Interface transmit statistics: Disabled

Meaning

The sample output shows that the link is up and there are no alarms in this loopback configuration. When an internal loopback is configured, the physical loopback should come up without an alarm.

Sample Output

When you see that the physical link is down, there may be a problem with the port. The following output is an example of the show interfaces fe-fpc/pic/port command when the physical link is down:

```
user@router> show interfaces fe-1/3/0
Physical interface: fe-1/3/0, Enabled, Physical link is Down
  Interface index: 44, SNMP ifIndex: 35
  Link-level type: Ethernet, MTU: 1514, Source filtering: Disabled
  Speed: 100mbps, Loopback: Disabled, Flow control: Enabled
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps
  Link flags     : None
  Current address: 00:90:69:8d:2c:db, Hardware address: 00:90:69:8d:2c:db
  Input rate     : 0 bps (0 pps), Output rate: 0 bps (0 pps)
  Active alarms : LINK
  Active defects: LINK
  MAC statistics:
    Input octets: 0, Input packets: 0, Output octets: 0, Output packets: 0
  Filter statistics:
    Filtered packets: 0, Padded packets: 0, Output packet errors: 0
  Autonegotiation information:
    Negotiation status: Incomplete, Link partner status: Down
    Reason: Link partner autonegotiation failure
    Link partner: Half-duplex, Flow control: None
```

Meaning

The sample output shows that the physical link is down and there are active alarms and defects.

Table 132 on page 1056 presents problem situations and actions for a physical link that is down.
Table 132: Problems and Solutions for a Physical Link That Is Down

<table>
<thead>
<tr>
<th>Problem</th>

<tbody>
<tr>
<td>Cable mismatch</td>
<td>Verify that the fiber connection is correct.</td>
</tr>
<tr>
<td>Damaged and/or dirty cable</td>
<td>Verify that the fiber can successfully loop a known good port of the same type.</td>
</tr>
<tr>
<td>Too much or too little optical attenuation</td>
<td>Verify that the attenuation is correct per the PIC optical specifications.</td>
</tr>
<tr>
<td>The transmit port is not transmitting within the dBm optical range per the specifications</td>
<td>Verify that the Tx power of the optics is within range of the PIC optical specification.</td>
</tr>
<tr>
<td>Mismatch between the cable type and the port</td>
<td>Verify that a single-mode fiber cable is connected to a single-mode interface and that a multimode fiber cable is connected to a multimode interface. (This problem does not always cause the physical link to go down; errors and dropped packets are sometimes the result.)</td>
</tr>
</tbody>
</table>

Configure a Static Address Resolution Protocol Table Entry

Purpose

Configure a static Address Resolution Protocol (ARP) entry to allow a packet to be sent out of a looped Ethernet interface.

NOTE: Remove the static ARP entry at the end of the loop test after you have completed the tests and monitored interface traffic.

Action

To configure a static ARP table entry for a Gigabit Ethernet interface, follow these steps. You can follow the same procedure to configure a static ARP entry for a Fast Ethernet interface.

1. Find the Media Access Control (MAC) address for the Gigabit Ethernet interface:

   ```
   user@host> show interfaces ge-fpc/pic/port
   Physical interface: ge-4/0/6, Enabled, Physical link is Up
   Interface index: 144, SNMP ifIndex: 516, Generation: 147
   Device flags : Present Running Loop-Detected
   Interface flags: SNMP-Traps Internal: 0x4000
   Link flags : None
   CoS queues : 8 supported, 4 maximum usable queues
   Schedulers : 0
   ```
Hold-times: Up 0 ms, Down 0 ms

Current address: 00:1f:12:fe:c5:2e, Hardware address: 00:1f:12:fe:c5:2e

Last flapped: 2015-01-20 23:40:04 PST (00:13:49 ago)

2. In configuration mode, go to the following hierarchy level:

   [edit]
   user@host# edit interfaces interface-name unit logical-unit-number family inet address address

3. Configure the static ARP entry:

   user@host# set arp ip-address mac mac-address

4. Commit the configuration:

   user@host# commit

5. Verify that the static ARP entry is installed:

   [edit interfaces ge-4/0/6 unit 0 family inet address 10.108.120.1/30]
   user@host# run show arp no-resolve

   MAC Address Address Interface Flags
   00:1f:12:fe:c5:2e 10.108.120.2 ge-4/0/6.0 permanent
Meaning

The sample output is for Step 1 through Step 6 and shows that a static ARP entry was configured on Gigabit Ethernet interface ge-4/0/6.

Clear Fast Ethernet or Gigabit Ethernet Interface Statistics

Purpose

You can reset the Fast Ethernet and Gigabit Ethernet interface statistics. Resetting the statistics provides a clean start so that previous input/output errors and packet statistics do not interfere with the current diagnostics.

Action

To clear all statistics for the interface, use the following Junos OS CLI operational mode command:

```
user@host> clear interfaces statistics fe-fpc/pic/port ge-fpc/pic/port
```

Sample Output

```
user@host> clear interfaces statistics ge-4/0/6
user@host>
```

Meaning

This command clears the interface statistics counters for the Gigabit Ethernet interface only.

Ping the Fast Ethernet or Gigabit Ethernet Interface

Purpose

Use the ping command to verify the loopback connection.

Action

To send ping packets from the Ethernet interface, use the following Junos OS CLI operational mode command:

```
user@host> ping remote-IP-address bypass-routing interface fe-fpc/pic/port ge-fpc/pic/port count 100 rapid
```
Sample Output

```
user@router> ping 10.108.120.2 bypass-routing interface ge-7/2/1 count 100 rapid
PING 10.108.120.2 (10.108.120.2): 56 data bytes
36 bytes from 10.108.120.1: Time to live exceeded
4 5 00 00054 e871 0 0000 01 01 cc5c 10.108.120.1 10.108.120.2
36 bytes from 10.108.120.1: Time to live exceeded
4 5 00 00054 e874 0 0000 01 01 cc59 10.108.120.1 10.108.120.2
36 bytes from 10.108.120.1: Time to live exceeded
4 5 00 00054 e878 0 0000 01 01 cc55 10.108.120.1 10.108.120.2
36 bytes from 10.108.120.1: Time to live exceeded
4 5 00 00054 e87c 0 0000 01 01 cc51 10.108.120.1 10.108.120.2
36 bytes from 10.108.120.1: Time to live exceeded
4 5 00 00054 e880 0 0000 01 01 cc4d 10.108.120.1 10.108.120.2
36 bytes from 10.108.120.1: Time to live exceeded
4 5 00 00054 e884 0 0000 01 01 cc49 10.108.120.1 10.108.120.2
36 bytes from 10.108.120.1: Time to live exceeded
```

Meaning  The sample output shows that the time to live (TTL) expired, indicating that the link is receiving the frames from the ping test. The MAC address used is the same as the physical address of the port being tested because this allows the port to accept the frames from the ping test. As the packet is looped over the link, you expect to receive a TTL exceeded message for each ping sent. These messages are generated because the ping packets are repeatedly looped between the router and the physical loopback. When the packet is sent to the other end of the link, which does not exist, the loopback returns the packet back to the same interface, where it is again subjected to the Packet Forwarding Engine fabric for routing. After the route lookup, the TTL is decremented, and the packet is again sent out of the looped interface. This process repeats until the packet is either lost, or the TTL expires with subsequent TTL expired message displayed. Should any errors occur, the packet is discarded and a time-out error is displayed, rather than the expected TTL expired message. Note that the default TTL for ICMP echo packets in Junos OS is 64. This means a given test packet must be successfully sent and received 63 times before a TTL expired message can be generated. You can alter the TTL value to adjust the tolerance for loss, for example, a value of 255 is the most demanding test because now the packet must be sent and received error free 254 times.

Check for Fast Ethernet or Gigabit Ethernet Interface Error Statistics

Purpose  Persistent interface error statistics indicate that you need to open a case with the Juniper Networks Technical Assistance Center (JTAC).

Action  To check the local interface for error statistics, use the following Junos OS CLI operational mode command:
Sample Output

```
user@router> show interfaces ge-4/0/6 extensive
Physical interface: ge-4/0/6, Enabled, Physical link is Up Interface index: 144, SNMP

Interface transmit statistics: Disabled

Meaning
Check for any error statistics. There should not be any input or output errors. If there are any persistent input or output errors, open a case with the Juniper Networks Technical Assistance Center (JTAC) at support@juniper.net or at 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).

Diagnose a Suspected Circuit Problem

Purpose
When you suspect a circuit problem, it is important to work with the transport-layer engineer to resolve the problem. The transport-layer engineer may create a loop to the
router from various points in the network. You can then perform tests to verify the connection from the router to that loopback in the network.

**Action**

After the transport-layer engineer has created the loop to the router from the network, you must verify the connection from the router to the loopback in the network. Follow Step 2 through Step 8 in “Diagnose a Suspected Hardware Problem with a Fast Ethernet or Gigabit Ethernet Interface” on page 1050. Keep in mind that any problems encountered in the test indicate a problem with the connection from the router to the loopback in the network.

By performing tests to loopbacks at various points in the network, you can isolate the source of the problem.

**See Also**

- *Ethernet Interfaces Feature Guide for Routing Devices*

**Display the Fast Ethernet or Gigabit Ethernet Interface LINK Alarm**

**Problem**

*Description:* To display the Fast Ethernet or Gigabit Ethernet LINK alarm, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show interfaces (fe-fpc/pic/port | ge-fpc/pic/port) extensive
```
The following sample output is for a Fast Ethernet interface:

```
user@host> show interfaces fe-1/3/3 extensive

Physical interface: fe-1/3/3, Enabled, Physical link is Down
  Interface index: 47, SNMP ifIndex: 38
  Description: Test
  Link-level type: Ethernet, MTU: 1514, Source filtering: Disabled
  Speed: 100mbps, Loopback: Disabled, Flow control: Enabled
  Device flags : Present Running
  Interface flags: SNMP-Traps
  Link flags : None

```
Meaning

The sample output shows where the alarm and other errors might be occurring and any counters that are incrementing. The only alarm associated with Fast Ethernet or Gigabit Ethernet interfaces is the LINK alarm. A LINK alarm indicates a physical problem. To isolate where the physical problem might be occurring, conduct loopback testing. See “Checklist for Using Loopback Testing for Fast Ethernet and Gigabit Ethernet Interfaces” on page 1049 for information on conducting a loopback test.

| NOTE: | Since link status is polled once every second, some items that require fast link down detection, such as Multiprotocol Label Switching (MPLS) fast reroute, take longer to execute. |

Fast Ethernet and Gigabit Ethernet Counters

| Problem | Description: Table 134 on page 1066 shows the major counters that appear in the output for the show interfaces fe-fpc/pic/port extensive and the show interfaces ge-fpc/pic/port extensive commands. These counters generally increment when there is a problem with a Fast Ethernet or Gigabit Ethernet interface. In the Counters column, the counters are listed in the order in which they are displayed in the output. |

<p>| Table 134: Major Fast Ethernet and Gigabit Ethernet Counters |
|---|---|---|
| Counter | Description | Reason for Increment |
| Input Errors: | | |
| Errors | The sum of the incoming frame aborts and frame check sequence (FCS) errors. | |</p>
<table>
<thead>
<tr>
<th>Counter</th>
<th>Description</th>
<th>Reason for Increment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policed discard</td>
<td>The frames discarded by the incoming packet match code.</td>
<td>The frames were discarded because they were not recognized or of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
</tr>
<tr>
<td>Drops</td>
<td>The number of packets dropped by the output queue of the I/O Manager application-specific integrated circuit (ASIC).</td>
<td>If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's random early detection (RED) mechanism.</td>
</tr>
<tr>
<td>L3 incompletes</td>
<td>The number of packets discarded due to the packets failing Layer 3 header checks.</td>
<td>This counter increments when the incoming packet fails Layer 3 (usually IPv4) checks of the header. For example, a frame with less than 20 bytes of available IP header would be discarded and this counter would increment.</td>
</tr>
<tr>
<td>L2 channel errors</td>
<td>The errors that occur when the software could not find a valid logical interface (such as fe-1/2/3.0) for an incoming frame.</td>
<td>This error increments when, for example, a lookup for a virtual LAN (VLAN) fails.</td>
</tr>
<tr>
<td>L2 mismatch timeouts</td>
<td>The count of malformed or short packets.</td>
<td>The malformed or short packets cause the incoming packet handler to discard the frame and be unreadable.</td>
</tr>
<tr>
<td>FIFO errors</td>
<td>The number of first in, first out (FIFO) errors in the receive direction as reported by the ASIC on the Physical Interface Card (PIC).</td>
<td>The value in this field should always be 0. If this value is not zero, cabling could be badly organized or the PIC could be broken.</td>
</tr>
</tbody>
</table>

**Output Errors**

<table>
<thead>
<tr>
<th>Errors</th>
<th>The sum of outgoing frame aborts and FCS errors.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Collisions</td>
<td>The number of Ethernet collisions.</td>
<td>The Fast Ethernet PIC supports only full-duplex operation, so this number should always remain 0. If it is incrementing, there is a software bug.</td>
</tr>
<tr>
<td>Drops</td>
<td>The number of packets dropped by the output queue of the I/O Manager ASIC.</td>
<td>If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</td>
</tr>
<tr>
<td>Aged packets</td>
<td>The number of packets that remained in shared packet SDRAM for so long that the system automatically purged them.</td>
<td>The value in this field should never increment. If it increments, it is probably a software bug or broken hardware.</td>
</tr>
<tr>
<td>HS link FCS errors, FIFO errors</td>
<td>The number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td>The value in this field should always be 0. If it increments, either the FPC or the PIC is broken.</td>
</tr>
</tbody>
</table>
### Table 134: Major Fast Ethernet and Gigabit Ethernet Counters (continued)

<table>
<thead>
<tr>
<th>Counter</th>
<th>Description</th>
<th>Reason for Increment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Miscellaneous Counters</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Input DA rejects</strong></td>
<td>The number of packets that the filter rejected because the destination Media Access Control (MAC) address of the packet is not on the accept list.</td>
<td>It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad Address Resolution Protocol (ARP) entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting).</td>
</tr>
<tr>
<td><strong>Output packet pad count</strong></td>
<td>The number of packets that the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware.</td>
<td>Usually, padding is done only on small ARP packets, but some very small Internet Protocol (IP) packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist, or it is misconfigured.</td>
</tr>
<tr>
<td><strong>Output packet error count</strong></td>
<td>Number of packets with an indicated error that the filter was given to transmit.</td>
<td>These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</td>
</tr>
<tr>
<td><strong>CAM destination filters, CAM source filters</strong></td>
<td>The number of entries in the content-addressable memory (CAM) dedicated to destination and source MAC address filters.</td>
<td>There can be up to 64 source entries. If source filtering is disabled, which is the default, the value for these fields should be 0.</td>
</tr>
</tbody>
</table>

### Troubleshooting: 10-Gigabit Ethernet Port Stuck in Down State

**Problem** | **Description**: 10-Gigabit Ethernet port is stuck in DPC or PIC down state.

**Environment**: Juniper Networks T Series and MX Series routers. Refer to the related documentation section for more information.

**Symptoms**: The device has failed to initialize because the Ethernet port is down.

**Diagnosis** | Try disabling and reenabling the interface and resetting the transceiver and cable. If the interface remains down, it can be stuck in DPC or PIC down state.

Does the router function normally after disabling and reenabling the interface and resetting the transceiver and cable?
Yes:
The system is not stuck in DPC or PIC down state. Disabling and reenabling the interface or resetting the transceiver, and cable resolved the issue.

No:
The interface might be stuck in DPC or PIC down state. Refer to the “To resolve the issue” on page 1069 section for recovery options.

1. Resolution

To resolve the issue
From the aforementioned diagnosis, you ascertain that the interface is stuck in DPC or PIC down state.
This is not a hardware defect. Implement one of the following solutions on the backup Routing Engine to resolve this issue:

- Reset the PIC.
- Toggle the framing mode.

1. In configuration mode, go to the [edit interfaces] hierarchy level.

```
user@host1# edit interfaces interface name
```

2. Toggle the framing mode. In the following configuration, WAN-PHY mode is toggled.

```
[edit interfaces interface-name is in the et-fpc/pic/port
user@host1# set framing wan-phy
user@host1# commit
user@host1# framing {
user@host1# wan-phy;
user@host1# }
user@host1# delete framing
user@host1# commit
```

3. Reset the PIC (T Series Routers)

```
user@host1# request chassis pic fpc-slot x pic-slot y offline
user@host1# request chassis pic fpc-slot x pic-slot y online
```

4. Reset the PIC (MX Series Routers)

```
user@host1# request chassis fpc slot x offline
user@host1# request chassis fpc slot x online
```

alarm (optics-options)

Syntax

```
alarm low-light—alarm {
    (link-down | syslog);
}
```

Hierarchy Level

[edit interfaces interface-name optics-options]

Release Information

Statement introduced in Junos OS Release 10.0.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.

Description

Specify the action to take if the receiving opticssignal is below the optics low-light alarm threshold.

Options

- link-down—Drop the 10-Gigabit Ethernet link and marks link as down.
- syslog—Write the optics information to the system log.

Required Privilege Level

interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Related Documentation

**backward-frr-enable**

**Syntax**

(backward-frr-enable | no-backward-frr-enable);

**Hierarchy Level**

[edit interfaces interface-name otn-options preemptive-fast-reroute]

**Release Information**

Statement introduced in Junos OS Release 13.2 for PTX Series routers.

**Description**

Enable or disable backward fast reroute status insertion.

Enable backward fast reroute to insert local pre-forward error correction (FEC) bit error rate (BER) status into transmitted OTN frames, notifying the remote interface. The remote interface can use the information to reroute traffic to a different interface. When you enable backward fast reroute and also enable pre-FEC BER monitoring including the `signal-degrade-monitor-enable` statement, notification of signal degradation and rerouting of traffic occurs in less time than that required through a Layer 3 protocol.

**NOTE:** When you configure pre-FEC BER signal degrade monitoring, we recommend that you configure both the `signal-degrade-monitor-enable` and `backward-frr-enable` statements.

You can also configure the pre-FEC BER thresholds that raise or clear a signal degrade alarm and the time interval for the thresholds. If the BER thresholds and interval are not configured, the default values are used. Include the `ber-threshold-signal-degrade value`, `ber-threshold-clear value`, and `interval value` statements at the [edit interfaces interface-name otn-options signal-degrade] hierarchy level to configure the BER thresholds and time interval. See “Understanding Pre-FEC BER Monitoring and BER Thresholds” on page 582 for more information about pre-FEC BER monitoring and determining BER threshold settings.

**Default**

By default, backward fast reroute insertion is disabled.

**Options**

- `backward-frr-enable`—Enable backward fast reroute status insertion.
- `no-backward-frr-enable`—Do not enable backward fast reroute status insertion.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

ber-threshold-clear

Syntax
ber-threshold-clear value;

Hierarchy Level
[edit interfaces interface-name otn-options signal-degrade]
[edit interfaces interface-name otn-options odu-signal-degrade]

Release Information
Statement introduced in Junos OS Release 13.2 for PTX Series routers.
Statement introduced in Junos OS Release 15.1F6 for MPC5E, MIC6-100G-CFP2 on MPC6E
on MX240, MX480, MX960, MX2010, and MX2020 routers.

Description
Specify bit error rate (BER) threshold to clear the interface alarm for signal degradation.

You can configure the BER clear threshold to customize the BER that will clear an interface
alarm when signal degrade monitoring is enabled.

NOTE: Configuring a high BER threshold for signal degradation and a long
interval might cause the internal counter register to be saturated. Such a
configuration is ignored by the router, and the default values are used instead.
A system log message is logged for this error.

If you configure the BER thresholds at the [edit interfaces interface-name otn-options
signal-degrade] hierarchy level, then the thresholds are calculated using the pre-forward
error correction (pre-FEC) BER (the BER before FEC correction). These thresholds are
used for pre-FEC BER monitoring. See "Understanding Pre-FEC BER Monitoring and BER
Thresholds" on page 582 for more information about pre-FEC BER monitoring and
determining BER threshold settings.

If you configure the BER thresholds at the [edit interfaces interface-name otn-options
odu-signal-degrade] hierarchy level, then the thresholds are calculated using the post-FEC
BER (the BER after FEC correction). This BER is referred to as the optical channel data
unit (ODU) BER.

NOTE: You can configure ODU BER thresholds only at the [edit interfaces
interface-name otn-options odu-signal-degrade] hierarchy level on the
P2-100GE-OTN PIC.

Table 135 on page 1078 shows the default values for pre-FEC BER and ODU BER signal
degradede threshold values for different PICs. If the BER signal degrade threshold is not
configured, the default value is used.
Table 135: Default Clear Threshold Values

<table>
<thead>
<tr>

<td>1.0E−6</td>
<td>1.0E−9</td>
</tr>
</tbody>
</table>

To configure the threshold that raises the signal degrade alarm, include the `ber-threshold-signal-degrade` statement at the same hierarchy level. To configure the time interval during which the BER must stay above or below the configured thresholds to raise or clear the alarm, include the `interval` statement at the same hierarchy level.

**NOTE:** For the P1-PTX-2-100G-WDM PIC, the BER must stay above the signal degradation threshold for ten consecutive intervals for the alarm to be raised and the BER must stay below the clear threshold for ten consecutive intervals for the alarm to be cleared. For example, if the interval is configured as 10 ms, then the BER must stay above the signal degradation threshold for 100 ms (10 ms * 10 intervals) for the alarm to be raised, or below the clear threshold for 100 ms for the alarm to be cleared.
Options  Values: value—BER threshold for clearing the signal degradation in scientific notation. Both the mantissa and exponent are configurable. Enter the value in the format xE-n, where x is the mantissa and n is the exponent. For example, 4.5E-3.

Range: The mantissa must be a decimal number. There is no limit on the number of digits before or after the decimal point. The exponent must be an integer from 0 through 9.

Default: See Table 135 on page 1078 for the default values.

BEST PRACTICE: Always set the ber-threshold-clear value lower than the ber-threshold-signal-degrade value. For the FEC limits, see the table describing the signal degrade and clear thresholds after configuration in “Understanding Pre-FEC BER Monitoring and BER Thresholds” on page 582.

NOTE: In Junos OS Release 13.2R1, only the exponent is valid input for the BER threshold value, and the mantissa is not configurable. The BER threshold value is 1.0E–n where n > 0, and the valid range of n is from 1 through 10.

Required Privilege Level

### ber-threshold-signal-degrade

**Syntax**

```
ber-threshold-signal-degrade value;
```

**Hierarchy Level**

```
[edit interfaces interface-name otn-options signal-degrade]
[edit interfaces interface-name otn-options odu-signal-degrade]
```

**Release Information**

Statement introduced in Junos OS Release 13.2 for PTX Series routers.
Statement introduced in Junos OS Release 15.1F6 for MPC5E, MIC6-100G-CFP2 on MPC6E on MX240, MX480, MX960, MX2010, and MX2020 routers.

**Description**

Specify the bit error rate (BER) threshold to raise an interface alarm for signal degradation.

You can configure the BER signal degrade threshold to customize the BER that will raise an interface alarm when signal degrade monitoring is enabled.

**NOTE:** Configuring a high BER threshold for signal degradation and a long interval might cause the internal bit error counter register to get saturated. For example, for the P1-PTX-2-100G-WDM PIC, the internal bit error counter gets saturated when the error count reaches 2E+29. Therefore, the value of `ber-threshold-signal-degrade * line rate / interval` must be less than 2E+29 to avoid saturation. Assuming a fixed PIC line rate of 1.27E+11 bits per second and an interval of 1000 ms, the `ber-threshold-signal-degrade` value must be less than 4.22E–3.

If the value of the `ber-threshold-signal-degrade * line rate / interval` exceeds the saturation limit, the configuration is ignored by the router, and the default values are used instead. A system log message is logged for this error.

If you configure the BER thresholds at the `[edit interfaces interface-name otn-options signal-degrade]` hierarchy level, then the thresholds are calculated using the pre-forward error correction (pre-FEC) BER (the BER before FEC correction). These thresholds are used for pre-FEC BER monitoring. See "Understanding Pre-FEC BER Monitoring and BER Thresholds" on page 582 for more information about pre-FEC BER monitoring and determining BER threshold settings.

If you configure the BER thresholds at the `[edit interfaces interface-name otn-options odu-signal-degrade]` hierarchy level, then the thresholds are calculated using the post-FEC BER (the BER after FEC correction). This BER is referred to as the optical channel data unit (ODU) BER.

**NOTE:** You can configure ODU BER thresholds only at the `[edit interfaces interface-name otn-options odu-signal-degrade]` hierarchy level on the P2-100GE-OTN PIC.
Table 136 on page 1081 shows the default values for pre-FEC BER and ODU BER signal degrade threshold values for different PICs. If the BER signal degrade threshold is not configured, the default value is used.

Table 136: Default Signal Degrade Threshold Values

<table>
<thead>
<tr>
<th>PIC or MPC</th>
<th>Default Pre-FEC BER Signal Degrade Threshold Value</th>
<th>Default ODU BER Signal Degrade Threshold Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>P1-PTX-2-100G-WDM</td>

<td>1.0E−6</td>
</tr>
<tr>
<td>MPC5E</td>
<td>1.14E−5</td>
<td>1.0E−6</td>
</tr>
</tbody>
</table>

To configure the threshold that clears the signal degrade alarm, include the `ber-threshold-clear` statement at the same hierarchy level. To configure the time interval during which the BER must stay above or below the configured thresholds to raise or clear the alarm, include the `interval` statement at the same hierarchy level.

**NOTE:** For the P1-PTX-2-100G-WDM PIC, the BER must stay above the signal degradation threshold for ten consecutive intervals for the alarm to be raised and the BER must stay below the clear threshold for ten consecutive intervals for the alarm to be cleared. For example, if the interval is configured as 10 ms, then the BER must stay above the signal degradation threshold for 100 ms (10 ms * 10 intervals) for the alarm to be raised, or below the clear threshold for 100 ms for the alarm to be cleared.
Options  **value**—BER threshold for signal degradation in scientific notation. Both the mantissa and exponent are configurable. Enter the value in the format \(x E^n\), where \(x\) is the mantissa and \(n\) is the exponent. For example, \(4.5E-3\).

**Range:** The mantissa must be a decimal number. There is no limit on the number of digits before or after the decimal point. The exponent must be an integer from 0 through 9.

**Default:** See Table 136 on page 1081.

---

**NOTE:** In Junos OS Release 13.2R1, only the exponent is valid input for the BER threshold value, the mantissa is not configurable. The BER threshold value is \(1.0E-n\) where \(n > 0\), and the valid range of \(n\) is from 1 through 10.

---

**BEST PRACTICE:** To enable proactive protection before packet loss occurs, set the `ber-threshold-signal-degrade value` below the FEC limit. For the FEC limits, see the table describing the signal degrade and clear thresholds after configuration in "Understanding Pre-FEC BER Monitoring and BER Thresholds" on page 582.

### bypass

**Syntax**

(bypass | no-bypass);

**Hierarchy Level**

[edit interfaces interface-name otn-options odu-delay-management ]

**Release Information**

Statement introduced in Junos OS Release 13.2 for PTX Series routers.

**Description**

Pass or do not pass the delay measurement (DM) value through a node.

**Default**

If you omit the bypass statement, the default behavior is to disable ODU delay management options.

By default, do not pass the DM value through a node.

**Options**

- **bypass**—Pass the DM value through a node.
- **no-bypass**—Do not pass the DM value through a node.

**Required Privilege Level**

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

### fec

**Syntax (M Series, MX Series, PTX Series)**

```
fec (efec | gfec | gfec-sdfec | hgfec | sd-fec | ufec | none);
```

**Syntax (ACX6360)**

```
fec ( sdfec | sdfec15 | none);
```

**Hierarchy Level (M Series, MX Series, PTX Series)**

```[edit interfaces interface-name otn-options]```

**Hierarchy Level (ACX6360)**

```[edit interfaces interface-name optics-options]```

**Release Information**

Statement introduced in Junos OS Release 9.4. Statement and **gfec-sdfec** option introduced in Junos OS Release 13.2 for PTX Series routers, with P1-PTX-2-100G-WDM PIC.

Options **efec**, **gfec**, and **ufec** introduced in Junos OS Release 14.1 for PTX Series routers, with P1-PTX-24-10G-W-SFPP.

Option **hgfec** introduced in Junos OS Release 15.1F5 for MX Series Routers with MIC3-100G-DWDM MIC.

Option **sdfec** introduced in Junos OS Release 15.1F5 for MX Series Routers with MIC3-100G-DWDM MIC.

Option **sdfec** introduced in Junos OS Release 15.1F6 for PTX Series Routers with PTX-5-100G-WDM PIC.

Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.

Statement introduced in Junos OS Release 18.3R1 for ACX6360 routers.

**Description**

Enable forward error correction (FEC) mode.

**Default**

If you do not specify a mode, the default mode is **gfec**. On PTX Series routers with P1-PTX-2-100G-WDM, the default value is **gfec-sdfec**. On PTX Series routers with PTX-5-100G-WDM and on MX Series routers with MIC3-100G-DWDM, the default value is **sdfec**.

**Options**

- **efec**—(M Series, MX Series routers and PTX Series routers only) G.975.1.I.4 enhanced forward error correction (EFEC) is configured to detect and correct bit errors. This mode is supported only on 10G ports and not supported on the 40G and 100G ports.

- **gfec**—(M series, MX Series routers and PTX Series routers only) G.709 generic forward error correction (GFEC) mode is configured to detect and correct bit errors.
gfec-sdfec—(PTX Series routers only) GFEC and soft-decision forward error correction (SD-FEC) modes are configured to detect and correct bit errors.

hgfec—(MX Series routers only) High gain forward error correction mode is configured to detect and correct bit errors.

sdfec—(MX Series routers, PTX Series routers, and ACX6360 routers only) Sky-Compatible Soft-decision forward error correction mode is configured to detect and correct bit errors.

sdfec15—(ACX6360 routers only) Soft Decision Forward Error Correction with 15 percent overhead is configured to detect and correct bit errors.

none—(M Series and MX Series routers only) FEC mode is not configured.

---

**NOTE:** On MX Series routers with MIC3-100G-DWDM and PTX Series routers with PTX-5-100G-WDM, none option is not supported. The fec mode must be enabled on the MIC3-100G-DWDM MIC and the PTX-5-100G-WDM PIC.

ufec—(MX Series routers and PTX Series routers only) G.975.1I.7 Ultra Forward Error Correction (UFEC) mode is configured to detect and correct bit errors. This mode is supported only on 10G ports and not supported on the 40G and 100G ports.

---

**Required Privilege**

**Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**fixed-stuff-bytes**

**Syntax**

(fixed-stuff-bytes | no-fixed-stuff-bytes);

**Hierarchy Level**

[edit interfaces interface-name otn-options rate]

**Release Information**
Statement introduced in Junos OS Release 9.4.

**Description**
Enable or disable fixed stuff bytes.

**Default**
By default, no fixed stuff bytes are set.

**Options**
- **fixed-stuff-bytes**—Fixed stuff bytes 11.0957 Gbps.
- **no-fixed-stuff-bytes**—No fixed stuff bytes 11.0491 Gbps.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

**high-polarization**

**Syntax**

```
high-polarization;
```

**Hierarchy Level**

```
[edit interfaces interface-name optics-options]
```

**Release Information**

Statement introduced in Junos OS Release 18.2R1 for ACX6360 routers.

**Description**

Enable the physical port to rapidly track the state of polarization changes. Enabling this statement reduces the optical signal to noise ratio (OSNR) by few tenths of dB.

**Default**

By default, the `high-polarization` statement is disabled.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**

- Supported Optics Options on ACX6360 Routers on page 579
interval

Syntax  
interval value;

Hierarchy Level  
[edit interfaces interface-name otn-options signal-degrade]
[edit interfaces interface-name otn-options odu-signal-degrade]

Release Information  
Statement introduced in Junos OS Release 13.2 for PTX Series routers.
Statement introduced in Junos OS Release 15.1F6 for MPC5E, MIC6-100G-CFP2 on MPC6E on MX240, MX480, MX960, MX2010, and MX2020 routers.

Description  
Specify the interval for which the BER must stay above the signal degradation threshold—as configured in the ber-threshold-signal-degrade value statement—for the alarm to raised. After an alarm is raised, if the BER returns below the clear threshold—as configured in the ber-threshold-clear value statement—for the specified interval, the alarm is cleared.

NOTE: Configuring a high BER threshold for signal degradation and a long interval might cause the internal counter register to be saturated. Such a configuration is ignored by the router, and the default values are used instead. A system log message is logged for this error.

If you configure the BER thresholds at the [edit interfaces interface-name otn-options signal-degrade] hierarchy level, then the thresholds are calculated using the pre-forward error correction (pre-FEC) BER (the BER before FEC correction). These thresholds are used for pre-FEC BER monitoring. See "Understanding Pre-FEC BER Monitoring and BER Thresholds" on page 582 for more information about pre-FEC BER monitoring and determining BER threshold settings.

If you configure the BER thresholds at the [edit interfaces interface-name otn-options odu-signal-degrade] hierarchy level, then the thresholds are calculated using the post-FEC BER (the BER after FEC correction). This BER is referred to as the optical channel data unit (ODU) BER.

NOTE: You can configure ODU BER thresholds only at the [edit interfaces interface-name otn-options odu-signal-degrade] hierarchy level on the P2-100GE-OTN PIC.

Options  
value—Time interval in milliseconds.
NOTE: For the P1-PTX-2-100G-WDM PIC, the BER must stay above the signal degradation threshold for ten consecutive intervals for the alarm to be raised and the BER must stay below the clear threshold for ten consecutive intervals for the alarm to be cleared. For example, if the interval is configured as 10 ms, then the BER must stay above the signal degradation threshold for 100 ms (10 ms * 10 intervals) for the alarm to be raised, or below the clear threshold for 100 ms for the alarm to be cleared.

NOTE: For P1-PTX-24-10G-W-SFPP PIC and P2-100GE-OTN PIC, when the router cannot configure BER with the given interval, it selects an optimum interval that is supported for the given BER configuration. If the router is still not able to support the configuration (for example, with a wider gap between the degrade set and clear values), the default values are used and a log is generated.

For the P2-10G-40G-QSFPP PIC, the time interval is supported in multiples of 100 ms. For example, when you configure the interval as 10 ms, then it is rounded off to the nearest multiple of 100 ms.

Range: 1 ms through 1000 ms.
Default: 100 ms.

NOTE: For the P2-100GE-OTN PIC, the default value is 10 ms.

is-ma

Syntax  (is-ma | no-is-ma);

Hierarchy Level  [edit interfaces interface-name otn-options]

Release Information  Statement introduced in Junos OS Release 13.2 for PTX Series routers.

Description  Specify whether masked alarms are enabled or disabled.

Default  If you omit the is-ma statement, masked alarms are disabled.

Options  is-ma—Enable masked alarms.

no-is-ma—Do not enable masked alarms.

Required Privilege  Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

# laser-enable

| Syntax         | (laser-enable | no-laser-enable); |
|----------------|----------------|
| Hierarchy Level| [edit interfaces interface-name otn-options] |

**Release Information**  
Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 13.2 for PTX Series routers.  
Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.

**Description**  
Specify whether lasers are enabled or disabled.

**Default**  
If you omit the laser-enable statement, lasers are disabled.

**Options**  
- **laser-enable**—Enable lasers.  
- **no-laser-enable**—Do not enable lasers.

**Required Privilege Level**  
- interface—To view this statement in the configuration.  
- interface-control—To add this statement to the configuration.

**Syntax**

odu-signal-degrade {
  ber-threshold-clear;
  ber-threshold-signal-degrade;
  interval
}

**Hierarchy Level**

[edit interfaces interface-name otn-options]

**Release Information**

Statement introduced in Junos OS Release 14.1R2 for P2-100GE-OTNPIC in PTX5000 routers.
Statement introduced in Junos OS Release 14.2 for P2-100GE-OTNPIC in PTX5000 routers.
Statement introduced in Junos OS Release 15.1F6 for MPC5E, MIC6-100G-CFP2 on MPC6E on MX240, MX480, MX960, MX2010, and MX2020 routers.
Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.

**Description**

Specify optical channel data unit (ODU) signal degradation threshold-related values.

**Default**

If you omit the **odu-signal-degrade** statement, the default threshold values are used.

The following are the default threshold values for optical channel data unit (ODU) signal degradation for the P2-100GE-OTNPIC:

- ber-threshold-clear—1E-09
- ber-threshold-signal-degrade—1E-06
- interval—10 ms

The following are the default threshold values for optical channel data unit (ODU) signal degradation for the MPC5E and the MIC6-100G-CFP2 MIC:

- ber-threshold-clear—1.14E-5
- ber-threshold-signal-degrade—1.0E-6
- interval—10 ms

**Options**

The remaining statements are explained separately. See CLI Explorer.

preemptive-fast-reroute

Syntax

preemptive-fast-reroute {
  (backward-frr-enable | no-backward-frr-enable);
  (signal-degrade-monitor-enable | no-signal-degrade-monitor-enable);
  (odu-backward-frr-enable | no-odu-backward-frr-enable);
  (odu-signal-degrade-monitor-enable | no-odu-signal-degrade-monitor-enable);
}

Hierarchy Level

[edit interfaces interface-name otn-options]

Release Information

Statement introduced in Junos OS Release 13.2 for PTX Series routers.
Statement introduced in Junos OS Release 13.3 for MX Series routers.
Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.

Description

Enable or disable preemptive fast reroute options.

Default

By default, backward fast reroute insertion and signal degradation monitoring are disabled.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

remote-loop-enable

Syntax  
(remote-loop-enable | no-remote-loop-enable);

Hierarchy Level  
[edit interfaces interface-name otn-options odu-delay-management]

Release Information  
Statement introduced in Junos OS Release 17.1 for 100-Gigabit OTN DWDM PIC with CFP2 on PTX3000 and PTX5000 routers. Statement introduced in Junos OS Release 17.1 for 100-Gigabit OTN DWDM MIC with CFP2-ACO on MX240, MX480, MX960, MX2010, and MX2020 routers with MPC3E and MPC3E-NG.

Description  
Enable the remote interface to loop back the delay measurement pattern to the local interface. Delay is measured by transmitting a known pattern (delay measurement pattern) in a selected bit of the delay measurement (DM) field and measuring the number of frames that are missed when the delay measurement pattern is received at the transmitting end (local interface).

NOTE: Do not enable remote loopback on both ends (local and remote). If you enable remote loopback on both interfaces, the delay measurement pattern is looped back continuously between the two interfaces.

Default  
Delay measurement is disabled by default.

Options  
remote-loop-enable—Enables loopback of the delay measurement pattern at the remote interface.

no-remote-loop-enable—Disables loopback of the delay measurement pattern at the remote interface.

Required Privilege Level  
interface—to view this statement in the configuration.  
interface-control—to add this statement to the configuration.

signal-degrade

Syntax

```
signal-degrade {
  ber-threshold-clear value;
  ber-threshold-signal-degrade value;
  interval value;
}
```

Hierarchy Level

```
[edit interfaces interface-name otn-options]
```

Release Information

Description

Specify bit error rate (BER) signal degradation thresholds and time interval for raising and clearing alarms for optical transport network (OTN) links.

Default

If you omit the signal-degrade statement, the default threshold values are used.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**signal-degrade-monitor-enable**

**Syntax**

```
(signal-degrade-monitor-enable | no-signal-degrade-monitor-enable);
```

**Hierarchy Level**

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
```

**Release Information**

Statement introduced in Junos OS Release 13.2 for PTX Series routers.

**Description**

Enable or disable pre-forward error correction (FEC) bit error rate (BER) monitoring.

With pre-FEC BER monitoring enabled, when the configured pre-FEC BER signal degrade threshold is reached, the PIC stops forwarding packets to the remote interface and raises an interface alarm. Ingress packets continue to be processed. If pre-FEC BER monitoring is used with MPLS fast reroute or another link protection method, then traffic is rerouted to a different interface.

You can also configure backward fast reroute to insert local pre-FEC BER status into transmitted OTN frames, notifying the remote interface of signal degradation. The remote interface can use the information to reroute traffic to a different interface. If you use pre-FEC BER monitoring together with backward fast reroute, then notification of signal degradation and rerouting of traffic occurs in less time than that required through a Layer 3 protocol. To configure backward fast reroute, include the `backward-frr-enable` statement at the same hierarchy level.

**NOTE:** When you configure pre-FEC BER signal degrade monitoring, we recommend that you configure both the `signal-degrade-monitor-enable` and `backward-frr-enable` statements.

You can also configure the pre-FEC BER thresholds that raise or clear a signal degrade alarm and the time interval for the thresholds. If the BER thresholds and interval are not configured, the default values are used. Include the `ber-threshold-signal-degrade value`, `ber-threshold-clear value`, and `interval value` statements at the `[edit interfaces interface-name otn-options signal-degrade]` hierarchy level to configure the BER thresholds and time interval. See “Understanding Pre-FEC BER Monitoring and BER Thresholds” on page 582 for more information about pre-FEC BER monitoring and determining BER threshold settings.

**Default**

By default, pre-FEC BER signal degrade monitoring is disabled.

**Options**

- `signal-degrade-monitor-enable`—Enable pre-FEC BER signal degrade monitoring.
- `no-signal-degrade-monitor-enable`—Do not enable pre-FEC BER signal degrade monitoring.
### start-measurement

| Syntax       | (no-start-measurement | start-measurement); |

tca

Syntax  
tca tca-identifier (enable-tca | no-enable-tca) (threshold number | threshold-24hrs number)

Hierarchy Level  
[edit interfaces interface-name optics-options]

[edit interfaces interface-name otn-options]

Release Information  
Statement introduced in Junos OS Release 14.2 on the PTX Series.
Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.

Description  
TCAs can give the management system an early indication as to the state of the associated entity when it crosses a certain threshold. TCAs can be set for both minimum and maximum values for gauges and only maximum values for counters. The timely detection of TCAs is essential to proactively manage the interface. TCAs are not an indication of a fault, but rather an indication that the entity may be close to a fault. You can choose which TCAs you want monitored by enabling the TCA. You can either keep the default threshold settings or change the settings.

Enable threshold crossing alerts (TCAs) for the following:

- Optical channel data unit (ODU)
- Optical channel transport unit (OTU)
- Laser power
- Laser temperature

Default  
By default, TCAs are not enabled.

Options  
tca-identifier —At the otn-options hierarchy level, it can be one of the following:

- odu-tca-bbe—ODU background block error threshold-crossing defect trigger
- odu-tca-bbe-fe—ODU far-end background block error threshold-crossing defect trigger
- odu-tca-es—ODU errored seconds threshold-crossing defect trigger
- odu-tca-es-fe—ODU far-end errored seconds threshold-crossing defect trigger
- odu-tca-ses—ODU severely errored seconds threshold-crossing defect trigger
- odu-tca-ses-fe—ODU far-end severely errored seconds threshold-crossing defect trigger
- odu-tca-uas—ODU unavailable seconds threshold-crossing defect trigger
- odu-tca-uas-fe—ODU far-end unavailable seconds threshold-crossing defect trigger
• **otu-tca-bbe**—OTU background block error threshold-crossing defect trigger
• **otu-tca-bbe-fe**—OTU far-end background block error threshold-crossing defect trigger
• **otu-tca-es**—OTU errored seconds threshold-crossing defect trigger
• **otu-tca-es-fe**—OTU far-end errored seconds threshold-crossing defect trigger
• **otu-tca-fec-ber**—OTU forward error correction bit error rate threshold-crossing defect trigger
• **otu-tca-ses**—OTU severely errored seconds threshold-crossing defect trigger
• **otu-tca-ses-fe**—OTU far-end severely errored seconds threshold-crossing defect trigger
• **otu-tca-uas**—OTU unavailable seconds threshold-crossing defect trigger
• **otu-tca-uas-fe**—OTU far-end unavailable seconds threshold-crossing defect trigger

**tca-identifier**—At the optics-options hierarchy level, it can be one of the following:

• **carrier-frequency-offset-high-tca**—Carrier frequency high threshold setting trigger
• **carrier-frequency-offset-low-tca**—Carrier frequency low threshold setting trigger
• **fec-ber**—Optics Errored Seconds Threshold crossing defect trigger
• **fec-corrected-errors-high-tca**—FEC Corrected Error High Threshold crossing defect trigger
• **fec-uncorrected-words-high-tca**—FEC Uncorrected Words High Threshold crossing defect trigger
• **laser-frequency-error-high-tca**—Laser frequency error high TCA
• **laser-frequency-error-low-tca**—Laser frequency error low TCA
• **pam-histogram-high-tca**—PAM Histogram high TCA
• **residual-isil-high-tca**—Residual ISI high TCA
• **residual-isil-low-tca**—Residual ISI low TCA
• **rx-power-high-tca**—Rx power high threshold setting trigger
• **rx-power-low-tca**—Rx power low threshold setting trigger
• **snr-low-tca**—SNR low TCA
• **tec-current-high-tca**—TEC Current high TCA
• **tec-current-low-tca**—TEC Current low TCA
• **temperature-high-tca**—Temperature high threshold setting trigger
• **temperature-low-tca**—Temperature low threshold setting trigger
• **tx-power-high-tca**—Tx power high threshold setting trigger
• **tx-power-low-tca**—Tx power low threshold setting trigger
enable-tca | no-enable-tca—To enable or disable the threshold crossing alert.

threshold | threshold-24hrs:

- threshold number—Set the 15-minute interval threshold.
- threshold-24hrs number—Set the 24-hour interval threshold.

transport-monitoring

Syntax transport-monitoring;

Hierarchy Level [edit interfaces]

Release Information Statement introduced in Junos OS Release 14.2 for PTX5000 and PTX3000 routers.

Description Monitor the performance and state of packet transport for OTN and optics modules. The following statistics are monitored:

- Packet transport for ninety-six 15-minute intervals for the current 24 hours.
- Cumulative data of the current 24 hours.
- Cumulative data of the previous 24 hours.

If this statement is configured, transport monitoring related information is shown in the output of show interface transport command and corresponding MIBs are available. If this option is disabled, an error is shown in the output and corresponding MIBs are not available.

Required Privilege Level system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

trigger

Syntax  

```
trigger trigger-identifier (hold-time hold-time-value | ignore);
```

Hierarchy Level  

```
[edit interfaces interface-name otn-options]
```

Release Information  

Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 13.2 for PTX Series routers.  
Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.

Description  

Specify defect triggers.

Default  

By default, triggers are ignored.

Options  

```
trigger-identifier—(For M Series, MX Series, SRX Series, and T Series routers only) Trigger identifier. It can be one of the following:

- oc-lof—Optical channel Loss of Frame defect trigger.
- oc-lom—Optical channel Loss of Multiframe defect trigger.
- oc-los—Optical channel Loss of Signal defect trigger.
- oc-wavelength-lock—Optical channel Wavelength Lock defect trigger.
- odu-ais—Optical channel data unit (ODU) Alarm Indication Signal defect trigger.
- odu-bbe-th—ODU Background Block Error Threshold defect trigger.
- odu-bdi—ODU Backward Defect Indication defect trigger.
- odu-bei—(MX Series routers only) ODU Backward Error Indication defect trigger.
- odu-es-th—ODU Errored Seconds Threshold defect trigger.
- odu-iae—(MX Series routers only) ODU Incoming Alignment Error defect trigger.
- odu-lck—ODU Locked defect trigger.
- odu-oci—ODU Open Connection Indication defect trigger.
- odu-sd—ODU Signal Degradation defect trigger.
- odu-ses-th—ODU Severely Errored Seconds Threshold defect trigger.
- odu-tca-es—(MX Series routers only) ODU Errored Seconds Threshold crossing defect trigger.
- odu-tca-ses—(MX Series routers only) ODU Severely Errored Seconds Threshold crossing defect trigger.
```
- **odu-tca-uas**—(MX Series routers only) ODU Unavailable Seconds Threshold crossing defect trigger.
- **odu-ttim**—ODU Trail Trace Identifier Mismatch defect trigger.
- **opu-ptim**—(MX Series routers only) Payload Type Identifier Mismatch defect trigger.
- **odu-uas-th**—ODU Unavailable Seconds Threshold defect trigger.
- **opu-ptm**—Optical Channel Payload (OPU) Payload Type Mismatch defect trigger.
- **otu-ais**—Optical Channel Transport Unit (OTU) Alarm Indication Signal defect trigger.
- **otu-bbe-th**—OTU Background Block Error Threshold defect trigger.
- **otu-bdi**—OTU Backward Defect Indication defect trigger.
- **otu-es-th**—OTU Errored Seconds Threshold defect trigger.
- **otu-fec-deg**—OTU FEC Degradedefect trigger.
- **otu-fec-exe**—OTU FEC Excessive Error defect trigger.
- **otu-iae**—OTU Incoming Alignment defect trigger.
- **otu-sd**—OTU Signal Degradedefect trigger.
- **otu-ses-th**—OTU Severely Errored Seconds Threshold defect trigger.
- **otu-tca-es**—(MX Series routers only) OTU Errored Seconds Threshold crossing defect trigger.
- **otu-tca-ses**—(MX Series routers only) OTU Severely Errored Seconds Threshold crossing defect trigger.
- **otu-tca-uas**—(MX Series routers only) OTU Unavailable Seconds Threshold crossing defect trigger.
- **otu-ttim**—OTU Trail Trace Identifier Mismatch defect trigger.
- **otu-uas-th**—OTU Unavailable Seconds Threshold defect trigger.
trigger-identifier—(For PTX Series routers only) Trigger identifier. It can be one of the following:
- **oc-lof**—Optical channel Loss of Frame defect trigger.
- **oc-lom**—Optical channel Loss of Multiframe defect trigger.
- **oc-los**—Optical channel Loss of Signal defect trigger.
- **oc-tsf**—Optical channel TOE security functionality (TSF) defect trigger.
- **oc-wavelength-lock**—Optical channel Wavelength Lock defect trigger.
- **odu-ais**—ODU Alarm Indication Signal defect trigger.
- **odu-bdi**—ODU Backward Defect Indication defect trigger.
- **odu-bei**—ODU Backward Error Indication defect trigger.
- **odu-iae**—ODU IAE defect trigger.
- **odu-lck**—ODU Locked defect trigger.
- **odu-oci**—ODU Open Connection Indication defect trigger.
- **odu-sd**—ODU Signal Degradation defect trigger.
- **odu-tca-bbe**—ODU Background Block Error Threshold crossing defect trigger.
- **odu-tca-bbe-fe**—ODU far-end Background Block Error (BEI) Threshold crossing defect trigger.
- **odu-tca-es**—ODU Errored Seconds Threshold crossing defect trigger.
- **odu-tca-es-fe**—ODU far-end Errored Seconds Threshold crossing defect trigger.
- **odu-tca-ses**—ODU Severely Errored Seconds Threshold crossing defect trigger.
- **odu-tca-ses-fe**—ODU far-end Severely Errored Seconds Threshold crossing defect trigger.
- **odu-tca-uas**—ODU Unavailable Seconds Threshold crossing defect trigger.
- **odu-tca-uas-fe**—ODU far-end Unavailable Seconds Threshold crossing defect trigger.
- **odu-ttim**—ODU Trail Trace Identifier Mismatch defect trigger.
- **opu-ptim**—Payload Type Identifier Mismatch defect trigger.
- **otu-ais**—OTU Alarm Indication Signal defect trigger.
- **otu-bdi**—OTU Backward Defect Indication defect trigger.
- **otu-fec-deg**—OTU FEC Degradation defect trigger.
- **otu-fec-exe**—OTU FEC Excessive Error defect trigger.
- **otu-iae**—OTU Incoming Alignment defect trigger.
- **otu-tca-es-fe**—OTU far-end Errored Seconds Threshold crossing defect trigger.
- **otu-tca-ses**—OTU Severely Errored Seconds Threshold crossing defect trigger.
- **otu-tca-ses-fe**—OTU far-end Severely Errored Seconds Threshold crossing defect trigger.
- **otu-tca-uas**—OTU Unavailable Seconds Threshold crossing defect trigger.
- **otu-tca-uas-fe**—OTU far-end Unavailable Seconds Threshold crossing defect trigger.
- **otu-ttim**—OTU Trail Trace Identifier Mismatch defect trigger.

**hold-time hold-time-value**—Hold time value. It can be one of the following:

- **down**—Delay before marking interface down when defect occurs (1..65534 milliseconds).
- **up**—Delay before marking interface up when defect is absent (1..65534 milliseconds).

**NOTE:** The trigger hold time value alone does not mark an interface to be up when the defect is absent or mark an interface to be down when the defect occurs. The hold time value only impacts the alarm reporting time. To mark an interface up or down, you must also configure the physical interface hold time at the [edit interfaces interface-name hierarchy level].

**Required Privilege Level**
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

### tx-power

**Syntax**

```
tx-power dbm;
```

**Hierarchy Level**

```
[edit interfaces interface-name optics-options]
```

**Release Information**

Statement introduced in Junos OS Release 13.2 for PTX Series routers. Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.

**Description**

Transmit laser output power (dBm).

**Default**

If you don’t specify a value, the default transmit laser output power is –2 dBm.

**Options**

- `dbm`—Transmit power value.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

### warning

**Syntax**

```plaintext
warning low-light-warning {
  (link-down | syslog);
}
```

**Hierarchy Level**

[edit interfaces interface-name optics-options]

**Release Information**

Statement introduced in Junos OS Release 10.0.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series routers.
Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.

**Description**

Specifies the action to take if the receiving optics signal is below the optics low-light warning threshold.

**Options**

- `link-down`—Drop the 10-Gigabit Ethernet link and marks link as down.
- `syslog`—Write the optics information to the system log.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

**wavelength**

**Syntax**  
```  
wavelength nm;  
```

**Hierarchy Level**  
```  
[edit interfaces interface-name optics-options]  
```

**Release Information**  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 13.2 for PTX Series routers.

**Description**  
For 10-Gigabit or 100-Gigabit Ethernet DWDM interfaces only, configure full C-band ITU-Grid tunable optics.

**Options**  
`nm`—Wavelength value. It can be one of the following:

- 1528.38—1528.38 nanometers (nm), corresponds to a 50-GHz grid  
- 1528.77—1528.77 nm, corresponds to 50-GHz and 100-GHz grids  
- 1529.16—1529.16 nm, corresponds to a 50-GHz grid  
- 1529.55—1529.55 nm, corresponds to 50-GHz and 100-GHz grids  
- 1529.94—1529.94 nm, corresponds to a 50-GHz grid  
- 1530.33—1530.33 nm, corresponds to 50-GHz and 100-GHz grids  
- 1530.72—1530.72 nm, corresponds to a 50-GHz grid  
- 1531.12—1531.12 nm, corresponds to 50-GHz and 100-GHz grids  
- 1531.51—1531.51 nm, corresponds to a 50-GHz grid  
- 1531.90—1531.90 nm, corresponds to 50-GHz and 100-GHz grids  
- 1532.29—1532.29 nm, corresponds to a 50-GHz grid  
- 1532.68—1532.68 nm, corresponds to 50-GHz and 100-GHz grids  
- 1533.07—1533.07 nm, corresponds to a 50-GHz grid  
- 1533.47—1533.47 nm, corresponds to 50-GHz and 100-GHz grids  
- 1533.86—1533.86 nm, corresponds to a 50-GHz grid  
- 1534.25—1534.25 nm, corresponds to 50-GHz and 100-GHz grids

**NOTE:** All values are displayed. However, if you configure a value that is not supported by the device, an error message is displayed and the device is not tuned to the specified wavelength.
- 1534.64—1534.64 nm, corresponds to a 50-GHz grid
- 1535.04—1535.04 nm, corresponds to 50-GHz and 100-GHz grids
- 1535.43—1535.43 nm, corresponds to a 50-GHz grid
- 1535.82—1535.82 nm, corresponds to 50-GHz and 100-GHz grids
- 1536.22—1536.22 nm, corresponds to a 50-GHz grid
- 1536.61—1536.61 nm, corresponds to 50-GHz and 100-GHz grids
- 1537.00—1537.00 nm, corresponds to a 50-GHz grid
- 1537.40—1537.40 nm, corresponds to 50-GHz and 100-GHz grids
- 1537.79—1537.79 nm, corresponds to a 50-GHz grid
- 1538.19—1538.19 nm, corresponds to 50-GHz and 100-GHz grids
- 1538.58—1538.58 nm, corresponds to a 50-GHz grid
- 1538.98—1538.98 nm, corresponds to 50-GHz and 100-GHz grids
- 1539.37—1539.37 nm, corresponds to a 50-GHz grid
- 1539.77—1539.77 nm, corresponds to 50-GHz and 100-GHz grids
- 1540.16—1540.16 nm, corresponds to a 50-GHz grid
- 1540.56—1540.56 nm, corresponds to 50-GHz and 100-GHz grids
- 1540.95—1540.95 nm, corresponds to a 50-GHz grid
- 1541.35—1541.35 nm, corresponds to 50-GHz and 100-GHz grids

**avg-fd-twoway-threshold**

**Syntax**

```
avg-fd-twoway-threshold avg-fd-twoway-threshold-value
flap-trap-monitor seconds;
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles profile-name]
```

**Release Information**

Statement introduced in Junos OS Release 15.1 for MX Series routers.

**Description**

Configure the threshold value for average frame delay, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.

Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

**Options**

- **avg-fd-twoway-threshold-value**—Threshold value for average frame delay, in microseconds, for two-way ETH-DM.
  - Range: 1 through 4294967295 microseconds

- **flap-trap-monitor seconds**—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPm ThresholdFlapAlarm notification to the network management system (NMS).
  - Range: 1 through 360 seconds

**Required Privilege**

- **Level**
  - Configure—To enter configuration mode.
  - Control—To modify any configuration.

**Related Documentation**

avg-ifdv-twoway-threshold

Syntax

```
avg-ifdv-twoway-threshold avg-ifdv-twoway-threshold-value; {
flap-trap-monitor seconds; }
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles profile-name]
```

Release Information

Statement introduced in Junos OS Release 15.1 for MX Series routers.

Description

Configure the threshold value for average frame delay variation, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay variation is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.

Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics. In two-way ETH-DM mode, frame delay and frame delay variation values are based on the time difference between when the initiator MEP transmits a request frame and receives a reply frame from the responder MEP, subtracting the time elapsed at the responder MEP.

Options

```
avg-ifdv-twoway-threshold-value—Threshold value for average frame delay variation, in microseconds, for two-way ETH-DM.
Range: 1 through 4294967295 microseconds

avg-flr-forward-threshold avg-flr-forward-threshold-value;
flap-trap-monitor seconds; }
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles profile-name]
```

**Release Information**

Statement introduced in Junos OS Release 15.1 for MX Series routers.

**Description**

Configure the threshold value for average frame loss ratio, in milli-percent, in the upstream or forward direction for Ethernet loss measurement (ETH-LM) and Ethernet synthetic loss measurement (ETH-SLM). When the configured threshold for average forward frame loss ratio is exceeded, an SNMP trap is generated for ETH-LM and ETH-SLM. SNMP traps are triggered if you configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold. If you do not configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold, no SNMP traps are generated. You can configure these threshold values with an SLA iterator for ETH-SLM and ETH-LM.

ETH-SLM is an application that enables the calculation of frame loss by using synthetic frames instead of data traffic. This mechanism can be considered as a statistical sample to approximate the frame loss ratio of data traffic.

**Options**

- `avg-flr-forward-threshold-value`—Threshold value for average frame loss ratio in the forward or upstream direction, in milli-percent, for ETH-SLM and ETH-LM.
  - **Range:** 1 through 100000 milli-percent

- `flap-trap-monitor seconds`—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPm ThresholdFlapAlarm notification to the network management system (NMS).
  - **Range:** 1 through 360 seconds

**Required Privilege Level**

- `configure`—To enter configuration mode.
- `control`—To modify any configuration.

**convey-loss-threshold**

**Syntax**

convey-loss-threshold;

**Hierarchy Level**

[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name continuity-check]

**Description**

Enable loss-threshold-tlv transmission.

During a unified ISSU, the control plane may go down for several seconds and cause CFM continuity check packets to get dropped. This may cause the remote maintenance endpoint (MEP) to detect a connectivity loss and mark the MEP as down. To keep the MEP active during a unified ISSU, the loss threshold TLV communicates the minimum threshold value the receiving MEP requires to keep the MEP active. The receiving MEP parses the TLV and updates the loss threshold value, but only if the new threshold value is greater than the locally configured threshold value. You can control the transmission of the loss threshold TLV in continuity check messages PDUs. The `convey-loss-threshold` statement specifies that the loss threshold TLV must be transmitted as part of the continuity check messages. If the statement is not specified, continuity check messages transmit this TLV only when a unified ISSU is in progress.

**Required Privilege**

interface—To view this statement in the configuration.

cycle-time

Syntax

```
cycle-time cycle-time-value;
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles profile-name]
```

Release Information

Statement introduced in Junos OS Release 11.1.
Statement introduced in Junos OS Release 11.4 for EX Series switches.

Description

Configure the time (in milliseconds) taken between back-to-back transmissions of SLA frames for a single connection.

Options

- `cycle-time-value`—Cycle time value in milliseconds.
  - Range: 10 through 3,600,000
  - Default: 1000

Required Privilege

- **Level**
  - Configure—To enter configuration mode.
  - Control—To modify any configuration.

### detect-loc

**Syntax**

```plaintext
detect-loc;
```

**Hierarchy Level**

```plaintext
[edit protocols oam ethernet connectivity-fault-management maintenance-domain]
  md-name maintenance-association ma-name mep mep-id remote-mep mep-id]

[edit protocols oam ethernet link-fault-management interface interface-name]
```

**Release Information**

Statement introduced in Junos OS Release 14.2.

**Description**

Specify whether Ethernet OAM continuity checks are performed for an individual remote maintenance end point (MEP).

When you configure the `detect-loc` statement at `[edit protocols oam ethernet link-fault-management interface interface-name]` hierarchy level, a loss-of-continuity (LOC) defect is raised when the peer is not found within a period that is equal to 3 times the current keepalive pdu interval. When an LOC defect is raised, a syslog error message is generated.

**NOTE:** When you configure the `detect-loc` statement at the `[edit protocols oam ethernet link-fault-management interface interface-name]` hierarchy level, any action-profile configured to bring down the interface is executed when an LOC defect is detected. However, the action-profile is not executed if you have not configured `detect-loc` statement the `detect-loc` statement at the `[edit protocols oam ethernet link-fault-management interface interface-name]` hierarchy level.

To view the current LOC status of an interface, execute the `show oam ethernet link-fault-management` command.

**Default**

The MEP does not generate LOC defect messages by default.

**Required Privilege**

- **Level**: interface—To view this statement in the configuration.
  - interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring a MEP to Generate and Respond to CFM Protocol Messages on page 745

enhanced-cfm-mode

Syntax

```
enhanced-cfm-mode enhanced-cfm-mode;
```

Hierarchy Level

```
[edit logical-systems name protocols oam ethernet connectivity-fault-management],
[edit protocols oam ethernet connectivity-fault-management]
```

Release Information

Statement introduced in Junos OS Release 17.2R1 for MX Series routers.

Description

Enables enhanced CFM mode. When you enable enhanced CFM mode, Junos OS supports 32,000 maintenance association end points (MEPs) and maintenance intermediate points (MIPs) each per chassis for bridge, VPLS, L2VPN, and CCC domains. To support enhanced CFM mode, configure the network services mode on the router as `enhanced-ip`.

NOTE: After enabling CFM mode, restart CFM for the changes to take effect. If you do not restart CFM, CFM automatically restarts after 1 minute.

[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles profile-name avg-flr-backward-threshold],
```

**Release Information**

Statement introduced in Junos OS Release 17.2R1 for MX Series routers.

**Description**

Enables damping of jnxSoamPmThresholdCrossingAlarm traps sent to the network management system (NMS) by summarizing the flap occurrences over a period of time and sends a single jnxSoamPmThresholdFlapAlarm notification to the NMS. You can enable damping at the global level for the iterator or you can enable damping at the individual threshold type of an iterator. You can specify the duration of time for summarizing flap occurrences.

**Options**

`seconds`—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPmThresholdFlapAlarm notification to the NMS.

Range: 1 through 360 seconds

**Required Privilege Level**

routing

hardware-assisted-timestamping

Syntax  

```
hardware-assisted-timestamping;
```

Hierarchy Level  

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
```

Release Information  
Statement introduced in Junos OS Release 9.5.

Description  
For Ethernet interfaces on Enhanced and Enhanced Queuing Dense Port Concentrators (DPCs) in MX Series routers only, enable hardware-assisted timestamping support for Ethernet frame delay measurement.

By default, the ETH-DM feature calculates frame delays using software-based timestamping of the ETH-DM PDU frames sent and received by the MEPs in the session. As an option that can increase the accuracy of ETH-DM calculations when the DPC is loaded with heavy traffic in the receive direction, you can enable hardware-assisted timestamping of session frames in the receive direction.

Required Privilege Level  
```
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.
```

**hardware-assisted-keepalives**

**Syntax**

```
hardware-assisted-keepalives [enable | disable];
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
```

**Release Information**

Statement introduced in Junos OS Release 14.2R1.

**Description**

For Ethernet interfaces on Modular Port Concentrators (MPCs) in MX Series routers only, delegate the transmission of the continuity check messages (CCMs) to the forwarding ASIC (that is, to the hardware) by enabling inline transmission of CCMs. Inline transmission of CCMs is also known as Inline-KA.

By default, CCMs are transmitted by the CPU of the MPC and not by the hardware. If the duration between transmissions of CCMs is low or if the CCMs for a specific line card scale, we recommend that you enable delegation of the transmission of CCMs to the hardware. By enabling inline transmission of CCMs, you can achieve maximum scaling of CCMs.

**NOTE:** Starting in Junos OS Release 16.1R1, the inline support for 1s interval is supported on MPC1 to MPC7 (except MPC3 and MPC4) line cards.

**Default**

Inline transmission is disabled by default.

**Options**

- **enable**—Enable inline transmission of CCMs.

**NOTE:** Inline transmission of CCMs is not enabled when there is a CFM session already established. To enable inline transmission, you must first deactivate the CFM session using the `deactivate` command and then reactivate the CFM session using the `activate` command.

- **disable**—Disable inline transmission of CCMs.

**NOTE:** After disabling inline transmission of CCMs, you must reboot the router for the changes to take effect.
hold-interval (OAM)

Syntax

```
hold-interval minutes;
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name continuity-check]
```

Release Information

Description

The time to wait in minutes before flushing the maintenance association end point (MEP) database, if no updates occur. The configurable range is 1 minute through 30240 minutes. The default value is 10 minutes.

---

**NOTE:** Hold timer based flushing is applicable only for auto discovered remote MEPs and not for statically configured remote MEPs.

Options

```
minutes—Time to wait, in minutes.
```

```

Release Information

Statement introduced in Junos OS Release 17.3R1 for MX Series Routers.

Description

Configure CFM to propagate the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages when the interface is down. When the status of the EVPN provider edge device is standby, the EVPN VPWS service is notified and it sets the interface status to CCC-down. When the interface status is CCC-down, it indicates that the provider edge service is down. When you enable CFM monitoring, CFM propagates the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages. Thus, the customer edge device is aware that the provider edge device is down.

Usually, when the interface goes down, CFM propagates the status of the provider edge device via the interface status TLV. If the customer edge device does not support the interface status TLV, you can use the RDI bit to propagate the status of the provider edge device.

Required Privilege Level

routing—To view this statement in the configuration.

**interval**

**Syntax**

```
interval (100ms | 10m | 10ms | 10s | 1m | 1s);
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name continuity-check]
```

**Release Information**

Statement introduced in Junos OS Release 8.4.
Option 10ms introduced in Junos OS Release 9.1.
Third-party interoperability during a unified in-service software upgrade (ISSU) introduced in Junos OS Release 17.1.

**Description**

Configure the interval between successive transmissions of continuity check messages (CCMs) as part of the connectivity fault detection strategy. When the receiving maintenance association end point (MEP) does not receive a CCM at the configured interval, the `loss-threshold` statement determines how many CCMs can be lost before the sending MEP is marked as down. The `hold-interval` statement then determines the frequency at which the database of MEPs in the maintenance association (MA) is flushed in the absence of updates.

During a unified in-service software upgrade (ISSU), Junos OS connectivity fault management (CFM) works when the peer device is not a Juniper Networks router. Interoperating with the router of another vendor, the Juniper Networks router retains session information and continues to transmit CCM (continuity check message) PDUs during the unified ISSU upgrade. For this feature to work, you must enable Packet Forwarding Engine keepalives with the `hardware-assisted-keepalives` statement, and configure the interval between CCMs to be 1 second with `interval` statement.

---

**NOTE:** For the continuity check message interval to be configured for 10 milliseconds, periodic packet management (PPM) runs on the Routing Engine and Packet Forwarding Engine by default. You can disable PPM only on the Packet Forwarding Engine. To disable PPM on the Packet Forwarding Engine, use the `no-delegate-processing` statement at the `[edit routing-options ppm]` hierarchy level.

---

**NOTE:** A continuity check interval of 10 milliseconds is not supported for CFM sessions over a label-switched interface (LSI).

**Options**

- `100ms`—100 milliseconds.
- `10m`—10 minutes.
10ms—10 milliseconds.
10s—10 seconds.
1m—1 minute.
1s—1 second.
Default: 1m

**lowest-priority-defect**

**Syntax**

`lowest-priority-defect (all-defects | err-xcon | mac-rem-err-xcon | no-defect | rem-err-xcon | xcon)`

**Hierarchy Level**

`[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name mep mep-id]`

**Release Information**

Statement introduced in Junos OS Release 10.0.

**Description**

Specify the lowest priority defect that is allowed to generate a Fault Alarm whenever CFM detects a defect. This configuration is done at the MEP level.

**Options**

Specify one of the following lowest priority defect options:

- **all-defects**—Allows all defects.
- **err-xcon**—Allows only erroneous CCM and cross-connect CCM defects.
- **mac-rem-err-xcon**—Allows only MAC, not receiving CCM, erroneous CCM, and cross-connect defects.
- **no-defect**—Allows no defects.
- **rem-err-xcon**—Allows only not receiving CCM, erroneous CCM, and cross-connect CCM defects.
- **xcon**—Allows only cross-connect CCM defects.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring the Maintenance End Point Lowest Priority Defect*
maintenance-association

Syntax

```java
maintenance-association ma-name {
  short-name-format (character-string | vlan | 2octet | rfc-2685-vpn-id);
  protect-maintenance-association protect-ma-name;
  remote-maintenance-association remote-ma-name;
  continuity-check {
    hold-interval minutes;
    interval (10m | 10s | 1m | 1s | 100ms);
    loss-threshold number;
  }
  mep mep-id {
    auto-discovery;
    direction (up | down);
    interface interface-name (protect | working);
    lowest-priority-defect (all-defects | err-xcon | mac-rem-err-xcon | no-defect | rem-err-xcon | xcon);
    priority number;
    remote-mep mep-id {
      action-profile profile-name;
      sla-iterator-profile profile-name {
        data-tlv-size size;
        iteration-count count-value;
        priority priority-value;
      }
    }
  }
}
```

Hierarchy Level

[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]

Release Information

Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

Description

Configure the name of the maintenance association in IEEE-compliant format.

Options

- **ma-name**—The name of the maintenance association within the maintenance domain.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

Related Documentation

## maintenance-domain

**Syntax**

```plaintext
maintenance-domain domain-name {
  bridge-domain name <vlan-id [ vlan-ids ]>;
  instance vpls-instance-name;
  level number;
  maintenance-association ma-name {
    protect-maintenance-association protect-ma-name;
    remote-maintenance-association remote-ma-name;
    short-name-format (character-string | vlan | 2octet | rfc-2685-vpn-id);
    continuity-check {
      hold-interval minutes;
      interval (10m | 10s | 1m | 1s | 100ms);
      loss-threshold number
    }
    mep mep-id {
      auto-discovery;
      direction (up | down);
      interface interface-name (protect | working);
      lowest-priority-defect (all-defects | err-xcon | mac-rem-err-xcon | no-defect | rem-err-xcon | xcon);
      priority number;
      remote-mep mep-id {
        action-profile profile-name;
        sla-iterator-profile profile-name {
          data-tlv-size size;
          iteration-count count-value;
          priority priority-value;
        }
      }
    }
    mip-half-function (none | default | explicit);
    name-format (character-string | none | dns | mac+2oct);
  }
  virtual-switch name {
    bridge-domain name <vlan-id [ vlan-ids ]>;
  }
}
```

**Hierarchy Level**

[edit protocols oam ethernet connectivity-fault-management]

**Release Information**

Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
Support for multiple down MEP introduced in Junos OS Release 15.1R1 for MX Series Routers.

**Description**

Configure the name of the maintenance domain in IEEE-compliant format.
NOTE: For MX Series Routers, you can configure multiple down MEPs for a single instance of maintenance domain identifier and maintenance association name to monitor services provided on Virtual Private LAN Service (VPLS), bridge, circuit cross-connect (CCC), and IPv4 domains.

Options **domain-name**—Name of the maintenance domain.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**measurement-interval**

**Syntax**  
measurement-interval (5|15|30|60)

**Hierarchy Level**  
[edit protocols oam ethernet cfm performance-monitoring]
[edit protocols oam ethernet cfm performance-monitoring sla-iterator-profiles profile-name]

**Release Information**

**Description**  
Configure measurement interval to be used for a performance monitoring session. You must configure the measurement-interval at the [edit protocols oam ethernet cfm performance-monitoring] hierarchy level, which is a global level parameter. You can override the configured value by specifying a measurement-interval for the iterator profile at the [edit protocols oam ethernet cfm performance-monitoring sla-iterator-profiles profile-name] hierarchy level.

---

**NOTE:** When you configure when MEF-36-compliant performance monitoring, you must also configure an enhanced-sla-iterator at the [edit protocols oam ethernet cfm performance-monitoring] hierarchy level.

**Default**  
15 minutes

**Required Privilege**  
configure—To enter configuration mode.
control—To modify any configuration.

**Related Documentation**  
- IEEE 802.1ag OAM Connectivity Fault Management Overview on page 728

measurement-type

**Syntax**

```
measurement-type (loss | statistical-loss-measurement | two-way-delay);
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
  sla-iterator-profiles profile-name]
```

**Release Information**

Statement introduced in Junos OS Release 11.1.
The **statistical-loss-measurement** option introduced in Junos OS Release 11.2.

**Description**

Configure the measurement type for the service level agreement (SLA) frames. An SLA frame is a type of packet used to measure frame loss in Ethernet connections.

**Options**

- **loss**—Use Y.1731-compliant line module (LM) frames to measure frame loss.

  - **statistical-loss-measurement**—Use Y.1731-compliant two-way data module (DM) frames to statistically measure frame loss.

  - **two-way-delay**—Use Y.1731-compliant two-way DM frames to measure frame loss.

**Required Privilege Level**

- Configure—To enter configuration mode.
- Control—To modify any configuration.

**Related Documentation**

- Configuring an Iterator Profile on page 886
**mep**

**Syntax**

```
mep mep-id [
  action-profile action-profile-name
  auto-discovery;
  direction (up | down);
  interface interface-name (protect | working);
  priority number;
  remote-mep mep-id [
    action-profile profile-name;
    sla-iterator-profile profile-name {
      data-tlv-size size;
      iteration-count count-value;
      priority priority-value;
    }
  }
]
```

**Hierarchy Level**
```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name maintenance-association ma-name]
```

**Release Information**
Statement introduced in Junos OS Release 8.4.

**Description**
The numeric identifier of the maintenance association end point (MEP) within the maintenance association.

**Options**
```
mep mep-id—Specify the numeric identifier of the MEP.
```

**Range**: 1 through 8191

The remaining statements are explained separately. See [CLI Explorer](https://www.juniper.net/documentation/en_US/junos_18.4-R1.0/index.html).

**Required Privilege**
```
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.
```

**Related Documentation**

**mip-half-function**

**Syntax**

```
mip-half-function (none | default | explicit);
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name],
[edit protocols oam ethernet connectivity-fault-management maintenance-association ma-name]
```

**Release Information**

**Description**

Specify the OAM Ethernet CFM maintenance domain MIP half functions.

**NOTE:** Whenever a MIP is configured and a bridge domain is mapped to multiple maintenance domains or maintenance associations, it is essential that the `mip-half-function` value for all maintenance domains and maintenance associations are the same.

**Options**

- **none**—Specify to not use the mip-half-function.
- **default**—Specify to use the default mip-half-function.
- **explicit**—Specify an explicit mip-half-function.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

name-format

Syntax
name-format (character-string | none | dns | mac+2oct);

Hierarchy Level
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]

Release Information
Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

Description
Specify the format of the maintenance domain name.

Options
- character-string—The name is an ASCII character string.
- none—The maintenance domain name is not used.
- dns—The name is in domain name service (DNS) format. For example: www.juniper.net.
- mac+2oct—Name is the MAC address plus a two-octet maintenance association identifier. For example: 08:00:22:33:44:55.100.

Default: character-string

Required Privilege Level
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

## policer (CFM Global)

### Syntax

```c
policer {
  all cfm-policer-name;
  continuity-check cfm-policer-name;
  other cfm-policer-name;
}
```

### Hierarchy Level

```bash
[edit protocols oam ethernet connectivity-fault-management]
```

### Release Information

Statement introduced in Junos OS Release 10.0.

### Description

Specify a policer at the global level to police the CFM traffic belonging to all sessions.

### Options

- **continuity-check cfm-policer-name**—Police all continuity check packets with the policer specified.
- **other cfm-policer-name**—Police all non-continuity check packets with the policer specified.
- **all cfm-policer-name**—Police all CFM packets with policer specified. If the all option is used, then you cannot specify above two options.

### Required Privilege

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

### Related Documentation

- Configuring Rate Limiting of Ethernet OAM Messages on page 787
- policer (CFM Session) on page 1182
**policer (CFM Session)**

**Syntax**

```plaintext
policer {
  all cfm-policer-name;
  continuity-check cfm-policer-name;
  other cfm-policer-name;
}
```

**Hierarchy Level**

```plaintext
[edit protocols oam ethernet connectivity-fault-management maintenance-domain name level number maintenance-association name]
```

**Release Information**

Statement introduced in Junos OS Release 10.0.

**Description**

Specify a separate policer to rate-limit packets specific to that session.

**Options**

- `continuity-check cfm-policer-name`—Police continuity check packets belonging to this session.
- `other cfm-policer-name`—Police all non-continuity check packets belonging to this session.
- `all cfm-policer-name`—Police all CFM packets belonging to this session. If the `all` option is used, then you cannot specify the above two options.

**Required Privilege**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management]
[edit protocols oam ethernet connectivity-fault-management maintenance-domain]
  maintenance-domain-name maintenance-association maintenance-association-name
  continuity-check]
```

Release Information

Statement introduced in Junos OS Release 16.1R2.

Description

Configures Junos OS to send the sender ID TLV along with the packets. The sender ID TLV is an optional TLV that is sent in continuity check messages (CCMs), loopback messages, and Link Trace Messages (LTMs), as specified in the IEEE 802.1ag standard. TLVs (type, length, and value) are described in the IEEE 802.1ag standard for Connectivity Fault Management (CFM) as a method of encoding variable-length and optional information in a protocol data unit (PDU).

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

802.3ad

Syntax

```plaintext
802.3ad {
  primary | backup;
  ae interface-number ;
  lacp {
    port-priority priority-number;
  }
  link-index index-number
  distribution-list distribution-list-number
}
```

Hierarchy Level

[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]

Release Information

Statement introduced before Junos OS Release 7.4. 
primary and backup options added in Junos OS Release 8.3.

Description

Specify aggregated Ethernet logical interface number.

Options

bundle—Join an aggregated Ethernet interface.

```plaintext
ae interface-number—Aggregated Ethernet logical interface number. For MX Series routers running Junos release 14.2R3 and later you can configure a maximum of 1000 aggregated interfaces. On MX2010 and MX2020 routers you can configure a maximum of 800 aggregated interfaces.
```

```plaintext
primary | backup—For link protection configurations, specify the link as primary link or backup link for egress traffic.
```

```plaintext
lacp—Configure Link Aggregation Control Protocol. Specify the port priority in the range 0 through 65535. Default port-priority is 127.
```

```plaintext
link-index—Specify the desired child link index within the aggregated Ethernet Interface. Index number of the logical interface reflects its initialization sequence.
```

```plaintext
distribution-list—For targeted distribution, specify the distribution list to which the interface belongs.
```

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

accept-source-mac

Syntax

```plaintext
accept-source-mac {
  mac-address mac-address {
    policer {
      input cos-policer-name;
      output cos-policer-name;
    }
  }
}
```

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.
Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description

For Gigabit Ethernet intelligent queuing (IQ) interfaces only, accept traffic from and to the specified remote media access control (MAC) address.

The `accept-source-mac` statement is equivalent to the `source-address-filter` statement, which is valid for aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only. To allow the interface to receive packets from specific MAC addresses, include the `accept-source-mac` statement.

On untagged Gigabit Ethernet interfaces, you should not configure the `source-address-filter` statement and the `accept-source-mac` statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the `source-address-filter` statement and the `accept-source-mac` statement with an identical MAC address specified in both filters.

The remaining statements are explained separately. See CLI Explorer.

---

**NOTE:** The `policer` statement is not supported on PTX Series Packet Transport Routers.

---

**NOTE:** On QFX platforms, if you configure source MAC addresses for an interface using the `static-mac` or `persistent-learning` statements and later configure a different MAC address for the same interface using the `accept-source-mac` statement, the MAC addresses that you previously configured for the interface remain in the ethernet-switching table and can still be used to send packets to the interface.
Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

access-concentrator

Syntax

```
access-concentrator name;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family pppoe],
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number family pppoe],
[edit interfaces interface-name unit logical-unit-number family pppoe],
[edit interfaces interface-name unit logical-unit-number pppoe-options],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family pppoe],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number pppoe-options],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number pppoe-underlying-options]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Support at the [edit interfaces interface-name unit logical-unit-number pppoe-underlying-options] and [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number pppoe-underlying-options] hierarchy levels introduced in Junos OS Release 10.1.
Support at the [edit ... family pppoe] hierarchies introduced in Junos OS Release 11.2.

Description

Configure an alternative access concentrator name in the AC-NAME tag in a PPPoE control packet for use with a dynamic PPPoE subscriber interface. If you do not configure the access concentrator name, the AC-NAME tag contains the system name.

NOTE: The [edit ... family pppoe] hierarchies are supported only on MX Series routers with MPCs.

Options

- `name`—Name of the access concentrator.

Required Privilege Level

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

account-layer2-overhead (PIC Level)

Syntax
account-layer2-overhead;

Hierarchy Level
[edit chassis fpc slot-number pic pic-number]

Release Information
Statement introduced in Junos OS Release 13.2.

Description
Enable the automatic adjustment of Layer 2 overhead in bytes, which is the octet adjustment per packet, based on the encapsulation on the logical interface for the total octet count for ingress and egress traffic on all the interfaces in the PIC.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Accounting of the Layer 2 Overhead Attribute in Interface Statistics on page 665

action (OAM)

Syntax
action {
  link-down;
  send-critical-event;
  syslog;
}

Hierarchy Level
[edit protocols oam ethernet link-fault-management action-profile]

Release Information
Statement introduced in Junos OS Release 8.5.

Description
Define the action or actions to be taken when the OAM fault event occurs.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Specifying the Actions to Be Taken for Link-Fault Management Events on page 832

    frame-period-summary count;
    symbol-period count;
  }
}
```

**Hierarchy Level**

[edit protocols oam ethernet link-fault-management]

**Release Information**

Statement introduced in Junos OS Release 8.5 for T, M, MX and ACX Series Routers, SRX Series Firewalls, and EX Series Switches.
Statement introduced in Junos OS Release 9.4 for EX Series switches and NFX Series devices.

**Description**

Configure an Ethernet OAM link fault management (LFM) action profile by specifying a profile name.
The remaining statements are explained separately. See CLI Explorer.

**Options**

- **profile-name**—Name of the action profile.

The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

```

Release Information

- Statement introduced in Junos OS Release 13.2R3 for MX Series Routers.
- Statement introduced in Junos OS Release 15.1X53-D10 for the QFX Series.

Description

Correct a genuine traffic imbalance by using a feedback mechanism to distribute the traffic across the links of an aggregated Ethernet bundle.

Options

- **pps**—(PTX Series only) The type of traffic rate among the members of the AE bundle is measured packets per second. The default rate type is bytes per second.
  - **scan-interval multiple**—(PTX Series only) Scan interval, as a multiple of a 30-second interval.
    - **Range**: 1 through 5
    - **Default**: 1
  - **tolerance tolerance-percentage**—(MX Series and PTX Series) Limit to the variance in the packet traffic flow to the aggregated Ethernet links in a percentage.
    - **Range**: 1 through 100 percent
    - **Default**: 20 percent

Required Privilege Level

- interface - To view this statement in the configuration.
- interface-control - To add this statement to the configuration.

[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Configure the interface address.

**NOTE:** If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, and the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```plaintext
interfaces {
    xe-0/0/0 {
        unit 0 {
            family inet {
                address 192.168.1.1/8;
            }
        }
    }
    xe-0/0/1 {
        unit 0 {
            family inet {
                address 192.168.1.1/8;
            }
        }
    }
}
```

For more information on configuring the same address on multiple interfaces, see *Configuring the Interface Address*.

- In Junos OS Release 13.3 and later, when you configure an IPv6 host address and an IPv6 subnet address on an interface, the commit operation fails.
- In releases earlier than Junos OS Release 13.3, when you use the same configuration on an interface, the commit operation succeeds, but only one of the IPv6 addresses that was entered is assigned to the interface. The other address is not applied.
Options  

**address**—Address of the interface.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

**advertisement-interval**

**Syntax**

advertisement-interval seconds;

**Hierarchy Level**

[edit protocols lldp],
[edit routing-instances routing-instance-name protocols lldp]

**Release Information**

Statement introduced in Junos OS Release 9.6 for MX Series and T Series routers.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Configure an interval for LLDP advertisement.

For switches configured for Link Layer Discovery Protocol, configure the frequency at which LLDP advertisements are sent.

The `advertisement-interval` value must be greater than or equal to four times the `transmit-delay` value, or an error will be returned when you attempt to commit the configuration.

**NOTE:** The default value of `transmit-delay` is 2 seconds. If you configure the `advertisement-interval` as less than 8 seconds and you do not configure a value for `transmit-delay`, the default value of `transmit-delay` is automatically changed to 1 second in order to satisfy the requirement that the `advertisement-interval` value must be greater than or equal to four times the `transmit-delay` value.

**Default**

Disabled.

**Options**

`seconds`—Interval between LLDP advertisement.

**Required Privilege Level**

routing—to view this statement in the configuration.

routing-control—to add this statement to the configuration.

agent-specifier

Syntax

agent-specifier {
  aci circuit-id-string ari remote-id-string {
    drop;
    delay seconds;
    terminate;
    dynamic-profile profile-name;
    routing-instance routing-instance-name;
    static-interface interface-name;
  }
}

Hierarchy Level

[edit protocols pppoe service-name-tables table-name service service-name]

Release Information

Statement introduced in Junos OS Release 10.0. drop, delay, terminate, dynamic-profile, routing-instance, and static-interface options introduced in Junos OS Release 10.2.

Description

Specify the action taken by the interface for the specified agent circuit identifier/agent remote identifier (ACI/ARI) pair when the interface receives a PPPoE Active Discovery Initiation (PADI) control packet that includes the vendor-specific tag with ACI/ARI pair information. You can configure an ACI/ARI pair for a named service, empty service, or any service in a PPPoE service name table. A maximum of 8000 ACI/ARI pairs are supported per PPPoE service name table. You can distribute the ACI/ARI pairs in any combination among the named, empty, and any service entries in the service name table.

You can use an asterisk (*) as a wildcard character to match ACI/ARI pairs, the ACI alone, or the ARI alone. The asterisk can be placed only at the beginning, the end, or both the beginning and end of the identifier string. You can also specify an asterisk alone for either the ACI or the ARI. You cannot specify only an asterisk for both the ACI and the ARI. When you specify a single asterisk as the identifier, that identifier is ignored in the PADI packet.

For example, suppose you care about matching only the ACI and do not care what value the ARI has in the PADI packet, or even whether the packet contains an ARI value. In this case you can set the remote-id-string to a single asterisk. Then the interface ignores the ARI received in the packet and the interface takes action based only on matching the specified ACI.

Default

The default action is terminate.

Options

aci circuit-id-string—Identifier for the agent circuit ID that corresponds to the DSLAM interface that initiated the service request. This is a string of up to 63 characters.

ari remote-id-string—Identifier for the subscriber associated with the DSLAM interface that initiated the service request. This is a string of up to 63 characters.
The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

}
```

Hierarchy Level

```
[edit chassis]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Support for LACP link protection and system priority introduced in Junos OS Release 9.3.

Description

Configure properties for aggregated devices on the router. Aggregate Ethernet links are logical interfaces defined on the device that bundle together multiple physical interfaces into a single interface for the use of redundancy and bandwidth aggregation. When interconnecting devices you can create aggregate ethernet interfaces to bundle together multiple physical ethernet links to increase bandwidth and redundancy between devices.

Link aggregation enables you to group Ethernet interfaces to form a single link layer interface. Link Aggregation Control Protocol (LACP) is supported in chassis cluster deployments, where aggregated Ethernet interfaces and redundant Ethernet interfaces are supported simultaneously.

You must first configure the system to enable configuring the Aggregated Ethernet (ae) Interfaces. By default, Juniper devices do not have any aggregated ethernet interfaces created. To configure the device to support a given number of ae interfaces, you must define it on a per chassis basis using the `set chassis aggregated-devices devices {1-32}` in configuration mode. The number of devices you define will be the number of aggregated ethernet interfaces that the system will create which can be configured just like any other ethernet interface. Also you can view the interfaces created by using the `show interface terse` command. Once you have defined the number of aggregated ethernet devices on the chassis you can then continue to configure the LAG members on a per ethernet interface basis.

Options

The remaining statements are explained separately.
Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

```

NOTE: The `edit logical-systems` hierarchy is not available on QFabric systems.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

For Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, configure Address Resolution Protocol (ARP) table entries, mapping IP addresses to MAC addresses. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.

NOTE: By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the `family inet` statement. By including the `arp` statement at the `[edit interfaces interface-name unit...

Copyright © 2019, Juniper Networks, Inc.
logical-unit-number family inet policer] hierarchy level, you can apply a specific ARP-packet policer to an interface. This feature is not available on EX Series switches.

When you need to conserve IP addresses, you can configure an Ethernet interface to be unnumbered by including the unnumbered-address statement at the [edit interfaces interface-name unit logical-unit-number family inet] hierarchy level.

NOTE: For EX-Series switches, set only the time interval between ARP updates.
Options

**ip-address**—IP address to map to the MAC address. The IP address specified must be part of the subnet defined in the enclosing address statement.

**mac mac-address**—MAC address to map to the IP address. Specify the MAC address as six hexadecimal bytes in one of the following formats: `nnnn.nnnn.nnnn` or `nnn.nn.nnn.nn.nn`. For example, `0000.5e00.5355` or `00:00:5e:00:53:55`.

**multicast-mac mac-address**—Multicast MAC address to map to the IP address. Specify the multicast MAC address as six hexadecimal bytes in one of the following formats: `nnnn.nnnn.nnnn` or `nnn.nn.nnn.nn.nn.nn`. For example, `0000.5e00.5355` or `00:00:5e:00:53:55`.

**publish**—(Optional) Have the router or switch reply to ARP requests for the specified IP address. If you omit this option, the router or switch uses the entry to reach the destination but does not reply to ARP requests.

---

**NOTE:** For unicast MAC addresses only, if you include the publish option, the router or switch replies to proxy ARP requests.

---

**aging-timer**—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.

**gratuitous-arp-delay**—(T Series only) Configure a delay for gratuitous ARP requests at the system level. By default, Junos OS sends gratuitous ARP requests immediately after network-related configuration changes are made on an interface (for example, a VLAN ID, MAC address, or IP address change). This might lead to the Packet Forwarding Engine dropping some initial request packets if the configuration updates have not been fully processed. To avoid such request packets being dropped, you can configure a delay in gratuitous ARP requests.

**Values:**

- **seconds**—Configure the ARP request delay in seconds. We recommend configuring a value in the range of 3 through 6 seconds.

**gratuitous-arp-on-ifup**—(ACX Series, SRX Series, T Series only) Add this statement to the [edit system arp] hierarchy to configure Junos OS to automatically issue a gratuitous ARP announcement when an interface is online.

**interfaces**—(T Series only) Specify the ARP aging timer in minutes for a logical interface of family type inet.

**Values:**

- **aging-timer minutes**—Time between ARP updates, in minutes.
- **Default:** 20
- **Range:** 1 through 6,00,000
**passive-learning**—(M Series, MX Series, PTX Series, SRX Series, T Series only) Configure backup VRRP routers or switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests. By default, the backup VRRP router drops these requests; therefore, if the master router fails, the backup router must learn all entries present in the ARP cache of the master router. Configuring passive learning reduces transition delay when the backup router is activated. Learning of ARP mappings (IP-to-MAC address) by backup VRRP routers or switches for hosts sending the requests is disabled unless this statement is configured.

**purging**—(M Series, MX Series, PTX Series, SRX Series, T Series only) Purge obsolete ARP entries from the cache when an interface or link goes offline.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description
For Gigabit Ethernet interfaces on M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers explicitly enable autonegotiation and remote fault. For EX Series switches, explicitly enable autonegotiation only.

- **auto-negotiation**—Enables autonegotiation. This is the default.
- **no-auto-negotiation**—Disable autonegotiation. When autonegotiation is disabled, you must explicitly configure the link mode and speed.

When you configure Tri-Rate Ethernet copper interfaces to operate at 1 Gbps, autonegotiation must be enabled.

**NOTE:** On EX Series switches, an interface configuration that disables autonegotiation and manually sets the link speed to 1 Gbps is accepted when you commit the configuration; however, if the interface you are configuring is a Tri-Rate Ethernet copper interface, the configuration is ignored as invalid and autonegotiation is enabled by default.

To correct the invalid configuration and disable autonegotiation:

1. Delete the no-auto-negotiation statement and commit the configuration.
2. Set the link speed to 10 or 100 Mbps, set no-auto-negotiation, and commit the configuration.

On EX Series switches, if the link speed and duplex mode are also configured, the interfaces use the values configured as the desired values in the negotiation. If autonegotiation is disabled, the link speed and link mode must be configured.

**NOTE:** On T4000 routers, the auto-negotiation command is ignored for interfaces other than Gigabit Ethernet.
NOTE: On ACX Series routers, when you configure fiber interfaces (fiber media mode) to operate at 1 Gbps, autonegotiation is enabled by default to negotiate the speed and duplex settings. You can disable autonegotiation by using the (no-auto-negotiation) statement, and commit the configuration. In the fiber media mode. In copper interfaces (copper media mode), autonegotiation is enabled by default. To disable autonegotiation, you need to explicitly configure the link speed to 10 or 100 Mbps, set no-auto-negotiation, and commit the configuration.

Default
Autonegotiation is automatically enabled. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.

Options
remote-fault (local-interface-online | local-interface-offline)—(Optional) For M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers only, manually configure remote fault on an interface.

Default: local-interface-online

Required Privilege
Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

  }
}
```

**Hierarchy Level**

- [edit]
- [edit logical-systems logical-system-name routing-instances routing-instance-name]
- [edit routing-instances routing-instance-name]

**Release Information**

Statement introduced in Junos OS Release 8.4.
Support for logical systems added in Junos OS Release 9.6.
Support for the `no-irb-layer-2-copy` statement added in Junos OS Release 10.2.

**Description**

(MX Series routers only) Configure a domain that includes a set of logical ports that share the same flooding or broadcast characteristics in order to perform Layer 2 bridging.

On MX Series routers, Integrated routing and bridging (IRB) is not supported on Pseudowire Subscriber (PS) Logical Interface. Hence you cannot add IRB to bridge domain with PS interface, that is, you cannot configure IRB and PS interface in the same bridge domain. Note that adding IRB to a bridge-domain having PS interface causes kernel crash and continuous reboot of the router until the configuration is rolled back.

**Options**

- `bridge-domain-name`—Name of the bridge domain.
NOTE: You cannot use the slash (/) character as part of the bridge domain name. If you do, the configuration will not commit.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

bfd-liveness-detection (LAG)

Syntax

```plaintext
bfd-liveness-detection {
    authentication {
        algorithm algorithm-name;
        key-chain key-chain-name;
        loose-check;
    }
    detection-time {
        threshold milliseconds;
    }
    holddown-interval milliseconds;
    local-address bfd-local-address;
    minimum-interval milliseconds;
    minimum-receive-interval milliseconds;
    multiplier number;
    neighbor bfd-neighbor-address;
    no-adaptation;
    transmit-interval {
        minimum-interval milliseconds;
        threshold milliseconds;
    }
    version (1 | automatic);
}
```

Hierarchy Level

[edit interfaces aex aggregated-ether-options]

Release Information

Statement introduced in Junos OS Release 13.3.

Description

Configure Bidirectional Forwarding Detection (BFD) timers and authentication for aggregated Ethernet interfaces.

Options

**holddown-interval** **milliseconds** — Specify a time limit, in milliseconds, indicating the time that a BFD session remains up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

- **Range:** 0 through 255,000
- **Default:** 0

**local-address** **bfd-local-address** — Specify the loopback address or the AE interface address of the source of the BFD session.

NOTE: Beginning with Release 16.1R2, Junos OS checks and validates the configured micro BFD local-address against the interface or loopback IP address before the configuration commit. Junos OS performs this
check on both IPv4 and IPv6 micro BFD address configurations, and if they do not match, the commit fails.

**minimum-interval milliseconds**—Specify a minimum time interval after which the local routing device transmits a BFD packet and then expects to receive a reply from the BFD neighbor. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the `transmit-interval` `minimum-interval` statement.

  Range: 1 through 255,000

**minimum-receive-interval milliseconds**—Specify the minimum time interval after which the routing device expects to receive a reply from the BFD neighbor.

  Range: 1 through 255,000

**multiplier number**—Specify the number of BFD packets that were not received by the BFD neighbor before the originating interface is declared down.

  Range: 1 through 255

**neighbor bfd-neighbor-address**—Specify the loopback address or the AE interface address of a remote destination to send BFD packets.

**no-adaptation**—Disable the BFD adaptation. Include this statement if you do not want the BFD sessions to adapt to changing network conditions. We recommend that you do not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**version**—Configure the BFD version to detect (BFD version 1) or autodetect (the BFD version).

**NOTE:** The version option is not supported on the QFX Series.

**Default:** automatic

The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**

**cak (MX Series)**

**Syntax**

```
cak hexadecimal-number;
```

**Hierarchy Level**

```
[edit security macsec connectivity-association connectivity-association-name pre-shared-key]
```

**Release Information**

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Statement introduced in Junos OS Release 17.3R1 for MX10003 Universal Routing Platforms.

**Description**

Specifies the connectivity association key (CAK) for a pre-shared key.

A pre-shared key includes a connectivity association key name (CKN) and a CAK. A pre-shared key is exchanged between two devices at each end of a point-to-point link to enable MACsec using dynamic security keys. The MACsec Key Agreement (MKA) protocol is enabled once the pre-shared keys are successfully exchanged. The pre-shared key—the CKN and CAK—must match on both ends of a link.

**Default**

No CAK exists, by default.

**Options**

`hexadecimal-number`—The key name, in hexadecimal format.

The key name is 32 hexadecimal characters in length. If you enter a key name that is less than 32 characters long, the remaining characters are set to 0.

On MX10003 router, to maximize the security, it is recommended to configure CAK of even length.

- If you configure CAK of length that is less than 32 hexadecimal digits and if cipher-suite is gcm-aes-128/gcm-aes-256 and less than 64 hexadecimal digits, then the following warning message is displayed: warning: To maximize security, recommend configuring all 32 digits of pre-shared-key cak or warning: To maximize security, recommend configuring all 64 digits of pre-shared-key cak

- On MX10003 router, if you configure the length of CAK to an odd value, then the following warning message is displayed: To maximize security, it is recommended to configure pre-shared-key cak of even length

}
```

Hierarchy Level

[edit protocols]

Release Information

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description

Specify the design elements of a captive portal login page.

Options

- **banner-message**—The first screen displayed before the captive portal login page is displayed—for example, a disclaimer message.
  - **Range:** 1–2047 characters

- **footer-bgcolor** —The hexadecimal color code for the color of the footer bar across the bottom of the captive portal login page—for example, #2E8B57 (sea green).
  - **Values:** # symbol followed by six characters.

- **footer-message**—Text message displayed in the footer bar across the bottom of the captive portal login page.
  - **Range:** 1–2047 characters
  - **Default:** Copyright ©2010, Juniper Networks Inc.

- **footer-text-color** — Color of the text in the footer.
  - **Default:** The default color is white.

- **form-header-bgcolor** —The hexadecimal color code for the background color of the header bar across the top of the form area of the captive portal login page.
  - **Values:** # symbol followed by six characters.

- **form-header-message**—Text message displayed in the header bar across the top of the form area of the captive portal login page.
**Range:** 1–255 characters  
**Default:** Captive Portal User Authentication

**form-header-text-color**—Color of the text in the form header.  
**Default:** The default color is black.

**form-reset-label**—Label displayed in the button that the user can select to clear the username and password fields on the form.  
**Range:** 1–255 characters  
**Default:** Reset

**form-submit-label**—Label displayed in the button that the user selects to submit their login information—for example, Log In.  
**Range:** 1–255 characters  
**Default:** Log In

**header-bgcolor**—The hexadecimal color code for the color of the header bar across the top of the captive portal login page.  
**Values:** # symbol followed by six characters.

**header-logo**—Filename of the file containing the image of the logo displayed at the top of the captive portal login page. The image file can be in GIF, JPEG, or PNG format.  
**Default:** The Juniper Networks logo

**header-message**—Text displayed in the header bar across the bottom of the captive portal login page.  
**Range:** 1–2047 characters  
**Default:** User Authentication

**header-text-color**—Color of the text in the header.  
**Default:** The default color is white.

**post-authentication-url**—URL to which the users are directed upon successful authentication—for example www.mycafe.com.  
**Range:** 1–255 characters  
**Default:** The page originally requested by the user.

**Required Privilege**  
**Level**

cipher-suite (MACsec)

Syntax

cipher-suite encryption-algorithm-name;

Hierarchy Level

[edit security macsec connectivity-association connectivity-association-name]

Release Information

Statement introduced in Junos OS Release 16.2R1 for MX240, MX480, MX960, MX2020, and MX2010 routers.
Statement introduced in Junos OS Release 17.2R1 for QFX Series switches.
Statement introduced in Junos OS Release 17.3R1 for JNP-MIC1-MACSEC MIC on MX10003 routers.
Statement introduced in Junos OS Release 18.2R1 for EX Series switches.

Description

Specify the set of ciphers used to encrypt traffic on an Ethernet link that is secured with Media Access Control Security (MACsec). The encryption used by MACsec ensures that the data in the Ethernet frame cannot be viewed by anybody monitoring traffic on the link. MACsec encryption is optional and user-configurable. The configured cipher suites should be the same between MACsec peers.

MACsec utilizes the Galois/Counter Mode Advanced Encryption Standard (GCM-AES). The default cipher suite used for MACsec is GCM-AES-128, with a maximum key length of 128 bits. MACsec also supports GCM-AES-256, with a maximum key length of 256 bits.

GCM–AES–128 and GCM–AES–256 use a 32-bit packet number as part of the initial value that has to be unique for every packet sent with a given secure association key (SAK). When the permutations of the 32-bit packet number are exhausted, the SAK must be refreshed. The frequency of SAK refreshes can be reduced by using a cipher suite with Extended Packet Numbering (XPN), which increases the size of the packet number to 64-bits. Both GCM-AES-128 and GCM-AES-256 are available with XPN.

NOTE: When enabling MACsec on et interfaces, use either the GCM-AES-XPN-128 or GCM-AES-XPN-256 cipher suite.

NOTE: On EX4300-48MP switches, the XPN cipher suites are not supported on multi-rate ports.

Default

If the cipher-suite statement is not configured, the default cipher suite used for encryption is GCM-AES-128.

Options

gcm-aes-128—GCM-AES-128 has a maximum key size of 128 bits.
gcm-aes-xpn-128—GCM-AES-XPN-128 has a maximum key size of 128 bits and extended packet number.

gcm-aes-256—GCM-AES-256 has a maximum key size of 256 bits.

gcm-aes-xpn-256—GCM-AES-XPN-256 has a maximum key size of 256 bits and extended packet number.

[edit logical-systems logical-system-name routing-instances routing-instance-name bridge-domains bridge-domain-name ],
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name ],

Release Information

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers.

Description

Configure the specified community VLAN to be a secondary VLAN of the specified primary VLAN. A community VLAN is used to transport frames among members of a community, which is a subset of users within the VLAN, and to forward frames upstream to the primary VLAN.

NOTE: When you specify this configuration statement, the VLAN ID of a logical interface that you associate with a bridge domain that matches with the VLAN ID or list of IDs that you specify using the community-vlans state is treated as a community port.

Options

number—Individual VLAN IDs separated by a space.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Related Documentation
compatibility-version

Syntax

compatibility-version;

Hierarchy Level

[edit protocols protection-group ethernet-ring ring-name]

Release Information

Statement introduced in Junos OS Release 14.2.

Description

Specify the compatible version mode to be used. When compatibility-version is set to value 1, the node operates in ITU-T Recommendation G.8032/Y.1344 version 1 compatible mode. In this mode all the supported external commands are blocked, ring-id is forced to be 1 and mode of operation is set to revertive mode.

Options

• 1—Use ITU-T Recommendation G.8032/Y.1344 compatible mode version 1.
• 2—Use ITU-T Recommendation G.8032/Y.1344 compatible mode version 2.

Required Privilege Level

connectivity-association (MACsec Interfaces for MX Series)

**Syntax**

```
connectivity-association connectivity-association-name;
```

**Hierarchy Level**

```
[edit security macsec interfaces interface-name]
```

**Release Information**

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**

Applies a connectivity association to an interface, which enables Media Access Control Security (MACsec) on that interface.

**Default**

No connectivity associations are associated with any interfaces.

**Options**

- `connectivity-association-name`—Name of the MACsec connectivity association. 
  - **Range:** 1 through 32 alphanumeric characters. Allowed characters are [a-z, A-Z, 0-9]

**Required Privilege Level**

- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Media Access Control Security (MACsec) on MX Series Routers
connectivity-association (MX Series)

Syntax  

```plaintext
connectivity-association connectivity-association-name {  
  exclude-protocol protocol-name;  
  include-sci;  
  mka {  
    must-secure;  
    key-server-priority priority-number;

}
```

Hierarchy Level  

[edit security macsec]

Release Information  

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description  

Create or configure a MACsec connectivity association.

A connectivity association is not applying MACsec to traffic until it is associated with an interface. MACsec connectivity associations are associated with interfaces using the `interfaces` statement in the [edit security macsec] hierarchy.

Default  

No connectivity associations are present, by default.

Options  

- `connectivity-association-name`—Name of the MACsec connectivity association.  
  - Range: 1 through 32 alphanumeric characters. Allowed characters are [a-z, A-Z, 0-9]
The remaining statements are explained separately.

**Required Privilege**

Level:
- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

Hierarchy Level [edit protocols oam ethernet]

Release Information Statement introduced in Junos OS Release 8.4.
For Ethernet interfaces on M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M20, M3020, MX Series, and T Series routers, specify connectivity fault management for IEEE 802.1ag Operation, Administration, and Management (OAM) support. In Junos OS Release 9.3 and later, this statement is also supported on aggregated Ethernet interfaces.

The remaining statements are explained separately. See CLI Explorer.

**Required Privilege**

**Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

---

**control-channel**

**Syntax**

```
control-channel channel-name {
  vlan vlan-id;
  interface name interface-name
}
```

**Hierarchy Level**

```
[edit protocols protection-group ethernet-ring name (east-interface | west-interface)]
```

**Release Information**

Statement introduced in Junos OS Release 9.4.

Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description**

Configure the Ethernet RPS control channel logical interface to carry the RAPS PDU. The related physical interface is the physical ring port.

**Options**

- **vlan vlan-id**—If the control channel logical interface is a trunk port, then a dedicated `vlan vlan-id` defines the dedicated VLAN channel to carry the RAPS traffic. Only configure the `vlan-id` when the control channel logical interface is the trunk port.

- **interface name interface-name**—Interface name of the control channel.

**Required Privilege**

**Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

[edit protocols pppoe service-name-tables table-name service-name agent-specifier
aci circuit-id-string ari remote-id-string ]
```

**Release Information**
Statement introduced in Junos OS Release 10.0.
Support at [edit protocols pppoe service-name-tables table-name service service-name
agent-specifier aci circuit-id-string ari remote-id-string ] hierarchy level introduced in Junos
OS Release 10.2.

**Description**
Configure the PPPoE underlying interface on the router to wait a specified number of
seconds after receiving a PPPoE Active Discovery Initiation (PADI) control packet from
a PPPoE client before sending a PPPoE Active Discovery Offer (PADO) packet to indicate
that it can service the client request

The router (PPPoE server) does not check whether another server has already sent a
PADO packet during the delay period in response to the PPPoE client's PADI packet. It
is up to the PPPoE client to determine whether another PPPoE server has responded to
its PADI request, or if it must respond to the delayed PADO packet to establish a PPPoE
session.

**Options**

- **seconds**—Number of seconds that the PPPoE underlying interface waits after receiving
  a PADI packet from a PPPoE client before sending a PADO packet in response.
  **Range:** 1 through 120 seconds

**Required Privilege**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

### device-count

<table>
<thead>
<tr>
<th>Syntax</th>
<th>device-count number;</th>
</tr>
</thead>
</table>

**Hierarchy Level**

[edit chassis aggregated-devices ethernet]
[edit chassis aggregated-devices sonet]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement functionality updated in Junos OS Release 14.2, as described below.

**Description**

Configure the number of aggregated logical devices available to the router.

Starting in Junos release 14.2, for MX series routers, aggregated Ethernet interfaces created under a logical system can be individually named. Prior to 14.2, ae interfaces were named automatically (AE1, AE2) etc. upon setting the device count. This change allows administrators to use custom naming schemes. System resources are only allocated for named ae interfaces, regardless of how many were declared in the device count. (In Junos 14.2 and earlier, ae naming occurred automatically up to the number specified for device count, and system resources were allocated whether a given ae interface was used or not.)

**Options**

- **number**—Set the number of aggregated logical devices that will be available for configuration.

  **NOTE:** Starting with Junos OS Release 13.2, a maximum of 64 aggregated interfaces are supported for link aggregation of SONET/SDH interfaces. In releases before Junos OS Release 13.2, a maximum of 16 aggregated interfaces are supported for link aggregation of SONET/SDH interfaces.

  For Junos OS Evolved, you can specify up to 512 aggregated Ethernet devices.

  **Range:** 1 - 496. The upper limit for this value is system specific.
  **Range:** 1 - 512 for Junos OS Evolved.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Junos OS for Supporting Aggregated Devices on page 133

**direction (MX Series)**

| Syntax       | direction (inbound | outbound); |
|--------------|------------------|

| Hierarchy Level | [edit security macsec connectivity-association connectivity-association-name secure-channel secure-channel-name] |

| Release Information | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. |

| Description | Configure whether the secure channel applies MACsec security to traffic entering or leaving an interface. |

If you need to apply MACsec on traffic entering and leaving an interface, you need to create one secure channel to apply MACsec on incoming traffic and another secure channel to apply MACsec on outgoing traffic within the same connectivity association. When you associate the connectivity association with an interface, MACsec is applied on traffic entering and leaving that interface.

You only use this configuration option when you are configuring MACsec using static secure association keys (SAK) security mode. When you are configuring MACsec using static connectivity association keys (CAK) security mode, two secure channels that are not user-configurable—one inbound secure channel and one outbound secure channel—are automatically created within the connectivity association.

| Default | This statement does not have a default value. |

If you have configured a secure channel to enable MACsec using static SAK security mode, you must specify whether the secure channel applies MACsec to traffic entering or leaving an interface. A candidate configuration that contains a secure channel that has not configured a direction cannot be committed.

| Options | inbound—Enable MACsec security on traffic entering the interface that has applied the secure channel. |

| | outbound—Enable MACsec security on traffic leaving the interface that has applied the secure channel. |

The remaining statements are explained separately.

| Required Privilege Level | admin—To view this statement in the configuration. |

| | admin-control—To add this statement to the configuration. |

```
[edit protocols authentication-access-control interface (all | [interface-names ])]
```

Release Information

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description

Configure 802.1X authentication for Port-Based Network Access Control. 802.1X authentication is supported on interfaces that are members of private VLANs (PVLANs).

The remaining statements are explained separately. See CLI Explorer.

Default

802.1X is disabled.

Required Privilege

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.
**domain-id**

**Syntax**
```
domain-id domain-id;
```

**Hierarchy Level**
```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols (ospf | ospf3)],
[edit routing-instances routing-instance-name protocols (ospf | ospf3)]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Specify a domain ID for a route. The domain ID identifies the OSPF domain from which the route originated.

**Options**
- **domain-id**—You can specify either an IP address or an IP address and a local identifier using the following format: `ip-address:local-identifier`. If you do not specify a local identifier with the IP address, the identifier is assumed to have a value of 0.
- **Default:** If the router ID is not configured in the routing instance, the router ID is derived from an interface address belonging to the routing instance.

**Required Privilege**
- **Level**
  - routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

## drop (PPPoE Service Name Tables)

**Syntax**

```
drop;
```

**Hierarchy Level**

```
[edit protocols pppoe service-name-tables table-name service service-name],
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string]
```

**Release Information**

**Description**

Direct the router to drop (ignore) a PPPoE Active Discovery Initiation (PADI) control packet received from a PPPoE client that contains the specified service name tag or agent circuit identifier/agent remote identifier (ACI/ARI) information. This action effectively denies the client’s request to provide the specified service, or to accept requests from the subscriber or subscribers represented by the ACI/ARI information.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring PPPoE Service Name Tables
**dynamic-profile (PPPoE Service Name Tables)**

**Syntax**

```
dynamic-profile profile-name;
```

**Hierarchy Level**

```
[edit protocols pppoe service-name-tables table-name service service-name],
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string]
```

**Release Information**

Statement introduced in Junos OS Release 10.2.

**Description**

Specify a dynamic profile to instantiate a dynamic PPPoE interface. You can associate a dynamic profile with a named service entry, empty service entry, or any service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.

The dynamic profile associated with a service entry in a PPPoE service name table overrides the dynamic profile associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.

If you include the `dynamic-profile` statement at the `[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string]` hierarchy level, you cannot also include the `static-interface` statement at this level. The `dynamic-profile` and `static-interface` statements are mutually exclusive for ACI/ARI pair configurations.

**Options**

- `profile-name`—Name of the dynamic profile that the router uses to instantiate a dynamic PPPoE interface.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring PPPoE Service Name Tables
- Assigning a Dynamic Profile and Routing Instance to a Service Name or ACI/ARI Pair for Dynamic PPPoE Interface Creation
east-interface

Syntax

east-interface {
  node-id mac-address;
  control-channel channel-name {
    vlan number;
    interface name interface-name
  }
  interface-none
  ring-protection-link-end;
} } 

Hierarchy Level

[edit protocols protection-group ethernet-ring ring-name ]

Release Information

Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description

Define one of the two interface ports for Ethernet ring protection, the other being defined by the west-interface statement at the same hierarchy level. The interface must use the control channel’s logical interface name. The control channel is a dedicated VLAN channel for the ring port.

EX Series switches do not use the node-id statement—the node ID is automatically configured on the switches using the MAC address.

NOTE: Always configure this port first, before configuring the west-interface statement.

NOTE: The Node ID is not configurable on EX Series switches. The node ID is automatically configured using the MAC address.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

### egress-policer-overhead

**Syntax**

```plaintext
egress-policer-overhead bytes;
```

**Hierarchy Level**

```
[edit chassis fpc slot-number pic pic-number]
```

**Release Information**

Statement introduced before Junos OS Release 11.1.

**Description**

Add the specified number of bytes to the actual length of an Ethernet frame when determining the actions of Layer 2 policers, MAC policers, or queue rate limits applied to output traffic on the line card. You can configure egress policer overhead to account for egress shaping overhead bytes added to output traffic on the line card.

On M Series and T Series routers, this statement is supported on Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs and Enhanced IQ2 (IQ2E) PICs. On MX Series routers, this statement is supported for interfaces configured on Dense Port Concentrators (DPCs).

**Options**

- **bytes**—Number of bytes added to a packet exiting an interface.
  
  **Range:** 0–255 bytes
  
  **Default:** 0

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers. Only the atm-ccc-cell-relay and atm-ccc-vc-mux options are supported on ACX Series routers.
Statement introduced in Junos OS Release 17.3R1 for QFX10000 Series switches (ethernet-ccc and vlan-ccc options only).

Description

Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.

Options

atm-ccc-cell-relay—Use ATM cell-relay encapsulation.
atm-ccc-vc-mux—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.
atm-cisco-nlpid—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the inet family only.
atm-mlppp-llc—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.
atm-nlpid—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the inet family only.
atm-ppp-llc—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.
atm-ppp-vc-mux—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.

atm-snap—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

atm-tcc-snap—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

atm-tcc-vc-mux—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the tcc family only.

atm-vc-mux—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the inet family only.

ether-over-atm-llc—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

ether-vpls-over-atm-llc—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, Multiprotocol Encapsulation over ATM Adaptation Layer 5). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

ether-vpls-over-fr—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, Multiprotocol Interconnect over Frame Relay.

NOTE: The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

ether-vpls-over-ppp—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

ethernet—Use Ethernet II encapsulation (as described in RFC 894, A Standard for the Transmission of IP Datagrams over Ethernet Networks).

ethernet-ccc—Use Ethernet CCC encapsulation on Ethernet interfaces.
**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

**ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ppp**—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the ppp family only.

**frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the tcc family only.

**gre-fragmentation**—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet’s size exceeds the tunnel’s maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

**multilink-frame-relay-end-to-end**—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**multilink-ppp**—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

**ppp-over-ether**—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.
**ppp-over-ether-over-atm-llc**—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

**vlan-bridge**—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**vlan-ccc**—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-tcc**—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-vpls**—Use Ethernet VLAN encapsulation on VPLS circuits.

**vxlan**—Use VXLAN data plane encapsulation for EVPN.

**Required Privilege Level**  
interface—to view this statement in the configuration.  
interface-control—to add this statement to the configuration.

### Physical Interfaces: M Series, MX Series, QFX Series, T Series, PTX Series

- [edit interfaces interface-name],
- [edit interfaces rlsq number:number]

### Logical Interfaces

- [edit interfaces interface-name unit logical-unit-number ]

### Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.5.
- Statement introduced in Junos OS Release 11.1 for EX Series switches.
- Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers (flexible-ethernet-services, ethernet-ccc, and ethernet-tcc options only).

### Description

For M Series, MX Series, QFX Series, T Series, PTX Series, specify the physical link-layer encapsulation type.

For SRX Series, specify logical link layer encapsulation.

### NOTE:

Not all encapsulation types are supported on the switches. See the switch CLI.
Default  **ppp**—Use serial PPP encapsulation.
Physical Interface Options and Logical Interface Options

For physical interfaces:

NOTE: Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on EX Series switches.

- **atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.
- **atm-pvc**—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).
- **cisco-hdlc**—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:
  - CCC version (**cisco-hdlc-ccc**)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the ccc family only.
  - TCC version (**cisco-hdlc-tcc**)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- **cisco-hdlc-ccc**—Use Cisco-compatible HDLC framing on CCC circuits.
- **cisco-hdlc-tcc**—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.
- **ethernet-bridge**—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.
- **ethernet-over-atm**—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPU packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.
- **ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.
• **ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

• **ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

• **ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

• **ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

• **extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the ccc family only.

• **extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.

• **extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.

• **extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

• **extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the ccc family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.

• **extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.
- **extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

  **NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

- **flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet interfaces, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

- **flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

- **frame-relay**—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.

- **frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have frame-relay-ccc encapsulation. When you use this encapsulation type, you can configure the ccc family only.

- **frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

  **NOTE:** When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

- **frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.
- **frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the ccc family only.

- **frame-relay-tcc**—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

- **generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.

- **multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

- **ppp**—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.

- **ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.

- **ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the tcc family only.

- **vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the ccc family only.
• **vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to **vlan-vci-ccc**.

• **vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:**

- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
- Starting with Junos OS release 13.3, a commit error occurs when you configure **vlan-vpls** encapsulation on a physical interface and configure **family inet** on one of the logical units. Previously, it was possible to commit this invalid configuration.

For logical interfaces:

• **frame-relay**—Configure a Frame Relay encapsulation when the physical interface has multiple logical units, and the units are either point to point or multipoint.

• **multilink-frame-relay-uni-nni**—Link services interfaces functioning as FRF.16 bundles can use Multilink Frame Relay UNI NNI encapsulation.

• **ppp**—For normal mode (when the device is using only one ISDN B-channel per call). Point-to-Point Protocol is for communication between two computers using a serial interface.

• **ppp-over-ether**—This encapsulation is used for underlying interfaces of pp0 interfaces.

encryption (MACsec for MX Series)

Syntax

```
encryption;
```

Hierarchy Level

```
[edit security macsec connectivity-association
connectivity-association-name secure-channel
secure-channel-name]
```

Release Information

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description

Enable MACsec encryption within a secure channel.

You can enable MACsec without enabling encryption. If a connectivity association with a secure channel that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the frame, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic has not been tampered with and does not represent a security threat.

Traffic traversing a MAC-enabled point-to-point Ethernet link traverses the link at the same speed regardless of whether encryption is enabled or disabled. You cannot increase the speed of traffic traversing a MACsec-enabled Ethernet link by disabling encryption.

This command is used to enable encryption when MACsec is configured using secure association key (SAK) security mode only. When MACsec is configuring using static connectivity association key (CAK) security mode, the encryption setting is configured outside of the secure channel using the no-encryption configuration statement.

Default

MACsec encryption is disabled when MACsec is configured using static SAK security mode, by default.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

[edit interfaces irb unit unit-number]
```

### Release Information

Statement introduced in Junos OS Release 15.1R1.
Statement introduced in Junos OS Release 15.1X53-D60 for the QFX Series.

### Description

**NOTE:** On EX9200 and QFX10000 switches, enhanced convergence is applicable for unicast traffic only—for example, when a MAC address is learned over an MC-AE interface, or an ARP entry is resolved over an MC-AE interface.

Improves Layer 2 and Layer 3 convergence time when a multichassis aggregated Ethernet (MC-AE) link goes down or comes up in a bridge domain or VLAN. Convergence time is improved because the traffic on the MC-AE interface is switched to the interchassis link (ICL) without waiting for a MAC address update.

If you have configured an IRB interface over an MC-AE interface that has enhanced convergences enabled, then you must configure enhanced convergence on the IRB interface as well. Enhanced convergence must be enabled for both Layer 2 and Layer 3 interfaces.

Hierarchy Level [edit protocols oam]

Release Information Statement introduced in Junos OS Release 8.2 for MX, T, ACX Series routers, SRX firewalls, M320 and EX Series switches.
Statement introduced in Junos OS Release 9.4 for EX Series switches and NFX Series devices.
connectivity-fault-management introduced in Junos OS Release 10.2 for EX Series switches.

Description Provide IEEE 802.3ah Operation, Administration, and Maintenance (OAM) support for Ethernet interfaces or configure connectivity fault management (CFM) for IEEE 802.1ag Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation
- Enabling IEEE 802.3ah OAM Support on page 823
- Example: Configuring Ethernet OAM Link Fault Management
ethernet-policer-profile

Syntax

```
ethernet-policer-profile {
  input-priority-map {
    ieee8021p premium [ values ];
  }
  output-priority-map {
    classifier {
      premium {
        forwarding-class class-name {
          loss-priority (high | low);
        }
      }
    }
  }
  policer cos-policer-name {
    aggregate {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
    premium {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
  }
}
```

Hierarchy Level

[edit interfaces interface-name gigether-options ethernet-switch-profile],
[edit interfaces interface-name aggregated-ether-options ethernet-switch-profile]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

**NOTE:** On QFX Series standalone switches, this statement hierarchy is only supported on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet, Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, configure a class of service (CoS)-based policer. Policing applies to the inner VLAN identifiers, not to the outer tag. For Gigabit Ethernet interfaces with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), the **premium** policer is not supported.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

**interface**—To view this statement in the configuration.

**interface-control**—To add this statement to the configuration.
Related Documentation

### ethernet-ring

**Syntax**

```plaintext
ethernet-ring ring-name {
  control-vlan (vlan-id | vlan-name);
  data-channel {
    vlan number
  }
  east-interface {
    control-channel channel-name {
      vlan number;
      interface name interface-name
    }
  }
  guard-interval number;
  node-id mac-address;
  restore-interval number;
  ring-protection-link-owner;
  west-interface {
    control-channel channel-name {
      vlan number;
    }
  }
}
```

**Hierarchy Level**

```
[edit protocols protection-group]
```

**Release Information**

Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  

**Description**

For Ethernet PICs on MX Series routers or for EX Series switches, specify the Ethernet ring in an Ethernet ring protection switching configuration.

**Options**

- `ring-name`—Name of the Ethernet protection ring.  
  The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

- interface—To view this statement in the configuration.  
- interface-control—To add this statement to the configuration.

**Related Documentation**

**ethernet-switch-profile**

**Syntax**
```
ethernet-switch-profile {
  ethernet-policer-profile {
    input-priority-map {
      ieee802.1p premium [values];
    }
    output-priority-map {
      classifier {
        premium {
          forwarding-class class-name {
            loss-priority (high | low);
          }
        }
      }
    }
    policer cos-policer-name {
      aggregate {
        bandwidth-limit bps;
        burst-size-limit bytes;
      }
      premium {
        bandwidth-limit bps;
        burst-size-limit bytes;
      }
    }
    storm-control storm-control-profile;
    tag-protocol-id tpid;
    mac-learn-enable;
  }
}
```

**Hierarchy Level**
```
[edit interfaces interface-name gigether-options],
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name ether-options]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.  
Statement introduced in Junos OS Release 13.2 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X50-D15 for the EX Series switches.

**Description**

**NOTE:** On QFX Series standalone switches, the ethernet-policer-profile CLI hierarchy and the mac-learn-enable statement are supported only on the Enhanced Layer 2 Switching CLI.

---

1302  
Copyright © 2019, Juniper Networks, Inc.
For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, aggregated Ethernet with Gigabit Ethernet interfaces, the built-in Gigabit Ethernet port on the M7i router); 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, configure VLAN tag and MAC address accounting and filtering properties.

The remaining statements are explained separately. See CLI Explorer.

NOTE: When you gather interfaces into a bridge domain, the no-mac-learn-enable statement at the [edit interfaces interface-name gigether-options ethernet-switch-profile] hierarchy level is not supported. You must use the no-mac-learning statement at the [edit bridge-domains bridge-domain-name bridge-options interface interface-name] hierarchy level to disable MAC learning on an interface in a bridge domain. For information on disabling MAC learning for a bridge domain, see the MX Series Layer 2 Configuration Guide.

Default If the ethernet-switch-profile statement is not configured, Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router) behave like Gigabit Ethernet interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

evcs

Syntax

```
evcs evc-id {
  evc-protocol cfm;
  remote-uni-count count;
  multipoint-to-multipoint;
}
```

Hierarchy Level

```
[edit protocols oam ethernet]
```

Release Information

Statement introduced in Junos OS Release 9.5.

Description

On MX Series routers with ge, xe, or ae interfaces, configure an OAM Ethernet virtual connection.

Options

- `remote-uni-count count`—(Optional) Specify the number of remote UNIs in the EVC configuration, the default is 1.

- `multipoint-to-multipoint`—(Optional) Specify multiple points in the EVC configuration, the default is point-to-point if `remote-uni-count` is 1.

Remaining options are explained separately.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

evc-protocol cfm

Syntax

```
evc-protocol cfm {
  maintenance-association association-name | vpls routing-instance routing-id;
  maintenance-domain domain-id;
  mep-id mep-id;
}
```

Hierarchy Level

```
[edit protocols oam ethernet evcs]
```

Release Information

Statement introduced in Junos OS Release 9.5.

```
meq-id mep-id statement introduced in Junos OS Release 15.1.
```

Description

Specify connectivity fault management (CFM) or virtual private LAN service (VPLS) as the Ethernet virtual connection (EVC) protocol.

Options

- `management-domain domain-id`—(Optional) For CFM, specify the CFM management domain.
- `management-association association-id`—(Optional) For CFM, specify the CFM management association.
- `routing-instance instance-id`—(Optional) For VPLS, specify the VPLS routing instance.
- `mep-id mep-id`—(Required for CFM) Identifier for the maintenance association endpoint

**NOTE:** This option is available on MX Series routers only.

```
Range: 1 through 8191
```

Required Privilege

```
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.
```

### event-thresholds

**Syntax**
```
event-thresholds {
  frame-error count;
  frame-period count;
  frame-period-summary count;
  symbol-period count;
}
```

**Hierarchy Level**
```
[edit protocols oam link-fault-management interface interface-name]
```

**Release Information**
Statement introduced in Junos OS Release 8.4.

**Description**
Configure threshold limit values for link events in periodic OAM PDUs.
The remaining statements are explained separately. See CLI Explorer.

**Required Privilege**
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**exclude-protocol (MX Series)**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>exclude-protocol protocol-name;</th>
</tr>
</thead>
</table>

**Hierarchy Level**

[edit security macsec connectivity-association connectivity-association-name]

**Release Information**

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**

Specifies protocols whose packets are not secured using Media Access Control Security (MACsec) when MACsec is enabled on a link using static connectivity association key (CAK) security mode.

When this option is enabled in a connectivity association that is attached to an interface, MACsec is not enabled for all packets of the specified protocols that are sent and received on the link.

**Default**

Disabled.

All packets are secured on a link when MACsec is enabled, with the exception of all types of Spanning Tree Protocol (STP) packets.

**Options**

*protocol-name*—Specifies the name of the protocol that should not be MACsec-secured.

Options include:

- cdp—Cisco Discovery Protocol.
- lacp—Link Aggregation Control Protocol.
- lldp—Link Level Discovery Protocol.

**Required Privilege Level**

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

**Related Documentation**

## exercise

**Syntax**
```
request protection-group ethernet-aps exercise md <md> ma <ma>
```

**Hierarchy Level**
```
[edit protocols protection-group ethernet-aps]
```

**Description**
This configuration statement is used to test if APS is operating correctly, it does not interrupt regular APS operations.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Ethernet Automatic Protection Switching Overview on page 229

## failover-delay

**Syntax**
```
failover-delay milliseconds;
```

**Hierarchy Level**
```
[edit protocols vrrp]
```

**Release Information**
Statement introduced in Junos OS Release 9.4.

**Description**
Configure the failover delay for VRRP and VRRP for IPv6 operations.

**Options**
- `milliseconds`—Specify the failover delay time, in milliseconds.
  - **Range:** 50 through 2000

**Required Privilege Level**
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

Option max-sessions-vsa-ignore introduced in Junos OS Release 11.4.

Description Configure protocol family information for the logical interface.

NOTE: Not all subordinate statements are available to every protocol family.
Options

**family**—Protocol family:

- **any**—Protocol-independent family used for Layer 2 packet filtering

---

**NOTE:** This option is not supported on T4000 Type 5 FPCs.

- **bridge**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation. You can optionally configure this protocol family for the logical interface on which you configure VPLS.

- **ethernet-switching**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation

- **ccc**—Circuit cross-connect protocol suite. You can configure this protocol family for the logical interface of CCC physical interfaces. When you use this encapsulation type, you can configure the **ccc** family only.

- **inet**—Internet Protocol version 4 suite. You must configure this protocol family for the logical interface to support IP protocol traffic, including Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), Internet Control Message Protocol (ICMP), and Internet Protocol Control Protocol (IPCP).

- **inet6**—Internet Protocol version 6 suite. You must configure this protocol family for the logical interface to support IPv6 protocol traffic, including Routing Information Protocol for IPv6 (RIPng), Intermediate System-to-Intermediate System (IS-IS), BGP, and Virtual Router Redundancy Protocol for IPv6 (VRRP).

- **iso**—International Organization for Standardization Open Systems Interconnection (ISO OSI) protocol suite. You must configure this protocol family for the logical interface to support IS-IS traffic.

- **mlfr-end-to-end**—Multilink Frame Relay FRF.15. You must configure this protocol or multilink Point-to-Point Protocol (MLPPP) for the logical interface to support multilink bundling.

- **mlfr-uni-nni**—Multilink Frame Relay FRF.16. You must configure this protocol or **mlfr-end-to-end** for the logical interface to support link services and voice services bundling.

- **multilink-ppp**—Multilink Point-to-Point Protocol. You must configure this protocol (or **mlfr-end-to-end**) for the logical interface to support multilink bundling.

- **mpls**—Multiprotocol Label Switching (MPLS). You must configure this protocol family for the logical interface to participate in an MPLS path.

- **pppoe**—Point-to-Point Protocol over Ethernet

- **tcc**—Translational cross-connect protocol suite. You can configure this protocol family for the logical interface of TCC physical interfaces.
• **tnp**—Trivial Network Protocol. This protocol is used to communicate between the Routing Engine and the router’s packet forwarding components. The Junos OS automatically configures this protocol family on the router’s internal interfaces only, as discussed in *Understanding Internal Ethernet Interfaces*.

• **vpls**—(M Series and T Series routers only) Virtual private LAN service. You can optionally configure this protocol family for the logical interface on which you configure VPLS. VPLS provides an Ethernet-based point-to-multipoint Layer 2 VPN to connect customer edge (CE) routers across an MPLS backbone. When you configure a VPLS encapsulation type, the `family vpls` statement is assumed by default.

    MX Series routers support dynamic profiles for VPLS pseudowires, VLAN identifier translation, and automatic bridge domain configuration.

    For more information about VPLS, see the *Junos OS VPNs Library for Routing Devices*.

The remaining statements are explained separately. See **CLI Explorer**.

### Required Privilege Levels

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

fast-aps-switch

Syntax

```
fast-aps-switch;
```

Hierarchy Level

```
[edit interfaces interface-name sonet-options aps]
```

Release Information

Statement introduced in Junos OS Release 12.1.

Description

(M320 routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only, EX Series switches, and MX series routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only using container interfaces) Reduce the Automatic Protection Switching (APS) switchover time in Layer 2 circuits.

NOTE:

- The fast APS switching feature is supported only within a single chassis on a MX series router using a container interface.
- Configuring this statement reduces the APS switchover time only when the Layer 2 circuit encapsulation type for the interface receiving traffic from a Layer 2 circuit neighbor is SAToP.
- When the `fast-aps-switch` statement is configured in revertive APS mode, you must configure an appropriate value for revert time to achieve reduction in APS switchover time.
- To prevent the logical interfaces in the data path from being shut down, configure appropriate hold-time values on all the interfaces in the data path that support TDM.
- The `fast-aps-switch` statement cannot be configured when the APS annex-b option is configured.
- The interfaces that have the `fast-aps-switch` statement configured cannot be used in virtual private LAN service (VPLS) environments.

Required Privilege

Level

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

[edit interfaces ge-fpc/pic/port],
[edit interfaces et-fpc/pic/port],
[edit interfaces ps0],
[edit interfaces xe-fpc/pic/port]
```

Release Information

Statement introduced in Junos OS Release 8.1.
Support for aggregated Ethernet added in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.
Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

Description

Support simultaneous transmission of 802.1Q VLAN single-tag and dual-tag frames on logical interfaces on the same Ethernet port, and on pseudowire logical interfaces.

This statement is supported on M Series and T Series routers, for Fast Ethernet and Gigabit Ethernet interfaces only on Gigabit Ethernet IQ2 and IQ2-E, IQ, and IQE PICs, and for aggregated Ethernet interfaces with member links in IQ2, IQ2-E, and IQ PICs or in MX Series DPCs, or on Ethernet interfaces for PTX Series Packet Transport Routers or 100-Gigabit Ethernet Type 5 PIC with CFP.

This statement is supported on Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series and QFX Series switches.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

flow-control

Syntax  (flow-control | no-flow-control);

Hierarchy Level  [edit interfaces interface-name aggregated-ether-options],
    [edit interfaces interface-name ether-options],
    [edit interfaces interface-name fastether-options],
    [edit interfaces interface-name gigether-options],
    [edit interfaces interface-name multiservice-options],
    [edit interfaces interface-range name aggregated-ether-options],
    [edit interfaces interface-range name ether-options]

Release Information  Statement introduced before Junos OS Release 7.4.
    Statement introduced in Junos OS Release 9.0 in EX Series switches.
    Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description  For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.

NOTE: On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

Default  Flow control is enabled.

NOTE: Flow control is enabled by default only on physical interfaces and it is disabled by default on aggregated Ethernet interfaces.

Required Privilege Level  interface—To view this statement in the configuration.
    interface-control—To add this statement to the configuration.

    • Configuring Gigabit Ethernet Interfaces for EX Series Switches with ELS support
### fnp

**Syntax**

```plaintext
fnp {
    interval <100ms | 1s | 10s | 1m | 10m>;;
    loss-threshold number
    interface interface name {
        domain-id domain-id
    }
}
```

**Hierarchy Level**

```
[edit protocols oam ethernet]
```

**Release Information**

Command introduced in Junos OS Release 11.4.

**Description**

On routers with ge, xe, or ae interfaces, configure an OAM Ethernet failure notification protocol.

**Options**

- `interval number`—Specifies the time between the transmission of FNP messages.
- `loss-threshold number`—FNP messages that can be lost before the FNP message is considered aged out and flushed.
- `interface interface-name`—Name of the Ethernet interface.
- `domain-id number`—Domain ID of the access network.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Ethernet Failure Notification Protocol Overview on page 866

**force switch**

**Syntax**

```
request protection-group ethernet-aps force-switch md <md> ma <ma>
```

**Hierarchy Level**

```
[edit protocols protection-group ethernet-aps]
```

**Description**

Forces traffic to switch from the active path to the alternate path. If the working path is the active path, traffic will be switched to the protection path. If the protection path is the active path, traffic will be switched to the protection path.

**Required Privilege**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Ethernet Automatic Protection Switching Overview on page 229

---

**force-up**

**Syntax**

```
force-up;
```

**Hierarchy Level**

```
[edit interfaces interface-name aggregated-ethernet-options lacp]
```

**Release Information**

Statement introduced in Junos OS Release 14.2 for MX Series routers.

```
NOTE: For EX9200 switches, you must configure force-up on physical interfaces of both MC-LAG peers for this feature to work properly.
```

**Description**

Configure the peer interface (in MC-LAG) to remain up even with limited LACP capability.

**Required Privilege**

- interface— To view this statement in the configuration.
- interface-control— To add this statement to the configuration.

**Related Documentation**

- Forcing MC-LAG Links or Interfaces with Limited LACP Capability to Be Up
forwarding-class (Gigabit Ethernet IQ Classifier)

Syntax

```
forwarding-class class-name {
    loss-priority (high | low);
}
```

Hierarchy Level

```
[edit interfaces interface-name gigether-options ethernet-switch-profile ethernet-policer-profile output-priority-map classifier premium]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For Gigabit Ethernet IQ interfaces only, define forwarding class name and option values.

Options

- `class-name`—Name of forwarding class.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

frame-error

Syntax
frame-error count;

Hierarchy Level
[edit protocols oam ethernet link-fault-management action-profile event link-event-rate],
[edit protocols oam link-fault-management interface interface-name event-thresholds]

Release Information
Statement introduced in Junos OS Release 8.4.

Description
Threshold for sending frame error events or taking the action specified in the action profile.

A frame error is any frame error on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value within the window.

The window or period during which frame errors are counted is 5 seconds or multiples of it (with a maximum value of 1 minute). This window denotes the duration as intervals of 100 milliseconds, encoded as a 16-bit unsigned integer. This window is not configurable in Junos OS. According to the IEEE 802.3ah standard, the default value of the frame-errors window is 1 second. This window has a lower bound of 1 second and an upper bound of 1 minute.

Options
**count**—Threshold count for frame error events.

**Range:** 0 through 100

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring Threshold Values for Local Fault Events on an Interface on page 827

### frame-period

**Syntax**

```plaintext
frame-period count;
```

**Hierarchy Level**

[edit protocols oam ethernet link-fault-management action-profile event link-event-rate],
[edit protocols oam link-fault-management interface interface-name event-thresholds]

**Release Information**

Statement introduced in Junos OS Release 8.4.

**Description**

Threshold for sending frame period error events or taking the action specified in the action profile.

A frame error is any frame error on the underlying physical layer. The frame period threshold is reached when the number of frame errors reaches the configured value within the period window. The default period window is the number of minimum-size frames that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.

**Options**

- **count**—Threshold count for frame period error events.
  - **Range:** 0 through 100

**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**

**frame-period-summary**

**Syntax**

frame-period-summary count;

**Hierarchy Level**

[edit protocols oam ethernet link-fault-management action-profile event link-event-rate],
[edit protocols oam link-fault-management interface interface-name event-thresholds]

**Release Information**

Statement introduced in Junos OS Release 8.4.

**Description**

Threshold for sending frame period summary error events or taking the action specified in the action profile.

An errored frame second is any 1-second period that has at least one errored frame. This event is generated if the number of errored frame seconds is equal to or greater than the specified threshold for that period window. The default window is 60 seconds. The window is not configurable.

**Options**

`count`—Threshold count for frame period summary error events.

*Range:* 0 through 100

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

framing (10-Gigabit Ethernet Interfaces)

Syntax
framing (lan-phy | wan-phy);

Hierarchy Level
[edit interfaces xe-fpc/pic/port]

[edit interfaces et-fpc/pic/port] (PTX Series Packet Transport Routers and MX Series Routers)

Release Information
Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 12.3R2 for PTX Series Packet Transport Routers.

Description
For routers supporting the 10-Gigabit Ethernet interface, configure the framing format. WAN PHY mode is supported on MX240, MX480, MX960, T640, T1600, T4000, and PTX Series Packet Transport Routers routers only.

NOTE:
- The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).
- On PTX Series routers, WAN PHY mode is supported only on the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+.
- When the PHY mode changes, interface traffic is disrupted because of port reinitialization.
- In Junos OS Releases 17.4R2, 17.4R3, and later, on the following MPCs or routers, you cannot configure wan-phy mode at 10-Gbps, 40-Gbps, and 100-Gbps on a per-port basis:
  - MPC7E-10G, MPC7E-MRATE, MX2K-MPC8E, and MX2K-MPC9E
  - MPC10003
  - MX204 router
  - JNP10K-LC2101 MPC

Default
Operates in LAN PHY mode.
Options

- **lan-phy**—10GBASE-R interface framing format that bypasses the WIS sublayer to directly stream block-encoded Ethernet frames on a 10-Gigabit Ethernet serial interface.

- **wan-phy**—10GBASE-W interface framing format that allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and SONET devices.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**guest-vlan (MX Series in Enhanced LAN Mode)**

**Syntax**

```
guest-vlan (vlan-id | vlan-name);
```

**Hierarchy Level**

```[edit protocols authentication-access-control interface (all | [interface-names]) dot1x]```

**Release Information**
Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

**Description**
Specify the VLAN to which an interface is moved when no 802.1X supplicants are connected on the interface. The VLAN specified must already exist on the switch.

**Default**
None

**Options**

- `vlan-id`—VLAN tag identifier of the guest VLAN.
- `vlan-name`—Name of the guest VLAN.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.
guard-interval

Syntax  
```
guard-interval number;
```

Hierarchy Level  
```
[edit protocols protection-group ethernet-ring ring-name]
```

Release Information
- Statement introduced in Junos OS Release 9.4.
- Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description
When a link goes down, the ring protection link (RPL) activates. When the downed link comes back up, the RPL link receives notification, restores the link, and waits for the restore interval before issuing another block on the same link. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.

Options
- `number`—Guard timer interval, in milliseconds.
  - Range: 10 through 2000 ms
  - Default: 500 ms

Required Privilege Level
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

Related Documentation

**hold-multiplier**

**Syntax**

```plaintext
hold-multiplier number;
```

**Hierarchy Level**

- [edit protocols lldp]
- [edit routing-instances routing-instance-name protocols lldp]

**Release Information**

**Description**

Configure a value for the LLDP hold multiplier.

Hold timer interval in seconds to cache learned LLDP information before discarding.

**Options**

- **number**—Advertisement interval multiplier for LLDP cache discard.
  - **Default:** 4 (giving 120 second LLDP cache lifetime with other defaults)
  - **Range:** 2 through 10

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**Related Documentation**

- Configuring LLDP on page 356
hold-time up

Syntax
hold-time up timer-value;

Hierarchy Level
[edit interfaces ae x aggregated-ether-options lacp],

Release Information
Statement introduced in Junos OS Release 14.2R3.

Description
Specifies the time period for which the Link Aggregation Control Protocol (LACP) maintains the state of a child (member) link as expired or default.

When a child link goes from the current state to the expired state, the LACP monitors the reception of protocol data units (PDUs) on the child link for the configured hold-up time interval and does not allow the child link to transition back to the current state. This configuration thus prevents excessive flapping of a child link on an aggregated Ethernet interface.

The configured hold-up timer value is applicable to all the child links within a link aggregated (LAG) interface. By default, this feature is disabled.

Options
timer-value—Hold-up interval in seconds.

Range: 1 to 6000 seconds

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Description

Configure Interchassis Control Protocol (ICCP) between the multichassis link aggregation group (MC-LAG) peers. ICCP replicates forwarding information, validates configurations, and propagates the operational state of the MC-LAG members.

Default

If you do not include this statement, no ICCP protocol tracing operations are performed.

Options

- **traceoptions**—Set Interchassis Control Protocol (ICCP) tracing options.
- **local-ip-address**—Specify the source address where the ICCP packet is routed.
- **session-establishment-hold-time**—Specify if the chassis takes over as the master at the ICCP session.
- **authentication-key**—Specify TCP Message Digest 5 (MD5) option for an ICCP TCP session.
- **peer ip-address**—Specify the IP address of the peer that hosts an MC-LAG. You must configure ICCP for both peers that host the MC-LAG.
- **redundancy-group-id-list**—Specify the redundancy groups between two ICCP peers.
- **liveness-detection**—Specify Bidirectional Forwarding Detection (BFD) protocol options.
id (MACsec for MX Series)

**Syntax**
```
id {
    mac-address mac-address;
    port-id port-id-number;
}
```

**Hierarchy Level**
```
[edit security macsec connectivity-association connectivity-association-name secure-channel secure-channel-name]
```

**Release Information**
Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**
Specify a MAC address and a port that traffic on the link must be from to be accepted by the interface when MACsec is enabled using static secure association key (SAK) security mode.

**Options**
The remaining statements are explained separately.

**Required Privilege Level**
admin—To view this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 18.1R1 for SRX1500 devices.
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series.
**Description**  Configure IGMP snooping to constrain multicast traffic to only the ports that have receivers attached. IGMP snooping enables the device to selectively send out multicast packets on only the ports that need them. Without IGMP snooping, the device floods the packets on every port. The device listens for the exchange of IGMP messages by the device and the end hosts. In this way, the device builds an IGMP snooping table that has a list of all the ports that have requested a particular multicast group. The factory default configuration enables IGMP snooping on all VLANs.

**NOTE:** IGMP snooping must be disabled on the device before enabling ISSU.

**NOTE:** Starting with Junos OS Release 18.1R1, QFX5110 switches support IGMP snooping in an EVPN-VXLAN multihoming environment, but in this environment you must enable IGMP snooping on all VLANs associated with any configured VXLANs. You cannot selectively enable IGMP snooping only on those VLANs that might have interested listeners, because all the VXLANs share VXLAN tunnel endpoints (VTEPs) between the same multihoming peers and must have the same settings.

**Default**  IGMP snooping is disabled on the device.

**Options**  The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]
```

**Release Information**
Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

**Description**
Ignore the counting of Layer 3 incomplete errors on Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces.

**Required Privilege Level**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**
- Ignoring Layer 3 Incomplete Errors on page 20

### Include-SCI (MACsec for MX Series)

**Syntax**
```plaintext
include-sci;
```

**Hierarchy Level**
```
[edit security macsec connectivity-association connectivity-association-name]
```

**Release Information**
Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**
Specifies that the SCI tag should be appended to each packet on a link that has enabled MACsec.

This option is used only when connecting a router to a host device that requires SCI tagging. SCI tags are eight octets long, so appending an SCI tag to all traffic on the link adds a significant amount of unneeded overhead.

**Default**
SCI tagging is not enabled by default.

**Required Privilege Level**
- `admin`—To view this statement in the configuration.
- `admin-control`—To add this statement to the configuration.

**Related Documentation**
- Configuring Media Access Control Security (MACsec) on MX Series Routers
**ingress-policer-overhead**

**Syntax**

```plaintext
ingress-policer-overhead bytes;
```

**Hierarchy Level**

```plaintext
[edit chassis fpc slot-number pic pic-number]
```

**Release Information**

Statement introduced before Junos OS Release 11.1. Statement introduced in Junos OS Release 15.1X49-D30 for vSRX.

**Description**

Add the configured number of bytes to the length of a packet entering the interface.

Configure a policer overhead to control the rate of traffic received on an interface. Use this feature to help prevent denial-of-service (DoS) attacks or to enforce traffic rates to conform to the service-level agreement (SLA). When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate-limiting action.

Traffic policing combines the configured policy bandwidth limits and the burst size to determine how to meter the incoming traffic. If you configure a policer overhead on an interface, Junos OS adds those bytes to the length of incoming Ethernet frames. This added overhead fills each frame closer to the burst size, allowing you to control the rate of traffic received on an interface.

You can configure the policer overhead to rate-limit queues and Layer 2 and Layer 3 policers, for standalone (SA) and high-availability (HA) deployments. The policer overhead and the shaping overhead can be configured simultaneously on an interface.

---

**NOTE:** vSRX supports policer overhead on Layer 3 policers only.

The policer overhead applies to all interfaces on the PIC. In the following example, Junos OS adds 10 bytes of overhead to all incoming Ethernet frames on ports ge-0/0/0 through ge-0/0/4.

```plaintext
set chassis fpc 0 pic 0 ingress-policer-overhead 10
```

---

**NOTE:** vSRX only supports fpc 0 pic 0. When you commit the ingress-policer-overhead statement, the vSRX takes the PIC offline and then back online.
You need to craft the policer overhead size to match your network traffic. A value that is too low will have minimal impact on traffic bursts. A value that is too high will rate-limit too much of your incoming traffic.

In this example, the policer overhead of 255 bytes is configured for ge-0/0/0 through ge-0/0/4. The firewall policer is configured to discard traffic when the burst size is over 1500 bytes. This policer is applied to ge-0/0/0 and ge 0/0/1. Junos OS adds 255 bytes to every Ethernet frame that comes into the configured ports. If, during a burst of traffic, the combined length of incoming frames and the overhead bytes exceeds 1500 bytes, the policer starts to discard further incoming traffic.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 255
set interfaces ge-0/0/0 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/0 unit 0 family inet address 10.9.1.2/24
set interfaces ge-0/0/1 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/1 unit 0 family inet address 10.9.2.2/24
set firewall policer overhead_policer if-exceeding bandwidth-limit 32k
set firewall policer overhead_policer if-exceeding burst-size-limit 1500
set firewall policer overhead_policer then discard
```

**Options**

- **bytes**—Number of bytes added to a frame entering an interface.
- **Range:** 0–255 bytes
- **Default:** 0

```
[edit chassis fpc 0 pic 0]
user@host# set ingress-policer-overhead 10;
```

inline

Syntax  inline;

Hierarchy Level  [edit protocols lacp ppm]

Release Information  Statement introduced in Junos OS Release 19.1R1 for MX Series routers with MPC line cards.

Description  (MX Series routers with MPC line cards only) To enable the inline Link Aggregation Control Protocol (LACP) PDU transmission processing.

This statement disables the default distributed periodic packet management (PPM) processing for Link Aggregation Control Protocol (LACP) packets and run all Link Aggregation Control Protocol (LACP) PDU transmission processing inline. The inline option can be used in scenarios where the line card CPU is under heavy load and cannot schedule the PPM processing for LACP packets. PPM, by default, delegates the transmission of PDUs to the PPMAN process on the PFE/line card. But when the inline option is configured, it delegates the transmission of LCAP PDUs even further away from the line card CPU and into the forwarding chipset.

For example, in a system with both MPCs and DPCs, upon configuration of [protocols lacp ppm inline], the PDUs are sent inline on the MPCs and performed by periodic packet management (PPM) on DPCs.

BEST PRACTICE: We recommend to retain the default and disable distributed PPM or enable inline processing only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM or enable inline processing only if you have a compelling reason to disable it.

Refer Disabling or Enabling Inline Periodic Packet Management for LACP Packets for more details.

Default  Distributed PPM processing is enabled for all packets that use PPM.

Required Privilege Level  routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface

Syntax

```
interface (all | interface-name) {
  disable;
}
```

Hierarchy Level

[edit protocols lldp],
[edit routing-instances routing-instance-name protocols lldp]

Release Information

Description

Specify an LLDP interface.

Options

`interface-name`—A valid physical interface name.

**NOTE:** On MX Series and T Series routers, you run LLDP on a physical interface, such as ge-1/0/0, and not at the logical interface (unit) level.

Starting with Junos OS Release 14.2, you can also specify LLDP neighbor details for management interfaces, such as fxp or me, on MX Series routers.

For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports*.

`all`—Run LLDP on all interfaces.

`disable`—Disable LLDP on the specified interface

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Related Documentation

interface (IEEE 802.1x)

Syntax

```
interface interface-id {
  maximum-requests integer;
  quiet-period seconds;
  reauthentication (disable | interval seconds);
  retries integer;
  server-timeout seconds;
  supplicant (single);
  supplicant-timeout seconds;
  transmit-period seconds;
}
```

Hierarchy Level

```
[edit protocols dot1x authenticator]
```

Release Information
Statement introduced in Junos OS Release 9.3.

Description
Use this statement to configure the 802.1x Port-Based Network Access Control protocol-specific Ethernet interface options.

Default
The default values are provided for the options below on the respective statement pages.

Options

- **maximum-requests**—Specify the maximum number of retransmission times for an EAPOL Request packet to the client before it times out the authentication session.

- **quiet-period**—Specify the number of seconds the port remains in the wait state following a failed authentication exchange with the client, before reattempting the authentication.

- **reauthentication**—Includes two options:
  - **disable**—Periodic reauthentication of the client is disabled.
  - **interval**—Specify the periodic reauthentication time interval.

- **retries**—Specify the number of tries after which the port remains in the wait state for quiet-period seconds before reattempting the authentication.

- **server-timeout**—Specify the number of seconds the port waits for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.

- **supplicant (single)**—Specify supplicant single mode. See the usage guidelines to configure other modes.

- **supplicant-timeout**—Specify the number of seconds the port waits for a response when relaying a request from the authentication server to the client before resending the request.
transmit-period—Specify the number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Syntax** `interface [interface-names];`

**Hierarchy Level** `[edit protocols authentication-access-control]`

**Release Information** Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

**Description** Configure interfaces on which the specified MAC addresses are allowed to bypass RADIUS authentication and allowed to connect to the LAN without authentication.

**Options** `interface-names`—List of interfaces.

**Required Privilege Level**
- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**
interfaces (MACsec for MX Series)

Syntax

```
interfaces interface-name {
    connectivity-association connectivity-association-name;
}
```

Hierarchy Level

[edit security macsec]

Release Information

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description

Applies the specified connectivity association to the specified interface to enable MACsec.

One connectivity association can be applied to multiple interfaces.

You must always use this statement to apply a connectivity association to an interface to enable MACsec. You must complete this configuration step regardless of whether MACsec is enabled using static connectivity association key (CAK) security mode or static secure association key (SAK) security mode.

If you are enabling MACsec using static SAK security mode and need to configure MACsec on inbound and outbound traffic on the same interface, you must configure a connectivity association with one secure channel for inbound traffic and a second secure channel for outbound traffic. The connectivity association is then applied to the interface using this statement to enable MACsec for traffic entering and leaving the interface.

NOTE: Starting in Junos OS Release 16.1R2, when Media Access Control Security (MACsec) is enabled on an interface, the interface flow control capability is enabled by default, regardless of the configuration that you set using the (flow-control | no-flow-control) statement at the [edit interfaces interface-name gigether-options] hierarchy level. When MACsec is disabled, interface flow control is restored to the configuration that you set using the flow-control statement at the [edit interfaces] hierarchy level. When MACsec is enabled, additional header bytes are added to the packet by the MACsec PHY. With line rate traffic, when MACsec is enabled and flow control is disabled, the pause frames sent by the MACsec PHY are terminated by the MIC's MAC (enhanced 20-port Gigabit Ethernet MICs on MX Series routers) and not transferred to the Packet Forwarding Engine, causing framing errors. Therefore, when MACsec is enabled on an interface, flow control is also automatically enabled on such an interface.

Default

Interfaces are not associated with any connectivity associations, by default.
**interface-group**

**Syntax**

```
interface-group {
  interface-device-name
  unit-list
}
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
  md-name maintenance-association ma-name mep mep-id remote-mep mep-id ]
```

**Release Information**

Statement introduced in Junos OS Release 18.1R1.

**Description**

Mark the interface group down for the action profile configured with the action `interface-group-down`. Provides information for the interface-group on which the configured action will be taken when the configured event occur for a specific remote MEP ID.

**Options**

- `interface-device-name`—Name of the interface device. Only Ethernet devices are allowed. The device interface name includes `ge, ae, xe and et`.
- `unit-list`—One or more logical interface unit numbers.
  - **Range:** A string in the range `<0-16385>` or `<0-16385>-<0-16385>`. For example, `unit-list[12 23-33 44]`

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

## isolated-vlan (MX Series)

**Syntax**

isolated-vlan vlan-id;

**Hierarchy Level**

```plaintext
[edit bridge-domains bridge-domain-name ],
[edit logical-systems logical-system-name routing-instances routing-instance-name bridge-domains bridge-domain-name bridge-options],
[edit logical-systems logical-system-name routing-instances routing-instance-name bridge-domains bridge-domain-name ],
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name ],
```

**Release Information**

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers.

**Description**

Configure the specified isolated VLAN to be a secondary VLAN of the specified primary VLAN. An isolated VLAN receives packets only from the primary VLAN and forwards frames upstream to the primary VLAN.

**NOTE:** When you specify this configuration statement, the VLAN ID of a logical interface that you associate with a bridge domain that matches with the VLAN ID that you specify using the isolated-vlan state is treated as an isolated port.

**Options**

- `vlan-id`—Individual VLAN IDs separated by a space.

**Required Privilege**

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.
key (MACsec for MX Series)

Syntax

```
key key-string;
```

Hierarchy Level

```
[edit security macsec connectivity-association
  connectivity-association-name secure-channel
  secure-channel-name security-association security-association-number]
```

Release Information

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description

Specifies the static security key to exchange to enable MACsec using static secure association key (SAK) security mode.

The key string is a 32-digit hexadecimal number. The key string and the security association must match on both sides of an Ethernet connection to secure traffic using MACsec when enabling MACsec using SAK security mode.

You must configure at least two security associations with unique security association numbers and key strings to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.

Default

This statement does not have a default value.

Options

```
key-string — Specifies the key to exchange with the other end of the link on the secure channel. The key-string is a 32-digit hexadecimal string that is created by the user.
```

Required Privilege Level

- **admin**—To view this statement in the configuration.
- **admin-control**—To add this statement to the configuration.

Related Documentation

key-server-priority (MACsec for MX Series)

**Syntax**

```plaintext
key-server-priority priority-number;
```

**Hierarchy Level**

```plaintext
[edit security macsec connectivity-association
connectivity-association-name mka]
```

**Release Information**

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**

Specifies the key server priority used by the MACsec Key Agreement (MKA) protocol to select the key server when MACsec is enabled using static connectivity association key (CAK) security mode.

The switch with the lower `priority-number` is selected as the key server.

If the `priority-number` is identical on both sides of a point-to-point link, the MKA protocol selects the device with the lower MAC address as the key server.

**Default**

The default key server priority number is 16.

**Options**

`priority-number`—Specifies the MKA server election priority number.

The `priority-number` can be any number between 0 and 255. The lower the number, the higher the priority.

**Required Privilege Level**

- `admin`—To view this statement in the configuration.
- `admin-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring Media Access Control Security (MACsec) on MX Series Routers
**lACP (802.3ad)**

**Syntax**

```
lACP {
    port-priority port-priority;
}
```

**Hierarchy Level**

- [edit interfaces interface-name fastether-options 802.3ad]
- [edit interfaces interface-name gigether-options 802.3ad]

**Release Information**

Statement introduced in Junos OS Release 9.3.

**Description**

Configure the Link Aggregation Control Protocol (LACP) port priority for Ethernet interfaces.

**Options**

- `port-priority`—Priority for being elected as the active port to collect and distribute traffic. A smaller value indicates a higher priority for selection.
  
  **Range:** 0 through 65,535
  
  **Default:** 127

**Required Privilege Level**

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

**Related Documentation**

- port-priority on page 1467
### lACP (Aggregated Ethernet)

**Syntax (T, PTX, MX Series)**

```yaml
lacp {
  (active | passive);
  admin-key key;
  accept-data;
  fast-failover;
    link-protection {
      disable;
      (revertive | non-revertive);
    }
  periodic interval;
  system-id mac-address;
  system-priority priority;
}
```

**Hierarchy Level (PTX, MX Series)**

```yaml
[edit interfaces aeX aggregated-ether-options]
[edit logical-systems logical-system-name interfaces aeX aggregated-ether-options]
```

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.
- `fast-failover` option introduced in Junos OS Release 12.2.
- Support for logical systems introduced in Junos OS Release 14.1.

**Description**

Configure the Link Aggregation Control Protocol (LACP) for aggregated Ethernet interfaces only.

When you configure the `accept-data` statement at the `[edit interfaces aeX aggregated-ether-options lACP]` hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.

**NOTE:** When you configure the `accept-data` statement at the `[edit interfaces aeX aggregated-ether-options lACP]` hierarchy level, this behavior occurs:

- By default, the `accept-data` statement is not configured when LACP is enabled.
- You can configure the `accept-data` statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.
- When LACP is down and a member link receives packets, the router or switch does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the `accept-data` statement is configured.
If you do not specify LACP as either active or passive, LACP remains passive.

**Options**
- **active**—Initiate transmission of LACP packets.
- **admin-key number**—Specify an administrative key for the router or switch.

---

**NOTE:** You must also configure multichassis link aggregation (MC-LAG) when you configure the admin-key.

**fast-failover**—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.

**passive**—Respond to LACP packets.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege**
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**
- Configuring LACP for Aggregated Ethernet Interfaces on page 143
layer2-policer

Syntax

layer2-policer {
  input-policer policer-name;
  input-three-color policer-name;
  output-policer policer-name;
  output-three-color policer-name;
}

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number],

Release Information

Statement introduced in Junos OS Release 8.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

For 1-Gigabit Ethernet and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces on M Series, MX Series, and T Series routers, and for aggregated Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces on EX Series switches, apply Layer 2 logical interface policers. The following policers are supported:

- Two-color
- Single-rate tricolor marking (srTCM)
- Two-rate tricolor marking (trTCM)

Two-color and tricolor policers are configured at the [edit firewall] hierarchy level.

Options

input-policer policer-name—Two-color input policer to associate with the interface. This statement is mutually exclusive with the input-three-color statement.

input-three-color policer-name—Tricolor input policer to associate with the interface. This statement is mutually exclusive with the input-policer statement.

output-policer policer-name—Two-color output policer to associate with the interface. This statement is mutually exclusive with the output-three-color statement.

output-three-color policer-name—Tricolor output policer to associate with the interface. This statement is mutually exclusive with the output-policer statement.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

### link-adjacency-loss

**Syntax**
```
link-adjacency-loss;
```

**Hierarchy Level**
```
[edit protocols oam ethernet link-fault-management action-profile event]
```

**Release Information**
Statement introduced in Junos OS Release 8.5.

**Description**
Loss of adjacency with IEEE 802.3ah link-fault management peer event. When included, the loss-of-adjacency event triggers the action specified under the `action` statement.

**Required Privilege**
- **Level**
  - `interface`—To view this statement in the configuration.
  - `interface-control`—To add this statement to the configuration.

**Related Documentation**
- Monitoring the Loss of Link Adjacency on page 833

### link-discovery

**Syntax**
```
link-discovery (active | passive);
```

**Hierarchy Level**
```
[edit protocols oam ethernet link-fault-management interface interface-name]
```

**Release Information**
Statement introduced in Junos OS Release 8.2.

**Description**
For Ethernet interfaces on EX Series switches, and M320, M120, MX Series, and T Series routers, specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Management (OAM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs.

**Options**
- `(active | passive)`—Passive or active mode. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. Once the discovery process is initiated, both sides participate in discovery.

**Required Privilege**
- **Level**
  - `interface`—To view this statement in the configuration.
  - `interface-control`—To add this statement to the configuration.

**Related Documentation**
- Configuring Link Discovery on page 824
link-degrade-monitor

Syntax

```
link-degrade-monitor {
  actions media-based;
  recovery {
    (auto | manual);
    timer timer;
  }
  thresholds {
    clear clear-value;
    interval interval-value;
    set set-value;
    warning-clear warning-clear-value;
    warning-set warning-set-value;
  }
}
```

Hierarchy Level

[edit interfaces interfaces-name]

Release Information

Statement introduced in Junos OS Release 15.1.

Description

Configure link degrade monitoring on an interface and specify the corrective action to be triggered when a link degrade event is detected. Deleting the configuration disables the feature. When configured, the feature monitors the quality of physical links on Ethernet interfaces (10-Gigabit, 40-Gigabit, and 100-Gigabit) and triggers the user-configured action when the link's bit error rate (BER) value breaches the preconfigured threshold. This feature can detect a BER value as low as $10^{-13}$ to $10^{-5}$.

Options

- **actions media-based**—Action to be taken when a link degrade event is detected. A media-based action brings down the physical link at both local and remote ends of the interface, and stops BER monitoring at the local end until an autorecovery is triggered.

  The remaining statements are described separately.

Required Privilege

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

link-mode

Syntax  

```
link-mode mode (automatic | full-duplex | half-duplex);
```

Hierarchy Level  

```
[edit interfaces interface-name],
[edit interfaces interface-name ether-options],
[edit interfaces ge-pim/0/0 switch-options switch-port port-number]
```

Release Information  

Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description  

Set the device’s link connection characteristic.

Options  

```
mode—Link characteristics:
```  

- automatic—Link mode is negotiated. This is the default for EX Series switches.
- full-duplex—Connection is full duplex.
- half-duplex—Connection is half duplex.

Default: Fast Ethernet interfaces can operate in either full-duplex or half-duplex mode.  
The router’s or switch’s management Ethernet interface, fxp0 or em0, and the built-in Fast Ethernet interfaces on the FIC (M7i router) autonegotiate whether to operate in full-duplex or half-duplex mode. Unless otherwise noted here, all other interfaces operate only in full-duplex mode.

NOTE: On EX Series switches, if no-auto-negotiation is specified in [edit interfaces interface-name ether-options], you can select only full-duplex or half-duplex. If auto-negotiation is specified, you can select any mode.

NOTE:  
- Member links of an aggregated Ethernet bundle must not be explicitly configured with a link mode. You must remove any such link-mode configuration before committing the aggregated Ethernet configuration.
- Starting with Junos OS release 17.4R1 and later, the link-mode configuration is not supported for 10-Gigabit Ethernet interfaces.
- Starting in Junos OS release 18.4R1, half-duplex mode is supported on SRX340 and SRX345 devices.
Required Privilege Level

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

### link-protection

**Syntax**
```
link-protection {
  disable;
  (revertive | non-revertive);
}
```

**Hierarchy Level**
- [edit interfaces ae aggregated-ether-options]
- [edit interfaces ae aggregated-ether-options lacp]

**Release Information**
- Statement introduced in Junos OS Release 8.3.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.
- Support for `disable`, `revertive`, and `non-revertive` statements added in Junos OS Release 9.3.

**Description**
On the router, for aggregated Ethernet interfaces only, configure link protection. In addition to enabling link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the `primary` and `backup` statements at the `[edit interfaces ge-fpc/pic/port g ether-options 802.3ad ae x]` hierarchy level or the `[edit interfaces fe-fpc/pic/port fast ether-options 802.3ad ae x]` hierarchy level.

On the switch, you can configure either Junos OS link protection for aggregated Ethernet interfaces or the LACP standards link protection for aggregated Ethernet interfaces.

For Junos OS link protection, specify `link-protection` at the following hierarchy levels:

- `[edit interfaces ge-fpc/pic/port ether-options 802.3ad ae x]`
- `[edit interfaces xe-fpc/pic/port ether-options 802.3ad ae x]` hierarchy level or at the `[edit interfaces xe-fpc/pic/port ether-options 802.3ad ae x]` hierarchy level.

To disable link protection, use the `delete interface ae aggregate-ether-options link-protection` statement at the `[edit interfaces ae aggregated-ether-options]` hierarchy level or the `[edit interfaces ae aggregated-ether-options lacp]` hierarchy level.

**Options**
The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**
- Configuring Aggregated Ethernet Link Protection on page 152
- Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches
link-protection (non-LACP)

Syntax

```
link–protection {
  link–protection–revertive;
}
```

Hierarchy Level

[edit interfaces ae aggregated-ether-options]

Release Information

Statement introduced in Junos OS Release 17.3R1.

Description

User can specify the `link–protection–revertive` statement in the link protection configuration at the aggregated Ethernet interface level to set revertive mode. In revertive mode, adding a higher-priority link to the aggregated Ethernet bundle results in recalculation of the priorities and traffic will switch from the currently active link to the newly added, higher-priority link. Recalculation of priorities is performed only while link event such as addition\deletion and UP/Down operation on link, that is, configuration of this option will not result in any recalculation immediately until next link-event occurs.

In addition to enabling static link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the `primary` and `backup` statements at the [edit interfaces ge-fpc/pic/port gigether-options 802.3ad aex] hierarchy level or the [edit interfaces fe-fpc/pic/port fastether-options 802.3ad aex] hierarchy level.

For static link protection, specify `link-protection` at the following hierarchy levels:

- [edit interfaces ge-fpc/pic/port ether-options 802.3ad aex]
- [edit interfaces xe-fpc/pic/port ether-options 802.3ad aex] hierarchy level or at the [edit interfaces xe-fpc/pic/port ether-options 802.3ad aex] hierarchy level.

To disable static link protection, use the `delete interface ae aggregate-ether-options link-protection` statement at the [edit interfaces aex aggregated-ether-options] hierarchy level.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

# link-speed (Aggregated Ethernet)

**Syntax**

```
link-speed speed;
```

**Hierarchy Level (EX Series)**

[edit interfaces aex aggregated-ether-options],
[edit interfaces interface-range name aggregated-ether-options],
[edit interfaces interface-range name aggregated-sonet-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
mixed option added in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers and 15.1F6 and 16.1R2 for PTX3000 routers.

**Description**

For aggregated Ethernet interfaces only, set the required link speed.

**Options**

`speed`—For aggregated Ethernet links, you can specify `speed` in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

Aggregated Ethernet links on the M120 router can have one of the following speeds:

- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **oc192**—Links are OC192 or STM64c.

Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:

- **10m**—Links are 10 Mbps.
- **100m**—Links are 100 Mbps.
- **1g**—Links are 1 Gbps.
- **10g**—Links are 10 Gbps.

Aggregated Ethernet links on T Series, MX Series, PTX Series routers, and QFX5100, QFX10002, QFX10008, and QFX10016 switches can be configured to operate at one of the following speeds:

- **100g**—Links are 100 Gbps.
- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **40g**—Links are 40 Gbps.
- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

**mixed**—Enables bundling of different Ethernet rate links in the same Aggregated Ethernet interface.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

**link-speed (Aggregated SONET/SDH)**

**Syntax**

```plaintext
link-speed (speed | mixed);
```

**Hierarchy Level**

```
[edit interfaces asx aggregated-sonet-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

*mixed* option added in Release 8.0.

**Description**

For aggregated SONET/SDH interfaces only, set the required link speed.

**Options**

- **speed**—Aggregated SONET/SDH links can have one of the following speed values.
  - *oc3*—Links are OC3c or STM1c.
  - *oc12*—Links are OC12c or STM4c.
  - *oc48*—Links are OC48c or STM16c.
  - *oc192*—Links are OC192c or STM64c.
  - *oc768*—Links are OC768c or STM256c.

- **mixed**—For aggregated SONET/SDH links on T Series routers, you can mix interface speeds in SONET/SDH aggregation bundles. Interface speeds from OC3 through OC768 are supported.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Aggregated Ethernet Link Speed on page 138

lldp

Syntax

```
lldp {
    advertisement-interval seconds;
    disable;
    hold-multiplier number;
    interface (all | interface-name) {
        disable;
    }
    lldp-configuration-notification-interval seconds;
    management-address ip-management-address;
    mau-type
    port-description-type {
        interface-alias;
        interface-description;
    }
    port-id-subtype {
        interface-name;
        locally-assigned;
    }
    ptopo-configuration-maximum-hold-time seconds;
    ptopo-configuration-trap-interval seconds;
    traceoptions {
        file filename <files number> <size maximum-file-size> <world-readable | no-world-readable>;
        flag flag <disable>;
    }
    transmit-delay seconds;
}
```

Hierarchy Level

[edit protocols],
[edit routing-instances routing-instance-name protocols]

Release Information

Description

Specify LLDP configuration parameters.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

- Configuring LLDP on page 356
lldp-configuration-notification-interval

Syntax  
lldp-configuration-notification-interval seconds;

Hierarchy Level  
[edit protocols lldp]  
[edit routing-instances routing-instance-name protocols lldp]

Release Information  
Statement introduced in Junos OS Release 9.6 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  
Specify how often SNMP trap notifications are generated as a result of LLDP database changes.

Default  
SNMP trap notifications of LLDP database changes are disabled.

Options  
seconds—Time for the period of SNMP trap notifications about the LLDP database. This feature is disabled by default.  
Range: 5 through 3600

Required Privilege Level  
routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

Related Documentation  
- Configuring LLDP on page 356  
- show lldp
**trap-notification**

**Syntax**

```
trap-notification (enable|disable);
```

**Hierarchy Level**

```
[edit protocols lldp interface (all | interface-name)]
```

**Release Information**

Statement introduced in Junos OS Release 15.1R7-S3 for EX3300, EX4200, EX4500, EX4550, EX6200, EX8200 switches.

**Description**

Enables or disables the lldp/ptopo traps for the specific interface or all the interfaces.

**Default**

Trap notifications of lldp/ptopo are disabled.

- To configure LLDP/PTOPO traps on all interfaces:
  
  ```
  [edit protocols lldp]
  user@switch# set interface all trap-notification enable
  ```

- To configure LLDP/PTOPO on a specific interface:
  
  ```
  [edit protocols lldp]
  user@switch# set interface interface-name trap-notification enable
  ```

**Options**

- `enable`—Enables LLDP/PTOPO trap notifications.
- `disable`—Disables LLDP/PTOPO trap notifications.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring LLDP on page 356

- `show lldp`
**Imi (Ethernet OAM)**

**Syntax**
```plaintext
Imi {
  status-counter count;
  polling-verification-timer value;
  interface name {
    uni-id uni-name;
    status-counter number;
    polling-verification-timer value;
    evc-map-type (all-to-one-bundling | bundling | service-multiplexing);
    evc evc-name {
      default-evc;
      vlan-list vlan-id-list;
    }
  }
}
```

**Hierarchy Level**
[edit protocols oam ethernet]

**Release Information**
Statement introduced in Junos OS Release 9.5.

**Description**
On routers with ge, xe, or ae interfaces, configure an OAM Ethernet Local Management Interface (E-LMI).

---

**NOTE:** On MX Series routers, E-LMI is supported on Gigabit Ethernet (ge), 10-Gigabit Ethernet (xe), and Aggregated Ethernet (ae) interfaces configured on MX Series routers with DPC only.

**Options**
- **status-counter count**—Status counter (N393), defaults to 4.
- **interface name**—Polling verification timer (T392), defaults to 15 seconds.
- **uni-id uni-name**—(Optional) Defaults to the physical interface name.
- **status-counter number**—(Optional) Defaults to a global value.
- **polling-verification-timer value**—(Optional) Defaults to a global value.
- **evc-map-type (all-to-one-bundling | bundling | service-multiplexing)**—Specify the Ethernet virtual connection (EVC) map type.
- **evc evc-name**—Specify the name of the EVC.
- **default-evc**—Set the specified EVC as the default EVC.
- **vlan-list vlan-id-list**—Specify a group of VLANs to assign to the EVC.
load-balance

Syntax

```plaintext
load-balance {
  adaptive{
    pps;
    scan-interval multiple;
    tolerance percentage;
  }
  no-adaptive;
  per-packet;
}
```

Hierarchy Level

```
[edit interfaces ae
  aggregated-ether-options]
```

Release Information

Statement introduced in Junos OS Release 13.3.

Description

Load-balances the received traffic across all the available paths of aggregated Ethernet bundles for better link utilization.

Options

- **adaptive**—(MX Series and PTX Series) Corrects a genuine traffic imbalance by using a feedback mechanism to distribute the traffic across the links of an Aggregated Ethernet bundle.
- **no-adaptive**—(MX Series and PTX Series) Disables the adaptive load-balancing solution configured to distribute traffic by using a feedback mechanism.
- **per-packet**—(MX Series only) Randomly sprays packets to the aggregate next hops in a round-robin manner to avoid traffic imbalance.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

load-balance-stateful (Aggregated Ethernet Interfaces)

Syntax

```text
load-balance-stateful {
    per-flow;
    rebalance interval;
    load-type (low | medium | large);
}
```

Hierarchy Level

```text
[edit interfaces aeX unit logical-unit-number forwarding-options]
```

Release Information

Statement introduced in Junos OS Release 13.2R1.

Description

Define the capability to perform uniform load balancing and also perform rebalancing is introduced on MX Series routers with MPCs, except MPC3Es and MPC4Es. Rebalancing is not supported when load-balancing is skewed or distorted owing to a change in the number of flows. The mechanism to record and retain states for the flows and distribute the traffic load accordingly is added. As a result, for m number of flows, they are distributed among n member links of a LAG bundle or among the unilist of next-hops in an ECMP link. This method of splitting the load among member links is called stateful load balancing and it uses 5-tuple information (source and destination addresses, protocol, source and destination ports). Such a method can be mapped directly to the flows, or to a precompute hash based on certain fields in the flow. As a result, the deviation observed on each child link is reduced.

Options

```text
stateful—Define the stateful load-distribution mechanism for traffic flows on aggregated Ethernet interfaces.
```

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation

load-type (Aggregated Ethernet Interfaces)

Syntax

load-type (low | medium | large);

Hierarchy Level

[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful]

Release Information

Statement introduced in Junos OS Release 13.2R1.

Description

Define the load-balancing type to inform the Packet Forwarding Engine regarding the appropriate memory pattern to be used for traffic flows. The approximate number of flows for effective load-balancing for each keyword is a derivative.

Options

- **low**—Define a low load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is less or minimal (between 1 and 100 flows).
- **medium**—Define a medium or moderate load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is relatively higher (between 100 and 1000 flows).
- **large**—Define a high load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is excessive or reaches the maximum supported flows (between 1000 and 10,000 flows).

Required Privilege

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

Related Documentation

- Configuring Stateful Load Balancing on Aggregated Ethernet Interfaces on page 192
### lockout

**Syntax**

```
request protection-group ethernet-aps lockout md <md> ma <ma>
```

**Hierarchy Level**

```
[edit protocols protection-group ethernet-aps]
```

**Description**

Configure a lockout of the protection path, forcing the use of the working path and locking out the protect path regardless of anything else.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**logical-interface-policer**

**Syntax**

```
logical-interface-policer;
```

**Hierarchy Level**

```
[edit dynamic-profiles profile-name firewall policer policer-name],
[edit dynamic-profiles profile-name firewall three-color-policer name],
[edit firewall atm-policer atm-policer-name],
[edit firewall policer policer-name],
[edit firewall policer policer-template-name],
[edit firewall three-color-policer policer-name],
[edit logical-systems logical-system-name firewall policer policer-name],
[edit logical-systems logical-system-name firewall three-color-policer name]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Support at the [edit firewall three-color-policer policer-name] hierarchy level introduced in Junos OS Release 8.2.
Logical systems support introduced in Junos OS Release 9.3.
Support at the [edit dynamic-profiles ... policer policer-name] and [edit dynamic-profiles ... three-color-policer name] hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Support for PTX series routers with third-generation FPCs added in Junos OS Release 18.3R1.

**Description**

Configure a logical interface policer. For PTX series routers running Junos OS Release 18.3R1 or later, you can use this command to configure separate firewall filters for different family address types (IPv4 and IPv6) that share the same interface, and configure the same policer as an action for the filter.

To configure the aggregate policer, configure the firewall policer you want to use as logical-interface-policer. And at the firewall family family-name filter filter-name hierarchy level where you will reference the policer, make the policer an interface-specific firewall filter action.

The sample configuration shows the relationship.

```
firewall {
    policer Shared_Policer {
        logical-interface-policer;
        if-exceeding {
            bandwidth-limit 100m;
            burst-size-limit 500k;
        }
        then {
            discard;
        }
    }
}
```
family inet {
    filter filter_name{
        interface-specific;
        term term_name {
            then {
                policer Shared_Policer;
                count cinet;
            }
        }
    }
}

NOTE: Starting in Junos OS Release 12.2R2, on T Series Core Routers only, you can configure an MPLS LSP policer for a specific LSP to be shared across different protocol family types. You must include the logical-interface-policer statement to do so.

Required Privilege
firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

loopback (Aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet)

**Syntax**

```
(loopback | no-loopback);
```

**Hierarchy Level**

- [edit interfaces interface-name aggregated-ether-options],
- [edit interfaces interface-name ether-options],
- [edit interfaces interface-name fastether-options],
- [edit interfaces interface-name gigether-options],
- [edit interfaces interface-range name ether-options]

For QFX Series and EX Series:

- [edit interfaces interface-name aggregated-ether-options],
- [edit interfaces interface-name ether-options],

For SRX Series Devices and vSRX:

- [edit interfaces interface-name redundant-ether-options]

**Release Information**

- Statement introduced before Junos OS Release 7.4 for MX Series.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
- Statement introduced in Junos OS Release 11.1 for the QFX Series.
- Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
- Statement modified in Junos OS Release 9.2 for the SRX Series.

**Description**

For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces, enable or disable loopback mode.

---

**NOTE:**

- By default, local aggregated Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces connect to a remote system.
- IPv6 Neighbor Discovery Protocol (NDP) addresses are not supported on Gigabit Ethernet interfaces when loopback mode is enabled on the interface. That is, if the loopback statement is configured at the [edit interfaces ge-fpc/pic/port gigether-options] hierarchy level, an NDP address cannot be configured at the [edit interfaces ge-fpc/pic/port unit logical-unit-number family inet6 address] hierarchy level.

**Default**

By default, loopback is disabled.
Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

### loopback-tracking

**Syntax**  

```
loopback-tracking;
```

**Hierarchy Level**  

```
[edit protocols oam ethernet link-fault-management]
```

**Release Information**  

Statement introduced in Junos OS Release 14.2.

**Description**  

Enables loopback tracking on Ethernet interfaces. When loopback tracking is enabled and the Ethernet Operation, Administration, and Management (OAM) link-fault management process (lfmd) detects its own generated packets on an interface, it marks the interface as down. When the loopback issue resolves, the interface is brought back up.

**Required Privilege Level**

```

#### Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

#### Description

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, and 100-Gigabit Ethernet Type 5 PIC with CFP, specify a remote MAC address on which to count incoming and outgoing packets.

#### Options

- **mac-address**—MAC address. Specify the MAC address as six hexadecimal bytes in one of the following formats: `nnnn.nnnn.nnnn` or `nnnn:nnnn:nnnn`. For example, `0011.2233.4455` or `00:11:22:33:44:55`.

- **policer**—MAC policer. For more information, see `policer (MAC)`.

#### Required Privilege

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

#### Related Documentation

**mac-address (MACsec)**

**Syntax**
```
mac-address mac-address;
```

**Hierarchy Level**
```
[edit security macsec connectivity-association
connectivity-association-name secure-channel
secure-channel-name id]
```

**Release Information**
Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**
Specify a MAC address to enable MACsec using static secure association key (SAK) security mode. The `mac-address` variables must match on the sending and receiving ends of a link to enable MACsec using static SAK security mode.

If you are configuring a MAC address on a secure channel in the outbound direction, you should specify the MAC address of the interface as the `mac-address`.

If you are configuring a MAC address on a secure channel in the inbound direction, you should specify the MAC address of the interface at the other end of the link as the `mac-address`.

You only use this configuration option when you are configuring MACsec using static SAK security mode. This option does not need to be specified when you are enabling MACsec using static connectivity association key (CAK) security mode.

**Default**
No MAC address is specified in the secure channel, by default.

**Options**
- `mac-address`—The MAC address, in six groups of two hexadecimal digits.

**Required Privilege Level**
- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

**Related Documentation**
- [Configuring Media Access Control Security (MACsec) on MX Series Routers](#)
**mac-learn-enable**

**Syntax**
mac-learn-enable;

**Hierarchy Level**
[edit interfaces interface-name gigether-options ethernet-switch-profile]
[edit interfaces aex aggregated-ether-options ethernet-switch-profile]

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, for 100-Gigabit Ethernet Type 5 PIC with CFP, and for MPC3E, MPC4E, MPC5E, MPC5EQ, and MPC6E MPCs, configure dynamic learning of the source and destination MAC addresses. By default, the interface is not allowed to dynamically learn source and destination MAC addresses.

To disable dynamic learning of the source and destination MAC addresses after it has been configured, you must delete **mac-learn-enable** from the configuration.

MPCs support MAC address accounting for an individual interface or an aggregated Ethernet interface member link only after the interface has received traffic from the MAC source. If traffic is only exiting an interface, the MAC address is not learned and MAC address accounting does not occur.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

mac-radius (MX Series in Enhanced LAN Mode)

Syntax  
```
mac-radius <flap-on-disconnect> <restrict>;
```

Hierarchy Level  
```
[edit protocols authentication-access-control interface (all | [interface-names]) dot1x]
```

Release Information  
Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description  
Configure MAC RADIUS authentication for specific interfaces. MAC RADIUS authentication allows LAN access to permitted MAC addresses. When a new MAC address appears on an interface, the switch consults the RADIUS server to check whether the MAC address is a permitted address. If the MAC address is configured on the RADIUS server, the device is allowed access to the LAN.

If MAC RADIUS is configured, the switch first tries to get a response from the host for 802.1X authentication. If the host is unresponsive, the switch attempts to authenticate using MAC RADIUS.

To restrict authentication to MAC RADIUS only, use the restrict option. In restrictive mode, all 802.1X packets are eliminated and the attached device on the interface is considered a nonresponsive host.

Options

- **flap-on-disconnect**—(Optional) When the RADIUS server sends a disconnect message to a supplicant, the switch resets the interface on which the supplicant is authenticated. If the interface is configured for multiple supplicant mode, the switch resets all the supplicants on the specified interface. This option takes effect only when the restrict option is also set.

- **restrict**—(Optional) Restricts authentication to MAC RADIUS only. When `mac-radius restrict` is configured the switch drops all 802.1X packets. This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface, and eliminates the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.

Required Privilege

- **Level**
  - routing—to view this statement in the configuration.
  - routing-control—to add this statement to the configuration.
mac-validate

Syntax

mac-validate (loose | strict);

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number family family]

Release Information

Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Enable IP and MAC address validation for static Ethernet and IP demux interfaces.

Options

loose—Forwards incoming packets when both the IP source address and the MAC source address match one of the trusted address tuples. Drops packets when the IP source address matches one of the trusted tuples, but the MAC address does not match the MAC address of the tuple. Continues to forward incoming packets when the source address of the incoming packet does not match any of the trusted IP addresses.

strict—Forwards incoming packets when both the IP source address and the MAC source address match one of the trusted address tuples. Drops packets when the MAC address does not match the tuple’s MAC source address, or when IP source address of the incoming packet does not match any of the trusted IP addresses.

Required Privilege

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

max-sessions (PPPoE Service Name Tables)

**Syntax**

```plaintext
max-sessions number;
```

**Hierarchy Level**

```
[edit protocols pppoe service-name-tables table-name service service-name]
```

**Release Information**

Statement introduced in Junos OS Release 10.2.

**Description**

Configure the maximum number of active PPPoE sessions using either static or dynamic PPPoE interfaces that the router can establish with the specified named service, empty service, or any service entry in a PPPoE service name table. The router maintains a count of active PPPoE sessions for each service entry to determine when the maximum sessions limit has been reached.

The router uses the `max-sessions` value for a PPPoE service name table entry in conjunction with the `max-sessions` value configured for the PPPoE underlying interface, and with the maximum number of PPPoE sessions supported on your router. If your configuration exceeds any of these maximum session limits, the router is unable to establish the PPPoE session.

**Options**

`number`—Maximum number of active PPPoE sessions that the router can establish with the specified PPPoE service name table entry, in the range 1 to the platform-specific maximum PPPoE sessions supported for your router. The default value is equal to the maximum number of PPPoE sessions supported on your routing platform.

**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family pppoe],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family pppoe-underlying-options]
```

**Release Information**

Statement introduced in Junos OS Release 11.4.

**Description**

Configure the router to ignore (clear) the value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks vendor-specific attribute (VSA) [26-143], and restore the PPPoE maximum session value on the underlying interface to the value configured in the CLI with the `max-sessions` statement. The PPPoE maximum session value specifies the maximum number of concurrent static or dynamic PPPoE logical interfaces (sessions) that the router can activate on the PPPoE underlying interface, or the maximum number of active static or dynamic PPPoE sessions that the router can establish with a particular service entry in a PPPoE service name table.

**Default**

If you do not include the `max-sessions-vsa-ignore` statement, the maximum session value returned by RADIUS in the Max-Clients-Per-Interface VSA takes precedence over the PPPoE maximum session value configured with the `max-sessions` statement.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

maximun-links

Syntax  
maximun-links maximun-links-limit;

Hierarchy Level  
[edit chassis aggregated-devices]

Release Information  
Statement introduced in Junos OS Release 11.1 for T Series routers.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
Statement introduced in Junos OS Release 12.3 for MX Series routers.

Description  
Configure the maximum links limit for aggregated devices. Note that for MX Series routers, to set a range of 32 or 64 the router must be running in Enhanced IP mode, which is only supported for Trio-based MPCs and multiservice DPCs (MS-DPCs). For more information on Enhanced IP mode, Network Services Mode Overview.

For MX series routers and PTX series switches, the option for 64 links is only supported for Junos OS release 12.3 and later.

NOTE: This statement is not supported on the MX80, MX104, and PTX1000 routers.

Options  
maximun-links-limit—Maximum links limit for aggregated devices.
Range: 16, 32, 64

NOTE: On T-Series routers, the maximum-links supported is 32 in an aggregated Ethernet link.

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

  switchover-mode (non-revertive | revertive);
}
```

Hierarchy Level

[edit interfaces aeX aggregated-ether-options],
[edit logical-systems logical-system-name interfaces aeX aggregated-ether-options]

Release Information

Statement introduced in Junos OS Release 9.6 for MX Series routers.
- `events` statement introduced in Junos OS Release 11.4R4 for MX Series routers.
- Statement introduced in Junos OS Release 12.2 for the QFX Series. Only the `chassis-id`, `mc-ae-id`, `mode active-active`, and `status-control (active | standby)` options are supported on QFX Series devices.
- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
- `prefer-status-control-active` statement introduced in Junos OS Release 13.2R1 for EX Series switches.
- `init-delay-time seconds` statement introduced in Junos OS Release 13.2R3 for EX Series switches.
- `switchover-mode` and `revert-time` statements introduced in Junos OS Release 13.3.
- Support for logical systems introduced in Junos OS Release 14.1.

Description

Enable multichassis link aggregation groups (MC-LAG), which enables one device to form a logical LAG interface with two or more other devices.

Options

- **chassis-id**—Specify the chassis ID for Link Aggregation Control Protocol (LACP) to calculate the port number of MC-LAG physical member links.
  - **Values:** 0 or 1

- **events**—Specify an action if a specific MC-LAG event occurs.
  - `iccp-peer-down`—Specify an action if the ICCP peer of this node goes down.
  - `force-icl-down`—If the node's ICCP peer goes down, bring down the interchassis-link logical interface.
prefer-status-control-active—Specify that the node configured as status-control active become the active node if the peer of this node goes down.

When ICCP goes down, you can use this keyword to make a mc-lag PE to become the active PE. For example, if you want mc-lag PE1 to be Active on ICCP down, then configure this keyword in PE1. It is not recommended to configure this keyword in both the mc-lag PEs.

**NOTE:** The prefer-status-control-active statement can be configured with the status-control standby configuration to prevent the LACP MC-LAG system ID from reverting to the default LACP system ID on ICCP failure. Use this configuration only if you can ensure that ICCP will not go down unless the router or switch is down. You must also configure the hold-time down value (at the [edit interfaces interface-name] hierarchy level) for the interchassis link with the status-control standby configuration to be higher than the ICCP BFD timeout. This configuration prevents data traffic loss by ensuring that when the router or switch with the status-control active configuration goes down, the router or switch with the status-control standby configuration does not go into standby mode.

To make the prefer-status-control-active configuration work with the status-control standby configuration when an interchassis-link logical interface is configured on aggregate Ethernet interface, you must either configure the lacp periodic interval statement at the [edit interface interface-name aggregated-ether-options] hierarchy level as slow or configure the detection-time threshold statement at the [edit protocols iccp peer liveness-detection] hierarchy level as less than 3 seconds.

init-delay-time seconds—To minimize traffic loss, specify the number of seconds in which to delay bringing the multichassis aggregated Ethernet interface back to the up state when you reboot an MC-LAG peer.

**NOTE:** On QFX and EX Series switches, the default session establishment hold time is 300 seconds. However, the session establishment time must be at least 100 seconds higher than the init delay time. You can optionally update the session establishment time to be 340 seconds and the init delay time to be 240 seconds.
**mc-ae-id mc-ae-id**—Specify the identification number of the MC-LAG device. The two MC-LAG network devices that manage a given MC-LAG must have the same identification number.

**Range:** 1 through 65,535

**mode (active-active | active-standby)**—Specify whether the MC-LAG is in active-active or active-standby mode.

**NOTE:** You can configure IPv4 (inet) and IPv6 (inet6) addresses on mc-ae interfaces when the active-standby mode is configured.

**redundancy-group group-id**—Specify the redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate multiple chassis that perform similar redundancy functions.

**Range:** 1 through 4,294,967,294

**revert-time**—Wait interval (in minutes) before the switchover to the preferred node is performed when the **switchover-mode** is configured as revertive.

**Range:** 1 through 10

**status-control (active | standby)**—Specify whether the chassis becomes active or remains in standby mode when an interchassis link failure occurs.

**switchover-mode (non-revertive | revertive)**—Specify whether Junos OS should trigger a link switchover to the preferred node when the active node is available.

**NOTE:** For revertive mode to automatically switch over to the preferred node, the status-control statement should be configured as active.

**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

Hierarchy Level (QFX Series)

[edit interfaces ae aggregated-ether-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

For aggregated Ethernet, SONET/SDH, multilink, link services, and voice services interfaces only, set the minimum number of links that must be up for the bundle to be labeled up.

Options

number—Number of links.

Range: On M120, M320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, the valid range for minimum-links number is 1 through 64. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX8200 switches, the range of valid values for minimum-links number is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX4600, QFX Series and Q Fabric Systems, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up.

Default: 1

### must-secure (MX Series)

**Syntax**

must-secure;

**Hierarchy Level**

[edit security macsec connectivity-association connectivity-association-name mka]

**Release Information**

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**

Specifies that all traffic travelling on the MACsec-secured link must be MACsec-secured to be forwarded onward.

When the `must-secure` option is enabled, all traffic that is not MACsec-secured that is received on the interface is dropped.

When the `must-secure` option is disabled, all traffic from devices that support MACsec is MACsec-secured while traffic received from devices that do no support MACsec is forwarded through the network.

The `must-secure` option is particularly useful in scenarios where multiple devices, such as a phone and a PC, are accessing the network through the same Ethernet interface. If one of the devices supports MACsec while the other device does not support MACsec, the device that doesn't support MACsec can continue to send and receive traffic over the network—provided the `must-secure` option is disabled—while traffic to and from the device that supports MACsec is MACsec-secured. In this scenario, traffic to the device that is not MACsec-secured must be VLAN-tagged.

**Default**

The `must-secure` option is disabled.

**Required Privilege Level**

`admin`—To view this statement in the configuration.

`admin-control`—To add this statement to the configuration.

**Related Documentation**

#### Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for Layer 2 VPNs and VPLS introduced in Junos OS Release 10.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Support at the [set interfaces interface-name unit logical-unit-number family ccc] hierarchy level introduced in Junos OS Release 12.3R3 for MX Series routers.
Statement introduced in Junos OS 17.3R1 Release for MX Series Routers.

#### Description

Specify the maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

To route jumbo data packets on an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI) on EX Series switches, you must configure the jumbo MTU size on the member physical interfaces of the VLAN that you have associated with the IRB interface or RVI, as well as on the IRB interface or RVI itself (the interface named irb or vlan, respectively).
CAUTION: For EX Series switches, setting or deleting the jumbo MTU size on an IRB interface or RVI while the switch is transmitting packets might cause packets to be dropped.

NOTE: The MTU for an IRB interface is calculated by removing the Ethernet header overhead \([6(DMAC)+6(SMAC)+2(EtherType)]\). Because, the MTU is the lower value of the MTU configured on the IRB interface and the MTU configured on the IRB’s associated bridge domain IFDs or IFLs, the IRB MTU is calculated as follows:

- In case of Layer 2 IFL configured with the flexible-vlan-tagging statement, the IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
- In case of Layer 2 IFL configured with the vlan-tagging statement, the IRB MTU is calculated by including a single VLAN 4 bytes overhead.
NOTE:

• If a packet whose size is larger than the configured MTU size is received on the receiving interface, the packet is eventually dropped. The value considered for MRU (maximum receive unit) size is also the same as the MTU size configured on that interface.

• Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. You cannot configure an MTU for management Ethernet interfaces (fxp0, em0, or me0) or for loopback, multilink, and multicast tunnel devices.

• On ACX Series routers, you can configure the protocol MTU by including the mtu statement at the [edit interfaces interface-name unit logical-unit-number family inet] or [edit interfaces interface-name unit logical-unit-number family inet6] hierarchy level.
  
  • If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
  
  • If you are configuring the protocol MTU for both inet and inet6 families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for inet and inet6 families that are configured on the same logical interface.

• Starting in Release 14.2, MTU for IRB interfaces is calculated by removing the Ethernet header overhead (6(DMAC)+6(SMAC)+2(EtherType)), and the MTU is a minimum of the two values:
  
  • Configured MTU
  
  • Associated bridge domain's physical or logical interface MTU

  • For Layer 2 logical interfaces configured with flexible-vlan-tagging, IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
  
  • For Layer 2 logical interfaces configured with vlan-tagging, IRB MTU is calculated by including single VLAN 4 bytes overhead.

NOTE: Changing the Layer 2 logical interface option from vlan-tagging to flexible-vlan-tagging or vice versa adjusts the logical interface MTU by 4 bytes with the existing MTU size. As a result, the Layer 2 logical interface is deleted and re-added, and the IRB MTU is re-computed appropriately.
For more information about configuring MTU for specific interfaces and router or switch combinations, see Configuring the Media MTU.

Options bytes—MTU size.

Range: 256 through 9192 bytes, 256 through 9216 (EX Series switch interfaces), 256 through 9500 bytes (Junos OS 12.1X48R2 for PTX Series routers), 256 through 9500 bytes (Junos OS 16.1R1 for MX Series routers)

NOTE: Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E

Default: 1500 bytes (INET, INET6, and ISO families), 1448 bytes (MPLS), 1514 bytes (EX Series switch interfaces)

Required Privilege Level

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

**multicast-router-interface (IGMP Snooping)**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>multicast-router-interface;</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Hierarchy Level</strong></td>
<td>[edit bridge-domains bridge-domain-name protocols igmp-snooping interface interface-name], [edit bridge-domains bridge-domain-name protocols igmp-snooping vlan vlan-id interface interface-name], [edit protocols igmp-snooping vlan (all</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Statically configure the interface as an IGMP snooping multicast-router interface—that is, an interface that faces toward a multicast router or other IGMP querier.</td>
</tr>
</tbody>
</table>

**NOTE:** If the specified interface is a trunk port, the interface becomes a multicast-routing device interface for all VLANs configured on the trunk port. In addition, all unregistered multicast packets, whether they are IPv4 or IPv6 packets, are forwarded to the multicast routing device interface, even if the interface is configured as a multicast routing device interface only for IGMP snooping.

Configure an interface as a bridge interface toward other multicast routing devices.

**Default** Disabled. If this statement is disabled, the interface drops IGMP messages it receives. The interface can either be a host-side or multicast-routing device interface.

**Required Privilege Level** routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

multi-chassis-protection

Syntax
multi-chassis-protection {
  peer a.b.c.d {
    interface interface-name;
  }
}

Hierarchy Level
[edit interfaces interface-name]

Release Information
Statement introduced in Junos OS Release 11.1.

Description
For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, you can use this statement under the physical interface level to reduce the configuration at the logical interface level if the following assumption exists:

If there are n + 1 logical interfaces under ae0, from ae0.0 through ae0.n, there will be n + 1 logical interfaces under ge-0/0/0 as well, from ge-0/0/0.0 through ge-0/0/0.n, and each ge-0/0/0 logical interface will be a protection link for the ae0 logical interface.

NOTE: A bridge domain cannot have MC-AE logical interfaces which belong to different redundancy groups.

If the Inter-Chassis Control Protocol (ICCP) connection is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer.

The remaining statements are explained separately. See CLI Explorer.

Options
- interface interface-name—Specify the interface: interface interface-name-fpc/pic/port

Required Privilege Level
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

</tr>
<tr>
<td>Description</td>
<td>Disables MACsec encryption for a connectivity association that is configured to enable MACsec using static connectivity association key (CAK) or dynamic security mode. You can enable MACsec without enabling encryption. If a connectivity association that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the packet, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic does not represent a security threat. This command is used to disable encryption when MACsec is configured using static CAK or dynamic security mode only. When MACsec is configuring using static secure association key (SAK) security mode, the encryption setting is managed in the secure channel using the encryption configuration statement.</td>
</tr>
<tr>
<td>Default</td>
<td>MACsec encryption is enabled if MACsec is enabled using static CAK or dynamic security mode.</td>

no-keepalives

Syntax

no-keepalives;

Hierarchy Level

[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Disable the sending of keepalives on a physical interface configured with PPP, Frame Relay, or Cisco HDLC encapsulation. The default keepalive interval is 10 seconds.

For ATM2 IQ interfaces only, you can disable keepalives on a logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- atm-ppp-llc—PPP over AAL5 LLC encapsulation.
- atm-ppp-vc-mux—PPP over AAL5 multiplex encapsulation.

Required Privilege

Interface—To view this statement in the configuration.

Interface-control—To add this statement to the configuration.

</tbody>
</table>
no-native-vlan-insert

Syntax
no-native-vlan-insert;

Hierarchy Level
[edit interfaces interface-name]

Release Information
Statement introduced in Junos OS Release 17.1R1.

Description
Send traffic without the native VLAN ID (native-vlan-id) to the remote end of the network if untagged traffic is received.

If this statement is not configured, then native-vlan-id is added to untagged traffic. But if this statement is configured, then native-vlan-id is not added to untagged traffic.

NOTE:
- This feature works only on MX Series routers with MPCs/MICs. Configuring this statement on MX Series routers with DPCs results is no behavioral change. However, if you configure the statement on aggregated Ethernet (ae) interfaces with logical interfaces across MPCs/MICs and DPCs, then the MPCs/MICs and DPCs behave differently.
- In the egress direction, this feature is disrupted by VLAN normalization. Because of normalization, the egress interface cannot distinguish between untagged traffic and tagged traffic. And untagged traffic is sent out with native-vlan-id. Consider this while configuring both VLAN normalization and new native-vlan-id statement.
  
  There will be a problem with ingress firewall filter if filter term includes native-vlan-id. With no-native-vlan-insert statement configured, native-vlan-id will not be inserted to untagged traffic. So, firewall filter term will not match with untagged traffic. But if incoming traffic have VLAN ID which is equal to native-vlan-id, then firewall filter term will match and firewall will work.
- When this feature is used with AE, all sub-interfaces of AE should be in same type of FPC.

Default
By default, native-vlan-id is inserted to untagged traffic. That is, if this statement is not configured, then native-vlan-id is inserted to untagged traffic.

Required Privilege
Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

no-pre-classifier

Syntax

```plaintext
no-pre-classifier;
```

Hierarchy Level

[edit chassis fpc n pic n]

Release Information

Statement introduced in Junos OS Release 10.4.

Description

Specify disabling the control queue for all ports on the 10-Gigabit Ethernet LAN/WAN PIC. Deleting this configuration re-enables the control queue feature on all ports of the 10-Gigabit Ethernet LAN/WAN PIC.

NOTE: For the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PD-5-10XGE-SFPP), the control queue has a rate limiter to limit the control traffic to 2 Mbps (fixed, not user-configurable) per port. If the transit control traffic crosses this limit, then it can cause drops on locally terminating control traffic, causing flap of protocols such as BGP and OSPF. To avoid the control traffic being dropped, configure the no-pre-classifier statement to disable the control queue.

Default

The no-pre-classifier statement is not configured and the control queue is operational.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

## no-send-pads-ac-info

**Syntax**
```
no-send-pads-ac-info;
```

**Hierarchy Level**
```
[edit protocols pppoe]
```

**Release Information**
Statement introduced in Junos OS Release 12.2.

**Description**
Prevent the router from sending the AC-Name and AC-Cookie tags in the PPPoE Active Discovery Session (PADS) packet. When you configure this statement, it affects PADS packets sent on all PPPoE interfaces configured on the router after the command is issued; it has no effect on previously created PPPoE interfaces. By default, the AC-Name and AC-Cookie tags are transmitted in the PADS packet, along with the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags.

**NOTE:** In Junos OS Release 12.1 and earlier, only the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags are contained in the PADS packet by default. The AC-Name and AC-Cookie tags are not transmitted in the PADS packet by default.

**Required Privilege Level**
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**
- [Disabling the Sending of PPPoE Access Concentrator Tags in PADS Packets](#)
### no-send-pads-error

**Syntax**  
no-send-pads-error;

**Hierarchy Level**  
[edit protocols pppoe]

**Release Information**  
Statement introduced in Junos OS Release 12.3.

**Description**  
Discard PADR messages to prevent transmission of PADS control packets with AC-System-Error tags.

**Required Privilege**  
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

**offset (MX Series)**

**Syntax**

```
offset (0 | 30 | 50);
```

**Hierarchy Level**

```
[edit security macsec connectivity-association connectivity-association-name]
[edit security macsec connectivity-association connectivity-association-name secure-channel secure-channel-name]
```

**Release Information**

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**

Specifies the number of octets in an Ethernet frame that are sent in unencrypted plain-text when encryption is enabled for MACsec.

Setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the remaining traffic. Setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the remaining traffic.

You would typically forward traffic with the first 30 or 50 octets unencrypted if a feature needed to see the data in the octets to perform a function, but you otherwise prefer to encrypt the remaining data in the frames traversing the link. Load balancing features, in particular, typically need to see the IP and TCP/UDP headers in the first 30 or 50 octets to properly load balance traffic.

You configure the `offset` in the `[edit security macsec connectivity-association connectivity-association-name]` hierarchy when you are enabling MACsec using static connectivity association key (CAK) or dynamic security mode.

You configure the `offset` in the `[edit security macsec connectivity-association connectivity-association-name secure-channel secure-channel-name]` hierarchy when you are enabling MACsec using static secure association key (SAK) security mode.

**Default**

0

**Options**

0—Specifies that no octets are unencrypted. When you set the offset to 0, all traffic on the interface where the connectivity association or secure channel is applied is encrypted.

30—Specifies that the first 30 octets of each Ethernet frame are unencrypted.

---

**NOTE:** In IPv4 traffic, setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 30, therefore, is typically used when a feature needs this information to perform a task on IPv4 traffic.
50—Specified that the first 50 octets of each Ethernet frame are unencrypted.

**NOTE:** In IPv6 traffic, setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 50, therefore, is typically used when a feature needs this information to perform a task on IPv6 traffic.

**Required Privilege Level**
- `admin`—To view this statement in the configuration.
- `admin-control`—To add this statement to the configuration.

  }
  wavelength nm;
}
```

Hierarchy Level

[edit interfaces interface-name]

Release Information

Statement introduced before Junos OS Release 7.4.
- `alarm` option and `warning` options introduced in Junos OS Release 10.0.
- Statement introduced in Junos OS Release 12.1 for EX Series switches.
- Statement and `tx-power` option introduced in Junos OS Release 13.2 for PTX Series routers.
- `tca` option introduced in Junos OS Release 14.2 for PTX Series routers.
- Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.
- Statement introduced in Junos OS Release 18.3R1 for ACX6360 routers.

Description

For 10-Gigabit Ethernet or 100-Gigabit Ethernet dense wavelength-division multiplexing (DWDM) interfaces only, configure full C-band International Telecommunication Union (ITU)-Grid tunable optics.

On the PTX Series routers, when an interface is configured in 8QAM mode, you must configure both the optics from an AC400 module with the same optics-options for the links to come up.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

</thead>
</table>

### Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number layer2-policer],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number layer2-policer]
```

### Release Information

Statement introduced in Junos OS Release 8.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

### Description

Apply a single-rate two-color policer to the Layer 2 output traffic at the logical interface. The `output-policer` and `output-three-color` statements are mutually exclusive.

### Options

- **policer-name**—Name of the single-rate two-color policer that you define at the [edit firewall] hierarchy level.

### Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

### Related Documentation

output-priority-map

Syntax

```
output-priority-map {
    classifier {
        premium {
            forwarding-class class-name {
                loss-priority (high | low);
            }
        }
    }
}
```

Hierarchy Level

- [edit interfaces interface-name gigether-options ethernet-switch-profile ethernet-policer-profile]
- [edit interfaces interface-name ether-options ethernet-switch-profile ethernet-policer-profile]

Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description

For Gigabit Ethernet IQ and 10-Gigabit Ethernet interfaces only, define the output policer priority map to be applied to outgoing frames on this interface.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

output-vlan-map (Aggregated Ethernet)

Syntax

```
output-vlan-map {
  (pop | push | swap);
  tag-protocol-id tpid;
  vlan-id number;
}
```

Hierarchy Level

- [edit interfaces interface-name unit logical-unit-number],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information

Statement introduced in Junos OS Release 8.2. Starting in Junos OS Release 17.3R1, input-vlan-map for outer vlan is supported for L2 circuit over aggregated Ethernet interfaces for QFX10000 Series switches.

Description

Define the rewrite profile to be applied to outgoing frames on this logical interface. On MX Series routers, this statement only applies to aggregated Ethernet interfaces using Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E interfaces and 100-Gigabit Ethernet Type 5 PIC with CFP.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**pado-advertise**

**Syntax**
pado-advertise;

**Hierarchy Level**
[edit protocols pppoe]

**Release Information**
Statement introduced in Junos OS Release 10.2.

**Description**
Enable named services configured in PPPoE service name tables to be advertised in PPPoE Active Discovery Offer (PADO) control packets. By default, advertisement of named services in PADO packets is disabled.

---

**NOTE:** If you enable advertisement of named services in PADO packets, make sure the number and length of all advertised service entries does not exceed the maximum transmission unit (MTU) size of the PPPoE underlying interface.

---

**Required Privilege Level**
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**
- Configuring PPPoE Service Name Tables
- Enabling Advertisement of Named Services in PADO Control Packets
passive-monitor-mode

Syntax

```
passive-monitor-mode;
```

Hierarchy Level

```
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Monitor packet flows from another router. If you include this statement in the configuration, the interface does not send keepalives or alarms, and does not participate actively on the network.

This statement is supported on ATM, Ethernet, and SONET/SDH interfaces. For more information, see ATM Interfaces Feature Guide for Routing Devices.

For ATM and Ethernet interfaces, you can include this statement on the physical interface only.

For SONET/SDH interfaces, you can include this statement on the logical interface only.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

pdu-interval

Syntax

```
pdu-interval interval;
```

Hierarchy Level

```
[edit protocols oam ethernet link-fault-management interface interface-name]
```

Release Information

Statement introduced in Junos OS Release 8.2 for MX, M, T, ACX, Series routers, SRX Series firewalls, and EX Series Switches.
Statement introduced in Junos OS Release 9.4 for EX Series switches.

Description

For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, specify the periodic OAM PDU sending interval for fault detection. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

Options

- **interval**—Periodic OAM PDU sending interval.
  - **Range:** For MX, M, T, ACX, Series routers, SRX Series firewalls and EX Series switches – 100 through 1000 milliseconds
  - **Default:** For EX Series switches – 1000 milliseconds

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Ethernet OAM Link Fault Management
- Configuring Ethernet OAM Link Fault Management
pdu-threshold

Syntax

pdu-threshold threshold-value;

Hierarchy Level

[edit protocols oam ethernet link-fault-management interface interface-name]

Release Information

Statement introduced in Junos OS Release 8.2 for T, M, MX and ACX Series routers, SRX Series firewalls and EX Series switches.
Statement introduced in Junos OS Release 9.4 for EX Series switches and NFX Series devices.

Description

Configure how many protocol data units (PDUs) are missed before declaring the peer lost in Ethernet OAM link fault management (LFM) for all interfaces or for specific interfaces.

For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, specify the number of OAM PDUs to miss before an error is logged. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

Options

threshold-value—The number of PDUs missed before declaring the peer lost.
Range: 3 through 10 PDUs
Default: 3 PDUs

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

• Configuring the OAM PDU Threshold on page 826

**per-flow (Aggregated Ethernet Interfaces)**

**Syntax**

```
per-flow;
```

**Hierarchy Level**

```
[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful]
```

**Release Information**

Statement introduced in Junos OS Release 13.2R1.

**Description**

Enable the mechanism to perform an even, effective distribution of traffic flows across member links of an aggregated Ethernet interface (ae) bundle on MX Series routers with MPCs, except MPC3Es and MPC4Es. When multiple flows are transmitted out of an ae interface, the flows must be distributed across the different member links evenly to enable an effective and optimal load-balancing behavior. To obtain a streamlined and robust method of load-balancing, the member link of the aggregated Ethernet interface bundle that is selected each time for load balancing plays a significant part.

**Options**

- **per-flow**—Enable the stateful load-distribution mechanism per traffic flow on an aggregated Ethernet interface.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Stateful Load Balancing on Aggregated Ethernet Interfaces on page 192
## peer

<table>
<thead>
<tr>
<th>Syntax</th>
<th>peer a.b.c.d [  Interface interface-name;  ]</th>
</tr>
</thead>
</table>

| Hierarchy Level    | [edit interfaces interface-name multi-chassis-protection] |

### Release Information
Statement introduced in Junos OS Release 11.1.

### Description
For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, use the `multi-chassis-protection` statement under the physical interface level to reduce the configuration at the logical interface level. If the interchassis control protocol connection (ICCP) is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer active-active node specified by the `peer` statement. You must also specify the peer’s physical interface.

### Options
- **a.b.c.d**—Specify the IP address of the peer.
- **interface interface-name**—Specify the peer’s physical interface: `interface interface-name-fpc/pic/port`

### Required Privilege Level
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

policer (CFM Firewall)

Syntax

```
policer cfm-policer {
  if-exceeding {
    bandwidth-limit 8k;
    burst-size-limit 2k;
  }
  then discard;
}
```

Hierarchy Level

[edit firewall]

Release Information

Statement introduced in Junos OS Release 10.0.

Description

Attach an explicit policer to CFM sessions.

Required Privilege

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Rate Limiting of Ethernet OAM Messages on page 787

## policer (CoS)

**Syntax**
```
policer cos-policer-name [ 
    aggregate { 
        bandwidth-limit bps;  
        burst-size-limit bytes;  
    } 
    premium { 
        bandwidth-limit bps;  
        burst-size-limit bytes;  
    } 
] 
```

**Hierarchy Level**
```
[edit interfaces interface-name gigether-options ethernet-switch-profile ethernet-policer-profile] 
```

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
For Gigabit Ethernet IQ, Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, define a CoS policer template to specify the premium bandwidth and burst-size limits, and the aggregate bandwidth and burst-size limits. The premium policer is not supported on MX Series routers or for Gigabit Ethernet interfaces with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router).

**Options**
- **cos-policer-name**—Name of one policer to specify the premium bandwidth and burst-size limits, and the aggregate bandwidth and burst-size limits.

  The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring Gigabit Ethernet Policers on page 671
### policer (MAC)

**Syntax**

```plaintext
policer {
  input cos-policer-name;
  output cos-policer-name;
}
```

**Hierarchy Level**

```plaintext
[edit interfaces interface-name unit logical-unit-number accept-source-mac mac-address mac-address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number accept-source-mac mac-address]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, configure MAC policing.

**NOTE:**

On MX Series routers with Gigabit Ethernet or Fast Ethernet PICs, the following considerations apply:

- Interface counters do not count the 7-byte preamble and 1-byte frame delimiter in Ethernet frames.
- In MAC statistics, the frame size includes MAC header and CRC before any VLAN rewrite/imposition rules are applied.
- In traffic statistics, the frame size encompasses the L2 header without CRC after any VLAN rewrite/imposition rule.

**Options**

- **input cos-policer-name**—Name of one policer to specify the premium bandwidth and aggregate bandwidth.
- **output cos-policer-name**—Name of one policer to specify the premium bandwidth and aggregate bandwidth.

- [edit interfaces interface-name unit logical-unit-number output-vlan-map],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]

#### Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
- Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

#### Description

**NOTE:** On EX4300 switches, `pop` is not supported at the `[edit interfaces interface-name unit logical-unit-number input-vlan-map]` hierarchy level.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2, and IQ2-E interfaces; 10-Gigabit Ethernet LAN/WAN PIC; aggregated Ethernet interfaces using Gigabit Ethernet IQ interfaces; 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces, specify the VLAN rewrite operation to remove a VLAN tag from the top of the VLAN tag stack. The outer VLAN tag of the frame is removed.

#### Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

### pop-swap

**Syntax**

```
pop-swap;
```

**Hierarchy Level**

```
[edit interfaces interface-name unit logical-unit-number input-vlan-map],
[edit interfaces interface-name unit logical-unit-number output-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]
```

**Release Information**

Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Specify the VLAN rewrite operation to remove the outer VLAN tag of the frame, and replace the inner VLAN tag of the frame with a user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame.

You can use this statement on Gigabit Ethernet IQ, IQ2, IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, on aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs on MX Series routers, and 100-Gigabit Ethernet Type 5 PIC with CFP.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

**port-description-type**

**Syntax**
```
port-description-type {
    interface-alias;
    interface-description;
}
```

**Hierarchy Level**
```
[edit protocols lldp]
[edit routing-instances routing-instance-name protocols lldp]
```

**Release Information**
Statement introduced in Junos OS Release 13.3R5, 14.2R2, 14.1R4, and 12.3R9.

**Description**
For Link Layer Discovery Protocol, configure the value to be used for port description TLV.

**Options**
- **interface-alias**—Use the `ifAlias` MIB object value to generate the port description TLV.
- **interface-description**—Use the `ifDescr` MIB object value to generate the port description TLV.

**Default:** By default, **interface-alias** is used for generation of port description TLV. The **interface-alias** value is same as description of an interface configured by statement `set interface name description description`.

---

**NOTE:** The LLDP MIB `lldpLocPortDesc` value gets changed depending on the setting of **port-description-type** statement. That is:

- If you configure the **port-description-type** interface-alias statement, the MIB variable `lldpLocPortDesc` displays the value same as that of MIB variable `ifAlias`, which is same as the description of the interface. By default, the MIB variable `lldpLocPortDesc` displays the value same as that of MIB variable `ifAlias`.

- If you configure the **port-description-type** interface-description statement, the MIB variable `lldpLocPortDesc` displays the value of MIB variable `ifDescr`, which is same as that of interface name.

---

**Required Privilege Level**
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

**port-id (MACsec for MX Series)**

**Syntax**

```plaintext
port-id port-id-number;
```

**Hierarchy Level**

```plaintext
[edit security macsec connectivity-association
    connectivity-association-name secure-channel
    secure-channel-name id]
```

**Release Information**

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**

Specify a port ID in a secure channel when enabling MACsec using static secure association key (SAK) security mode. The port IDs must match on a sending and receiving secure channel on each side of a link to enable MACsec.

Once the port numbers match, MACsec is enabled for all traffic on the connection.

You only use this configuration option when you are configuring MACsec using static SAK security mode. This option does not need to be specified when you are enabling MACsec using static connectivity association key (CAK) security mode.

**Default**

No port ID is specified.

**Options**

- `port-id-number`—The port ID number.

**Required Privilege Level**

- `admin`—To view this statement in the configuration.
- `admin-control`—To add this statement to the configuration.

**Related Documentation**

- *Configuring Media Access Control Security (MACsec) on MX Series Routers*
**port-priority**

**Syntax**

```
port-priority priority;
```

**Hierarchy Level**

```
[edit interfaces interface-name gigether-options 802.3ad lacp]
```

**Release Information**

Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 11.4 for EX Series switches.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

**Description**

Define LACP port priority at the interface level.

**Options**

`priority`—Priority for being elected to be the active port and both collect and distribute traffic. A smaller value indicates a higher priority for being elected.

- **Range**: 0 through 65535
- **Default**: 127

**Required Privilege**

- **Level**: interface—To view this statement in the configuration.
- **Level**: interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Aggregated Ethernet LACP (CLI Procedure)
**port-id-subtype**

**Syntax**

```plaintext
port-id-subtype {
  interface-name;
  locally-assigned;
}
```

**Hierarchy Level**

[edit protocols lldp]
[edit routing-instances routing-instance-name protocols lldp]

**Release Information**

Statement introduced in Junos OS Release 12.3R1

**Description**

For Link Layer Discovery Protocol, configure the port ID type, length, and value (TLV).

**Options**

`interface-name`—Use the interface name to generate the port ID TLV.

**Default:** Use the SNMP index of the interface to generate the port ID TLV. This is the default option used to generate port ID TLV.

---

**NOTE:** For QFX5200 switches, the default value used to generate port ID TLV in LLDP messages is interface name, not SNMP index.

---

**NOTE:** The `show lldp neighbors` command displays the content of the port ID TLV received from the peer in the port info field. Changing the configuration of `port-id-subtype` affects the display of the `show lldp neighbors` command on the peer device running Junos OS.

When the value of `port-id-subtype` is set to `locally-assigned`, which is the default value, the `show lldp neighbors` command on the peer device running Junos OS displays the SNMP index as the port information for the local device.

When the value of `port-id-subtype` is set to `interface-name`, the `show lldp neighbors` command on the peer device running Junos OS displays the interface name as the port information for the local device.

The value of the MIB variable instance `lldpLocPortId` depends on the entity that is used to generate the port ID TLV. If the port ID TLV generation is configured to use the `interface-name` in the command `set port-id-subtype interface-name`, then the value of the MIB variable `lldpLocPortId` instance is the interface name and not the SNMP index.
Required Privilege Level

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

Hierarchy Level  
[edit dynamic-profiles profile-name interfaces]

Release Information  
Statement introduced in Junos OS Release 10.1.

Description  
Configure the dynamic PPPoE logical interface in a dynamic profile. When the router creates a dynamic PPPoE logical interface on an underlying Ethernet interface configured with PPPoE (ppp-over-ether) encapsulation, it uses the information in the dynamic profile to determine the properties of the dynamic PPPoE logical interface.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

- Statement introduced in Junos OS Release 12.1 for T Series devices.
- Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Configure PPM processing options for Link Aggregation Control Protocol (LACP) packets.

This command configures the PPM processing options for LACP packets only. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the `no-delegate-processing` configuration statement in the [edit routing-options ppm] statement hierarchy.

Default

Distributed PPM processing is enabled for all packets that use PPM.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

[set interface ppp interface unit logical-unit-number ppp-max-payload ppp-max-payload],
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Client Statement introduced in Junos OS Release 8.5.
Server Statement introduced in Junos OS Release 8.5.
Client Statement introduced in Junos OS Release 15.1X49-D100.

**Description**

Configure PPP over Ethernet-specific interface properties.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

The maximum payload allowed on an Ethernet frame is 1500 bytes. For a PPPoE interface, the PPPoE header uses 6 bytes and the PPP protocol ID uses 2 bytes. This restricts the maximum MTU size on a PPPoE interface to 1492 bytes, which can cause frequent fragmentation and reassembly of larger PPP packets received over the PPPoE interface. To prevent frequent fragmentation and reassembly for PPP packets over Ethernet, you can configure the maximum transmission unit (MTU) and MRU sizes for PPP subscribers.

For PPPoE subscribers, the PPP MRU or PPP MTU size can be greater than 1492 bytes if the PPP-Max-Payload tag is received in the PPPoE Active Discovery Request (PADR) packets.

The PPP-Max-Payload option allows you to override the default behavior of the PPPoE client by providing a maximum size that the PPP payload can support in both sending and receiving directions. The PPPoE server might allow the negotiation of an MRU larger than 1492 octets and the ability to use an MTU larger than 1500 octets.

It is important to set an appropriate value for the MTU size of the physical interface before setting ppp-max-payload. The value of mtu must be greater than the value of ppp-max-payload.

To enable Jumbo frames refer *Understanding Jumbo Frames Support for Ethernet Interfaces*. 
**pppoe-underlying-options (Static and Dynamic Subscribers)**

preferred-source-address

Syntax

preferred-source-address address;

Hierarchy Level

[edit dynamic-profiles interfaces interface-name unit logical-unit-number family family unnumbered-address interface-name],
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family family],

Release Information

Statement introduced in Junos OS Release 9.2.
Support for the $junos-preferred-source-address and $junos-preferred-source-ipv6-address predefined variables introduced in Junos OS Release 9.6.

Description

For unnumbered Ethernet interfaces configured with a loopback interface as the donor interface, specify one of the loopback interface's secondary addresses as the preferred source address for the unnumbered Ethernet interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. To configure the preferred source address dynamically, instead of using this statement, you must include the $junos-preferred-source-address predefined variable for IPv4 (family inet) addresses or the $junos-preferred-source-ipv6-address predefined variable for IPv6 (family inet6) addresses.

Configuration of a preferred source address for unnumbered Ethernet interfaces is supported for IPv4 and IPv6 address families.

NOTE: When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the $junos-routing-instance predefined variable, you must not configure a preferred source address, whether with the $junos-preferred-source-address predefined variable, the $junos-preferred-source-ipv6-address predefined variable, or the preferred-source-address statement. Configuring the preferred source address in this circumstance causes a commit failure.

Options

address—Secondary IP address of the donor loopback interface. Alternatively, use the $junos-preferred-source-address or the $junos-preferred-source-ipv6-address predefined variable to dynamically apply a preferred source address to the unnumbered Ethernet interface.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**pre-shared-key (MX Series)**

**Syntax**
```plaintext
pre-shared-key {
    cak hexadecimal-number;
    ckn hexadecimal-number;
}
```

**Hierarchy Level**
```
[edit security macsec connectivity-association connectivity-association-name]
```

**Release Information**
Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**
Specifies the pre-shared key used to enable MACsec using static connectivity association key (CAK) security mode.

A pre-shared key includes a connectivity association key name (CKN) and a connectivity association key (CAK). A pre-shared key is exchanged between two devices at each end of a point-to-point link to enable MACsec using static CAK security mode. The MACsec Key Agreement (MKA) protocol is enabled after the pre-shared keys are successfully verified and exchanged. The pre-shared key—the CKN and CAK—must match on both ends of a link.

**Default**
No pre-shared keys exist, by default.

**Options**
The remaining statements are explained separately.

# ptopo-configuration-trap-interval

## Syntax

```
ptopo-configuration-trap-interval seconds;
```

## Hierarchy Level

```
[edit protocols lldp],
[edit routing-instances routing-instance-name protocols lldp]
```

## Release Information

## Description

Configure a time for the period of SNMP trap notifications to the Master Agent to wait regarding changes in topology global statistics.

## Options

- **seconds**—Time for the period of SNMP trap notifications about global statistics. This feature is disabled by default.
  
  **Range:** 0 through 3600

## Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

push

Syntax

```
push;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number input-vlan-map],
[edit interfaces interface-name unit logical-unit-number output-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

Description

NOTE: On EX4300 switches, push is not supported at the [edit interfaces interface-name unit logical-unit-number output-vlan-map] hierarchy level.

Specify the VLAN rewrite operation to add a new VLAN tag to the top of the VLAN stack. An outer VLAN tag is pushed in front of the existing VLAN tag.

You can use this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces; 10-Gigabit Ethernet LAN/WAN PIC; aggregated Ethernet interfaces using Gigabit Ethernet IQ interfaces; 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.

If you include the push statement in the configuration, you must also include the pop statement at the [edit interfaces interface-name unit logical-unit-number output-vlan-map] hierarchy level.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

proxy

Syntax

proxy inet-address address;

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number family tcc],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family tcc]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the IP address for which the TCC router is proxying. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only. Ethernet TCC is not supported on the T640 router.

Options

inet-address—Configure the IP address of the neighbor to the TCC router.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

proxy-arp

Syntax  proxy-arp (restricted | unrestricted);

Hierarchy Level  [edit interfaces interface-name unit logical-unit-number],
                 [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information  Statement introduced before Junos OS Release 7.4.
                      Statement introduced in Junos OS Release 9.6 for EX Series switches.
                      restricted added in Junos OS Release 10.0 for EX Series switches.
                      Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description  For Ethernet interfaces only, configure the router or switch to respond to any ARP request,
as long as the router or switch has an active route to the ARP request’s target address.

NOTE:  You must configure the IP address and the inet family for the interface when you enable proxy ARP.

Default  Proxy ARP is not enabled. The router or switch responds to an ARP request only if the
destination IP address is its own.

Options  • none—The router or switch responds to any ARP request for a local or remote address
         if the router or switch has a route to the target IP address.

         • restricted—(Optional) The router or switch responds to ARP requests in which the
           physical networks of the source and target are different and does not respond if the
           source and target IP addresses are in the same subnet. The router or switch must also
           have a route to the target IP address.

         • unrestricted—(Optional) The router or switch responds to any ARP request for a local
           or remote address if the router or switch has a route to the target IP address.

Default:  unrestricted

Required Privilege Level  interface—To view this statement in the configuration.
                         interface-control—To add this statement to the configuration.

quiet-period (MX Series in Enhanced LAN Mode)

Syntax
quiet-period seconds;

Hierarchy Level
[edit protocols authentication-access-control interface (all | [interface-names)])

Release Information
Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description
For 802.1X and captive portal authentication, configure the number of seconds the interface remains in the wait state following a failed authentication attempt by a supplicant before reattempting authentication.

Default
60 seconds

Options
seconds—Number of seconds the interface remains in the wait state.
Range: 0 through 65,535 seconds
Default: 60 seconds

Required Privilege
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
reauthentication

Syntax

reauthentication (disable | interval seconds);

Hierarchy Level

[edit protocols dot1x authenticator interface interface-id]

Release Information

Statement introduced in Junos OS Release 9.3.

Description

Set or disable the periodic reauthentication of the client.

Options

• disable—Disable the periodic reauthentication of the client.
  • interval seconds—Specify the periodic reauthentication time interval.

Range: 1 through 65,535 seconds

Default: 3600 seconds

Required Privilege

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

reauthentication (MX Series in Enhanced LAN Mode)

**Syntax**

reauthentication interval;

**Hierarchy Level**

[edit protocols authentication-access-control interface (all | [interface-names]) dot1x]

**Release Information**

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

**Description**

For 802.1X authentication, specify the number of seconds before an authentication session times out.

**Options**

interval—Sets the periodic reauthentication time interval in seconds.

*Range:* 1 through 4,294,967,296 seconds

*Default:* 3600 seconds

**Required Privilege Level**

routing—to view this statement in the configuration.

routing-control—to add this statement to the configuration.

rebalance (Aggregated Ethernet Interfaces)

**Syntax**

rebalance interval

**Hierarchy Level**

[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful per-flow]

**Release Information**

Statement introduced in Junos OS Release 13.2R1.

**Description**

Configure periodic rebalancing of traffic flows of an aggregated Ethernet bundle by clearing the load balance state at a specified interval.

**Options**

interval—Number of minutes after which the load-balancing state must be cleared for the specified interface.

*Range:* 1 through 1000 flows per minute

**Required Privilege Level**

interface—to view this statement in the configuration.

interface-control—to add this statement to the configuration.

recovery

Syntax

recovery {
  (auto | manual);
  timer timer-value;
}

Hierarchy Level

[edit interfaces interfaces-name link-degrade-monitor]

Release Information

Statement introduced in Junos OS Release 15.1.

Description

Configure the mechanism to be used to recover a degraded link. The recovery options supported are auto and manual.

Options

auto—Recover a degraded link automatically. Use this option with the media-based action when there are no Layer 2 or Layer 3 protocols configured on the interface. If this option is configured, the degraded link is monitored at user-configured intervals; and if the link quality is found to have improved (if bit error rate hits the clear threshold), the link is automatically recovered. With this configuration, you must configure a timer value.

manual—Recover a degraded link manually. Use this option with the media-based action configuration when Layer 2 and Layer 3 protocols are configured on the interface. If this option is configured, you need to use the request interface link-degrade-recover interface-name statement to recover the link.

NOTE: The manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while autorecovery is in progress.

timer timer-value—Specify the interval value (in seconds) after which autorecovery of the degraded link must be triggered. This option is applicable if you configure the autorecovery option. The interval period starts from the time the link is degraded. The default interval is 1800 seconds. The autorecovery attempt is repeated until the link is recovered or the link monitoring feature is disabled through configuration.

NOTE: During autorecovery, you might notice link flaps at the remote end of the link.
remote

Syntax
remote {
  (inet-address address | mac-address address);
}

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number family tcc],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family tcc]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the location of the remote router. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only.

Options
mac-address—Configure the MAC address of the remote site.
inet-address—Configure the IP address of the remote site.

**remote-loopback**

**Syntax**

remote-loopback;

**Hierarchy Level**

```
[edit protocols oam link-fault-management interface interface-name]
```

**Release Information**

Statement introduced in Junos OS Release 8.2.

**Description**

For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, set the remote DTE into loopback mode. Remove the statement from the configuration to take the remote DTE out of loopback mode. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Setting a Remote Interface into Loopback Mode on page 837
replay-window-size (MX Series)

Syntax

```
replay-window-size number-of-packets;
```

Hierarchy Level

```
[edit security macsec connectivity-association]
```

Release Information

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description

Specifies the size of the replay protection window.

This statement has to be configured to enable replay protection.

When MACsec is enabled on an Ethernet link, an ID number is assigned to each packet entering the link. The ID number of the packet is checked by the receiving interface after the packet has traversed the MACsec-enabled link.

When replay protection is enabled, the sequence of the ID number of received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving interface. For instance, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

Default

Replay protection is disabled.

Options

`number-of-packets`—Specifies the size of the replay protection window, in packets.

When this variable is set to 0, all packets that arrive out-of-order are dropped.

Required Privilege

**routing-instance**

**Syntax**
```
routing-instance {
    destination routing-instance-name;
}
```

**Hierarchy Level**
```
[edit interfaces interface-name unit logical-unit-number tunnel],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number tunnel]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
To configure interfaces and logical-systems, specify the destination routing instance that points to the routing table containing the tunnel destination address.

**Default**
The default Internet routing table is inet.0.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Junos OS Services Interfaces Library for Routing Devices
**routing-instance (PPPoE Service Name Tables)**

**Syntax**
```
routing-instance routing-instance-name;
```

**Hierarchy Level**
```
[edit protocols pppoe service-name-tables table-name service service-name],
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier
   aci circuit-id-string ari remote-id-string ]
```

**Release Information**
Statement introduced in Junos OS Release 10.2.

**Description**
Use in conjunction with the `dynamic-profile` statement at the same hierarchy levels to specify the routing instance in which to instantiate a dynamic PPPoE interface. You can associate a routing instance with a named service entry, `empty` service entry, or any service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.

The routing instance associated with a service entry in a PPPoE service name table overrides the routing instance associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.

If you include the `routing-instance` statement at the `[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string ]` hierarchy level, you cannot also include the `static-interface` statement at this level. The `routing-instance` and `static-interface` statements are mutually exclusive for ACI/ARI pair configurations.

**Options**
`routing-instance-name`—Name of the routing instance in which the router instantiates the dynamic PPPoE interface.

**Required Privilege Level**
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring PPPoE Service Name Tables
- Assigning a Dynamic Profile and Routing Instance to a Service Name or ACI/ARI Pair for Dynamic PPPoE Interface Creation
rx-enable

Syntax

```plaintext
expected-defect [ rx-enable ; ]
```

Hierarchy Level

```plaintext
[edit protocols oam ethernet connectivity-fault-management expected-defect]
```

Release Information

Statement introduced in Junos OS Release 19.1.

Description

Enable the ethernet expected defect (ETH-ED) function to process the received EDM PDUs.

The remaining statements are explained separately. See CLI Explorer.

Default

The MEP does not process EDM PDUs.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

- connectivity-fault-management on page 1258
- show oam ethernet connectivity-fault-management mep-database on page 2262
**rx-max-duration**

**Syntax**

```
expected-defect {
  rx-max-duration ;
}
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management expected-defect]
```

**Release Information**

Statement introduced in Junos OS Release 19.1.

**Description**

Duration to indicate the maximum acceptable value at which the loss of continuity alarms are suppressed. If the duration in the received EDM PDU exceeds this configured value then the duration value will be truncated to this configured value and loss of continuity (LoC) alarms shall be suppressed for this duration.

**Options**

**Minimum value**—The minimum value at which the loss of continuity alarms will be suppressed is 120 seconds.

**Minimum value**—The maximum acceptable value at which the loss of continuity alarms will be suppressed is 3600 seconds.

**Default**—900 seconds.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

sa-multicast (100-Gigabit Ethernet)

Syntax

```
sa-multicast;
```

Hierarchy Level

```
[edit chassis fpc slot pic slot forwarding-mode]
```

Release Information

Statement introduced in Junos OS Release 10.4.

Description

Configure the 100-Gigabit Ethernet PIC or MIC to interoperate with other Juniper Networks 100-Gigabit Ethernet PICs.

NOTE: The default packet steering mode for PD-1CE-CFP-FPC4 is SA multicast bit mode. No SA multicast configuration is required to enable this mode.

sa-multicast supports interoperability between the following PICs and MICs:

- 100-Gigabit Ethernet Type 5 PIC with CFP (PF-1CGE-CFP) and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-ICE-CFP-FPC4).
- 100-Gigabit Ethernet MICs and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-ICE-CFP-FPC4).

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

sa-multicast (PTX Series Packet Transport Routers)

Syntax

\[ \text{sa-multicast;} \]

Hierarchy Level

\[ \text{[edit chassis fpc slot pic slot port port-number forwarding-mode]} \]

Release Information

Statement introduced in Junos OS Release 12.1X48R4.

Description

Configure source address (SA) multicast bit mode on the 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP to enable interoperability with 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4.

NOTE: When SA multicast bit steering mode is configured on a PTX Series Packet Transport Router 100-Gigabit Ethernet port, VLANs are not supported for that port.

Required Privilege Level

interface—to view this statement in the configuration.

interface-control—to add this statement to the configuration.

secure-channel

Syntax

secure-channel secure-channel-name {
  direction (inbound | outbound);
  encryption (MACsec);
  id {
    mac-address mac-address;
    port-id port-id-number;
  }
  offset (0|30|50);
  security-association security-association-number {
    key key-string;
  }
}

Hierarchy Level
[edit security macsec connectivity-association connectivity-association-name]

Release Information
Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description
Create and configure a secure channel to enable and configure MACsec when MACsec
is enabled using static secure association key (SAK) security mode.

You do not need to use this option to enable MACsec using static connectivity association
key (CAK) security mode. All configuration for MACsec using static CAK security mode
is done inside of the connectivity association but outside of the secure channel. When
MACsec is enabled using static CAK security mode, an inbound and an outbound secure
channel—neither of which is user-configurable—is automatically created within the
connectivity association.

Options
The remaining statements are explained separately.

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

**security-association**

**Syntax**

```plaintext
security-association security-association-number {
    key key-string;
}
```

**Hierarchy Level**

```
[edit security macsec connectivity-association
connectivity-association-name secure-channel
secure-channel-name]
```

**Release Information**

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description**

Specifies the number of one of the security associations in the secure channel when MACsec is enabled using static secure association key (SAK) security mode. Because SAKs are created by the key server when MACsec is enabled using static connectivity association key (CAK) security mode, the `security-association` statement is not used when enabling MACsec using static CAK security mode.

You must configure at least two security associations to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.

**Default**

No security keys are configured, by default.

**Options**

`security-association-number`—Specifies the security association number and creates the SAK.

The security association number is a whole number between 0 and 3. You can configure two security associations in a secure channel when enabling MACsec using static security keys.

**Required Privilege Level**

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

server-fail

**Syntax**

```
server-fail (deny | permit | use-cache | vlan-id | vlan-name);
```

**Hierarchy Level**

```
[edit protocols authentication-access-control interface (all | [interface-names]) dot1x]
```

**Release Information**

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

**Description**

For EX Series switches configured for 802.1X authentication, specify the server fail fallback action the switch takes when all RADIUS authentication servers are unreachable.

When you specify the action `vlan-name` or `vlan-id`, the VLAN must already be configured on the switch.

**Default**

Authentication is denied.

**Options**

- **deny**—Force fail the supplicant authentication. No traffic will flow through the interface.
- **permit**—Force succeed the supplicant authentication. Traffic will flow through the interface as if it were successfully authenticated by the RADIUS server.
- **use-cache**—Force succeed the supplicant authentication only if it was previously authenticated successfully. This action ensures that already authenticated supplicants are not affected.
- **vlan-id**—Move supplicant on the interface to the VLAN specified by this numeric identifier. This action is allowed only if it is the first supplicant connecting to the interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.
- **vlan-name**—Move supplicant on the interface to the VLAN specified by this name. This action is allowed only if it is the first supplicant connecting to an interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.

**Required Privilege**

- **Level**
  - routing—to view this statement in the configuration.
  - routing-control—to add this statement to the configuration.
**server-reject-vlan (MX Series in Enhanced LAN Mode)**

**Syntax**

```
server-reject-vlan (vlan-id | vlan-name) {
    eapol-block;
    block-interval block-interval;
}
```

**Hierarchy Level**

```
[edit protocols authentication-access-control interface (all | [interface-names]) dot1x]
```

**Release Information**

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

**Description**

For EX Series switches configured for 802.1X authentication, specify that when the switch receives an Extensible Authentication Protocol Over LAN (EAPoL) Access-Reject message during the authentication process between the switch and the RADIUS authentication server, supplicants attempting access to the LAN are granted access and moved to a specific VLAN. Any VLAN name or VLAN ID sent by a RADIUS server as part of the EAPoL Access-Reject message is ignored.

When you specify the VLAN ID or VLAN name, the VLAN must already be configured on the switch.

The remaining statements are explained separately. See [CLI Explorer](https://www.juniper.net/documentation/).  

**Default**

None

**Options**

- **vlan-id**—Numeric identifier of the VLAN to which the supplicant is moved.
- **vlan-name**—Name of the VLAN to which the supplicant is moved.

**Required Privilege Level**

- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.
server-timeout

Syntax

server-timeout seconds;

Hierarchy Level

[edit protocols dot1x authenticator interface interface-id]

Release Information

Statement introduced in Junos OS Release 9.3.

Description

Sets the number of seconds the port waits for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.

Options

seconds—The number of seconds the port waits for a response when relaying a request from the authentication server to the client before resending the request.

Range: 1 through 60 seconds

Default: 30 seconds

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

service (PPPoE)

Syntax

```
service service-name {
  drop;
  delay seconds;
  terminate;
  dynamic-profile profile-name;
  routing-instance routing-instance-name;
  max-sessions number;
  agent-specifier {
    aci circuit-id-string ari remote-id-string {
      drop;
      delay seconds;
      terminate;
      dynamic-profile profile-name;
      routing-instance routing-instance-name;
      static-interface interface-name;
    }
  }
}
```

Hierarchy Level

```
[edit protocols pppoe service-name-tables table-name]
```

Release Information

Statement introduced in Junos OS Release 10.0.

any, dynamic-profile, routing-instance, max-sessions, and static-interface options introduced in Junos OS Release 10.2.

Description

Specify the action taken by the interface on receipt of a PPPoE Active Discovery Initiation (PADI) control packet for the specified named service, empty service, or any service in a PPPoE service name table. You can also specify the dynamic profile and routing instance that the router uses to instantiate a dynamic PPPoE interface, and the maximum number of active PPPoE sessions that the router can establish with the specified service.

Default

The default action is terminate.

Options

- **service-name**—Service entry in the PPPoE service name table:
  - **service-name**—Named service entry of up to 32 characters; for example, premiumService. You can configure a maximum of 512 named service entries across all PPPoE service name tables on the router.
  - **empty**—Service entry of zero length that represents an unspecified service. Each PPPoE service name table includes one empty service entry by default.
  - **any**—Default service for non-empty service entries that do not match the named or empty service entries configured in the PPPoE service name table. Each PPPoE service name table includes one any service entry by default.
The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

### Required Privilege Level
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

source-address-filter

Syntax  
source-address-filter {
  mac-address;
}

Hierarchy Level  
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.

Description  
For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, Gigabit Ethernet IQ interfaces,
and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the
built-in Gigabit Ethernet port on the M7i router), specify the MAC addresses from which
the interface can receive packets. For this statement to have any effect, you must include
the source-filtering statement in the configuration to enable source address filtering.

Options  
mac-address—MAC address filter. You can specify the MAC address as nnn:nnn:nnn:nnn:nnn
or nnn.nnn.nnn.nnn, where n is a decimal digit. To specify more than one address,
include multiple mac-address options in the source-address-filter statement.

If you enable the VRRP on a Fast Ethernet or Gigabit Ethernet interface, as described in
“VRRP and VRRP for IPv6 Overview” on page 363, and if you enable MAC source
address filtering on the interface, you must include the virtual MAC address in the
list of source MAC addresses that you specify in the source-address-filter statement.
MAC addresses ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are
reserved for VRRP, as defined in RFC 3768, Virtual Router Redundancy Protocol. When
you configure the VRRP group, the group number must be the decimal equivalent
of the last hexadecimal byte of the virtual MAC address.

On untagged Gigabit Ethernet interfaces, you should not configure the source-address-filter
statement and the accept-source-mac statement simultaneously. On tagged Gigabit
Ethernet interfaces, you should not configure the source-address-filter statement
and the accept-source-mac statement with an identical MAC address specified in
both filters.

Required Privilege

Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

source-filtering

Syntax  (source-filtering | no-source-filtering);

Hierarchy Level  [edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.

Description  For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and Gigabit Ethernet IQ interfaces only, enable the filtering of MAC source addresses, which blocks all incoming packets to that interface. To allow the interface to receive packets from specific MAC addresses, include the source-address-filter statement.

If the remote Ethernet card is changed, the interface is no longer able to receive packets from the new card because it has a different MAC address.

Default  Source address filtering is disabled.

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

### Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Speed option 2.5Gbps introduced in Junos OS Release 18.1R2 for EX2300 switch.
Speed option 10Gbps and 5Gbps introduced in Junos OS Release 18.2R1 for EX4300 switch.
Speed option 1-Gbps is introduced in Junos OS Release 19.1R1 on the 4-port 1-Gigabit Ethernet/10-Gigabit Ethernet uplink module on EX4300-48MP switches.

### Description
Configure the interface speed. This statement applies to the management Ethernet interface (fxp0 or em0), Fast Ethernet 12-port and 48-port PICs, the built-in Fast Ethernet interfaces.
port on the FIC (M7i router), Combo Line Rate DPCs and Tri-Rate Ethernet Copper interfaces on MX Series routers, and Gigabit Ethernet interfaces on EX Series switches.

When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled. When you configure 100BASE-FX SFP, you must set the port speed at 100 Mbps.

NOTE: On MX Series routers with Tri-rate Enhanced DPC (DPCE-R-40GE-TX), when you configure the interface speed using the auto-10m-100m option, the speed is negotiated to the highest value possible (100 Mbps), if the same value is configured on both sides of the link. However, when you view the interface speed of the DPC, using the show interfaces command, the value of the speed is not accurately displayed. For instance, if you configure the speed of the Tri-rate enhanced DPC, as 100Mbps on both sides of the link, the interface speed of the DPC is negotiated to 100 Mbps. However, the interface speed of the DPC displays 1 bps. This is an issue with the show interfaces command only. The actual interface speed is 100 Mbps.

On 10-Gigabit Ethernet SFP interfaces, autonegotiation is enabled by default and auto-detects the speed to be either 1 Gbps or 10 Gbps. On QFX5100-48S, QFX5100-96S, and QFX5100-24Q devices using 10-Gigabit Ethernet SFP interfaces, the speed is set to 10 Gbps by default and cannot be configured to operate in a different speed. On QFX5100-48S and QFX5100-96S devices using 1-Gigabit Ethernet SFP interfaces, the speed is set to 1 Gbps by default and cannot be configured to operate in a different speed.

NOTE: In Junos OS Release 14.1X53-D35 on QFX5100-48T-6Q devices using 10-Gigabit Ethernet Copper interfaces, autonegotiation is disabled by default on the copper ports, and the interfaces operate at a speed of 100M. You can, however, enable auto-negotiation by issuing the set interface name ether-options auto-negotiation command on the interface for which you want to change the interface speed. With autonegotiation enabled, the interface auto-detects the speed in which to operate.

NOTE: Only 10 Gbps and 40 Gbps interfaces are supported on OCX Series switches.

NOTE: When displaying interface information with show interfaces commands, you might see speed values for 1 Gbps interfaces displayed as 1000mbps.
(For EX2300 only) Starting in Junos OS Release 18.1R2, the multi-rate speed is supported on EX2300-48MP and EX2300-24MP switches. The speed configuration statement is supported on both multi-rate gigabit ethernet interface (mge) and gigabit ethernet (ge) interface. The mge interface is a rate-selectable (multirate) Gigabit Ethernet interface that can support speeds of 10-Gbps, 5-Gbps, and 2.5-Gbps over CAT5e/CAT6/CAT6a cables. In the EX2300, the mge interface supports 100-Mbps, 1-Gbps, and 2.5-Gbps speeds, which can be configured by using the speed configuration statement. Note that 10Mbpss speed is supported only on ge interfaces of EX2300 switch.

On EX2300-24MP and EX2300-48MP switches, if both Energy Efficient Ethernet (EEE) and 100-Mbps speed are configured on a rate-selectable (or multirate) Gigabit Ethernet (mge) port, the port operates only at 100-Mbps speed but EEE is not enabled on that port. EEE is supported only on mge interfaces that operate at 1-Gbps and 2.5-Gbps speeds.

(For EX4300-48MP only) Starting with Junos OS Release 19.1R1, the 4-port 1-Gigabit Ethernet/10-Gigabit Ethernet uplink module (EX-UM-4SFPP-MR) on EX4300-48MP switches supports 1-Gbps speed. You do not need to explicitly configure 1-Gbps speed on the uplink module as it automatically identifies the installed 1-gigabit SFP transceivers and creates the interface accordingly.

NOTE: On EX4300-48MP, the status LED of 1-Gigabit Ethernet uplink module port is solid green (instead of blinking green) because of a device limitation. However, there is no impact on device functionality.

Default (EX Series) If the auto-negotiation statement at the [edit interfaces interface-name ether-options] hierarchy level is enabled, the auto-negotiation option is enabled by default.
Options  You can specify the speed as either 10m (10 Mbps), 100m (100 Mbps), and on MX Series routers, 1g (1 Gbps). You can also specify the auto option on MX Series routers.

For Gigabit Ethernet interfaces on EX Series switches, you can specify one of the following options:

# speed (MX Series DPC)

**Syntax**

speed (auto | 1Gbps | 100Mbps | 10Mbps);

**Hierarchy Level**

[edit interfaces ge-fpc/pic/port]

**Release Information**

Statement introduced in Junos OS Release 9.5.

**Description**

On MX Series routers with Combo Line Rate DPCs and Tri-Rate Copper SFPs you can set auto negotiation of speed. To specify the auto negotiation speed, use the `speed (auto | 1Gbps | 100Mbps | 10Mbps)` statement under the [edit interface ge-/fpc/pic/port] hierarchy level. The `auto` option will attempt to automatically match the rate of the connected interface. To set port speed negotiation to a specific rate, set the port speed to 1Gbps, 100Mbps, or 10Gbps.

---

**NOTE:** If the negotiated speed and the interface speed do not match, the link will not be brought up. Half duplex mode is not supported.

---

**Options**

You can specify the speed as either `auto` (autonegotiate), `10Mbps` (10 Mbps), `100Mbps` (100 Mbps), or `1Gbps` (1 Gbps).

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

### stacked-vlan-tagging

<table>
<thead>
<tr>
<th>Syntax</th>
<th>stacked-vlan-tagging:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hierarchy Level</td>
<td>[edit interfaces interface-name]</td>
</tr>
</tbody>
</table>

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

**Description**
For Gigabit Ethernet IQ interfaces, Gigabit Ethernet, 10-Gigabit Ethernet LAN/WAN PIC, and 100-Gigabit Ethernet Type 5 PIC with CFP, enable stacked VLAN tagging for all logical interfaces on the physical interface.

For pseudowire subscriber interfaces, enable stacked VLAN tagging for logical interfaces on the pseudowire service.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

**static (Protocols 802.1X)**

**Syntax**

```plaintext
static mac-address {
  interface interface-names;
  vlan-assignment (vlan-id |vlan-name );
}
```

**Hierarchy Level**

```plaintext
[edit protocols authentication-access-control]
```

**Release Information**

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

**Description**

Configure MAC addresses to exclude from 802.1X authentication. The static MAC list provides an authentication bypass mechanism for supplicants connecting to a port, permitting devices such as printers that are not 802.1X-enabled to be connected to the network on 802.1X-enabled ports.

Using this 802.1X authentication-bypass mechanism, the supplicant connected to the MAC address is assumed to be successfully authenticated and the port is opened for it. No further authentication is done for the supplicant.

You can optionally configure the VLAN that the supplicant is moved to or the interfaces on which the MAC address can gain access from.

**Options**

- `mac-address` — The MAC address of the device for which 802.1X authentication should be bypassed and the device permitted access to the port.

  The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.
static-interface

Syntax
static-interface interface-name;

Hierarchy Level
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string]

Release Information
Statement introduced in Junos OS Release 10.2.

Description
Reserve the specified static PPPoE interface for use only by the PPPoE client with matching agent circuit identifier (ACI) and agent remote identifier (ARI) information. You can specify only one static interface per ACI/ARI pair configured for a named service entry, empty service entry, or any service entry in the PPPoE service name table.

The static interface associated with an ACI/ARI pair takes precedence over the general pool of static interfaces associated with the PPPoE underlying interface.

If you include the static-interface statement in the configuration, you cannot also include either the dynamic-profile statement or the routing-instance statement. The dynamic-profile, routing-instance, and static-interface statements are mutually exclusive for ACI/ARI pair configurations.

Options
interface-name—Name of the static PPPoE interface reserved for use by the PPPoE client with matching ACI/ARI information. Specify the interface in the format pp0.logical, where logical is a logical unit number from 0 through 16385 for static interfaces.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

supplicant (MX Series in Enhanced LAN Mode)

**Syntax**
supplicant (multiple | single | single-secure);

**Hierarchy Level**
[edit protocols authentication-access-control interface (all | [interface-names])]

**Release Information**
Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

**Description**
Configure the MAC-based method used to authenticate clients for 802.1X or captive portal authentication.

**Default**
single

**Options**
single—Authenticates only the first client that connects to an authenticator port. All other clients connecting to the authenticator port after the first are permitted free access to the port without further authentication. If the first authenticated client logs out, all other supplicants are locked out until a client authenticates again.

single-secure—Authenticates only one client to connect to an authenticator port. The host must be directly connected to the switch.

multiple—Authenticates multiple clients individually on one authenticator port. You can configure the number of clients per port. If you also configure a maximum number of devices that can be connected to a port through port security settings, the lower of the configured values is used to determine the maximum number of clients allowed per port.

**Required Privilege**
routing—To view this statement in the configuration.

Level routing-control—To add this statement to the configuration.
### supplicant-timeout

**swap**

**Syntax**

```
swap;
```

**Hierarchy Level**

- `[edit interfaces interface-name unit logical-unit-number input-vlan-map]`
- `[edit interfaces interface-name unit logical-unit-number output-vlan-map]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]`

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

**Description**

Specify the VLAN rewrite operation to replace a VLAN tag. The outer VLAN tag of the frame is overwritten with the user-specified VLAN tag information.

On MX Series routers, you can enter this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, aggregated Ethernet using Gigabit Ethernet IQ interfaces, and 100-Gigabit Ethernet Type 5 PIC with CFP. On EX Series switches, you can enter this statement on Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

swap-by-poppush

Syntax
swap-by-poppush;

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number]

Release Information
Statement introduced in Junos OS Release 11.2

Description
For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, and aggregated Ethernet using Gigabit Ethernet IQ interfaces, specify the VLAN rewrite operation to replace a VLAN tag. Pop original tag, then push an entirely new tag. The swap operation is performed as pop followed by push.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

swap-push

Syntax
swap-push;

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number input-vlan-map],
[edit interfaces interface-name unit logical-unit-number output-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]

Release Information
Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description
Specify the VLAN rewrite operation to replace the outer VLAN tag of the frame with a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame.

You can use this statement on Gigabit Ethernet IQ, IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, and for aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs on MX Series routers, and 100-Gigabit Ethernet Type 5 PIC with CFP.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

- *Rewriting the Inner and Outer VLAN Tags*
# switch-options

**Syntax**

```c
switch-options {
    switch-port *port-number* {
        (auto-negotiation | no-auto-negotiation);
        speed (10m | 100m | 1g);
        link-mode (full-duplex | half-duplex);
    }
}
```

**Hierarchy Level**  
[edit interfaces ge-pim/0/0]

**Release Information**  
Statement introduced in Junos OS Release 8.4.

**Description**  
Configuration of the physical port characteristics is done under the single physical interface.

**Required Privilege Level**  
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.
### switch-port

**Syntax**

```
switch-port port-number {
(auto-negotiation | no-auto-negotiation);
speed (10m | 100m | 1g);
link-mode (full-duplex | half-duplex);
}
```

**Hierarchy Level**

```
[edit interfaces ge-pim/0/0 switch-options]
```

**Release Information**

Statement introduced in Junos OS Release 8.4.

**Description**

Configuration of the physical port characteristics, done under the single physical interface.

**Default**

Autonegotiation is enabled by default. If the link speed and duplex are also configured, the interfaces use the values configured as the desired values in the negotiation.

**Options**

- **port-number**—Ports are numbered 0 through 5 on the 6-port Gigabit Ethernet uPIM, 0 through 7 on the 8-port Gigabit Ethernet uPIM, and 0 through 15 on the 16-port Gigabit Ethernet uPIM.

  The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.
## symbol-period

<table>
<thead>
<tr>
<th>Syntax</th>
<th>symbol-period count;</th>
</tr>
</thead>
</table>

### Hierarchy Level

- [edit protocols oam ethernet link-fault-management action-profile event, link-event-rate],
- [edit protocols oam link-fault-management interface interface-name event-thresholds]

### Release Information

Statement introduced in Junos OS Release 8.4.

### Description

Configure the threshold for sending symbol period events or taking the action specified in the action profile.

A symbol error is any symbol code error on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period window. The default period window is the number of symbols that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.

### Options

- **count**—Threshold count for symbol period events.
  - **Range:** 0 through 100

### Required Privilege Level

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

### Related Documentation

## system-id

**Syntax**

```
system-id system-id;
```

**Hierarchy Level**

```
[edit interfaces aeX aggregated-ether-options lacp]
```

**Release Information**

Statement introduced in Junos OS Release 12.2R1
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

**Description**

Define the LACP system identifier at the aggregated Ethernet interface level.

The user-defined system identifier in LACP enables two ports from two separate routers (M Series or MX Series routers) to act as though they were part of the same aggregate group.

The system identifier is a 48-bit (6-byte) globally unique field. It is used in combination with a 16-bit system-priority value, which results in a unique LACP system identifier.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring LACP for Aggregated Ethernet Interfaces on page 143
**system-priority**

**Syntax**

```
system-priority priority;
```

**Hierarchy Level**

```
[edit interfaces aeX aggregated-ether-options lacp]
```

**Release Information**

Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 11.4 for EX Series switches.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

**Description**

Define LACP system priority at the aggregated Ethernet interface level. This system priority value takes precedence over a system priority value configured at the global `[edit chassis]` hierarchy level.

The device with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 127), the device MAC address determines which switch is in control.

**Options**

- **priority**—Priority for the aggregated Ethernet system. A smaller value indicates a higher priority.
  - **Range:** 0 through 65535
  - **Default:** 127

**Required Privilege Level**

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.
tag-protocol-id (TPIDs Expected to Be Sent or Received)

Syntax

```
tag-protocol-id [tpids];
```

Hierarchy Level

```
[edit interfaces interface-name gigether-options ethernet-switch-profile],
[edit interfaces interface-name aggregated-ether-options ethernet-switch-profile],
[edit interfaces interface-name aggregated-ether-options ethernet-switch-profile],
[edit interfaces interface-name ether-options ethernet-switch-profile]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.
Statement introduced in Junos OS Release 14.1X53-D15 for the QFX Series.

Description

For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, aggregated Ethernet with Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, and the built-in Gigabit Ethernet port on the M7i router), define the TPIDs expected to be sent or received on a particular VLAN. For each Gigabit Ethernet port, you can configure up to eight TPIDs using the `tag-protocol-id` statement; but only the first four TPIDs are supported on IQ2 and IQ2-E interfaces.

For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers only the default TPID value (`0x8100`) is supported.

For Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, define the TPIDs expected to be sent or received on a particular VLAN. The default TPID value is `0x8100`. Other supported values are `0x88a8`, `0x9100`, and `0x9200`.

Options

`tpids`—TPIDs to be accepted on the VLAN. Specify TPIDs in hexadecimal.

Required Privilege Level

`interface`—To view this statement in the configuration.
`interface-control`—To add this statement to the configuration.

Related Documentation

tag-protocol-id (TPID to Rewrite)

**Syntax**
tag-protocol-id tpid;

**Hierarchy Level**
[edit interfaces interface-name unit logical-unit-number input-vlan-map],
[edit interfaces interface-name unit logical-unit-number output-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**
For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces only, configure the outer TPID value. All TPIDs you include in input and output VLAN maps must be among those you specify at the [edit interfaces interface-name gigether-options ethernet-switch-profile tag-protocol-id [tpids]] hierarchy level.

For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers the default TPID value (0x8100) is supported.

**Default**
If the `tag-protocol-id` statement is not configured, the TPID value is 0x8100.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring Inner and Outer TPIDs and VLAN IDs on page 698
targeted-options (Grouping Subscribers by Bandwidth Usage)

**Syntax**

```
targeted-options {
  backup backup;
  group group;
  primary primary;
  weight ($junos-interface-target-weight | weight-value);
}
```

**Hierarchy Level**

- `edit dynamic-profiles name interfaces name unit logical-unit-number`,
- `edit dynamic-profiles name logical-systems name interfaces name unit logical-unit-number`,
- `edit interfaces name unit logical-unit-number`

**Release Information**

- `weight` option added in Junos OS Release 17.3 for MX Series and MX Virtual Chassis.
- `$junos-interface-target-weight` option added in Junos OS Release 18.4R1.

**Description**

Configure primary and backup links, group similar subscribers, and specify a subscriber weight for manual targeting to distribute subscribers across aggregated Ethernet member links.

**Options**

- **backup**—(Optional) Specify a backup member link per subscriber when you configure manual targeting.

  **group**—(Optional) Assign a group name for subscribers with similar bandwidth usage. Subscribers that are configured for targeted distribution without a group name are added to the `default` group and distributed evenly across member links. Grouping of subscribers is supported only for static subscribers.

  **Default**: default

- **primary**—Specify a primary member link per subscriber when you configure manual targeting. You must always configure a primary link when you configure manual targeting.

- **weight ($junos-interface-target-weight | weight-value)**—Specify the weight for targeted subscribers like PPPoe, demux, and conventional VLANs based on factors such as customer preferences, class of service (CoS), or bandwidth requirement. Member links for logical interfaces of aggregated Ethernet logical interfaces are assigned based on the value of the weight. When a new VLAN is added to the same aggregated Ethernet bundle, then the primary member link selected for targeting is the one with the minimum primary load and the backup link selected for targeting is the one with the minimum overall load.

  The `$junos-interface-target-weight` predefined variable is supported for dynamic configuration only. When you configure this predefined variable, the weight value is sourced from VSA 26–213 in the RADIUS Access-Accept message when a dynamic subscriber is authenticated.
Range: 1 through 1000

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

targeted-options (Manual Targeting)

Syntax

```plaintext
targeted-options {
  (logical-interface-chassis-redundancy | logical-interface-fpc-redundancy);
  rebalance-periodic {
    interval interval;
    start-time start-time;
  }
  type (auto | manual);
}
```

Hierarchy Level

- [edit dynamic-profiles name interfaces name aggregated-ether-options],
- [edit dynamic-profiles name logical-systems name interfaces name aggregated-ether-options],
- [edit interfaces name aggregated-ether-options]
- [edit interfaces name unit ]

Release Information

Description

Configure manual targeting or auto-targeting.

Options

- **type**—Configure manual targeting type as manual or auto.
  - **Values:**
    - **auto**—Configure targeted-distribution without specific primary and backup links.
    - **manual**—Configure targeted distribution with specific member links as primary and backup for a subscriber. When you configure manual targeting, you must always configure a primary link. Configuring a backup link is optional. You specify the primary and backup links for a subscriber in the individual interface configuration. You configure primary and backup links by using the `targeted-options` statement at the [edit interfaces name unit] hierarchy level.

  Manual targeting enhances the distribution of targeted VLANs or subscribers across member links of an aggregated Ethernet bundle by making it bandwidth-aware.

  Default: **auto**

  The remaining statements are described separately.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

thresholds

Syntax

```plaintext
thresholds {
  clear clear-value;
  interval interval-value;
  set set-value;
  warning-clear warning-clear-value;
  warning-set warning-set-value;
}
```

Hierarchy Level

```
[edit interfaces interfaces-name link-degrade-monitor]
```

Release Information

Statement introduced in Junos OS Release 15.1.

Description

Configure the BER threshold values (such as set and clear thresholds) at which different corrective actions must be triggered on a degraded interface.

Options

**clear clear-value**—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted. You can configure this value in the $1E^{-n}$ format, where $1$ is the mantissa (remains constant) and $n$ is the exponent. For example, a threshold value of $1E^{-3}$ refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 12.

**interval interval-value**—The number of consecutive link degrade events that are considered before any corrective action is taken. The supported value range for the interval is 1 through 256, and the default interval is 10.

**set set-value**—The BER threshold value at which the link is considered degraded and a corrective action, specified by the user, is triggered. You can configure this value in the $1E^{-n}$ format, where $1$ is the mantissa (remains constant) and $n$ is the exponent. For example, a threshold value of $1E^{-3}$ refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 7.

**warning clear warning-clear-value**—The link clear warning threshold. Every time this threshold value is reached, a system message is logged to indicate that the link degrade condition has been cleared on the interface. You can configure this value in the $1E^{-n}$ format, where $1$ is the mantissa (remains constant) and $n$ is the exponent. For example, a threshold value of $1E^{-3}$ refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 11.

**warning set warning-set-value**—The link degrade warning threshold. Every time this threshold value is reached, a system message is logged to indicate that a link degrade has occurred on the interface. You can configure this value in the $1E^{-n}$ format, where $1$ is the mantissa (remains constant) and $n$ is the exponent. For example, a threshold value of $1E^{-3}$ refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 9.
NOTE: The lower the BER with high confidence level, the longer it takes to estimate it. In such cases, a few packet drops might be noticed (based on the bit error distribution) before a link degrade event is detected.

**Required Privilege**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <size maximum-file-size> <world-readable | no-world-readable>;
  flag flag <disable>;
}
```

Hierarchy Level

- [edit protocols lldp]
- [edit routing-instances routing-instance-name protocols lldp]

Release Information

Description

Set LLDP protocol-level tracing options.

Default

The default LLDP protocol-level trace options are inherited from the global traceoptions statement.

Options

- **disable**—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as all.

- **file filename**—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place spanning-tree protocol tracing output in the file `/var/log/stp-log`.

- **files number**—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

  If you specify a maximum number of files, you must also specify a maximum file size with the `size` option.

  **Range:** 2 through 1000 files

  **Default:** 1 trace file only

- **flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. The following are the LLDP-specific tracing options:

  - **all**—Trace all operations.
  - **config**—Log configuration events.
  - **interface**—Trace interface update events.
  - **protocol**—Trace protocol information.
• **rtsock**—Trace socket events.

• **vlan**—Trace vlan update events.

The following are the global tracing options:

• **all**—All tracing operations.

• **config-internal**—Trace configuration internals.

• **general**—Trace general events.

• **normal**—All normal events. This is the default. If you do not specify this option, only unusual or abnormal operations are traced.

• **parse**—Trace configuration parsing.

• **policy**—Trace policy operations and actions.

• **regex-parse**—Trace regular-expression parsing.

• **route**—Trace routing table changes.

• **state**—Trace state transitions.

• **task**—Trace protocol task processing.

• **timer**—Trace protocol task timer processing.

• **no-world-readable**—(Optional) Prevent any user from reading the log file. This is the default. If you do not include this option, tracing output is appended to an existing trace file.

• **size maximum-file-size**—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the files option.

**Syntax:** `x k` to specify KB, `x m` to specify MB, or `x g` to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

• **world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege**

|---|---|
| Description | Define tracing operations for individual interfaces.  
To specify more than one tracing operation, include multiple `flag` statements.  
The interfaces `traceoptions` statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system `syslog` file in the directory `/var/log/dcd`.  
On EX Series, QFX Series, and NFX Series platforms, configure tracing options the link fault management.  
On ACX Series, SRX Series, MX Series, M Series, and T Series platforms define tracing operations for the interface process (dcd). |
| Default | If you do not include this statement, no interface-specific tracing operations are performed. |
Options  Table 138 on page 1569 lists options for traceoption command for the following platforms:

**traceoptions (LACP)**

**Syntax**
```
traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
}
```

**Hierarchy Level**
```
[edit protocols lacp]
```

**Release Information**
Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

**Description**
Define tracing operations for the LACP protocol.

**Default**
If you do not include this statement, no LACP protocol tracing operations are performed.

**Options**
- **filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, interface process tracing output is placed in the file `lacpd`.

- **files number**—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

**Range:** 2 through 1000

**Default:** 3 files

- **flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:
  - `all`—All LACP tracing operations
  - `configuration`—Configuration code
  - `packet`—Packets sent and received
  - `process`—LACP process events
  - `protocol`—LACP protocol state machine
  - `routing-socket`—Routing socket events
  - `startup`—Process startup events

- **no-world-readable**—(Optional) Prevent any user from reading the log file.
size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the files option:

Syntax: \(xk\) to specify kilobytes, \(xm\) to specify megabytes, or \(xg\) to specify gigabytes

Range: 10 KB through the maximum file size supported on your router

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

traceoptions (MACsec)

**Syntax**
```plaintext
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>
  flag flag;
}
```

**Hierarchy Level**
[edit security macsec]

**Release Information**
Statement introduced in Junos OS Release 15.1 for MIC-3D-20GE-SFP-E on MX Series routers.
Statement introduced in Junos OS Release 16.1 for MPC7E-10G on MX Series routers.
Statement introduced in Junos OS Release 17.3R2 for JNP-MIC1-MACSEC MIC on MX10003 routers.

**Description**
Define tracing operations at the MACsec level. Tracing operations provide support for debugging protocol-level issues. MACsec is an industry-standard security technology that provides secure communication for almost all types of traffic on Ethernet links. To specify more than one tracing operation, include multiple flag statements.

The interfaces traceoptions statement does not support a separate trace file. The logging is done by the kernel, so the tracing information is placed in the syslog file in the directory /var/log/dcd.

**Default**
If you do not include this statement, no tracing operations are performed.

**Options**
- **file filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. By default, interface process tracing output is placed in the directory. If you do not specify the name of the trace file, all files are placed in the directory /var/log/dcd.

- **files number**—(Optional) Maximum number of trace files. When a trace file named trace-file reaches the maximum value, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. Values range from 2 through 1000.

- **flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. The following are the tracing operation options:
  - **all**—Trace all operations.
  - **config**—Trace configuration messages.
  - **debug**—Trace debug messages.
  - **normal**—Trace normal messages.
no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

world-readable—(Optional) Allow any user to read the log file.

---

**Required Privilege**

- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

traceoptions (MACsec interfaces)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
}
```

Hierarchy Level

[edit security macsec interfaces interface-name]

Release Information

Statement introduced in Junos OS Release 16.1 for MPC7E-10G on MX Series routers.
Statement introduced in Junos OS Release 17.3R2 for JNP-MIC1-MACSEC MIC on MX10003 routers.

Description

Define tracing operations for individual MACsec interfaces. Tracing operations provide support for debugging protocol-level issues. MACsec is an industry-standard security technology that provides secure communication for almost all types of traffic on Ethernet links. To specify more than one tracing operation, include multiple flag statements.

The interfaces traceoptions statement does not support a separate trace file. The logging is done by the kernel, so the tracing information is placed in the system syslog file in the directory /var/log/dcd.

Default

If you do not include this statement, no tracing operations are performed.

Options

file filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. By default, interface process tracing output is placed in the directory. If you do not specify the name of the tracefile, all files are placed in the directory /var/log/dcd.

files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches the maximum value, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. Values range from 2 through 1000.

flag flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. The following are the tracing operation options:

  all—Trace all operations.
  keys—Trace key creation or generation information.
  mka-packets—Trace MACsec Key Agreement (MKA) protocol input and output packet information.
  normal—Trace all normal events and messages.
  state—Trace MKA protocol state information.
to-secy—Trace MKA to security entity state change information.

no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

world-readable—(Optional) Allow any user to read the log file.

**Required Privilege Level**
- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

traceoptions (PPPoE)

Syntax

```
traceoptions {
    file "filename" <files number> <match regular-expression > <size maximum-file-size>
    <world-readable | no-world-readable>;
    filter {
        aci regular-expression;
        ari regular-expression;
        service-name regular-expression;
        underlying-interface interface-name;
    }
    flag flag;
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

[edit protocols pppoe]

Release Information

Option filter introduced in Junos OS Release 12.3

Description

Define tracing operations for PPPoE processes.

Options

- **file filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

- **files number**—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

  Range: 2 through 1000

  Default: 3 files

- **disable**—Disable this trace flag.

- **filter**—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.

  - **aci regular-expression**—Regular expression to match the agent circuit identifier provided by PPPoE client.

  - **ari regular-expression**—Regular expression to match the agent remote identifier provided by PPPoE client.

BEST PRACTICE: Due to the complexity of agent circuit identifiers and agent remote identifiers, we recommend that you do not try an exact match when filtering on these options. For service names, searching on the exact name is appropriate, but you can also use a regular expression with that option.
• **ari regular-expression**—Regular expression to match the agent remote identifier provided by PPPoE client.

• **service regular-expression**—Regular expression to match the name of PPPoE service.

• **underlying-interface interface-name**—Name of a PPPoE underlying interface. You cannot use a regular expression for this filter option.

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

• **all**—Trace all operations.

• **config**—Trace configuration events.

• **events**—Trace events.

• **gres**—Trace GRES events.

• **init**—Trace initialization events.

• **interface-db**—Trace interface database operations.

• **memory**—Trace memory processing events.

• **protocol**—Trace protocol events.

• **rtsock**—Trace routing socket events.

• **session-db**—Trace connection events and flow.

• **signal**—Trace signal operations.

• **state**—Trace state handling events.

• **timer**—Trace timer processing.

• **ui**—Trace user interface processing.

**level**—Level of tracing to perform. You can specify any of the following levels:

• **all**—Match all levels.

• **error**—Match error conditions.

• **info**—Match informational messages.

• **notice**—Match notice messages about conditions requiring special handling.

• **verbose**—Match verbose messages.

• **warning**—Match warning messages.

Default: **error**

**match regular-expression**—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.
size maximum-file-size—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the files option.

Syntax: 
- size k to specify KB,
- size m to specify MB, or
- size g to specify GB

Range: 10240 through 1073741824

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege

Level
trace—To view this statement in the configuration.
trace-control—To add this statement to the configuration.

## traceoptions (802.1X and Captive Portal for MX Series in Enhanced LAN Mode)

**Syntax**

```plaintext
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match regex>;
  flag flag;
}
```

**Hierarchy Level**

[edit protocols authentication-access-control]

**Release Information**

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

**Description**

Define tracing operations for the 802.1X protocol, LLDP, and captive portal authentication.

**Default**

Tracing operations are disabled.

**Options**

- **file filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

- **files number**—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size by using the `size` option.

  - **Range:** 2 through 1000
  - **Default:** 3 files

- **flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

  - **all**—All tracing operations.
  - **config-internal**—Trace internal configuration operations.
  - **dot1x-event**—Trace 802.1x events.
  - **dot1x-debug**—Trace 802.1x events.
  - **dot1x-ipc**—Trace IPC interactions.
  - **eapol**—Trace EAPOL packets transmitted and received.
  - **general**—Trace general operations.
  - **normal**—Trace normal operations.
  - **parse**—Trace reading of the configuration.
  - **regex-parse**—Trace regular-expression parsing operations.
• **state**—Trace protocol state changes.
• **task**—Trace protocol task operations.
• **timer**—Trace protocol timer operations.
• **vlan**—Trace VLAN transactions.

**match regex**—(Optional) Refine the output to include lines that contain the regular expression.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files with the files option, you also must specify a maximum file size.

**Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege**

**Level** routing—To view this statement in the configuration.

**Level** routing-control—To add this statement to the configuration.
transmit-delay

Syntax
transmit-delay seconds;

Hierarchy Level
[edit protocols lldp],
[edit routing-instances routing-instance-name protocols lldp]

Release Information

Description
(MX Series and T Series routers only) Configure a delay between two successive LLDP advertisements.

Options
seconds—Delay between two successive LLDP advertisements.
Default: 2
Range: 1 through 8192

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
• Configuring LLDP on page 356
transmit-interval (MACsec for MX Series)

Syntax  
transmit-interval interval;

Hierarchy Level  
[edit security macsec connectivity-association]
connectivity-association-name mka

Release Information  
Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description  
Specifies the transmit interval for MACsec Key Agreement (MKA) protocol data units (PDUs).

The MKA transmit interval setting sets the frequency for how often the MKA PDU is sent to the directly connected device to maintain MACsec on a point-to-point Ethernet link. A lower interval increases bandwidth overhead on the link; a higher interval optimizes the MKA protocol data unit exchange process.

The transmit interval settings must be identical on both ends of the link when MACsec using static connectivity association key (CAK) security mode is enabled.

We recommend increasing the interval to 6000 milliseconds in high-traffic and large scale configuration load environments.

Default  
The default transmit interval is 2000 milliseconds.

Options  
interval—Specifies the transmit interval, in milliseconds.

Required Privilege  
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation  
• Configuring Media Access Control Security (MACsec) on MX Series Routers
transmit-period

Syntax

```plaintext
transmit-period seconds;
```

Hierarchy Level

```plaintext
[edit protocols dot1x authenticator interface interface-id]
```

Release Information

Statement introduced in Junos OS Release 9.3.

Description

Set the number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.

Options

- `seconds`—The number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.
  - Range: 1 through 65,535 seconds
  - Default: 30 seconds

Required Privilege Level

- interface—To view this statement in the configuration.

```

## Release Information

## Description

Configure the interface on which PPP over Ethernet is running.

For demux interfaces, configure the underlying interface on which the demultiplexing (demux) interface is running.

## Options

- **interface-name**—Name of the interface on which PPP over Ethernet or demux is running.

  For example, `at-0/0/1.0` (ATM VC), `fe-1/0/1.0` (Fast Ethernet interface), `ge-2/0/0.0` (Gigabit Ethernet interface), `ae1.0` (for IP demux on an aggregated Ethernet interface), or `ae1` (for VLAN demux on an aggregated Ethernet interface).

---

**NOTE:** Demux interfaces are currently supported on Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet interfaces, or aggregated Ethernet devices.

## Required Privilege Level

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

[edit interfaces interface-set interface-set-name interface interface-name]

Release Information
Statement introduced before Junos OS Release 7.4.
Range increased for static pseudowire interfaces to 1,073,741,823 in Junos OS Release 18.3R1.

Description
Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

Options
logical-unit-number—Number of the logical unit.
Range: 0 through 1,073,741,823 for demux, PPPoE, and pseudowire static interfaces. 0 through 16,385 for all other static interface types.

etree-ac-role (leaf | root)—To configure an interface as either leaf or root.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

unnumbered-address (Dynamic Profiles)

Syntax
unnumbered-address interface-name <preferred-source-address address>;

Hierarchy Level
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number family family],
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family family]

Release Information
Statement introduced in Junos OS Release 9.2.
Support for the $junos-preferred-source-address and $junos-preferred-source-ipv6-address predefined variables introduced in Junos OS Release 9.6.

Description
For Ethernet interfaces, enable the local address to be derived from the specified interface. Configuring unnumbered Ethernet interfaces enables IP processing on the interface without assigning an explicit IP address to the interface. To configure unnumbered address dynamically, include the $junos-loopback-interface-address predefined variable.

You can configure unnumbered address support on Ethernet interfaces for IPv4 and IPv6 address families.

Options

interface-name—Name of the interface from which the local address is derived. The specified interface must have a logical unit number, a configured IP address, and must not be an unnumbered interface. This value can be a specific interface name or the $junos-loopback-interface predefined variable.

When defining the unnumbered-address statement using a static interface, keep the following in mind:

- If you choose to include the routing-instance statement at the [edit dynamic-profiles] hierarchy level, that statement must be configured with a dynamic value by using the $junos-routing-instance predefined variable. In addition, whatever static unnumbered interface you specify must belong to that routing instance; otherwise, the profile instantiation fails.

- If you choose to not include the routing-instance statement at the [edit dynamic-profiles] hierarchy level, the unnumbered-address statement uses the default routing instance. The use of the default routing instance requires that the unnumbered interface be configured statically and that it reside in the default routing instance.

NOTE: When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the $junos-routing-instance predefined variable, you must not configure a preferred source address, whether with the $junos-preferred-source-address predefined variable, the $junos-preferred-source-ipv6-address predefined variable, or the
preferred-source-address statement. Configuring the preferred source address in this circumstance causes a commit failure.

When defining the unnumbered-address statement using the $junos-loopback-interface predefined variable, keep the following in mind:

- To use the $junos-loopback-interface predefined variable, the dynamic profile must also contain the routing-instance statement configured with the $junos-routing-instance predefined variable at the [edit dynamic-profiles] hierarchy level.
- The applied loopback interface is based on the dynamically obtained routing instance of the subscriber.

address—(Optional) Secondary IP address of the donor interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. This value can be a static IP address, the $junos-preferred-source-address predefined variable for the inet family, or the $junos-preferred-source-ipv6-address predefined variable for the inet6 family.

When defining the preferred-source-address value using a static IP address, keep the following in mind:

- The unnumbered interface must be statically configured.
- The IP address specified as the preferred-source-address must be configured in the specified unnumbered interface.

When defining the preferred-source-address value using the $junos-preferred-source-address or the $junos-preferred-source-ipv6-address predefined variables, keep the following in mind:

- You must configure the unnumbered-address statement using the $junos-loopback-interface predefined variable.
- You must configure the routing-instance statement using the $junos-routing-instance predefined variable at the [edit dynamic-profiles] hierarchy level.
- The preferred source address chosen is based on the dynamically applied loopback address which is in turn derived from the dynamically obtained routing instance of the subscriber. The configured loopback address with the closest network match to the user IP address is selected as the preferred source address.

Required Privilege

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**version-3**

**Syntax**
```
version-3;
```

**Hierarchy Level**
```
[edit protocols vrrp]
```

**Release Information**
Statement introduced in Junos OS Release 12.2.

**Description**
Enable Virtual Router Redundancy Protocol version 3 (VRRPv3).

---

**NOTE:**
- Even though the `version-3` statement can be configured only at the `[edit protocols vrrp]` hierarchy level, VRRPv3 is enabled on all the configured logical systems as well.
- When enabling VRRPv3, you must ensure that VRRPv3 is enabled on all the VRRP routers in the network. This is because VRRPv3 does not interoperate with the previous versions of VRRP.

**Required Privilege**
- **Level**
  - routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

**Related Documentation**
- Junos OS Support for VRRPv3
virtual-control-channel

**Syntax**

virtual-control-channel channel-name {
  west-interface name;
  east-interface name;
}

**Hierarchy Level**

[edit protocols protection-group ethernet-ring name (east-interface | west-interface)]

**Release Information**

Statement introduced in Junos OS Release 14.2.

**Description**

Specify virtual control channels which are logical interfaces on the east and west interfaces of the major ring.

**Options**

- **west-interface name**—Logical interface on the major ring’s west port.
- **east-interface name**—Logical interface on the major ring’s east port.

**Required Privilege Level**

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

## vlan-assignment

**Syntax**

```
vlan-assignment (vlan-id | vlan-name);
```

**Hierarchy Level**

```
[edit protocols authentication-access-control]
```

**Release Information**

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

**Description**

Configure the VLAN that is associated with the list of MAC addresses that are excluded from RADIUS authentication.

**Options**

`vlan-id | vlan-name`—The name of the VLAN or the VLAN tag identifier to associate with the device. The VLAN already exists on the switch.

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.
### vlan-id (VLAN ID to Be Bound to a Logical Interface)

<table>
<thead>
<tr>
<th><strong>Syntax</strong></th>
<th><code>vlan-id number;</code></th>
</tr>
</thead>
</table>
| **Hierarchy Level** | [edit interfaces interface-name unit logical-unit-number],

```

**VLAN Tagging and Layer 3 Subinterfaces**

```
[edit interfaces interface-name unit logical-unit-number]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 9.2 for EX Series switches VLAN tagging and Layer 3 subinterfaces.
Support for logical systems added in Junos OS Release 9.6.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
For VLANs, specify a VLAN identifier (VID) to include in the packets sent to and from the VLAN, or a VPLS routing instance.

**NOTE:** When configuring a VLAN identifier for provider backbone bridge (PBB) routing instances, dual-tagged VIDs and the none option are not permitted.

For 802.1Q tagging, configure an 802.1Q tag to apply to all traffic that originates on the VLAN.

The number zero is reserved for priority tagging and the number 4095 is also reserved.

For VLAN ID to Rewrite Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2, 10-Gigabit Ethernet LAN/WAN PIC, and IQ2-E interfaces and aggregated Ethernet using Gigabit Ethernet IQ interfaces, specify the line VLAN identifiers to be rewritten at the input or output interface.

You cannot include the `vlan-id` statement with the `swap` statement, `swap-push` statement, `push-push` statement, or `push-swap` statement at the `[edit interfaces interface-name unit logical-unit-number output-vlan-map]` hierarchy level. If you include any of those statements in the output VLAN map, the VLAN ID in the outgoing frame is rewritten to the `vlan-id` statement that you include at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level.
**Default**  For 802.1Q Tagging on EX Series and SRX Series, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1.

On a EX2300 switch, the maximum number of vlans supported is 2024. The vlans can be in the range of 1-4093.

On a EX3400 switch, the maximum number of vlans that can be created is 4093 including the default vlan with id 1. In a single **vlan-id-list** **default** **vlan1** is always inherited, so the valid configurable vlan range is 2-4093. You can use **vlan-id** up to and including 4094, but 4093 is the maximum number of vlans that can be configured.

For VLANs on a QFX3500 and QFX3500 switch, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1. The number zero is reserved for priority tagging and the number 4093 is also reserved.

On a QFX5100 switch, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1. The number zero is reserved for priority tagging and the number 4093 is also reserved.

---

**NOTE:** You can only create up 4090 VLANs on a QFX5100 switch. If you create more than 4090 VLANs, the interfaces associated with the extra VLANs are not displayed in the show vlans command output. For example, if you create 4094 VLANs, the extra VLANs will not have interfaces associated with the VLANs. The order in which you configure the extra VLANs determines which interfaces are missing from the show vlans command output.

---

For VLAN tagging and Layer 3 subinterfaces, bind an 802.1Q VLAN tag ID to a logical interface.

---

**NOTE:** The VLAN tag ID cannot be configured on logical interface unit 0. The logical unit number must be 1 or higher.
Options

For VLANs:

- **number**—A valid VLAN identifier. If you configure multiple VLANs with a valid VLAN identifier, you must specify a unique VLAN identifier for each. However, you can use the same VLAN identifier for VLANs that belong to different virtual switches. Use this option to send single tagged frames with the specified VLAN identifier over VPLS VT interfaces.

  **NOTE:** If you specify a VLAN identifier, you cannot also use the all option. They are mutually exclusive.

- **all**—Specify that the VLAN spans all the VLAN identifiers configured on the member logical interfaces.

  **NOTE:** You cannot specify the all option if you include a routing interface in the VLAN.

- **none**—Specify to enable shared VLAN learning or to send untagged frames over VPLS VT interfaces.

  **NOTE:** Multichassis link aggregation (MC-LAG) does not support the none option with the vlan-id statement with VLANs.

For 802.1Q Tagging:

- **number**—VLAN tag identifier
  
  **Range:**
  
  - 1 through 4094 (all switches except EX8200 Virtual Chassis)
  - 1 through 4092 (EX8200 Virtual Chassis only)
  
  **Default:** 1

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**vlan-id-list (Ethernet VLAN Circuit)**

**Syntax**

```
vlan-id-list [vlan-id vlan-id–vlan-id];
```

**Hierarchy Level**

- [edit interfaces interface-name unit logical-unit-number]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**
Statement introduced in Junos OS Release 9.5.

**Description**
Binds a single-tag logical interface to a list of VLAN IDs. Configures a logical interface to receive and forward any tag frame whose VLAN ID tag matches the list of VLAN IDs you specify.

**NOTE:**
When you create a circuit cross-connect (CCC) using VLAN-bundled single-tag logical interfaces on Layer 2 VPN routing instances, the circuit automatically uses ethernet encapsulation. For Layer 2 VPN, you need to include the encapsulation-type statement and specify the value ethernet at either of the following hierarchy levels:

- [edit routinginstances routing-instance-name protocols l2vpn]
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn]

For more information about the encapsulation-type configuration statement and the Layer 2 encapsulation types ethernet and ethernet-vlan, see the Junos OS VPNs Library for Routing Devices.

**Options**

```
[vlan-id vlan-id–vlan-id]—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.
```

**Range:** 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

**NOTE:** Configuring vlan-id-list with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id-range 1-4094;
}

[edit interfaces interface-name]
unit 0;

**Required Privilege Level**
- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

vlan-id-list (Interface in Bridge Domain)

Syntax

```
vlan-id-list [ number number-number ];
```

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number family bridge],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family bridge]

Release Information

Statement introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 15.1.

Description

Configure a logical interface to forward packets and learn MAC addresses within each bridge domain configured with a VLAN ID that matches a VLAN ID specified in the list. VLAN IDs can be entered individually using a space to separate each ID, entered as an inclusive list separating the starting VLAN ID and ending VLAN ID with a hyphen, or a combination of both.

Options

- `number number`—Individual VLAN IDs separated by a space.
- `number-number`—Starting VLAN ID and ending VLAN ID in an inclusive range.

Range: 1 through 4095

Required Privilege Level

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

Related Documentation

### vlan-id-range

<table>
<thead>
<tr>
<th>Syntax</th>
<th><code>vlan-id-range vlan-id–vlan-id</code></th>
</tr>
</thead>
</table>

**Hierarchy Level**

[edit interfaces `interface-name` unit `logical-unit-number`],
[edit logical-systems `logical-system-name` interfaces `interface-name` unit `logical-unit-number`]

**Release Information**

Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Bind a range of VLAN IDs to a logical interface.

**Options**

`number`—The first number is the lowest VLAN ID in the range the second number is the highest VLAN ID in the range.

**Range:** 1 through 4094

**NOTE:** Configuring `vlan-id-range` with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```plaintext
[edit interfaces `interface-name`]
  vlan-tagging;
  unit `number` {
    vlan-id-range 1-4094;
  }

[edit interfaces `interface-name`]
  unit 0;
```

VLAN ID 0 is reserved for tagging the priority of frames.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Binding a Range of VLAN IDs to a Logical Interface
## vlan-rewrite

| Syntax          | `vlan-rewrite translate (200 500 | 201 501)` |
|-----------------|--------------------------------------------------|
| Hierarchy Level | [edit interfaces `interface-name` unit `number` family bridge interface-mode trunk]  
[edit interfaces `interface-name` unit `number` family ethernet-switching interface-mode trunk] |
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description     | Translates an incoming VLAN to a bridge-domain VLAN, corresponding counter translation at egress. Supports translation of VLAN 200 to VLAN 500 and VLAN 201 to VLAN 501. Other valid VLANs pass through without translation. |
| Options         | translate `200 500`—Translates incoming packets with VLAN 200 to 500.  
translate `201 501`—Translates incoming packets with VLAN 201 to 501.  
translate `202 502`—Translates incoming packets with VLAN 202 to 502. |
| Required Privilege Level | interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration. |
| Related Documentation | *Rewriting a VLAN Tag and Adding a New Tag* |
### vlan-rule (100-Gigabit Ethernet Type 4 PIC with CFP)

| Syntax       | `vlan-rule (high-low | odd-even);` |
|--------------|-------------------|
| Hierarchy Level | `[edit chassis fpc slot pic slot forwarding-mode vlan-steering]` |
| Release Information | Statement introduced in Junos OS Release 10.4. |
| Description | Configure the interoperation mode of the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-ICE-CFP-FPC4) when interoperating with 100 gigabit Ethernet interfaces from other vendors. If no VLAN rule is configured, all tagged packets are distributed to PFE0. |
| Options      | **high-low**—VLAN IDs 1 through 2047 are distributed to PFE0 and VLAN IDs 2048 through 4096 are distributed to PFE1. **odd-even**—Odd number VLAN IDs are distributed to PFE1 and even number VLAN IDs are distributed to PFE0. |
| Required Privilege Level | interface—To view this statement in the configuration. interface-control—To add this statement to the configuration. |
| Related Documentation | • Configuring VLAN Steering Mode for 100-Gigabit Ethernet Type 4 PIC with CFP on page 466  
• forwarding-mode (100-Gigabit Ethernet) on page 1322  
• vlan-steering (100-Gigabit Ethernet Type 4 PIC with CFP) on page 1617 |
### vlan-steering (100-Gigabit Ethernet Type 4 PIC with CFP)

**Syntax**

```
 vlan-steering {
   vlan-rule (high-low | odd-even);
 }
```

**Hierarchy Level**

```
[edit chassis fpc slot pic slot forwarding-mode]
```

**Release Information**

Statement introduced in Junos OS Release 9.4.

**Description**

Configure the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-ICE-CFP-FPC4) to interoperate with 100 gigabit Ethernet interfaces from other vendors.

The other statement is explained separately.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**vlan-tagging**

**Syntax**

```shell
clan-tagging;
```

**Syntax (QFX Series, NFX Series, and EX4600)**

```shell
clan-tagging;
```

**Syntax (SRX Series Interfaces)**

```shell
clan-tagging native-vlan-id vlan-id;
```

**Hierarchy Level**

- [edit interfaces interface-name],
- [edit logical-systems logical-system-name interfaces interface-name]

**QFX Series, NFX Series, and EX4600 Interfaces**

- [edit interfaces (QFX Series) interface-name ]
- [edit interfaces (QFX Series) interface-range interface-range-name ]

**SRX Series Interfaces**

- [edit interfaces interface ]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 9.5.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.
- Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
- Statement introduced in Junos OS Release 13.2 for PTX Series Routers.
- Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series.

**Description**

For Fast Ethernet and Gigabit Ethernet interfaces, aggregated Ethernet interfaces configured for VPLS, and pseudowire subscriber interfaces, enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface.

**NOTE:** For QFX Series configure VLAN identifier for untagged packets received on the physical interface of a trunk mode interface. Enable VLAN tagging. The platform receives and forwards single-tag frames with 802.1Q VLAN tags.

On EX Series switches except for EX4300 and EX9200 switches, the `clan-tagging` and `family ethernet-switching` statements cannot be configured on the same interface. Interfaces on EX2200, EX3200, EX3300, EX4200, and EX4500 switches are set to `family ethernet-switching` by the default factory configuration. EX6200 and EX8200 switch interfaces do not have a default family setting.
VLAN tagging is disabled by default.

**Options**

- `native-vlan-id`— (SRX Series) Configures a VLAN identifier for untagged packets. Enter a number from 0 through 4094.

  **NOTE:** The `native-vlan-id` can be configured only when either flexible-vlan-tagging mode or interface-mode trunk is configured.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

**vlan-tags**

**Syntax**

```plaintext
types outer [tpid].vlan-id [inner [tpid].vlan-id];
```

**Hierarchy Level**

```plaintext
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number]
```

**Release Information**

Statement introduced in Junos OS Release 9.5. VLAN demux interface support introduced in Junos OS Release 10.2.

**Description**

For Gigabit Ethernet IQ and IQE interfaces only, binds TPIDs and 802.1Q VLAN tag IDs to a logical interface. You must include the `stacked-vlan-tagging` statement at the `[edit interfaces interface-name]` hierarchy level.

**NOTE:** The inner-range `vid1–vid2` option is supported on IQE PICs only.

**Options**

- `inner [tpid].vlan-id`—A TPID (optional) and a valid VLAN identifier in the format `tpid`.vlan-id. When used in the `dynamic-profiles` hierarchy, specify the `junos-vlan-id` predefined variable to dynamically obtain the VLAN ID.

**NOTE:** On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the inner-range `tpid.vid1–vid2` option with the `vlan-tags` statement for ISP-facing interfaces.

- `outer [tpid].vlan-id`—A TPID (optional) and a valid VLAN identifier in the format `tpid`.vlan-id. When used in the `dynamic-profiles` hierarchy, specify the `junos-stacked-vlan-id` predefined variable.

**Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

- `outer [tpid].vlan-id`—A TPID (optional) and a valid VLAN identifier in the format `tpid`.vlan-id. When used in the `dynamic-profiles` hierarchy, specify the `junos-stacked-vlan-id` predefined variable.

**Range:** For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring Dual VLAN Tags on page 697
**vlan-tags (Dual-Tagged Logical Interface)**

**Syntax**

```
vlan-tags inner-list [vlan-id vlan-id–vlan-id ] outer <tpid.>vlan-id;
```

**Hierarchy Level**

[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**

Statement introduced in Junos OS Release 9.5.

**Description**

(MX Series routers only) Binds a dual-tag logical interface to a list of VLAN IDs. Configures the logical interface to receive and forward any dual-tag frame whose inner VLAN ID tag matches the list of VLAN IDs you specify.

---

**NOTE:**

To create a circuit cross-connect (CCC) using VLAN-bundled dual-tag logical interfaces on Layer 2 VPN routing instances, you must include the encapsulation-type statement and specify the value ethernet-vlan at the one of the following hierarchy levels:

- [edit routing-instances routing-instance-name protocols l2vpn]
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn]

For more information about the encapsulation-type configuration statement and the Layer 2 encapsulation types ethernet and ethernet-vlan, see the Junos OS VPNs Library for Routing Devices.

---

**Options**

**inner-list [vlan-id vlan-id vlan-id–vlan-id]**—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

**Range:** 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

**outer <tpid.>vlan-id**—An optional Tag Protocol ID (TPID) and a valid VLAN ID.

**Range:** For TPID, specify a hexadecimal value in the format 0xnnnn.

**Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

---

**NOTE:** Configuring inner-list with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1 through
4094), it has the same result as not specifying a range; however, it consumes
PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
  vlan-tagging;
  unit number {
    vlan-tags outer vid inner-list 1-4094;
  }
```

```
[edit interfaces interface-name]
  vlan-tagging;
  unit number {
    vlan-id vid;
  }
```

---

**Required Privilege**

**vlan-tags (Stacked VLAN Tags)**

**Syntax**

```text
vlan-tags inner tpid.vlan-id inner-list value inner-range vid1—vid2 outer tpid.vlan-id;
```

**Hierarchy Level**

```text
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

**Description**

Bind TPIDs and 802.1Q VLAN tag IDs to a logical interface. TPID fields are used to identify the frame as an IEEE 802.1Q-tagged frame.

**Options**

- **inner tpid.vlan-id**—A TPID and a valid VLAN identifier. TPID is a 16-bit field set to a value of 0x8100 in order to identify the frame as an IEEE 802.1Q-tagged frame.

  **Range:** (most routers) For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

- **inner-list value**—List or a set of VLAN identifiers.

  **NOTE:** This is supported on MX Series routers with Trio-based FPCs.

- **inner-range tpid. vid1—vid2**—Specify a TPID and a range of VLAN IDs where vid1 is the start of the range and vid2 is the end of the range.

  **NOTE:** On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the inner-range tpid. vid1—vid2 option with the vlan-tags statement for ISP-facing interfaces.

- **outer tpid.vlan-id**—A TPID and a valid VLAN identifier.

  **Range:** (most routers) For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

  **NOTE:** Configuring inner-range with the entire vlan-id range consumes system resources and is not a best practice. The inner-range must be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated
with a logical interface. If you specify the entire range (1 through 4094), it has the same result as not specifying a range; however, it consumes Packet Forwarding Engine resources such as VLAN lookup table entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
stacked-vlan-tagging;
unit number {
    vlan-tags outer vid inner-range 1-4094;
}
```

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id vid;
}
```

---

### wait-to-block-interval

**Syntax**

```
wait-to-block-interval number;
```

**Hierarchy Level**

```
[edit protocols protection-group ethernet-ring ring-name]
```

**Release Information**

Statement introduced in Junos OS Release 14.2.

**Description**

Enable the Wait to Block (WTB) timer interval when clearing force switch and manual switch commands.

**Options**

- **number**—Wait-to-block interval, in seconds.
- **Range:** 5 through 10 s
- **Default:** 5 s

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure)
west-interface

Syntax

```countries
west-interface {
  node-id mac-address;
  control-channel channel-name {
    vlan number;
    interface name interface-name
  }
  interface-none
  ring-protection-link-end;
  virtual-control-channel {
    west-interface name;
    east-interface name;
  }
}
```

Hierarchy Level

[edit protocols protection-group ethernet-ring ring-name]

Release Information

Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description

Define one of the two interface ports for Ethernet ring protection, the other being defined by the `east-interface` statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

NOTE: Always configure this port second, after configuring the `east-interface` statement.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

clear interfaces interface-set statistics

**Syntax**

`clear interfaces interface-set statistics interface-set-name`

**Release Information**

Command introduced in Junos OS Release 8.5.

**Description**

Set interface set statistics to zero.

**Options**

`interface-set-name`—Set statistics on a specified interface set to zero. Wildcard values can be used in the interface set name. This command will not clear the statistics of the member logical interfaces.

**Required Privilege**

`clear`

**List of Sample Output**

`clear interfaces interface-set statistics on page 1632`

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

`clear interfaces interface-set statistics`

```
user@host> clear interfaces interface-set statistics
```
clear interfaces interval

Syntax

clear interfaces interval interface-name

Release Information

Command introduced before Junos OS Release 7.4.

Description

Clear the channel service unit (CSU) alarm and defect counters so that only the current time interval is displayed. This operation affects the show interface interval command, but not an SNMP query.

Options

interface-name—Name of a particular interface.

Required Privilege

Level

clear

Related Documentation

clear interfaces aeX forwarding-options load-balance state

Syntax

```
clear interfaces aeX unit logical-unit-number aggregate forwarding-options load-balance state
```

Release Information

Command introduced in Junos OS Release 13.2R1.

Description

Clear the specified aggregate Ethernet interface load balancing state and re-create it newly. If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur.

If you observe load distribution to be not very effective, you can clear the load-balancing states or use rebalancing functionality to cause an automatic clearance of the hardware states. When you configure the rebalancing facility, traffic flows can get redirected to different links, which can cause packet reordering.

Options

- **aeX**—Name of a particular aggregated Ethernet interface.
- **logical-unit-number**—Number of the logical unit of the interface.
- **forwarding-options load-balance state**—Cause the load-balancing state to be cleared for the specific interface.

Required Privilege Level

```
clear
```

## clear interfaces aggregate forwarding-options load-balance state

<table>
<thead>
<tr>
<th>Syntax</th>
<th>clear interfaces aggregate forwarding-options load-balance state</th>
</tr>
</thead>
</table>

**Release Information**  
Command introduced in Junos OS Release 13.2R1.

**Description**  
Clear all the aggregate Ethernet interface load balancing states and re-create them newly. If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur.

**Options**  
`interface-name`—Name of a particular interface.

**Required Privilege**  
`clear` Level

**Related Documentation**  
- show interfaces interval on page 2180

**List of Sample Output**  
clear interfaces aggregate forwarding-options on page 1637

**Sample Output**

clear interfaces aggregate forwarding-options

```
user@host> clear interfaces aggregate forwarding-options load-balance state
```
**clear interfaces transport pm**

**Syntax**

```
clear interfaces transport pm (all | optics | otn) (all | current | current-day) (all | interface-name)
```

**Release Information**

Command introduced in Junos OS Release 14.2 on the PTX Series.

**Description**

Clear optics and OTN information from the transport performance monitoring data.

**Options**

- (all | optics | otn)—Clear both optics and OTN information or either only optics or only OTN information.
- (all | current | current-day)—Clear information for the current 15-minute interval, the ninety-six 15-minute intervals, the current day, and the previous day; information only for the current 15-minute interval; or information only for the current 24 hours.
- (all | interface-name)—Clear information for all interfaces or only for the specified interface (for example, et-fpc/pic/port).

**Required Privilege**

`clear`

**Related Documentation**

- show interfaces transport pm on page 2201
- 100-Gigabit Ethernet OTN Options Configuration Overview on page 574

**List of Sample Output**

clear interfaces transport pm on page 1638

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

clear interfaces transport pm

```
user@host> clear interfaces transport pm transport otn current all
```
clear lldp neighbors

**Syntax**

```plaintext
clear lldp neighbor
<interface interface-name>
```

**Release Information**

**Description**
Clear information regarding all Link Layer Discovery Protocol (LLDP) neighbors or LLDP neighbors of the specified interface.

For information about interface names, see [Interface Naming Overview](#). For information about interface names for TX Matrix routers, see [TX Matrix Router Chassis and Interface Names](#). For information about FPC numbering on TX Matrix routers, see [Routing Matrix with a TX Matrix Router FPC Numbering](#).

For information about interface names in the Junos Fusion technology, see [Understanding Junos Fusion Ports](#).

**Options**

- `interface interface-name`—(Optional) Clear the LLDP neighbors on the specified interface.

**Required Privilege Level**
clear

**Related Documentation**
- [clear lldp statistics on page 1640](#)

**List of Sample Output**
- clear lldp neighbors on page 1639
- clear lldp neighbors interface ge-0/1/1.0 on page 1639

**Output Fields**
When you enter this command, you are provided no feedback on the status of your request. You can enter the `show lldp neighbors` command before and after clearing the LLDP neighbors to verify the clear operation.

**Sample Output**

```
clear lldp neighbors

user@switch> clear lldp neighbors

clear lldp neighbors interface ge-0/1/1.0

user@switch> clear lldp neighbors interface ge-0/1/1.0
```
clear lldp statistics

**Syntax**
clear lldp neighbor
<interface interface-name>

**Release Information**

**Description**
Clear all Link Layer Discovery Protocols (LLDP) statistics or LLDP statistics associated with the specified interface.

For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about interface names in the Junos Fusion technology, see *Understanding Junos Fusion Ports*.

**Options**
- **interface interface-name**—(Optional) Clear LLDP statistics on the specified interface.

**Required Privilege Level**
clear

clear lldp statistics on page 1640
clear lldp statistics interface ge-0/1/1.0 on page 1640

**Output Fields**
When you enter this command, you are provided no feedback on the status of your request. You can enter the `show lldp statistics` command before and after clearing the LLDP statistics to verify the clear operation.

**Sample Output**
clear lldp statistics
user@switch> clear lldp statistics

clear lldp statistics interface ge-0/1/1.0
user@switch> clear lldp statistics interface ge-0/1/1.0
clear oam ethernet connectivity-fault-management continuity-measurement

Syntax

```
clear oam ethernet connectivity-fault-management continuity-measurement
maintenance-domain md-name
maintenance-association ma-name
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

Release Information

Command introduced in Junos OS Release 11.1.

Description

For all routers that support IEEE 802.1ag OAM connectivity fault management (CFM), clear the existing continuity measurement and restart counting the operational uptime (that is, the total time during which CCM adjacency is active for a particular remote MEP).

Options

- **maintenance-domain md-name**—Name of an existing CFM maintenance domain.
- **maintenance-association ma-name**—Name of an existing CFM maintenance association.
- **local-mep local-mep-id**—(Optional) Display connectivity fault management information for the specified local MEP only.
- **remote-mep remote-mep-id**—(Optional) Display connectivity fault management information for the specified remote MEP only.

Sample Output

```
user@host> clear oam ethernet connectivity-fault-management continuity-measurement
maintenance-domain md5 maintenance-association ma5 local-mep 100 remote-mep 102
Continuity measurement restarted.
```
clear oam ethernet connectivity-fault-management linktrace path-database

Syntax

```
clear oam ethernet connectivity-fault-management linktrace path-database mac-address maintenance-association ma-name maintenance-domain md-name
```

Release Information

Command introduced in Junos OS Release 9.0.

Description

Clear all the linktrace entries and the relevant path information from the database for a particular remote host on M320, MX Series, T320, and T640 routers.

Options

- **mac-address**—Clear connectivity fault management path database information for the specified MAC address of the remote host.

- **maintenance-association ma-name**—Clear connectivity fault management path database information for the specified maintenance association.

- **maintenance-domain md-name**—Clear connectivity fault management path database information for the specified maintenance domain.

This command produces no output.
```
clear oam ethernet connectivity-fault-management loss-statistics

**Syntax**

```plaintext
clear oam ethernet connectivity-fault-management loss-statistics
  <interface ethernet-interface-name>
  <level md-level>
```

**Release Information**

Command introduced in Junos OS Release 11.1.

**Description**

For all routers that support IEEE 802.1ag OAM connectivity fault management (CFM), clear all loss statistics maintained by CFM for a given maintenance domain and maintenance association.

In addition, for Ethernet interfaces on MX Series routers, clear any ITU-T Y.1731 Ethernet frame loss measurement (ETH-LM) statistics.

By default, the command clears ETH-LM statistics for CFM maintenance association end points (MEPs) attached to any interface on the router.

**Options**

- `interface ethernet-interface-name`—(Optional) Clear ETH-LM statistics and ETH-LM frame counts only for MEPs attached to the specified Ethernet physical interface.

- `level md-level`—(Optional) Clear ETH-LM statistics and ETH-LM frame counts only for MEPs within CFM maintenance domains (MDs) of the specified level.

**Required Privilege**

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
clear oam ethernet connectivity-fault-management loss-statistics
user@host> clear oam ethernet connectivity-fault-management loss-statistics
Cleared loss measurements statistics of all CFM sessions
```
clear oam ethernet connectivity-fault-management policer

Syntax

```plaintext
clear oam ethernet connectivity-fault-management policer maintenance-domain md-name
maintenance-association ma-name
```

Release Information

- Command introduced in Junos OS Release 10.0.

Description

On M7i and M10i with the Enhanced CFEB (CFEB-E), M320, M120, MX Series, T320, and T640 routers, clear connectivity-fault-management policer statistics.

Options

The following options are supported:

- **maintenance-domain md-name** — Name of an existing CFM maintenance domain. If this option is not specified, policer statistics are cleared for all maintenance associations for all maintenance domains.

- **maintenance-association ma-name** — Name of an existing CFM maintenance association. If this option is not specified, policer statistics are cleared for all maintenance associations for a given maintenance domain. This option cannot be specified without specifying maintenance-domain name.

Required Privilege Level

- **view**

Related Documentation

Policer statistics cleared
```
clear oam ethernet connectivity-fault-management statistics

Syntax

```
clear oam ethernet connectivity-fault-management statistics
   <interface ethernet-interface-name>
   <level md-level>
```

Release Information

Description

For all routers that support IEEE 802.1ag OAM connectivity-fault management (CFM), clear all statistics maintained by CFM.

In addition, for Ethernet interfaces on Dense Port Concentrators (DPCs) in MX Series routers only, also clear any ITU-T Y.1731 Ethernet frame delay measurement (ETH-DM) statistics and ETH-DM frame counts.

By default, the command clears CFM statistics and ETH-DM statistics and frame counts for CFM maintenance association end points (MEPs) attached to any interface on the router.

Options

- `ethernet-interface-name`—(Optional) Clear CFM statistics, ETH-DM statistics, and ETH-DM frame counts only for MEPS attached to the specified Ethernet physical interface.

- `level`—(Optional) Clear CFM statistics, ETH-DM statistics, and ETH-DM frame counts only for MEPS within CFM maintenance domains (MDs) of the specified level.

<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

Release Information

Command introduced in Junos OS Release 13.2 for MX Series routers.

Description

(MX Series routers)—For all routers that support IEEE 802.1ag OAM connectivity fault management (CFM), clear the existing on-demand Ethernet synthetic loss measurement (ETH-SLM) statistics and restart counting the ETH-SLM frame counts and statistics.

Options

- `maintenance-domain md-name`—Name of an existing CFM maintenance domain.
- `maintenance-association ma-name`—Name of an existing CFM maintenance association.
- `local-mep local-mep-id`—(Optional) Clear connectivity fault management information for the specified local MEP only.
- `remote-mep remote-mep-id`—(Optional) Clear connectivity fault management information for the specified remote MEP only.

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear oam ethernet connectivity-fault-management synthetic-loss-measurement
user@host> clear oam ethernet connectivity-fault-management synthetic-loss-measurement
maintenance-domain md5 maintenance-association ma5 local-mep 100 remote-mep 102
Synthetic loss measurement restarted.
```
clear oam ethernet link-fault-management state

Syntax

```
clear oam ethernet link-fault-management state <interface-name>
```

Release Information

Command introduced in Junos OS Release 8.4.

Description

On all M Series, MX Series, ACX series, PTX Series, T320, and T640 routers, clear link fault management state information, restart the link discovery process, and reset OAM loopback state (if set previously) on Ethernet interfaces.

Options

- **none**—Clear OAM link fault management state information, restart the link discovery process, and reset OAM loopback state (if set previously) on all Ethernet interfaces.
- **interface-name**—(Optional) Clear OAM link fault management state information, restart the link discovery process, and reset OAM loopback state (if set previously) on the specified Ethernet interface only.

Required Privilege

- **Level**
  - **view**

```

Release Information
Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description
Clear—reset to zero (0)—all MACsec Key Agreement (MKA) protocol statistics.
You are clearing the statistics that are viewed using the `show security mka statistics` when you enter this command.

Options
- `none`—Clear all MKA counters for all interfaces on the switch.
- `interface interface-name`—(Optional) Clear MKA traffic counters for the specified interface only.

Required Privilege
Clear

Sample Output
```
clear security mka statistics
user@switch> clear security mka statistics
```
**Syntax**

monitor ethernet delay-measurement
maintenance-domain *md-name*
maintenance-association *ma-name*
(one-way | two-way)
(remote-mac-address | mep remote-mep-id)
<count frame-count>
<local-mep mep-id>
<wait interval-seconds>
<priority 802.1p value>
<size>
<no-session-id-tlv>
<xml>

**Release Information**

Command introduced in Junos OS Release 9.5.

`local-mep` option introduced in Junos OS Release 15.1.

**Description**

Start an ITU-T Y.1731 Ethernet frame delay measurement session between the specified local connectivity fault management (CFM) maintenance association endpoint (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. Frame delay measurement statistics are stored at one of the MEPs for later retrieval.

---

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl +c to explicitly quit the `monitor ethernet delay-measurement` command and return to the CLI command prompt.

---

To start an Ethernet frame delay measurement session, the router initiates an exchange of frames carrying one-way or two-way frame delay measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet frame delay measurement PDU frames exchanged to measure frame delay times—are displayed as the runtime output of the `monitor ethernet delay-measurement` command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet frame delay measurement statistics, described below, are measured and stored at only one of the MEPs:

**Frame delay**—The difference, in microseconds, between the time a frame is sent and when it is received.

**Frame delay variation**—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.
Options

- **maintenance-domain md-name**—Name of an existing CFM maintenance domain.
- **maintenance-association ma-name**—Name of an existing CFM maintenance association.
- **one-way**—Measurement type is one-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a one-way delay measurement request (IDM) frame and the time at which the receiver MEP receives the frame.
- **two-way**—Measurement type is two-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a two-way delay measurement message (DMM) frame and the time at which the initiator MEP receives an associated two-way delay measurement reply (DMR) frame from the responder MEP, subtracting the time elapsed at the responder MEP.
- **mep remote-mep-id**—Numeric identifier of the peer MEP with which to perform Ethernet frame delay measurement. The discovered MAC address of the peer MEP is used. The range of values is 1 through 8191.
- **remote-mac-address**—Unicast MAC address of the peer MEP with which to perform Ethernet frame delay measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: `nnnn.nnnn.nnnn` or `nn:nn:nn:nn:nn:nn`. For example, `0011.2233.4455` or `00:11:22:33:44:55`. Multicast MAC addresses are not supported.
- **count frame-count**—(Optional) Number of frames to send to the specified peer MEP. The range of values is 1 through 65,535 frames. The default value is 10 frames.
- **local-mep mep-id**—(Required when multiple MEPs are configured) Identifier for the local maintenance association end point.
- **wait interval-seconds**—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.
- **priority 802.1p value**—(Optional) Priority of the delay measurement request frame supported by both one-way delay measurement and two-way delay measurement. The range of values is from 0 through 7. The default value is zero.
- **size**—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.
- **no-session-id-tlv**—(Optional) Prevent insertion of the session ID TLV in the request frame.
- **xml**—(Optional) Allow the output of the command to be displayed in XML format supported by both one-way delay measurement and two-way delay measurement. Note that the only way to get output in XML format is to use the `xml` argument. The `display xml` command does not work.
To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- `show oam ethernet connectivity-fault-management interfaces detail`
- `show oam ethernet connectivity-fault-management mep-database`
- `show oam ethernet connectivity-fault-management mep-statistics`

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- `show oam ethernet connectivity-fault-management delay-statistics`
- `show oam ethernet connectivity-fault-management mep-statistics`

To clear both the frame counts and the statistics collected for MEPs, use the `clear oam ethernet connectivity-fault-management statistics` command, described in the CLI Explorer.

For a complete description of Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

### Required Privilege Level

- **trace and maintenance**

### List of Sample Output

- `monitor ethernet delay-measurement one-way` on page 1656
- `monitor ethernet delay-measurement two-way` on page 1657
- `monitor ethernet delay-measurement two-way (Invalid DMR Frames Received)` on page 1657

### Output Fields

The `monitor ethernet delay-measurement` command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

- Table 139 on page 1655 lists the run-time output fields for the `monitor ethernet delay-measurement one-way` command.
- Table 140 on page 1656 lists the run-time output fields for the `monitor ethernet delay-measurement two-way` command.

Output fields are listed in the approximate order in which they appear.

#### Table 139: `monitor ethernet delay-measurement one-way` Output Fields

<table>
<thead>
<tr>
<th>Output Field Name</th>
<th>Output Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>One-way ETH-DM request to</strong></td>
<td>Unicast MAC address of the remote peer MEP.</td>
</tr>
<tr>
<td>Interface</td>
<td>Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.</td>
</tr>
<tr>
<td>1DM Frames sent</td>
<td>PDU frames sent to the remote MEP in this ETH-DM session.</td>
</tr>
<tr>
<td>Packets transmitted</td>
<td>Total number of 1DM PDU frames sent to the remote MEP during this measurement session.</td>
</tr>
</tbody>
</table>
Table 139: monitor ethernet delay-measurement one-way Output Fields (continued)

<table>
<thead>
<tr>
<th>Output Field Name</th>
<th>Output Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average delay</td>
<td>Average two-way frame delay measured in this session.</td>
</tr>
<tr>
<td>Average delay variation</td>
<td>Average frame jitter measured in this session.</td>
</tr>
<tr>
<td>Best case delay</td>
<td>Lowest two-way frame delay measured in this session.</td>
</tr>
<tr>
<td>Worst case delay</td>
<td>Highest two-way frame delay measured in this session.</td>
</tr>
</tbody>
</table>

**NOTE:** For one-way delay measurement, these CLI output fields display NA (“not applicable”) at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.

Table 140: monitor ethernet delay-measurement two-way Output Fields

<table>
<thead>
<tr>
<th>Output Field Name</th>
<th>Output Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Two-way Ethernet frame delay measurement request to</td>
<td>Unicast MAC address of the remote peer MEP.</td>
</tr>
<tr>
<td>Interface</td>
<td>Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.</td>
</tr>
<tr>
<td>DMR received from</td>
<td>Unicast MAC address of the remote MEP that transmitted this DMR frame in response to a DMM frame.</td>
</tr>
<tr>
<td>Delay</td>
<td>Two-way delay, in microseconds, for the initiator-transmitted DMM frame.</td>
</tr>
<tr>
<td>Delay variation</td>
<td>Difference, in microseconds, between the current and previous delay values. This is also known as frame jitter.</td>
</tr>
<tr>
<td>Packets transmitted</td>
<td>Total number of DMM PDU frames sent to the remote MEP in this measurement session.</td>
</tr>
<tr>
<td>Valid packets received</td>
<td>Total number of DMR PDU frames received from the remote MEP in this measurement session.</td>
</tr>
<tr>
<td>Average delay</td>
<td>Average two-way frame delay measured in this session.</td>
</tr>
<tr>
<td>Average delay variation</td>
<td>Average frame jitter measured in this session.</td>
</tr>
<tr>
<td>Best case delay</td>
<td>Lowest two-way frame delay measured in this session.</td>
</tr>
<tr>
<td>Worst case delay</td>
<td>Highest two-way frame delay measured in this session.</td>
</tr>
</tbody>
</table>

<wait interval-seconds>
<priority 802.1p value>
<no-session-id-tlv>
<xml>
```

**Release Information**

Command introduced in Junos OS Release 11.1.

*local-mep* option introduced in Junos OS Release 15.1

**Description**

Start an ITU-T Y.1731 Ethernet frame loss measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a count of transmitted and received data frames between the pair of MEPs. Frame loss measurement statistics are stored at one of the MEPs for later retrieval. For MX Series routers, supports point-to-point down MEPs for Ethernet interfaces (as per IEEE 802.1ag over VPWS).

**NOTE:** If you attempt to monitor loss to a nonexistent MAC address, you must type Ctrl + c to explicitly quit the `monitor ethernet loss-measurement` command and return to the CLI command prompt.

To start an Ethernet frame loss measurement session, the router first sends frames with ETH-LM information to a peer MEP and similarly receives frames with ETH-LM information from the peer MEP. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPs. The loss measurement statistics are retrieved as the output of the `monitor ethernet loss-measurement` command and are also stored at the initiator. The frames counts are stored at both the initiator and the receiver MEPs for later retrieval.

**Options**

- **maintenance-domain md-name**—Name of an existing CFM maintenance domain.
- **maintenance-association ma-name**—Name of an existing CFM maintenance association.
- **mep remote-mep-id**—Numeric identifier of the peer MEP with which to perform Ethernet frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8192.
- **remote-mac-address**—Unicast MAC address of the peer MEP with which to perform Ethernet frame loss measurement. Specify the MAC address as six hexadecimal
bytes in one of the following formats: \texttt{nnnn.nnnn.nnnn} or \texttt{nnnn:nnnn:nnnn} (for example, \texttt{0011.2233.4455} or \texttt{00:11:22:33:44:55}). Multicast MAC addresses are not supported.

- **count frame-count**—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65535 frames. The default value is 10 frames.

- **local-mep mep-id**—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

- **wait interval-seconds**—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

- **priority 802.1p value**—(Optional) Priority of the delay measurement request frame. The range of values is from 0 through 7. The default value is 1 second.

- **no-session-id-tlv**—(Optional) Disable the session id TLV argument set in the request frame.

- **xml**—(Optional) Allow the output of the command to be displayed in XML format.

### Additional Information

To display the iterator output for an LM session, run the following command:

- \texttt{show oam ethernet connectivity-fault-management sla-iterator-statistics sla-iterator <profile> maintenance-association <MA> maintenance-domain <MD> local-mep <MEP> remote-mep <RMEP>}

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- \texttt{show oam ethernet connectivity-fault-management loss-statistics}
- \texttt{show oam ethernet connectivity-fault-management interfaces detail}
- \texttt{show oam ethernet connectivity-fault-management mep-database}
- \texttt{show oam ethernet connectivity-fault-management mep-statistics}

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- \texttt{show oam ethernet connectivity-fault-management delay-statistics}
- \texttt{show oam ethernet connectivity-fault-management mep-statistics}

To clear both the frame counts and the statistics collected for MEPs, use the \texttt{clear oam ethernet connectivity-fault-management loss-statistics maintenance-domain md-name maintenance-association ma-name} command, as described in the CLI Explorer.

For a complete description of Ethernet frame loss measurement, see the ITU-T Y.1731 Ethernet Service OAM topics in the Junos OS Network Interfaces Library for Routing Devices.

**Output Fields**

Table 141 on page 1660 lists the output fields for the `monitor ethernet loss-measurement` command and their descriptions. Output fields are listed in the approximate order in which they appear.

### Table 141: `monitor ethernet loss-measurement` output fields

<table>
<thead>
<tr>
<th>Output Field Name</th>
<th>Output Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet loss delay measurement request to</td>
<td>Unicast MAC address of the remote peer MEP.</td>
</tr>
<tr>
<td>Interface</td>
<td>Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.</td>
</tr>
<tr>
<td>LMR received from</td>
<td>Unicast MAC address of the remote MEP that transmitted this LMR frame in response to a loss measurement message (LMM) frame.</td>
</tr>
<tr>
<td>Near-end frame loss</td>
<td>Count of frame loss associated with ingress data frames.</td>
</tr>
<tr>
<td>Far-end frame loss</td>
<td>Count of frame loss associated with egress data frames.</td>
</tr>
<tr>
<td>Near-end loss ratio</td>
<td>Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval $T$ at the ingress interface.</td>
</tr>
<tr>
<td>Far-end loss ratio</td>
<td>Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval $T$ at the egress interface.</td>
</tr>
<tr>
<td>LMM packets transmitted</td>
<td>Total number of LMM PDU frames sent to the remote MEP in this measurement session.</td>
</tr>
<tr>
<td>LMR packets received</td>
<td>Total number of LMR PDU frames received from the remote MEP in this measurement session.</td>
</tr>
<tr>
<td>Average near-end frame loss</td>
<td>Average frame loss measured in this session associated with ingress data frames.</td>
</tr>
<tr>
<td>Average near-end loss ratio</td>
<td>Average frame loss ratio measured in this session associated with ingress data frames.</td>
</tr>
<tr>
<td>Average far-end frame loss</td>
<td>Average frame loss measured in this session associated with egress data frames.</td>
</tr>
<tr>
<td>Average far-end loss ratio</td>
<td>Average frame loss ratio measured in this session associated with egress data frames.</td>
</tr>
<tr>
<td>Near-end best case frame loss</td>
<td>Lowest frame loss measured in this session associated with ingress data frames.</td>
</tr>
</tbody>
</table>
### Table 141: monitor ethernet loss-measurement output fields (continued)

<table>
<thead>
<tr>
<th>Output Field Name</th>
<th>Output Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Near-end best case loss ratio</td>
<td>Lowest frame loss ratio measured in this session associated with ingress data frames.</td>
</tr>
<tr>
<td>Near-end worst case frame loss</td>
<td>Highest frame loss measured in this session associated with ingress data frames.</td>
</tr>
<tr>
<td>Near-end worst case loss ratio</td>
<td>Highest frame loss ratio measured in this session associated with ingress data frames.</td>
</tr>
<tr>
<td>Far-end best case frame loss</td>
<td>Lowest frame loss measured in this session associated with egress data frames.</td>
</tr>
<tr>
<td>Far-end best case loss ratio</td>
<td>Lowest frame loss ratio measured in this session associated with egress data frames.</td>
</tr>
<tr>
<td>Far-end worst case frame loss</td>
<td>Highest frame loss measured in this session associated with egress data frames.</td>
</tr>
<tr>
<td>Far-end worst case loss ratio</td>
<td>Highest frame loss ratio measured in this session associated with egress data frames.</td>
</tr>
</tbody>
</table>

Note that in the preceding table, the term *number of service frames not delivered* is the difference between the number of service frames arriving at the ingress Ethernet flow point and the number of service frames delivered at the egress Ethernet flow point in a point-to-point Ethernet connection.

<xml>
```

Release Information

Command introduced in Junos OS Release 13.2 for MX Series routers.
`local-mep` option introduced in Junos OS Release 15.1

Description

(MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl + c to explicitly quit the `monitor ethernet synthetic-loss-measurement` command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the `monitor ethernet synthetic-loss-measurement` command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay—The difference, in microseconds, between the time a frame is sent and when it is received.

Frame delay variation—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

Options

- `maintenance-domain md-name`—Name of an existing CFM maintenance domain.
- `maintenance-association ma-name`—Name of an existing CFM maintenance association.
mep remote-mep-id—Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.

remote-mac-address—Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: nnnn.nnnn.nnnn or nnnn:nnnn:nnnn:nnnn. For example, 0011.2233.4455 or 00:11:22:33:44:55. Multicast MAC addresses are not supported.

count frame-count—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.

local-mep mep-id—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

wait interval-milliseconds—(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50,000 milliseconds. The default value is 100 milliseconds.

priority 802.1p value—(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.

size—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

xml—(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the xml argument. The display xml command does not work.

Additional Information To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer:

- show oam ethernet connectivity-fault-management interfaces detail
- show oam ethernet connectivity-fault-management mep-database
- show oam ethernet connectivity-fault-management mep-statistics

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer:

- show oam ethernet connectivity-fault-management synthetic-loss-measurement
- show oam ethernet connectivity-fault-management mep-statistics

To clear both the frame counts and the statistics collected for MEPS, use the clear oam ethernet connectivity-fault-management statistics command, described in the CLI Explorer.

For a complete description of Ethernet synthetic frame loss measurement, see the ITU-T Y.1731 Ethernet Service OAM topics in the Junos OS Network Interfaces Library for Routing Devices.

Release Information

- Command introduced in Junos OS Release 13.2 for MX Series routers.
- `local-mep` option introduced in Junos OS Release 15.1

Description

(MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPS for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl + c to explicitly quit the `monitor ethernet synthetic-loss-measurement` command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPS. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the `monitor ethernet synthetic-loss-measurement` command and are also stored at both the initiator and receiver MEPS for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPS:

- **Frame delay**—The difference, in microseconds, between the time a frame is sent and when it is received.
- **Frame delay variation**—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

Options

- `maintenance-domain md-name`—Name of an existing CFM maintenance domain.
- `maintenance-association ma-name`—Name of an existing CFM maintenance association.
mep remote-mep-id—Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.

remote-mac-address—Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: nnnnnnnn.nn or nnnnnnnnnnnnnnnnnnnnnnn.nn. For example, 0011.2233.4455 or 00:11:22:33:44:55. Multicast MAC addresses are not supported.

count frame-count—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.

local-mep mep-id—(Required when multiple MEPS are configured) Identifier for the local maintenance endpoint.

wait interval-milliseconds—(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50,000 milliseconds. The default value is 100 milliseconds.

priority 802.1p value—(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.

size—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

xml—(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the xml argument. The display xml command does not work.

Additional Information

To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer:

- show oam ethernet connectivity-fault-management interfaces detail
- show oam ethernet connectivity-fault-management mep-database
- show oam ethernet connectivity-fault-management mep-statistics

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer:

- show oam ethernet connectivity-fault-management synthetic-loss-measurement
- show oam ethernet connectivity-fault-management mep-statistics

To clear both the frame counts and the statistics collected for MEPS, use the clear oam ethernet connectivity-fault-management statistics command, described in the CLI Explorer.

For a complete description of Ethernet synthetic frame loss measurement, see the ITU-T Y.1731 Ethernet Service OAM topics in the Junos OS Network Interfaces Library for Routing Devices.
List of Sample Output

The `monitor ethernet synthetic-loss-measurement` command displays different output at the CLI, depending on when you start a synthetic frame loss measurement:

- Table 142 on page 1665 lists the run-time output fields for the `monitor ethernet synthetic-loss-measurement` command.

Output fields are listed in the approximate order in which they appear.

```
request interface link-degrade-recover

Syntax

request interface link-degrade-recover interfaces-name

Release Information

Command introduced in Junos OS Release 15.1.

Description

Manually recover a degraded physical link. Manual recovery is used when the interface has any Layer 2 and Layer 3 protocols that prevents autorecovery. This command is applicable only if you have configured the manual link recovery option on the interface.

NOTE: Manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while auto-recovery is in progress.

Options

interfaces-name—Name of the interface.

Required Privilege

**request interface mc-ae switchover (Multichassis Link Aggregation)**

**Syntax**
```
request interface mc-ae switchover
<immediate> mcae-id mcae-id;
```

**Release Information**
Command introduced in Junos OS Release 13.3.

**Description**
Manually revert egress traffic from the active node to the designated preferred node of a multichassis aggregated Ethernet interface. You can use this command to manually switch over traffic to the preferred node when the `switchover-mode` statement for the multichassis aggregated Ethernet interface is configured as `non-revertive` at the `[edit interfaces aeX mc-ae]` hierarchy level.

**NOTE:** To run this command successfully, the `status-control` statement should be configured as `active` at the `[edit interfaces aeX mc-ae]` hierarchy level.

**Options**
- **immediate**—(Optional) Trigger immediate switchover to the preferred node. If this option is not configured, Junos OS waits for the timer configured using the `revert-time` statement at the `[edit interfaces aeX mc-ae]` hierarchy level to expire before it triggers the switchover.

- **mcae-id mcae-id**—Triggers switchover for the specified mc-ae interface.

**Required Privilege Level**
view

**Output Fields**
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**
```
request interface mc-ae switchover immediate mcae-id

    user@host >request interface mc-ae switchover immediate mcae-id 2
    MCAE: Switchover Done
```
Sample Output

request interface mc-ae switchover mcae-id

    user@host >request interface mc-ae switchover mcae-id 2
    Switchover In Progress: Please check after 1 minutes,

    Use “show interfaces mc-ae revertive-info” to check for the status
**request interface (revert | switchover) (Aggregated Ethernet Link Protection)**

**Syntax**  
request interface (revert | switchover) ae

**Release Information**  
Command introduced in Junos OS Release 8.3.

**Description**  
Manually revert egress traffic from the designated backup link to the designated primary link of an aggregated Ethernet interface for which link protection is enabled, or manually switch egress traffic from the primary link to the backup link. This traffic includes transit traffic and local traffic originated on the router itself.

**NOTE:**  
When link protection is enabled on an aggregated Ethernet interface, if the primary link fails, the router automatically routes egress traffic to the backup link. However, the router does not automatically route egress traffic back to the primary link when the primary link is subsequently reestablished. Instead, you manually control when to have traffic diverted back to the primary link by issuing the `request interface (revert | switchover)` (Aggregated Ethernet Link Protection) operational command and specifying the revert keyword.

On M Series and T Series routers, use the `request interface (revert | switchover)` (Adaptive Services) operational command to manually revert to the primary adaptive services interface or link services interface, or to switch from the primary to the secondary interface. For information about this command, see `request interface (revert | switchover)` (Adaptive Services).

**Options**

- **revert**—Restores egress traffic processing to the primary link.
- **switchover**—Transfers egress traffic processing to the secondary (backup) link.
- **ae**—Aggregated Ethernet logical interface number: 0 through 15.

**Required Privilege Level**

request interface revert on page 1676

**Output Fields**  
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
request interface revert
```

```
user@host >request interface revert ae1
```
request lacp link-switchover

Syntax
request lacp link-switchover ae

Release Information
Command introduced in Junos OS Release 9.3.

Description
Manually switch aggregated Ethernet active or standby LACP links.

NOTE: Because this command overrides LACP priority calculations, we strongly recommend that you use this command only when the actor (in this case, the Juniper Networks router) is controlling the active or standby link and the partner (peer) is following. This scenario occurs when you configure only the actor for link protection.

Options
ae—Aggregated Ethernet logical interface number: 0 through 15.

Required Privilege Level
view

List of Sample Output
request lacp link-switchover aeX on page 1677

Output Fields
When you enter this command, you are provided feedback on the status of your request. To view the switchover, use the show lacp interfaces command.

Sample Output
request lacp link-switchover aeX

user@host >request lacp link-switchover aeOaeO: Request succeeded

### Release Information

- **interconnect-device name**: Command introduced before Junos OS Release 7.4.
- **node-device name**: Command introduced in Junos OS Release 9.0 for EX Series switches.
- **models**: Command introduced in Junos OS Release 8.2.
- **sfc** option introduced in Junos OS Release 9.6 for the TX Matrix Plus router.
- **Command introduced in Junos OS Release 11.1 for QFX Series.**
- **Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.**
- **Command introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.**
- **Command introduced in Junos OS Release 12.3 for MX2010 and MX2020 Universal Routing Platforms.**
- **Information for disk and usb** introduced in Junos OS Release 15.1X53-D60 for QFX10002, QFX10008, and QFX10016 switches.
- **Command introduced in Junos OS Release 15.1X54-D20 for ACX5048 and ACX5096 Routers.**
- **Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.**
- **Command introduced in Junos OS Release 17.2 for PTX10008 Routers.**
- **Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.**
- **Command introduced in Junos OS Release 17.3 for MX150 Router Appliance.**
- **Command introduced in Junos OS Release 17.4 for MX204 Routers.**
- **Command introduced in Junos OS Release 18.1R1 for EX9251 Switches.**
- **Command introduced in Junos OS Release 18.2 for EX9253 Switches.**
- **Command introduced in Junos OS Release 18.2R1 for MX10008 Routers**

---

### Description

Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.

In the EX Series switch command output, FPC refers to the following:

- On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC **number** is always 0.
- On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC **number** equals the member ID, from 0 through 9.
- On EX8208 and EX8216 switches—Refers to a line card; FPC **number** equals the slot number for the line card.

On QFX3500, QFX5100, and OCX Series standalone switches, and PTX1000 routers both the FPC and FPC **number** are always 0.
On T4000 Type 5 FPCs, there are no top temperature sensor or bottom temperature sensor parameters. Instead, fan intake temperature sensor and fan exhaust temperature sensors parameters are displayed.

Starting from Junos OS Release 11.4, the output of the show chassis hardware models operational mode command displays the enhanced midplanes FRU model numbers (CHAS-BP3-MX240-S, CHAS-BP3-MX480-S or CHAS-BP3-MX960-S) based on the router. Prior to release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through the Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 14.1, the output of the show chassis hardware detail | extensive | clei-models | models operational mode command displays the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-P1A) and other components in a PTX5000 Packet Transport Router.

**Options**

| none | Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers. |
| clei-models | (Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs). |
| detail | (Optional) Include RAM and disk information in output. |
| extensive | (Optional) Display ID EEPROM information. |
| all-members | (MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration. |
| interconnect-device name | (QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device. |
| lcc number | (TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router. Replace number with the following values depending on the LCC configuration: |
| 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. |
| 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. |
• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

**member member-id**—(MX Series routers and EX Series switches) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

**models**—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

**node-device name**—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

**satellite [slot-id slot-id | device-alias alias-name]**—(Junos Fusion only) (Optional) Display hardware information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

**scc**—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

**Additional Information**

The `show chassis hardware detail` command now displays DiMM information for the following Routing Engines, as shown in Table 144 on page 1681.

**Table 144: Routing Engines Displaying DiMM Information**

<table>
<thead>
<tr>
<th>Routing Engines</th>
<th>Routers</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE-S-1800x2 and RE-S-1800x4</td>
<td>MX240, MX480, and MX960 routers</td>
</tr>
<tr>
<td>RE-A-1800x2</td>
<td>M120 and M320 routers</td>
</tr>
</tbody>
</table>

In Junos OS Release 11.4 and later, the output for the `show chassis hardware models` operational mode command for MX Series routers display the enhanced midplanes FRU model numbers—CHAS-BP3-MX240-S, CHAS-BP3-MX480-S, or CHAS-BP3-MX960-S—based on the router. In releases before Junos OS Release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 17.3R1, the output of the `show chassis hardware` command displays the mode in which vMX is running (performance mode or lite mode) in the part
number field for the FPC. RIOT-PERF indicates performance mode and RIOT-LITE indicates lite mode.

**Output Fields**

Table 145 on page 1687 lists the output fields for the `show chassis hardware` command. Output fields are listed in the approximate order in which they appear.
Table 145: show chassis hardware Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item</td>
<td>Chassis component:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• (EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• (MX Series routers and EX Series switches)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two “pseudo” FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). MX104 routers have a built-in Packet forwarding Engine and a Forwarding Engine Board (FEB). The Packet Forwarding Engine of the MX104 router has three “pseudo” FPCs (FPC0, FPC1, and FPC2).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• (M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• (M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• (QFX Series)—Information about the chassis, Pseudo CB, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• (PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• (MX2010, MX2020, and MX2008 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• (vMX routers)—Information about the chassis, midplane, Routing Engines, and Control Boards (CBs). Also displays information about Flexible PIC Concentrators (FPCs) and associated Modular Interface Cards (MICs) and Physical Interface Cards (PICs).</td>
<td></td>

</tbody>
</table>

**Description**
- Type of power supply.
- Type of PIC. If the PIC type is not supported on the current software release, the output states **Hardware Not Supported**.
- Type of FPC: FPC Type 1, FPC Type 2, FPC Type 3, FPC Type 4, or FPC Type OC192.

On EX Series switches, a brief description of the FPC.

The following list shows the PIM abbreviation in the output and the corresponding PIM name.
- **2x FE**—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM
- **4x FE**—4-port Fast Ethernet ePIM
- **1x GE Copper**—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port)
- **1x GE SFP**—SFP Gigabit Ethernet ePIM (one fiber port)
- **2x Serial**—Dual-port serial PIM
- **2x T1**—Dual-port T1 PIM
- **2x E1**—Dual-port E1 PIM
- **2x CT1E1**—Dual-port channelized T1/E1 PIM
- **1x T3**—T3 PIM (one port)
- **1x E3**—E3 PIM (one port)
- **4x BRI S/T**—4-port ISDN BRI S/T PIM
- **4x BRI U**—4-port ISDN BRI U PIM
- **1x ADSL Annex A**—ADSL 2/2+ Annex A PIM (one port, for POTS)
Table 145: show chassis hardware Output Fields (continued)

### Syntax (OCX Series)

`show chassis pic fpc-slot slot-number pic-slot slot-number`

### Syntax (ACX Series Universal Access Routers)

`show chassis pic fpc-slot slot-number pic-slot slot-number`

### Syntax (ACX5048 and ACX5096 Routers)

`show chassis pic (fpc-slot slot-number | pic-slot slot-number)`

### Syntax (ACX500 Routers)

`show chassis pic (fpc-slot slot-number | pic-slot slot-number)`

### Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for QFX Series.
- Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
- Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
- Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.
- Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
- Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
- `transport` option introduced in Junos OS Release 16.1R1 for MX Series Routers.
- Command introduced in Junos OS Release 17.2 for MX2008 3D Universal Edge Routers.
- Command introduced in Junos OS Release 17.2 for PTX10008 Routers.
- Command introduced in Junos OS Release 17.3 for MX10003 3D Universal Edge Routers.
- Command introduced in Junos OS Release 17.3 for MX150 Router Appliance.
- Command introduced in Junos OS Release 17.4 for MX204 3D Universal Edge Routers.

### Description

Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.

### Options

**fpc-slot** `slot-number`—Display information about the PIC in this particular FPC slot:

- On a TX Matrix router, if you specify the number of the T640 router by using the `lcc number` option (the recommended method), replace `slot-number` with a value from 0 through 7. Otherwise, replace `slot-number` with a value from 0 through 31.

  Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the `lcc number` option (the recommended method), replace `slot-number` with a value from 0 through 7. Otherwise, replace `slot-number` with a value from 0 through 31. For example, the following commands have the same result:

  ```
  user@host> show chassis pic fpc-slot 1 lcc 1 pic-slot 1
  user@host> show chassis pic fpc-slot 9 pic-slot 1
  ```

- M120 routers only—Replace `slot-number` with a value from 0 through 5.
MX80 routers only—Replace `slot-number` with a value from 0 through 1.
MX104 routers only—Replace `slot-number` with a value from 0 through 2.
MX240 routers only—Replace `slot-number` with a value from 0 through 2.
MX480 routers only—Replace `slot-number` with a value from 0 through 5.
MX960 routers only—Replace `slot-number` with a value from 0 through 11.
MX2010 routers only—Replace `slot-number` with a value from 0 through 9.
MX2020 routers only—Replace `slot-number` with a value from 0 through 19.
MX2008 routers only—Replace `slot-number` with a value from 0 through 9.
MX10003 routers only—Replace `slot-number` with a value from 0 through 1.
Other routers—Replace `slot-number` with a value from 0 through 7.

EX Series switches:
- EX3200 switches and EX4200 standalone switches—Replace `slot-number` with 0.
- EX4200 switches in a Virtual Chassis configuration—Replace `slot-number` with a value from 0 through 9 (switch's member ID).
- EX8208 switches—Replace `slot-number` with a value from 0 through 7 (line card).
- EX8216 switches—Replace `slot-number` with a value from 0 through 15 (line card).

QFX Series:
- QFX3500, QFX3600, QFX5100, and OCX Series standalone switches—Replace `slot-number` with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
- QFabric systems—Replace `slot-number` with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

`all-members`—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

`interconnect-device name`—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

`lcc number`—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.
Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

member member-id—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace member-id with a value of 0 or 1.

node-device name—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

pic-slot slot-number—Display information about the PIC in this particular PIC slot. For routers, replace slot-number with a value from 0 through 3. For EX3200 and EX4200 switches, replace slot-number with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace slot-number with 0. For the QFX3500 standalone switch and the QFabric system, replace slot-number with 0 or 1.

transport—Display PIC information for optical transport network.

Output Fields Table 146 on page 1950 lists the output fields for the show chassis pic command. Output fields are listed in the approximate order in which they appear.

Table 146: show chassis pic Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>PIC type.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as MIC-3D-1STM64-XFP and with the SONET framing mode, the type is displayed as MIC-3D-1OC192-XFP. By default, the 1-port OC192/STM64 MICs displays the type as MIC-3D-1OC192-XFP.</td>
</tr>
<tr>
<td>Account Layer2 Overhead</td>
<td>(MX Series routers) Indicates whether functionality to count the Layer 2 overhead bytes in the interface statistics at the PIC level is enabled or disabled.</td>
</tr>
<tr>
<td>ASIC type</td>
<td>Type of ASIC on the PIC.</td>
</tr>
<tr>
<td>State</td>
<td>Status of the PIC. State is displayed only when a PIC is in the slot.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Online</strong>—PIC is online and running.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Offline</strong>—PIC is powered down.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Empty</strong>—No PIC is present.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Present</strong>—PIC is plugged in. The PIC is not powered on or operational.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Onlining</strong>—PIC is in the process of going online. PICs and rest of the hardware is initializing.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Offlining</strong>—PIC is in the process of going offline. PIC and rest of the hardware is being shutdown down to take the offline gracefully.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Fault</strong>—PIC is in an alarmed state and the PIC is not operational.</td>
</tr>
<tr>
<td>PIC version</td>
<td>PIC hardware version.</td>
</tr>
<tr>
<td>Uptime</td>
<td>How long the PIC has been online.</td>
</tr>
</tbody>
</table>
Table 146: show chassis pic Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>(Multiservices PICs only) Services package supported: Layer-2 or Layer-3.</td>
</tr>
<tr>
<td>Port Number</td>
<td>Port number for the PIC.</td>
</tr>
<tr>
<td>Cable Type</td>
<td>Type of cable connected to the port: LH, LX, or SX.</td>
</tr>
<tr>
<td>PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)</td>
<td>Port-level information for the PIC.</td>
</tr>
<tr>
<td></td>
<td>• Port—Port number</td>
</tr>
<tr>
<td></td>
<td>• Cable type—Type of optical transceiver installed.</td>
</tr>
<tr>
<td></td>
<td>• Fiber type—Type of fiber. SM is single-mode.</td>
</tr>
<tr>
<td></td>
<td>• Xcvr vendor—Transceiver vendor name.</td>
</tr>
<tr>
<td></td>
<td>• Xcvr vendor part number—Transceiver vendor part number.</td>
</tr>
<tr>
<td></td>
<td>• Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction</td>
</tr>
<tr>
<td></td>
<td>• Xcvr Firmware—Transceiver firmware version.</td>
</tr>
<tr>
<td>PIC Port Information (MX960 Router Bidirectional Optics)</td>
<td>Port-level information for the PIC.</td>
</tr>
<tr>
<td></td>
<td>• Port—Port number</td>
</tr>
<tr>
<td></td>
<td>• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D.</td>
</tr>
<tr>
<td></td>
<td>• Fiber type—Type of fiber. SM is single-mode.</td>
</tr>
<tr>
<td></td>
<td>• Xcvr vendor—Transceiver vendor name.</td>
</tr>
<tr>
<td></td>
<td>• Xcvr vendor part number—Transceiver vendor part number.</td>
</tr>
<tr>
<td></td>
<td>• BX10-10-km bidirectional optics.</td>
</tr>
<tr>
<td></td>
<td>• BX40-40-km bidirectional optics.</td>
</tr>
<tr>
<td></td>
<td>• SFP-LX-40-km SFP optics.</td>
</tr>
<tr>
<td></td>
<td>• Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.</td>
</tr>
<tr>
<td>PIC Port Information (Next-Generation SONET/SDH SFP)</td>
<td>Port-level information for the next-generation SONET/SDH SFP PIC.</td>
</tr>
<tr>
<td></td>
<td>• Port—Port number.</td>
</tr>
<tr>
<td></td>
<td>• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed.</td>
</tr>
<tr>
<td></td>
<td>• Fiber type—Type of fiber: SM (single-mode) or MM (multimode).</td>
</tr>
<tr>
<td></td>
<td>• Xcvr vendor—Transceiver vendor name.</td>
</tr>
<tr>
<td></td>
<td>• Xcvr vendor part number—Transceiver vendor part number.</td>
</tr>
<tr>
<td></td>
<td>• Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.</td>
</tr>
</tbody>
</table>
Table 146: show chassis pic Output Fields (continued)

show ethernet-switching redundancy-groups

Syntax

show ethernet-switching redundancy-groups
<redundancy-group-id [0 to 4294967294]>
arp-statistics
nd-statistics
remote-macs

Release Information

Command introduced in Junos OS Release 13.2.
Command introduced in Junos OS Release 15.1R1 for EX Series switches

Description

Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.

Options

redundancy-group-id—(Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.

arp-statistics—(Optional) Count of ARP packets sent and received by the two MC-AE nodes.

nd-statistics—(Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.

remote-macs —(Optional) List of remote MAC addresses in the “Installed” state, as learned from the remote MC-AE node.

Required Privilege

view

### show interfaces (Adaptive Services)

**Syntax**

```
show interfaces interface-type
   <brief | detail | extensive | terse>
   <descriptions>
   <media>
   <snmp-index snmp-index>
   <statistics>
```

**Release Information**
Command introduced before Junos OS Release 7.4.

**Description**
Display status information about the specified adaptive services interface.

**Options**

- `interface-type`—On M Series and T Series routers, the interface type is `sp-fpc/pic/port`.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about network interfaces.
- `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

**Required Privilege Level**
`view`

**List of Sample Output**
- `show interfaces (Adaptive Services) on page 1982`
- `show interfaces brief (Adaptive Services) on page 1982`
- `show interfaces detail (Adaptive Services) on page 1982`
- `show interfaces extensive (Adaptive Services) on page 1983`

**Output Fields**
Table 150 on page 1977 lists the output fields for the `show interfaces` (adaptive services and redundant adaptive services) command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical Interface</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Physical interface</td>
<td>Name of the physical interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Enabled</td>
<td>State of the interface. Possible values are described in the “Enabled Field” section under Common Output Fields Description.</td>
<td>All levels</td>
</tr>
<tr>
<td>Interface index</td>
<td>Physical interface's index number, which reflects its initialization sequence.</td>
<td><code>detail extensive none</code></td>
</tr>
</tbody>
</table>

### Table 150: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic statistics</td>
<td>Number and rate of bytes and packets received and transmitted on the physical interface.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>

**NOTE:** With static NAT configured as basic NAT44 or destination NAT44 on MX Series routers with MS-MICs and MS-MPCs, the Input bytes field might show 16 more bytes than the Output bytes field. This is caused by the accounting of 16 bytes of the Juniper Forwarding Module cookie.

- **Input bytes**—Number of bytes received on the interface.
- **Output bytes**—Number of bytes transmitted on the interface.
- **Input packets**—Number of packets received on the interface.
- **Output packets**—Number of packets transmitted on the interface.

show interfaces (Aggregated Ethernet)

**Syntax**

```
show interfaces ae
  <number>
  <brief | detail | extensive | terse>
  <descriptions>
  <media>
  <snmp-index snmp-index>
  <statistics>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

(M Series, T Series, MX Series, and PTX Series routers) Display status information about the specified aggregated Ethernet interfaces.

**Options**

- **ae**—Display standard information about the specified aggregated Fast Ethernet or Gigabit Ethernet interface.
- **number**—Display the specified level of output.
- **brief | detail | extensive | terse**—(Optional) Display interface description strings.
- **descriptions**—(Optional) Display media-specific information.
- **media**—(Optional) Display information for the specified SNMP index of the interface.
- **statistics**—(Optional) Display static interface statistics.

**NOTE:** On Junos OS Evolved, in untagged aggregated ethernet (ae) interfaces with no logical interface configuration, the ae interface will not be shown as "down" and the speed will not be shown as "unspecified." The speed will be the aggregate speed of all the child member interfaces which are "up." In Junos OS, the speed is shown as "unspecified" in this case.

<tr>
<td></td>
<td><strong>NOTE:</strong> In DPCs that are not of the enhanced type, such as DPC 40x1GE R, DPCE 20x1GE + 2x10GE R, or DPCE 40x1GE R, you might notice a discrepancy in the output of the <code>show interfaces</code> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs.</td>

show interfaces demux0 (Demux Interfaces)

Syntax

```
show interfaces demux0.logical-interface-number
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

Release Information

Command introduced in Junos OS Release 9.0.

Description

(MX Series and M Series routers only) Display status information about the specified demux interface.

Options

- `none`—Display standard information about the specified demux interface.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about network interfaces.
- `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

Required Privilege

Level

view

show interfaces diagnostics optics (Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, and Virtual Chassis Port)

Syntax

show interfaces diagnostics optics interface-name

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for PTX Series routers.

Description

Display diagnostics data, warnings, and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, or Virtual Chassis port interfaces.

Options

interface-name—Interface name. For example:

| ge-fpc/pic/port      |
| et-fpc/pic/port      |
| et-fpc/pic/port:channel |
| xe-fpc/pic/port      |
| vcp-fpc/pic/port     |

Additional Information

The transceivers are polled in 1-second intervals for diagnostics data, warnings, and alarms. The alarms do not cause the links to go down or the LEDs to change color, nor generate SNMP traps. Changes in alarm and warning status generate system log messages.

Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transceiver vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a device is not working.

NOTE: Some transceivers do not support all optical diagnostics features described in the output fields.

If optics measures transmit or receive power as zero, then, the measured power is displayed as 0.000 mW / - Inf dBm

You can configure the P2-10G-40G-QSFPP PIC to operate either in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode. When the PIC is in 40-Gigabit Ethernet mode, you must execute the `show interfaces diagnostics optics et-fpc/pic/port` command. The output of this command displays the diagnostic optics information about the corresponding 40-Gigabit Ethernet port of the PIC. However, when the PIC is in 10-Gigabit Ethernet mode, you must execute the `show interfaces diagnostics optics et-fpc/pic/port:channel` command.
The output of this command displays the diagnostic optics information about the corresponding 10-Gigabit Ethernet port of the PIC. For information about the P2-10G-40G-QSFPP PIC, see “P2-10G-40G-QSFPP PIC Overview” on page 428.

show interfaces (far-end-interval)

Syntax

```
show interfaces far-end-interval interface-fpc/pic/port
```

Release Information

Command introduced in Junos OS Release 9.4.

Description

On channelized interfaces, display the far end interval data for the specified interface.

Required Privilege Level

view

List of Sample Output

show interfaces far-end-interval coc12-5/2/0 on page 2041
show interfaces far-end-interval coc1-5/2/1:1 on page 2042

Output Fields

Table 159 on page 2041 lists the output fields for the `show interfaces far-end-interval` command. Output fields are listed in the approximate order in which they appear.

```

**show interfaces (Fast Ethernet)**

**Syntax**

```plaintext
show interfaces interface-type
  <brief | detail | extensive | terse>
  <descriptions>
  <media>
  <snmp-index snmp-index>
  <statistics>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

Display status information about the specified Fast Ethernet interface.

**Options**

- `interface-type`—On M Series and T Series routers, the interface type is `fe-fpc/pic/port`.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about network interfaces.
- `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

**Required Privilege Level**

`view`

**List of Sample Output**

- `show interfaces (Fast Ethernet)` on page 2056
- `show interfaces brief (Fast Ethernet)` on page 2057
- `show interfaces detail (Fast Ethernet)` on page 2057
- `show interfaces extensive (Fast Ethernet)` on page 2057

**Output Fields**

Table 160 on page 2043 lists the output fields for the `show interfaces` (Fast Ethernet) command. Output fields are listed in the approximate order in which they appear.

### Table 160: show interfaces Fast Ethernet Output Fields

<tr>
<td><strong>Source filtering</strong></td>
<td>Source filtering status: Enabled or Disabled.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>LAN-PHY mode</strong></td>
<td>10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>WAN-PHY mode</strong></td>
<td>10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>Unidirectional</strong></td>
<td>Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>Flow control</strong></td>
<td>Flow control status: Enabled or Disabled.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>Auto-negotiation</strong></td>
<td>(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>Remote-fault</strong></td>
<td>(Gigabit Ethernet interfaces) Remote fault status:</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>Device flags</strong></td>
<td>Information about the physical device. Possible values are described in the “Device Flags” section under Common Output Fields Description.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>Interface flags</strong></td>
<td>Information about the interface. Possible values are described in the “Interface Flags” section under Common Output Fields Description.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>Link flags</strong></td>
<td>Information about the link. Possible values are described in the “Links Flags” section under Common Output Fields Description.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>Wavelength</strong></td>
<td>(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).</td>
<td>All levels</td>
</tr>
</tbody>
</table>
Table 160: show interfaces Fast Ethernet Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).</td>
<td>All levels</td>
</tr>
<tr>
<td>CoS queues</td>
<td>Number of CoS queues configured.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td>Schedulers</td>
<td>(Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.</td>
<td>extensive</td>
</tr>
<tr>
<td>Hold-times</td>
<td>Current interface hold-time up and hold-time down, in milliseconds.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td>Current address</td>
<td>Configured MAC address.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td>Hardware address</td>
<td>Hardware MAC address.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td>Last flapped</td>
<td>Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago). For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).</td>
<td>detail extensive none</td>
</tr>
<tr>
<td>Input Rate</td>
<td>Input rate in bits per second (bps) and packets per second (pps).</td>
<td>None specified</td>
</tr>
<tr>
<td>Output Rate</td>
<td>Output rate in bps and pps.</td>
<td>None specified</td>
</tr>
<tr>
<td>Statistics last cleared</td>
<td>Time when the statistics for the interface were last set to zero.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>

Traffic statistics
- **Input bytes**—Number of bytes received on the interface.
- **Output bytes**—Number of bytes transmitted on the interface.
- **Input packets**—Number of packets received on the interface.
- **Output packets**—Number of packets transmitted on the interface.

Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.

For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the `show interfaces` command.
### Table 160: show interfaces Fast Ethernet Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input errors</strong></td>
<td>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Framing errors</strong>—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Runts</strong>—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Policed discards</strong>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L3 incompletes</strong>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code> statement.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 channel errors</strong>—Number of times the software did not find a valid logical interface for an incoming frame.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 mismatch timeouts</strong>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO errors</strong>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
</tbody>
</table>
Table 160: show interfaces Fast Ethernet Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output errors</td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly. Increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Errors—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MTU errors—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Resource errors—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td>Egress queues</td>
<td>Total number of egress queues supported on the specified interface.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Queue counters</td>
<td>CoS queue number and its associated user-configured forwarding class name.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>(Egress)</td>
<td>• Queued packets—Number of queued packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Transmitted packets—Number of transmitted packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Dropped packets—Number of packets dropped by the ASIC's RED mechanism.</td>
<td></td>
</tr>
</tbody>
</table>
### Table 160: show interfaces Fast Ethernet Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ingress queues</td>
<td>Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.</td>
<td>extensive</td>
</tr>
<tr>
<td>Queue counters (Ingress)</td>
<td>CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Queued packets</strong>—Number of queued packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Transmitted packets</strong>—Number of transmitted packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Dropped packets</strong>—Number of packets dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td>Active alarms and Active defects</td>
<td>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <strong>None</strong> or <strong>Link</strong>.</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>None</strong>—There are no active defects or alarms.</td>
<td>none</td>
</tr>
<tr>
<td></td>
<td>• <strong>Link</strong>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td>OTN FEC statistics</td>
<td>The forward error correction (FEC) counters provide the following statistics.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Corrected Errors</strong>—The count of corrected errors in the last second.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Corrected Error Ratio</strong>—The corrected error ratio in the last 25 seconds. For example, 1e−7 is 1 error per 10 million bits.</td>
<td></td>
</tr>
<tr>
<td>PCS statistics</td>
<td>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Bit errors</strong>—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errored blocks</strong>—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.</td>
<td></td>
</tr>
</tbody>
</table>

<td>Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</td>
<td></td>
</tr>
<tr>
<td><strong>Input DA rejects</strong></td>
<td>Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).</td>
<td></td>
</tr>
<tr>
<td><strong>Input SA rejects</strong></td>
<td>Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</td>
<td></td>
</tr>
<tr>
<td><strong>Output packet count</strong></td>
<td>Number of packets that the filter has given to the MAC hardware.</td>
<td></td>
</tr>
<tr>
<td><strong>Output packet pad count</strong></td>
<td>Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</td>
<td></td>
</tr>
<tr>
<td><strong>Output packet error count</strong></td>
<td>Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</td>
<td></td>
</tr>
<tr>
<td><strong>CAM destination filters, CAM source filters</strong></td>
<td>Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</td>
<td></td>
</tr>
</tbody>
</table>

**PMA PHY** (10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:  
- **Seconds**—Number of seconds the defect has been active.  
- **Count**—Number of times that the defect has gone from inactive to active.  
- **State**—State of the error. Any state other than **OK** indicates a problem.  

Subfields are:  
- **PHY Lock**—Phase-locked loop  
- **PHY Light**—Loss of optical signal

)
Release Information
Command introduced before Junos OS Release 7.4 for Gigabit interfaces.
Command introduced in Junos OS Release 8.0 for 10 Gigabit interfaces.
Command modified in Junos OS Release 9.5 for SRX Series devices.
Command introduced in Junos OS Release 18.1 for Gigabit interfaces.

Description
Display status information about the specified Gigabit Ethernet interface.

(M320, M120, MX Series, and T Series routers only) Display status information about the specified 10-Gigabit Ethernet interface.

Display the IPv6 interface traffic statistics about the specified Gigabit Ethernet interface for MX Series routers. The input and output bytes (bps) and packets (pps) rates are not displayed for IFD and local traffic.

Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

NOTE: On SRX Series appliances, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

Starting in Junos OS Release 18.4R1, Output fields Next-hop and vpls-status is displayed in the show interfaces interface name detail command, only for Layer 2 protocols on MX480 routers.

Options
For Gigabit interfaces:

ge-fpc/pic/port—Display standard information about the specified Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For 10 Gigabit interfaces:

xe-fpc/pic/port—Display standard information about the specified 10-Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.
media—(Optional) Display media-specific information about network interfaces.

snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For SRX interfaces:

- interface-name—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
  - at-pim/0/port—ATM-over-ADSL or ATM-over-SHDSL interface.
  - ce1-pim/0/port—Channelized E1 interface.
  - cl-0/0/8—3G wireless modem interface for SRX320 devices.
  - ct1-pim/0/port—Channelized T1 interface.
  - dl0—Dialer Interface for initiating ISDN and USB modem connections.
  - e1-pim/0/port—E1 interface.
  - e3-pim/0/port—E3 interface.
  - fe-pim/0/port—Fast Ethernet interface.
  - ge-pim/0/port—Gigabit Ethernet interface.
  - se-pim/0/port—Serial interface.
  - t1-pim/0/port—T1 (also called DS1) interface.
  - t3-pim/0/port—T3 (also called DS3) interface.
  - wx-slot/0/0—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

- interface-name—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
  - at-pim/0/port—ATM-over-ADSL or ATM-over-SHDSL interface.
  - ce1-pim/0/port—Channelized E1 interface.
  - cl-0/0/8—3G wireless modem interface for SRX320 devices.
  - ct1-pim/0/port—Channelized T1 interface.
  - dl0—Dialer Interface for initiating ISDN and USB modem connections.
  - e1-pim/0/port—E1 interface.
  - e3-pim/0/port—E3 interface.
  - fe-pim/0/port—Fast Ethernet interface.
  - ge-pim/0/port—Gigabit Ethernet interface.
- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

**Additional Information**
In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.

**Output Fields**  
Table 161 on page 2065 describes the output fields for the `show interfaces` (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see Table 162 on page 2092.
### Table 161: show interfaces (Gigabit Ethernet) Output Fields

</tr>
</tbody>
</table>
### Table 161: `show interfaces (Gigabit Ethernet)` Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Traffic statistics</strong></td>
<td>Number and rate of bytes and packets received and transmitted on the physical interface.</td>
<td><em>detail extensive</em></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input bytes</strong>—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output bytes</strong>—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input packets</strong>—Number of packets received on the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packets</strong>—Number of packets transmitted on the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For more information, see Table 31 under the <code>show interfaces</code> command.</td>
<td></td>
</tr>
<tr>
<td><strong>Input errors</strong></td>
<td>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td><em>extensive</em></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Framing errors</strong>—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Runt</strong>—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Policed discards</strong>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L3 incompletes</strong>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code> statement.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 channel errors</strong>—Number of times the software did not find a valid logical interface for an incoming frame.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 mismatch timeouts</strong>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO errors</strong>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
</tbody>
</table>
Table 161: show interfaces (Gigabit Ethernet) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output errors</td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Errors—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the Drops field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number must always be 0. If it is nonzero, there is a software bug.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FiFO errors—Number of FiFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MTU errors—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Resource errors—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td>Egress queues</td>
<td>Total number of egress queues supported on the specified interface.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>

NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the `show interfaces` command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs.
Table 161: show interfaces (Gigabit Ethernet) Output Fields (continued)

</table>
| Queue counters (Egress)     | CoS queue number and its associated user-configured forwarding class name.  
  • Queued packets—Number of queued packets.  
  • Transmitted packets—Number of transmitted packets.  
  • Dropped packets—Number of packets dropped by the ASIC’s RED mechanism.  
  **NOTE:** Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the Dropped packets field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs. | detail extensive |
| Ingress queues              | Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.                                                                                                            | extensive       |
| Queue counters (Ingress)    | CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.  
  • Queued packets—Number of queued packets.  
  • Transmitted packets—Number of transmitted packets.  
  • Dropped packets—Number of packets dropped by the ASIC’s RED mechanism. | extensive       |
| Active alarms and Active defects | Ethernet-specific defects that can prevent the interface from passing packets.  
  When a defect persists for a certain amount of time, it is promoted to an alarm.  
  Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface.  
  These fields can contain the value None or Link.  
  • None—There are no active defects or alarms.  
  • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. | detail extensive none |
| Interface transmit statistics | (On MX Series devices) Status of the interface-transmit-statistics configuration: Enabled or Disabled.  
  • Enabled—When the interface-transmit-statistics statement is included in the configuration. If this is configured, the interface statistics show the actual transmitted load on the interface.  
  • Disabled—When the interface-transmit-statistics statement is not included in the configuration. If this is not configured, the interface statistics show the offered load on the interface. | detail extensive |
| OTN FEC statistics          | The forward error correction (FEC) counters provide the following statistics:  
  • Corrected Errors—Count of corrected errors in the last second.  
  • Corrected Error Ratio—Corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits. | detail extensive |
### Table 161: show interfaces (Gigabit Ethernet) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PCS statistics</strong></td>
<td>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Bit errors</strong>—Number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errored blocks</strong>—Number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Link Degrade</strong></td>
<td>Shows the link degrade status of the physical link and the estimated bit error rates (BERs). This field is available only for the PICs supporting the physical link monitoring feature.</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Link Monitoring</strong>—Indicates if physical link degrade monitoring is enabled on the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Enable</strong>—Indicates that link degrade monitoring has been enabled (using the link-degrade-monitor statement) on the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Disable</strong>—Indicates that link degrade monitoring has not been enabled on the interface. If link degrade monitoring has not been enabled, the output does not show any related information, such as BER values and thresholds.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Link Degrade Set Threshold</strong>—The BER threshold value at which the link is considered degraded and a corrective action is triggered.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Link Degrade Clear Threshold</strong>—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Estimated BER</strong>—The estimated bit error rate.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Link-degrade event</strong>—Shows link degrade event information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Seconds</strong>—Time (in seconds) elapsed after a link degrade event occurred.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Count</strong>—The number of link degrade events recorded.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>State</strong>—Shows the link degrade status (example: Defect Active).</td>
<td></td>
</tr>
</tbody>
</table>
Table 161: show interfaces (Gigabit Ethernet) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC statistics</td>
<td><strong>Receive and Transmit</strong> statistics reported by the PIC's MAC subsystem, including the following:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Total octets and total packets</strong>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <code>show interfaces</code> command.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Unicast packets, Broadcast packets, and Multicast packets</strong>—Number of unicast, broadcast, and multicast packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>CRC/Align errors</strong>—Total number of packets received that had a length (exceeding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO error</strong>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC control frames</strong>—Number of MAC control frames.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC pause frames</strong>—Number of MAC control frames with <strong>pause</strong> operational code.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Oversized frames</strong>—There are two possible conditions regarding the number of oversized frames:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Packet length exceeds interface MTU, or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Packet length exceeds MRU</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Jabber frames</strong>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Fragment frames</strong>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>VLAN tagged frames</strong>—Number of frames that are VLAN tagged. The system uses the TPID of 0xb100 in the frame to determine whether a frame is tagged or not.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the VLAN tagged frames field displays 0 when the <code>show interfaces</code> command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Code violations</strong>—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”</td>
<td></td>
</tr>
</tbody>
</table>

Table 161: show interfaces (Gigabit Ethernet) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter statistics</td>
<td>Receive and Transmit statistics reported by the PIC’s MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet’s source and destination MAC addresses to determine whether the packet may enter the system or be rejected.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input packet count</strong>—Number of packets received from the MAC hardware that the filter processed.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Input packet rejects</strong>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input DA rejects</strong>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input SA rejects</strong>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field must increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet count</strong>—Number of packets that the filter has given to the MAC hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet pad count</strong>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet error count</strong>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPCh hardware. On a normal system, the value of this field must not increment.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>CAM destination filters, CAM source filters</strong>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</td>
<td></td>
</tr>
<tr>
<td>---</td>
<td><strong>PMA PHY</strong> (10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</td>
<td>extensive</td>
</tr>
<tr>

</tbody>
</table>
### Schedulers

(Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.

### Hold-times

Current interface hold-time up and hold-time down, in milliseconds.

### Current address

Configured MAC address.

### Hardware address

Hardware MAC address.

### Last flapped

Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago). For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).

### Input Rate

Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.

### Output Rate

Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.

### Statistics last cleared

Time when the statistics for the interface were last set to zero.

### Egress account overhead

Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.

### Ingress account overhead

Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.

### Traffic statistics

Number and rate of bytes and packets received and transmitted on the physical interface.

- **Input bytes**—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.
- **Output bytes**—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.
- **Input packets**—Number of packets received on the interface.
- **Output packets**—Number of packets transmitted on the interface.
## Input Errors

Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:

- **Errors**—Sum of the incoming frame aborts and FCS errors.
- **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.
- **Framing errors**—Number of packets received with an invalid frame checksum (FCS).
- **Runts**—Number of frames received that are smaller than the runt threshold.
- **Policing discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.
- **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the `ignore-l3-incompletes` statement.
- **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame.
- **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.
- **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.
- **Resource errors**—Sum of transmit drops.

## Output Errors

Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:

- **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.
- **Errors**—Sum of the outgoing frame aborts and FCS errors.
- **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.
- **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.
- **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.
- **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.
- **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.
- **MTU errors**—Number of packets whose size exceeded the MTU of the interface.
- **Resource errors**—Sum of transmit drops.
**Egress queues** | Total number of egress queues supported on the specified interface. | detail extensive

**NOTE:** In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the `show interfaces` command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs.

<td></td>
</tr>
<tr>
<td></td>
<td>• none—FEC mode is not configured.</td>
<td></td>
</tr>
</tbody>
</table>
### OTN Rate
- **fixed-stuff-bytes**—Fixed stuff bytes 11.0957 Gbps.
- **no-fixed-stuff-bytes**—No fixed stuff bytes 11.0491 Gbps.
- **pass-through**—Enable OTN passthrough mode.
- **no-pass-through**—Do not enable OTN passthrough mode.

### OTN Line Loopback
- Status of the line loopback, if configured for the DWDM OTN PIC. Its value can be: **enabled** or **disabled**.

### OTN FEC statistics
- **Corrected Errors**—The count of corrected errors in the last second.
- **Corrected Error Ratio**—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.

### OTN FEC alarms
- OTN FEC excessive or degraded error alarms triggered on the interface.
  - **FEC Degraded**—OTU FEC Degraded defect.
  - **FEC Excessive**—OTU FEC Excessive Error defect.

### OTN OC
- OTN OC defects triggered on the interface.
  - **LOS**—OC Loss of Signal defect.
  - **LOF**—OC Loss of Frame defect.
  - **LOM**—OC Loss of Multiframe defect.
  - **Wavelength Lock**—OC Wavelength Lock defect.

### OTN OTU
- OTN OTU defects detected on the interface.
  - **AIS**—OTN AIS alarm.
  - **BDI**—OTN OTU BDI alarm.
  - **IAE**—OTN OTU IAE alarm.
  - **TTIM**—OTN OTU TTIM alarm.
  - **SF**—OTN ODU bit error rate fault alarm.
  - **SD**—OTN ODU bit error rate defect alarm.
  - **TCA-ES**—OTN ODU ES threshold alarm.
  - **TCA-SES**—OTN ODU SES threshold alarm.
  - **TCA-UAS**—OTN ODU UAS threshold alarm.
  - **TCA-BBE**—OTN ODU BBE threshold alarm.
  - **BIP**—OTN ODU BIP threshold alarm.
  - **BBE**—OTN ODU BBE threshold alarm.
  - **ES**—OTN OTU ES threshold alarm.
  - **SES**—OTN OTU SES threshold alarm.
  - **UAS**—OTN OTU UAS threshold alarm.

### Received DAPI
- Destination Access Port Interface (DAPI) from which the packets were received.

### Received SAPI
- Source Access Port Interface (SAPI) from which the packets were received.

### Transmitted DAPI
- Destination Access Port Interface (DAPI) to which the packets were transmitted.
### Transmitted SAPI
Source Access Port Interface (SAPI) to which the packets were transmitted.

### PCS statistics
(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.

- **Bit errors**—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.
- **Errored blocks**—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.

### MAC statistics
Receive and Transmit statistics reported by the PIC’s MAC subsystem, including the following:

- **Total octets and total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.
- **Unicast packets, Broadcast packets, and Multicast packets**—Number of unicast, broadcast, and multicast packets.
- **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCSoctets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
- **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.
- **MAC control frames**—Number of MAC control frames.
- **MAC pause frames**—Number of MAC control frames with pause operational code.
- **Oversized frames**—Number of frames that exceed 1518 octets.
- **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCSoctets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.
- **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCSoctets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.
- **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.
- **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”

### OTN Received Overhead Bytes
APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08

### OTN Transmitted Overhead Bytes
APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08
Filter statistics  Receive and Transmit statistics reported by the PIC’s MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet’s source and destination MAC addresses to determine whether the packet should enter the system or be rejected.

- **Input packet count**—Number of packets received from the MAC hardware that the filter processed.
- **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.
- **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).
- **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.
- **Output packet count**—Number of packets that the filter has given to the MAC hardware.
- **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.
- **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.
- **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.

**PMA PHY**  (10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:

- **Seconds**—Number of seconds the defect has been active.
- **Count**—Number of times that the defect has gone from inactive to active.
- **State**—State of the error. Any state other than **OK** indicates a problem.

- **UAS-PFE**—Unavailable seconds (far-end STS path)

---

**Autonegotiation information**

Information about link autonegotiation.

- **Negotiation status:**
  - **Incomplete**—Ethernet interface has the speed or link mode configured.
  - **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
  - **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.

- **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.

- **Link partner:**
  - **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
  - **Flow control**—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is **None**. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
  - **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.

- **Local resolution**—Information from the link partner:
  - **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
  - **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
Extensive Information about the configuration of the Packet Forwarding Engine:

- **Destination slot**—FPC slot number.

Extensive Information about the CoS queue for the physical interface.

- **CoS transmit queue**—Queue number and its associated user-configured forwarding class name.
- **Bandwidth %**—Percentage of bandwidth allocated to the queue.
- **Bandwidth bps**—Bandwidth allocated to the queue (in bps).
- **Buffer %**—Percentage of buffer space allocated to the queue.
- **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.
- **Priority**—Queue priority: **low** or **high**.
- **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.

<td>All levels</td>
</tr>
</tbody>
</table>
**VLAN-Tag**
Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags.

- **push**—An outer VLAN tag is pushed in front of the existing VLAN tag.
- **pop**—The outer VLAN tag of the incoming frame is removed.
- **swap**—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information.
- **push**—An outer VLAN tag is pushed in front of the existing VLAN tag.
- **push-push**—Two VLAN tags are pushed in from the incoming frame.
- **swap-push**—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame.
- **swap-swap**—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value.
- **pop-swap**—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame.
- **pop-pop**—Both the outer and inner VLAN tags of the incoming frame are removed.

**Demux:**
IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:

- Source Family Inet
- Destination Family Inet

**Encapsulation**
Encapsulation on the logical interface. All levels

**Protocol**
Protocol family. Possible values are described in the “Protocol Field” section under Common Output Fields Description.

**MTU**
Maximum transmission unit size on the logical interface.

**Maximum labels**
Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.

**Traffic statistics**
Number and rate of bytes and packets received and transmitted on the specified interface set.

- **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.
- **Input packets, Output packets**—Number of packets received and transmitted on the interface set.

**IPv6 transit statistics**
Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.

**Local statistics**
Number and rate of bytes and packets destined to the routing device.
**Transit statistics**  Number and rate of bytes and packets transiting the switch.  

**NOTE:** For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the **Output bytes** and **Output packets** interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.

</table>
For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. The following table describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). The **ge-0/3/0** interface is the inbound physical interface, and the **ge-0/0/0** interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit .50 (VLAN 50).

<td></td>
<td></td>
</tr>
<tr>
<td>• Packet length exceeds 1518 octets, or</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Packet length exceeds MRU</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Code violations—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 163: show interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter statistics</td>
<td><strong>Receive</strong> and <strong>Transmit</strong> statistics reported by the PIC’s MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet’s source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Input packet count</strong>—Number of packets received from the MAC hardware that the filter processed.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>- <strong>Input packet rejects</strong>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Input DA rejects</strong>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Input SA rejects</strong>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Output packet count</strong>—Number of packets that the filter has given to the MAC hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Output packet pad count</strong>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Output packet error count</strong>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>CAM destination filters, CAM source filters</strong>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</td>
<td></td>
</tr>

NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface
egress statistics displayed in the show interfaces command output might not accurately
reflect the traffic on the wire when output shaping is applied. Traffic management output
shaping might drop packets after they are tallied by the interface counters. For detailed
information, see the description of the logical interface Transit statistics fields in
Table 161 on page 2065.

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

(M Series, T Series, TX Matrix Plus, and PTX Series devices only) Display status information about the management Ethernet and internal Ethernet interfaces.

**Options**

em0 | fxp0 | mgmtre0—(M Series, MX Series, T Series, and PTX Series) Display standard information about the management Ethernet interface. For supported Ethernet interface by chassis and Routing Engine, see Supported Routing Engines by Router.

bcm0 | em0 | em1 | fxp1 | fxp2 | ixgbe0 | ixgbe1—(M Series, MX Series, T Series, and PTX Series) Display standard information about the internal Ethernet interfaces. See Supported Routing Engines by Router for the internal Ethernet interface names for each Routing Engine by hardware platform.

**NOTE:** On Junos OS Evolved, the ixgbe0 and ixgbe1 internal interfaces are deprecated.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.
media—(Optional) Display media-specific information.

snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

**show interfaces (PPPoE)**

**Syntax**

```
show interfaces pp0.logical
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

**Release Information**
Command introduced before Junos OS Release 7.4.

**Description**
(M120 routers, M320 routers, and MX Series routers only). Display status information about the PPPoE interface.

**Options**
- `pp0.logical`—Display standard status information about the PPPoE interface.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about PPPoE interfaces.
- `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.
- `statistics`—(Optional) Display PPPoE interface statistics.

**Required Privilege Level**
view

**List of Sample Output**
- `show interfaces (PPPoE) on page 2163`
- `show interfaces (PPPoE over Aggregated Ethernet) on page 2163`
- `show interfaces brief (PPPoE) on page 2164`
- `show interfaces detail (PPPoE) on page 2164`
- `show interfaces extensive (PPPoE on M120 and M320 Routers) on page 2165`

**Output Fields**
Table 165 on page 2157 lists the output fields for the `show interfaces (PPPoE)` command. Output fields are listed in the approximate order in which they appear.

**Table 165: show interfaces (PPPoE) Output Fields**

<table>

</table>

| Traffic statistics | Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled. | detail extensive |
| NOTE: | These fields include dropped traffic and exception traffic, as those fields are not separately defined. | |
|            | • Input bytes—Number of bytes received on the interface. | |
|            | • Output bytes—Number of bytes transmitted on the interface. | |
|            | • Input packets—Number of packets received on the interface. | |
|            | • Output packets—Number of packets transmitted on the interface. | |

| IPv6 transit statistics | Input errors on the interface: | extensive |
|                        | • Errors—Sum of incoming frame aborts and FCS errors. | |
|                        | • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism. | |
|                        | • Framing errors—Number of packets received with an invalid frame checksum (FCS). | |
|                        | • Runts—Number of frames received that are smaller than the runt threshold. | |
|                        | • Giants—Number of frames received that are larger than the giant threshold. | |
|                        | • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. | |
|                        | • Resource errors—Sum of B chip Tx drops and IXP Tx net transmit drops. | |

| Output errors | Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: | extensive |
|              | • Carrier transitions —Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIM is malfunctioning. | |
|              | • Errors—Sum of the outgoing frame aborts and FCS errors. | |
|              | • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism. | |
|              | • MTUErrors—Number of packets whose size exceeded the MTU of the interface. | |
|              | • Resource errors—Sum of B chip Tx drops and IXP Tx net transmit drops. | |

show interfaces interface-set (Ethernet Interface Set)

Syntax

```
show interfaces interface-set interface-set-name
  <detail | terse>
```

Release Information

Command introduced in Junos OS Release 8.5.

Description

Display information about the specified gigabit or 10-Gigabit Ethernet interface set.

You can also use the `show interfaces interface-set` command to display information about agent circuit identifier (ACI) interface sets.

Options

- `interface-set interface-set-name`—Display information about the specified Gigabit Ethernet, 10-Gigabit Ethernet, ACI, or ALI interface set.
- `detail | terse`—(Optional) Display the specified level of output.

Required Privilege

View

show interfaces interface-set queue

Syntax

```
show interfaces interface-set queue interface-set-name
<aggregate | remaining-traffic>
<forwarding-class class-name>
```

Release Information

Command introduced in Junos OS Release 8.5.

Description

Display information about the gigabit or 10-Gigabit Ethernet interface set queue. Supported in MX Series routers with enhanced queuing DPCs.

Options

- **interface-set-name**—(Optional) Display information about the specified gigabit or 10-Gigabit Ethernet interface set. Wildcard values can be used in the interface set name.
- **aggregate**—(Optional) Display the aggregated queuing statistics of all member logical interfaces for interface sets that have traffic-control profiles configured.
- **both-ingress-egress**—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics.
- **egress**—(Optional) Display egress queue statistics.
- **forwarding-class class-name**—(Optional) Display queuing statistics for the specified forwarding class.
- **ingress**—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics.
- **remaining-traffic**—(Optional) Display the queuing statistics of all member logical interfaces for interface sets that do not have traffic-control profiles configured.

Required Privilege

```
view
```

show interfaces interval

Syntax

```
show interfaces interval
<interface-name>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display the channel service unit (CSU) interface alarm and error count in 15-minute intervals for the past 24 hours. If the system has been operational for less than 24 hours, the maximum number of intervals available is displayed.

Options

```
interface-name—(Optional) Name of a particular interface.
```

Required Privilege

view

List of Sample Output

- show interfaces interval (Channelized OC12) on page 2182
- show interfaces interval (E3) on page 2182
- show interfaces interval (SONET/SDH) on page 2182

Output Fields

Table 168 on page 2180 lists the output fields for the show interfaces interval command. Output fields are listed in the approximate order in which they appear.

### Table 168: show interfaces interval Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical interface</td>
<td>Name of the interface.</td>
</tr>
<tr>
<td>SNMP ifindex</td>
<td>SNMP index number for the physical interface.</td>
</tr>
<tr>
<td>hh:mm-current</td>
<td>Time of day (in hours and minutes) at the beginning of the latest counter interval. The value of the latest counter interval is always less than 15 minutes.</td>
</tr>
<tr>
<td>hh:mm-hh:mm</td>
<td>Time of day (in hours and minutes) at the beginning and end of each 15-minute interval.</td>
</tr>
<tr>
<td>alarm or event: n</td>
<td>Count of alarms and events within each 15-minute interval. The specific alarm or event depends on the interface media type. For a description of the alarm or event listed, see the interface-type media field (for example, T1 media) under the show interfaces command for the particular interface type in which you are interested.</td>
</tr>
<tr>
<td>Interval Total</td>
<td>Sum of all the alarm and defect counters for the last 24-hour period.</td>
</tr>
</tbody>
</table>
### Table 168: show interfaces interval Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Interval Total</strong></td>
<td>Sum of all the alarm and defect counters for the last 24-hour period.</td>
</tr>
<tr>
<td><strong>Current Day Interval Total</strong></td>
<td>Sum of all the alarm and defect counters in the current day.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> The <strong>Current Day Interval</strong> output field is reset after 24 hours.</td>
</tr>
<tr>
<td><strong>Previous Day Interval Total</strong></td>
<td>Sum of all the alarm and defect counters in the previous day.</td>
</tr>
</tbody>
</table>
Sample Output

**show interfaces interval (Channelized OC12)**

```
user@host> show interfaces interval t3-0/3/0:0

show interfaces irb

Syntax

show interfaces irb
  <brief | detail | extensive | terse>
  <descriptions>
  <media>
  <snmp-index snmp-index>
  <statistics>

Release Information

Command introduced in Junos OS Release 8.4.

Description

Display integrated routing and bridging interfaces information.

Options

  brief | detail | extensive | terse—(Optional) Display the specified level of output.
  descriptions—(Optional) Display interface description strings.
  mac—Display hardware MAC address
  media—(Optional) Display media-specific information about network interfaces.
  snmp-index snmp-index—(Optional) Display information for the interface with the specified SNMP index.
  statistics—(Optional) Display static interface statistics.

Additional Information

Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another bridging domain that has a Layer 3 protocol configured.

<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>- Errors—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Framing errors—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Runts—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Giants—Number of frames received that are larger than the giant threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Resource errors—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td>Output errors</td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>- Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Errors—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- MTU errors—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Resource errors—Sum of transmit drops.</td>
<td></td>
</tr>

**show interfaces mac-database**

**Syntax**
```
show interfaces mac-database (ge-fpc/pic/port | ge-fpc/pic/port.n | aex | xe-fpc/pic/port | xe-fpc/pic/port.n | et-fpc/pic/port | et-fpc/pic/port.n) <mac-address mac-address>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Support for statement with the aex option introduced in Junos OS Release 15.1.

**Description**
(M Series, T Series, MX Series routers, and PTX Series Packet Transport Routers only)
Display media access control (MAC) address information for the specified interface.

**Options**
- `ge-fpc/pic/port`—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.
- `ge-fpc/pic/port.n`—Display MAC addresses that have been learned on a particular logical interface.
- `aex`—Display MAC addresses that have been learned on a particular aggregated Ethernet interface.
- `xe-fpc/pic/port`—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.
- `xe-fpc/pic/port.n`—Display MAC addresses that have been learned on a particular logical interface.
- `et-fpc/pic/port`—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.
- `et-fpc/pic/port.n`—Display MAC addresses that have been learned on a particular logical interface.
- `mac-address mac-address`—(Optional) Display detailed MAC address statistics, including policer information for ge, xe, and et interfaces.

**Additional Information**
On IQ2 PIC interfaces, the default value for maximum retention of entries in the MAC address table has changed, for cases in which the table is not full. The new holding time is 12 hours. The previous retention time of 3 minutes is still in effect when the table is full.

**Required Privilege Level**

**show interfaces mc-ae**

**Syntax**

```
show interfaces mc-ae
extensive
revertive-info
<id identifier unit number>
```

**Release Information**

- `revertive-info` statement introduced in Junos OS Release 13.3
- `extensive` statement introduced in Junos OS Release 16.1R1

**Description**

On MX Series routers with multichassis aggregated Ethernet (aeX) interfaces, displays information about the aeX interfaces.

**Options**

- `extensive`—(Optional) Display extensive information for multichassis aggregated Ethernet interface.
- `revertive-info`—(Optional) Display revertive mode information for multichassis aggregated Ethernet interface.
- `identifier`—(Optional) Identifier of the multichassis aggregated Ethernet interface.
- `number`—(Optional) Specify the logical interface by unit number.

**Required Privilege Level**

`view`

**Related Documentation**

- Configuring Multichassis Link Aggregation on MX Series Routers

**List of Sample Output**

- `show interfaces mc-ae` on page 2198
- `show interfaces mc-ae (Active/Active Bridging and VRRP over IRB on MX Series Routers)` on page 2199
- `show interfaces mc-ae revertive-info` on page 2199
- `show interfaces mc-ae extensive` on page 2199
- `show interfaces mc-ae extensive (MX Series Router after a configuration exchange error)` on page 2200

**Output Fields**

Table 171 on page 2197 lists the output fields for the `show interfaces mc-ae` command. Output fields are listed in the approximate order in which they appear.

*Table 171: show interfaces mc-ae Output Fields*

show interfaces transport pm

Syntax

```
show interfaces transport pm (all | optics | otn) (all | current | currentday | interval | previousday) (all | interface-name)
```

Release Information

Command introduced in Junos OS Release 14.2 on the PTX Series.
Command introduced in Junos OS Release 16.1 on the MX Series.

Description

Display diagnostic data, warnings, and alarms for transport performance monitoring interfaces.

Options

(all | optics | otn)—Display both optics and OTN information or either only optics or only OTN information.

(all | current | currentday | interval | previousday)—Display information for the current 15-minute interval, the current day, the ninety-six 15-minute intervals, and the previous day; information only for the current 15-minute interval; information only for the current 24 hours; information only for the ninety-six 15-minute intervals; information only for the previous day.

(all | interface-name)—Display information for all interfaces or only for the specified interface (for example, et-fpc/pic/port).

Required Privilege Level

**show l2-learning redundancy-groups**

**Syntax**
```
show l2-learning redundancy-groups
  logical-system [system-name | all]
  <redundancy-group-id [0 to 4294967294]>
  arp-statistics
  nd-statistics
  remote-macs
```

**Release Information**
- Command introduced in Junos OS Release 13.2.
- Support for logical systems added in Junos OS Release 14.1.
- Command introduced in Junos OS Release 15.1R1 for EX Series switches

**Description**
(MX Series routers only) Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch or logical systems on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.

**Options**
- `logical-system [system-name | all]` — (Optional) Display information for a specified logical system or all systems.
- `redundancy-group-id` — (Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.
- `arp-statistics` — (Optional) Count of ARP packets sent and received by the two MC-AE nodes.
- `nd-statistics` — (Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.
- `remote-macs` — (Optional) List of remote MAC addresses in the “Installed” state, as learned from the remote MC-AE node.

**Required Privilege Level**
view

```

Release Information

Command introduced in Junos OS Release 7.6.

```extensive```
statement introduced in Junos OS Release 16.1R1

Command introduced in Junos OS Release 10.0 for EX Series switches.

Command introduced in Junos OS Release 11.1 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Command introduced in Junos OS Release 14.2R3

Description

Display Link Aggregation Control Protocol (LACP) information about the specified aggregated Ethernet, Fast Ethernet, or Gigabit Ethernet interface.

Options

- **none**—Display LACP information for all interfaces.
- **interface-name**—(Optional) Display LACP information for the specified interface:
  - Aggregated Ethernet—`aenumber`
  - Fast Ethernet—`fe-fpc/pic/port`
  - Gigabit Ethernet—`ge-fpc/pic/port`
  - 10 Gigabit Ethernet—`xe-fpc/pic/port`
- **extensive**—Display LACP information for the interface in detail.

**NOTE:** The `show lacp interfaces` command returns the following error message if your system is not configured in either active or passive LACP mode:

“Warning: lACP subsystem not running – not needed by configuration”

Required Privilege Level

<td>All Levels</td>
</tr>
<tr>
<td></td>
<td>Aggregated interface value.</td>
<td>All Levels</td>
</tr>
</tbody>
</table>

LACP State

- **Role**—Role played by the interface. It can be one of the following:
  - **Actor**—Local device participating in LACP negotiation.
  - **Partner**—Remote device participating in LACP negotiation.

- **Exp**—Expired state. **Yes** indicates the actor or partner is in an expired state. **No** indicates the actor or partner is not in an expired state.

- **Def**—Default. **Yes** indicates that the actor’s receive machine is using the default operational partner information, administratively configured for the partner. **No** indicates the operational partner information in use has been received in an LACP PDU.

- **Dist**—Distribution of outgoing frames. **No** indicates distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is **Yes**.

- **Col**—Collection of incoming frames. **Yes** indicates collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is **No**.

- **Syn**—Synchronization. If the value is **Yes**, the link is considered synchronized. It has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is **No**, the link is not synchronized. It is currently not in the right aggregation.

- **Aggr**—Ability of aggregation port to aggregate (**Yes**) or to operate only as an individual link (**No**).

- **Timeout**—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or fast transmission rate, depending upon the expressed LACP timeout preference (**Long Timeout** or **Short Timeout**).

- **Activity**—Actor or partner’s port activity. **Passive** indicates the port’s preference for not transmitting LAC PDUs unless its partner’s control value is **Active**. **Active** indicates the port’s preference to participate in the protocol regardless of the partner’s control value.

- **Core isolation state down (CDN)**—LACP interface state. Down indicates the LACP interface is down because all the eBGP sessions for Ethernet VPN (EVPN) are down.
### Table 177: show lACP interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>

<tbody>
<tr>
<td>LACP Protocol</td>
<td>LACP protocol information for each aggregated interface:</td>
<td>All Levels</td>
</tr>
<tr>
<td></td>
<td>• Link state (active or standby) indicated in parentheses next to the interface when link protection is configured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Receive State</strong>—One of the following values:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Current</strong>—The state machine receives an LACP PDU and enters the <strong>Current</strong> state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Defaulted</strong>—If no LACP PDU is received before the timer for the <strong>Current</strong> state expires a second time, the state machine enters the <strong>Defaulted</strong> state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Expired</strong>—If no LACP PDU is received before the timer for the <strong>Current</strong> state expires once, the state machine enters the <strong>Expired</strong> state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Initialize</strong>—When the physical connectivity of a link changes or a Begin event occurs, the state machine enters the <strong>Initialize</strong> state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>LACP Disabled</strong>—If the port is operating in half duplex, the operation of LACP is disabled on the port, forcing the state to <strong>LACP Disabled</strong>. This state is similar to the <strong>Defaulted</strong> state, except that the port is forced to operate as an individual port.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Port Disabled</strong>—If the port becomes inoperable and a Begin event has not occurred, the state machine enters the <strong>Port Disabled</strong> state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Transmit State</strong>—Transmit state of state machine. One of the following values:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Fast Periodic</strong>—Periodic transmissions are enabled at a fast transmission rate.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>No Periodic</strong>—Periodic transmissions are disabled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Periodic Timer</strong>—Transitory state entered when the periodic timer expires.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Slow Periodic</strong>—Periodic transmissions are enabled at a slow transmission rate.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Mux State</strong>—State of the multiplexer state machine for the aggregation port. The state is one of the following values:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Attached</strong>—Multiplexer state machine initiates the process of attaching the port to the selected aggregator.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Collecting</strong>—<strong>Yes</strong> indicates that the receive function of this link is enabled with respect to its participation in an aggregation. Received frames are passed to the aggregator for collection. <strong>No</strong> indicates the receive function of this link is not enabled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Collecting Distributing</strong>—Collecting and distributing states are merged together to form a combined state (coupled control). Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Detached</strong>—Process of detaching the port from the aggregator is in progress.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Distributing</strong>—<strong>Yes</strong> indicates that the transmit function of this link is enabled with respect to its participation in an aggregation. Frames may be passed down from the aggregator’s distribution function for transmission. <strong>No</strong> indicates the transmit function of this link is not enabled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Waiting</strong>—Multiplexer state machine is in a holding process, awaiting an outcome.</td>
<td></td>
</tr>

**show lldp neighbors**

**Syntax**

```
show lldp neighbors
<interface interface-name>
```

**Release Information**

**Description**

Display information about LLDP neighbors.

*For information about interface names, see Interface Naming Overview. For information about interface names for TX Matrix routers, see TX Matrix Router Chassis and Interface Names. For information about FPC numbering on TX Matrix routers, see Routing Matrix with a TX Matrix Router FPC Numbering.*

For information about extended port names in the Junos Fusion technology, see Understanding Junos Fusion Ports.

**Options**

`interface interface-name`—(Optional) Display the neighbor information about a particular physical interface.

---

**NOTE:** Starting with Junos OS Release 14.2, you can also display LLDP neighbor details for management interfaces, such as `fxp` or `me`, on MX Series routers.

**Required Privilege Level**

view

```
show oam ethernet connectivity-fault-management delay-statistics

Syntax

```
show oam ethernet connectivity-fault-management delay-statistics
<count entry-count>
<local-mep mep-id>
<maintenance-association ma-name>
<maintenance-domain md-name>
<remote-mep remote-mep-id>
```

Release Information

Command introduced in Junos OS Release 9.5.
Command introduced in Junos OS Release 11.4 for EX Series switches.

Description

On MX Series routers with Ethernet interfaces on Dense Port Concentrators (DPCs),
display ETH-DM delay statistics.

On EX Series switches, display delay measurement results.

Options

- `count entry-count`—(Optional) Number of entries to display from the statistics table. The
  range of values is 1 through 100. The default value is 100 entries.

- `local-mep mep-id`—(Optional) Numeric identifier of the local MEP. On MX Series routers,
  the range of values is 1 through 8192. On EX Series switches, the range of values is 1
  through 8191.

- `maintenance-association ma-name`—Name of an existing CFM maintenance association.

- `maintenance-domain md-name`—Name of an existing connectivity fault management
  (CFM) maintenance domain.

- `remote-mep remote-mep-id`—(Optional) Numeric identifier of the remote MEP. On MX
  Series routers, the range of values is 1 through 8192. On EX Series switches, the range
  of values is 1 through 8191.

Required Privilege Level

show oam ethernet connectivity-fault-management forwarding-state

**Syntax**
```
show oam ethernet connectivity-fault-management forwarding-state
  interface interface-name | instance instance-name
  <brief | detail | extensive>
```

**Release Information**
Command introduced in Junos OS Release 8.4.

**Description**
On M7i and M10i with the Enhanced CFEB (CFEB-E), M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management forwarding state information for Ethernet interfaces.

**Options**
- `interface interface-name`—Display forwarding state information for the specified Ethernet interface only.
- `instance instance-name`—Display forwarding state information for the specified forwarding instance only.
- `brief | detail | extensive`—(Optional) Display the specified level of output.

**Required Privilege Level**
view

**show oam ethernet connectivity-fault-management interfaces**

**Syntax**

```
show oam ethernet connectivity-fault-management interfaces
<ethernet-interface-name>
<level md-level>
<brief | detail | extensive>
```

**Release Information**

Command introduced in Junos OS Release 8.4.
Support for ITU-T Y.1731 frame delay measurement added in Junos OS Release 9.5.
Support for ITU-T Y.1731 Ethernet synthetic frame loss measurement (ETH-SLM) added in Junos OS Release 13.2 for ACX Series and MX Series routers.

**Description**

On M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for Ethernet interfaces.

In addition, for Ethernet interfaces on MX Series routers, also display any ITU-T Y.1731 frame delay measurement (ETH-DM) frame counts when `detail` or `extensive` mode is specified.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

**Options**

- **brief | detail | extensive** — (Optional) Specified level of output.
- **ethernet-interface-name** — (Optional) CFM information only for CFM entities attached to the specified Ethernet interface.
- **level md-level** — (Optional) CFM information for CFM identities enclosed within a maintenance domain of the specified level.

**Required Privilege**

- **view**

**show oam ethernet connectivity-fault-management linktrace path-database**

**Syntax**
```
show oam ethernet connectivity-fault-management linktrace path-database mac-address
maintenance-association ma-name maintenance-domain md-name
```

**Release Information**
Command introduced in Junos OS Release 9.0.

**Description**
On M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management maintenance linktrace database information.

**Options**
- `mac-address`—Display connectivity fault management path database information for the specified MAC address of the remote host.
- `maintenance-association ma-name`—Display connectivity fault management path database information for the specified maintenance association.
- `maintenance-domain md-name`—Display connectivity fault management path database information for the specified maintenance domain.

**Required Privilege Level**
view

show oam ethernet connectivity-fault-management linktrace path-database on page 2256
show oam ethernet connectivity-fault-management linktrace path-database (Two traceroute Commands) on page 2256

**Output Fields**
Table 186 on page 2255 lists the output fields for the `show oam ethernet connectivity-fault-management linktrace path-database` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linktrace to</td>
<td>MAC address of the 802.1ag node to which the linktrace message is targeted.</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface used by the local MEP to send the linktrace message (LTM).</td>
</tr>
<tr>
<td>Maintenance Domain</td>
<td>Maintenance domain identifier specified in the traceroute command.</td>
</tr>
<tr>
<td>Maintenance Association</td>
<td>Maintenance association identifier specified in the traceroute command.</td>
</tr>
<tr>
<td>Level</td>
<td>Maintenance domain level configured for the maintenance domain.</td>
</tr>
<tr>
<td>Local Mep</td>
<td>MEP identifier of the local MEP originating the linktrace.</td>
</tr>
</tbody>
</table>
Table 186: show oam ethernet connectivity-fault-management linktrace path-database Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hop</td>
<td>Sequential hop count of the linktrace path.</td>
</tr>
<tr>
<td>TTL</td>
<td>Number of hops remaining in the linktrace message (LTM). The time to live (TTL) is decremented at each hop.</td>
</tr>
<tr>
<td>Source MAC address</td>
<td>MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.</td>
</tr>
<tr>
<td>Next hop MAC address</td>
<td>MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.</td>
</tr>
<tr>
<td>Transaction Identifier</td>
<td>4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all maintenance domains. Use the transaction identifier to match an incoming linktraceresponses (LTR), with a previously sent LTM.</td>
</tr>
</tbody>
</table>

Chapter 41: Operational Commands
**show oam ethernet connectivity-fault-management loss-statistics**

**Syntax**
```
show oam ethernet connectivity-fault-management loss-statistics
maintenance-domain md-name
maintenance-association ma-name
<count entry-count>
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

**Release Information**
Command introduced in Junos OS Release 11.1.

**Description**
On MX Series and ACX series routers with Ethernet interfaces, display ETH-LM statistics for on-demand mode only.

**Options**
- `maintenance-domain md-name`—Name of an existing CFM maintenance domain.
- `maintenance-association ma-name`—Name of an existing CFM maintenance association.
- `count entry-count`—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.
- `local-mep local-mep-id`—(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8191.
- `remote-mep remote-mep-id`—(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8191.

**Required Privilege Level**
view

**Related Documentation**
- show oam ethernet connectivity-fault-management mep-statistics on page 2274

**Output Fields**
Table 187 on page 2258 lists the output fields for the `show oam ethernet connectivity-fault-management loss-statistics` command. Output fields are listed in the approximate order in which they appear.

## show oam ethernet connectivity-fault-management mep-database

### Syntax
```
show oam ethernet connectivity-fault-management mep-database
maintenance-domain domain-name
maintenance-association ma-name
<local-mep local-mep-id>
<remote-mep remote-mep-id>
extensive
```

### Release Information
- Command introduced in Junos OS Release 8.4.
- Support for ITU-T Y.1731 frame delay measurement added in Junos OS Release 9.5.
- Support for ITU-T Y.1731 synthetic frame loss measurement added in Junos OS Release 13.2 for MX Series routers.
- Support for ITU-T Y.1731 ethernet expected defect function (ETH-ED) added in Junos OS Release 19.1 for MX Series routers.

**NOTE:** Ethernet expected defect function (ETH-ED) will be supported on all MX series routers only when enhanced-ip mode is enabled. ETH-ED will not be supported if CFM is running in centralized mode.

### Description
On M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M320, M120, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

In addition, on M120, M320, and MX series routers, also display port status TLV, interface status TLV, and action profile information.

In addition, for Ethernet interfaces on MX Series routers, also display any ITU-T Y.1731 frame delay measurement (ETH-DM) frame counts.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

### Options
- `maintenance-association ma-name`—Name of the maintenance association.
- `maintenance-domain domain-name`—Name of the maintenance domain.
- `local-mep-id`—(Optional) Numeric identifier of local MEP.
- `remote-mep-id`—(Optional) Numeric identifier of the remote MEP.

### Required Privilege Level
- `view`

Table 188: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Connection Protection TLV                   | Status of the connection protection TLV, if configured on the MEP interface: no, yes  
If yes, then the transmitted connection protection TLV is decoded and the following three fields are displayed: Prefer me, Protection in use, FRR Flag                                                                                                                                                                                                 |
| Prefer me                                   | If set to yes, the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to remote side.  
Its value can be yes or no.                                                                                                                                                                                                                                                                              |
| Protection in use                           | Used for protection decision coordination. Its value is set to yes if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path.  
Its value can be yes or no.                                                                                                                                                                                                                                                                              |
| FRR Flag                                    | LSR/LER forwarding the CCM Frame into a bypass tunnel is set.  
Its value can be yes or no.                                                                                                                                                                                                                                                                                                                                 |
<p>| MEP identifier                              | Maintenance association end point (MEP) identifier.                                                                                                                                                                                                                                                                                                      |
| Direction                                   | MEP direction configured.                                                                                                                                                                                                                                                                                                                                 |
| MAC address                                 | MAC address configured for the MEP.                                                                                                                                                                                                                                                                                                                    |
| Auto-discovery                              | Whether automatic discovery is enabled or disabled.                                                                                                                                                                                                                                                                                                  |
| Priority                                    | Priority used for CCMs and linktrace messages transmitted by the MEP.                                                                                                                                                                                                                                                                                 |
| Interface name                              | Interface identifier.                                                                                                                                                                                                                                                                                                                                 |
| Interface status                            | Local interface status.                                                                                                                                                                                                                                                                                                                                 |
| Link status                                 | Local link status.                                                                                                                                                                                                                                                                                                                                    |
| Remote MEP not receiving CCM                | Whether the remote MEP is not receiving CCMs.                                                                                                                                                                                                                                                                                                        |
| Erroneous CCM received                      | Whether erroneous CCMs have been received.                                                                                                                                                                                                                                                                                                             |
| Cross-connect CCM received                  | Whether cross-connect CCMs have been received.                                                                                                                                                                                                                                                                                                       |
| RDI sent by some MEP                        | Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPS.                                                                                                                                                                           |
| CCMs sent                                   | Number of CCMs transmitted.                                                                                                                                                                                                                                                                                                                          |</p>

maintenance-domain md5 maintenance-association ma5
If connection-protection is not enabled on down MEPs, but connection-protection TLV
is used, MX always sets the protection-in-use flag in connection-protection tlv, while
CCMs are sent out. During reversion, this is an indicator to the receiver that protect-path
is in use, otherwise the peer (receiver) assumes working is active and reversion does not
work as expected. Setting this bit does not affect protection-switching/traffic-loss.

**show oam ethernet connectivity-fault-management mep-statistics**

**Syntax**
```
show oam ethernet connectivity-fault-management mep-statistics
 maintenance-domain md-name
 maintenance-association ma-name
 <mep mep-id>
 <remote-mep remote-mep-id>
 <count entry-count>
```

**Release Information**
- Command introduced in Junos OS Release 9.5.
- Command introduced in Junos OS Release 11.4 for EX Series switches.
- Support for ITU-T Y.1731 Ethernet synthetic frame loss measurement (ETH-SLM) added in Junos OS Release 13.2 for MX Series routers.

**Description**
On MX Series and ACX Series routers and EX Series switches with Ethernet interfaces, display ETH-DM statistics and ETH-DM frame counts.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

**Options**
- **maintenance-domain md-name**—Name of an existing CFM maintenance domain.
- **maintenance-association ma-name**—Name of an existing CFM maintenance association.
- **mep mep-id**—(Optional) Numeric identifier of the local MEP. The range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.
- **remote-mep remote-mep-id**—(Optional) Numeric identifier of the remote MEP. The range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.
- **count entry-count**—(Optional) Number of entries to display from the statistics table. The range of values is 1 through 100. The default value is 100 entries.

**Required Privilege**
- **Level** view

**show oam ethernet connectivity-fault-management path-database**

**Syntax**
```
show oam ethernet connectivity-fault-management path-database
<host-mac-address>
<maintenance-association ma-name>
<maintenance-domain domain-name>
```

**Release Information**
Command introduced in Junos OS Release 8.4.

**Description**
On M7i and M10i with Enhanced CFEB (CFEB-E), M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management path database information for a host configured with an MEP.

**Options**
- `host-mac-address`—(Optional) Display connectivity fault management path database information for a specified Ethernet host.
- `maintenance-association ma-name`—(Optional) Display connectivity fault management path database information for the specified maintenance association.
- `maintenance-domain domain-name`—(Optional) Display connectivity fault management path database information for the specified maintenance domain.

**Required Privilege Level**
view

**List of Sample Output**
`show oam ethernet connectivity-fault-management path-database on page 2287`

**Output Fields**
`Table 190 on page 2286 lists the output fields for the show oam ethernet connectivity-fault-management path-database command. Output fields are listed in the approximate order in which they appear.`

### Sample Output

```
user@host> show oam ethernet connectivity-fault-management path-database
maintenance-domain md1 maintenance-association ma1 00:05:85:79:39:ef

Linktrace to 00:05:85:79:39:ef, Interface : ge-3/0/0
  Maintenance Domain: md1, Level: 7
  Maintenance Association: ma1, Local Mep: 201
```
**show oam ethernet connectivity-fault-management policer**

**Syntax**

```
show oam ethernet connectivity-fault-management policer <maintenance-domain md-name> <maintenance-association ma-name>
```

**Release Information**

Command introduced in Junos OS Release 10.0.

**Description**

**Options**

This command has the following options:

- `maintenance-domain md-name`—Name of an existing CFM maintenance domain. If this option is not specified, policer statistics are displayed for all maintenance associations for all maintenance domains.

- `maintenance-association ma-name`—Name of an existing CFM maintenance association. If this option is not specified, policer statistics are displayed for all maintenance associations for given maintenance domain. This option cannot be specified without specifying maintenance-domain name.

**Required Privilege Level**

view

**Related Documentation**

- clear oam ethernet connectivity-fault-management policer on page 1644

**List of Sample Output**

show oam ethernet connectivity-fault-management sla-iterator-statistics

Syntax

```
show oam ethernet connectivity-fault-management sla-iterator-statistics
maintenance-domain md-name
maintenance-association ma-name
sla-iterator sla-iterator
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

Release Information

Command introduced in Junos OS Release 11.4 for EX Series switches.
Command introduced in Junos OS Release 12.2 for ACX Series routers.
Command introduced in Junos OS Release 13.2 for MX Series routers (not on MPC3E Hyperion cards).

Description

Display the Ethernet Operation, Administration, and Maintenance (OAM) service-level agreement (SLA) iterator statistics.

Options

- `maintenance-domain md-name`—Name of an existing connectivity fault management (CFM) maintenance domain.
- `maintenance-association ma-name`—Name of an existing CFM maintenance association.
- `sla-iterator sla-iterator`—Name of the iterator profile.
- `local-mep local-mep-id`—(Optional) Numeric identifier of the local MEP. The range of values is 1 through 8191.
- `remote-mep remote-mep-id`—(Optional) Numeric identifier of the remote MEP. The range of values is 1 through 8192.

Required Privilege

<count entry-count>
maintenance-domain md-name
<remote-mep remote-mep-id>
```

Release Information
Command introduced in Junos OS Release 13.2 for MX Series routers.

Description
On MX Series routers with Modular Port Concentrators (MPCs) with Ethernet interfaces, display the on-demand ETH-SLM statistics.

Options
- **count entry-count**—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.
- **local-mep local-mep-id**—(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8192.
- **maintenance-association ma-name**—Name of an existing CFM maintenance association.
- **maintenance-domain md-name**—Name of an existing connectivity fault management (CFM) maintenance domain.
- **remote-mep remote-mep-id**—(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8192.

List of Sample Output
Table 193 on page 2302 lists the output fields for the show oam ethernet connectivity-fault-management synthetic-loss-statistics command. Output fields are listed in the approximate order in which they appear.
### Table 193: show oam ethernet connectivity-fault-management synthetic-loss-statistics Output Fields

<table>
<thead>
<tr>
<th>Output Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEP identifier</td>
<td>Maintenance association end point (MEP) numeric identifier.</td>
</tr>
<tr>
<td>MAC address</td>
<td>Unicast MAC address configured for the MEP.</td>
</tr>
<tr>
<td>Remote MEP count</td>
<td>Number of remote MEPs (unless you specify the remote-mep option).</td>
</tr>
<tr>
<td>Remote MEP identifier</td>
<td>Numeric identifier of the remote MEP.</td>
</tr>
<tr>
<td>Remote MAC address</td>
<td>Unicast MAC address of the remote MEP.</td>
</tr>
<tr>
<td>SLM packets sent</td>
<td>Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.</td>
</tr>
<tr>
<td>SLM packets received</td>
<td>Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.</td>
</tr>
<tr>
<td>SLR packets sent</td>
<td>Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.</td>
</tr>
<tr>
<td>SLR packets received</td>
<td>Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.</td>
</tr>
<tr>
<td>Local TXFC1 value</td>
<td>Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.</td>
</tr>
<tr>
<td>Local RXFC1 value</td>
<td>Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TxFC1 is sent in the packet.</td>
</tr>
<tr>
<td>Last Received SLR frame TXFC1(tc)</td>
<td>Value of the local counter TxFC1 at the time of SLM frame transmission.</td>
</tr>
<tr>
<td>Last Received SLR frame RXFC1(t)</td>
<td>Value of the local counter RxFC1 at the time of SLR frame transmission.</td>
</tr>
<tr>
<td>Frame loss (near-end)</td>
<td>Count of frame loss associated with ingress data frames.</td>
</tr>
<tr>
<td>Frame loss (far-end)</td>
<td>Count of frame loss associated with egress data frames.</td>
</tr>
</tbody>
</table>

**show oam ethernet evc**

**Syntax**

```
show oam ethernet evc <evc-id>
```

**Release Information**
Command introduced in Junos OS Release 9.5.

**Description**
On MX Series routers with OAM Ethernet Virtual Connection (EVC) configurations, displays the EVC configuration and status information.

**Options**
This command has no options.

**Required Privilege Level**
View

**Output Fields**
Table 194 on page 2304 lists the output fields for the `show oam ethernet evc` command. Output fields are listed in the approximate order in which they appear.

```
**show oam ethernet fnp interface**

**Syntax**

```
show oam ethernet fnp interface
<ethernet-interface-name>
<routing-instance routing-instance-name>
```

**Release Information**

Command introduced in Junos OS Release 11.4.

**Description**

On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) information for Ethernet interfaces.

**Options**

- `interface-name`—(Optional) Display Ethernet FNP information for the specified Ethernet interface only.
- `routing-instance-name`—(Optional) Display FNP for the specified routing instance.

show oam ethernet link-fault-management

Syntax

```
show oam ethernet link-fault-management
  <brief | detail>
  <interface-name>
```

Release Information

Command introduced in Junos OS Release 8.2.

Description

On EX Series switches and M320, M120, MX Series, T320, and T640 routers, display Operation, Administration, and Management (OAM) link fault management information for Ethernet interfaces.

Options

- **brief | detail**—(Optional) Display the specified level of output.
- **interface-name**—(Optional) Display link fault management information for the specified Ethernet interface only.

Required Privilege

**show oam ethernet lmi**

**Syntax**

```
show oam ethernet lmi (interface <interface-name>)
```

**Release Information**

Command introduced in Junos OS Release 9.5.

**Description**

On routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet, and OAM Ethernet Local Management Interface (E-LMI) configuration, display the LMI information for the configured interfaces or optionally for a specified interface.

**NOTE:** On MX Series routers, E-LMI is supported on Gigabit Ethernet (ge), 10-Gigabit Ethernet (xe), and Aggregated Ethernet (ae) interfaces configured on MX Series routers with DPC only.

**Options**

- **interface**—(Optional) Display LMI information for a specified interface.
  - **interface-name**—(Optional) Display Ethernet LMI information for the specified interface only.

**Required Privilege Level**

View

**Output Fields**

Table 199 on page 2320 lists the output fields for the show oam ethernet lmi command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical Interface</td>
<td>Header for the EVC information showing the Ethernet virtual circuit (EVC) name, configuration, and active/inactive status.</td>

show oam ethernet lmi statistics

Syntax

show oam ethernet lmi statistics <interface interface-name>

Release Information

Command introduced in Junos OS Release 9.5.

Description

On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Local Management Interface (LMI) statistics.

Options

interface—(Optional) Display LMI statistics for a specified interface.

interface-name—(Optional) Display Ethernet LMI information for the specified Ethernet interface only.

Required Privilege

view

```
**show pppoe interfaces**

**Syntax**

```
show pppoe interfaces
  <brief | detail
  <pp0.logical>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

Display session-specific information about PPPoE interfaces.

**Options**

- `none`—Display interface information for all PPPoE interfaces.
- `brief | detail`—(Optional) Display the specified level of output.
- `pp0.logical`—(Optional) Name of an interface. The logical unit number for static interfaces can be a value from 0 through 16385. The logical unit number for dynamic interfaces can be a value from 1073741824 through the maximum number of logical interfaces supported on your router.

**Required Privilege**

view

**Related Documentation**

- Verifying and Managing Agent Circuit Identifier-Based Dynamic VLAN Configuration

**List of Sample Output**

- `show pppoe interfaces on page 2326`
- `show pppoe interfaces (Status for the Specified Interface) on page 2326`
- `show pppoe interfaces brief on page 2326`
- `show pppoe interfaces detail on page 2327`
- `show pppoe interfaces (PPPoE Subscriber Interface with ACI Interface Set) on page 2327`

**Output Fields**

Table 201 on page 2324 lists the output fields for the `show pppoe interfaces` command. Output fields are listed in the approximate order in which they appear. Not all fields are displayed for PPPoE interfaces on M120 and M320 routers in server mode.

**show pppoe service-name-tables**

**Syntax**

```plaintext
show pppoe service-name-tables
<table-name>
```

**Release Information**

Command introduced in Junos OS Release 10.0.

**Description**

Display configuration information about PPPoE service name tables.

**Options**

- `none`—Display the names of configured PPPoE service name tables.
- `table-name`—(Optional) Name of a configured PPPoE service name table.

**Required Privilege**

- **Level:** `view`

**Related Documentation**

- Verifying a PPPoE Configuration on page 378
- Verifying and Managing Dynamic PPPoE Configuration

**List of Sample Output**

- show pppoe service-name-tables on page 2329
- show pppoe service-name-tables (For the Specified Table Name) on page 2329

**Output Fields**

Table 202 on page 2328 lists the output fields for the `show pppoe service-name-tables` command. Output fields are listed in the approximate order in which they appear.

**Table 202: show pppoe service-name-tables Output Fields**

show pppoe sessions

Syntax

```
show pppoe sessions
<aci circuit-id-string>
<ari remote-id-string>
<service service-name>
```

Release Information

Command introduced in Junos OS Release 10.2.

Description

Display information about all active PPPoE sessions on the router, or about the active PPPoE sessions established for a specified service name, agent circuit identifier (ACI), or agent remote identifier (ARI).

Options

```
one—Display information for all active PPPoE sessions on the router.

aci circuit-id-string—(Optional) Display information only for active PPPoE sessions established with the specified agent circuit identifier. The agent circuit identifier corresponds to the DSLAM interface that initiated the service request.

ari remote-id-string—(Optional) Display information only for active PPPoE sessions established with the specified agent remote identifier. The agent remote identifier corresponds to the subscriber associated with the DSLAM interface that initiated the service request.

service service-name—(Optional) Display information only for active PPPoE sessions established with the specified service, where service-name can be empty, any, or a named service.
```

```
show pppoe statistics

Syntax

show pppoe statistics
<logical-interface-name>

Release Information

Command introduced before Junos OS Release 7.4.
logical-interface-name option introduced in Junos OS Release 10.1.

Description

Display statistics information about PPPoE interfaces.

Options

none—Display PPPoE statistics for all interfaces.
logical-interface-name—(Optional) Name of a PPPoE underlying logical interface.

Required Privilege

view

Output Fields

Table 205 on page 2336 lists the output fields for the `show pppoe underlying-interfaces` command. Output fields are listed in the approximate order in which they appear.
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Underlying Interface</td>
<td>Name of the PPPoE underlying logical interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Service Name Table</td>
<td>Name of the service name table.</td>
<td>All levels</td>
</tr>
<tr>
<td>Dynamic Profile</td>
<td>Name of the dynamic profile that was used to create this interface. If the interface was statically created, then the value is none.</td>
<td>All levels</td>
</tr>
<tr>
<td>Index</td>
<td>Index number of the logical interface, which reflects its initialization sequence.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>State</td>
<td>Origin of the logical interface: Static or Dynamic. Indicates whether the interface was statically or dynamically created.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Operational States</td>
<td>Fields in this block are actual operational values rather than simply the configured values. The operational values can be the result of RADIUS-initiated changes.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Max Sessions</td>
<td>Maximum number of PPPoE logical interfaces that can be activated on the underlying interface. When this number of logical interfaces has been established, all subsequent PPPoE Active Discovery Initiation (PADI) packets are dropped and all subsequent PPPoE Active Discovery Request (PADR) packets trigger PPPoE Active Discovery Session (PADS) error responses.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Max Sessions VSA Ignore</td>
<td>Whether the router is configured to ignore (clear) the PPPoE maximum session value returned by RADIUS in the Max- Clients- Per- Interface Juniper Networks VSA [26-143] and restore the PPPoE maximum session value on the underlying interface to the value configure with the max-sessions statement: Off (default) or On.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Active Sessions</td>
<td>Number of active PPPoE sessions on the underlying interface. If a dynamic profile is listed, then it is the number of active PPPoE sessions on the underlying interface that are using this profile. The Active Sessions value must not exceed the Max Sessions value.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Agent Circuit Identifier</td>
<td>Whether the underlying interface is configured with the agent-circuit-identifier statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on agent circuit identifier (ACI) information.</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>Autosensing indicates that creation of ACI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ACI-based dynamic VLANs is not configured on the underlying interface, this field does not appear.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>NOTE: The Agent Circuit Identifier field is replaced with the Line Identity field when an ALI interface set is configured with the line-identity autoconfiguration stanza.</td>
<td></td>
</tr>
</tbody>
</table>
Table 205: show pppoe underlying-interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Line Identity</strong></td>
<td>Whether the underlying interface is configured with the <code>line-identity</code> statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on the specified trusted option: ACI, ARI, both, or neither. Autosensing indicates that creation of ALI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ALI dynamic VLANs based on trusted options is not configured on the underlying interface, this field does not appear. <strong>NOTE:</strong> The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the <code>agent-circuit-id</code> autoconfiguration stanza.</td>
<td></td>
</tr>
<tr>
<td><strong>Duplicate Protection</strong></td>
<td>State of PPPoE duplicate protection: <strong>On</strong> or <strong>Off</strong>. When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client. The uniqueness of the PPPoE client is determined by the client’s MAC address.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>Short Cycle Protection</strong></td>
<td>State of PPPoE short cycle protection: <strong>mac-address</strong>, <strong>circuit-id</strong>, or <strong>Off</strong>. Enabling short cycle protection, also known as PPPoE lockout, on the PPPoE underlying interface temporarily prevents (locks out) a failed or short-lived (short-cycle) PPPoE subscriber session from reconnecting to the router for a default or configurable period of time. PPPoE client sessions are identified by their unique media access control (MAC) source address or agent circuit identifier (ACI) value.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>Direct Connect</strong></td>
<td>State of the configuration to ignore DSL Forum VSAs: <strong>On</strong> or <strong>Off</strong>. When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td><strong>AC Name</strong></td>
<td>Name of the access concentrator.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>
| **PacketType**       | Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:  
  - **PADI**—PPPoE Active Discovery Initiation packets.  
  - **PADO**—PPPoE Active Discovery Offer packets.  
  - **PADR**—PPPoE Active Discovery Request packets.  
  - **PADS**—PPPoE Active Discovery Session-Confirmation packets.

**Release Information**

Command introduced in Junos OS Release 9.4.
Command introduced in Junos OS Release 12.1 for EX Series switches.
Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

**Description**

Display the status of the Automatic Protection Switching (APS) and Ring APS (RAPS) messages on an Ethernet ring.

**Options**

This command has no options.

**Required Privilege Level**

view

**Output Fields**

Table 207 on page 2345 lists the output fields for the show protection-group ethernet-ring aps command. Output fields are listed in the approximate order in which they appear.
Table 207: show protection-group ethernet-ring aps Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet Ring</td>
<td>Name configured for the Ethernet ring.</td>
</tr>
<tr>
<td>Request/State</td>
<td>Status of the Ethernet ring RAPS messages.</td>
</tr>
<tr>
<td></td>
<td>• NR—Indicates that there is no request for APS on the ring.</td>
</tr>
<tr>
<td></td>
<td>• SF—Indicates that there is a signal failure on the ring.</td>
</tr>
<tr>
<td></td>
<td>• FS—Indicates that there are active forced-switch requests in the ring.</td>
</tr>
<tr>
<td></td>
<td>• MS—Indicates that there are active manual-switch requests in the ring.</td>
</tr>
<tr>
<td></td>
<td>NOTE: Both FS and MS values are valid only when G.8032v2 is supported.</td>
</tr>
<tr>
<td>Ring Protection Link Blocked</td>
<td>Blocking on the ring protection link: Yes or No.</td>
</tr>
<tr>
<td>No Flush</td>
<td>Indicates the value of the Do Not Flush (DNF) flag in the received RAPS PDU. If the value is Yes, then FDB flush is not triggered as part of processing of the received RAPS PDU.</td>
</tr>
<tr>
<td>Blocked Port Reference</td>
<td>This parameter is the reference to the blocked ring port. If the east ring port is blocked, the Blocked Port Reference (BPR) value is 0. If the west ring port is blocked, the BPR value is 1. If both ring ports are blocked, this parameter can take any value. If both east and west ports are blocked or not blocked, the value would be 0. This field is valid only when G.8032v2 is supported.</td>
</tr>
<tr>
<td>Blocked Port Reference</td>
<td>Reference of the ring port on which traffic is blocked.</td>
</tr>
<tr>
<td>Originator</td>
<td>Indicates whether the node is the originator of the RAPS messages.</td>
</tr>
<tr>
<td>Remote Node ID</td>
<td>Identifier (in MAC address format) of the remote node.</td>
</tr>
</tbody>
</table>

pg101           SF              No           No
Originator  Remote Node ID
No          00:01:02:00:00:01
```

show protection-group ethernet-ring aps (MX Interconnection Ring Node, Failure condition in major ring on non-RPL link of the ring)

```bash
user@host> show protection-group ethernet-ring aps
Ethernet Ring   Request/state  RPL Blocked  No Flush  BPR
pg_major        SF             No           No        0
pg_subring      NR             Yes          Yes       0
Originator  Remote Node ID
No          00:01:00:00:00:01
No          00:02:00:00:00:02
```

show protection-group ethernet-ring aps (MX Series router)

```bash
user@host> show protection-group ethernet-ring aps
Ethernet Ring   Request/state  RPL Blocked  No Flush  BPR  Originator  Remote Node ID
Inst_Vlans_1-15 NR             Yes          Yes       1    Yes         NA
Inst_Vlans_16-30 NR            Yes          Yes       0    No
00:00:00:03:00:02
```

show protection-group ethernet-ring aps detail (MX Series router)

```bash
user@host> show protection-group ethernet-ring aps detail
Ethernet-Ring name : Inst_Vlans_1-15
Request/State      : NR
```
Ring Protection Link blocked : Yes
No Flush Flag : Yes
Blocked Port Reference : 1
Originator : Yes
Remote Node ID : NA

Ethernet-Ring name : Inst_Vlans_16-30
Request/State : NR
Ring Protection Link blocked : Yes
No Flush Flag : Yes
Blocked Port Reference : 0
Originator : No
Remote Node ID : 00:00:00:03:00:02

show protection-group ethernet-ring aps (MX Interconnection Ring Node as RPL owner of major ring, rings in IDLE state)

user@host>show protection-group ethernet-ring aps detail

Ethernet-Ring name : pg_major
Request/State : NR
Ring Protection Link blocked : Yes
No Flush Flag : Yes
Blocked Port Reference : 0
Originator : Yes
Remote Node ID : NA

Ethernet-Ring name : pg_subring
Request/State : NR
Ring Protection Link blocked : Yes
No Flush Flag : Yes
Blocked Port Reference : 0
Originator : No
Remote Node ID : 00:00:03:00:03:00:02

show protection-group ethernet-ring aps detail (EX2300 and EX3400 Switches)

user@switch>show protection-group ethernet-ring aps detail

Ethernet-Ring name : pg1001
Request/State : NR
Ring Protection Link blocked : Yes
No Flush Flag : Yes
Blocked Port Reference : 0
Originator : Yes
Remote Node ID : NA
show protection-group ethernet-ring configuration

Syntax

```
show protection-group ethernet-ring configuration
```

Release Information

Command introduced in Junos OS Release 12.1 for EX Series switches.
Command introduced in Junos OS Release 14.1 for MX Series routers.
Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

Description

Display the configuration of Ethernet ring protection group on EX Switches and MX Series routers.

Required Privilege Level

view

Output Fields

Table 208 on page 2348 lists the output fields for the `show protection-group ethernet-ring configuration` command. Output fields are listed in the approximate order in which they appear.

Table 208: show protection-group ethernet-ring configuration Output Fields

<table>
<thead>
<tr>
<th>Output Fields</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>G8032 Compatibility Version</td>
<td>This is the compatibility version mode of ERP. This parameter always takes the value 1 in the case of G8032v1. This parameter is valid only for MX Series routers.</td>
</tr>
<tr>
<td>East Interface</td>
<td>One of the two switch interfaces that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 0.</td>
</tr>
<tr>
<td>West Interface</td>
<td>One of the two interfaces in a switch that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 1.</td>
</tr>
</tbody>
</table>
### Table 208: show protection-group ethernet-ring configuration Output Fields (continued)

<table>
<thead>
<tr>
<th>Output Fields</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| **Restore Interval** | Configured interval of wait time after a link is restored. When a link goes down, the RPL link is activated. When the down link becomes active again, the RPL owner receives a notification. The RPL owner waits for the restore interval before issuing a block on the RPL link. The configured restore interval can be 5 through 12 minutes for ERPv1 and 1 through 12 minutes for ERPv2. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.  
**NOTE:** Wait to Restore (WTR) configuration values on EX2300 and EX3400 switches must be 5-12 minutes.                                                                                           |
| **Wait to Block Interval** | Configured interval of wait time for link restoration when a manual command (manual switch or force switch) is cleared. On clearing the manual command, the RPL owner receives NR messages, which starts a timer with interval ‘Wait to Block’ to restore the RPL link after its expiration. This delay timer is set to be 5 seconds longer than the guard timer. The configured number can be from 5 seconds through 10 seconds. The parameter is valid only for G.8032v2.  
**NOTE:** The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command `show protection-group ethernet-ring node-state detail` lists a WTB setting but that setting has no effect. |
| **Guard Interval**   | Configured number of milliseconds (in 10 millisecond intervals, 10 milliseconds through 2000 milliseconds) that the node does not process any Ethernet ring protection protocol data units (PDUs). This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value. |
| **Hold off interval** | This is the interval at which the link is held down even before declaring that the link is down. Because the parameter is not supported at present, its value is always considered 0. This parameter is valid only for MX Series routers.                                                                                           |
| **Node ID**          | Node ID for the switch or router. If the node ID is not configured, it is assigned by default. For EX Series switches, the Node ID value cannot be configured, whereas for MX Series routers, it can be configured.                                                                                     |
| **Ring ID**          | In G8032v2, the ring ID can be within the range 1–239. All the nodes in a ring should have the same ring ID. In the case of G8032v1, the value of the ring ID is always 1. This parameter is valid only for MX Series routers.                                                                 |
| **Node Role**        | Indicates whether the ring node is operating as a normal ring-node or RPL-owner or RPL-neighbor. For G8032v1 RPL-neighbor role is not supported. This parameter is valid only for MX Series routers.                                                                 |

### Table 208: show protection-group ethernet-ring configuration Output Fields (continued)

<table>
<thead>
<tr>
<th>Output Fields</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Revertive Mode of Operation</strong></td>
<td>This parameter indicates whether the ring is operating in revertive mode or nonrevertive mode. In nonrevertive mode of operation, when all links in the ring and Ethernet Ring Nodes have recovered and no external requests are active, the Ethernet Ring does not automatically revert. G8032v1 supports only revertive mode of operation. This parameter is valid only for MX Series routers.</td>
</tr>
<tr>
<td><strong>RAPS Tx Dot1p priority</strong></td>
<td>The RAPS Tx Dot1p priority is a parameter with which the RAPS is transmitted from the ring node. For G8032v1, the value of this parameter is always 0. For G8032v2, the value of this parameter can be within the range 0–7. This parameter is valid only for MX Series routers.</td>
</tr>
<tr>
<td><strong>Node type</strong></td>
<td>Indicates whether ring node is a normal ring node having two ring-links or an open ring-node having only a single ring-link or a interconnection ring-node. An interconnection ring node can be connected to major ring in non virtual-channel mode or in virtual channel mode. Ring interconnection is not supported for G8032v1. This parameter is valid only for MX Series routers.</td>
</tr>
<tr>
<td><strong>Major ring name</strong></td>
<td>If the node type is interconnection in the ring, this parameter takes the name of the major ring to which the sub-ring node is connected. This parameter is valid only for MX Series routers.</td>
</tr>
<tr>
<td><strong>Interconnection mode</strong></td>
<td>Indicates the interconnection mode if the type of the node is interconnection. An interconnection ring node can be connected to major ring in non-virtual channel mode or in virtual channel mode. This parameter is valid only for MX Series routers.</td>
</tr>
<tr>
<td><strong>PropagateTopologyChange event</strong></td>
<td>When Propagate Topology Change event is set to 1, the change in the topology of sub-ring is propagated to the major ring, enabling the transmission of EVENT FLUSH RAPS PDU in the major ring. When the parameter is set to 0, the topology change in the sub-ring is not propagated to the major ring blocking EVENT FLUSH RAPS PDU transmission in the major ring. This parameter is valid only for MX Series routers.</td>
</tr>
<tr>
<td><strong>Control Vlan</strong></td>
<td>The VLAN that transfers ERP PDUs from one node to another.</td>
</tr>
<tr>
<td><strong>Physical Ring</strong></td>
<td>Physical ring if the east and west interfaces are nontrunk ports. For MX Series routers, the ring is termed a physical ring if no data channels are defined for the ring and the entire physical port forwarding is controlled by ERP.</td>
</tr>
<tr>
<td><strong>Data Channel VLAN(s)</strong></td>
<td>Data VLANs for which forwarding behavior is controlled by the ring instance.</td>
</tr>
</tbody>
</table>

### Sample Output

#### show protection-group ethernet-ring configuration (EX Switch)

```bash
user@switch>show protection-group ethernet-ring configuration

show protection-group ethernet-ring data-channel

**Syntax**

```
show protection-group ethernet-ring data-channel
    <brief | detail>
    <group-name group-name>
```

**Release Information**

Command introduced in Junos OS Release 10.2. Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

**Description**

Display the configuration of Ethernet ring protection group on EX Switches and MX Series routers.

**Options**

brief | detail—(Optional) Display the specified level of output.

`group-name`—(Optional) Protection group for which to display statistics. If you omit this optional field, all protection group statistics for configured groups will be displayed.

**Required Privilege Level**

view

**Related Documentation**

- show protection-group ethernet-ring aps on page 2344
- show protection-group ethernet-ring interface on page 2360
- show protection-group ethernet-ring node-state on page 2364
- show protection-group ethernet-ring statistics on page 2369
- show protection-group ethernet-ring vlan on page 2375

**List of Sample Output**

- show protection-group ethernet-ring data-channel on page 2356
- show protection-group ethernet-ring data-channel detail on page 2356
- show protection-group ethernet-ring data-channel detail (EX2300 and EX3400 Switches) on page 2357

**Output Fields**

Table 209 on page 2355 lists the output fields for the `show protection-group ethernet-ring data-channel` command. Output fields are listed in the approximate order in which they appear.

Table 209: `show protection-group ethernet-ring data-channel` Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Name of the interface configured for the Ethernet ring.</td>
</tr>
</tbody>
</table>
Table 209: show protection-group ethernet-ring data-channel Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STP index</td>
<td>The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on a physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior.</td>
</tr>
</tbody>
</table>

**Forward State**

- **forwarding**—Indicates packets are being forwarded.
- **discarding**—Indicates packets are being discarded.

Sample Output

show protection-group ethernet-ring data-channel

```
user@host> show protection-group ethernet-ring data-channel
Ethernet ring data channel information for protection group pg301

Interface      STP index  Forward State
xe-5/0/2        78         forwarding
xe-2/2/0        79         discarding

Ethernet ring data channel parameters for protection group pg302

Interface      STP index  Forward State
xe-5/0/2        80         forwarding
xe-2/2/0        81         forwarding
```

show protection-group ethernet-ring data-channel detail

</table>
**show protection-group ethernet-ring flush-info**

**Syntax**

```
show protection-group ethernet-ring flush-info
```

**Release Information**

Command introduced in Junos OS Release 14.2.

**Description**

Display information about flush ports in an Ethernet ring.

**Options**

This command has no options.

**Required Privilege Level**

view

show protection-group ethernet-ring statistics

Syntax

```
show protection-group ethernet-ring statistics group-name group-name
<brief | detail>
```

Release Information

Command introduced in Junos OS Release 9.4.
Command introduced in Junos OS Release 12.1 for EX Series switches.
Command introduced in Junos OS Release 12.3X54 for ACX Series routers.

Description

Display statistics regarding Automatic Protection Switching (APS) protection groups on an Ethernet ring.

Options

- `group-name`—Display statistics for the protection group. If you omit this option, protection group statistics for all configured groups are displayed.
- `brief`—Display brief statistics for the protection group.
- `detail`—Display detailed statistics for the protection group.

Required Privilege

view

Output Fields

Table 213 on page 2370 lists the output fields for the `show protection-group ethernet-ring statistics` command.
### Table 213: `show protection-group ethernet-ring statistics` Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet Ring Statistics for PG</td>
<td>Name of the protection group for which statistics are displayed.</td>
</tr>
<tr>
<td>RAPS event sent</td>
<td>Number of times Ring Automatic Protection Switching (RAPS) message transmission event occurred locally. This field is applicable only to MX Series routers.</td>
</tr>
<tr>
<td>RAPS event received</td>
<td>Number of RAPS messages received and processed by ERP state-machine and which resulted in state transition. This field is applicable only to MX Series routers.</td>
</tr>
<tr>
<td>Local SF</td>
<td>Number of times a signal failure has occurred locally.</td>
</tr>
<tr>
<td>Remote SF</td>
<td>Number of times a signal failure has occurred anywhere else on the ring.</td>
</tr>
<tr>
<td>NR event</td>
<td>Number of times a No Request event has occurred on the ring. This field is applicable only to EX Series switches.</td>
</tr>
<tr>
<td>NR event sent</td>
<td>Number of times a No Request event has occurred locally. This field is applicable only to MX Series routers.</td>
</tr>
<tr>
<td>NR event received</td>
<td>Number of times a No Request event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.</td>
</tr>
<tr>
<td>NR-RB event</td>
<td>Number of times a No Request, Ring Blocked event has occurred on the ring. This field is applicable only to EX Series switches.</td>
</tr>
<tr>
<td>NR-RB event sent</td>
<td>Number of times a No Request, Ring Blocked event has occurred locally. This field is applicable only to MX Series routers.</td>
</tr>
<tr>
<td>NR-RB event received</td>
<td>Number of times a No Request, Ring Blocked event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.</td>
</tr>
<tr>
<td>Flush event sent</td>
<td>Number of times flush-event RAPS message transmission event occurred locally. This field is applicable only to MX Series routers.</td>
</tr>
<tr>
<td>Flush event received</td>
<td>Number of flush-event RAPS messages received and processed by the ring instance control process. This field is applicable only to MX Series routers.</td>
</tr>
<tr>
<td>Local FS event sent</td>
<td>Number of times a forced switch event has occurred locally. This field is applicable only to MX Series routers.</td>
</tr>
<tr>
<td>Remote FS event received</td>
<td>Number of times a forced switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.</td>
</tr>
<tr>
<td>Local MS event sent</td>
<td>Number of times a manual switch event has occurred locally. This field is applicable only to MX Series routers.</td>
</tr>
</tbody>
</table>
Table 213: show protection-group ethernet-ring statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote MS event received</td>
<td>Number of times a manual switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.</td>
</tr>
</tbody>
</table>

Table 214 on page 2371 lists the output fields for the `show protection-group ethernet-ring statistics` command when the `detail` option is used. These fields are valid only for MX Series routers.

Table 214: show protection-group ethernet-ring statistics detail Output Fields (for MX Series Routers)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total number of FDB flush</td>
<td>Number of times forwarding database (FDB) flush has happened for the ring instance.</td>
</tr>
<tr>
<td>Flush-logic triggered flush</td>
<td>Number of times FDB flush has happened because of flush-logic based on node ID and Blocked Port Reference (BPR).</td>
</tr>
<tr>
<td>Remote RAPS PDU received</td>
<td>Number of valid RAPS PDU messages received. This counter counts only RAPS messages generated by other devices on the ring.</td>
</tr>
<tr>
<td>Remote RAPS dropped due to guard-timer</td>
<td>Number of RAPS messages dropped by the device because the guard timer is running.</td>
</tr>
<tr>
<td>Invalid remote RAPS PDU dropped</td>
<td>Number of RAPS messages dropped by the device because the messages are invalid.</td>
</tr>
<tr>
<td>RAPS dropped due to miscellaneous errors</td>
<td>Number of RAPS messages dropped because of any other reason. For example, messages dropped because of unsupported functionality.</td>
</tr>
<tr>
<td>Local received RAPS PDU dropped</td>
<td>Number of self-generated RAPS messages received and dropped.</td>
</tr>
</tbody>
</table>

show protection-group ethernet-ring vlan

Syntax

show protection-group ethernet-ring vlan
<brief | detail>
<group-name group-name>

Release Information

Command introduced in Junos OS Release 10.2.
Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

Description

On MX Series routers, display all data channel logical interfaces and the VLAN IDs controlled by a ring instance data channel.

Options

brief | detail—(Optional) Display the specified level of output.

group-name—(Optional) Protection group for which to display details such as data channel interfaces, vlan, and bridge-domain. If you omit this optional field, details for all configured protection groups will be displayed.

Required Privilege Level

view

Output Fields

Table 215 on page 2375 lists the output fields for the show protection-group ethernet-ring vlan command. Output fields are listed in the approximate order in which they appear.

Table 215: show protection-group ethernet-ring vlan Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Name of the interface configured for the Ethernet protection ring.</td>
</tr>
</tbody>
</table>
Table 215: show protection-group ethernet-ring vlan Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vlan</td>
<td>Name of the VLAN associated with the interface configured for the Ethernet protection ring.</td>
</tr>
<tr>
<td>STP index</td>
<td>The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on a physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior.</td>
</tr>
<tr>
<td>Bridge Domain</td>
<td>Name of the bridge domain that is associated with the VLAN configured for the Ethernet protection ring.</td>
</tr>
</tbody>
</table>

Sample Output

```bash
user@host> show protection-group ethernet-ring vlan
Ethernet ring IFBD parameters for protection group vkm01

show security macsec connections (MX Series)

Syntax

```
show security macsec connections
<interface interface-name>
```

Release Information

Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

Description

Display the status of the active MACsec connections on the router.

Options

- `none`—Display MACsec connection information for all interfaces on the switch.
- `interface interface-name`—(Optional) Display MACsec connection information for the specified interface only.

Required Privilege Level

`view`

List of Sample Output

- show security macsec connections on page 2381
- show security macsec connections (MX480 routers with MPC7E-10G) on page 2381
- show security macsec connections (MX960 routers with MPC7E-10G) on page 2382

Output Fields

Table 216 on page 2380 lists the output fields for the `show security macsec connections` command. Output fields are listed in the approximate order in which they appear.

Table: show security macsec connections Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface name</td>
<td>Name of the interface.</td>
</tr>
<tr>
<td>CA name</td>
<td>Name of the connectivity association.</td>
</tr>
<tr>
<td>Cipher suite</td>
<td>Name of the cipher suite used for encryption.</td>
</tr>
<tr>
<td>Encryption</td>
<td>Encryption setting. Encryption is enabled when this output is <code>on</code> and disabled when this output is <code>off</code>. The encryption setting is set using the <code>no-encryption</code> statement in the connectivity association when using static connectivity association key (CAK) security mode and is set using the <code>encryption</code> statement in the secure channel when using static secure association key (SAK) or dynamic security mode.</td>
</tr>
</tbody>
</table>
Table 216: show security macsec connections Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key server offset</td>
<td>The offset value in a packet from which encryption can be performed. The offset is set using the <code>offset</code> statement when configuring the connectivity association when using static connectivity association key (CAK) or dynamic security mode or the secure channel when using static secure association key (SAK) security mode.</td>
</tr>
<tr>
<td>Include SCI</td>
<td>SCI tagging. The SCI tag is included on packets in a secure channel when this output is <code>yes</code>, and not included on packets in a secure channel when this output is <code>no</code>. SCI tagging is automatically enabled on MX Series routers. By default, include SCI tag is disabled. You can enable SCI tagging using the <code>include-sci</code> statement in the connectivity association configuration.</td>
</tr>
<tr>
<td>Replay protect</td>
<td>By default, replay protection is disabled. Replay protection ensures that a snooped packet is not replayed or a packet number is reused. Replay protection is enabled when this output is <code>on</code> and disabled when this output is <code>off</code>. You can enable replay protection using the <code>replay-protect</code> statement in the connectivity association configuration.</td>
</tr>
<tr>
<td>Replay window</td>
<td>Number of packets that can be replayed. Must be configured with replay protection. This output is set to 0 when replay protection is disabled, and is the size of the replay window, in number of packets, when replay protection is enabled. The size of the replay window is configured using the <code>replay-window-size</code> statement in the connectivity association configuration.</td>
</tr>
</tbody>
</table>

Sample Output

**show security macsec connections**

```

show security macsec statistics (MX Series)

Syntax

```
show security macsec statistics
<brief | detail>
<interface interface-name>
```

Release Information

Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

Description

Display Media Access Control Security (MACsec) statistics.

Options

- **none**—Display MACsec statistics in brief form for all interfaces on the router.
- **brief | detail**—(Optional) Display the specified level of output. Using the **brief** option is equivalent to entering the command with no options (the default). The **detail** option displays additional fields that are not visible in the **brief** output.

NOTE: The field names that only appear in this command output when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel.

```
interface interface-name
```

(Optional) Display MACsec statistics for the specified interface only.

Required Privilege

**view**

List of Sample Output

- show security macsec statistics interface detail on page 2385
- show security macsec statistics (MX480 router with MPC7E-10G) on page 2386
- show security macsec statistics (MX480 router with MPC7E-10G) on page 2386
- show security macsec statistics detail (MX480 router with MPC7E-10G) on page 2387

Output Fields

Table 217 on page 2383 lists the output fields for the **show security macsec statistics** command. Output fields are listed in the approximate order in which they appear.

The field names that appear in this command’s output only when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel. Those field names are, therefore, not included in this table.

show security mka sessions (MX Series)

**Syntax**

```
show security mka sessions
<interface interface-name>
```

**Release Information**

Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

**Description**

Display MACsec Key Agreement (MKA) session information for all interfaces. The MKA protocol is responsible for maintaining MACsec on the link, and decides which router on the point-to-point link becomes the key server.

**Options**

- `interface interface-name`—(Optional) Display the MKA session information for the specified interface only.
- `none`—Display the MKA session information for all interfaces.

**Required Privilege Level**

`view`

**List of Sample Output**

- show security mka sessions on page 2389
- show security mka sessions (MX480 with MPC7E-10G) on page 2389
- show security mka sessions (MX480 with MPC7E-10G) on page 2390

**Output Fields**

Table 218 on page 2388 lists the output fields for the `show security mka sessions` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface name</td>
<td>Name of the interface.</td>
</tr>
<tr>
<td>Member identifier</td>
<td>Name of the member identifier.</td>
</tr>
<tr>
<td>CAK name</td>
<td>Name of the connectivity association key (CAK). The CAK is configured using the <code>cak</code> keyword when configuring the pre-shared key.</td>
</tr>
<tr>
<td>Transmit interval</td>
<td>The transmit interval. Both ends of the point-to-point link should be configured to the same value. Default value is 2000 seconds. Possible values: 2000 through 10000 milliseconds.</td>
</tr>
<tr>
<td>Outbound SCI</td>
<td>Name of the outbound secure channel identifier.</td>
</tr>
<tr>
<td>Message number</td>
<td>Number of the last data message.</td>
</tr>
<tr>
<td>Key number</td>
<td>Key number.</td>
</tr>
</tbody>
</table>

show security mka statistics (MX Series)

**Syntax**

```
show security mka statistics
<interface interface-name>
```

**Release Information**

Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

**Description**

Display MACsec Key Agreement (MKA) protocol statistics.

The output for this command does not include statistics for MACsec data traffic. For MACsec data traffic statistics, see `show security macsec statistics`.

**Options**

- `interface interface-name`—(Optional) Display the MKA information for the specified interface only.
- `none`—Display the MKA information for all interfaces.

**Required Privilege Level**

`view`

**List of Sample Output**

- `show security mka statistics on page 2392`
- `show security mka statistics (MX480 routers with MPC7E-10G) on page 2392`
- `show security mka statistics (MX480 routers with MPC7E-10G) on page 2393`

**Output Fields**

Table 219 on page 2391 lists the output fields for the `show security mka statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 219: show security mka statistics Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received packets</td>
<td>Number of received MKA control packets. This counter increments for received MKA control packets only. This counter does not increment when data packets are received.</td>

```
show vrrp

**Syntax**

```
show vrrp
   <brief | detail | extensive | summary>
   <interface interface-name <group number>>
   <logical-system logical-system-name >
   <nsr>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

nsr option added in Junos OS Release 13.2.

**Description**

Display status information about Virtual Router Redundancy Protocol (VRRP) groups.

**Options**

- **none**—(Same as brief) Display brief status information about all VRRP interfaces.
- **brief | detail | extensive | summary**—(Optional) Display the specified level of output.
- **interface interface-name <group number>**—(Optional) Display information and status about the specified VRRP interface and, optionally, the group number.
- **logical-system logical-system-name**—(Optional) Perform this operation on a particular logical system.
- **nsr**—(Optional) Display state replication information when graceful Routing Engine switchover (GRES) with nonstop active routing (NSR) is configured. Use only on the backup Routing Engine.

**Required Privilege**

view

**Related Documentation**

- show vrrp track
- clear vrrp

<tr>
<td>• transition</td>
<td>The interface is changing between being the backup and being the master router.</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE:** When show vrrp nsr is used on the backup Routing Engine, it displays the current VRRP state on the master Routing Engine, which is the future VRRP state for the backup Routing Engine. Do not use on the master Routing Engine.
### Table 220: show vrrp Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSR</td>
<td>VRRP nonstop active routing is enabled for the configured VRRP group: <em>yes</em> or <em>no</em>.</td>
<td>brief none</td>
</tr>
</tbody>
</table>

**NOTE:** A *yes* value means that the new master Routing Engine will immediately start with the VRRP State value from the original master Routing Engine.

A *no* value means that the VRRP session will:

- Start afresh.
- Go through an silent startup period.
- Move to a backup state.
- Wait for the D Timer to run out before becoming the master (only if the master has not been configured already).

<table>
<thead>
<tr>
<th>RPD-NSR</th>
<th>The routing options have been set to nonstop active routing: <em>yes</em> or <em>no</em>.</th>
<th>brief none</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>VRRP timer information:</td>
<td>brief none</td>
</tr>
</tbody>
</table>

- A—How long, in seconds, until the advertisement timer expires.
- D—How long, in seconds, until the Master is Down timer expires.

---

### Sample Output

**show vrrp**

```
user@host> show vrrp

Interface           State    Group  VR state Timer  Type  Address
fe-0/0/0.121        up        1      master   A 1.052 lcl   fec0::12:1:1:1
                      vip     fe80::12:1:1:99
fe-0/0/2.131        up        1      master   A 0.364 lcl   fec0::13:1:1:1
                      vip     fec0::13:1:1:99

show vrrp brief

The output for the show vrrp brief command is identical to that for the show vrrp command. For sample output, see show vrrp on page 2400.

show vrrp nsr

This command is similar to `show vrrp`. Here, the `VR state` column displays the current VRRP state on the master Routing Engine, which is the future VRRP state for the backup Routing Engine. Do not use on the master Routing Engine.

NSR is yes if VRRP nonstop active routing is enabled for the configured VRRP group.

RPD-NSR is yes if the routing options have been set to nonstop active routing.

traceroute ethernet

Syntax

```
traceroute ethernet
local-mep mep-id
maintenance-association ma-name
maintenance-domain md-name
<ttl value>
<wait seconds>
mac-address | mep-id
<detail>
```

Release Information

Command introduced in Junos OS Release 9.0.

- `mep-id` option introduced in Junos OS Release 9.1.
- `local-mep` option introduced in Junos OS Release 15.1

Description

Triggers the linktrace protocol to trace the route between two maintenance points. The result of the traceroute protocol is stored in the path database. To display the path database, use the `show oam ethernet connectivity-fault-management path-database` command.

Before using the traceroute command, you can verify the remote MEP's MAC address using the `show oam ethernet connectivity-fault-management path-database` command.

Options

- `local-mep mep-id`—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.
- `detail`—(Optional) Provide detailed information of the responder hostname, ingress port name, egress port name, TTL, and relay action.
- `mac-address`—Destination unicast MAC address of the remote maintenance point.
- `mep-id`—MEP Identifier of the remote maintenance point. The range of values is 1 through 8191.
- `maintenance-association ma-name`—Specifies an existing maintenance association from the set of configured maintenance associations.
- `maintenance-domain md-name`—Specifies an existing maintenance domain from the set of configured maintenance domains.
- `ttl value`—Number of hops to use in the linktrace request. The range is 1 to 255 hops. The default is 4.
- `wait seconds`—(Optional) Maximum time to wait for a response to the traceroute request. The range is 1 to 255 seconds. The default is 5.

Required Privilege

- `network`

traceroute ethernet detail on page 2407

**Output Fields**  
Table 221 on page 2406 lists the output fields for the traceroute ethernet command. Output fields are listed in the approximate order in which they appear.

*Table 221: traceroute ethernet Output Fields*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linktrace to</td>
<td>MAC address of the destination maintenance point.</td>
</tr>
<tr>
<td>Interface</td>
<td>Local interface used to send the linktrace message (LTM).</td>
</tr>
<tr>
<td>Maintenance Domain</td>
<td>Maintenance domain specified in the traceroute command.</td>
</tr>
<tr>
<td>Level</td>
<td>Maintenance domain level configured.</td>
</tr>
<tr>
<td>Maintenance Association</td>
<td>Maintenance association specified in the traceroute command.</td>
</tr>
<tr>
<td>Local Mep</td>
<td>The local maintenance end point identifier.</td>
</tr>
<tr>
<td>Transaction Identifier</td>
<td>4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all Maintenance Domains. Use the transaction identifier to match an incoming linktrace response (LTR), with a previously sent LTM.</td>
</tr>
<tr>
<td>Hop</td>
<td>Sequential hop count of the linktrace path.</td>
</tr>
<tr>
<td>TTL</td>
<td>Number of hops remaining in the linktrace message. The time to live (TTL) is decremented at each hop.</td>
</tr>
<tr>
<td>Source MAC address</td>
<td>MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.</td>
</tr>
<tr>
<td>Next-hop MAC address</td>
<td>MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.</td>
</tr>
<tr>
<td>Responder Hostname</td>
<td>The hostname of the responding router. A valid hostname is received only when the responding system is a Juniper Networks router.</td>
</tr>
<tr>
<td>Ingress port name</td>
<td>The port name for ingress connections.</td>
</tr>
<tr>
<td>Egress port name</td>
<td>The port name for egress connections.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Flags</strong></td>
<td>The configurable flags can include:</td>
</tr>
<tr>
<td></td>
<td>• H—Hardware only, incoming LT frame has hardware bit set.</td>
</tr>
<tr>
<td></td>
<td>• T—Terminal MEP, responder is a terminating MEP.</td>
</tr>
<tr>
<td></td>
<td>• F—FWD yes, LTM frame is relayed further.</td>
</tr>
<tr>
<td><strong>Relay Action</strong></td>
<td>The associated relay action. Relay action can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• RlyHit—Relay hit; target MAC address matches the MP mac address.</td>
</tr>
<tr>
<td></td>
<td>• RlyFDB—Relay FDB; output port decided by consulting forwarding database.</td>
</tr>
<tr>
<td></td>
<td>• RlyMPDB—Relay MIP; output port decided by consulting MIP database.</td>
</tr>
</tbody>
</table>

**Sample Output**

**traceroute ethernet**

```bash
user@host> traceroute ethernet maintenance-domain md1 maintenance-association ma1 00:01:02:03:04:05
Linktrace to 00:01:02:03:04:05, Interface : ge-5/0/0.0
Maintenance Domain: MD1, Level: 7
Maintenance Association: MA1, Local Mep: 1
Hop  TTL  Source MAC address  Next hop MAC address
Transaction Identifier:100001
1    63   00:00:aa:aa:aa:aa         00:00:ab:ab:ab:ab
2    62   00:00:bb:bb:bb:bb         00:00:bc:bc:bc:bc
3    61   00:00:cc:cc:cc:cc         00:00:cd:cd:cd:cd
4    60   00:01:02:03:04:05         00:00:00:00:00:00
```

**traceroute ethernet detail**

```bash
user@host> run traceroute ethernet maintenance-domain md6 maintenance-association ma6 mep 101 detail
Linktrace to 00:00:5E:00:53:CC, Interface : ge-1/0/0.1
Maintenance Domain: md6, Level: 6
Maintenance Association: ma6, Local Mep: 201
Transaction Identifier: 2077547465
Legend for RelayAction:
RlyHit -- Relay hit, Target MAC address matches the MP mac address
RlyFDB -- Relay FDB, output port decided by consulting FDB database
RlyMPDB -- Relay MIP, output port decided by consulting MIP database
Legend for Flags:
H -- Hardware only, incoming LT frame has hardware bit set
T -- Terminal MEP, responder is a terminating MEP
F -- FWD yes, LTM frame is relayed further
```
