device is configured. Junos OS selects one of the available VT interfaces to de-encapsulate the egress traffic.

Options
device-names—Specify which VT interfaces are used to handle the RSVP traffic.

Range: 0 to 8 devices

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

    maximum-helper-restart-time seconds;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options],
[edit protocols rsvp],
[edit routing-options]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Configure graceful restart on the router. You must configure the ```graceful-restart``` statement at the ```[edit routing-options]``` hierarchy level to enable graceful restart on the router.

Options

- `disable`—Disable graceful restart on the router or for RSVP.
- `helper-disable`—Disable RSVP graceful restart helper mode (this option is only available at the ```[edit protocols rsvp]``` hierarchy level).

Default: Helper mode is enabled by default.

- `maximum-helper-recovery-time seconds`—The maximum length of time the router stores the state of neighboring routers when they undergo a graceful restart. The value applies to all neighboring routers, so it should be based on the time that the slowest RSVP neighbor requires for restart.

Default: 180 seconds
Range: 1 through 3600 seconds

- `maximum-helper-restart-time seconds`—The maximum length of time the router waits between when it discovers that a neighboring router has gone down and when it declares the neighbor down. This value is applied to all neighboring routers, so it should be based on the time that the slowest RSVP neighbor requires for restart.

Default: 20 seconds
Range: 1 through 1800 seconds
**Required Privilege Level**

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Enable the sending of hello packets on the interface.

Options

seconds—Length of time between hello packets. A value of 0 disables the sending of hello packets on the interface.

Range: 1 through 60 seconds
Default: 9 seconds

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**

Specify the maximum number of routers that an LSP can traverse. This limit can be applied to any of the following:

- **LSPs**—The configured hop limit includes the ingress and egress routers. You can specify a hop limit for an LSP and for both primary and secondary paths.

- **Fast reroute detour**—Specify the number of additional routers a fast reroute detour can traverse relative to the protected LSP. For example, if an LSP traverses 4 routers, any detour for the LSP can be no more than 10 router hops, including the ingress and egress routers.

- **Link protection bypass**—Specify the maximum number of routers that a link protection bypass can traverse.

**Options**

- **number**—Maximum number of hops.

**Range:** 2 through 255 (for an LSP or for a link protection bypass); 0 through 255 (for fast reroute)

**Default:** 255 (for an LSP or for a link protection bypass); 6 (for fast reroute)
**Required Privilege Level**

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

keep-multiplier

Syntax

keep-multiplier number;

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Specify a value used by RSVP to calculate timer values for network outages, and declare that a reservation or a neighbor is down. It indicates the number of messages that can be lost before a particular state is declared stale and must be deleted. The keep multiplier directly affects the lifetime of an RSVP state.

Starting in Junos OS Release 16.1, for MX Series routers and PTX Series routers, the default RSVP message refresh time, to which this multiplier is applied, has increased from 30 seconds to 20 minutes. The higher message refresh time provides support for RSVP Refresh Reduction Extensions, and improved scaling for MPLS traffic-engineered LSPs, as defined in RFC 2961. The changes are backward compatible so if any nodes in the two-hop neighborhood do not support the higher refresh time, the updated node will automatically fall back to the previous default refresh time to prevent error or tear down messages.

Options

number—Multiplier value.

Range: 1 through 255
Default: 3

NOTE: For MX Series routers and PTX Series routers (running Junos OS release 16.1 or later), this multiplier is applied to a default refresh time of 20 minutes. In earlier Junos OS releases, and for other platforms, the default refresh time remains 30 seconds.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 18.2. under the hierarchy level [edit routing-instances
instance-name provider-tunnel]

Description

Specify the LSP template. An LSP template is used as the basis for other dynamically generated LSPs. This feature can be used for a number of applications, including point-to-multipoint LSPs, flooding VPLS traffic, configuring ingress replication for IP multicast using MBGP MVPNs, and to enable RSVP automatic mesh. There is no default setting for the `label-switched-path-template` statement, so you must configure either the default-template using the `default-template` option, or you must specify the name of your preconfigured LSP template.

Options

default-template—Specify that the default LSP template be used for the dynamically generated LSPs.
**lsp-template-name**—Specify the name of an LSP to be used as a template for the dynamically generated LSPs.

**Required Privilege Level**
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name]
```

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.

Description
Enable link protection on the specified interface. Using link protection, you can configure a network to reroute traffic quickly around broken links. To fully enable link protection, you also need to configure the link-protection statement at the [edit protocols mpls label-switched-path lsp-name] hierarchy level. You can configure single or multiple bypasses for protected interface.

Default
Link protection is disabled.

Options
no-node-protection—Disable node-link protection on the RSVP interface. Link protection remains active. When this option is configured, the router can only initiate a next-hop bypass, not a next-next-hop bypass.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.

**max-bypasses**

**Syntax**

```
max-bypasses number;
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Range modified in Junos OS Release 9.3.

**Description**

Specify the maximum number of dynamic bypass LSPs permitted for protecting this interface. When this option is configured, multiple bypasses for link protection are enabled. Call admission control (CAC) is also enabled. The limit on bypasses configured applies only to dynamically generated bypass LSPs. By default, this option is disabled and only one dynamic bypass LSP is enabled for each interface. If you configure `max-bypasses`, you must also configure the `bandwidth` statement.

**Options**

`number`—Configure the maximum number of bypass LSPs. If you configure a value of 0, no dynamic bypass LSPs are allowed to be established for the interface. Only static bypass LSPs can be configured.

Range: 0 through 99
Default: 1

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**RELATED DOCUMENTATION**

no-local-reversion

Syntax

local-reversion;
nolocal-reversion;

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]

Release Information

Statement introduced in Junos OS Release 10.4.

Description

Disable RSVP local restorative mode as specified in RFC 4090, *Fast Reroute Extensions to RSVP-TE for LSP Tunnels*.

NOTE: For Junos OS Release 16.1 running on MX Series or PTX Series routers, no-local-reversion is enabled by default, that is, local reversion is not running, and the statement has been deprecated. To enable local reversion, use the local-reversion statement.

RSVP local restorative mode is supported on all Juniper Networks routers running Junos OS. It is the default behavior. If you include this statement, the Juniper Networks router uses global restorative mode instead. You might need to disable RSVP local restorative mode on Juniper Networks routers if your network includes equipment that does not support this mode.

The following information can also be found in RFC 4090. Refer to the RFC for additional information. When an LSP fails, the connection can be repaired locally using a traffic protection mechanism such as fast reroute. To restore the LSP to a full working path, RFC 4090 specifies the following strategies:

- Local restorative mode—Upon detecting that the path is restored, the point of local repair (PLR) resignals each of the LSPs that were formerly routed over the restored path. Every LSP successfully resignalized along the restored path is switched back.
- Global restorative mode—The ingress router of each tunnel is responsible for reoptimizing the LSPs that used the failed path. There are several potential reoptimization triggers: RSVP error messages, inspection of OSPF LSAs or IS-IS LSPs, and timers. This re-optimization process can proceed as soon as the failure is detected. It is not tied to the restoration of the failed path.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
node-hello

Syntax

(node-hello | no-node-hello);

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]

Release Information

Statement introduced in Junos OS Release 10.0.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Enable node-ID based RSVP hellos globally on all of the RSVP interfaces on the router to allow Juniper Networks routers to interoperate with the equipment of other vendors. By default, the Junos OS uses interface-based RSVP hellos; node-ID based RSVP hellos are disabled. If you have not enabled RSVP node IDs on the router, Junos OS does not accept any node-ID hello packets.

NOTE: For Junos OS Release 16.1 running on MX Series or PTX Series routers, when using enhanced FRR, node-ID based hellos are enabled by default. Disabling the enhanced fast reroute (FRR) profile by using the no-enhanced-frr-bypass command also disables the node-hello command. To re-enable node hellos after the enhanced FRR profile has been disabled, use the node-hello command.

NOTE: If link-protection is enabled, remote node hellos that are initiated by the Point of Local Repair (PLR) to Node Protecting Merge Point (NP-MP) are enabled automatically. Similarly, if no-enhanced-frr-profile is enabled (that is, enhanced FRR is off), remote node hellos are automatically disabled. There is no command to explicitly enable or disable remote-node hellos.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

no-adjacency-down-notification (Protocols IS-IS)

Syntax

```
no-adjacency-down-notification;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis interface interface-name],
[edit protocols isis interface interface-name]
```

Release Information

Statement introduced in Junos OS Release 8.0.

Description

Disable adjacency down notification for IS-IS to allow for migration from IS-IS to OSPF without disruption of the RSVP neighbors and associated RSVP-signal label-switched paths (LSPs).

Whenever IS-IS is deactivated, the IS-IS adjacencies are brought down. IS-IS signals to RSVP to bring down any RSVP neighbors associated with the IS-IS adjacencies, and this further causes the associated LSPs signaled by RSVP to go down as well.

A similar process occurs whenever OSPF is deactivated. The OSPF neighbors are brought down. OSPF signals to RSVP to bring down any of the RSVP neighbors associated with the OSPF neighbors, and this further causes the associated LSPs signaled by RSVP to go down as well.

If you need to migrate from IS-IS to OSPF or from OSPF to IS-IS, the internal gateway protocol (IGP) notification to RSVP for an adjacency or neighbor down event needs to be ignored. Using the `no-adjacency-down-notification` or `no-neighbor-down-notification` statements, you can disable IS-IS adjacency down notification or OSPF neighbor down notification, respectively, until the migration is complete. The network administrator is responsible for configuring the statements before the migration, and then removing them from the configuration afterward, so that IGP notification can function normally.

Required Privilege Level

- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.

no-cspf (Protocols RSVP)

Syntax

no-cspf;

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection bypass bypass-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name]

Release Information
Statement introduced in Junos OS Release 7.5.

Description
Disable CSPF computation on all bypass LSPs or on a specific bypass LSP. You need to disable CSPF for link protection to function properly on interarea paths.

Default
CSPF is enabled.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

RELATED DOCUMENTATION

| Disabling CSPF for Bypass LSPs | 876 |
no-interface-hello

Syntax

no-interface-hello;

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]

Release Information

Statement introduced in Junos OS Release 10.0.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Explicitly disable RSVP interface hellos globally on the router.

NOTE: For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling RSVP interface hellos globally, the no-interface-hello command triggers a switch back to the previous profile for all label-switched paths (LSPs.)

This type of configuration might be necessary in networks where the Juniper Networks router has numerous RSVP connections with equipment from other vendors. However, if you disable RSVP interface hellos globally, you can also configure a hello interval on an RSVP interface using the hello-interval statement. This configuration disables RSVP interface hellos globally but enables RSVP interface hellos on the specified interface. This configuration might be necessary in a heterogeneous network where some devices support RSVP node-ID hellos and other devices support RSVP interface hellos.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

RELATED DOCUMENTATION

no-neighbor-down-notification

Syntax

no-neighbor-down-notification;

Hierarchy Level

[edit logical-systems logical-system-name protocols ospf area area-id interface interface-name],
[edit protocols ospf area area-id interface interface-name]

Release Information
Statement introduced in Junos OS Release 8.0.

Description
Disable neighbor down notification for OSPF to allow for migration from OSPF to IS-IS without disruption of the RSVP neighbors and associated RSVP-signaled LSPs.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
no-node-id-subobject

Syntax

no-node-id-subobject;

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]

Release Information

Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Disable the record route object (RRO) node-ID subobject for compatibility with earlier versions of Junos OS.

NOTE: For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling the record route object (RRO) node ID sub-object, the no-node-id-subobject command triggers a switch back to the previous profile for all label-switched paths (LSPs).

To interoperate with other vendors' equipment, Junos OS supports the RRO node-ID subobject for use in inter-AS link and node protection configurations.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

RELATED DOCUMENTATION

no-p2mp-sublsp

Syntax

no-p2mp-sublsp;

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]

Release Information

Statement introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Reject Resv messages that include the S2L_SUB_LSP object. By default, Resv messages that include the S2L_SUB_LSP object are accepted. However, in a network which includes Juniper Networks devices running both Junos OS Release 9.2 and later and Junos OS Release 9.1 and earlier, it is necessary to configure the `no-p2mp-sublsp` statement on devices running Junos OS Release 9.2 and later to ensure that point-to-multipoint LSPs function properly.

Default

Resv messages that include the S2L_SUB_LSP object are accepted.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

optimize-timer (Protocols RSVP)

Syntax

```plaintext
optimize-timer seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Configure an optimize timer for a bypass LSP. The optimize timer initiates a periodic optimization process that reshuffles data LSPs among bypass LSPs to achieve the most efficient use of network resources. The optimization process attempts to either minimize the number of bypasses currently in use, minimize the total amount of bandwidth reserved for all bypasses, or both.

Options

- `seconds`—Specify the number of seconds between optimizations.

Range: 0 through 65,535 seconds

Default: 0 (disabled)

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

RELATED DOCUMENTATION

path (Protocols RSVP)

Syntax

    path address <strict | loose>;

Hierarchy Level

    [edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection],
    [edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection bypass bypass-name],
    [edit protocols rsvp interface interface-name link-protection],
    [edit protocols rsvp interface interface-name link-protection bypass bypass-name]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Configure an explicit path (a sequence of strict or loose routes) to control where and how a bypass LSP is established. If multiple bypasses are configured, they all will use the same explicit path.

Default
No path is configured. CSPF automatically calculates the path the bypass LSP takes.

Options
address—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is loose. As an option, you can include the ingress and egress routers in the path. Specify the addresses in order, starting with the ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.

Default: If you do not specify any routers explicitly, no routing limitations are imposed on the bypass LSP.

loose—(Optional) The next address in the path statement is loose. The LSP can traverse other routers before reaching this router.

Default: strict

strict—(Optional) The LSP must go to the next address specified in the path statement without traversing other nodes. This is the default.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
**peer-interface (Protocols RSVP)**

**Syntax**

```
peer-interface peer-interface-name {

[edit protocols rsvp],
[edit routing-instances name protocols rsvp]
```

Release Information

Statement introduced in Junos OS Release 18.1R1 on MX Series routers, PTX Series routers, and vMX.

Description

Specify RSVP pop-and-forward LSP tunnel-specific global parameters. The application label depth (AppLD) value must be configured uniformly across the RSVP-TE network.

Options

`application-label depth depth`—Specify the maximum number of service labels.

- **Range:** 0 through 3
- **Default:** 1

Required Privilege Level

`routing`

preemption

Syntax

```plaintext
preemption {
  (aggressive | disabled | normal);
  soft-preemption {
    cleanup-timer seconds;
  }
}
```

Hierarchy Level

```plaintext
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Control RSVP session preemption.

Default

normal

Options

- **aggressive**—Preempt RSVP sessions whenever bandwidth is insufficient to handle all sessions. A session is preempted whenever bandwidth is lowered or a new higher-priority session is established.

- **disabled**—Do not preempt RSVP sessions.

- **normal**—Preempt RSVP sessions to accommodate new higher-priority sessions when bandwidth is insufficient to handle all sessions.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

**priority (Protocols RSVP)**

**Syntax**

```
priority setup-priority reservation-priority;
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-protection bypass bypass-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name],
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Configure the setup priority and reservation priority for a bypass LSP. If insufficient link bandwidth is available during session establishment, the setup priority is compared with other setup priorities for established sessions on the link to determine whether some of them should be preempted to accommodate the new session. The session with the lower-hold priority is preempted.

**Options**

- **reservation-priority**—Reservation priority, used to keep a reservation after it has been set up. A smaller number has a higher priority. The priority must be greater than or equal to the setup priority to prevent preemption loops.
  
  **Range:** 0 through 7, where 0 is the highest and 7 is the lowest priority.
  **Default:** 0 (Once the session is set up, no other session can preempt it.)

- **setup-priority**—Setup priority.
  
  **Range:** 0 through 7, where 0 is the highest and 7 is the lowest priority.
  **Default:** 7 (The session cannot preempt any existing sessions.)

**Required Privilege Level**

- routing—To view this statement in the configuration.

[edit logical-systems logical-system-name protocols rsvp peer-interface peer-interface-name],
[edit protocols rsvp interface interface-name],
[edit protocols rsvp peer-interface peer-interface-name]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Enable reliable message delivery on the interface.

To have both refresh reduction and reliable delivery, enable both the aggregate and reliable statements.

NOTE: For Junos OS Release 16.1 running on MX Series or PTX Series routers, setting no-reliable on an interface automatically disables the fast reroute (FRR) scalability enhancements, including refresh reduction, for all label-switched paths (LSPs) traversing the interface.

Default
Starting in Junos OS Release 16.1R1, all refresh reduction extensions are enabled by default.

Prior to Junos OS Release 16.1R1, the reliable option is disabled by default.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

rsvp

Syntax

rsvp;

Hierarchy Level

[edit logical-systems logical-system-name protocols],
[edit protocols]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.5 for EX Series switches.

Description

Enable Resource Reservation Protocol (RSVP) signaling.

You must include the rsvp statement in the configuration to enable RSVP on the router.

The primary purpose of RSVP in Junos OS for EX Series switches is to support dynamic signaling within label switched paths (LSPs).

Default

RSVP is disabled.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

**rsvp-te (Routing Options)**

**Syntax**

```
rsvp-te entry-name {
    destination-networks network-prefix;
    label-switched-path-template (Multicast) {
        default-template;
        template-name;
    }
}
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name routing-options dynamic-tunnels tunnel-name],
[edit routing-options dynamic-tunnels tunnel-name]
```

**Release Information**

Statement introduced in Junos OS Release 10.1.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**

Enable RSVP to automatically establish LSPs for any new PE router added to a full mesh of LSPs. To enable this feature, you must configure the `rsvp-te` statement on all of the PE routers in the full mesh.

**Options**

- **entry-name**—Specify the entry for the RSVP tunnel.

The other options are explained separately.

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

setup-protection

Syntax

setup-protection;

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]

Description

The facility-backup fast reroute mechanism can provide setup protection for LSPs which are in the process of being signaled. Both point-to-point LSPs and point-to-multipoint LSPs are supported. You should configure the **setup-protection** statement on each of the routers along the LSP path on which you want to enable LSP setup protection. You should also configure IGP traffic engineering on all of the routers on the LSP path.

Required Privilege Level

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Configure the amount of bandwidth subscribed to a class type (when you have enabled Differentiated Services) or bypass LSP (when you have enabled link protection). `subscription` is the percentage of the link bandwidth that can be used for the RSVP reservation process.

Options

- `ctnumber percentage`—Percentage of the class-type bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type. You can specify bandwidth subscriptions for class types 0 through 3. This option is not available for bypass LSPs.
  
  Range: 0 through 65,000  
  Default: 100 percent

- `percentage`—Percentage of the class-type or bypass LSP bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type or bypass LSP.
  
  Range: 0 through 65,000  
  Default: 100 percent

Required Privilege Level

- routing—To view this statement in the configuration.

traceoptions (Protocols RSVP)

Syntax

```
traceoptions {
    enhanced-frr;
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Enable RSVP-level trace options.

Default

The default RSVP-level trace options are those inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.

enhanced-frr—(Optional) Enable this option to trace internal events and state changes related to the FRR facility protection enhancements associated with the increased RSVP scaling introduced in Junos OS Release 16.1.

filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. We recommend that you place RSVP tracing output in the file `rsvp-log`.

files number—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Range: 2 through 1000

Default: 2 files
If you specify a maximum number of files, you must also include the size statement to specify the maximum file size.

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.

- **all**—All tracing operations
- **error**—All detected error conditions
- **event**—RSVP-related events
- **io-event [detail] [disable]** —Enable tracing of events that occur within the RSVP I/O task; can only be configured for the master routing instance. The trace output is generally independent of routing instance.
- **io-packets [detail] [disable] [receive] [send]** —Enable tracing of messages as they are received from the network or as they are sent out. This flag can be configured independently for each routing instance. Both bundled and individual messages are identified. Use detail to show all objects contained in the message. Use send and receive to limit tracing to outgoing or incoming packets.
- **lmp**—RSVP-LMP interactions
- **packets**—All RSVP packets
- **path**—All path messages
- **pathtear**—PathTear messages
- **resv**—Resv messages
- **resvtear**—ResvTear messages
- **route**—Routing information
- **state**—Session state transitions, including when RSVP-signaled LSPs come up and go down.

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-world-readable**—(Optional) Enable only certain users to read the log file.
size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches this size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: xk to specify KB, xm to specify MB, or xg to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

If you specify a maximum file size, you must also include the files statement to specify the maximum number of files.

world-readable—(Optional) Enable any user to read the log file.

Required Privilege Level
routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

tunnel-services (RSVP)

Syntax

tunnel-services {
    devices device-names;
}

Hierarchy Level

[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]

Release Information
Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Enable ultimate-hop popping on point-to-multipoint LSPs. The Junos OS selects one of the available virtual
tunnel (VT) interfaces to de-encapsulate the egress traffic. By default, the selection process is performed
automatically.

Default
Ultimate-hop popping is disabled.

Options

devices device-names—Specify which VT interfaces are used to handle the RSVP traffic.

Range: 0 to 8 devices

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

```

Release Information

Statement introduced in Junos OS Release 12.3.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description

Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.

Be aware of the following platform requirements and restrictions:

- UHP LSPs using VT interfaces—Supported on all M Series, MX Series, T Series, and TX Matrix routers.
- UHP LSPs using LSI interfaces—Supported on MX 3D Series routers only.
- UHP LSP requirements for the egress PE device—For M Series and T Series routers, a VT interface is needed.
- UHP LSPs and Layer 3 VPNs—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only.
- UHP LSPs and VPLS—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the `no-tunnel-services` statement at the `[edit routing-instances routing-instance-name protocols vpls]` hierarchy level.

Default

Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.
**Required Privilege Level**

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

</table>
**update-threshold**

**Syntax**

```plaintext
update-threshold {
    threshold-percent;
    threshold-value threshold-value;
}
```

**Hierarchy Level**

[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
threshold-value option introduced in Junos OS Release 19.4R1 on all platforms.

**Description**

Adjust the threshold at which a change in bandwidth triggers an interior gateway protocol (IGP) update.

**Options**

- **threshold-percent**—Specify the percentage change in reserved bandwidth to trigger IGP update.
  - **Default:** 10 percent
  - **Range:** 0.001 through 20 percent

- **threshold-value threshold-value**—Specify the change in reserved bandwidth to trigger IGP update. (is capped at 20% of link bandwidth).

  If the threshold-value is configured to greater than 20% of bandwidth on that link, the threshold-value is capped at 20% of bandwidth.

  For instance, if bandwidth on an interface is 1Gbps, and the threshold-value is configured greater than 200Mbps, the threshold-value is capped at 200Mbps. The threshold-percent is displayed as 20.000% and the threshold-value as 200Mbps.
NOTE: The two options, threshold-percent and threshold-value, are mutually exclusive. You can configure only one option at a given point in time to generate an IGP update for lower bandwidth reservations. As a result, when one option is configured, the other option is calculated and displayed on the CLI.

For instance, on a link of 1Gbps, if the threshold-percent is configured to 5%, the threshold-value is calculated and displayed as 50Mbps. Similarly, if the threshold-value is configured to 50m, then the threshold-percent is calculated and displayed as 5%.

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

allow-subnet-mismatch

Syntax

allow-subnet-mismatch;

Hierarchy Level

[edit logical-systems logical-system-name protocols ldp interface interface-name],
[edit protocols ldp interface interface-name]

Release Information
Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Ignore the LDP subnet check. For Junos OS Release 8.4 and later releases, an LDP source address subnet check was added for the neighbor establishment procedure. The source address in the LDP link hello packet is matched against the interface address.

Default
The source address in the LDP link hello packet is matched against the interface address.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 7.6.
Statement introduced for BGP in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.
Statement introduced for BMP in Junos OS Release 13.3.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Configure an authentication algorithm type.
NOTE: Keep the following points in mind when you configure the authentication algorithm in an IPsec proposal:

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, an error occurs and the tunnel is not established in this scenario. For example, if one end of the tunnel contains router 1 configured with the authentication algorithm as hmac-sha-256-128 and the other end of the tunnel contains router 2 configured with the authentication algorithm as hmac-md5-96, the VPN tunnel is not established.

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, and when one end of the tunnel contains two IPsec proposals to check whether a less secure algorithm is selected or not, an error occurs and the tunnel is not established. For example, if you configure two authentication algorithms for an IPsec proposal as hmac-sha-256-128 and hmac-md5-96 on one end of the tunnel, router 1, and if you configure the algorithm for an IPsec proposal as hmac-md5-96 on the other end of the tunnel, router 2, the tunnel is not established and the number of proposals mismatch.

- When you configure two IPsec proposals at both ends of a tunnel, such as the `authentication-algorithm hmac-sha-256-128` and `authentication-algorithm hmac-md5-96` statements at the `[edit services ipsec-vpn ipsec proposal proposal-name]` hierarchy level on one of the tunnel, router 1 (with the algorithms in two successive statements to specify the order), and the `authentication-algorithm hmac-md5-96` and `authentication-algorithm hmac-sha-256-128` statements at the `[edit services ipsec-vpn ipsec proposal proposal-name]` hierarchy level on one of the tunnel, router 2 (with the algorithms in two successive statements to specify the order, which is the reverse order of router 1), the tunnel is established in this combination as expected because the number of proposals is the same on both ends and they contain the same set of algorithms. However, the authentication algorithm selected is hmac-md5-96 and not the stronger algorithm of hmac-sha-256-128. This method of selection of the algorithm occurs because the first matching proposal is selected. Also, for a default proposal, regardless of whether the router supports the Advanced Encryption Standard (AES) encryption algorithm, the 3des-cbc algorithm is chosen and not the aes-cfb algorithm, which is because of the first algorithm in the default proposal being selected. In the sample scenario described here, on router 2, if you reverse the order of the algorithm configuration in the proposal so that it is the same order as the one specified on router 1, hmac-sha-256-128 is selected as the authentication method.

- You must be aware of the order of proposals in an IPsec policy at the time of configuration if you want the matching of proposals to happen in a certain order of preference, such as the strongest algorithm to be considered first when a match is made when both policies from the two peers have a proposal.
Options

**algorithm**—Specify one of the following types of authentication algorithms:

- **aes-128-cmac-96**—Cipher-based message authentication code (AES128, 96 bits).
- **hmac-sha-1-96**—Hash-based message authentication code (SHA1, 96 bits).
- **md5**—Message digest 5.

Default: hmac-sha-1-96

**NOTE:** The default is not displayed in the output of the `show bgp bmp` command unless a key or key-chain is also configured.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

authentication-key-chain (Protocols LDP)

Syntax

authentication-key-chain key-chain;

Hierarchy Level

[edit logical-systems name protocols ldp session address],
[edit logical-systems name routing-instances instance-name protocols ldp session address],
[edit protocols ldp session address],
[edit routing-instances instance-name protocols ldp session address]

Release Information

Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Apply and enable an authentication keychain to the routing device. Note that the referenced key chain must be defined. When configuring the authentication key update mechanism for LDP, you cannot commit the 0.0.0.0/allow statement with authentication keys or key chains. The CLI issues a warning and fails to commit such configurations.

NOTE: You must also configure an authentication algorithm using the authentication-algorithm statement.

Options

key-chain—Authentication keychain name. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

auto-targeted-session

Syntax

auto-targeted-session {
    maximum-sessions seconds;
    teardown-delay seconds;
}

Hierarchy Level

[edit logical-systems logical-system-name protocols ldp],
[edit protocols ldp]

Release Information
Statement introduced in Junos OS Release 14.2.

Description
Configure session parameters for LDP sessions established with the remote LFA node that are automatically targeted using the loopback addresses. Configure parameters of automatically targeted sessions for remote LFA only.

Options
maximum-sessions seconds — Specify the maximum number of auto-targeted LDP sessions allowed. Include this statement to optimize the use of router memory.
    Default: 100
    Range: 1 through 1000

teardown-delay seconds — Specify the minimum time period for which the auto-targeted session must be alive before tearing down the auto-targeted LDP sessions to the remote LFA node. Include this statement to prevent rapid route-resolution in case of temporary change in IGP topology.
    Default: 90 seconds
    Range: 1 through 300 seconds

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name protocols ldp oam],
[edit logical-systems logical-system-name protocols ldp oam fec address],
[edit protocols ldp oam],
[edit protocols ldp oam fec address]
```

Release Information

Statement introduced in Junos OS Release 7.6.
Support for the `bfd-liveness-detection` statement at the `[edit protocols ldp oam fec address]` hierarchy level and the `ecmp` option added in Junos OS Release 9.0.
Support for the `failure-action` statement with the `remove-nexthop` and `remove-route` options and the `holddown-interval` statement added in Junos OS Release 9.4.

Description

Enable Bidirectional Forwarding Detection (BFD) for all MPLS LSPs or for just a specific LSP.

Options

- `minimum-interval`—Minimum transmit and receive interval.
Range: 50 through 255,000 milliseconds
Default: 50

*minimum-receive-interval*—Minimum receive interval.

Range: 50 through 255,000 milliseconds
Default: 50

*minimum-transmit-interval*—Minimum transmit interval.

Range: 50 through 255,000 milliseconds
Default: 50

*multiplier*—Detection time multiplier.

Range: 50 through 255
Default: 3

The other options are explained separately.

[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**

Control forwarding equivalence class (FEC) deaggregation on the router. The use of the `deaggregate` statement in LDP is a standard practice that we recommend for LDP deployments.

**Default**

Deaggregation is disabled on the router.

**Options**

- **deaggregate**—Deaggregate FECs.
- **no-deaggregate**—Aggregate FECs.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

downstream-on-demand

Syntax

downstream-on-demand;

Hierarchy Level

[edit logical systems logical-system-name protocols ldp session session-address],
[edit protocols ldp session session-address]

Release Information

Statement introduced in Junos OS Release 12.2.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Enable LDP downstream on demand on the LDP session. LDP is widely deployed in downstream unsolicited advertisement mode. As service providers integrate the access and aggregation networks into a single MPLS domain, LDP downstream on demand is needed to distribute the bindings between access and aggregation networks to minimize the workload for the access node (AN) control plane and to avoid the storage of tens of thousands of label bindings from upstream aggregation nodes.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

RELATED DOCUMENTATION

[edit protocols ldp oam bfd-liveness-detection],
[edit protocols ldp oam fec address bfd-liveness-detection]
```

**Release Information**
Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 15.1X53-D30 for QFX Series switches.

**Description**
Allows LDP to establish BFD sessions for all ECMP paths configured for the specified FEC. If you configure the `ecmp` statement, you must also configure the `periodic-traceroute` statement for the specified FEC. If you do not do so, the commit operation fails. You can configure the `periodic-traceroute` statement at the global hierarchy level (``edit protocols ldp oam`]) while only configuring the `ecmp` statement for a specific FEC (``edit protocols ldp oam fec address bfd-liveness-detection`).

**Required Privilege Level**
Routing—To view this statement in the configuration.
Routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name protocols ldp oam fec address bfd-livenesss-detection],
[edit protocols ldp oam bfd-livenessss-detection],
[edit protocols ldp oam fec address bfd-livenessss-detection]

Release Information
Statement introduced in Junos OS Release 9.4.

Description
Configure route and next-hop properties in the event of a BFD session failure event on an LDP LSP. The failure event could be an existing BFD session that has gone down or could be a BFD session that never came up. LDP adds back the route or next hop when the relevant BFD session comes back up.

Options
remove-nexthop—Remove a route corresponding to a next hop of the LSP’s route at the ingress node when a BFD session failure event is detected.

remove-route—Remove the route corresponding to an LSP from the appropriate routing tables when a BFD session failure event is detected. If the LSP is configured with ECMP and a BFD session corresponding to any path goes down, the route is removed.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols ldp]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Configure LDP graceful restart on the LDP master protocol instance or for a specific routing instance.

**NOTE:** When you alter the graceful restart configuration at either the `[edit routing-options graceful-restart]` or `[edit protocols ldp graceful-restart]` hierarchy levels, any running LDP session is automatically restarted to apply the graceful restart configuration. This behavior mirrors the behavior of BGP when you alter its graceful restart configuration.

Required Privilege Level

[edit protocols ldp targeted-hello],
[edit routing-instances routing-instance-name protocols ldp interface interface-name],
[edit routing-instances routing-instance-name protocols ldp targeted-hello]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Support for LDP targeted hellos added in Junos OS Release 9.5.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**

Specify how long an LDP node should wait for a hello message before declaring a neighbor to be down. This value is sent as part of a hello message so that each LDP node tells its neighbors how long to wait. You can specify times for both link hello messages and targeted hello messages depending on the hierarchy level at which you configure the `hold-time` statement.

**Options**

- **seconds**—Hold-time value.

**Range:** 1 through 65,535 seconds

**Default:** 15 seconds for link hello messages, 45 seconds for targeted hello messages

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

ignore-lsp-metrics

Syntax

ignore-lsp-metrics;

Hierarchy Level

[edit logical-systems logical-system-name protocols ospf traffic-engineering shortcuts],
[edit protocols ospf traffic-engineering shortcuts]

Release Information

Statement introduced in Junos OS Release 7.5.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Cause OSPF to ignore the RSVP LSP metric.

Some other vendors use an OSPF metric of 1 for the loopback address. Juniper Networks routers use an OSPF metric of 0 for the loopback address. This can cause interoperability problems when you configure LDP tunneling over RSVP LSPs in heterogeneous networks.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]

Release Information
Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Configure the time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational. For large networks with numerous FECs, you might need to configure a longer value to allow enough time for the LDP label databases to be exchanged.

Options
holddown-interval seconds—Time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational.

Default: 10 seconds
Range: 10 through 60 seconds

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-system logical-system-name protocols ldp oam],
[edit protocols ldp entropy-label],
[edit protocols ldp oam]
```

**Release Information**

Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.

**Description**

Configure an LDP ingress policy for either the entropy label or Operation, Administration, and Management (OAM).

For OAM, configure the ingress policy to choose which forwarding equivalence classes (FECs) need to have OAM enabled. If the FEC passes through the policy or if the FEC is explicitly configured, OAM is enabled for a FEC. For FECs chosen using a policy, the BFD parameters configured under [edit protocols ldp oam bfd-liveness-detection] are applied.

**Options**

`ingress-policy-names`—Specify the names of the ingress policies.

**Required Privilege Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

make-before-break (LDP)

Syntax

```make-before-break {
  timeout seconds;
  switchover-delay seconds;
}
```

Hierarchy Level

[edit protocols ldp]

Release Information

Statement introduced in Junos OS Release 12.3.

Description

Configures make before break (MBB) for multicast LDP (MLDP) link protection to ensure minimum packet loss when attempting to signal a new label-switched path (LSP) before tearing down the old LSP path.

Options

timeout seconds—Specify a value to change a make-before-break timeout for point-to-multipoint LSPs. Even if an MBB acknowledgment is not received for a point-to-multipoint LSP before the specified timeout period expires, the label-switching router (LSR) performs an MBB switchover from the old LSR to the new upstream LSR.

  Range: 1 through 300 seconds
  Default: 30 seconds

switchover-delay seconds—Specify a value to change switchover delay for a point-to-multipoint LSP from the old LSR to the new upstream LSR. If an MBB acknowledgment is received on a point of local repair (PLR) router, the PLR waits for the specified seconds to switch its upstream LSR from the old LSR to the new LSR.

  Range: 1 through 300 seconds
  Default: 30 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

mldp-inband-signalling (Protocols Multipoint LDP)

Syntax

```snippets
mldp-inband-signalling {
  policy policy-name;
}
```

Hierarchy Level

```snippets
[edit logical-systems logical-system-name protocols pim],
[edit protocols pim],
```

Release Information

Statement introduced in Junos OS Release 13.2.
Support added in Junos OS Release 18.2R1 for using this command in conjunction with distributed MLD or distributed IGMP.

Description

Multipoint LDP (mLDP) in-band signalling lets you carry multicast traffic across an existing IP/MPLS backbone, while avoiding the use of PIM in the provider core.

On the label-edge router (LER), enable PIM to use mLDP in-band signaling for the upstream neighbors when the LER does not detect a PIM upstream neighbor. On the egress nodes, configure the MPLS LSP root in the PIM configuration, using the `policy` statement.

When used in conjunction with distributed MLD or distributed IGMP, mLDP inband signalling supports interconnecting separate PIM domains via a MPLS-based core. To enable the inter-working, `chassis network-services enhanced-ip` must be enabled and you need to set the `dynamic-profiles profile-name protocols igmp|mld interface interface-name` to `distributed`. Enabling this command, `mldp-inband-signalling`, has PIM act as a multipoint LDP inband edge router.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

mofrr-asm-starg (Multicast-Only Fast Reroute in a PIM Domain)

Syntax

mofrr-asm-starg;

Hierarchy Level

[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options multicast stream-protection],
[edit logical-systems logical-system-name routing-options multicast stream-protection],
[edit routing-instances routing-instance-name routing-options multicast stream-protection],
[edit routing-options multicast stream-protection]

Release Information

Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.

Description

Enable mofrr-asm-starg to include any-source multicast (ASM) for (*,G) joins in the Multicast-only fast reroute (MoFRR).

NOTE: mofrr-asm-starg applies to IP-PIM only. When enabled for group G, *,G will undergo MoFRR as long as there is no S#,G for Group G. In other words, *,G MoFRR will cease and any old states will be torn down when S#,G is created. Note too, that mofrr-asm-starg is not supported for mLDP (since mLDP itself does not support *,G).

In a PIM domain with MoFRR enabled, the default for stream-protection is S,G routes only.

Context: Multicast-only fast reroute (MoFRR) can be used to reduce traffic loss in a multicast distribution tree in the event of link down. To employ MoFRR, a downstream router is configured with an alternative path back towards the source, over which it receives a backup live stream of the same multicast traffic. That router propagates the same (S,G) join toward both upstream neighbors in order to create duplicate multicast trees. If a failure is detected on the primary tree, the router switches to the backup tree to prevent packet loss.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name routing-options multicast stream-protection],
[edit routing-instances routing-instance-name routing-options multicast stream-protection],
[edit routing-options multicast stream-protection]

Release Information
Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.

Description
When you configure multicast-only fast reroute (MoFRR) in a PIM domain, allow only a disjoint RPF (an RPF on a separate plane) to be selected as the backup RPF path.

In a multipoint LDP MoFRR domain, the same label is shared between parallel links to the same upstream neighbor. This is not the case in a PIM domain, where each link forms a neighbor. The mofrr-disjoint-upstream-only statement does not allow a backup RPF path to be selected if the path goes to the same upstream neighbor as that of the primary RPF path. This ensures that MoFRR is triggered only on a topology that has multiple RPF upstream neighbors.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-options multicast stream-protection]
```

Release Information

Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.

Description

MoFRR is supported on both equal-cost multipath (ECMP) paths and non-ECMP paths. Unicast loop-free alternate (LFA) routes need to be enabled to support MoFRR on non-ECMP paths. LFA routes are enabled with the link-protection statement in the interior gateway protocol (IGP) configuration. When you enable link protection on an OSPF or IS-IS interface, Junos OS creates a backup LFA path to the primary next hop for all destination routes that traverse the protected interface.

In the context of load balancing, MoFRR prioritizes the disjoint backup in favor of load balancing the available paths.

For Junos OS releases before 15.1R7, for both ECMP and Non-ECMP scenarios, the default MoFRR behavior was sticky, that is, if the Active link went down, the Active Path selection would give preference to Backup Path for the transition. The Active Path would not follow the unicast selected gateway.

Starting in Junos OS Release 15.1R7 however, the default behavior for non-ECMP scenarios is to be nonsticky, that is, the selection of Active Path strictly follows unicast selected gateway. MoFRR no longer chooses a unicast LFA path to become the MoFRR Active path; only a unicast LFA path can be selected to become MoFRR Backup.

Default

By default, the backup path gets promoted to be the primary path when MoFRR is configured in a PIM domain.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

neighbor (Protocols LDP)

Syntax

```
neighbor neighbor-address;
```

Hierarchy Level

```
[edit protocols ldp],
```

Release Information

Statement introduced in Junos OS Release 14.2R1 on all platforms.

Description

Configure an LDP targeted neighbor.

LDP sends a targeted hello message to the configured remote neighbor with a targeted request-send-targeted hello message (T) bit set. If the remote neighbor allows receipt of asymmetric hello messages, or if it is configured with the source address as the targeted neighbor, it responds with a targeted hello message. The receipt of a targeted hello message establishes a targeted adjacency with the remote neighbor as described in RFC 5036. Subsequently, a targeted session is established to the remote neighbor.

Options

- `neighbor-address`—IP address of the remote LDP neighbor.

Required Privilege Level

routing

Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp]
```
Release Information
Statement introduced in Junos OS Release 7.6.
lsp-ping-interval option introduced in Junos OS Release 9.4.

Description
Configure Operation, Administration, and Maintenance (OAM) and Bidirectional Forwarding Detection (BFD) protocol for LDP.

Options
fec fec-address—Specify the forwarding equivalence class (FEC) address. You must either specify a FEC address or configure an OAM ingress policy to ensure that the BFD session comes up.

lsp-ping-interval seconds—Specify the duration of the LSP ping interval in seconds. To issue a ping on an LDP-signaled LSP, use the ping mpls ldp command.

Default: 60 seconds
Range: 30 through 3,600 seconds

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

p2mp (Protocols LDP)

Syntax

```
p2mp {
    no-rsvp-tunneling;
    recursive;
    root-address root-address;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

Release Information

Statement introduced in Junos OS Release 11.2.
o-rsvp-tunneling option added in Junos OS Release 16.1R5.

Description

Enable point-to-multipoint MPLS LSPs in an LDP-signaled LSP.

Options

no-rsvp-tunneling—(Optional) Disable LDP point-to-multipoint LSPs from using RSVP-TE LSPs for tunneling, and use LDP paths instead.

NOTE: The no-rsvp-tunneling option is introduced in Junos OS Release 16.1R5, 17.3R1, 17.2R2, 16.2R3, and later releases.

Starting in Junos OS Release 12.3R1, Junos OS provides support for Multipoint LDP (M-LDP) for Targeted LDP (T-LDP) sessions with unicast replication, in addition to link sessions. As a result, the default behavior of M-LDP over RSVP tunneling is similar to unicast LDP. However, because T-LDP is chosen over LDP and link sessions to signal point-to-multipoint LSPs, the no-rsvp-tunelling option enables LDP natively throughout the network.

recursive—(Optional) Configure point-to-multipoint recursive parameters, including route.

root-address root-address—(Optional) Specify the root address of the point-to-multipoint LSP.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information
Statement introduced in Junos OS Release 8.4.
Support added at the [edit protocols ldp oam] and [edit logical-systems logical-system-name protocols ldp oam] hierarchy levels in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.2 for EX Series switches.

Description
Enable tracing of forwarding equivalence classes (FECs) for LDP LSPs.

Options

disable—(Optional) Disable tracing for a specific FEC. This option is available at the [edit protocols ldp oam fec fec-address periodic-traceroute] and [edit logical-systems logical-system-name protocols ldp oam fec fec-address periodic-traceroute] hierarchy levels only.

  exp exp-value—(Optional) Specify the class of service to use when sending probes.
Default: 7
Range: 0 through 7

  fanout fanout-value—(Optional) Specify the maximum number of next hops to search per node.
Default: 16
Range: 1 through 16

frequency minutes—(Optional) Specify the interval between traceroute attempts.
Default: 60 minutes
Range: 15 through 120 minutes

paths number-of-paths—(Optional) Specify the maximum number of paths to search.
Default: 3
Range: 1 through 255

retries retry-attempts—(Optional) Specify the number of attempts to send a probe to a specific node before giving up.
Default: 3
Range: 1 through 9

source address—(Optional) Specify the IPv4 source address to use when sending probes.

ttl value—(Optional) Specify the maximum time-to-live value. Nodes that are beyond this value are not traced.
Default: 64
Range: 1 through 255

wait seconds—(Optional) Specify the wait interval before resending a probe packet.
Default: 10 seconds
Range: 5 through 15 seconds

Required Privilege Level

policy (Multicast-Only Fast Reroute)

Syntax

```
policy policy-name;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options multicast stream-protection],
[edit logical-systems logical-system-name routing-options multicast stream-protection],
[edit routing-instances routing-instance-name routing-options multicast stream-protection],
[edit routing-options multicast stream-protection]
```

Release Information

Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.

Description

When you configure multicast-only fast reroute (MoFRR), apply a routing policy that filters for a restricted set of multicast streams to be affected by your MoFRR configuration. You can apply filters that are based on source or group addresses.

For example:

```
routing-options {
  multicast {
    stream-protection {
      policy mofrr-select;
    }
  }
}

policy-statement mofrr-select {
  term A {
    from {
      source-address-filter 225.1.1.1/32 exact;
    }
    then {
      accept;
    }
  }
  term B {
    from {
```
source-address-filter 226.0.0.0/8 or longer;
}
then {
    accept;
}
}
term C {
    from {
        source-address-filter 227.1.1.0/24 or longer;
        source-address-filter 227.4.1.0/24 or longer;
        source-address-filter 227.16.1.0/24 or longer;
    }
    then {
        accept;
    }
}
term D {
    from {
        source-address-filter 227.1.1.1/32 exact;
    }
    then {
        reject; #MoFRR disabled
    }
}
term E {
    from {
        route-filter 227.1.1.0/24 or longer;
    }
    then accept;
}
...

**Required Privilege Level**

policy (Protocols Multipoint LDP)

Syntax

```
policy policy-name;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols pim mldp-inband-signalling],
[edit protocols pim mldp-inband-signalling]
```

Release Information

Statement introduced in Junos OS Release 13.2.

Description

Multipoint LDP (M-LDP) in-band signaling enables you to carry multicast traffic across an existing IP/MPLS backbone, while avoiding the use of PIM in the provider core.

On the egress nodes of the point-to-multipoint LSP, specify an M-LDP join translation filter policy where PIM messages are translated into M-LDP FEC bindings. The policy statement is needed when internal BGP (IBGP) is not available in the core site or to override IBGP-based LSP root detection.

The filter policy is configured at the [edit policy-options] hierarchy level. The policy generally specifies one or more source-address filters and the point-to-multipoint LDP root IP address using the `p2mp-lsp-root` policy action.

Options

`policy-name`—Name of a policy configured at the [edit policy-options] hierarchy level.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

```
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
```
transport-address option introduced in Junos OS Release 19.1R1 for all platforms.
```

Description
Configure LDP session parameters by specifying the session destination address.

Options

**session-address**—Session destination address.

**authentication-algorithm**—Authentication algorithm name.
```
Values:
• hmac-sha-1-96—Hash-based Message Authentication Code (SHA1) (96 bits).
• md5—Message Digest 5.
```

**authentication-key**—MD5 authentication key.

**authentication-key-chain**—Key chain name.

**downstream-on-demand**—Configure downstream on demand label distribution mode.
mtu-discovery—Enable TCP path MTU discovery.

no-mtu-discovery—Disable TCP path MTU discovery.

transport-address transport-address—IP address used for TCP sessions to the LDP neighbors that have targeted-LDP adjacencies.

You cannot configure this statement for LDP sessions that have discovered adjacencies.

The transport-address configuration can be rejected at the time of validation, if there is no interface with the configured IP address.

Required Privilege Level
routing

  (mtu-discovery | no-mtu-discovery);
  transport-address transport-address;
}
```

Hierarchy Level

```
[edit logical-systems name protocols ldp],
[edit logical-systems name routing-instances name protocols ldp],
[edit protocols ldp],
[edit routing-instances name protocols ldp]
```

Release Information

transport-address option introduced in Junos OS Release 19.1R1 for all platforms.

Description

Specify the prefix address of the aggregated group of LDP neighbors for the remote end of the LDP session.

The session-group statement is useful when an LDP neighbor is dynamic; for instance, in the case of remote loop free alternate (LFA), a targeted or indirect LDP neighbor is automatically picked from any of the nodes in the network.

The session-group statement can also be used for configuring authentication for a prefix group, as LDP authentication for all sessions or authentication at the interface level is not supported.

The remaining statements are explained separately. See CLI Explorer.

Options

name—Session destination address or prefix length.

authentication-algorithm—Authentication algorithm name.

Values:
  - aes-128-cmac-96—Cipher-based Message Authentication Code (AES128) (96 bits)
  - hmac-sha-1-96—Hash-based Message Authentication Code (SHA1) (96 bits)
- **md5**—Message Digest 5

**authentication-key**—MD5 authentication key.

**authentication-key-chain**—Authentication key chain name.

**downstream-on-demand**—Configure downstream on demand label distribution mode.

**mtu-discovery | no-mtu-discovery**—Enable and disable TCP path MTU discovery, respectively.

**transport-address transport-address**—IP address used for TCP sessions to the LDP neighbors that have targeted-LDP adjacencies, and fall under the same IP subnet.

You cannot configure this statement for LDP sessions that have discovered adjacencies.

The transport-address configuration can be rejected at the time of validation, if there is no interface with the configured IP address.

**Required Privilege Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

session-protection

Syntax

```
session-protection {
  timeout seconds;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

Description

Configure when an LDP session is torn down and resignal after the router stops receiving hello messages from a neighboring router. You might want to modify this behavior to prevent an LDP session from being unnecessarily terminated and reestablished. The LDP session remains up for the duration specified as long as the routers maintain IP network connectivity.

Options

```
timeout seconds—Time in seconds before the LDP session is torn down and resignal.
```

Range: 1 through 65,535 seconds

Required Privilege Level

`routing`—To view this statement in the configuration.
`routing-control`—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols ldp]

Release Information
Statement introduced before Junos OS Release 7.4.
match-on address option for the filter flag modifier added in Junos OS Release 10.4.
nsr-synchronization and p2mp-nsr-synchronization operations for flag statement introduced in Junos OS Release 13.3.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Specify LDP protocol-level trace options.

Default
The default LDP protocol-level trace options are inherited from the routing protocols traceoptions statement included at the [edit routing-options] hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.

file filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory ldp-log. We recommend that you place LDP tracing output in the file ldp-log.

files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Range: 2 through 1000
Default: 2 files
If you specify a maximum number of files, you must also include the size statement to specify the maximum file size.

flag flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.

- address—Operation of address and address withdrawal messages
- binding—Label-binding operations
- error—Error conditions
- event—Protocol events
- initialization—Operation of initialization messages
- label—Operation of label request, label map, label withdrawal, and label release messages
- notification—Operation of notification messages
- nsr-synchronization—Nonstop active routing synchronization events
- p2mp-nsr-synchronization—Point-to-multipoint nonstop active routing synchronization events
- packets—Equivalent to setting address, initialization, label, notification, and periodic flags (see also the filter flag modifier)
- path—Label-switched path operations
- periodic—Operation of hello and keepalive messages
- route—Operation of route messages
- state—Protocol state transitions

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- detail—Provide detailed trace information.
- disable—Disable this trace flag.
- filter—Filter to apply to this flag. The filter flag modifier can be applied only to the route, path, and binding flags. This flag modifier has the following options:
  - match-on—Match on argument specified. The match-on option has the following suboptions:
    - address—Filter based on the source and destination addresses of packets. Available for the packets flag option only.
    - fec—Filter based on the FEC associated with the traced object.
    - policy policy-name—Specify the filter policy.
- receive—Packets being received.
- send—Packets being transmitted.
**no-world-readable**—(Optional) Prevent all users from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the `trace-file` again reaches this size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

**world-readable**—(Optional) Enable any user to read the log file.

**Required Privilege Level**

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

track-igp-metric (LSP)

Syntax

```
track-igp-metric <install-v4-prefixes> <install-v6-prefixes>;
```

Hierarchy Level

The hierarchy level for `track-igp-metric` globally enabled for all LSPs:

```
[edit protocols mpls]
```

The hierarchy level for `track-igp-metric` at the per LSP level:

```
[edit protocols mpls label-switched-path pathname],
```

Release Information

Statement introduced in Junos OS Release 18.4R1.

Description

Track IGP metric for LSP install prefixes

Options

- `install-v4-prefixes`—Track IGP metric for IPV4 prefixes.
- `install-v6-prefixes`—Track IGP metric for IPV6 prefixes.

Required Privilege Level

`routing`

```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

LDP traffic statistics display the amount of traffic passed through a router for a particular FEC.

Options

file filename—Name of the file to receive the output of the LDP statistics operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

files number—(Optional) Maximum number of LDP statistics files. When a statistics file named `ldp-stat` reaches its maximum size, it is renamed `ldp-stat.0`, then `ldp-stat.1`, and so on, until the maximum number of LDP statistics files is reached. Then the oldest file is overwritten.

Range: 2 through 1000
Default: 2 files

If you specify a maximum number of files, you also must include the `size` statement to specify the maximum file size.

interval seconds—(Optional) Specify the interval at which the statistics are polled and written to the file.
Default: 300 seconds (5 minutes)

no-penultimate-hop—(Optional) Do not collect traffic statistics on the penultimate hop router.

no-world-readable—(Optional) Prevent all users from reading the log file.
size size—(Optional) Maximum size of each statistics file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a statistics file named ldp-stat reaches this size, it is renamed ldp-stat.0. When ldp-stat again reaches this size, ldp-stat.0 is renamed ldp-stat.1 and ldp-stat is renamed ldp-stat.0. This renaming scheme continues until the maximum number of statistics files is reached. Then the oldest statistics file is overwritten.

Syntax: xk to specify KB, xm to specify MB, or xg to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

If you specify a maximum file size, you also must also include the files statement to specify the maximum number of files.

world-readable—(Optional) Enable log file access for all users.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit protocols ldp interface interface-name],
[edit routing-instances routing-instance-name protocols ldp interface interface-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
address option introduced in Junos OS Release 19.1R1 for all platforms.

Description

Enables you to configure the IP address used to specify the TCP session for the LDP session. Routers must first establish a TCP session between one another before they can establish an LDP session. The TCP session enables the routers to exchange the label advertisements needed for the LDP session. To establish the TCP session, each router must learn the other router's transport address. The transport address is an IP address used to identify the TCP session over which the LDP session will run.

Default

router-id

Options

address—Use the specified IP address as the transport address for the LDP session.

interface—Use the first IP address on the interface as the transport address for any LDP sessions to neighbors that can be reached over that interface. You cannot specify the interface option when there are multiple parallel links to the same LDP neighbor, because the LDP specification requires that the same transport address be advertised on all interfaces to the same neighbor. If LDP detects multiple parallel links to the same neighbor, it disables interfaces to that neighbor one by one until the condition is cleared, either by disconnecting the neighbor on an interface or by specifying the router-id option.

router-id—Use router identifier as the transport address. Unless otherwise configured, the router identifier is the loopback address.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers (ethernet, vlan-ccc, and vlan-tcc options only).
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers. Only the atm-ccc-cell-relay and atm-ccc-vc-mux options are supported on ACX Series routers.
Statement introduced in Junos OS Release 17.3R1 for QFX10000 Series switches (ethernet-ccc and vlan-ccc options only).

Description

Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.

Starting in Junos OS Release 20.1R1, aggregated ethernet interfaces supports VLAN TCC (Translational cross-connect) encapsulation on MX series platforms. See "Configuring VLAN TCC Encapsulation" on page 1516 for more details. Non-ethernet media types, SONET and ATM interfaces are only supported. It is expected that the user will have the member links of aggregated ethernet with supported hardware for configuring VLAN TCC encapsulation and no commit check is performed externally for the aggregated ethernet (AE) interfaces.

Options

- **atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.
- **atm-ccc-vc-mux**—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.
**atm-cisco-nlpid**—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the *inet* family only.

**atm-mlppp-llc**—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.

**atm-nlpid**—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the *inet* family only.

**atm-ppp-llc**—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.

**atm-ppp-vc-mux**—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.

**atm-snap**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

**atm-tcc-snap**—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

**atm-tcc-vc-mux**—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the *tcc* family only.

**atm-vc-mux**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the *inet* family only.

**ether-over-atm-llc**—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

**ether-vpls-over-atm-llc**—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**ether-vpls-over-fr**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, *Multiprotocol Interconnect over Frame Relay*.

---

**NOTE:** The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.
ether-vpls-over-ppp—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

ethernet—Use Ethernet II encapsulation (as described in RFC 894, A Standard for the Transmission of IP Datagrams over Ethernet Networks).

ethernet-ccc—Use Ethernet CCC encapsulation on Ethernet interfaces.

ethernet-vpls—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

NOTE: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

ethernet-vpls-fr—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

frame-relay-ccc—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.

frame-relay-ether-type—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

frame-relay-ether-type-tcc—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

frame-relay-ppp—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the ppp family only.

frame-relay-tcc—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the tcc family only.

gre-fragmentation—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet's size exceeds the tunnel's maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

multilink-frame-relay-end-to-end—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.
**multilink-ppp**—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

**ppp-over-ether**—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.

**ppp-over-ether-over-atm-llc**—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

**vlan-bridge**—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**vlan-ccc**—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.

**vlan-tcc**—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the tcc family only.

**vlan-vpls**—Use Ethernet VLAN encapsulation on VPLS circuits.

**vxlan**—Use VXLAN data plane encapsulation for EVPN.

**Required Privilege Level**
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

#### Release Information

Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.5.  
Statement introduced in Junos OS Release 11.1 for EX Series switches.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers (flexible-ethernet-services, ethernet-ccc, and ethernet-tcc options only).

**Description**
For M Series, MX Series, QFX Series, T Series, PTX Series, specify the physical link-layer encapsulation type.

For SRX Series, specify logical link layer encapsulation.

**NOTE:** Not all encapsulation types are supported on the switches. See the switch CLI.

**Default**
*ppp*—Use serial PPP encapsulation.
Physical Interface Options and Logical Interface Options

[Warning: element unresolved in stylesheets: <title> (in <config-options>). This is probably a new element that is not yet supported in the stylesheets.]

Physical Interface Options and Logical Interface Options

For physical interfaces:

NOTE: Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on EX Series switches.

- **atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.

- **atm-pvc**—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).

- **cisco-hdlc**—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:
  - CCC version (**cisco-hdlc-ccc**)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the ccc family only.
  - TCC version (**cisco-hdlc-tcc**)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

- **cisco-hdlc-ccc**—Use Cisco-compatible HDLC framing on CCC circuits.

- **cisco-hdlc-tcc**—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.

- **ethernet-bridge**—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.

- **ethernet-over-atm**—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPU packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.

- **ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.
- **ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

- **ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

- **ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

- **ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

- **extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the ccc family only.

- **extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.

- **extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.

- **extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

- **extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the ccc family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.

- **extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.
- **extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

  NOTE: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

- **flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet interfaces, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

- **flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

- **frame-relay**—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.

- **frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have `frame-relay-ccc` encapsulation. When you use this encapsulation type, you can configure the `ccc` family only.

- **frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

  NOTE: When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

- **frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.
• **frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the `ccc` family only.

• **frame-relay-tcc**—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

• **generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.

• **multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

• **ppp**—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.

• **ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.

• **ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the `tcc` family only.

• **vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the `ccc` family only.

• **vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to `vlan-vci-ccc`.

• **vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:**

- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.

- Starting with Junos OS release 13.3, a commit error occurs when you configure `vlan-vpls` encapsulation on a physical interface and configure `family inet` on one of the logical units. Previously, it was possible to commit this invalid configuration.
For logical interfaces:

- **frame-relay**—Configure a Frame Relay encapsulation when the physical interface has multiple logical units, and the units are either point to point or multipoint.

- **multilink-frame-relay-uni-nni**—Link services interfaces functioning as FRF.16 bundles can use Multilink Frame Relay UNI NNI encapsulation.

- **ppp**—For normal mode (when the device is using only one ISDN B-channel per call). Point-to-Point Protocol is for communication between two computers using a serial interface.

- **ppp-over-ether**—This encapsulation is used for underlying interfaces of pp0 interfaces.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**interface-switch**

**Syntax**

```plaintext
interface-switch connection-name {
    interface interface-name.unit-number;
}
```

**Hierarchy Level**

```plaintext
[edit logical-systems logical-system-name protocols connections],
[edit protocols connections]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Configure Layer 2 switching cross-connects. The cross-connect is bidirectional, so packets received on the first interface are transmitted out the second interface, and those received on the second interface are transmitted out the first.

For Layer 2 switching cross-connects to work, you must also configure MPLS.

**Options**

- `connection-name`—Connection name (up to 128 characters in Junos 12.3 and later).
- `interface interface-name.unit-number`—Interface name. Include the logical portion of the name, which corresponds to the logical unit number.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration

**l2circuit-control-passthrough**

**Syntax**

```
l2circuit-control-passthrough;
```

**Hierarchy Level**

```
[edit forwarding-options]
```

**Release Information**

Statement introduced in Junos OS Release 19.3R1 for PTX Series routers.

**Description**

Configure the device to allow LACP, LLDP, OAM LFM, and OAM CFM packets to cross the Layer 2 circuit. If the `l2circuit-control-passthrough` statement is not configured, LACP, LLDP, OAM LFM, and OAM CFM packets are classified as control packets and are not transmitted across the Layer 2 circuit.

**NOTE:** For MX Series routers, the functionality that the `l2circuit-control-passthrough` command provides is performed automatically.

**Default**

By default, this statement is not configured.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the `realm` statement introduced in Junos OS Release 9.2.
Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description
Disable OSPF, an OSPF interface, or an OSPF virtual link.

By default, control packets sent to the remote end of a virtual link must be forwarded using the default topology. In addition, the transit area path consists only of links that are in the default topology. You can disable a virtual link for a configured topology, but not for a default topology. Include the disable statement at the [edit protocols ospf area area-id virtual-link neighbor-id router-id transit-area area-id topology name] hierarchy level.

NOTE: If you disable the virtual link by including the disable statement at the [edit protocols ospf area area-id virtual-link neighbor-id router-id transit-area area-id] hierarchy level, you disable the virtual link for all topologies, including the default topology. You cannot disable the virtual link only in the default topology.

Default
The configured object is enabled (operational) unless explicitly disabled.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Apply one or more policies to routes being exported from the routing table into BGP.

If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route’s metric to 500, this route matches the criterion of metric 500 defined in the next policy.

Options

policy-names—Name of one or more policies.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
hello-dead-interval

Syntax

```
hello-dead-interval milliseconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols link-management peer peer-name lmp-protocol],
[edit protocols link-management peer peer-name lmp-protocol]
```

Release Information

Statement introduced in Junos OS Release 8.0.

Description

Specify how long the Link Management Protocol (LMP) waits before declaring the control channel to be dead. This is an interval during which the router receives no LMP hello packets from the neighbor on a control that is active or up.

Options

- `milliseconds`—Interval to wait before declaring the control channel to be dead.

Range: 500 through 300,000

Default: 500 milliseconds (three times the hello interval)

Required Privilege Level

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

```

**Release Information**

Statement introduced in Junos OS Release 8.1.

**Description**

Specify how often the router sends Link Management Protocol (LMP) hello packets.

**Options**

- `milliseconds`—Length of time between hello packets.

**Range:** 150 through 300,000

**Default:** 150 milliseconds

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the `realm` statement introduced in Junos OS Release 9.2.
Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.

**Description**

Specify how often the routing device sends hello packets out the interface. The hello interval must be the same for all routing devices on a shared logical IP network.

**Options**

- **seconds**—Time between hello packets, in seconds.

**Range:** 1 through 255 seconds

**Default:** 10 seconds (broadcast and point-to-point networks); 30 seconds (nonbroadcast multiple access [NBMA] networks)
**Required Privilege Level**

- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.

If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route’s metric to 500, this route matches the criterion of **metric 500** defined in the next policy.

It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to
control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.

Hidden routes can be viewed by using the `show route receive-protocol bgp neighbor-address hidden` command. The hidden routes can then be retained or dropped from the routing table by configuring the `keep all | none` statement at the `[edit protocols bgp]` or `[edit protocols bgp group group-name]` hierarchy level.

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the `keep all` statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the `keep none` statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

Options

`policy-names`—Name of one or more policies.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

**virtual-switch** and **layer2-control** options introduced in Junos OS Release 8.4.

Statement introduced in Junos OS Release 9.2 for EX Series switches.

Statement introduced in Junos OS Release 11.3 for the QFX Series.

Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**mpls-internet-multicast** option introduced in Junos OS Release 11.1 for the EX Series, M Series, MX Series, and T Series.

**evpn** option introduced in Junos OS Release 13.2 for MX 3D Series routers.

**evpn** option introduced in Junos OS Release 17.3 for the QFX Series.

**forwarding** option introduced in Junos OS Release 14.2 for the PTX Series.

**mpls-forwarding** option introduced in Junos OS Release 16.1 for the MX Series.

**evpn-vpws** option introduced in Junos OS Release 17.1 for MX Series routers.

Support for logical systems on MX Series routers added in Junos OS Release 17.4R1.

Description

Define the type of routing instance.

Options

**NOTE:** On ACX Series routers, you can configure only the forwarding, virtual router, and VRF routing instances.

**type**—Can be one of the following:

- **evpn**—(MX 3D Series routers, QFX switches and EX9200 switches)—Enable an Ethernet VPN (EVPN) on the routing instance.
  hierarchy level.

- **evpn-vpws**—Enable an Ethernet VPN (EVPN) Virtual Private Wire Service (VPWS) on the routing instance.
- **forwarding**—Provide support for filter-based forwarding, where interfaces are not associated with instances. All interfaces belong to the default instance. Other instances are used for populating RPD learned routes. For this instance type, there is no one-to-one mapping between an interface and a routing instance. All interfaces belong to the default instance inet.0.

- **l2backhaul-vpn**—Provide support for Layer 2 wholesale VLAN packets with no existing corresponding logical interface. When using this instance, the router learns both the outer tag and inner tag of the incoming packets, when the `instance-role` statement is defined as `access`, or the outer VLAN tag only, when the `instance-role` statement is defined as `nni`.

- **l2vpn**—Enable a Layer 2 VPN on the routing instance. You must configure the `interface`, `route-distinguisher`, `vrf-import`, and `vrf-export` statements for this type of routing instance.

- **layer2-control**—(MX Series routers only) Provide support for RSTP or MSTP in customer edge interfaces of a VPLS routing instance. This instance type cannot be used if the customer edge interface is multihomed to two provider edge interfaces. If the customer edge interface is multihomed to two provider edge interfaces, use the default BPDU tunneling.

- **mpls-forwarding**—(MX Series routers only) Allow filtering and translation of route distinguisher (RD) values in IPv4 and IPv6 VPN address families on both routes received and routes sent for selected BGP sessions. In particular, for Inter-AS VPN Option-B networks, this option can prevent the malicious injection of VPN labels from one peer AS boundary router to another.

- **mpls-internet-multicast**—(EX Series, M Series, MX Series, and T Series routers only) Provide support for ingress replication provider tunnels to carry IP multicast data between routers through an MPLS cloud, using MBGP or next-generation MVPN.

- **no-forwarding**—This is the default routing instance. Do not create a corresponding forwarding instance. Use this routing instance type when a separation of routing table information is required. There is no corresponding forwarding table. All routes are installed into the default forwarding table. IS-IS instances are strictly nonforwarding instance types.

- **virtual-router**—Enable a virtual router routing instance. This instance type is similar to a VPN routing and forwarding instance type, but used for non-VPN-related applications. You must configure the `interface` statement for this type of routing instance. You do not need to configure the `route-distinguisher`, `vrf-import`, and `vrf-export` statements.

- **virtual-switch**—(MX Series routers, EX9200 switches, and QFX switches only) Provide support for Layer 2 bridging. Use this routing instance type to isolate a LAN segment with its Spanning Tree Protocol (STP) instance and to separate its VLAN identifier space.
- **vpls**—Enable VPLS on the routing instance. Use this routing instance type for point-to-multipoint LAN implementations between a set of sites in a VPN. You must configure the `interface`, `route-distinguisher`, `vrf-import`, and `vrf-export` statements for this type of routing instance.

- **vrf**—VPN routing and forwarding (VRF) instance. Provides support for Layer 3 VPNs, where interface routes for each instance go into the corresponding forwarding table only. Required to create a Layer 3 VPN. Create a VRF table (`instance-name.inet.0`) that contains the routes originating from and destined for a particular Layer 3 VPN. For this instance type, there is a one-to-one mapping between an interface and a routing instance. Each VRF instance corresponds with a forwarding table. Routes on an interface go into the corresponding forwarding table. You must configure the `interface`, `route-distinguisher`, `vrf-import`, and `vrf-export` statements for this type of routing instance.

**Required Privilege Level**

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.

Description
Specify how long the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements (LSAs) to an interface's neighbors.

Options
seconds—Interval to wait.

Range: 1 through 65,535 seconds
Default: 5 seconds
NOTE: You must configure LSA retransmit intervals to be equal to or greater than 3 seconds to avoid triggering a retransmit trap, because Junos OS delays LSA acknowledgments by up to 2 seconds.

**Required Privilege Level**
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

retry-limit (Protocols Link Management)

Syntax

retry-limit number;

Hierarchy Level

[edit logical-systems logical-system-name protocols link-management peer peer-name lmp-protocol],
[edit protocols link-management peer peer-name lmp-protocol]

Release Information

Statement introduced in Junos OS Release 8.1.

Description

Specify how many times the Link Management Protocol (LMP) sends Config and LinkSummary messages on the LMP control channel without receiving an appropriate acknowledgment before it logs a message and restarts the LMP control channel configuration process.

Options

number—Maximum number of times messages are sent without receiving an acknowledgment.

Range: 3 through 1000
Default: 3

Required Privilege Level

routing—To view this statement in the configuration.
route-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name],
[edit routing-instances routing-instance-name protocols l2vpn mesh-group mesh-group-name],
[edit routing-instances routing-instance-name protocols vpls mesh-group mesh-group-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for EX Series switches.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.
Statement introduced in cRPD Release 19.4R1.

Description

Specify an identifier attached to a route, enabling you to distinguish to which VPN or virtual private LAN service (VPLS) the route belongs. Each routing instance must have a unique route distinguisher (RD) associated with it. The RD is used to place bounds around a VPN so that the same IP address prefixes can be used in different VPNs without having them overlap. If the instance type is vrf, the route-distinguisher statement is required.

For Layer 2 VPNs and VPLS, if you configure the l2vpn-use-bgp-rules statement, you must configure a unique RD for each PE router participating in the routing instance.

For other types of VPNs, we recommend that you use a unique RD for each provider edge (PE) router participating in specific routing instance. Although you can use the same RD on all PE routers for the same VPN routing instance, if you use a unique RD, you can determine the customer edge (CE) router from which a route originated within the VPN.

For Layer 2 VPNs and VPLSs, if you configure mesh groups, the RD in each mesh group must be unique.
CAUTION: We strongly recommend that if you change an RD that has already been configured, or change the routing-instance type from virtual-router to vrf, make the change during a maintenance window, as follows:

1. Deactivate the routing instance.
2. Change the RD.
3. Activate the routing instance.

This is not required if you are configuring the RD for the first time.
Options

**as-number**: an assigned AS number, and **number** is any 2-byte or 4-byte value. The AS number can be from 1 through 4,294,967,295. If the AS number is a 2-byte value, the administrative number is a 4-byte value. If the AS number is 4-byte value, the administrative number is a 2-byte value. An RD consisting of a 4-byte AS number and a 2-byte administrative number is defined as a type 2 RD in RFC 4364 BGP/MPLS IP VPNs.

**NOTE:** In Junos OS Release 9.1 and later, the numeric range for AS numbers is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, BGP Support for Four-octet AS Number Space. All releases of Junos OS support 2-byte AS numbers. To configure an RD that includes a 4-byte AS number, append the letter "L" to the end of the AS number. For example, an RD with the 4-byte AS number 7,765,000 and an administrative number of 1,000 is represented as **77765000L:1000**.

In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS dot notation format of two integer values joined by a period: `<16-bit high-order value in decimal>.<16-bit low-order value in decimal>`. For example, the 4-byte AS number of 65,546 in the plain-number format is represented as **1.10** in AS dot notation format.

**ip-address**: IP address (ip-address is a 4-byte value) within your assigned prefix range and a 2-byte value for the **id**. The IP address can be any globally unique unicast address.

**Range:** 0 through 4,294,967,295 ($2^{32} - 1$). If the router you are configuring is a BGP peer of a router that does not support 4-byte AS numbers, you need to configure a local AS number. For more information, see Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview.

**NOTE:** For Ethernet VPN (EVPN), an RD that includes zero as the **id** value is reserved for the default EVPN routing instance by default. Because the same RD cannot be assigned for two routing instances, using a **ip-address:id** RD for another routing instance (default-switch), where the **id** value is zero, throws a commit error.

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

}
```

Hierarchy Level

- [edit protocols link-management],
- [edit protocols link-management peer peer-name]

Release Information

Statement introduced before Junos OS Release 7.4.
**ethernet-vlan** option introduced in Junos OS Release 14.2.

Description

Represent a collection of physical ports or time slots. Assign a traffic engineering link to the specified network peer.

Options

- **te-link-name**—Name of the collection of physical ports or the name of the time slots.
- **disable**—Disable the traffic engineering link or an interface to a traffic engineering link.

The remaining statements are explained separately.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.
traceoptions (Protocols Link Management)

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols link-management],
[edit protocols link-management]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Support for hello-packets, packets, and state flags added in Junos OS Release 8.1.

Description

Trace options for the LMP protocol.

Options

**disable**—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.

**filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.

**files number**—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Range: 2 through 1000

Default: 2 files

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

- **all**—Trace all available operations
- **hello-packets**—Trace hello packets on any LMP control channel
- **init**—Output from the initialization messages
- **packets**—Trace all packets other than hello packets on any LMP control channel
- **parse**—Operation of the parser
- **process**—Operation of the general configuration
- **route-socket**—Operation of route socket events
- **routing**—Operation of the routing protocols
- **server**—Server processing operations
- **show**—`show` command servicing operations
- **state**—Trace state transitions of the LMP control channels and traffic engineering links

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:
- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-world-readable**—(Optional) Prevent all users from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the `trace-file` again reaches this size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

**world-readable**—(Optional) Enable log file access for all users.

**Required Privilege Level**
- routing and trace—To view this statement in the configuration.
- routing-control and trace-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area area-id interface interface-name]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.

Description
Set the estimated time required to transmit a link-state update on the interface. When calculating this time, make sure to account for transmission and propagation delays.

You should never have to modify the transit delay time.

Options
seconds—Estimated time, in seconds.

Range: 1 through 65,535 seconds
Default: 1 second

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

upstream-label

Syntax

```
upstream-label {
    vlan-id vlan-id;
}
```

Hierarchy Level

[edit protocols mpls label-switched-path lsp-name lsp-attributes]

Release Information

Statement introduced in Junos OS Release 14.2.

Description

Specify the upstream label for the bidirectional label-switched path (LSP).

Options

`vlan-id vlan-id`—VLAN ID to be used for the Generalized MPLS (GMPLS) VLAN LSP at the ingress provider edge (PE) to customer edge (CE) link.

Required Privilege Level

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols l2vpn mesh-group mesh-group-name],
[edit routing-instances routing-instance-name protocols vpls mesh-group mesh-group-name],
[edit switch-options]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for EX Series switches.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.
Statement introduced in Junos OS Release 14.1X53-D30 for QFX Series switches. auto option was also added at this time.
auto option added in Junos OS Release 19.1R1 for MX series.
Statement introduced in cRPD Release 19.4R1.

Description
Specify a virtual routing and forwarding (VRF) target community. If you configure the community option only, default VRF import and export policies are generated that accept and tag routes with the specified target community. The purpose of the vrf-target statement is to simplify the configuration by allowing you to configure most statements at the [edit routing-instances] hierarchy level. In effect, this statement configures a single policy for import and a single policy for export to replace the per-VRF policies for every community.

You can still create more complex policies by explicitly configuring VRF import and export policies using the import and export options.
Options

*community*—Community name.

*auto*—Automatically derives the route target (RT). The auto-derived route targets have higher precedence over manually configured RT in vrf-target, vrf-export policies, and vrf-import policies.

**NOTE:** Auto-derived route targets are supported only in virtual switch and EVPN routing instances.

*import* **community-name**—Allowed communities accepted from neighbors.

*export* **community-name**—Allowed communities sent to neighbors.

**Required Privilege Level**

routi**ng**—To view this statement in the configuration.

routi**ng-control**—To add this statement to the configuration.

delegation-cleanup-timeout

Syntax

delegation-cleanup-timeout seconds;

Hierarchy Level

[edit protocols pcep pce pce-id]

Release Information
Statement introduced in Junos OS Release 12.3.
Support for PTX Series added in Junos OS Release 14.2.
Support for QFX Series switches added in Junos OS Release 16.1R3.
Support for ACX Series added in Junos OS Release 17.1R1.

Description
Specify the amount of time (in seconds) that a Path Computation Client (PCC) must wait before returning control of all LSPs to the routing protocol process after a PCEP session with the main active stateful Path Computation Element (PCE) is disconnected.

NOTE: In compliance with draft-ietf-pce-stateful-pce-09, revoking of PCE-initiated LSP delegations by a PCC happens in a make-before-break fashion before the LSPs are redelegated to an alternate PCE. Starting in Junos OS Release 18.1R1, the lsp-cleanup-timer must be greater than or equal to the delegation-cleanup-timeout for the PCC to revoke the LSP delegations. If not, the redelegation timeout interval for the PCC can be set to infinity, where the LSP delegations to that PCE remain intact until specific action is taken by the PCC to change the parameters set by the PCE.

Options

seconds—Time (in seconds) that a PCC must wait before returning control of all LSPs to the routing protocol process after a PCEP session with the main active stateful PCE is disconnected.

A value of 0 indicates immediate delegation cleanup.

Range: 0 through 2147483647 seconds
Prior to Junos OS Release 18.4R1, the maximum range value is 600 seconds.

Default: 30 seconds

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

RELATED DOCUMENTATION

delegation-priority

Syntax

delegation-priority priority-number;

Hierarchy Level

[edit protocols pcep pce pce-id]

Release Information
Statement introduced in Junos OS Release 12.3.
Support for PTX Series added in Junos OS Release 14.2.
Support for QFX Series switches added in Junos OS Release 16.1R3.
Support for ACX Series added in Junos OS Release 17.1R1.

Description
Specify the priority number of the active stateful Path Computation Element (PCE). This value is used by the Path Computation Client (PCC) to elect a PCE to delegate LSPs. No two PCEs can have the same delegation-priority value. The PCC elects the PCE with a lower priority as the main active stateful PCE to delegate LSPs.

Options

priority-number—Priority number of the active stateful PCE.

Range: 1 through 65535
Default: 0 (no priority is set)

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

message-rate-limit

Syntax

message-rate-limit messages-per-minute;

Hierarchy Level

[edit protocols pcep]

Release Information
Statement introduced in Junos OS Release 12.3.
Support for PTX Series added in Junos OS Release 14.2.
Support for QFX Series added in Junos OS Release 16.1R3.
Support for ACX Series added in Junos OS Release 17.1R1.

Description
Specify the number of messages per minute that the Path Computation Client (PCC) can receive at maximum.

Options
messages-per-minute—Number of messages per minute that the PCC can receive at maximum.
  Range: 1 through 16384
  Default: 0 (disabled or no limit)

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.
Support for PTX Series added in Junos OS Release 14.2.
Support for QFX Series switches added in Junos OS Release 16.1R3.
Support for ACX Series added in Junos OS Release 17.1R1.

**authentication-key key**, **authentication-key-chain key-chain**, and **p2mp-lsp-report-capability** options introduced in Junos OS Release 16.1.
**Description**

Configure per-Path Computation Element (PCE) parameters.

*max-sid-depth* and *spring-capability* options introduced in Junos OS Release 17.2.

*p2mp-lsp-init-capability* and *p2mp-lsp-update-capability* options introduced in Junos OS Release 18.3R1 on all platforms.

*pce_traffic_steering* option introduced in Junos OS Release 19.4R1 on all platforms.
Options

**pce-id**—IP address of the PCE.

**authentication-key**—(Optional) Authentication password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

It is recommended to define and bind an authentication key for securing a PCEP session, as opposed to binding an authentication keychain.

**authentication-key-chain**—(Optional) Authentication keychain password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

**local-address ip-address**—(Optional) IP address of the local end of the PCEP session, the PCC.

**lsp-retry-delegation**—(Optional) Enable retry LSP delegation process.

**lsp-retry-delegation-timer**—(Optional) Specify the amount of time (in seconds) that the Path Computation Client (PCC) must wait before retrying delegation of Path Computation Element (PCE)-initiated LSPs in case of delegation failure or re-delegation.

- **Default:** 3600 seconds
- **Range:** 0 through 4294967294 seconds

**max-sid-depth**—(Optional) Specify the maximum value for service identifier (SID) depth.

- **Default:** 5
- **Range:** 1 through 5

**p2mp-lsp-init-capability**—(Optional) Capability to provision point-to-multipoint RSVP-TE LSPs by a PCE. By default, this capability is not supported on a PCC, and should be explicitly configured to enable PCE-initiated point-to-multipoint LSPs.

**p2mp-lsp-report-capability**—(Optional) Capability to report point-to-multipoint RSVP-TE LSPs to a PCE. By default, this capability is not supported on a PCC, and should be explicitly configured to enable reporting of point-to-multipoint LSPs to a PCE.

**p2mp-lsp-update-capability**—(Optional) Capability to update point-to-multipoint RSVP-TE LSP parameters by a PCE. By default, this capability is not supported on a PCC, and should be explicitly configured to enable updating of PCE-initiated point-to-multipoint LSPs.

**pce_traffic_steering**—(Optional) Configure the flow specification capability (also called traffic steering functionality) for enabling the mapping of PCE-initiated point-to-multipoint LSPs to an MVPN routing-instance.

**spring-capability**—(Optional) Enable SPRING-based provisioning for the PCE.
**Required Privilege Level**
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.
Support for PTX Series added in Junos OS Release 14.2.
Support for QFX Series switches added in Junos OS Release 16.1R3.
Support for ACX Series added in Junos OS Release 17.1R1.

Description

Configure the path computation element (PCE) type:

- active—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegated control over their LSPs to the PCE.
- stateful—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update the LSP state. A PCC maintains synchronization with the PCE.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
querier (performance-monitoring)

Syntax

```plaintext
querier {
    delay {

RELATED DOCUMENTATION
traceoptions (PCE)

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag (all | pcep);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols pcep pce pce-id]
```

Description
Configure the Path Computation Element Protocol (PCEP) tracing options.

Options
filename—Name of the file to receive the output of the tracing operation. All files are placed in the directory /var/log.

files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 2 files. If you specify a maximum number of files, you must also include the size statement to specify the maximum file size.

flag—Area of path computation client process (pccd) to enable debugging output.

- **all**—Trace all areas of PCD code.
- **pcep**—Trace Path Computation Element Protocol (PCEP) operations.

no-remote-trace—(Optional) Disable remote tracing options.

no-world-readable—(Optional) Allow only certain users to read the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches this size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** \(xk\) to specify KB, \(xm\) to specify MB, or \(xg\) to specify GB.
Range: 10 KB through the maximum file size supported on your system.
Default: 1 MB. If you specify a maximum file size, you must also include the files statement to specify the maximum number of files.

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level
routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

**traceoptions** (Protocols PCEP)

**Syntax**

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

**Hierarchy Level**

```
[edit protocols pcep]
```

**Description**

Configure the Path Computation Element Protocol (PCEP) tracing options.

**Options**

- **filename**—Name of the file to receive the output of the tracing operation. All files are placed in the directory `/var/log`.

- **files number**—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.
  
  **Range:** 2 through 1000 files
  
  **Default:** 2 files. If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

- **flag**—Area of path computation client process (pccd) to enable debugging output.

  **PCEP Tracing Flags**

  - **all**—Trace all areas of PCCD code
  - **pccd-config**—All configuration parsing operations
  - **pccd-core**—PCCD core operations
  - **pccd-functions**—PCCD function entries and outs
  - **pccd-main**—PCCD main module
  - **pccd-rpd**—PCCD communication with RPD
  - **pccd-ui**—PCCD user interface handling

- **no-remote-trace**—(Optional) Disable remote tracing options.
no-world-readable—(Optional) Allow only certain users to read the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).
When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches this size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: \texttt{xk} to specify KB, \texttt{xm} to specify MB, or \texttt{xg} to specify GB.
Range: 10 KB through the maximum file size supported on your system.
Default: 1 MB. If you specify a maximum file size, you must also include the \texttt{files} statement to specify the maximum number of files.

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level
routing and trace—To view this statement in the configuration.

List of Syntax
Syntax on page 3069
Syntax (EX and QFX Series Switches) on page 3069

Syntax

```
clear mpls lsp
  <all>
  <autobandwidth>
  <counters>
  <logical-system (all | logical-system-name)>
  <name name>
  <optimize | optimize-aggressive>
  <path regular-expression>
  <statistics>
```

Syntax (EX and QFX Series Switches)

```
clear mpls lsp
  <all>
  <autobandwidth>
  <name name>
  <optimize | optimize-aggressive>
  <path regular-expression>
  <statistics>
```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

Description
Release the routes and states associated with MPLS label-switched paths (LSPs), and start new LSPs.

CAUTION: This command disconnects existing Resource Reservation Protocol (RSVP) sessions on the ingress routing device. If there is a time lag between the old path being torn down and the new path being set up, this command might impact traffic traveling along the LSPs.
Options

**all**—Reset and restart all LSPs that originated from this routing device; that is, all LSPs for which this routing device is the ingress routing device. Depending on the number of LSPs involved, it might take a while to restart all the LSPs.

**autobandwidth**—(Optional) Clear LSP autobandwidth counters.

**counters**—(Optional) Reset the flap and the MBB counters to zero.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name name**—(Optional) Reset and restart the specified LSP or group of LSPs. You can include wildcard characters in the interface name, as described in the *Junos Network Interfaces Configuration Guide*.

**optimize | optimize-aggressive**—(Optional) Run nonpreemptive optimization or aggressive optimization computation now.

**path regular-expression**—(Optional) Clear the specific LSP path matching the specified regular expression.

**statistics**—(Optional) Clear LSP statistics. You cannot clear the MPLS LSP statistics using a regular expression (name and path options) on transit routers.

Required Privilege Level
clear

clear mpls container-lsp

Syntax

```plaintext
clear mpls container-lsp
<autobandwidth>
<history>
<logical-system (all | logical-system-name)>
<member>
<name name>
<optimize | optimize-aggressive>
<statistics>
```

Release Information
Statement introduced in Junos OS Release 14.2.
Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.

Description
Release the routes and states associated with MPLS container label-switched paths (LSPs), and start new LSPs.

Options
- **none**—Reset and restart all LSPs that originated from this routing device; that is, all LSPs for which this routing device is the ingress routing device. Depending on the number of LSPs involved, it might take a while to restart all the LSPs.
- **autobandwidth**—(Optional) Clear LSP autobandwidth counters.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **name name**—(Optional) Reset and restart the specified LSP or group of LSPs. You can include wildcard characters in the interface name, as described in the Junos Network Interfaces Configuration Guide.
- **optimize | optimize-aggressive**—(Optional) Run nonpreemptive optimization or aggressive optimization computation now.
- **statistics**—(Optional) Clear LSP statistics. You cannot clear the MPLS LSP statistics using a regular expression (name and path options) on transit routers.

Required Privilege Level

### monitor mpls delay rsvp

**Syntax**

```plaintext
monitor mpls delay rsvp lsp-name
  <detail>
  <count count>
  <interval seconds>
  <padding-size padding-size>
  <traffic-class traffic-class>
```

**Release Information**

Command introduced in Junos OS Release 14.2.

**Description**

Perform an on-demand delay measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

**Options**

- **lsp-name**—Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed.
  
- **detail**—(Optional) Display detailed output of the LSP delay measurement.
  
- **count count**—(Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.
  
  **Default:** 10
  
  **Range:** 1 through 1000000
  
- **interval seconds**—(Optional) Specify in seconds the interval between two successive query messages.
  
  **Range:** 1 through 255 seconds
  
- **padding-size padding-size**—(Optional) Specify the length of padding TLV to be included in the query message.
  
  **Range:** 0 through 1500
  
- **traffic-class traffic-class**—(Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.
  
  **Range:** 0 through 7

**Required Privilege Level**

- **view**

monitor mpls loss rsvp

Syntax

```
monitor mpls loss rsvp lsp-name
<detail>
<bytes>
<count count>
<interval seconds>
<traffic-class traffic-class>
```

Release Information
Command introduced in Junos OS Release 14.2.

Description
Perform an on-demand loss measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

Options

- **lsp-name**—Name of the associated bidirectional MPLS UHP LSP for which the loss measurement is performed.
- **detail**—(Optional) Display detailed output of the LSP loss measurement.
- **bytes**—(Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

**NOTE:** The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

- **count count**—(Optional) Specify the number of loss measurements to be carried out for the MPLS UHP LSP. For LSP loss measurement, the number of queries sent is the specified count number plus one additional query, because the LSP loss is measured using successive messages.
  - **Default:** 10
  - **Range:** 1 through 1000000
- **interval seconds**—(Optional) Specify in seconds the interval between two successive query messages.
  - **Range:** 1 through 255 seconds
**traffic-class traffic-class**—(Optional) Specify the traffic class and enable traffic-class-statistics for the LSP loss measurement.

Range: 0 though 7

monitor mpls loss-delay rsvp

Syntax

```
monitor mpls loss-delay rsvp lsp-name
<detail>
<bytes>
<count count>
<interval seconds>
<padding-size padding-size>
<traffi-class traffic-class>
```

Release Information
Command introduced in Junos OS Release 14.2.

Description
Perform a simultaneous on-demand loss and delay measurement using combined loss and delay messages, and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

Options

- **lsp-name**—Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed.
- **detail**—(Optional) Display detailed output of the LSP delay measurement.
- **bytes**—(Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

**NOTE:** The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

- **count count**—(Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.
  - **Default:** 10
  - **Range:** 1 through 1000000

- **interval seconds**—(Optional) Specify in seconds the interval between two successive query messages.
  - **Range:** 1 through 255 seconds
**padding-size padding-size**—(Optional) Specify the length of padding TLV to be included in the query message.

**Range:** 0 through 1500

**traffic-class traffic-class**—(Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.

**Range:** 0 though 7

**Required Privilege Level**

ping mpls bgp

Syntax

```
ping mpls bgp fec
   <bottom-label-ttl>
   <count count>
   <destination address>
   <detail>
   <exp forwarding-class>
   <instance routing-instance-name>
   <logical-system (all | logical-system-name)>
   <size bytes>
   <source source-address>
   <sweep>
```

Release Information

Command introduced in Junos OS Release 11.1.

Description

Check the operability of MPLS BGP-signaled label-switched path (LSP) connections. Press Ctrl+c to interrupt a `ping mpls bgp` command.

NOTE: The `ping mpls bgp fec` command only supports single paths.

Options

- **bottom-label-ttl**—(Optional) Time-to-live (TTL) value for the bottom label in the label stack. The range of values is 1 through 255. The default value is 255.

- **count count**—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

- **destination address**—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

- **detail**—(Optional) Display detailed information about the echo requests sent and received.

- **exp forwarding-class**—(Optional) Value of the forwarding class for the MPLS ping packets.

- **fec**—Ping a BGP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

- **instance routing-instance-name**—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on the specified logical system.

size bytes—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information
If the LSP changes, the label and interface information displayed when you issued the ping command continues to be used. You must configure MPLS at the [edit protocols mpls] hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only BGP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

NOTE: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

Required Privilege Level
network

List of Sample Output
ping mpls bgp fec count on page 3093

Output Fields
When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with
error codes are not counted in the received packets count. They are accounted for separately. To display the error codes, use the detail option (for example, ping mpls bgp 10.255.245.222 detail).

Sample Output

```
ping mpls bgp fec count
user@host> ping mpls bgp 10.255.245.222 count 10

!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received, 70% packet loss 4 packets received with error status, not counted as received.
```
ping mpls lsp-end-point

Syntax

```
ping mpls lsp-end-point prefix-name
  <count count>
  <destination address>
  <detail>
  <exp forwarding-class>
  <instance routing-instance-name>
  <logical-system (all | logical-system-name)>
  <size bytes>
  <source source-address>
  <sweep>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
The size and sweep options were introduced in Junos OS Release 9.6.
The instance option was introduced in Junos OS Release 10.0.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Check the operability of MPLS label-switched path (LSP) endpoint connections. Type Ctrl+c to interrupt a ping mpls command.

Options

count count—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination address—(Optional) Specify an address other than the default \(127.0.0.1/32\) for the ping echo requests. The address can be anything within the \(127/8\) subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp forwarding-class—(Optional) Value of the forwarding class for the MPLS ping packets.

instance routing-instance-name—(Optional) Ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP connection.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on the specified logical system.

prefix-name—LDP forwarding equivalence class (FEC) prefix or RSVP LSP endpoint address.
size bytes—(Optional) Size of the LSP ping request packet. If the endpoint is LDP-based, the minimum size of the packet is 88 bytes. If the endpoint is RSVP-based, the minimum size of the packet is 100 bytes. The maximum size in either case is 65468 bytes.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information
If the LSP changes, the label and interface information displayed when you issued the ping command continues to be used. You must configure MPLS at the [edit protocols mpls] hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

NOTE: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

<source source-address>
<sweep>
<v1>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
The size and sweep options were introduced in Junos OS Release 9.6.
The reply-mode option and its suboptions are introduced in Junos OS Release 10.4R1.

Description

Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a ping mpls l2circuit command.

NOTE: This command is not supported on EX4500 and EX4550 switches.

Options

**count count**—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination address**—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp forwarding-class**—(Optional) Value of the forwarding class for the MPLS ping packets.

**interface interface-name**—Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on the specified logical system.

reply-mode—(Optional) Reply mode for the ping request. This option has the following suboptions:

  application-level-control-channel—Reply using an application level control channel.

  ip-udp—Reply using an IPv4 or IPv6 UDP packet.

  no-reply—Do not reply to the ping request.

NOTE: The reply-mode option and its suboptions application-level-control-channel, ip-udp, and no-reply are also available in Junos OS Release 10.2R4 and 10.3R2.

size bytes—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes).

  Packets are 4-byte aligned. For example, if you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

v1—(Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV).

virtual-circuit virtual-circuit-id neighbor address—Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

Additional Information
You must configure MPLS at the [edit protocols mpls] hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

  <exp forwarding-class>
  <logical-system (all | logical-system-name)>
  reply-mode (application-level-control-channel | ip-udp | no-reply)
  <size bytes>
  <source source-address>
  <sweep>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
The size and sweep options were introduced in Junos OS Release 9.6.
The reply-mode option and its suboptions are introduced in Junos OS Release 10.4R1.

Description

Check the operability of MPLS Layer 2 virtual private network (VPN) connections. Type Ctrl+c to interrupt a ping mpls l2vpn command.

Options

bottom-label-ttl—(Optional) Display the time-to-live value for the bottom label in the label stack.

count count—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination address—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp forwarding-class—(Optional) Value of the forwarding class for the MPLS ping packets.

instance instance-name local-site-id local-site-id-number remote-site-id remote-site-id-number—Ping a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the ingress and egress provider edge (PE) routers or switches.
interface interface-name—Ping an interface configured for the Layer 2 VPN on the egress PE router or switch.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on the specified logical system.

reply-mode—(Optional) Reply mode for the ping request. This option has the following suboptions:

  application-level-control-channel—Reply using an application level control channel.
  ip-udp—Reply using an IPv4 or IPv6 UDP packet.
  no-reply—Do not reply to the ping request.

The reply-mode option and its suboptions application-level-control-channel, ip-udp, and no-reply are also available in Junos OS Release 10.2R4 and 10.3R2.

size bytes—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information
You must configure MPLS at the [edit protocols mpls] hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
The size and sweep options were introduced in Junos OS Release 9.6.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D30 for QFX Virtual Chassis and Virtual Chassis Fabric.

Description

Check the operability of a MPLS Layer 3 virtual private network (VPN) connection. Type Ctrl+c to interrupt a ping mpls l3vpn command.

Options

bottom-label-ttl—(Optional) Display the time-to-live value for the bottom label in the label stack.

count count—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination address—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp forwarding-class—(Optional) Value of the forwarding class for the MPLS ping packets.

l3vpn-name—(Optional) Layer 3 VPN name.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on the specified logical system.
**prefix prefix-name**—Ping to test whether a prefix is present in a provider edge (PE) router’s or switch’s VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix. This option does not test the connection between a PE router or switch and a customer edge (CE) router or switch.

**size bytes**—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

**source source-address**—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information
You must configure MPLS at the [edit protocols mpls] hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

If the Layer 3 VPN traffic transits a route reflector within the network, the `ping mpls l3vpn` command does not work.

**Required Privilege Level**
network

request mpls lsp adjust-autobandwidth
<logical-system (all | logical-system-name)>
<name lsp-name>
```

Syntax (EX and QFX Series Switches)

```xml
request mpls lsp adjust-autobandwidth
<name lsp-name>
```

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.5 for EX Series switches.
Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.

Description
Manually trigger a bandwidth allocation adjustment for active label-switched paths (LSPs).

Without running this command, the bandwidth adjustment is recomputed at a configurable interval. The default interval is 5 minutes. If you do not want to wait for the periodic adjustment (for example, during a software demonstration), this command is useful.

During bandwidth allocation adjustment, the LSP stays up to enable the bandwidth to be changed without dropping any traffic. This functionality is often referred to as make-before-break.

Options
none—Manually trigger a bandwidth allocation adjustment for all active LSP paths.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name lsp-name—(Optional) Manually trigger a bandwidth allocation adjustment on the specified LSP only.

Additional Information
For this command to work properly, the following conditions must exist:
• Automatic bandwidth allocation must be enabled on the LSP. The parameters for adjustment interval and maximum average bandwidth are not reset after you issue the `request mpls lsp adjust-autobandwidth` command.

• The difference between the adjusted bandwidth and the current LSP path bandwidth must be greater than the threshold limit.

**Required Privilege Level**
clear, maintenance

  <status>
```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.

Description
Display information about the configured circuit cross-connect (CCC) connections.

Options

**none**—Display the standard level of output for all configured CCC connections.

**all**—(Optional) Display all connections.

**brief | extensive**—(Optional) Display the specified level of output. Use history to display information about connection history. Use labels to display labels used for transmit and receive LSPs. Use status to display information about the connection and interface status.
**interface-switch**—(Optional) Display interface switch connections only.

**lsp-switch**—(Optional) Display LSP switch connections only.

**p2mp-receive-switch**—(Optional) Display point-to-multipoint LSP to local interfaces switch connections only.

**p2mp-transmit-switch**—(Optional) Display local interface to point-to-multipoint LSP switch connections only.

**remote-interface-switch**—(Optional) Display remote interface switch connections only.

**down | up | up-down**—(Optional) Display nonoperational, operational, or both kinds of connections.

**history**—(Optional) Display information about connection history.

**labels**—(Optional) Display labels used for transmit and receive.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name**—(Optional) Display information about the specified connection only.

**status**—(Optional) Display information about the connection and interface status.

show dynamic-tunnels database

Syntax

```
show dynamic-tunnels database
<destination>
<logical-system (all | logical-system-name)>
<table routing-table-name>
```

Release Information
Command introduced before Junos OS Release 7.4.

Description
Display dynamic tunnel database information.

Options

- **none**—Display dynamic tunnel database information for all destinations and routing tables.
- **destination**—(Optional) Display database entries for the specified IP address (with optional destination prefix length) only.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **table routing-table-name**—(Optional) Display database entries for the specified table only.

Required Privilege Level
view

List of Sample Output
- show dynamic-tunnels database (Tunnel Is Up) on page 3116
- show dynamic-tunnels database (No Tunnel PIC) on page 3116
- show dynamic-tunnels database (Tunnel Is Expiring) on page 3116
- show dynamic-tunnels database (Destination Specified) on page 3117
- show dynamic-tunnels database (Localization) on page 3117
- show dynamic-tunnels database (MPLS-over-UDP Dynamic Tunnels on PTX Series Routers and QFX Series Switches) on page 3117
- show dynamic-tunnels database (Segment Routing LSPs) on page 3118

Output Fields
- **Table 80 on page 3115** lists the output fields for the `show dynamic-tunnels database` command. Output fields are listed in the approximate order in which they appear.
### Table 80: show dynamic-tunnels database Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table</strong></td>
<td>Name of the routing table (for example, <em>inet.0</em>).</td>
</tr>
<tr>
<td><strong>Destination-network</strong></td>
<td>Destination IP address and subnet.</td>
</tr>
<tr>
<td><strong>Tunnel to</strong></td>
<td>Destination IP address and prefix of the tunnel.</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>State of the tunnel: <strong>Up</strong>, <strong>Up (expires in nnnnnoseconds)</strong>, or <strong>Dn</strong> (down).</td>
</tr>
<tr>
<td><strong>Reference count</strong></td>
<td>Number of routes across the dynamic tunnel that are currently being resolved.</td>
</tr>
<tr>
<td><strong>Next-hop type</strong></td>
<td>Type of tunnel: GRE or UDP (BGP-Signal).</td>
</tr>
<tr>
<td></td>
<td>- GRE or UDP (BGP signal)</td>
</tr>
<tr>
<td></td>
<td>- SRTE—Segment routing traffic-engineered LSP.</td>
</tr>
<tr>
<td><strong>Source address</strong></td>
<td>Source IP address of the tunnel.</td>
</tr>
<tr>
<td><strong>Next-hop</strong></td>
<td>IP address of the destination interface.</td>
</tr>
<tr>
<td><strong>VPN Label</strong></td>
<td>The label provided by the peer device to identify the VPN through which the packet needs to go. This label is used to identify the VRF for route lookup.</td>
</tr>
<tr>
<td><strong>Ingress Route</strong></td>
<td>The IGP route along with the corresponding metric that has been selected for forwarding the tunnel-encapsulated packet.</td>
</tr>
<tr>
<td><strong>Localized PFE</strong></td>
<td>Packet Forwarding Engine interface which is the anchor Packet Forwarding Engine for the localized next-hop-based dynamic tunnels.</td>
</tr>
<tr>
<td></td>
<td>When the anchor Packet Forwarding Engine of the tunnel goes down, it is represented by a # near the Packet Forwarding Engine name.</td>
</tr>
<tr>
<td><strong>LSP template name</strong></td>
<td>Name of the segment routing traffic-engineered template configured for dynamic creation of segment routing LSPs.</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>State of the destination interface: <strong>Up</strong>, <strong>Dn</strong>, or <strong>Dn (no tunnel pic)</strong>.</td>
</tr>
<tr>
<td><strong>Status</strong></td>
<td>Status of the dynamic segment routing LSP.</td>
</tr>
</tbody>
</table>
Sample Output

**show dynamic-tunnels database (Tunnel Is Up)**

<tr>
<td>System Identifier</td>
<td>Internal identifier for the peer. The range of values is 0 through 64,000.</td>
</tr>
<tr>
<td>Total bandwidth</td>
<td>Bandwidth resource, in bps or Mbps, on the TE-link learned from the routing process.</td>
</tr>
</tbody>
</table>
| Traffic parameters  | • Encoding—Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include SDH/SONET, Ethernet, and Packet.  
• Switching—Type of switching that can be performed on the traffic-engineered link: PSC-1 and Packet.  
• Granularity—Layer 2 data for switching Layer 2 LSPs for this resource. Not supported. This value is always unknown. |

**show mpls abstract-hop-membership**

**Syntax**

```
show mpls abstract-hop-membership
<abstract-hop-name>
<instance instance-name>
logical-system (all | logical-system-name)
```

**Release Information**

Command introduced in Junos OS Release 17.1 for all platforms.

**Description**

Display MPLS abstract hop membership tables for each abstract hop configured on the device.

**Options**

- `none`—(Optional) Display the MPLS abstract hop membership table for all the configured abstract hops on the router.

- `abstract-hop-name`—(Optional) Display the MPLS abstract hop membership table for the specified abstract hop.

- `instance instance-name`—(Optional) Display the MPLS abstract hop membership table for the specified instance. If `instance-name` is omitted, information is displayed for the master instance.

- `logical-system (all | logical-system-name)`—(Optional) Display the MPLS abstract hop membership table for all logical systems or on a particular logical system.

```
show mpls association

Syntax

```
show mpls association (iif incoming-interface | oif outgoing-interface)
<logical-system (all | logical-system-name)>
```

Release Information

Description
Display the Multiprotocol Label Switching (MPLS) label-switched paths (LSPs) based on the association with an incoming or outgoing LSP interface. The command output displays the list of RSVP-TE LSPs carrying traffic in and out of the same interface.

Options
- **iif incoming-interface-name**—Display list of RSVP-TE LSPs that share the specified incoming interface to bring in traffic. This option works on transit label-switching routers (LSRs) and egress label edge routers (LERs).
- **oif outgoing-interface-name**—Display list of RSVP-TE LSPs that share the specified outgoing interface to carry out traffic. This option works on ingress LERs and transit LSRs.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

```

Syntax (EX Series Switches)

```
show mpls call-admission-control
  <lsp-name>
```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.
instance instance-name option added in Junos OS Release 15.1.

Description
Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) call admission control (CAC) information.

Options
none—Display CAC information for all LSPs.

instance instance-name—(Optional) Display MPLS LSP CAC information for the specified instance. If instance-name is omitted, MPLS LSP CAC information for the master instance is displayed.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-name—(Optional) Display CAC information for the specified LSP only.

Additional Information
The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by any Layer 2 connection at that class type.

Release Information

Command introduced in Junos OS Release 14.2.
Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.

Description

Display information about configured and active Multiprotocol Label Switching (MPLS) container label-switched paths (LSPs).

Options

none—Display standard information about all configured and active member LSPs of the container LSP.

brief | detail | extensive | terse—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

count-active-routes—(Optional) Show active routes for the container LSP.

defaults—(Optional) Display the default settings of the container LSP.

descriptions—(Optional) Display the container LSP descriptions. To view this information, you must configure the description statement at the [edit protocol mpls container-lsp] hierarchy level. Only the LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

down | up—(Optional) Display only LSPs that are inactive or active, respectively.

egress—(Optional) Display the LSPs ending at this device.
NOTE: The **egress** option displays all the LSPs including regular LSPs, members of container LSPs, and transit LSPs. This is an expected behavior for all platforms.

**ingress**—(Optional) Display the member LSPs originating from this device.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name name**—(Optional) Display information about the specified LSP or group of LSPs.

**statistics**—(Optional) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

**transit**—(Optional) Display LSPs transiting this routing device.

**unidirectional**—(Optional) Display unidirectional LSP information.

**Required Privilege Level**

<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received RRO</td>
<td>Received record route.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>RRO is a series of hops, each with an address followed by a flag. In most cases, the received RRO is the same as the computed ERO. If the received RRO is different from the computed ERO, there is a topology change in the network, and the route is taking a detour.</td>
<td></td>
</tr>
</tbody>
</table>

The following flags identify the protection capability and status of the downstream node:

- 0x01—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the local protection flag was set in the SESSION_ATTRIBUTE object of the corresponding path message.
- 0x02—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).
- 0x03—Combination of 0x01 and 0x02.
- 0x04—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.
- 0x08—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the local protection available bit is set but the node protection bit is cleared.
- 0x09—Detour is established. Combination of 0x01 and 0x08.
- 0x10—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted.
- 0x20—Node ID. Indicates that the address specified in the RRO’s IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently.
- 0xb—Detour in use. Combination of 0x01, 0x02, and 0x08.

show mpls context-identifier

Syntax

```
show mpls context-identifier
  <brief | detail>
  <logical-system (all | logical-system-name)>
  <primary>;
  <protector>;
```

Release Information
Command introduced in Junos OS Release 11.4R3.

Description
Display information about configured egress protection context identifiers.

Options
none—Display standard information about egress protection.

brief | detail—(Optional) Display the specified level of output.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

primary—(Optional) Perform this operation on the primary node.

protector—(Optional) Perform this operation on the protector node.

```
show mpls correlation label

Syntax

```
show mpls correlation label label-value
<brief | detail | extensive | terse>
<descriptions>
<logical-system (all | logical-system-name)>
```

Release Information
Command introduced in Junos OS Release 15.2 for the M Series, MX Series, and T Series.

Description
Display the correlation information for the Multiprotocol Label Switching (MPLS) label-switched path (LSP) with the owner of the label.

Options

- **label-value**—Display information about the specified label.

- **brief | detail | extensive | terse**—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

- **descriptions**—(Optional) Display the LSP descriptions. To view this information, you must configure the description statement at the `edit protocol mpls lsp` hierarchy level. Only the LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Command introduced in Junos OS Release 9.5 for EX Series switches.
instance instance-name option added in Junos OS Release 15.1.

Description
Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) Differentiated Services (DiffServ) class and preemption priority information.

Options
none—Display DiffServ classes and priorities used by MPLS LSPs.

instance instance-name—(Optional) Display DiffServ classes and priorities used by MPLS LSPs for the specified instance. If instance-name is omitted, DiffServ information for the master instance is displayed.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

```
show mpls interface

Syntax

show mpls interface

Release Information
Command introduced in Junos OS Release 9.5 for EX Series switches.

Description
Display information about MPLS-enabled interfaces. MPLS is enabled on an interface when the interface is configured with both the `set protocols mpls interface interface-name` and `set interfaces interface-name unit 0 family mpls` commands.

Required Privilege Level
view

</table>
```
show mpls egress-protection

Syntax

```
show mpls egress-protection
  <brief | detail>
  <logical-system (all | logical-system-name)>
```

Release Information

Command introduced in Junos OS Release 11.4R3.

Description

Display information about egress protection.

**NOTE:** Use this command on the device configured as the protector PE router to display information about egress protection. If you use this command on the device configured as the primary PE router, no output is displayed.

Options

- **none**—Display standard information about egress protection.
- **brief | detail**—(Optional) Display the specified level of output.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

- **view**

**RELATED DOCUMENTATION**

- Example: Configuring MPLS Egress Protection for Layer 3 VPN Services
- Example: Configuring Layer 3 VPN Egress Protection with RSVP and LDP

**List of Sample Output**

List of Sample Output

show mpls interface on page 3172
**Output Fields**

Table 97 on page 3171 describes the output fields for the `show mpls interface` command. Output fields are listed in the approximate order in which they appear.

### Table 97: show mpls interface Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Name of the interface.</td>
</tr>
<tr>
<td>State</td>
<td>State of the interface: <strong>Up</strong> or <strong>Dn</strong> (down).</td>
</tr>
<tr>
<td>Administrative groups</td>
<td>Administratively assigned colors of the link.</td>
</tr>
<tr>
<td>Maximum labels</td>
<td>Maximum number of MPLS labels upon which MPLS can operate on a logical interface. This is configured using the <code>maximum-labels</code> statement at the <code>[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family mpls]</code> or the <code>[edit interfaces interface-name unit logical-unit-number family mpls]</code> hierarchy levels.</td>
</tr>
<tr>
<td>Static protection revert time</td>
<td>Time (in seconds) that a static LSP must wait before traffic reverts from the bypass path to the original path. This is configured using the <code>protection-revert-time</code> statement at the <code>[edit logical-systems logical-system-name protocols mpls interface interface-name static]</code> or the <code>[edit protocols mpls interface interface-name static]</code> hierarchy levels.</td>
</tr>
<tr>
<td>Always mark connection protection tlv</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong>: <strong>Enabled</strong> indicates that the <code>always-mark-connection-protection-tlv</code> statement is configured at the <code>[edit logical-systems logical-system-name protocols mpls interface interface-name static]</code> or the <code>[edit protocols mpls interface interface-name static]</code> hierarchy levels. When this statement is configured, it marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. To switch traffic to the bypass LSP, the <code>switch-away-lsps</code> statement must be configured.</td>
</tr>
</tbody>
</table>
Table 97: show mpls interface Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch away lsp</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong>: <strong>Enabled</strong> indicates that the <code>switch-away-lsps</code> statement is configured at the <code>[edit logical-systems logical-system-name protocols mpls interface interface-name static]</code> or the <code>[edit protocols mpls interface interface-name static]</code> hierarchy levels. This enables you to switch an LSP away from a network node using a bypass LSP. This feature can be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic.</td>
</tr>
</tbody>
</table>

---

**Sample Output**

*show mpls interface*

```
user@host> show mpls interface

Interface: ge-0/2/1.57
  State: Up
  Administrative group: <none>
  Maximum labels: 5
  Static protection revert time: 5 seconds
  Always mark connection protection tlv: Disabled
  Switch away lsps : Disabled
```
show mpls label usage

Syntax

show mpls label usage
  <label label value>
  <label-range range-startrange-end>
  <logical-system (all | logical-system-name)>

Release Information

Command introduced in Junos OS Release 15.1.
Support for the label statement added in Junos OS Release 17.2.
Support for the label-range statement added in Junos OS Release 17.2.

Description

Show the available label space resource in RPD and also the applications that use the label space in RPD. There are four different label spaces currently used in MPLS—namely LSI, dynamic, block, and static. Each label space has a fixed number and cannot grow beyond the fixed value. Using this command, the administrator can monitor the available labels in each label space and the applications that are using the labels. Based on the availability of labels, the administrator can decide to stop any service and free some labels or use other service where the labels are available.

Starting in Junos OS Release 17.2, you can configure the enhanced-ip command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability.

When you set each member router’s network services to enhanced-ip, only MPC or Modular Interface Cards (MICs) modules and Multiservices Dense Port Concentrator (MS-DPC) modules are powered on in the chassis. Non-service DPCs do not work with enhanced IP network services.

Options

none— Display the available labels in each label space and the applications using the labels.

label label value—(Optional) Display the information about which label value is used by which protocol, if any.

label-range range-start range-end —(Optional) Display the complete information about the label-range specified. With the enhanced-ip command enabled on the supported device, effective ranges and configured ranges along with details of different label spaces such as LSI, dynamic, block, and static types are displayed.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information
Once the label space crosses the threshold, a new syslog message is added.

<label-space-name> label space usage crossed threshold limit of 90%.

For instance, LSI label space usage crossed threshold limit of 90%.

show mpls label usage label-range

Syntax

show mpls label usage label-range
<block-label-range range-start range-end>
<dynamic-label-range range-start range-end>
<label-limit label-limit value>
<lsi-label-range range-start range-end>
<static-label-range range-start range-end>

Release Information
Command introduced in Junos OS Release 17.2.

Description
There are four different label spaces currently used in MPLS—namely LSI, dynamic, block, and static. Each label space has a fixed number and cannot grow beyond the fixed value. Using `show mpls label usage label-range` command, the administrator can monitor the available labels in each label space and the applications that are using the labels. Based on the availability of labels, the administrator can decide to stop any service and free some labels or use other service where the labels are available.

Starting in Junos OS Release 17.2, you can configure the `enhanced-ip` command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability.

When you set each member router’s network services to `enhanced-ip`, only MPC or Modular Interface Cards (MICs) modules and Multiservices Dense Port Concentrator (MS-DPC) modules are powered on in the chassis. Non-service DPCs do not work with enhanced IP network services.

Options

block-label-range range-start range-end — Display the details of block label type.

dynamic-label-range range-start range-end — Display the details of dynamic label type.

label-limit label-limit value — Limit for the number of concurrent active labels.

lsi-label-range range-start range-end — Display the details of LSI label type.

static-label-range range-start range-end — Display the details of static label type.

Release Information
Command introduced before Junos OS Release 7.4.
defaults option added in Junos OS Release 8.5.
Command introduced in Junos OS Release 9.5 for EX Series switches.
autobandwidth option added in Junos OS Release 11.4.
externally-controlled option added in Junos OS Release 12.3.
externally-provisioned option added in Junos OS Release 13.3.
Command introduced in Junos OS Release 13.2X51-D15 for QFX Series.
instance instance-name option added in Junos OS Release 15.1.

Description
Display information about configured and active dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

Options
none—Display standard information about all configured and active dynamic MPLS LSPs.

brief | detail | extensive | terse—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

In the extensive command output, the duplicate back-to-back messages are recorded as aggregated messages. An additional timestamp is included for these aggregated messages, where if the aggregated messages are five or less, timestamp deltas are recorded for each message, and if the aggregated messages are greater than five, the first and last timestamp is recorded.

For example:

- All timestamps

- Timestamp deltas

  9204 Jun 29 13:23:45.405 54.239.43.110: Explicit Route: bad strict route [3 times - 13:21:00, +1:01, +2:10]

- First and last timestamp
abstract-computation—(Optional) Display abstract computation preprocessing for LSPs.

See `show mpls lsp abstract-computation` for more details.

autobandwidth—(Optional) Display automatic bandwidth information. This option is explained separately (see `show mpls lsp autobandwidth`).

bidirectional | unidirectional—(Optional) Display bidirectional or unidirectional LSP information, respectively.

bypass—(Optional) Display LSPs used for protecting other LSPs.

count-active-routes—(Optional) Display active routes for LSPs.

defaults—(Optional) Display the MPLS LSP default settings.

descriptions—(Optional) Display the MPLS label-switched path (LSP) descriptions. To view this information, you must configure the description statement at the `[edit protocol mpls lsp]` hierarchy level. Only LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

down | up—(Optional) Display only LSPs that are inactive or active, respectively.

externally-controlled—(Optional) Display the LSPs that are under the control of an external Path Computation Element (PCE).

externally-provisioned—(Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

instance `instance-name`—(Optional) Display MPLS LSP information for the specified instance. If `instance-name` is omitted, MPLS LSP information is displayed for the master instance.

locally-provisioned—(Optional) Display LSPs that have been provisioned locally by the Path Computation Client (PCC).

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-type—(Optional) Display information about a particular LSP type:

- bypass—Sessions for bypass LSPs.
- egress—Sessions that terminate on this routing device.
- ingress—Sessions that originate from this routing device.
- **pop-and-forward**—Sessions that originate from RSVP-TE pop-and-forward LSP tunnels.
- **transit**—Sessions that pass through this routing device.

**name name**—(Optional) Display information about the specified LSP or group of LSPs.

**p2mp**—(Optional) Display information about point-to-multipoint LSPs.

**reverse-statistics**—(Optional) Display packet statistics for reverse direction of LSPs.

**segment**—(Optional) Display segment identifier (SID) labels.

**statistics**—(Optional) (Ingress and transit routers only) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

**NOTE:** If a bypass LSP is configured for the primary static LSP, display cumulative statistics of packets traversing through the protected LSP and bypass LSP when traffic is re-optimized when the protected LSP link is restored. (Bypass LSPs are not supported on QFX Series switches.)

When used with the **bypass** option (**show mpls lsp bypass statistics**), display statistics for the traffic that flows only through the bypass LSP.

**transit**—(Optional) Display LSPs transiting this routing device.

</table>
| **LSP Control Status**      | (Ingress LSP) LSP control mode:  
  • External—By default, all PCE-controlled LSPs are under external control. When an LSP is under external control, the PCC uses the PCE-provided parameters to set up the LSP.  
  • Local—A PCE-controlled LSP can come under local control. When the LSP switches from external control to local control, path computation is done using the CLI-configured parameters and constraint-based routing. Such a switchover happens only when there is a trigger to re-signal the LSP. Until then, the PCC uses the PCE-provided parameters to signal the PCE-controlled LSP, although the LSP remains under local control.  
  A PCE-controlled LSP switches to local control from its default external control mode in cases such as no connectivity to a PCE or when a PCE returns delegation of LSPs back to the PCC. | extensive       |

<tr>
<td>------------</td>
<td>------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td><strong>Received RRO</strong></td>
<td>(Ingress LSP) Received record route. A series of hops, each with an address followed by a flag. (In most cases, the received record route is the same as the computed explicit route. If Received RRO is different from Computed ERO, there is a topology change in the network, and the route is taking a detour.) The following flags identify the protection capability and status of the downstream node:</td>
<td>detail extensive</td>
</tr>
<tr>
<td>0x01—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the Local protection flag was set in the SESSION_ATTRIBUTE object of the corresponding Path message.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0x02—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0x03—Combination of 0x01 and 0x02.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0x04—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0x08—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the Local protection available bit is set but the Node protection bit is cleared.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0x09—Detour is established. Combination of 0x01 and 0x08.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0x10—Preemption pending. The preemping node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0x20—Node ID. Indicates that the address specified in the RRO’s IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0xb—Detour is in use. Combination of 0x01, 0x02, and 0x08.</td>
<td></td>

<td></td>
</tr>
</tbody>
</table>

The XML tag name of the `bandwidth` tag under the `auto-bandwidth` tag has been updated to `maximum-average-bandwidth`. You can see the new tag when you issue the `show mpls lsp extensive` command with the `| display xml` pipe option. If you have any scripts that use the `bandwidth` tag, ensure that they are updated to `maximum-average-bandwidth`.

**show mpls lsp abstract-computation**

**Syntax**

```
show mpls lsp abstract-computation
  <brief | detail | extensive>;
  <logical-system (all | logical-system-name)>;
  <name lsp-name>;
```

**Release Information**

Command introduced in Junos OS Release 17.1 for all platforms.

**Description**

Display the ingress to egress abstract hop computation used by the constrained shortest path in the preprocessing for LSPs. The command output displays the various computation passes involved per LSP, and the qualifying exit devices for each pass. It also displays the affinity per pass, and the current start device chosen for the pass.

**Options**

- **brief | detail | extensive**—(Optional) Display the desired level of output.

- **logical-system (all | logical-system-name)**—(Optional) Display the abstract computation for abstract hop constraints on all logical systems or on a particular logical system.

- **lsp-name**—(Optional) Name of the LSP for which the abstract hop computation is displayed.

**Required Privilege Level**

view

show mpls lsp autobandwidth

Syntax

```
show mpls lsp autobandwidth
  <brief | detail | extensive>
  <logical-system (all | logical-system-name)>
  <name lsp-name>
```

Release Information
Statement introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.  
Statement introduced in Junos OS Release 15.1X54–D60 for the ACX5000 Series.  
Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.  
Name lsp-name option introduced in Junos OS Release 18.1R1 for all platforms.

Description
Display automatic bandwidth information for the LSP(s).

After a Routing Engine switchover, the output of the `show mpls autobandwidth` command might not be up-to-date, as the automatic bandwidth information for the LSP(s) is gathered by the new master Routing Engine during the first adjustment interval.

Options
- **brief | detail | extensive** — (Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.
- **logical-system (all | logical-system-name)** — (Optional) Perform this operation on all logical systems or on a particular logical system.
- **name lsp-name** — (Optional) Specify name of the LSP for which the automatic bandwidth information should be displayed.

Output Fields

Table 102 on page 3210 describes the output fields for the `show mpls lsp autobandwidth` command. Output fields are listed in the approximate order in which they appear.

Table 102: show mpls lsp autobandwidth Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Destination (egress routing device) of the session.</td>
<td>All Levels</td>
</tr>
<tr>
<td>From</td>
<td>Source (ingress routing device) of the session.</td>
<td>All Levels</td>
</tr>
<tr>
<td>LSPname</td>
<td>Name of the LSP.</td>
<td>All Levels</td>
</tr>
<tr>
<td>Min BW</td>
<td>(Ingress LSP) Configured minimum value of the LSP, in bps.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Max BW</td>
<td>(Ingress LSP) Configured maximum value of the LSP, in bps.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Max AvgBW util</td>
<td>(Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Overflow limit</td>
<td>(Ingress LSP) Configured value of the threshold overflow limit.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Overflow sample count</td>
<td>(Ingress LSP) Current value for the overflow sample count.</td>

  <path-name>
```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.
`instance instance-name` option added in Junos OS Release 15.1.

Description
Display dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

Options
`none`—Display standard information about all MPLS LSPs.

`instance instance-name`—(Optional) Display the dynamic MPLS LSP for the specified instance. If `instance-name` is omitted, dynamic MPLS LSP for the master instance is displayed.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

`path-name`—(Optional) Display information about the specified LSP only.

show mpls path on page 3213

Output Fields
Table 103 on page 3213 describes the output fields for the `show mpls path` command. Output fields are listed in the approximate order in which they appear.

Table 103: `show mpls path` Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path name</td>
<td>Information about ingress LSPs. Each path has one line of output.</td>
</tr>
<tr>
<td>Address</td>
<td>Addresses of the routing devices that form the LSP.</td>
</tr>
<tr>
<td>Strict/loose address</td>
<td>Whether the address is a configured as a strict or loose address.</td>
</tr>
</tbody>
</table>

Sample Output

```
show mpls path

user@host> show mpls path

Path name     Address          Strict/loose address
p1             123.456.55.6     Strict
               123.456.1.6      Loose
p2             191.456.1.4     Strict
```
show mpls srlg

Syntax

```
show mpls srlg
<logical-systems (all | logical-system-name)>
```

Release Information
Command introduced before Junos OS Release 11.4.

Description
Display Shared Risk Link Group (SRLG) cost and value configuration information.

NOTE: If an SRLG is associated with a link that is used by an ingress LSP in the router, then on deleting the SRLG configuration from that router, the SRLG gets removed from the SRLG table only on the next reoptimization of the LSP. Until then, the output of the `run show mpls srlg` command displays `Unknown-XXX` instead of the SRLG name and a non zero srlg-cost for that SRLG.

Options

logical-system (all | logical-system-name)—(Optional) View SRLG configuration information for all logical systems or a particular logical system.

Required Privilege Level

show mpls static-lsp

Syntax

show mpls static-lsp
<brief | detail | extensive | terse>
<bypass>
<descriptions>
<down | up>
<ingress>
<instance instance-name>
<logical-system (all | logical-system-name)>
<lsp-type>
<name name>
<statistics>
<transit>

Release Information
Command introduced in Junos OS Release 10.1.
Command updated in Junos OS Release 14.1X53-D25 to accommodate the stitching feature of MPLS.
Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D30 for QFX Virtual Chassis and Virtual Chassis Fabric.

Description
Display information about configured and active static Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

Options
none—Display standard information about all configured and active static MPLS LSPs.

brief | detail | extensive | terse—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

bypass—(Optional) Display LSPs used for protecting other static LSPs.

descriptions—(Optional) Display the MPLS static LSP descriptions. To view this information, you must configure the description statement at the [edit protocols mpls static-label-switched-path path-name bypass], [edit protocols mpls static-label-switched-path path-name ingress], or [edit protocols mpls static-label-switched-path path-name transit incoming-label] hierarchy levels. Only static LSPs with a description are displayed.

down | up—(Optional) Display only static LSPs that are inactive or active, respectively.
instance instance-name—(Optional) Display information about all configured and active static MPLS LSPs for the specified routing instance. If instance-name is omitted, information about all configured and active static MPLS LSPs for the master instance is displayed.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-type—(Optional) Display information about a particular LSP type:

- bypass—Sessions for bypass LSPs.
- ingress—Sessions that originate from this routing device.
- transit—Sessions that pass through this routing device.

name name—(Optional) Display information about the specified static LSP or group of LSPs.

statistics—(Optional) Display accounting information about static LSPs.

transit—(Optional) Display static LSPs transiting this routing device.

**show route forwarding-table**

**Syntax**

```
show route forwarding-table
<detail | extensive | summary>
<ccc ccc-interface-name>
<destination>
<family family-name>
<label label>
<matching ip_prefix>
<multicast>
<vpn vpn>
```

**Release Information**
Command introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D30 for QFX Virtual Chassis and Virtual Chassis Fabric.

**Description**
Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**Options**
- **none**—Display the routes in the forwarding table.
- **detail | extensive | summary**—(Optional) Display the specified level of output.
- **ccc**—(Optional) Display the specified circuit cross-connect interface name for entries to match.
- **destination**—(Optional) Display the destination prefix.
- **family family-name**—(Optional) Display routing table entries for the specified family: ethernet-switching, inet, inet6, iso, mpls, vlan classification.
- **label label**—(Optional) Display route entries for the specified label name.
- **matching ip_prefix**—(Optional) Display route entries for the specified IP prefix.
- **multicast**—(Optional) Display route entries for multicast routes.
- **vpn vpn**—(Optional) Display route entries for the specified VPN.

Output Fields

Table 107 on page 3229 lists the output fields for the show route forwarding-table command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the detail keyword is used instead of the extensive keyword.

Table 107: show route forwarding-table Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Routing table</td>
<td>Name of the routing table (for example, inet, inet6, mpls).</td>
<td>All levels</td>
</tr>
<tr>
<td>Address family</td>
<td>Address family (for example, IP, IPv6, ISO, MPLS).</td>
<td>All levels</td>
</tr>
<tr>
<td>Destination</td>
<td>Destination of the route.</td>
<td>detail, extensive</td>
</tr>
</tbody>
</table>
Table 107: show route forwarding-table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
</table>
| Route Type (Type) | How the route was placed into the forwarding table. When the **detail** keyword is used, the route type might be abbreviated (as shown in parentheses):  
  - **cloned (clon)**—(TCP or multicast only) Cloned route.  
  - **destination (dest)**—Remote addresses directly reachable through an interface.  
  - **destination down (iddn)**—Destination route for which the interface is unreachable.  
  - **interface cloned (ifcl)**—Cloned route for which the interface is unreachable.  
  - **route down (ifdn)**—Interface route for which the interface is unreachable.  
  - **ignore (ignr)**—Ignore this route.  
  - **interface (intf)**—Installed as a result of configuring an interface.  
  - **permanent (perm)**—Routes installed by the kernel when the routing table is initialized.  
  - **user**—Routes installed by the routing protocol process or as a result of the configuration. | All levels |
| Route reference (RtRef) | Number of routes to reference. | **detail**, **extensive** |
| Flags | Route type flags:  
  - **none**—No flags are enabled.  
  - **accounting**—Route has accounting enabled.  
  - **cached**—Cache route.  
  - **incoming-iface interface-number**—Check against incoming interface.  
  - **prefix load balance**—Load balancing is enabled for this prefix.  
  - **sent to PFE**—Route has been sent to the Packet Forwarding Engine.  
  - **static**—Static route. | **extensive** |
| Nexthop | IP address of the next hop to the destination. | **detail**, **extensive** |
Table 107: show route forwarding-table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Next hop type</strong></td>
<td>Next-hop type. When the <strong>detail</strong> keyword is used, the next-hop type might be</td>
<td><strong>detail, extensive</strong></td>
</tr>
<tr>
<td><strong>(Type)</strong></td>
<td>abbreviated (as indicated in parentheses):</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>broadcast</strong> <em>(bcst)</em>—Broadcast.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>deny</strong>—Deny.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>hold</strong>—Next hop is waiting to be resolved into a unicast or multicast type.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>indexed</strong> <em>(idxd)</em>—Indexed next hop.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>indirect</strong> <em>(indr)</em>—Indirect next hop.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>local</strong> <em>(locl)</em>—Local address on an interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>routed multicast</strong> <em>(mcrt)</em>—Regular multicast next hop.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>multicast</strong> <em>(mcst)</em>—Wire multicast next hop (limited to the LAN).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>multicast discard</strong> <em>(mdsc)</em>—Multicast discard.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>multicast group</strong> <em>(mgrp)</em>—Multicast group member.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>receive</strong> <em>(recv)</em>—Receive.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>reject</strong> <em>(rjct)</em>—Discard. An ICMP unreachable message was sent.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>resolve</strong> <em>(rslv)</em>—Resolving the next hop.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>unicast</strong> <em>(ucst)</em>—Unicast.</td>
<td></td>

List of Syntax
Syntax on page 3239
Syntax (EX Series Switches, QFX Series Switches) on page 3239

Syntax

```
show route table routing-table-name
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

Syntax (EX Series Switches, QFX Series Switches)

```
show route table routing-table-name
<brief | detail | extensive | terse>
```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Show route table evpn statement introduced in Junos OS Release 15.1X53-D30 for QFX Series switches.

Description
Display the route entries in a particular routing table.

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Routing-table-name—Display route entries for all routing tables whose names begin with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route table inet command).

Required Privilege Level
view

Output Fields

Table 108 on page 3241 describes the output fields for the show route table command. Output fields are listed in the approximate order in which they appear.
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routing-table-name</td>
<td>Name of the routing table (for example, inet.0).</td>
</tr>
<tr>
<td>Restart complete</td>
<td>All protocols have restarted for this routing table.</td>
</tr>
<tr>
<td></td>
<td>Restart state:</td>
</tr>
<tr>
<td></td>
<td>• Pending: protocol-name—List of protocols that have not yet completed graceful restart for this routing table.</td>
</tr>
<tr>
<td></td>
<td>• Complete—All protocols have restarted for this routing table.</td>
</tr>
<tr>
<td></td>
<td>For example, if the output shows-</td>
</tr>
<tr>
<td></td>
<td>• LDP.inet.0 : 5 routes (4 active, 1 holddown, 0 hidden)</td>
</tr>
<tr>
<td></td>
<td>Restart Pending: OSPF LDP VPN</td>
</tr>
<tr>
<td></td>
<td>This indicates that OSPF, LDP, and VPN protocols did not restart for the LDP.inet.0 routing table.</td>
</tr>
<tr>
<td></td>
<td>• vpls_1.12vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)</td>
</tr>
<tr>
<td></td>
<td>Restart Complete</td>
</tr>
<tr>
<td></td>
<td>This indicates that all protocols have restarted for the vpls_1.12vpn.0 routing table.</td>
</tr>
<tr>
<td>number destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
</tr>
<tr>
<td>number routes</td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
</tr>
<tr>
<td></td>
<td>• active (routes that are active)</td>
</tr>
<tr>
<td></td>
<td>• holddown (routes that are in the pending state before being declared inactive)</td>
</tr>
<tr>
<td></td>
<td>• hidden (routes that are not used because of a routing policy)</td>
</tr>
</tbody>
</table>
Table 108: show route table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-destination (entry, announced)</td>
<td>Route destination (for example: 10.0.0.1/24). The <strong>entry</strong> value is the number of routes for this destination, and the <strong>announced</strong> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</td>
</tr>
<tr>
<td></td>
<td>• <strong>MPLS-label</strong> (for example, 80001).</td>
</tr>
<tr>
<td></td>
<td>• <strong>interface-name</strong> (for example, ge-1/0/2).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address</strong>:control-word-status:encapsulation type:vc-id:source** (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address</strong>—Address of the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>control-word-status</strong>—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord.</td>
</tr>
<tr>
<td></td>
<td>• <strong>encapsulation type</strong>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</td>
</tr>
<tr>
<td></td>
<td>• <strong>vc-id</strong>—Virtual circuit identifier.</td>
</tr>
<tr>
<td></td>
<td>• <strong>source</strong>—Source of the advertisement: Local or Remote.</td>
</tr>
<tr>
<td></td>
<td>• <strong>inclusive multicast Ethernet tag route</strong>—Type of route destination represented by (for example, 3:100.100.100.10::0:10::100.100.100.10/384):</td>
</tr>
<tr>
<td></td>
<td>• <strong>route distiguisher</strong>—(8 octets) Route distiguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Ethernet tag ID</strong>—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>IP address length</strong>—(1 octet) Length of IP address in bits.</td>
</tr>
<tr>
<td></td>
<td>• <strong>originating router's IP address</strong>—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.</td>
</tr>
<tr>
<td>label stacking</td>
<td>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</td>
</tr>
<tr>
<td></td>
<td>• <strong>S=0 route</strong> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</td>
</tr>
<tr>
<td></td>
<td>• If there is no <strong>S=</strong> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</td>
</tr>
</tbody>
</table>
Table 108: show route table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[protocol, preference]</td>
<td>Protocol from which the route was learned and the preference value for the route.</td>
</tr>
<tr>
<td></td>
<td>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</td>
</tr>
<tr>
<td></td>
<td>• -—A hyphen indicates the last active route.</td>
</tr>
<tr>
<td></td>
<td>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</td>
</tr>
<tr>
<td></td>
<td>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1’s complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</td>
</tr>
<tr>
<td>Level</td>
<td>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</td>
</tr>
<tr>
<td>Route Distinguisher</td>
<td>IP subnet augmented with a 64-bit prefix.</td>
</tr>
<tr>
<td>PMSI</td>
<td>Provider multicast service interface (MVPN routing table).</td>
</tr>
<tr>
<td>Next-hop type</td>
<td>Type of next hop. For a description of possible values for this field, see Table 109 on page 3248.</td>
</tr>
<tr>
<td>Next-hop reference count</td>
<td>Number of references made to the next hop.</td>
</tr>
<tr>
<td>Flood nexthop branches exceed maximum message</td>
<td>Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.</td>
</tr>
<tr>
<td>Source</td>
<td>IP address of the route source.</td>
</tr>
<tr>
<td>Next hop</td>
<td>Network layer address of the directly reachable neighboring system.</td>
</tr>
</tbody>
</table>
### Table 108: show route table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>via</strong></td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <strong>Selected</strong>. This field can also contain the following information:</td>
</tr>
<tr>
<td></td>
<td>• Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td></td>
<td>• Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</td>
</tr>
<tr>
<td><strong>Label-switched-path</strong></td>
<td>Name of the LSP used to reach the next hop.</td>
</tr>
<tr>
<td><strong>lsp-path-name</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Label operation</strong></td>
<td>MPLS label and operation occurring at this routing device. The operation can be <strong>pop</strong> (where a label is removed from the top of the stack), <strong>push</strong> (where another label is added to the label stack), or <strong>swap</strong> (where a label is replaced by another label).</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>(Local only) Local interface name.</td>
</tr>
<tr>
<td><strong>Protocol next hop</strong></td>
<td>Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.</td>
</tr>
<tr>
<td><strong>Indirect next hop</strong></td>
<td>Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>State of the route (a route can be in more than one state). See Table 110 on page 3249.</td>
</tr>
<tr>
<td><strong>Local AS</strong></td>
<td>AS number of the local routing devices.</td>
</tr>
<tr>
<td><strong>Age</strong></td>
<td>How long the route has been known.</td>
</tr>
<tr>
<td><strong>AIGP</strong></td>
<td>Accumulated interior gateway protocol (AIGP) BGP attribute.</td>
</tr>
<tr>
<td><strong>Metricn</strong></td>
<td>Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.</td>
</tr>
<tr>
<td><strong>MED-plus-IGP</strong></td>
<td>Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.</td>
</tr>
<tr>
<td>Field Name</td>
<td>Field Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TTL-Action</td>
<td>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</td>
</tr>
<tr>
<td>Task</td>
<td>Name of the protocol that has added the route.</td>
</tr>
</tbody>
</table>
| Announcement bits    | The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, n-Resolve inet indicates that the specified route is used for route resolution for next hops found in the routing table.  
  • n—An index used by Juniper Networks customer support only. |
| AS path              | AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:                                                                 |
  • I—IGP.                                                                   |
  • E—EGP.                                                                   |
  • Recorded—The AS path is recorded by the sample process (sampled).        |
  • ?—Incomplete; typically, the AS path was aggregated.                     |
  When AS path numbers are included in the route, the format is as follows: |
  • [ ]—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893. |
  • []—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. |
  • {}—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. |
  • ()—Parentheses enclose a confederation.                                  |
  • ( [])—Parentheses and brackets enclose a confederation set.              |

NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.
### Table 108: show route table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validation-state</td>
<td>(BGP-learned routes) Validation status of the route:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Invalid</strong>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Unknown</strong>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Unverified</strong>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Valid</strong>—Indicates that the prefix and autonomous system pair are found in the database.</td>
</tr>
<tr>
<td>FECs bound to route</td>
<td>Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.</td>
</tr>
<tr>
<td>Primary Upstream</td>
<td>When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.</td>
</tr>
<tr>
<td>RPF Nexthops</td>
<td>When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.</td>
</tr>
<tr>
<td>Label</td>
<td>Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.</td>
</tr>
<tr>
<td>weight</td>
<td>Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td>VC Label</td>
<td>MPLS label assigned to the Layer 2 circuit virtual connection.</td>
</tr>
<tr>
<td>MTU</td>
<td>Maximum transmission unit (MTU) of the Layer 2 circuit.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>VLAN identifier of the Layer 2 circuit.</td>
</tr>
<tr>
<td>Prefixes bound to route</td>
<td>Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.</td>
</tr>
</tbody>
</table>
Table 108: show route table Output Fields *(continued)*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communities</td>
<td>Community path attribute for the route. See Table 111 on page 3252 for all possible values for this field.</td>
</tr>
<tr>
<td>Layer2-info: encaps</td>
<td>Layer 2 encapsulation (for example, VPLS).</td>
</tr>
<tr>
<td>control flags</td>
<td>Control flags: <em>none</em> or Site Down.</td>
</tr>
<tr>
<td>mtu</td>
<td>Maximum transmission unit (MTU) information.</td>
</tr>
<tr>
<td>Label-Base, range</td>
<td>First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.</td>
</tr>
<tr>
<td>status vector</td>
<td>Layer 2 VPN and VPLS network layer reachability information (NLRI).</td>
</tr>
<tr>
<td>Accepted Multipath</td>
<td>Current active path when BGP multipath is configured.</td>
</tr>
<tr>
<td>Accepted LongLivedStale</td>
<td>The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</td>
</tr>
<tr>
<td>Accepted LongLivedStaleImport</td>
<td>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</td>
</tr>
<tr>
<td>ImportAccepted MulipathContrib</td>
<td>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</td>
</tr>
<tr>
<td>ImportAccepted LongLivedStaleImport</td>
<td>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</td>
</tr>
<tr>
<td>Accepted MultipathContrib</td>
<td>Path currently contributing to BGP multipath.</td>
</tr>
<tr>
<td>Localpref</td>
<td>Local preference value included in the route.</td>
</tr>
<tr>
<td>Router ID</td>
<td>BGP router ID as advertised by the neighbor in the open message.</td>
</tr>
</tbody>
</table>
### Table 108: show route table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Routing Table</td>
<td>In a routing table group, the name of the primary routing table in which the route resides.</td>
</tr>
<tr>
<td>Secondary Tables</td>
<td>In a routing table group, the name of one or more secondary tables in which the route resides.</td>
</tr>
</tbody>
</table>

Table 109 on page 3248 describes all possible values for the Next-hop Types output field.

### Table 109: Next-hop Types Output Field Values

<table>
<thead>
<tr>
<th>Next-Hop Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Broadcast (bcast)</td>
<td>Broadcast next hop.</td>
</tr>
<tr>
<td>Deny</td>
<td>Deny next hop.</td>
</tr>
<tr>
<td>Discard</td>
<td>Discard next hop.</td>
</tr>
<tr>
<td>Flood</td>
<td>Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.</td>
</tr>
<tr>
<td>Hold</td>
<td>Next hop is waiting to be resolved into a unicast or multicast type.</td>
</tr>
<tr>
<td>Indexed (idxd)</td>
<td>Indexed next hop.</td>
</tr>
<tr>
<td>Indirect (indr)</td>
<td>Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.</td>
</tr>
<tr>
<td>Interface</td>
<td>Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.</td>
</tr>
<tr>
<td>Local (locl)</td>
<td>Local address on an interface. This next-hop type causes packets with this destination address to be received locally.</td>
</tr>
<tr>
<td>Multicast (mcst)</td>
<td>Wire multicast next hop (limited to the LAN).</td>
</tr>
<tr>
<td>Multicast discard (mdsc)</td>
<td>Multicast discard.</td>
</tr>
</tbody>
</table>

Table 109: Next-hop Types Output Field Values (continued)

<table>
<thead>
<tr>
<th>Next-Hop Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multicast group (mgrp)</td>
<td>Multicast group member.</td>
</tr>
<tr>
<td>Receive (recv)</td>
<td>Receive.</td>
</tr>
<tr>
<td>Reject (rjct)</td>
<td>Discard. An ICMP unreachable message was sent.</td>
</tr>
<tr>
<td>Resolve (rslv)</td>
<td>Resolving next hop.</td>
</tr>
<tr>
<td>Routed multicast (mcrt)</td>
<td>Regular multicast next hop.</td>
</tr>
<tr>
<td>Router</td>
<td>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</td>
</tr>
</tbody>
</table>

To qualify as a next-hop type router, the route must meet the following criteria:

- Must not be a direct or local subnet for the routing device.
- Must have a next hop that is directly connected to the routing device.

| Table                          | Routing table next hop.                                                   |
| Unicast (ucst)                 | Unicast.                                                                  |
| Unilist (ulst)                 | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list. |

Table 110 on page 3249 describes all possible values for the State output field. A route can be in more than one state (for example, `<Active NoReadvrt Int Ext>`).

Table 110: State Output Field Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounting</td>
<td>Route needs accounting.</td>
</tr>
<tr>
<td>Active</td>
<td>Route is active.</td>
</tr>
<tr>
<td>Always Compare MED</td>
<td>Path with a lower multiple exit discriminator (MED) is available.</td>
</tr>
<tr>
<td>AS path</td>
<td>Shorter AS path is available.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cisco Non-deterministic MED selection</td>
<td>Cisco nondeterministic MED is enabled, and a path with a lower MED is available.</td>
</tr>
<tr>
<td>Clone</td>
<td>Route is a clone.</td>
</tr>
<tr>
<td>Cluster list length</td>
<td>Length of cluster list sent by the route reflector.</td>
</tr>
<tr>
<td>Delete</td>
<td>Route has been deleted.</td>
</tr>
<tr>
<td>Ex</td>
<td>Exterior route.</td>
</tr>
<tr>
<td>Ext</td>
<td>BGP route received from an external BGP neighbor.</td>
</tr>
<tr>
<td>FlashAll</td>
<td>Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.</td>
</tr>
<tr>
<td>Hidden</td>
<td>Route not used because of routing policy.</td>
</tr>
<tr>
<td>IfCheck</td>
<td>Route needs forwarding RPF check.</td>
</tr>
<tr>
<td>IGP metric</td>
<td>Path through next hop with lower IGP metric is available.</td>
</tr>
<tr>
<td>Inactive reason</td>
<td>Flags for this route, which was not selected as best for a particular destination.</td>
</tr>
<tr>
<td>Initial</td>
<td>Route being added.</td>
</tr>
<tr>
<td>Int</td>
<td>Interior route.</td>
</tr>
<tr>
<td>Int Ext</td>
<td>BGP route received from an internal BGP peer or a BGP confederation peer.</td>
</tr>
<tr>
<td>Interior &gt; Exterior &gt; Exterior via Interior</td>
<td>Direct, static, IGP, or EBGP path is available.</td>
</tr>
<tr>
<td>Local Preference</td>
<td>Path with a higher local preference value is available.</td>
</tr>
<tr>
<td>Martian</td>
<td>Route is a martian (ignored because it is obviously invalid).</td>
</tr>
<tr>
<td>MartianOK</td>
<td>Route exempt from martian filtering.</td>
</tr>
</tbody>
</table>
Table 110: State Output Field Values (continued)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Next hop address</td>
<td>Path with lower metric next hop is available.</td>
</tr>
<tr>
<td>No difference</td>
<td>Path from neighbor with lower IP address is available.</td>
</tr>
<tr>
<td>NoReadvrt</td>
<td>Route not to be advertised.</td>
</tr>
<tr>
<td>NotBest</td>
<td>Route not chosen because it does not have the lowest MED.</td>
</tr>
<tr>
<td>Not Best in its group</td>
<td>Incoming BGP AS is not the best of a group (only one AS can be the best).</td>
</tr>
<tr>
<td>NotInstall</td>
<td>Route not to be installed in the forwarding table.</td>
</tr>
<tr>
<td>Number of gateways</td>
<td>Path with a greater number of next hops is available.</td>
</tr>
<tr>
<td>Origin</td>
<td>Path with a lower origin code is available.</td>
</tr>
<tr>
<td>Pending</td>
<td>Route pending because of a hold-down configured on another route.</td>
</tr>
<tr>
<td>Release</td>
<td>Route scheduled for release.</td>
</tr>
<tr>
<td>RIB preference</td>
<td>Route from a higher-numbered routing table is available.</td>
</tr>
<tr>
<td>Route Distinguisher</td>
<td>64-bit prefix added to IP subnets to make them unique.</td>
</tr>
<tr>
<td>Route Metric or MED comparison</td>
<td>Route with a lower metric or MED is available.</td>
</tr>
<tr>
<td>Route Preference</td>
<td>Route with lower preference value is available.</td>
</tr>
<tr>
<td>Router ID</td>
<td>Path through a neighbor with lower ID is available.</td>
</tr>
<tr>
<td>Secondary</td>
<td>Route not a primary route.</td>
</tr>
<tr>
<td>Unusable path</td>
<td>Path is not usable because of one of the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• The route is damped.</td>
</tr>
<tr>
<td></td>
<td>• The route is rejected by an import policy.</td>
</tr>
<tr>
<td></td>
<td>• The route is unresolved.</td>
</tr>
<tr>
<td>Update source</td>
<td>Last tiebreaker is the lowest IP address value.</td>
</tr>
</tbody>
</table>

**Table 111 on page 3252** describes the possible values for the Communities output field.
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>area-number</code></td>
<td>4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.</td>
</tr>
<tr>
<td><code>bandwidth: local AS number:link-bandwidth-number</code></td>
<td>Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.</td>
</tr>
<tr>
<td><code>domain-id</code></td>
<td>Unique configurable number that identifies the OSPF domain.</td>
</tr>
<tr>
<td><code>domain-id-vendor</code></td>
<td>Unique configurable number that further identifies the OSPF domain.</td>
</tr>
<tr>
<td><code>link-bandwidth-number</code></td>
<td>Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).</td>
</tr>
<tr>
<td><code>local AS number</code></td>
<td>Local AS number: from 1 through 65,535.</td>
</tr>
<tr>
<td><code>options</code></td>
<td>1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.</td>
</tr>
<tr>
<td><code>origin</code></td>
<td>(Used with VPNs) Identifies where the route came from.</td>
</tr>
<tr>
<td><code>ospf-route-type</code></td>
<td>1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.</td>
</tr>
<tr>
<td><code>route-type-vendor</code></td>
<td>Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000. The format is area-number:ospf-route-type:options.</td>
</tr>
<tr>
<td><code>rte-type</code></td>
<td>Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306. The format is area-number:ospf-route-type:options.</td>
</tr>
<tr>
<td><code>target</code></td>
<td>Defines which VPN the route participates in; target has the format 32-bit IP address:16-bit number. For example, 10.19.0.0:100.</td>
</tr>
<tr>
<td><code>unknown IANA</code></td>
<td>Incoming IANA codes with a value between 0x1 and 0x7ff. This code of the BGP extended community attribute is accepted, but it is not recognized.</td>
</tr>
</tbody>
</table>
Table 111: Communities Output Field Values (continued)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unknown OSPF vendor community</td>
<td>Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized.</td>
</tr>
<tr>
<td>evpn-mcast-flags</td>
<td>Identifies the value in the multicast flags extended community and whether snooping is enabled. A value of 0x1 indicates that the route supports IGMP proxy.</td>
</tr>
<tr>
<td>evpn-l2-info</td>
<td>Identifies whether Multihomed Proxy MAC and IP Address Route Advertisement is enabled. A value of 0x20 indicates that the proxy bit is set. Use the <code>show bridge mac-ip-table extensive</code> statement to determine whether the MAC and IP address route was learned locally or from a PE device.</td>
</tr>

List of Syntax
Syntax on page 3295
Syntax (EX Series Switches) on page 3295

Syntax

```plaintext
show ted database
<brief | detail | extensive>
<instance instance-name>
<logical-system (all | logical-system-name)>
<system-name>
<topology-id topology bgp-ls-epe>
```

Syntax (EX Series Switches)

```plaintext
show ted database
<brief | detail | extensive>
<system-name>
```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.
instance instance-name option added in Junos OS Release 15.1.
topology-id topology option added in Junos OS Release 17.4R1 for MX Series and PTX Series.

Description
Display the entries in the Multiprotocol Label Switching (MPLS) traffic engineering database.

Options
none—Display standard information about all entries in the traffic engineering database.

brief | detail | extensive—(Optional) Display the specified level of output.

instance instance-name—(Optional) Display routing instance information for the specified instance. If instance-name is omitted, information is displayed for the master instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

system-name—(Optional) Display traffic engineering database information for a particular system.

topology-id topology—Display the topology information. By default, traffic engineering topology information is displayed.

**Output Fields**

Table 112 on page 3296 describes the output fields for the `show ted database` command. Output fields are listed in the approximate order in which they appear.

**Table 112: show ted database Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>TED database</td>
<td>Number of nodes and pseudonodes participating in IS-IS and OSPF domain routing.</td>
<td>All levels</td>
</tr>
<tr>
<td>ID</td>
<td>Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode. If the node contains a router ID, it is displayed in parentheses.</td>
<td>brief</td>
</tr>
<tr>
<td>NodeID</td>
<td>Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.</td>
<td>extensive</td>
</tr>
<tr>
<td>Type</td>
<td>Type of node. It can be either Rtr (router) or Net (pseudonode).</td>
<td>All levels</td>
</tr>
<tr>
<td>Age(s)</td>
<td>How long since the node was last refreshed, in seconds.</td>
<td>All levels</td>
</tr>
<tr>
<td>Lnkln</td>
<td>Number of nodes pointing toward this node.</td>
<td>All levels</td>
</tr>
<tr>
<td>LnkOut</td>
<td>Number of nodes to which this node points.</td>
<td>All levels</td>

show ted link

List of Syntax
Syntax on page 3307
Syntax (EX Series Switches) on page 3307

Syntax

```
show ted link
<brief | detail>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

Syntax (EX Series Switches)

```
show ted link
<brief | detail>
```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.
instance instance-name option added in Junos OS Release 15.1.

Description
Display Multiprotocol Label Switching (MPLS) traffic engineering database link information.

Options
none—Display standard information about traffic engineering database link information.

brief | detail—(Optional) Display the specified level of output.

instance instance-name—(Optional) Display routing instance information for the specified instance. If instance-name is omitted, information is displayed for the master instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

Syntax (EX Series Switches)

show ted protocol
  <brief | detail>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.
instance instance-name option added in Junos OS Release 15.1.

Description
Display information about the protocols from which the Multiprotocol Label Switching (MPLS) traffic engineering database learned about its nodes.

Options

none—Display standard information about the protocols from which the traffic engineering database learned about its nodes.

brief | detail—(Optional) Display the specified level of output.

instance instance-name—(Optional) Display routing instance information for the specified instance. If instance-name is omitted, information is displayed for the master instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

traceroute mpls bgp

Syntax

traceroute mpls bgp fec
<destination destination-address>
<detail>
<exp exp>
<fanout fanout-number>
<logical-system logical system-name>
<no-resolve>
<paths paths-number>
<pipe-mode>
<retries retries-number>
<routing-instance routing-instance-name>
<source source-address>
<ttl value>
<wait seconds>

Release Information
Command introduced in Junos OS Release 14.2.

Description
Trace route to a remote host for an MPLS label-switched path (LSP) signaled by the Border Gateway Protocol (BGP). Use traceroute mpls bgp as a debugging tool to locate MPLS BGP forwarding issues in a network. (Currently supported for IPv4 packets only.)

To use the traceroute mpls bgp command, make sure you have BGP routes with MPLS labels.

NOTE: The traceroute mpls bgp fec command only supports single paths.

Options
fec—Specify the IP address and optional prefix of the forwarding equivalence class (FEC). Suppose you are at PE1, use would want to use the IP address of PE2 to trace the BGP path to that router.

destination destination-address—(Optional) Specify the destination address to use when sending probes.

detail—(Optional) Display detailed output.

exp exp—(Optional) Specify the class of service to use when sending probes.

Range: 0 through 7
Default: 7
fanout fanout-number—(Optional) Specify the maximum number of next hops to search per node.
    Range: 1 through 16
    Default: 16

logical-system logical-system-name—(Optional) Specify the name of the logical system for the traceroute attempt.

no-resolve—(Optional) Specify not to resolve the hostname that corresponds to the IP address.

paths paths-number—(Optional) Specify the number of paths to search.
    Range: 1 through 255
    Default: 16

pipe-mode—(Optional) Specify to trace only the outermost FEC.

retries retries-number—(Optional) Specify the number of times to resend probe values.
    Range: 1 through 9
    Default: 3

routing-instance routing-instance-name—(Optional) Specify the name of the routing instance for the trace route attempt.

source source-address—(Optional) Specify the source address of the outgoing traceroute packets.

ttl value—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.
    Range: 1 through 125
    Default: 64

wait seconds—(Optional) Specify the number of seconds to wait before resending a probe.
    Range: 5 though 15
    Default: 10

Required Privilege Level
network

transit (Chained Composite Next Hops)

Syntax

transit {
    (all | no-all);
    (l2vpn | no-l2vpn);
    (l3vpn | no-l3vpn);
    (labeled-bgp | no-labeled-bgp);
    (ldp | no-ldp);
    (ldp-p2mp | no-ldp-p2mp);
    lsp-statistics-from-route;
    (rsvp | no-rsvp);
    (rsvp-p2mp | no-rsvp-p2mp);
    (static | no-static);
}

Hierarchy Level

[edit logical-systems logical-system-name routing-options forwarding-table chained-composite-next-hop],
[edit routing-options forwarding-table chained-composite-next-hop]

NOTE: The [edit logical-systems] hierarchy level is not supported on the QFX10000 switches.

Release Information

Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 15.1 for QFX10000 Series switches.

Description

Allows you to configure the chained composite next hops transit configuration options for devices handling transit traffic in the network. This statement and the associated functionality is available only on PTX Packet Transport Routers and QFX10000 switches.

Default

All of the transit statement options are enabled on PTX transport routers and QFX10000 switches. However, you can disable any of the statements with a no option.

Starting in Junos OS Release 14.1, the transit l3vpn statement is enabled by default on PTX Series Packet Transport Routers only.

Options
**all | no-all**—Enable or disable chained composite next-hops for all of the possible packet transit protocols and applications. The **all | no-all** statements do not apply to the **lsp-statistics-from-route** statement.

**l2vpn | no-l2vpn**—Enable or disable chained composite next-hops for Layer 2 VPNs.

**l3vpn | no-l3vpn**—Enable or disable chained composite next-hops for Layer 3 VPNs.

**labeled-bgp | no-labeled-bgp**—Enable or disable chained composite next-hops for labeled BGP.

**ldp | no-ldp**—Enable or disable chained composite next-hops for LDP.

**ldp-p2mp | no-ldp-p2mp**—Enable or disable chained composite next-hops for LDP-signaled P2MP LSPs.

**NOTE:** The **ldp-p2mp** and **rsvp-p2mp** statements are not supported on MX series routers.

On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the **ldp-p2mp** and **rsvp-p2mp** statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current master logical system to fail at the time of a Routing Engine switchover.

**lsp-statistics-from-route**—Enable LSP statistics collection from the route.

**rsvp | no-rsvp**—Enable or disable chained composite next-hops for RSVP.

**rsvp-p2mp | no-rsvp-p2mp**—Enable or disable chained composite next-hops for RSVP-signaled P2MP LSPs.

**NOTE:** The **ldp-p2mp** and **rsvp-p2mp** statements are not supported on MX series routers.

On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the **rsvp-p2mp** and **ldp-p2mp** statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current master logical system to fail at the time of a Routing Engine switchover.

**static | no-static**—Chained composite next hops are enabled for transit static LSPs by default. You can also disable this functionality for transit static LSPs.

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

  <gracefully>
  <lsp-id identifier>
  <name name>
  <optimize-fast-reroute>
  <tunnel-id identifier>
```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

Description
Reset and restart Resource Reservation Protocol (RSVP) sessions.

Options
all—Clear all RSVP sessions for which this routing device is the ingress, transit, or egress routing device.

connection-source address—(Optional) Source address for GMPLS and MPLS LSPs from the RSVP sender template.
connection-destination address—(Optional) Destination address for GMPLS and MPLS LSPs from the RSVP sender template.

generously—(Optional) Gracefully reset an RSVP session for a nonpacket LSP in two passes. In the first pass, the Admin-Status object is signaled along the path to the other endpoint of the RSVP session. In the second pass, the path used by the RSVP session is torn down. This option can only be used on the ingress or egress routing device of the RSVP session and is only valid for nonpacket LSPs.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-id identifier—(Optional) LSP identifier (source port) for the RSVP sender template.

name name—(Optional) Reset and restart the specified RSVP session.

optimize-fast-reroute—(Optional) Begin fast reroute optimization.

tunnel-id identifier—(Optional) Tunnel identifier (destination port) for the RSVP session.

**monitor label-switched-path**

**Syntax**

```
monitor label-switched-path lsp-name
<logical-system (logical-system-name)>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Logical system support introduced in Junos OS Release 9.4.
Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description**

Display the real-time status of the specified RSVP label-switched path (LSP). You can also use this command to monitor LSPs configured within logical systems.

**Options**

- `logical-system (logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

- `lsp-name`—Name of the LSP.

**Additional Information**

You can track the amount of traffic traversing an RSVP LSP and observe its essential parameters, such as uptime, ingress and egress addresses, labels, routes, and ports. Values are typically sampled every second. The display also allows you to scroll to other currently running LSPs. You cannot use this command to display information about static LSPs or LDP-signaled LSPs.

The output of this command shows how much each field has changed since you started the command or since you cleared the counters by using the c key. To control the output of the `monitor label-switched-path` command while it is running, use the keys listed in **Table 116 on page 3326**. The keys are not case-sensitive.

**Table 116: Output Control Keys for the monitor label-switched-path Command**

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Clears the screen and refreshes the display for this LSP.</td>
</tr>
<tr>
<td>f</td>
<td>Freezes the display, preventing new information from being displayed.</td>
</tr>
<tr>
<td>l</td>
<td>Monitors a different LSP. After you type l, you can type the new LSP name.</td>
</tr>
<tr>
<td>n</td>
<td>Displays information about the next LSP (whose name is alphabetically higher than the current LSP name) configured on the router.</td>
</tr>
</tbody>
</table>

Release Information

Command introduced before Junos OS Release 7.4.
The `egress` and `multipoint` options were introduced in Junos OS Release 9.2.
The `size` and `sweep` options were introduced in Junos OS Release 9.6.
The `dynamic-bypass` and `manual-bypass` options were introduced in Junos OS Release 10.2.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a `ping mpls` command.

Options

count count—(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination address—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.
detail—(Optional) Display detailed information about the echo requests sent and received.
NOTE: When using the `detail` option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.

In practice, it is difficult to synchronize the system times of independent Juniper Networks routers with sufficient accuracy to provide a meaningful time value for the `detail` option (even when synchronized using NTP).

dynamic-bypass—(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

egress egress-address—(Optional) Only the specified egress router or switch responds to the ping request.

exp forwarding-class—(Optional) Value of the forwarding class for the MPLS ping packets.

interface—(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the `manual-bypass` option.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on the specified logical system.

lsp-name—Ping an RSVP-signaled LSP using an LSP name.

manual-bypass—(Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the `interface` option.

multipoint—(Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the `egress` option to ping a specific egress router or switch participating in a point-to-multipoint LSP.

size bytes—(Optional) Size of the LSP ping request packet (100 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.

standby standby-path-name—(Optional) Name of the standby path.

sweep —(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information
If the LSP changes, the label and interface information displayed when you issued the `ping` command continues to be used. You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**NOTE:** In a Juniper-Cisco interoperability network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

**Required Privilege Level**

`network`

**List of Sample Output**

- `ping mpls rsvp (Echo Reply Received)` on page 3332
- `ping mpls rsvp (Echo Reply with ErrorCode)` on page 3333
- `ping mpls rsvp detail` on page 3333
- `ping mpls rsvp multipoint egress detail count` on page 3333
- `ping mpls rsvp multipoint detail count` on page 3333
- `ping mpls rsvp destination detail count size` on page 3334
- `ping mpls rsvp destination detail sweep size` on page 3335

**Output Fields**

When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

**Sample Output**

```
ping mpls rsvp (Echo Reply Received)
user@host> ping mpls rsvp test1
```
ping mpls rsvp (Echo Reply with Error Code)
user@host> ping mpls rsvp test2

show rsvp interface
  <brief | detail | extensive>
  <link-management>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.
instance option added in Junos OS Release 15.1 for the MX Series.

Description

Display the status of Resource Reservation Protocol (RSVP)-enabled interfaces and packet statistics. The RSVP input/input module collects statistics for certain events on a per-interface basis. Most of these events were tracked on a routing-instance basis in Junos OS releases earlier than Release 17.2. The show rsvp interface detail command displays these event counters under the Events section of the output only when the values of these fields are higher than zero. These statistics are also maintained at the global level (per routing-instance) and are also displayed in the output of the show rsvp statistics command.

Options

none—Display standard information about the status of RSVP-enabled interfaces and packet statistics.
brief | detail | extensive | link-management—(Optional) Display the specified level of output.
instance instance-name—(Optional) Display RSVP status information for the specified instance. If instance-name is omitted, RSVP status information is displayed for the master instance.
link-management—(Optional) Use the link-management option to display the control peers and corresponding TE-link information created by the Link Management Protocol (LMP).
**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

```

**Syntax (EX Series Switches)**

```plaintext
show rsvp neighbor
<brief | detail>
```

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.5 for EX Series switches.  
**instance** option added in Junos OS Release 15.1 for the MX Series.

**Description**

Display Resource Reservation Protocol (RSVP) neighbors that were discovered dynamically during the exchange of RSVP packets.

**Options**

**none**—Display standard information about RSVP neighbors.  
**brief | detail**—(Optional) Display the specified level of output.  
**instance instance-name**—(Optional) Display the RSVP neighbor information for the specified instance. If **instance-name** is omitted, RSVP neighbor information is displayed for the master instance.  
**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

show rsvp neighbor detail on page 3350
**Output Fields**

Table 119 on page 3346 lists the output fields for the `show rsvp neighbor` command. Output fields are listed in the approximate order in which they appear.

**Table 119: show rsvp neighbor Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSVP neighbor</td>
<td>Number of neighbors that the routing device has learned of. Each neighbor has one line of output.</td>
<td>All levels</td>
</tr>
<tr>
<td>via</td>
<td>Name of the interface where the neighbor has been detected. In the case of generalized MPLS (GMPLS) LSPs, the name of the peer where the neighbor has been detected.</td>
<td>detail</td>
</tr>
<tr>
<td>Address</td>
<td>Address of a learned neighbor.</td>
<td>All levels</td>
</tr>
<tr>
<td>Idle</td>
<td>Length of time the neighbor has been idle, in seconds. <strong>NOTE:</strong> Until Junos OS Release 15.1, in the output of the show rsvp neighbor command, the value under the Idle field immediately reflects the changed idle time when a link in the neighboring router is brought down. Starting with Junos OS Release 15.2, a router does not declare a neighbor as idle when a hello adjacency exists and has not timed out. When an interface is brought down, RSVP brings down the neighbor because of the notification it receives from IGP. The reason for considering the IGP-down notification is to support BFD-triggered fast reroute (FRR) and RSVP-TE is not directly a client for BFD notifications. When RSVP brings down the neighbor, the input/output process is not impacted. As a result, the idle time in the output of the show command is not immediately updated.</td>
<td>All levels</td>
</tr>
<tr>
<td>Up/Dn</td>
<td>Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down.</td>
<td>All levels</td>
</tr>
<tr>
<td>Up cnt and Down cnt</td>
<td>Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down.</td>
<td>detail</td>

</table>
### Table 119: show rsvp neighbor Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
</table>
| **Refresh** | Measure of processing overhead requests of refresh messages. Refresh reduction extensions improve routing device performance by reducing the process overhead, thus increasing the number of LSPs a routing device can support. **Refresh reduction** can have the following values:  
  - **operational**—All four RSVP refresh reduction extensions—message ack, bundling, summary refresh, and staged refresh timer—are functional between the two neighboring routing devices. For a detailed explanation of these extensions, see RFC 2961.  
  - **incomplete**—Some RSVP refresh reduction extensions are functional between the two neighboring routing devices.  
  - **not operational**—Either the refresh reduction feature has been turned off, or the remote routing device cannot support the refresh reduction extensions. | detail |
| **Remote end** | Neighboring routing device's status with regard to refresh reduction:  
  - **enabled**—Remote routing device has requested refresh reduction during RSVP message exchanges.  
  - **disabled**—Remote routing device does not require refresh reduction. | detail |
| **Pop label** | Pop labels of the RSVP-TE pop-and-forward LSP tunnels. | detail |
| **Ack-extension** | An RSVP refresh reduction extension:  
  - **enabled**—Both local and remote routing devices support the ack-extension (RFC 2961).  
  - **disabled**—Remote routing device does not support the ack-extension. | detail |
| **Link protection** | Status of the MPLS fast reroute mechanism that protects traffic from link failure:  
  - **enabled**—Link protection feature has been turned on, protecting the neighbor with a bypass LSP.  
  - **disabled**—No link protection feature has been enabled for this neighbor. | detail |
| **LSP name** | Name of the bypass LSP. | detail |
Table 119: show rsvp neighbor Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bypass LSP</td>
<td>Status of the bypass LSP. It can have the following values:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• does not exist—Bypass LSP is not available.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• connecting—Routing device is in the process of establishing a bypass LSP, and the LSP is not available for link protection at the moment.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• operational—Bypass LSP is up and running.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• down—Bypass LSP has gone down, with the most probable cause a node or a link failure on the bypass path.</td>
<td></td>
</tr>
<tr>
<td>Backup routes</td>
<td>Number of user LSPs (or routes) that are being protected by a bypass LSP (before link failure).</td>
<td>detail</td>
</tr>
<tr>
<td>Backup LSPs</td>
<td>Number of LSPs that have been temporarily established to maintain traffic by refreshing the downstream LSPs during link failure (not a one-to-one correspondence).</td>
<td>detail</td>
</tr>
<tr>
<td>Bypass explicit route</td>
<td>Explicit route object’s (ERO) path that is taken by the bypass LSP.</td>
<td>detail</td>
</tr>
<tr>
<td>Restart time</td>
<td>Length of time a neighbor waits to receive a Hello from the restarting node before declaring the node dead and deleting the states (in milliseconds).</td>
<td>detail</td>
</tr>
<tr>
<td>Recovery time</td>
<td>Length of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds). Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.</td>
<td>detail</td>
</tr>
</tbody>
</table>

Sample Output

show rsvp neighbor

user@host> show rsvp neighbor

RSVP neighbor: 2 learned
Address           Idle Up/Dn LastChange HelloInt HelloTx/Rx
192.168.207.203   0  3/2       13:01        3   366/349
192.168.207.207   0  1/0       22:49        3   448/448
Starting in Junos OS Release 16.1, this command also shows whether enhanced FRR procurs are enabled on the neighbor. Neighbors with Point of Local Repair (PLR) or Node Protecting Merge Point (NP-MP) also show the Hellos sent /received count.

user@host> show rsvp neighbor detail

show rsvp route-session-id

Syntax

show rsvp route-session-id

Release Information

Command introduced in Junos OS Release 16.1 for the MX Series.

Description

Display the session ID and the version information associated with the ingress route added by the Resource Reservation Protocol (RSVP) in the inet.3 table.

Session ID is a pre-populated identifier used for indirect next hops in BGP Prefix Independent Convergence (PIC) enabled router. Session ID is used to identify the session or path.

NOTE: protect core configuration is not required to display the route-session-id.

Options

none—Validate and display RSVP route session details.

Required Privilege Level

show rsvp pop-and-forward

Syntax

show rsvp pop-and-forward
  <brief | detail | extensive>
  <instance routing-instance-name>
  <label label>
  <logical-system (all | logical-system-name)>

Release Information
Command introduced in Junos OS Release 18.1R1 on MX Series routers, PTX Series routers, and vMX series routers.

Description
Display RSVP-TE pop-and-forward LSP tunnel information. This information includes the set of in-labels (one-hop pop label or a delegation label), the number of session using each label and the next segment-label (if there is another delegation hop downstream), and whether the in-label is used for unprotected or protected LSPs.

Options
none—Display the standard level of information for the RSVP-TE pop-and-forward LSP tunnels.

brief | detail | extensive—(Optional) Display the desired level of output. The brief option is the default level of output.

  The detail option provides more information about the hops in a delegation segment (whether its one-hop or multi-hop).

  The extensive option lists the set of LSPs that are using a given pop or delegation label.

instance routing-instance-name—(Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for the specified routing instance.

label label—(Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for the specified label.

logical-system (all | logical-system-name)—(Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for all or the specified logical system.

Required Privilege Level

```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.
**externally-provisioned** option added in Junos OS Release 13.3.
Command introduced in Junos OS Release 13.2X51-D15 for QFX Series.

instance option added in Junos OS Release 15.1 for the MX Series.

Description
Display information about RSVP sessions.

Options
none—Display standard information about all RSVP sessions.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

bidirectional | unidirectional—(Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively.

bypass—(Optional) Display RSVP sessions for bypass LSPs.

down | up—(Optional) Display only LSPs that are inactive or active, respectively.

externally-provisioned—(Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

instance instance-name—(Optional) Display RSVP sessions for the specified instance. If instance-name is omitted, RSVP session information is displayed for the master instance.

interface interface-name—(Optional) Display RSVP sessions for the specified interface only.

RSVP reserves resources only for outgoing LSPs of an interface. Because resources are not reserved for incoming LSPs, the show rsvp sessions interface interface-name command output displays only those RSVP sessions whose next hops correspond to the specified interface.

To identify the number of RSVP sessions formed over the uplink interface on the egress label-switching router (LSR), you can use the following command:

user@host> show rsvp session egress extensive | match "PATH rcvfrom:" | match interface-name | count

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-type—(Optional) Display information about RSVP sessions with regard to LSPs:

• bypass—Sessions used for bypass LSPs.
• lsp—Sessions used to set up LSPs.
• nolsp—Sessions not used to set up LSPs.

name session-name—(Optional) Display information about the named session.

p2mp—(Optional) Display point-to-multipoint information.
**session-type**—(Optional) Display information about a particular session type:

- **egress**—Sessions that terminate on this routing device.
  
  To identify the number of RSVP sessions formed over the uplink interface on the egress label-switching router (LSR), you can use the following command:

  ```bash
  user@host> show rsvp session egress extensive | match "PATH rcvfrom:" | match interface-name | count
  ```

- **ingress**—Sessions that originate from this routing device.

- **transit**—Sessions that transit through this routing device.

**statistics**—(Optional) Display packet statistics.

**te-link te-link**—(Optional) Display sessions with reservations on the specified TE link.

**Required Privilege Level**

```

Release Information

Command introduced in Junos OS Release 9.5 for EX Series switches.

Description

Display information about Resource Reservation Protocol (RSVP) sessions.

Options

**none**—Display standard information about all RSVP sessions.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**bidirectional | unidirectional**—(Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively.

**down | up**—(Optional) Display only LSPs that are inactive or active, respectively.

**interface interface-name**—(Optional) Display RSVP sessions for the specified interface only.

**lsp-type**—(Optional) Display information about RSVP sessions with regard to LSPs:

- **bypass**—Sessions used for bypass LSPs.
- **lsp**—Sessions used to set up LSPs.
- **nolsp**—Sessions not used to set up LSPs.

**name session-name**—(Optional) Display information about the named session.

**session-type**—(Optional) Display information about a particular session type:

- **egress**—Sessions that terminate on this switch.
- **ingress**—Sessions that originate from this switch.
• **transit**—Sessions that transit through this switch.

**statistics**—(Optional) Display packet statistics.

**te-link**—(Optional) Display sessions with reservations on the specified traffic-engineered link name.

**Required Privilege Level**

show rsvp statistics

List of Syntax
Syntax on page 3377
Syntax (EX Series Switches) on page 3377

Syntax

```
show rsvp statistics
  <instance instance-name>
  <logical-system (all | logical-system-name)>
```

Syntax (EX Series Switches)

```
show rsvp statistics
```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.
instance option added in Junos OS Release 15.1 for the MX Series.

Description
Display Resource Reservation Protocol (RSVP) packet and error statistics. The RSVP input/input module collects statistics for certain events on a per-interface basis. Most of these events were tracked on a routing-instance basis in Junos OS releases earlier than Release 17.2. The "show rsvp interface detail" command displays these event counters under the Events section of the output only when the values of these fields are higher than zero. These statistics are also maintained at the global level (per routing-instance) and are also displayed in the output of the "show rsvp statistics" command.

Options
none—Display RSVP packet and error statistics.

instance instance-name—(Optional) Display RSVP packet and error statistics for the specified instance. If instance-name is omitted, RSVP statistics are displayed for the master instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 123 on page 3378 describes the output fields for the show rsvp statistics command. Output fields are listed in the approximate order in which they appear.

Table 123: show rsvp statistics Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Packet Type</td>
<td>Statistics about different RSVP messages.</td>
</tr>
<tr>
<td>Total Sent</td>
<td>Total number of packets sent since RSVP was enabled.</td>
</tr>
<tr>
<td>Total Received</td>
<td>Total number of packets received since RSVP was enabled.</td>
</tr>
<tr>
<td>Last 5 seconds Sent</td>
<td>Total number of packets sent in the last 5 seconds.</td>
</tr>
<tr>
<td>Last 5 seconds Received</td>
<td>Number of packets received in the last 5 seconds.</td>
</tr>
<tr>
<td>Path</td>
<td>Statistics about Path messages, which are sent from the RSVP sender along the data paths and which store path state information in each node along the path.</td>
</tr>
<tr>
<td>PathErr</td>
<td>Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.</td>
</tr>
<tr>
<td>PathTear</td>
<td>Statistics about PathTear messages, which remove path states and dependent reservation states in any routing devices along a path.</td>
</tr>
<tr>
<td>Resv FF</td>
<td>Statistics about fixed-filter reservation style messages, which consist of distinct reservations among explicit senders.</td>
</tr>
<tr>
<td>Resv WF</td>
<td>Statistics about wildcard-filter reservation style messages, which consist of shared reservations among wildcard senders.</td>
</tr>
<tr>
<td>Res SE</td>
<td>Statistics about shared-explicit reservation style messages, which consist of shared reservations among explicit senders.</td>
</tr>
<tr>
<td>ResvErr</td>
<td>Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.</td>
</tr>
<tr>
<td>Field Name</td>
<td>Field Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ResvTear</td>
<td>Statistics about ResvTear messages, which remove reservation states along a path.</td>
</tr>
<tr>
<td>ResvConf</td>
<td>Statistics about ResvConfirm messages, which are responses to confirm a reservation request.</td>
</tr>
<tr>
<td>Ack</td>
<td>Acknowledge message for refresh reductions.</td>
</tr>
<tr>
<td>SRefresh</td>
<td>Summary refresh messages.</td>
</tr>
<tr>
<td>Hello</td>
<td>Number of RSVP hello packets that have been sent to and received from the neighbor.</td>
</tr>
<tr>
<td>EndtoEnd RSVP</td>
<td>Statistics for the number of End-to-end RSVP messages.</td>
</tr>
<tr>
<td>Errors</td>
<td>Statistics about errored RSVP packets.</td>
</tr>
<tr>
<td>Rcv pkt bad length</td>
<td>The packet was not processed because its length is inappropriate.</td>
</tr>
<tr>
<td>Rcv pkt unknown type</td>
<td>The packet is not one of the well-known RSVP types, as defined in RFC 2205, Resource ReSerVation Protocol (RSVP).</td>
</tr>
<tr>
<td>Rcv pkt bad version</td>
<td>The packet is not an RSVP version 1 packet.</td>
</tr>
<tr>
<td>Rcv pkt auth fail</td>
<td>The packet failed authentication checks.</td>
</tr>
<tr>
<td>Rcv pkt bad checksum</td>
<td>The RSVP checksum check failed.</td>
</tr>
<tr>
<td>Rcv pkt bad format</td>
<td>General packet processing failed because the packet was badly formed.</td>
</tr>
<tr>
<td>Memory allocation fail</td>
<td>An internal resource failure occurred.</td>
</tr>
<tr>
<td>No path information</td>
<td>A reservation was received, but no sender is active.</td>
</tr>
<tr>
<td>Resv style conflict</td>
<td>The same session contains inconsistent reservation styles.</td>
</tr>
<tr>
<td>Port conflict</td>
<td>There were inconsistent port numbers for the same session.</td>
</tr>
<tr>
<td>Resv no interface</td>
<td>An interface for the receive reservation packets cannot be located.</td>
</tr>
<tr>
<td>PathErr to client</td>
<td>Number of PathErr packets delivered to the local client.</td>
</tr>
<tr>
<td>Field Name</td>
<td>Field Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ResvErr to client</td>
<td>Number of ResvErr packets delivered to the local client.</td>
</tr>
<tr>
<td>Path timeout</td>
<td>Number of times the sender timed out because the path was removed.</td>
</tr>
<tr>
<td>Resv timeout</td>
<td>Number of times the receiver timed out because the reservation was removed.</td>
</tr>
<tr>
<td>Message out-of-order</td>
<td>Records the number of RSVP incoming messages that are considered out of order.</td>
</tr>
<tr>
<td></td>
<td>This is detected from the message ID object's sequence number.</td>
</tr>
<tr>
<td>Unknown ack msg</td>
<td>A neighboring routing device replies with an ACK object that contains an unknown message ID. This can indicate a message ID handshake problem. For example, a router receives an ACK for message IDs 1, 2, and 3. However, it only has state for message IDs 1 and 3. The router increments the unknown ack counter by 1.</td>
</tr>
<tr>
<td>Recv nack</td>
<td>If a neighboring router receives an unknown message ID in an RSVP refresh message, the router sends a Recv nack message back to the sender. This can happen if that neighbor has been rebooted. For this case, the router sends a regular RSVP refresh message to recover the state and start the message-ID handshake process again.</td>
</tr>
<tr>
<td>Recv duplicated msg-id</td>
<td>Number of times the same message ID is used by two different RSVP messages. This duplication is usually caused when a neighboring routing device restarts.</td>
</tr>
<tr>
<td>No TE-link to recv Hop</td>
<td>Counter of packets discarded because a TE link was not found.</td>
</tr>
<tr>
<td>Rcv pkt disabled interface</td>
<td>Number of RSVP packets received on an interface that is not enabled for RSVP.</td>
</tr>
<tr>
<td>Transmit buffer full</td>
<td>Number of times the buffer for assembling an outgoing RSVP message was not large enough.</td>
</tr>
<tr>
<td>Transmit failure</td>
<td>Number of times the RSVP task failed to send out a packet.</td>
</tr>
<tr>
<td>Receive failure</td>
<td>Number of times the RSVP task failed to read an incoming packet.</td>
</tr>
<tr>
<td>P2MP RESV discarded by appl</td>
<td>Number of Resv messages discarded because the MPLS label is not valid for the P2MP LSP application.</td>
</tr>
<tr>
<td>Rate limit</td>
<td>Number of RSVP packets dropped due to rate limiting.</td>
</tr>
<tr>
<td>Err msg loop detected</td>
<td>Number of RSVP error messages that have looped back to their originator. This is detected by checking the error node address in the ERROR_SPEC object.</td>
</tr>
</tbody>
</table>
**Sample Output**

`show rsvp statistics`

Starting in Junos OS Release 16.1, this command also shows conditional PathTear statistics and the number of times an LSP state has been retained because of Link Protecting Merge Point (LP-MP) or Node Protecting Merge Point (NP-MP) determination.

```
user@host> show rsvp statistics
```

show rsvp version

**List of Syntax**

*Syntax on page 3385*

*Syntax (EX Series Switches) on page 3385*

**Syntax**

```
show rsvp version
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**

```
show rsvp version
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description**

Display information about the Resource Reservation Protocol (RSVP) protocol settings, such as the version of the RSVP software, the refresh timer and keep multiplier, and local RSVP graceful restart capabilities on a routing device.

**Options**

- **none**—Display RSVP protocol settings.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

**view**

</table>
### Table 124: show rsvp version Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Route Session-Id count | Total count of session IDs associated with the combination of all the RSVP ingress routes.  
**NOTE:** Starting in Junos OS Release 16.1, the `show rsvp version` command output displays the Route Session-Id count output field by default, irrespective of the presence of associated session IDs.  
When there are no session IDs associated with any RSVP ingress route, the Route Session-Id count value is zero (0). |
| Graceful restart | Status of the graceful restart feature for RSVP on the restarting routing device: Enabled or Disabled. |
| Restart helper mode | Status of the helper mode feature: Enabled or Disabled. When this feature is enabled, the restarting routing device can help the neighbor with its RSVP restart procedures. |
| Maximum helper restart time | Number of milliseconds (ms) configured for the maximum helper restart time. The maximum helper restart time is the length of time the routing device waits before declaring that an RSVP neighbor attempting to restart gracefully is down. |
| Maximum helper recovery time | Number of milliseconds configured for the maximum helper recovery time. The maximum helper recovery time is the amount of time the routing device maintains the state of an RSVP neighbor attempting to restart gracefully. |
| Restart time | Number of milliseconds that a neighbor waits to receive a Hello message from the restarting node before declaring the node dead and deleting the states. |
| Recovery time | Number of milliseconds during which the restarting node attempts to recover its lost states with help from its neighbors. Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed. |
| P2p transit LSP nexthop mode | Point-to-point transit LSP next-hop mode on PTX Series devices. The possible values are Chained or Unchained. |
| P2mp transit LSP nexthop mode | Point-to-multipoint transit LSP next-hop mode on PTX Series devices. The possible values are Chained or Unchained. |
Sample Output

```
show rsvp version

Starting with Junos OS Release 16.1, this command also shows whether enhanced FRR procuers are enabled on the router.

user@host> show rsvp version

Resource ReSerVation Protocol, version 1. rfc2205
  RSVP protocol:             Enabled
  R(refresh timer):          30 seconds
  K(keep multiplier):       3
  Preemption:               Normal
  Soft-preemption cleanup:  30 seconds
  Graceful deletion timeout: 30 seconds

  P2mp transit LSP nexthop mode: Unchained
  Enhanced FRR local protection: Enabled
```
traceroute mpls rsvp

Syntax

```bash
traceroute mpls <rsvp> lsp-name
<detail>
<egress>
<exp>
<logical-system>
<multipoint>
<no-resolve>
<retries>
<source source-address>
<ttl>
```

Release Information
Command introduced in Junos OS Release 9.2.
`egress`, `multipoint`, and `ttl` options added in Junos OS Release 11.2.

Description
Trace route to a remote host for an MPLS LSP signaled by RSVP. Use `traceroute mpls rsvp` as a debugging tool to locate MPLS label-switched path (LSP) forwarding issues in a network. (Currently supported for IPv4 packets only.)

Options
`lsp-name`—Specify the name of the LSP to be traced.

detail—(Optional) Display detailed output.

egress—(Optional) Request that a specific point-to-multipoint egress node reply to the trace route. The trace route would follow the associated sub-LSP to the egress node.

exp—(Optional) Specify the class of service to use when sending probes. The range of values is 0 through 7. The default value is 7.

logical-system—(Optional) Specify the name of the logical system for the traceroute attempt.

multipoint—(Optional) Perform a trace route on a point-to-multipoint LSP.

no-resolve—(Optional) Specify not to resolve the hostname that corresponds to the IP address.

retries—(Optional) Specify the number of times to resend probe. The range of values is 1 through 9. The default value is 3.

source source-address—(Optional) Specify the source address of the outgoing traceroute packets.

ttl—(Optional) Specify the number of hops to follow before forcing the trace route to quit.
**Required Privilege Level**

network

**List of Sample Output**
traceroute mpls rsvp on page 3391
traceroute mpls rsvp detail on page 3391

clear ldp neighbor

Syntax

```
clear ldp neighbor
  <instance instance-name>
  <logical-system (all | logical-system-name)>
  <neighbor>
```

Description
Tear down Label Distribution Protocol (LDP) neighbor connections.

Options

- **none**—Tear down connections with all LDP neighbors for all routing instances.
- **instance instance name**—(Optional) Clear the LDP session for the specified routing instance only.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **neighbor**—(Optional) Clear an LDP session for the specified neighbor (IP address) only.

Required Privilege Level
clear

RELATED DOCUMENTATION

- show ldp neighbor | 3424

List of Sample Output
clear ldp neighbor on page 3396

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear ldp neighbor
user@host> clear ldp neighbor
```
clear ldp session

Syntax

```
clear ldp session
<all>
<destination>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

Release Information
Command introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Clear Label Distribution Protocol (LDP) sessions.

Options
all—Clear LDP sessions for all destinations for all routing instances.

```
destination—(Optional) Clear an LDP session for the specified destination (IP address).
```

```
instance instance-name—(Optional) Clear the LDP session for the specified routing instance only.
```

```
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
```

Required Privilege Level
```
clear
```

RELATED DOCUMENTATION

```
show ldp session
```

List of Sample Output
**clear ldp session on page 3398**

Output Fields
When you enter this command, you are provided feedback on the status of your request.
Sample Output

clear ldp session

user@host> clear ldp session all
clear ldp statistics

Syntax

clear ldp statistics
<instance instance-name>
<logical-system (all | logical-system-name)>

Release Information
Command introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Set all Label Distribution Protocol (LDP) statistics to zero.

Options
none—Set all LDP statistics to zero for all routing instances.

instance instance-name—(Optional) Clear the LDP session for the specified routing instance only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
clear

RELATED DOCUMENTATION

table

clear ldp statistics
user@host> clear ldp statistics
ping mpls ldp

Syntax

```plaintext
ping mpls ldp fec
<count count>
<destination address>
<detail>
<exp forwarding-class>
<instance routing-instance-name>
<logical-system (all | logical-system-name)>
<p2mp root-addr ip-address lsp-id identifier>
<size bytes>
<source source-address>
<stitched-protocol>
<sweep>
```

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
size and sweep options introduced in Junos OS Release 9.6.
instance option introduced in Junos OS Release 10.0.
p2mp, root-address, and lsp-id options introduced in Junos OS Release 11.2.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Check the operability of MPLS LDP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a ping mpls command.

Options

count count—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination address—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp forwarding-class—(Optional) Value of the forwarding class for the MPLS ping packets.

fec—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

instance routing-instance-name—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on the specified logical system.

p2mp root-addr ip-address lsp-id identifier—(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.

size bytes—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

stitched-protocol—(Optional) Protocol stitched on intermediate node.

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information
If the LSP changes, the label and interface information displayed when you issued the ping command continues to be used. You must configure MPLS at the [edit protocols mpls] hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the ping mpls ldp command by specifying a new time in seconds using the lsp-ping-interval statement at the [edit protocols ldp oam] hierarchy level. For more information, see the MPLS Applications User Guide.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**NOTE:** In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

**Required Privilege Level**
network

List of Sample Output

ping mpls ldp fec count on page 3402
ping mpls ldp p2mp root-addr lsp-id on page 3402

Output Fields
When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls ldp fec count

```
user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received, 70%
packet loss 4 packets received with error status, not counted as received.
```

ping mpls ldp p2mp root-addr lsp-id

```
user@host> ping mpls ldp p2mp root-addr 10.1.1.1/32 lsp-id 1 count 1

```

Release Information
Command introduced in Junos OS Release 19.1R1

Description
Check the operability of MPLS segment routing label-switched path (LSP) connections added by ospf protocol. Type Ctrl+c to interrupt a `ping mpls segment routing ospf` command.

Options

- **count count**—(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is **1 through 1,000,000**. The default value is **5**.

- **destination address**—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the **127/8** subnet.

- **detail**—(Optional) Display detailed information about the echo requests sent and received.

- **exp forwarding-class**—(Optional) Value of the forwarding class for the MPLS ping packets.

- **fec**—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

- **instance routing-instance-name**—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on the specified logical system.

- **p2mp root-addr ip-address lsp-id identifier**—(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.
size bytes—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

stitched-protocol—(Optional) Protocol stitched on intermediate node.

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Required Privilege Level
network

List of Sample Output
ping mpls segment-routing ospf on page 3404
ping mpls segment-routing isis on page 3404

Output Fields
When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls segment routing isis

Syntax

```
ping mpls segment routing isis fec
<count count>
<destination address>
<detail>
<exp forwarding-class>
<instance routing-instance-name>
<logical-system (all | logical-system-name)>
<p2mp root-addr ip-address lsp-id identifier>
<size bytes>
<source source-address>
<stitched-protocol>
<sweep>
```

Release Information
Command introduced in Junos OS Release 19.1R1

Description
Check the operability of MPLS segment routing label-switched path (LSP) connections added by ISIS protocol. Type Ctrl+c to interrupt a ping mpls segment routing isis command.

Options

count count—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination address—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp forwarding-class—(Optional) Value of the forwarding class for the MPLS ping packets.

fec—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

instance routing-instance-name—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on the specified logical system.

p2mp root-addr ip-address lsp-id identifier—(Optional) Ping the endpoints of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.
size bytes—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

stitched-protocol—(Optional) Protocol stitched on intermediate node.

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

show ldp database

Syntax

show ldp database
  <brief | detail | extensive>
  <inet | l2circuit>
  <instance instance-name>
  <logical-system (all | logical-system-name)>
  <p2mp>
  <session session>
  <summary>

Release Information
Command introduced before Junos OS Release 7.4.
summary option introduced in Junos OS Release 14.2.

Description
Display entries in the LDP database.

Options
none—Display standard information about all entries in the LDP database for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

inet | l2circuit—(Optional) Display only IPv4 or Layer 2 circuit bindings.

instance instance-name—(Optional) Display routing instance information for the specified instance only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

p2mp—(Optional) Display point-to-multipoint binding information.

session session—(Optional) Display database for the specified session only. session is the destination address of the LDP session.

summary—(Optional)—Display summary output. This option displays the number of labels received and advertised for each LDP session.

show ldp fec-filters

Syntax

show ldp fec-filters
  <fec>
  <instance instance-name>
  <logical-system (all | logical-system-name)>

Release Information

Command introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Display information about configured Label Distribution Protocol (LDP) forwarding equivalence class (FEC) filters.

Options

fec—(Optional) Display FEC filter information for the specified FEC.

instance instance-name—(Optional) Display FEC filter information for the specified instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

Sample Output

show ldp fec-filters

user@host> show ldp fec-filters 10/8

10.22.1.2/32
  Ingress: f1-10.22.1.2/32 (index: 3)
  Transit: (null) (index: 0)
show ldp interface

Syntax

```
show ldp interface
  <brief | detail | extensive>
  <interface-name>
  <instance instance-name>
  <logical-system (all | logical-system-name)>
```

Release Information
Command introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Display the status of Label Distribution Protocol (LDP)-enabled interfaces.

Options
none—Display standard status information about all LDP-enabled interface for all routing instances.

`interface-name`—(Optional) Display information for the specified interface.

brief | detail | extensive—(Optional) Display the specified level of output.

instance `instance-name`—(Optional) Display information for the specified routing instance.

logical-system (all | `logical-system-name`)—(Optional) Perform this operation on all logical systems or on a particular logical system.

```
show ldp neighbor

Syntax

```
show ldp neighbor
  <brief | detail | extensive>
  <auto-targeted>
  <instance instance-name>
  <logical-system (all | logical-system-name)>
  <neighbor-address>
```

Release Information

Command introduced before Junos OS Release 7.4.
neighbor-address option added in Junos OS Release 8.5.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
auto-targeted option added in Junos OS Release 14.2.

Description

Display Label Distribution Protocol (LDP) neighbor information.

Options

none—Display standard information about LDP neighbors for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

auto-targeted—(Optional) Display information about LDP neighbors that are automatically targeted using the loopback addresses.

instance instance-name—(Optional) Display information for the specified routing instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor-address—(Optional) Display information about the specified LDP neighbor.

show ldp overview

Syntax

```
show ldp overview
<instance instance-name>
logical-system (all | logical-system-name)
```

Syntax (EX Series Switch and QFX Series)

```
show ldp overview
<instance instance-name>
```

Release Information
Command introduced in Junos OS Release 11.2.

Description
Display LDP overview information.

Options

- **none**— Display standard overview information about LDP for all routing instances.
- **instance instance-name**— (Optional) Display LDP overview information for the specified routing instance.
- **logical-system (all | logical-system-name)**— (Optional) Display LDP information from systems or a particular logical system on the devices.

<td>All Levels</td>
</tr>
</tbody>
</table>
| Explicit null                    | Advertise label 0 to the egress routing device of an LSP. Explicit null: **enabled** or **disabled**.  

**NOTE:** If you do not include the explicit-null statement in the configuration, label 3 (implicit null) is advertised. | All Levels      |
| IPv6 tunneling                   | Internet Protocol version 6 tunneling: **enabled** or **disabled**.                 | All Levels      |
| Strict targeted hellos           | Prevent LDP sessions from being established with remote neighbors that have not been specifically configured. Strict targeted hellos: **enabled** or **disabled**.  

**NOTE:** LDP peers will not respond to targeted hellos coming from a source that is not one of the configured remote neighbors. | All Levels      |
<p>| Loopback if added                | Loopback interface is added: <strong>yes</strong> or <strong>no</strong>.                                    | All Levels      |
| Route preference                 | Default preference value (also known as an administrative distance) assigned to each route that the routing table receives. LDP preference is: <strong>9</strong> | All Levels      |
| Unicast transit LSP chaining     | Unicast transit LSP chaining: <strong>enabled</strong> or <strong>disabled</strong>.                          | All Levels      |
| P2MP transit LSP chaining        | P2MP transit LSP chaining: <strong>enabled</strong> or <strong>disabled</strong>.                             | All Levels      |
| Transit LSP statistics based on route statistics | Transit LSP statistics based on route statistics: <strong>enabled</strong> or <strong>disabled</strong>. | All Levels      |
| Longest match                    | Longest match for label mapping: <strong>enabled</strong> or <strong>disabled</strong>.                       | All Levels      |
| Capabilities enabled             | Enabled capabilities: <strong>none</strong>                                                     | All Levels      |</p>
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field description</th>
<th>Level of Output</th>
</tr>
</thead>
</table>
| **Timers**      | • **Keepalive interval**: Keepalive interval value.  
                 • **Keepalive timeout**: Time interval for which the neighbor LDP node waits before determining session failure.  
                 • **Link hello interval**: Specify how often the router sends Link Management Protocol (LMP) hello packets.  
                 • **Link hello hold time**: Time interval for which an LDP node waits for a hello message before declaring a neighbor is down.  
                 • **Targeted hello interval**: Specify how often LDP sends targeted hello messages.  
                 • **Targeted hello hold time**: Time interval for which a sending LSR maintains a record of targeted hello messages from the receiving LSR without receipt of another targeted hello message from that LSR.  
                 • **Label withdraw delay**: Time interval for withdrawing labels to reduce router workload during IGP convergence.                                                                 | All Levels      |
| **Graceful restart** | Graceful restart attributes.  
                  • **Restart**– Graceful restart capability: enabled or disabled.  
                  • **Helper**– Standard graceful restart helper capability: enabled or disabled.  
                  • **Restart in process**– Graceful restart in process.  
                  • **Reconnect time**– Period of time that a restarting LSR (label switched router) designates to LDP neighbors to wait until the former reestablishes the session after restarting.  
                  • **Max neighbor reconnect time**– Maximum reconnect time.  
                  • **Recovery time**– Period of time that an LSR preserves its state across the restart.  
                  • **Max neighbor recovery time**– Maximum recovery time designated to LDP neighbors by a restarting LSR.                                                                 | All Levels      |
| **Traffic Engineering** | • **Bgp igp**– BGP and IGP destinations: enabled or disabled. When enabled, IGPs use MPLS paths for forwarding traffic.  
                                 • **Both ribs**– BGP and IGP destinations with routes in both RIBs: enabled or disabled.  
                                 • **Mpls forwarding**– MPLS routes used for forwarding: enabled or disabled.                                                                 | All Levels      |
Table 130: show ldp overview Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field description</th>
<th>Level of Output</th>
</tr>
</thead>
</table>
| IGP                         | • **Tracking igp metric** – Cause the IGP route metric to be used for the LDP routes instead of the default LDP route metric (the default LDP route metric is 1).  
  • **Sync session up delay** – Time interval to synchronize LDP session.                                                                                           | All Levels      |
| Session protection          | • **Session protection** – Remote neighbor added to LDP configuration which enables protection for all sessions in the corresponding LDP instance: enabled or disabled.  
  • **Session protection timeout** – Period of time until which the remote neighbor is connected to LSR in the absence of link neighbors.                                                                 | All Levels      |
| Interface addresses         | Advertises interface address.                                                                                                                                                                                     | All Levels      |
| advertising                 |                                                                                                                                                                                                                  |                 |
| Label allocation            | Label accounting information.                                                                                                                                                                                     | All Levels      |
|                             | • **Current number of LDP labels allocated**—Number of labels currently in use.                                                                                                                                 |                 |
|                             | • **Total number of LDP labels allocated**—Cumulative number of labels being allocated.                                                                                                                           |                 |
|                             | • **Total number of LDP labels freed**—Cumulative number of labels being freed.                                                                                                                                  |                 |
|                             | • **Total number of LDP label allocation failures**—Cumulative number of failures for allocating a label.                                                                                                       |                 |
|                             | • **Current number of labels allocated by all protocols**—Number of labels currently being used by routing protocols.                                                                                              |                 |

**Sample Output**

`show ldp overview`

```
user@host> show ldp overview

Instance: master  
  Router ID: 192.168.2.1  
  Message id: 0  
  Configuration sequence: 1  
  Deaggregate: disabled
```
Explicit null: disabled

show ldp p2mp tunnel

Syntax

```
show ldp p2mp tunnel
  <brief | detail | extensive>
  <instance instance-name>
  <logical-system (all | logical-system-name)>
```

Release Information
Command introduced in Junos OS Release 13.3.

Description
Display LDP point-to-multipoint tunnel table information.

Options
brief | detail | extensive—(Optional) Display the specified level of output.

instance instance-name—(Optional) Display routing instance information for the specified instance only.

logical-system (all | logical-system-name)—(Optional) Display LDP point-to-multipoint tunnel table information of all logical systems or a particular logical system.

Required Privilege Level
View

Sample Output

```
show ldp p2mp tunnel

user@host> show ldp p2mp tunnel extensive

<table>
<thead>
<tr>
<th>Instance</th>
<th>Tunnel type</th>
<th>Tunnel name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Name</td>
<td>10.254.1.1:1:ldp-p2mp:mvpn:vpn-1</td>
</tr>
<tr>
<td></td>
<td>P2MP root-addr</td>
<td>10.255.107.232, lsp-id 16777217</td>
</tr>
<tr>
<td></td>
<td>Self id</td>
<td>805306372</td>
</tr>
<tr>
<td></td>
<td>Reference count</td>
<td>2</td>
</tr>
</tbody>
</table>
```
show ldp path

Syntax

show ldp path
   <brief | detail | extensive>
   <destination>
   <instance instance-name>
   <logical-system (all | logical-system-name)>

Release Information
Command introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Display Label Distribution Protocol (LDP) label-switched paths (LSPs).

Options
none—Display standard information about all LDP LSPs for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

destination—(Optional) Restrict the output to entries that match the specified destination prefix.

instance instance-name—(Optional) Display information for the specified routing instance only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show ldp path extensive on page 3434

Output Fields
Table 131 on page 3433 describes the output fields for the show ldp path command. Output fields are listed in the approximate order in which they appear.

Table 131: show ldp path Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Session</td>
<td>Session ID and labels that this system has sent using LDP. These correspond to</td>
</tr>
<tr>
<td>(label)</td>
<td>MPLS packets received.</td>
</tr>
</tbody>
</table>
### Table 131: show ldp path Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input Session (label)</td>
<td>Session ID and labels that this system has received using LDP. These correspond to MPLS packets transmitted.</td>
</tr>
<tr>
<td>route</td>
<td>MPLS route.</td>
</tr>
<tr>
<td>Attached route</td>
<td>Route corresponding to the LSP.</td>
</tr>
<tr>
<td>Ingress route</td>
<td>The router acts as the ingress for the LSP.</td>
</tr>
<tr>
<td>Reference count</td>
<td>Reference count for the LDP neighbor.</td>
</tr>
<tr>
<td>Transit route</td>
<td>Names of the forwarding equivalence class (FEC) filters on the transit routers.</td>
</tr>
<tr>
<td>Global label</td>
<td>MPLS label that is used globally.</td>
</tr>
</tbody>
</table>

### Sample Output

**show ldp path extensive**

```
user@host> show ldp path extensive

Output Session (label) Input Session (label)
10.255.14.220:0(3) ( )
  Attached route: 10.255.14.221/32
  Reference count: 3, Global label: 3
  Reference count: 2, Transit route, Global label: 100000
  Reference count: 2, Transit route, Global label: 100001
```
show ldp route

Syntax

show ldp route
<brief | detail | extensive>
<destination>
<fec-and-route>
<fec-only>
<instance instance-name>
<logical-system (all | logical-system-name)>

Release Information
Command introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Display the entries in the Label Distribution Protocol (LDP) internal topology table. The internal topology table contains routes from inet.0 and inet.3 and is used when binding a label to a forwarding equivalence class (FEC).

Options
none—Display standard information about all entries in the LDP internal topology table for all routing instances.
brief | detail | extensive—(Optional) Display the specified level of output.
destination—(Optional) Restrict the output to entries that are longer than the specified destination prefix and prefix length.
fec-and-route—Display the show routes and the FECs.
fec-only—Display only LDP FECs.
instance instance-name—(Optional) Display entries for the specified routing instance only.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 132 on page 3436 describes the output fields for the `show ldp route` command. Output fields are listed in the approximate order in which they appear.

Table 132: show ldp route Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination</td>
<td>Destination prefix.</td>
</tr>
<tr>
<td>Next-hop intf/lsp/table</td>
<td>Interface that is the next hop to the destination prefix.</td>
</tr>
<tr>
<td>Next-hop address</td>
<td>IP address of the next hop.</td>
</tr>
<tr>
<td>Session ID</td>
<td>LDP session ID.</td>
</tr>
<tr>
<td>Route flags</td>
<td>Information about the route. For example, the Ingress TTL propagate flag indicates that the time-to-live (TTL) value is being propagated with the route.</td>
</tr>
<tr>
<td>Bound to outgoing label</td>
<td>The route has been bound to LSPs with the label being distributed for that LSP.</td>
</tr>
<tr>
<td>Topology entry</td>
<td>The topology that the route is bound to.</td>
</tr>
<tr>
<td>Ingress route status</td>
<td>Status of the ingress route. For example, it could be Active or Inactive.</td>
</tr>
<tr>
<td>Last modified</td>
<td>The length of time since the ingress route status last changed.</td>
</tr>
<tr>
<td>Last event(s)</td>
<td>The last event that occurred.</td>
</tr>
</tbody>
</table>

Last event(s): Update ingress route
Route flags: Ingress TTL propagate, Transit TTL propagate, Allow longest match
show ldp session

Syntax

```
show ldp session
<brief | detail | extensive>
<auto-targeted>
<destination>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

Release Information

Command introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
auto-targeted option added in Junos OS Release 14.2.

Description

Display information about Label Distribution Protocol (LDP) sessions.

Options

none—Display standard information about all LDP sessions for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

auto-targeted—(Optional) Display information about LDP sessions that are automatically targeted using loopback addresses.

destination—(Optional) Restrict LDP session display to the specified address.

instance instance-name—(Optional) Display routing instance information for the specified instance. If instance-name is omitted, information is displayed for the master instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

List of Sample Output

show ldp session brief on page 3450
Output Fields

Table 133 on page 3447 describes the output fields for the `show ldp session` command. Output fields are listed in the approximate order in which they appear.

Table 133: show ldp session Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>Transport address of the session.</td>
<td>any</td>
</tr>
<tr>
<td>State</td>
<td>State of the session: Nonexistent, Connecting, Initialized, OpenRec, OpenSent, Operational, or Closing. The states correspond to the state diagram specified in Internet Draft LDP Specificationdraft-ietf-mpls-rfc3036bis-01.txt.</td>
<td>any</td>
</tr>
<tr>
<td>Connection</td>
<td>TCP connection state: Closed, Opening, or Open.</td>
<td>any</td>
</tr>
<tr>
<td>Hold time</td>
<td>Time remaining until the session will be closed, in seconds.</td>
<td>any</td>
</tr>
<tr>
<td>Session ID</td>
<td>LDP identifiers of the peers of this session.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Next keepalive</td>
<td>Time until next keepalive is sent, in seconds.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the local router is playing the active role in the session and during session establishment.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Passive</td>
<td>Whether the local router is playing the passive role in the session and during session establishment.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Maximum PDU</td>
<td>Maximum protocol data unit (PDU) size (packet size) for the session.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Hold time</td>
<td>Time remaining until the session will be closed, in seconds. This value corresponds to the one configured using the keepalive-timeout statement configured at the [edit protocols ldp] hierarchy level.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Neighbor count</td>
<td>Number of neighbors that are contributing to the session.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Neighbor types</td>
<td>Category of LDP session: discovered or auto-targeted.</td>

<tr>
<td></td>
<td>• Initialization—Session initialization negotiation messages sent by an LSR to an LDP peer when the transport connection is established.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Keeaplive—Keepalive timer messages sent by an LSR to an LDP peer to keep the session active when there is no information or PDU exchanged between them.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Notification—Notification messages (such as state of the LDP session) or error information (such as bad PDU length) sent by an LSR to an LDP peer.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Address—Message sent by an LSR to an LDP peer to advertise interface addresses.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Address withdraw—Message sent by an LSR to an LDP peer to withdraw a previously advertised interface address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Label mapping—Message sent by an LSR to an LDP peer to advertise label mapping for a forwarding equivalence class (FEC).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Label request—Message sent by an LSR to an LDP peer to request a label mapping for an FEC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Label withdraw—Message sent by an LSR to an LDP peer to withdraw a previously advertised FEC-label mapping.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Label release—Message sent by an LSR to an LDP peer to notify the peer that a specific FEC-label mapping has been released.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Label abort—Message sent by an LSR to an LDP peer to abort a label request message.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Total—Messages sent and received during the lifetime of the session.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Last 5 seconds—Messages sent and received during the current session.</td>
<td></td>

show ldp statistics

Syntax

```
show ldp statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
```

Release Information
Command introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description
Display Label Distribution Protocol (LDP) statistics.

Options

- **none**—Display LDP statistics for all routing instances.
- **instance instance-name**—(Optional) Display information for the specified routing instance only.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

- **view**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last 5 seconds</td>
<td>Number of each message type sent and received in the last 5 seconds.</td>
</tr>
<tr>
<td>Sent, Received</td>
<td></td>
</tr>
<tr>
<td>Message type</td>
<td>LDP message types:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Hello</strong>—Messages that enable LDP nodes to discover one another and to detect the failure of a neighbor or of the link to the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Initialization</strong>—Messages that indicate an LDP session has started.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Keepalive</strong>—Messages that ensure that the keepalive timeout is not exceeded.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Notification</strong>—Advisory information and signal error information.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Address</strong>—Messages with address information.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Address withdrawal</strong>—Messages regarding address withdrawal.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Label mapping</strong>—Messages with label mapping information.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Label request</strong>—Request for a label mapping from a neighboring router.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Label withdrawal</strong>—Withdrawal message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Label release</strong>—Message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Label abort</strong>—Messages about label interruptions.</td>
</tr>
<tr>
<td></td>
<td>• <strong>All UDP</strong>—All hello messages sent by LSRs to the well-known UDP port, 646.</td>
</tr>
<tr>
<td></td>
<td>• <strong>All TCP</strong>—All LDP session messages.</td>
</tr>
</tbody>
</table>

### Table 134: show ldp statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDP events and errors:</td>
<td></td>
</tr>
<tr>
<td>Sessions opened</td>
<td>Number of LDP sessions that have been opened.</td>
</tr>
<tr>
<td>Sessions closed</td>
<td>Number of LDP sessions that have been closed.</td>
</tr>
<tr>
<td>Topology changes</td>
<td>Number of changes to the known LDP topology.</td>
</tr>
<tr>
<td>No interface</td>
<td>Number of missing interface address messages. When a new LDP session is initialized and before sending label lapping or label request messages, the LSR advertises its interface addresses with one or more address messages.</td>
</tr>
<tr>
<td>No session</td>
<td>Number of missing session messages. Session messages are used to establish, maintain, and terminate sessions between LDP peers.</td>
</tr>
<tr>
<td>No adjacency</td>
<td>The exchange of hello adjacency messages results in the creation of an adjacency. The LDP identifier, together with the sender’s LDP identifier in the PDU header, enables the receiver to match the initialization message with one of its hello adjacencies. If there is no matching hello adjacency, the LSR sends a session the initialization message is rejected.</td>
</tr>
<tr>
<td>Unknown version</td>
<td>The LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment.</td>
</tr>
<tr>
<td>Malformed PDU</td>
<td>An LDP PDU received on a TCP connection for an LDP session is malformed if the LDP identifier in the PDU header is unknown to the receiver, or if it is known but is not the LDP identifier associated by the receiver with the LDP peer for this LDP session.</td>
</tr>
<tr>
<td></td>
<td>An LDP PDU is considered to be malformed if the LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment.</td>
</tr>
<tr>
<td></td>
<td>An LDP PDU is considered malformed if the PDU length field is too small (less than 14) or too large (greater than maximum PDU length).</td>
</tr>
<tr>
<td>Malformed message</td>
<td>Malformed LDP messages that are part of the LDP discovery mechanism are handled by silently discarding them.</td>
</tr>
<tr>
<td></td>
<td>An LDP message is malformed if the message type is unknown. If the message type is less than 0x8000 (high order bit = 0), it is an error signaled by the unknown message type status code.</td>
</tr>
<tr>
<td></td>
<td>An LDP message is considered to be malformed if the message length is too large, meaning that the message extends beyond the end of the containing LDP PDU.</td>
</tr>
<tr>
<td></td>
<td>The LDP message is considered to be malformed if the message length is too small, meaning that it is smaller than the smallest possible value component.</td>
</tr>
<tr>
<td></td>
<td>The LDP message is considered to be malformed if the message is missing one or more mandatory parameters.</td>
</tr>
<tr>
<td>Unknown message type</td>
<td>If the message type is less than 0x8000 (high order bit = 0) or greater than or equal to 0x8000 (high order bit = 1) it is considered to be an unknown message.</td>
</tr>
<tr>
<td>Inappropriate message</td>
<td>The message is not of the type that the receiver expects to receive.</td>
</tr>
<tr>
<td>Malformed TLV</td>
<td>The TLV ILength is too large or the receiver cannot decode the TLV value. This can indicate an issue in either the sending or receiving LSR.</td>
</tr>
</tbody>
</table>

show ldp traffic-statistics

Syntax

```
show ldp traffic-statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
<p2mp>
```

Release Information

Command introduced before Junos OS Release 7.4.

**p2mp** option added in Junos OS Release 11.2.

Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

Description

Display Label Distribution Protocol (LDP) traffic statistics.

**NOTE:** If nonstop active routing features is configured, *show ldp traffic-statistics* command is not supported on backup Routing Engines.

Options

none—Display LDP traffic statistics for all routing instances.

instance *instance-name*—(Optional) Display LDP traffic statistics for the specified routing instance only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

p2mp—(Optional) Display only the data traffic statistics for a point-to-multipoint LSP.

Additional Information

To collect output from this command on a periodic basis, configure the *traffic-statistics* statement for the LDP protocol. For more information, see the Junos MPLS Applications Configuration Guide.

Required Privilege Level

Example: Configuring Multipoint LDP In-Band Signaling for Point-to-Multipoint LSPs | 1082

List of Sample Output
show ldp traffic-statistics on page 3462
show ldp traffic-statistics p2mp (Ingress or transit router only, Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 3463
show ldp traffic-statistics p2mp (Multipoint LDP with Multicast-Only Fast Reroute) on page 3464

Output Fields
Table 135 on page 3461 lists the output fields for the show ldp traffic-statistics command. Output fields are listed in the approximate order in which they appear.

Table 135: show ldp traffic-statistics Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message type</td>
<td>LDP message types.</td>
</tr>
<tr>
<td>FEC</td>
<td>Forwarding equivalence class (FEC) for which LDP traffic statistics are collected. For P2MP LSPs, FEC appears as a combination of root address and the LSP ID (root_addr:lsp_id). For M-LDP P2MP LSPs, FEC appears as a combination of root address multicast source address, and multicast group address (root_addr:lsp_id.grp.src).</td>
</tr>
<tr>
<td>Type</td>
<td>Type of traffic originating from a router, either Ingress (originating from this router) or Transit (forwarded through this router).</td>
</tr>
<tr>
<td>Packets</td>
<td>Number of packets passed by the FEC since its LSP came up.</td>
</tr>
<tr>
<td>Bytes</td>
<td>Number of bytes of data passed by the FEC since its LSP came up.</td>
</tr>
<tr>
<td>Shared</td>
<td>Whether a label is shared by prefixes: Yes or No. A Yes value indicates that several prefixes are bound to the same label (for example, when several prefixes are advertised with an egress policy). The LDP traffic statistics for this case apply to all the prefixes and should be treated as such.</td>
</tr>
<tr>
<td>Nexthop</td>
<td>The next hop address for P2MP LSPs. (This is the downstream LDP Session ID.)</td>
</tr>
</tbody>
</table>
Table 135: show ldp traffic-statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>For multipoint LDP with multicast-only fast reroute (MoFRR), the multipoint LDP node selects two separate upstream peers and sends two separate labels, one to each upstream peer. The same algorithm described in RFC 6388 is used to select the primary upstream path. The backup upstream path selection again uses the same algorithm but excludes the primary upstream LSR as a candidate. Two streams of MPLS traffic are sent to the egress node from the two different upstream peers. The MPLS traffic from only one of the upstream neighbors is selected as the primary path to accept the traffic, and the other becomes the backup path. The traffic on the backup path is dropped. When the primary upstream path fails, the traffic from the backup path is then accepted. The multipoint LDP node selects the two upstream paths based on the interior gateway protocol (IGP) root node next hop. Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.</td>
</tr>
</tbody>
</table>

| Backup route | For multipoint LDP with MoFRR, the route that is used if the primary route becomes unavailable. |

<tr>
<td>State</td>
<td>State of the current key.</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>The value can be:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• receive</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• send</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• send-receive</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For the active key, the State can be send-receive, send, or receive. For keys that have a future start time, the State is inactive. Compare the State field to the Mode field.</td>
<td></td>
</tr>
<tr>
<td>Option</td>
<td>For IS-IS only, the option determines how Junos OS encodes the message authentication code in routing protocol packets.</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>The values can be:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• basic—Based on RFC 5304.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• isis-enhanced—Based on RFC 5310.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The default value is basic. When you configure the isis-enhanced option, Junos OS sends RFC 5310-encoded routing protocol packets and accepts both RFC 5304-encoded and RFC 5310-encoded routing protocol packets that are received from other devices.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>When you configure basic (or do not include the options statement in the key configuration) Junos OS sends and receives RFC 5304-encoded routing protocols packets, and drops 5310-encoded routing protocol packets that are received from other devices.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Because this setting is for IS-IS only, the TCP and the BFD protocol ignore the encoding option configured in the key.</td>
<td></td>
</tr>
</tbody>
</table>
Table 136: show security keychain Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start-time</td>
<td>Time that the current key became active.</td>
<td>detail</td>
</tr>
<tr>
<td>Mode</td>
<td>Mode of each key (Informational only.)</td>
<td>detail</td>
</tr>
</tbody>
</table>

The value can be
- receive
- send
- send-receive

The mode of the key is based on the configuration. Suppose you configure two keys, one with a start-time of today and the other with a start-time of next week. For both keys, the Mode can be send-receive, send, or receive, regardless of the configured start-time. Compare the Mode field to the State field.

```

Release Information

Command introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description

Trace route to a remote host for an MPLS label-switched path signaled by the LDP. Use `traceroute mpls ldp` as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

Options

**fec**—Specify the IP address and optional prefix of the forwarding equivalence class (FEC).

**destination ip-address**—(Optional) Specify the destination address to use when sending probes.

- **Values:** The destination IP address must be within the 127.0.0.0/8 IP address space for Operation, Administration, and Maintenance (OAM) packets.

**detail**—(Optional) Display detailed output.

**exp exp**—(Optional) Specify the class-of-service to use when sending probes.

- **Range:** 0 through 7
- **Default:** 7
fanout \texttt{fanout-number}—(Optional) Specify the maximum number of nexthops to search per node.

\begin{itemize}
\item \textbf{Range:} 1 through 16
\item \textbf{Default:} 16
\end{itemize}

\texttt{logical-system}—(Optional) Specify the name of the logical system for the traceroute attempt.

\texttt{no-resolve}—(Optional) Specify not to resolve the hostname that corresponds to the IP address.

\texttt{paths maximum-paths}—(Optional) Specify the maximum number of paths to search.

\begin{itemize}
\item \textbf{Range:} 1 through 255
\item \textbf{Default:} 16
\end{itemize}

\texttt{pipe-mode}—(Optional) Specify to trace only nodes that understand LDP FEC.

In an interoperation with other vendor devices or devices running Junos OS Release that do not support tracing of hierarchical LSPs as described in RFC 6424, continuous non-complaint probe status is displayed in the \texttt{traceroute mpls ldp} command output. To avoid this LDP loop creation, use the \texttt{pipe-mode} option with the \texttt{traceroute mpls ldp fec} command.

\textbf{NOTE:} Even after using the \texttt{traceroute mpls ldp fec pipe-mode} command, one or more intermediate transit nodes that do not understand LDP FEC can return non-complaint probe status in the command output.

\texttt{retries retries-number}—(Optional) Specify the number of times to resend probe values.

\begin{itemize}
\item \textbf{Range:} 1 through 9
\item \textbf{Default:} 3
\end{itemize}

\texttt{routing-instance routing-instance-name}—(Optional) Specify the name of the routing instance for the traceroute attempt.

\texttt{source source-address}—(Optional) Specify the source address of the outgoing traceroute packets.

\texttt{ttl value}—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

\begin{itemize}
\item \textbf{Range:} 1 through 125
\item \textbf{Default:} 64
\end{itemize}

\texttt{update}—(Optional) Update database contents with traceroute results.

\texttt{wait seconds}—(Optional) Specify the number of seconds to wait before resending a probe.

\begin{itemize}
\item \textbf{Range:} 5 through 15
\item \textbf{Default:} 10
\end{itemize}

Release Information
Command introduced in Junos OS Release 19.1R1.

Description
Trace route to a remote host for a segment routing label-switched path added by the ISIS protocol. Use traceroute mpls segment-routing isisp as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

Options

fec—Specify the IP address and optional prefix of the forwarding equivalence class (FEC).

destination ip-address—(Optional) Specify the destination address to use when sending probes.

Values: The destination IP address must be within the 127.0.0.0/8 IP address space for Operation, Administration, and Maintenance (OAM) packets.

detail—(Optional) Display detailed output.

exp exp—(Optional) Specify the class-of-service to use when sending probes.

Range: 0 through 7
Default: 7

fanout fanout-number—(Optional) Specify the maximum number of nexthops to search per node.

Range: 1 through 16
Default: 16
logical-system—(Optional) Specify the name of the logical system for the traceroute attempt.

no-resolve—(Optional) Specify not to resolve the hostname that corresponds to the IP address.

paths maximum-paths—(Optional) Specify the maximum number of paths to search.
  Range: 1 through 255
  Default: 16

retries retries-number—(Optional) Specify the number of times to resend probe values.
  Range: 1 through 9
  Default: 3

routing-instance routing-instance-name—(Optional) Specify the name of the routing instance for the traceroute attempt.

source source-address—(Optional) Specify the source address of the outgoing traceroute packets.

ttl value—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.
  Range: 1 through 125
  Default: 64

wait seconds—(Optional) Specify the number of seconds to wait before resending a probe.
  Range: 5 through 15
  Default: 10

CCC and TCC Operational Commands

IN THIS CHAPTER

- show connections | 3482
- show route ccc | 3486
- show route forwarding-table | 3488
show connections

List of Syntax
Syntax on page 3482
Syntax (EX Series Switches) on page 3482

Syntax

    show connections
    <brief | extensive>
    <all | interface-switch | lsp-switch | p2mp-receive-switch | p2mp-transmit-switch | remote-interface-switch>
    <down | up | up-down>
    <history>
    <labels>
    <logical-system (all | logical-system-name)>
    <name>
    <status>

Syntax (EX Series Switches)

    show connections
    <brief | extensive>
    <all | interface-switch | lsp-switch | p2mp-receive-switch | p2mp-transmit-switch | remote-interface-switch>
    <down | up | up-down>
    <history>
    <labels>
    <name>
    <status>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.

Description
Display information about the configured circuit cross-connect (CCC) connections.

Options
none—Display the standard level of output for all configured CCC connections.

all—(Optional) Display all connections.

brief | extensive—(Optional) Display the specified level of output. Use history to display information about connection history. Use labels to display labels used for transmit and receive LSPs. Use status to display information about the connection and interface status.
interface-switch—(Optional) Display interface switch connections only.

lsp-switch—(Optional) Display LSP switch connections only.

p2mp-receive-switch—(Optional) Display point-to-multipoint LSP to local interfaces switch connections only.

p2mp-transmit-switch—(Optional) Display local interface to point-to-multipoint LSP switch connections only.

remote-interface-switch—(Optional) Display remote interface switch connections only.

down | up | up-down—(Optional) Display nonoperational, operational, or both kinds of connections.

history—(Optional) Display information about connection history.

labels—(Optional) Display labels used for transmit and receive.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name—(Optional) Display information about the specified connection only.

status—(Optional) Display information about the connection and interface status.

**Output Fields**

Table 79 on page 3111 describes the output fields for the `show connections` command. Output fields are listed in the approximate order in which they appear.

*Table 140: show connections Output Fields*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCC and TCC connections [Link Monitoring On</td>
<td>Off]</td>
</tr>
<tr>
<td>Legend for Status (St)</td>
<td>Connection or circuit status. See the output's legend for an explanation of the status field values.</td>
</tr>
</tbody>
</table>
### Table 140: show connections Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Legend for connection types</strong></td>
<td>Type of connection:</td>

show route ccc

Syntax

```
show route ccc ccc
  <brief | detail | extensive | terse>
  <logical-system (all | logical-system-name)>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display circuit cross-connect (CCC) entries in the Multiprotocol Link Switching (MPLS) routing table.

Options

ccc—Name of an entry with a circuit cross-connect interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

Release Information
Command introduced before Junos OS Release 7.4.
Option bridge-domain introduced in Junos OS Release 7.5
Option learning-vlan-id introduced in Junos OS Release 8.4
Options all and vlan introduced in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description
Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops.
This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

NOTE: The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the show pfe route command.

Options
none—Display the routes in the forwarding tables. By default, the show route forwarding-table command does not display information about private, or internal, forwarding tables.

detail | extensive | summary—(Optional) Display the specified level of output.

all—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.
bridge-domain (all | bridge-domain-name)—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

ccc interface-name—(Optional) Display route entries for the specified circuit cross-connect interface.

destination destination-prefix—(Optional) Destination prefix.

family family—(Optional) Display routing table entries for the specified family: bridge (ccc | destination | detail | extensive | interface-name | label | learning-vlan-id | matching | multicast | summary | table | vlan | vpn), ethernet-switching, evpn, fibre-channel, fmembers, inet, inet6, iso, mcsnoop-inet, mcsnoop-inet6, mpls, satellite-inet, satellite-inet6, satellite-vpls, tnp, unix, vpls, or vlan-classification.

interface-name interface-name—(Optional) Display routing table entries for the specified interface.

label name—(Optional) Display route entries for the specified label.

lcc number—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

learning-vlan-id learning-vlan-id—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

matching matching—(Optional) Display routing table entries matching the specified prefix or prefix length.

multicast—(Optional) Display routing table entries for multicast routes.

table —(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the show route instance command.

vlan (all | vlan-name)—(Optional) Display information for all VLANs or for the specified VLAN.

vpn vpn—(Optional) Display routing table entries for a specified VPN.

**Output Fields**

Table 107 on page 3229 lists the output fields for the `show route forwarding-table` command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the `detail` keyword is used instead of the `extensive` keyword.

**Table 141: show route forwarding-table Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logical system</td>
<td>Name of the logical system. This field is displayed if you specify the <code>table logical-system-name/routing-instance-name</code> option on a device that is configured for and supports logical systems.</td>
<td>All levels</td>
</tr>
<tr>
<td>Routing table</td>
<td>Name of the routing table (for example, inet, inet6, mpls).</td>
<td>All levels</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>
Table 141: show route forwarding-table Output Fields *(continued)*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>The features and protocols that have been enabled for a given routing table. This field can contain the following values:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>BUM hashing—BUM hashing is enabled.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC Stats—Mac Statistics is enabled.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Bridging—Routing instance is a normal layer 2 bridge.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>No VLAN—No VLANs are associated with the bridge domain.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>All VLANs—The <em>vlan-id all</em> statement has been enabled for this bridge domain.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Single VLAN—Single VLAN ID is associated with the bridge domain.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC action drop—New MACs will be dropped when the MAC address limit is reached.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Dual VLAN—Dual VLAN tags are associated with the bridge domain</td>
<td></td>
<td></td>
</tr>
<tr>
<td>No local switching—No local switching is enabled for this routing instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Learning disabled—Layer 2 learning is disabled for this routing instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>VPLS—The VPLS protocol is enabled.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>No IRB l2-copy—The no-irb-layer-2-copy feature is enabled for this routing instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ACKed by all peers—All peers have acknowledged this routing instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>BUM Pruning—BUM pruning is enabled on the VPLS instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Def BD VXLAN—VXLAN is enabled for the default bridge domain.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EVPN—EVPN protocol is enabled for this routing instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Def BD OVSDB—Open vSwitch Database (OVSDB) is enabled on the default bridge domain.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>L2 backhaul—Layer 2 backhaul is enabled.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>FRR optimize—Fast reroute optimization</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC pinning—MAC pinning is enabled for this bridge domain.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC Aging Timer—The MAC table aging time is set per routing instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>PBBN—This routing instance is configured as a provider backbone bridged network.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Table 141: show route forwarding-table Output Fields (continued)**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address family</td>
<td>Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).</td>

<td>Destination</td>
<td>Destination of the route.</td>
<td><strong>detail extensive</strong></td>
</tr>
<tr>
<td>Route Type (Type)</td>
<td>How the route was placed into the forwarding table. When the detail keyword is used, the route type might be abbreviated (as shown in parentheses):</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>cloned</strong> (clon)—(TCP or multicast only) Cloned route.</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• <strong>destination</strong> (dest)—Remote addresses directly reachable through an interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>destination down</strong> (iddn)—Destination route for which the interface is unreachable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>interface cloned</strong> (ifcl)—Cloned route for which the interface is unreachable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>route down</strong> (ifdn)—Interface route for which the interface is unreachable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>ignore</strong> (ignr)—Ignore this route.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>interface</strong> (intf)—Installed as a result of configuring an interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>permanent</strong> (perm)—Routes installed by the kernel when the routing table is initialized.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>user</strong>—Routes installed by the routing protocol process or as a result of the configuration.</td>
<td></td>
</tr>
<tr>
<td>Route Reference (RtRef)</td>
<td>Number of routes to reference.</td>
<td><strong>detail extensive</strong></td>
</tr>
</tbody>
</table>

- PBN—This routing instance is configured as a provider bridge network.
- ETREE—The ETREE protocol is enabled on this EVPN routing instance.
- ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance.
- Def BD EVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain.
- MPLS control word—Control word is enabled for this MPLS routing instance.

**show route forwarding-table extensive (RPF)**

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
    unit 0 {
        family inet {
            rpf-check;
            address 192.0.2.2/30;
        }
    }
}
```

```
user@host> show route forwarding-table extensive
```

**Routing table: inet [Index 0]**

Internet:

```
...  
```

```
Destination:  192.0.2.3/32
Route type: destination
Route reference: 0                   Route interface-index: 67
Flags: sent to PFE
Nexthop: 192.0.2.3
Next-hop type: broadcast             Index: 328      Reference: 1
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0
```

**show route forwarding-table extensive (PIM using point-to-multipoint mode)**

```
user@host> show route forwarding-table extensive
```

**Destination:  198.51.100.0/24**

```
Route type: user
Route reference: 0                   Route interface-index: 335
Multicast RPF nh index: 0
P2mpidx: 0
Flags: cached, check incoming interface , accounting, sent to PFE, rt nh decoupled
```

```
Next-hop type: indirect               Index: 1048575  Reference: 4

clear path-computation-client statistics

Syntax

clear path-computation-client statistics
<pce-id | all>

Release Information
Statement introduced in Junos OS Release 12.3.
Statement introduced in Junos OS Release 16.1R3 for QFX Series switches.
Command introduced in Junos OS Release 17.1R1 for ACX Series routers.

Description
Clear Path Computation Element (PCE) statistics.

Options
pce-id—(Optional) Clear statistics of the specified PCE.
all—(Optional) Clear statistics of all available PCEs configured on the path computation client (PCC).

Required Privilege Level
clear

RELATED DOCUMENTATION

| show path-computation-client statistics | 3531 |

List of Sample Output
clear path-computation-client statistics pce-id on page 3514
clear path-computation-client statistics all on page 3515

Output Fields
When you enter this command, you are not provided feedback on the status of your request.

Sample Output

clear path-computation-client statistics pce-id
user@host> clear path-computation-client statistics pce1
clear path-computation-client statistics all

user@host> clear path-computation-client statistics all
request path-computation-client active-pce

Syntax

request path-computation-client active-pce pce-id

Release Information
Command introduced in Junos OS Release 12.3.
Command introduced in Junos OS Release 16.1R3 for QFX Series switches.
Command introduced in Junos OS Release 17.1R1 for ACX Series routers.

Description
Request a new active Path Computation Element (PCE).

Options
pce-id—Unique user defined ID for this PCE.
retry-delegation—Retry label-switched path (LSP) delegation

Required Privilege Level
request

RELATED DOCUMENTATION

| show path-computation-client active-pce | 3520

Output Fields
This command produces no output. To verify the operation of the command, run the show path-computation-client active-pce before and after running the request path-computation-client active-pce command.
show isis spring sensor info

Syntax

```
show isis spring sensor info
logical-system (all | logical-system-name)
```

Release Information
Command introduced in 19.1R1 on MX Series routers with MPC and MIC interfaces, and PTX series routers.

Description
Displays a list of sensors associated with the label IS-IS route and next hops for segment routing traffic. The command only displays the information related to the sensors and not the traffic statistics.

Options

none— Display the sensor information of an IS-IS SPRING route.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

RELATED DOCUMENTATION

`sensor-based-stats`

`source-packet-routing (Protocols IS-IS and OSPF)`

`Understanding Source Packet Routing in Networking (SPRING)`

show path-computation-client active-pce

Syntax

```
show path-computation-client active-pce
<brief | detail>
```

Release Information

Command introduced in Junos OS Release 12.3.
Command introduced in Junos OS Release 16.1R3 for QFX Series switches.
Command introduced in Junos OS Release 17.1R1 for ACX Series routers.

Description

Displays information about the current active Path Computation Element (PCE).

Options

- **none**—Display brief information about the current active PCE.
- **brief | detail**—(Optional) Display the specific level of output.

Required Privilege Level

view

show path-computation-client lsp

Syntax

show path-computation-client lsp
   <extensive>
   <p2mp>

Release Information
Command introduced in Junos OS Release 17.2R1 on MX Series routers.
extensive and p2mp options introduced in Junos OS Release 18.3R1 on MX Series routers.

Description
Display the state of label-switched paths (LSPs) known to the Path Computation Client (PCC).

Options
none—Display information about LSPs known to the PCC.

extensive—(Optional) Display extensive level of output about each known LSP - point-to-point and point-to-multipoint LSPs.

p2mp—(Optional) Display information about known point-to-multipoint Path Computation Element (PCE)-initiated LSPs.

Required Privilege Level

show path-computation-client statistics

Syntax

show path-computation-client statistics
  <brief | detail>
  <all>

Release Information
Command introduced in Junos OS Release 12.3.
Command introduced in Junos OS Release 16.1R3 for QFX Series switches.
Command introduced in Junos OS Release 17.1R1 for ACX Series routers.

Description
Display statistics about the Path Computation Element (PCE).

Options
none—Display statistics about the primary PCE.

brief | detail—(Optional) Display the specific level of output.

all—(Optional) Display the statistics about all PCEs configured on the PCC.

Required Privilege Level

show path-computation-client status

Syntax

show path-computation-client status
<extensive>

Release Information
Command introduced in Junos OS Release 17.2R1 on MX Series routers.
extensive option introduced in Junos OS Release 18.3R1 on MX Series routers.

Description
Display the status of the Path Computation Client (PCC).

Options
none—Display the status of the PCC.

extensive—(Optional) Display extensive information about the PCC including point-to-point and
point-to-multipoint PCE-initiated LSPs.

For point-to-multipoint PCE-initiated LSPs, the extensive output displays the point-to-multipoint LSP
tree and branches separately for a PCEP session.

Required Privilege Level

show path-computation-client traffic-steering

Syntax

```
show path-computation-client traffic-steering
   pce pce-id
```

Release Information

Command introduced in Junos OS Release 19.4R1 on all platforms.

Description

Display information on flow specification capability (also called traffic steering functionality). This is used for enabling the mapping of PCE-initiated point-to-multipoint LSPs to an MVPN routing-instance.

Options

- **none**—Display information about the flow specification capability.
- **pce** `pce-id`—(Optional) Display information about the flow specification capability for the specified PCE ID.

Required Privilege Level

`view`

```
show spring-traffic-engineering

Syntax

```
show spring-traffic-engineering (lsp | overview | sbfd)
  <brief | detail>
  <logical-system (all | logical-system-name)>
  <name lsp-name>
```

Release Information
Command introduced in Junos OS Release 17.2 on MX Series routers.
`sbfd` option introduced in Junos OS Release 19.4R1 on all platforms.

Description
Display ingress details of SPRING traffic engineering.

Options
brief | detail—(Optional) Display the specific level of output.

lsp—Display details of SPRING traffic engineered LSPs on the ingress router or the Path Computation Client (PCC).

overview—Display overview of SPRING traffic engineered LSPs on the ingress router, or the PCC.

sbfd—Display SPRING Traffic Engineered BFD session.

name lsp-name—(Optional) Regular expression for LSP names to match for displaying SPRING traffic engineering details.

Required Privilege Level
view
