show interfaces (Channelized DS3-to-DS0)

Syntax

```
show interfaces ds-fpc/pic/port:t1channel:ds0channel
<brief | detail | extensive>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized DS3-to-DS0 interface.

Options

```
ds-fpc/pic/port:t1channel:ds0channel—Display standard information about the specified channelized DS3-to-DS0 interface.

brief | detail | extensive—(Optional) Display the specified level of output interface.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.
```

<tr>
<td><strong>Runts</strong></td>
<td>Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td><strong>Policed discards</strong></td>
<td>Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td><strong>L3 incompletes</strong></td>
<td>Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded.</td>
<td></td>
</tr>
<tr>
<td><strong>L2 channel errors</strong></td>
<td>Counter increments when the software could not find a valid logical interface for an incoming frame.</td>
<td></td>
</tr>
<tr>
<td><strong>L2 mismatch timeouts</strong></td>
<td>Count of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td><strong>SRAM errors</strong></td>
<td>Number of hardware errors that occurred in the static RAM (SRAM) on the PIC. If the value in this field increments, the PIC is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td><strong>HS link CRC errors</strong></td>
<td>Count of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td><strong>Carrier transitions</strong></td>
<td>Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly, (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td><strong>Errors</strong></td>
<td>Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td><strong>Drops</strong></td>
<td>Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td><strong>Aged packets</strong></td>
<td>Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td>Field Name</td>
<td>Field Description</td>
<td>Level of Output</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td><strong>DS1 alarms</strong></td>
<td>Media-specific defects that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td><strong>DS1 defects</strong></td>
<td>• LOS—Loss of signal. • LOF—Loss of frame. • AIS—Alarm indication signal. • YLW—Yellow alarm. Indicates errors at the remote site receiver.</td>
<td></td>

<td></td>
<td>• <strong>Count</strong>—Number of times that the defect has gone from inactive to active.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>State</strong>—State of the error. State other than <strong>OK</strong> indicates a problem.</td>
<td></td>
</tr>
</tbody>
</table>

The T1 media-specific error types can be:

- **SEF**—Severely errored framing
- **BEE**—Bit error event
- **AIS**—Alarm indication signal
- **LOF**—Loss of frame
- **LOS**—Loss of signal
- **YELLOW**—Errors at the remote site receiver
- **BPV**—Bipolar violation
- **EXZ**—Excessive zeros
- **LCV**—Line code violation
- **PCV**—Pulse code violation
- **CS**—Carrier state
- **LES**—Line error seconds
- **ES**—Errored seconds
- **SEFS**—Severely errored framing seconds (section)
- **SES**—Severely errored seconds
- **BES**—Bit error seconds
- **UAS**—Unavailable seconds

show interfaces (Channelized DS3-to-DS1)

Syntax

show interfaces t1-fpc/pic/port:t1channel
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized DS3-to-DS1 interface.

Options

 t1-fpc/pic/port:t1channel—Display standard information about the specified channelized DS3-to-DS1 interface.

 brief | detail | extensive | terse—(Optional) Display brief, detail, extensive, or terse information about the interface.

 descriptions—(Optional) Display interface description strings.

 media—(Optional) Display media-specific information about network interfaces.

 snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

 statistics—(Optional) Display static interface statistics.

Required Privilege

show interfaces (Channelized E1 IQ)

Syntax

```
show interfaces (ce1-fpc/pic/port | type-fpc/pic/port <channel>)
<brief | detail | extensive | terse></brie
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized E1 IQ interface.

Options

```
type-fpc/pic/port:<channel>—Interface type with optional corresponding channel levels. For the physical channelized E1 IQ interface, type is ce. For the clear channel, type is e1. At the first level of channelization, type is ds.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.
```

<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Carrier transitions</strong>—Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then either the cable, the far-end system, or the PIC is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Aged packets</strong>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MTU errors</strong>—Number of packets larger than the MTU threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
</tbody>
</table>

- **DS1 alarms**
  - E1 media-specific defects that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. The following lists all possible alarms and defects. For complete explanations of most of these alarms and defects, see Bellcore Telcordia GR-499-CORE.
  - **LOS**—Loss of signal.
  - **LOF**—Loss of frame.
  - **AIS**—Alarm indication signal.
  - **YLW**—Yellow alarm. Indicates errors at the remote site receiver.

show interfaces (Channelized OC12 IQ and IQE)

**Syntax**  
```
show interfaces (type-fpc/pic/port:<channel>:<channel>:<channel>)
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

**Release Information**  
Command introduced before Junos OS Release 7.4.

**Description**  
Display status information about the specified channelized OC12 IQ and IQE interface.

**Options**  
`type-fpc/pic/port:channel:channel:channel`—Interface type with optional corresponding channel levels.

For SONET mode, the interface type can be one of the following:

- `type-fpc/pic/port`—For the physical channelized OC12 IQ or IQE interface, **type** is `coc12`. For the clear channel, **type** is `so` (for OC12).
- `type-fpc/pic/port:channel`—At the first level of channelization, **type** can be `coc1` (channelized OC1), `ct3` (from `coc1`), `so` (for OC3), or `t3`.
- `type-fpc/pic/port:channel:channel`—At the second level of channelization, **type** can be `ct1` (from `ct3` or `coc1`) or `t1` (from `ct3` or `coc1`).
- `type-fpc/pic/port:channel:channel:channel`—At the third level of channelization, **type** is `ds` (from `ct1`).

For SDH mode, the interface type can be one of the following:

- `type-fpc/pic/port`—For the physical channelized OC12 IQ or IQE interface, **type** is `cstm4`. For the clear channel, **type** is `so` (for SONET/SDH (vc-4-4c)).
- `type-fpc/pic/port:channel`—At the first level of channelization, **type** can be `so` (from `cstm4`) or `cau4` (from `cstm4`).
- `type-fpc/pic/port:channel:channel`—At the second level of channelization, **type** can be `ct3` or `t3` (from or `cau4`).
- `type-fpc/pic/port:channel:channel:channel`—At the third level of channelization, **type** is `ct1` or `t1` (from `ct3`).
- `type-fpc/pic/port:channel:channel:channel:channel`—At the fourth level of channelization, **type** is `ds` (from `ct1`).

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about network interfaces.
snmp-index — (Optional) Display information for the specified SNMP index of the interface.

statistics — (Optional) Display static interface statistics.

show interfaces (Channelized OC3 IQ and IQE)

 Syntax

 `show interfaces (type-fpc/pic/port <:channel>:<channel>:<channel>)`
 `<brief | detail | extensive | terse>`
 `<descriptions>`
 `<media>`
 `<snmp-index snmp-index>`
 `<statistics>`

 Release Information

 Command introduced before Junos OS Release 7.4.

 Description

 (M Series and T Series routers only) Display status information about the specified channelized OC3 IQ or IQE interface.

 Options

 `type-fpc/pic/port:channel:channel:channel`—Interface type with optional corresponding channel levels. The interface type can be one of the following:

 - `type-fpc/pic/port`—For the physical interface, `type` is `coc3`. For the clear channel, `type` is `so` (for OC3).

 - `type-fpc/pic/port:channel`—At the first level of channelization, `type` can be `coc1` (channelized OC1), `ct3` (from `coc1`), or `t3` (from `coc1`).

 - `type-fpc/pic/port:channel:channel`—At the second level of channelization, `type` can be `ct1` (from `coc1` or `ct3`) or `t1` (from `coc1` or `ct3`).

 - `type-fpc/pic/port:channel:channel:channel`—At the third level of channelization, `type` can be `ds` (from `ct1`).

 `brief | detail | extensive | terse`—(Optional) Display the specified level of output.

 `descriptions`—(Optional) Display interface description strings.

 `media`—(Optional) Display media-specific information about network interfaces.

 `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

 `statistics`—(Optional) Display static interface statistics.

 Required Privilege

 `view`

 List of Sample Output

 `show interfaces extensive (Channelized OC3 IQ) (Physical) on page 1331`
 `show interfaces extensive (Channelized OC1 on Channelized OC3 IQ) on page 1332`
 `show interfaces extensive (Channelized T1 on Channelized OC3 IQ) on page 1333`
 `show interfaces extensive (DS0 on Channelized OC3 IQ) on page 1334`
**Output Fields**  
Table 36 on page 1318 lists the output fields for the `show interfaces` (all Channelized OC interfaces) command. Output fields are listed in the approximate order in which they appear.

**Table 36: Channelized OC show interfaces Output Fields**

<table>

</thead>
<tbody>
<tr>
<td>Output errors</td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Carrier transitions — Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Errors — Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Drops — Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Aged packets — Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• HS link FIFO underflows — Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MTU errors — Number of packets whose size exceeds the MTU of the interface.</td>
<td></td>

<td><strong>DS3 media</strong></td>
<td>Counts of T3 media-specific errors. For detailed definitions of the T3 (DS-3) error events (BPV, EXZ, LCV, PCV, and CCV) and performance parameters (LES, PES, PSES, CES, CSES, SEFS, and UAS), see RFC 2496.</td>
<td>extensive</td>
</tr>
</tbody>
</table>

The DS3 or E3 media-specific error types can be:

- **PLL Lock**—Phase-locked loop out of lock
- **Reframing**—Frame alignment recovery time
- **AIS**—Alarm indication signal
- **LOF**—Loss of frame
- **LOS**—Loss of signal
- **IDLE**—Idle code detected
- **YELLOW**—Errors at the remote site receiver
- **BPV**—Bipolar violation
- **EXZ**—Excessive zeros
- **LCV**—Line code violation
- **PCV**—(DS3 only) Pulse code violation
- **CCV**—(DS3 only) C-bit coding violation
- **FEBE**—(DS3 only) Far-end block error
- **LES**—Line error seconds
- **PES**—(DS3 only) P-bit errored seconds
- **PSES**—(DS3 only) P-bit errored seconds (section)
- **CES**—(DS3 only) C-bit errored seconds
- **CSES**—(DS3 only) C-bit severely errored seconds
- **SEFS**—Severely errored framing seconds
- **UAS**—Unavailable seconds

show interfaces (Channelized STM1 IQ)

Syntax

```
show interfaces (type-fpc/pic/port <channel><channel>)
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized STM1 IQ interface.

Options

```
type-fpc/pic/port:channel:channel—Interface type with optional corresponding channel levels. The interface type can be one of the following types:

  • type-fpc/pic/port:channel—For the physical channelized STM1 IQ interface, type is cstm1. For the clear channel, type is so. For channelization, the STM1 IQ interface must be converted to interface type cau4.

  • type-fpc/pic/port:channel—At the first level of channelization, type can be cel or e1 (clear channel or fractional channel from cau4).

  • type-fpc/pic/port:channel:channel—At the second level of channelization, type is ds (from cel).

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.
```

| Received path trace | Transmitted path trace | Channelized OCl2 interfaces allow path trace bytes to be sent inband across the SONET/SDH link. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits. This information is specific to each of the 12 channelized OCl2 interfaces. | extensive |

show interfaces (Channelized T1 IQ)

Syntax

```
show interfaces (ct1-fpc/pic/port | type-fpc/pic/port:<channel>:<channel>)
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

Release Information

Command introduced in Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized T1 IQ interface.

Options

- **type-fpc/pic/port:channel**—Interface type. With optional corresponding channel levels, the interface type can be one of the following:
  - **type-fpc/pic/port**—For the physical channelized T1 IQ interface, **type** is ct1.
  - **type-fpc/pic/port:channel**—For the clear channel, **type** is t1. At the first level of channelization, **type** can be ct1 or t1.
  - **type-fpc/pic/port:channel:channel**—At the second level of channelization, **type** can be ds.

- **brief | detail | extensive | terse**—(Optional) Display the specified level of output.
- **descriptions**—(Optional) Display interface description strings.
- **media**—(Optional) Display media-specific information about network interfaces.
- **snmp-index snmp-index**—(Optional) Display information for the specified SNMP index of the interface.
- **statistics**—(Optional) Display static interface statistics.

Required Privilege

**view**

List of Sample Output

- show interfaces extensive (CT1) on page 1363
- show interfaces extensive (T1) on page 1364
- show interfaces extensive (DS0) on page 1365

Output Fields

Table 38 on page 1356 lists the output fields for the `show interfaces` (Channelized T1 IQ and T3 IQ interfaces) command. Output fields are listed in the approximate order in which they appear.

</thead>
<tbody>
<tr>
<td><strong>Input errors</strong></td>
<td>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Framing errors</strong>—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Giants</strong>—Number of frames received that are larger than the giant threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Runt</strong>s—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Policed discards</strong>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L3 incompletes</strong>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 channel errors</strong>—Counter increments when the software could not find a valid logical interface for an incoming frame.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 mismatch timeouts</strong>—Count of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>HS link CRC errors</strong>—Count of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>SRAM errors</strong>—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC. If the value in this field increments, the PIC is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Carrier transitions</strong>—Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Aged packets</strong>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MTU errors</strong>—Number of packets whose size exceeds the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
</tbody>
</table>

show interfaces (Channelized T3 IQ)

Syntax

```ini
show interfaces (ct3-fpc/pic/port | type-fpc/pic/port:<channel>:<channel>)
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized T3 IQ interface.

Options

- `type-fpc/pic/port:channel`—Interface type. With optional corresponding channel levels, the interface type can be one of the following:
  - `type-fpc/pic/port`—For the physical channelized T3 IQ interface, `type` is `ct3`.
  - `type-fpc/pic/port:channel`—For the clear channel, `type` is `t3`. At the first level of channelization, `type` can be `ct1` or `t1`.
  - `type-fpc/pic/port:channel:channel`—At the second level of channelization, `type` is `ds`.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about network interfaces.
- `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

Required Privilege

`view`

List of Sample Output

- `show interfaces extensive (Channelized T3 IQ) (Physical)` on page 1369
- `show interfaces extensive (Channelized T1 on Channelized T3 IQ)` on page 1369
- `show interfaces extensive (DS0 on Channelized T3 IQ)` on page 1369

Output Fields

See the output field table for the `show interfaces (Channelized T1 IQ)` command.
### Sample Output

#### show interfaces extensive (Channelized T3 IQ) (Physical)

```
user@host> show interfaces extensive ct3-0/0/1
Physical interface: ct3-0/0/1, Enabled, Physical link is Up
  Interface index: 30, SNMP ifIndex: 317, Generation: 29
  Link-level type: Controller, MTU: 4474, Clocking: Internal, Speed: T3,
  Loopback: None, FCS: 16, Mode: C/Bit parity, Parent: None
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link flags     : None
...
```

#### show interfaces extensive (Channelized T1 on Channelized T3 IQ)

```
user@host> show interfaces extensive ct1-0/0/1:2
Physical interface: ct1-0/0/1:2, Enabled, Physical link is Up
  Interface index: 175, SNMP ifIndex: 1505, Generation: 174
  Link-level type: Controller, MTU: 1504, Clocking: Internal, Speed: T1,
  Loopback: None, FCS: 16, Framing: ESF, Parent: ct3-0/0/1 (Index 32)
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link flags     : None
...
```

#### show interfaces extensive (DS0 on Channelized T3 IQ)

```
user@host> show interfaces extensive ds-0/0/1:2:1
Physical interface: ds-0/0/1:2:1, Enabled, Physical link is Up
  Interface index: 176, SNMP ifIndex: 1563, Generation: 175
  Link-level type: PPP, MTU: 1504, Clocking: Internal, Speed: 640kbps,
  Loopback: None, FCS: 16, Parent: ct1-0/0/1:2 (Index 175)
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link flags     : Keepalives
...
```
show interfaces (Discard)

Syntax

    show interfaces dsc
    <brief | detail | extensive | terse>
    <descriptions>
    <media>
    <snmp-index snmp-index>
    <statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display status information about the specified discard interface.

Options

dsc—Display standard information about the specified discard interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—This option is not relevant for the discard interface and always shows a value of 0.

snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) This option is not relevant for the discard interface and always shows a value of 0.

Required Privilege

show interfaces (Fast Ethernet)

Syntax

```
show interfaces interface-type
  <brief | detail | extensive | terse>
  <descriptions>
  <media>
  <snmp-index snmp-index>
  <statistics>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display status information about the specified Fast Ethernet interface.

Options

- `interface-type`—On M Series and T Series routers, the interface type is `fe-fpc/pic/port`.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about network interfaces.
- `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

Required Privilege Level

`view`

List of Sample Output

- `show interfaces (Fast Ethernet)` on page 1390
- `show interfaces brief (Fast Ethernet)` on page 1390
- `show interfaces detail (Fast Ethernet)` on page 1390
- `show interfaces extensive (Fast Ethernet)` on page 1391

Output Fields

Table 40 on page 1376 lists the output fields for the `show interfaces (Fast Ethernet)` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output errors</td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Carrier transitions</strong>—Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Collisions</strong>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Aged packets</strong>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO errors</strong>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>HS link CRC errors</strong>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MTU errors</strong>—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td>Egress queues</td>
<td>Total number of egress queues supported on the specified interface.</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> In DPCs that are not of the enhanced type, such as DPC 40x1GE R, DPCE 20x1GE + 2x10GE R, or DPCE 40x1GE R, you might notice a discrepancy in the output of the <strong>show interfaces</strong> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs.</td>
<td></td>
</tr>
<tr>
<td>Queue counters</td>
<td>CoS queue number and its associated user-configured forwarding class name.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>(Egress)</td>
<td>• <strong>Queued packets</strong>—Number of queued packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Transmitted packets</strong>—Number of transmitted packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Dropped packets</strong>—Number of packets dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>MAC statistics</td>
<td><strong>Receive and Transmit</strong> statistics reported by the PIC's MAC subsystem, including the following:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Total octets and total packets</strong>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <code>show interfaces</code> command.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Unicast packets, Broadcast packets, and Multicast packets</strong>—Number of unicast, broadcast, and multicast packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>CRC/Align errors</strong>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO error</strong>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC control frames</strong>—Number of MAC control frames.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC pause frames</strong>—Number of MAC control frames with pause operational code.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Oversized frames</strong>—Number of frames that exceed 1518 octets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Jabber frames</strong>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Fragment frames</strong>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>VLAN tagged frames</strong>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Code violations</strong>—Number of times an event caused the PHY to indicate “Data reception error” or “Invalid data symbol error”</td>
<td></td>
</tr>

Table 40: show interfaces Fast Ethernet Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter statistics</td>
<td>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>* Input packet count—Number of packets received from the MAC hardware that the filter processed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>* Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>* Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>* Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>* Output packet count—Number of packets that the filter has given to the MAC hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>* Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>* Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>* CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</td>
<td></td>
</tr>
</tbody>
</table>

**PMA PHY** (10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:                                                                                                                                                                                                                                                      | extensive       |

Received path trace, Transmitted path trace (10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other routing device manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.

Packet Forwarding Engine configuration Information about the configuration of the Packet Forwarding Engine:

• Destination slot—FPC slot number.

**Release Information**

Command introduced before Junos OS Release 7.4 for Gigabit interfaces.
Command introduced in Junos OS Release 8.0 for 10 Gigabit interfaces.
Command modified in Junos OS Release 9.5 for SRX Series devices.
Command introduced in Junos OS Release 18.1 for Gigabit interfaces.
Command modified in Junos OS Release 19.3R1 for MX Series Routers.

Starting in Junos OS Release 19.3R1, Output fields `ifindex` and `speed` is modified in the `show interfaces interface name extensive` command, on all MX Series routers.

- The default behavior of WAN-PHY interface remains the same. The new `precise-bandwidth` option reflects the new speed (9.294Gbps) configured on the supported line cards.
- The WAN-PHY framing mode is supported only on MPC5E and MPC6E line cards.

Command modified in Junos OS Release 19.3R1 for vSRX and vSRX 3.0 platforms to support 1G, 10G, 40G, and 100G Gigabit Ethernet interfaces, for performing CoS operations and to provide better bandwidth for processing traffic during congestion using variant speeds.

**Description**

Display status information about the specified Gigabit Ethernet interface.

(M320, M120, MX Series, and T Series routers only) Display status information about the specified 10-Gigabit Ethernet interface.

Display the IPv6 interface traffic statistics about the specified Gigabit Ethernet interface for MX series routers. The input and output bytes (bps) and packets (pps) rates are not displayed for IFD and local traffic.

Display status information and statistics about interfaces on SRX Series, vSRX, and vSRX 3.0 platforms running Junos OS.

**NOTE:** On SRX Series appliances, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

Starting in Junos OS Release 18.4R1, Output fields `Next-hop` and `vpls-status` is displayed in the `show interfaces interface name detail` command, only for Layer 2 protocols on MX480 routers.

**Options**

For Gigabit interfaces:

`ge-fpc/pic/port`—Display standard information about the specified Gigabit Ethernet interface.

Starting in Junos OS Release 19.3R1, on vSRX and vSRX 3.0, this interface can be configured with different speed rates of 1G, 10G, 40G, and 100G. This speed is applied for performing CoS operations and to provide better bandwidth for processing traffic during congestion.
NOTE: Interfaces with different speeds are named uniformly with ge-0/0/x for backward compatibility. Use the show interfaces command to view the interface speeds.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For 10 Gigabit interfaces:

xe-fpc/pic/port—Display standard information about the specified 10-Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For SRX interfaces:

- interface-name—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
  - at-pim/0/port—ATM-over-ADSL or ATM-over-SHDSL interface.
  - ce1-pim/0/port—Channelized E1 interface.
  - cl-0/0/8—3G wireless modem interface for SRX320 devices.
  - ct1-pim/0/port—Channelized T1 interface.
  - dl0—Dialer Interface for initiating ISDN and USB modem connections.
  - e1-pim/0/port—E1 interface.
  - e3-pim/0/port—E3 interface.
  - fe-pim/0/port—Fast Ethernet interface.
  - ge-pim/0/port—Gigabit Ethernet interface.
Starting in Junos OS Release 19.3R1, on vSRX and vSRX 3.0, this interface supports different speed of 1G, 10G, 40G, and 100G. You can configure CoS on these interfaces. This speed is applied for performing CoS operations and to provide better bandwidth for processing traffic during congestion.

- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
  - **at-pim/0/port**—ATM-over-ADSL or ATM-over-SHDSL interface.
  - **cel-pim/0/port**—Channelized E1 interface.
  - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
  - **ct1-pim/0/port**—Channelized T1 interface.
  - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
  - **e1-pim/0/port**—E1 interface.
  - **e3-pim/0/port**—E3 interface.
  - **fe-pim/0/port**—Fast Ethernet interface.
  - **ge-pim/0/port**—Gigabit Ethernet interface.

Additional Information

In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.

Required Privilege

**view**
Starting in Junos OS Release 18.4R1, output fields `Next-hop` and `vpls-status` is displayed in the `show interfaces interface name detail` command, only for Layer 2 protocols on MX480 routers.

Output Fields  
Table 30 on page 1166 describes the output fields for the show interfaces (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see Table 31 on page 1195.

<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Framing errors</strong>—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Runts</strong>—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Policed discards</strong>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L3 incompletes</strong>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code> statement.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 channel errors</strong>—Number of times the software did not find a valid logical interface for an incoming frame.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 mismatch timeouts</strong>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO errors</strong>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>

<tbody>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td><strong>Carrier transitions</strong>—Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Collisions</strong>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number must always be 0. If it is nonzero, there is a software bug.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Aged packets</strong>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>FIFO errors</strong>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>HS link CRC errors</strong>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>MTU errors</strong>—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>

<table>
<thead>
<tr>
<th><strong>Egress queues</strong></th>
<th>Total number of egress queues supported on the specified interface.</th>
<th>detailed extensive</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the show interfaces command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs.</td>

Table 41: `show interfaces (Gigabit Ethernet) Output Fields (continued)`

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC statistics</td>
<td><strong>Receive and Transmit</strong> statistics reported by the PIC's MAC subsystem, including the following:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Total octets and total packets</strong>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <code>show interfaces</code> command.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Unicast packets, Broadcast packets, and Multicast packets</strong>—Number of unicast, broadcast, and multicast packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>CRC/Align errors</strong>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO error</strong>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC control frames</strong>—Number of MAC control frames.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC pause frames</strong>—Number of MAC control frames with <strong>pause</strong> operational code.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Oversized frames</strong>—There are two possible conditions regarding the number of oversized frames:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Packet length exceeds interface MTU, or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Packet length exceeds MRU</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Jabber frames</strong>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Fragment frames</strong>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>VLAN tagged frames</strong>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the <strong>VLAN tagged frames</strong> field displays 0 when the <code>show interfaces</code> command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Code violations</strong>—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”</td>
<td></td>
</tr>
<tr>
<td>OTN Received Overhead Bytes</td>

</tbody>
</table>
Table 41: show interfaces (Gigabit Ethernet) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter statistics</td>
<td><strong>Receive</strong> and <strong>Transmit</strong> statistics reported by the PIC’s MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet’s source and destination MAC addresses to determine whether the packet may enter the system or be rejected.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Input packet count</strong>—Number of packets received from the MAC hardware that the filter processed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input packet rejects</strong>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input DA rejects</strong>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input SA rejects</strong>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field must increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet count</strong>—Number of packets that the filter has given to the MAC hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet pad count</strong>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet error count</strong>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field must not increment.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>CAM destination filters, CAM source filters</strong>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</td>
<td></td>
</tr>
<tr>
<td>PMA PHY</td>

<td>Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Ingress account overhead</td>
<td>Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>
### Traffic statistics

Number and rate of bytes and packets received and transmitted on the physical interface.

- **Input bytes**—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.
- **Output bytes**—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.
- **Input packets**—Number of packets received on the interface.
- **Output packets**—Number of packets transmitted on the interface.

### Input errors

Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:

- **Errors**—Sum of the incoming frame aborts and FCS errors.
- **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.
- **Framing errors**—Number of packets received with an invalid frame checksum (FCS).
- **Runt**—Number of frames received that are smaller than the runt threshold.
- **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.
- **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the `ignore-l3-incompletes` statement.
- **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame.
- **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.
- **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.
- **Resource errors**—Sum of transmit drops.
### Output errors

Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:

- **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.

- **Errors**—Sum of the outgoing frame aborts and FCS errors.

- **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.

- **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.

- **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.

- **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.

- **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.

- **MTU errors**—Number of packets whose size exceeded the MTU of the interface.

- **Resource errors**—Sum of transmit drops.

### Egress queues

Total number of egress queues supported on the specified interface.

**NOTE:** In DPCs that are not of the enhanced type, such as DPC 40x1GE R, DPCE 20x1GE + 2x10GE R, or DPCE 40x1GE R, you might notice a discrepancy in the output of the `show interfaces` command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs.

### Queue counters (Egress)

CoS queue number and its associated user-configured forwarding class name.

- **Queued packets**—Number of queued packets.

- **Transmitted packets**—Number of transmitted packets.

- **Dropped packets**—Number of packets dropped by the ASIC’s RED mechanism.

### Ingress queues

Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.
### Queue counters (Ingress)

CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.

- **Queued packets**—Number of queued packets.
- **Transmitted packets**—Number of transmitted packets.
- **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.

### Active alarms and Active defects

Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value **None** or **Link**.

- **None**—There are no active defects or alarms.
- **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.

### OTN alarms

Active OTN alarms identified on the interface.

### OTN defects

OTN defects received on the interface.

### OTN FEC Mode

The FEC mode configured on the interface.

- **efec**—Enhanced forward error correction (EFEC) is configured to detect and correct bit errors.
- **gfec**—G.709 Forward error correction (GFEC) mode is configured to detect and correct bit errors.
- **none**—FEC mode is not configured.

### OTN Rate

OTN mode.

- **fixed-stuff-bytes**—Fixed stuff bytes 11.0957 Gbps.
- **no-fixed-stuff-bytes**—No fixed stuff bytes 11.0491 Gbps.
- **pass-through**—Enable OTN passthrough mode.
- **no-pass-through**—Do not enable OTN passthrough mode.

### OTN Line Loopback

Status of the line loopback, if configured for the DWDM OTN PIC. Its value can be: **enabled** or **disabled**.

### OTN FEC statistics

The forward error correction (FEC) counters for the DWDM OTN PIC.

- **Corrected Errors**—The count of corrected errors in the last second.
- **Corrected Error Ratio**—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.

### OTN FEC alarms

OTN FEC excessive or degraded error alarms triggered on the interface.

- **FEC Degradate**—OTU FEC Degradate defect.
- **FEC Excessive**—OTU FEC Excessive Error defect.
OTN OC | OTN OC defects triggered on the interface.
---|---
• LOS—OC Loss of Signal defect.
• LOF—OC Loss of Frame defect.
• LOM—OC Loss of Multiframe defect.
• Wavelength Lock—OC Wavelength Lock defect.

OTN OTU | OTN OTU defects detected on the interface
---|---
• AIS—OTN AIS alarm.
• BDI—OTN OTU BDI alarm.
• IAE—OTN OTU IAE alarm.
• TTIM—OTN OTU TTIM alarm.
• SF—OTN ODU bit error rate fault alarm.
• SD—OTN ODU bit error rate defect alarm.
• TCA-ES—OTN ODU ES threshold alarm.
• TCA-SES—OTN ODU SES threshold alarm.
• TCA-UAS—OTN ODU UAS threshold alarm.
• TCA-BBE—OTN ODU BBE threshold alarm.
• BIP—OTN ODU BIP threshold alarm.
• BBE—OTN OTU BBE threshold alarm.
• ES—OTN OTU ES threshold alarm.
• SES—OTN OTU SES threshold alarm.
• UAS—OTN OTU UAS threshold alarm.

Received DAPI | Destination Access Port Interface (DAPI) from which the packets were received.
---|---

Received SAPI | Source Access Port Interface (SAPI) from which the packets were received.
---|---

Transmitted DAPI | Destination Access Port Interface (DAPI) to which the packets were transmitted.
---|---

Transmitted SAPI | Source Access Port Interface (SAPI) to which the packets were transmitted.
---|---

PCS statistics | (10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.
---|---
• Bit errors—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.
• Errored blocks—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.
MAC statistics

Receive and Transmit statistics reported by the PIC’s MAC subsystem, including the following:

- **Total octets and total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.
- **Unicast packets, Broadcast packets, and Multicast packets**—Number of unicast, broadcast, and multicast packets.
- **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
- **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.
- **MAC control frames**—Number of MAC control frames.
- **MAC pause frames**—Number of MAC control frames with pause operational code.
- **Oversized frames**—Number of frames that exceed 1518 octets.
- **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.
- **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.
- **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.
- **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”

<table>

<td>extensive</td>
</tr>
</tbody>
</table>
Filter statistics

Receive and Transmit statistics reported by the PIC’s MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet’s source and destination MAC addresses to determine whether the packet should enter the system or be rejected.

- **Input packet count**—Number of packets received from the MAC hardware that the filter processed.
- **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.
- **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).
- **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.
- **Output packet count**—Number of packets that the filter has given to the MAC hardware.
- **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.
- **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.
- **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.

PMA PHY

(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:

- **Seconds**—Number of seconds the defect has been active.
- **Count**—Number of times that the defect has gone from inactive to active.
- **State**—State of the error. Any state other than **OK** indicates a problem.
**WIS section**  
(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:  
- **Seconds**—Number of seconds the defect has been active.  
- **Count**—Number of times that the defect has gone from inactive to active.  
- **State**—State of the error. Any state other than *OK* indicates a problem.  

Subfields are:  
- **BIP-B1**—Bit interleaved parity for SONET section overhead  
- **SEF**—Severely errored framing  
- **LOL**—Loss of light  
- **LOF**—Loss of frame  
- **ES-S**—Errored seconds (section)  
- **SES-S**—Severely errored seconds (section)  
- **SEFS-S**—Severely errored framing seconds (section)

**WIS line**  
(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information:  
- **Seconds**—Number of seconds the defect has been active.  
- **Count**—Number of times that the defect has gone from inactive to active.  
- **State**—State of the error. State other than *OK* indicates a problem.  

Subfields are:  
- **BIP-B2**—Bit interleaved parity for SONET line overhead  
- **REI-L**—Remote error indication (near-end line)  
- **RDI-L**—Remote defect indication (near-end line)  
- **AIS-L**—Alarm indication signal (near-end line)  
- **BERR-SF**—Bit error rate fault (signal failure)  
- **BERR-SD**—Bit error rate defect (signal degradation)  
- **ES-L**—Errored seconds (near-end line)  
- **SES-L**—Severely errored seconds (near-end line)  
- **UAS-L**—Unavailable seconds (near-end line)  
- **ES-LFE**—Errored seconds (far-end line)  
- **SES-LFE**—Severely errored seconds (far-end line)  
- **UAS-LFE**—Unavailable seconds (far-end line)
### Interface Operational Commands

#### WIS path

(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information.

- **Seconds**—Number of seconds the defect has been active.
- **Count**—Number of times that the defect has gone from inactive to active.
- **State**—State of the error. Any state other than **OK** indicates a problem.

Subfields are:

- **BIP-B3**—Bit interleaved parity for SONET section overhead
- **REI-P**—Remote error indication
- **LOP-P**—Loss of pointer (path)
- **AIS-P**—Path alarm indication signal
- **RDI-P**—Path remote defect indication
- **UNEQ-P**—Path unequipped
- **PLM-P**—Path payload label mismatch
- **ES-P**—Errored seconds (near-end STS path)
- **SES-P**—Severely errored seconds (near-end STS path)
- **UAS-P**—Unavailable seconds (near-end STS path)
- **SES-PFE**—Severely errored seconds (far-end STS path)
- **UAS-PFE**—Unavailable seconds (far-end STS path)

#### Autonegotiation information

Information about link autonegotiation.

- **Negotiation status:**
  - **Incomplete**—Ethernet interface has the speed or link mode configured.
  - **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
  - **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.

- **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.

- **Link partner:**
  - **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
  - **Flow control**—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is **None**. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
  - **Remote fault**—Remote fault information from the link partner. **Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.

- **Local resolution**—Information from the link partner:
  - **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
  - **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
Received path trace, Transmitted path trace

(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.

Packet Forwarding Engine configuration

Information about the configuration of the Packet Forwarding Engine:
- **Destination slot**—FPC slot number.

CoS information

Information about the CoS queue for the physical interface.
- **CoS transmit queue**—Queue number and its associated user-configured forwarding class name.
- **Bandwidth %**—Percentage of bandwidth allocated to the queue.
- **Bandwidth bps**—Bandwidth allocated to the queue (in bps).
- **Buffer %**—Percentage of buffer space allocated to the queue.
- **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.
- **Priority**—Queue priority: low or high.
- **Limit**—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.

Logical Interface

<table>
<thead>
<tr>
<th>Logical interface</th>
<th>Name of the logical interface.</th>
<th>All levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Index</td>
<td>Index number of the logical interface, which reflects its initialization sequence.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td>SNMP ifIndex</td>
<td>SNMP interface index number for the logical interface.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td>Generation</td>
<td>Unique number for use by Juniper Networks technical support only.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Flags</td>
<td>Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1152.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
### VLAN-Tag
Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags.

- **push**—An outer VLAN tag is pushed in front of the existing VLAN tag.
- **pop**—The outer VLAN tag of the incoming frame is removed.
- **swap**—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information.
- **push**—An outer VLAN tag is pushed in front of the existing VLAN tag.
- **push-push**—Two VLAN tags are pushed in from the incoming frame.
- **swap-push**—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame.
- **swap-swap**—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value.
- **pop-swap**—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame.
- **pop-pop**—Both the outer and inner VLAN tags of the incoming frame are removed.

### Demux:
IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:

- Source Family Inet
- Destination Family Inet

### Encapsulation
Encapsulation on the logical interface.

### Protocol
Protocol family. Possible values are described in the “Protocol Field” section under “Common Output Fields Description” on page 1152.

### MTU
Maximum transmission unit size on the logical interface.

### Maximum labels
Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.

### Traffic statistics
Number and rate of bytes and packets received and transmitted on the specified interface set.

- **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.
- **Input packets, Output packets**—Number of packets received and transmitted on the interface set.

### IPv6 transit statistics
Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.

### Local statistics
Number and rate of bytes and packets destined to the routing device.
**Transit statistics**  Number and rate of bytes and packets transiting the switch.

*NOTE:* For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the *Output bytes* and *Output packets* interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.

| **Generation** | Unique number for use by Juniper Networks technical support only. | detail extensive |
| **Route Table** | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0. | detail extensive none |
| **Flags** | Information about protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1152. | detail extensive |
| **Donor interface** | (Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address. | detail extensive none |
| **Preferred source address** | (Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface. | detail extensive none |
| **Input Filters** | Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces. | detail extensive |
| **Output Filters** | Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces. | detail extensive |
| **Mac-Validate Failures** | Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface. | detail extensive none |
| **Addresses, Flags** | Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1152. | detail extensive none |
| **protocol-family** | Protocol family configured on the logical interface. If the protocol is *inet*, the IP address of the interface is also displayed. | brief |
| **Flags** | Information about address flag (possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1152. | detail extensive none |
| **Destination** | IP address of the remote side of the connection. | detail extensive none |
| **Local** | IP address of the logical interface. | detail extensive none |
| **Broadcast** | Broadcast address of the logical interface. | detail extensive none |
| **Generation** | Unique number for use by Juniper Networks technical support only. | detail extensive |
For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. The following table describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). The `ge-0/3/0` interface is the inbound physical interface, and the `ge-0/0/0` interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit .50 (VLAN 50).

### Table 43: show interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input errors</strong></td>
<td>Input errors on the interface.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Framing errors</strong>—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Runts</strong>—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Policed discards</strong>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L3 incompletes</strong>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code> .</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 channel errors</strong>—Number of times the software did not find a valid logical interface for an incoming frame.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 mismatch timeouts</strong>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO errors</strong>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Carrier transitions</strong>—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Collisions</strong>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation; therefore, for Gigabit Ethernet PICs, this number must always remain 0. If it is nonzero, there is a software bug.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Aged packets</strong>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO errors</strong>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>HS link CRC errors</strong>—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MTU errors</strong>—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>

</tbody>
</table>

MAC statistics

Receive and Transmit statistics reported by the PIC’s MAC subsystem, including the following:

- **Total octets and total packets**—Total number of octets and packets.
- **Unicast packets, Broadcast packets, and Multicast packets**—Number of unicast, broadcast, and multicast packets.
- **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
- **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.
- **MAC control frames**—Number of MAC control frames.
- **MAC pause frames**—Number of MAC control frames with pause operational code.
- **Oversized frames**—There are two possible conditions regarding the number of oversized frames:
  - Packet length exceeds 1518 octets, or
  - Packet length exceeds MRU
- **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.
- **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.
- **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.
- **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”
Table 43: show interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter statistics</td>
<td>Receive and Transmit statistics reported by the PIC’s MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet’s source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Input packet count — Number of packets received from the MAC hardware that the filter processed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Input packet rejects — Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Input DA rejects — Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Input SA rejects — Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Output packet count — Number of packets that the filter has given to the MAC hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Output packet pad count — Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Output packet error count — Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• CAM destination filters, CAM source filters — Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</td>
<td></td>
</tr>
</tbody>
</table>

Autonegotiation information

Information about link autonegotiation. extensive

• Negotiation status:
  • Incomplete — Ethernet interface has the speed or link mode configured.
  • No autonegotiation — Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
  • Complete — Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.

Packet Forwarding Engine configuration

Information about the configuration of the Packet Forwarding Engine: extensive

• Destination slot — FPC slot number.

NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface
egress statistics displayed in the show interfaces command output might not accurately
reflect the traffic on the wire when output shaping is applied. Traffic management output
shaping might drop packets after they are tallied by the interface counters. For detailed
information, see the description of the logical interface Transit statistics fields in
Table 30 on page 1166.

show interfaces media (SONET/SDH)

The following example displays the output fields unique to the `show interfaces media` command for a SONET interface (with no level of output specified):

user@host> show interfaces media so-4/1/2
Physical interface: so-4/1/2, Enabled, Physical link is Up
Interface index: 168, SNMP ifIndex: 495
Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC48,
Loopback: None, FCS: 16, Payload scrambler: Enabled
Device flags : Present Running
Interface flags: Point-To-Point SNMP-Traps 16384
Link flags : Keepalives
Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
Keepalive: Input: 1783 (00:00:00 ago), Output: 1786 (00:00:08 ago)
LCP state: Opened
CHAP state: Not-configured
CoS queues : 8 supported
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)
SONET alarms : None
SONET defects : None
SONET errors:
  BIP-B1: 1, BIP-B2: 2, BIP-B3: 3, BIP-B4: 4, BIP-BIP2: 0
Received path trace: routerb so-1/1/2
Transmitted path trace: routera so-4/1/2

```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

(M Series, T Series, TX Matrix Plus, and PTX Series devices only) Display status information about the management Ethernet and internal Ethernet interfaces.

**Options**

em0 | fxp0 | mgmtre0—(M Series, MX Series, T Series, and PTX Series) Display standard information about the management Ethernet interface. For supported Ethernet interface by chassis and Routing Engine, see Supported Routing Engines by Router.

bcm0 | em0 | em1 | fxp1 | fxp2 | ixgbe0 | ixgbe1—(M Series, MX Series, T Series, and PTX Series) Display standard information about the internal Ethernet interfaces. See Supported Routing Engines by Router for the internal Ethernet interface names for each Routing Engine by hardware platform.

**NOTE:** On Junos OS Evolved, the ixgbe0 and ixgbe1 internal interfaces are deprecated.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.
**media**—(Optional) Display media-specific information.

**snmp-index**

**snmp-index**—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

Physical interface: em0, Enabled, Physical link is Up
  Interface index: 8, SNMP ifIndex: 0, Generation: 3
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
    Speed: 1000mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Full-Duplex
  Physical info  : Unspecified
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: 00:00:5E:00:53:1b, Hardware address: 00:00:5E:00:53:1b
  Alternate link address: Unspecified
  Last flapped   : Never
  Statistics last cleared: Never
  Traffic statistics:
  Input bytes : 15255909
  Output bytes : 4608
  Input packets: 214753
  Output packets: 72
  IPv6 transit statistics:
  Input bytes : 0
  Output bytes : 0
  Input packets: 0
  Output packets: 0

Logical interface em0.0 (Index 3) (SNMP ifIndex 18) (Generation 1)
  Flags: SNMP-Traps Encapsulation: ENET2
  Traffic statistics:
  Input bytes : 117135
  Output bytes : 1331647
  Input packets: 1804
  Output packets: 5344
  Local statistics:
  Input bytes : 117135
  Output bytes : 1331647
  Input packets: 1804
  Output packets: 5344
  Protocol inet, MTU: 1500, Generation: 1, Route table: 0
    Flags: Is-Primary
  Addresses, Flags: Is-Preferred Is-Primary
    Destination: 192.168.178.0/25, Local: 192.168.178.11, Broadcast:
      192.168.178.127, Generation: 1
Output packets: 72
Local statistics:
Input bytes: 14394630
Output bytes: 3024
Input packets: 214723
Output packets: 72
Protocol inet, MTU: 1500, Generation: 1, Route table: 0
Flags: Is-Primary
Addresses, Flags: Is-Default Is-Preferred Is-Primary
  Destination: 192.168.3/24, Local: 192.168.3.30,
  Broadcast: 192.168.3.255, Generation: 1

show interfaces extensive (Management Ethernet)

user@host> show interfaces fxp0 extensive

Physical interface: fxp0, Enabled, Physical link is Up
  Interface index: 1, SNMP ifIndex: 1, Generation: 0
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: 100mbps
  Device flags: Present Running
  Interface flags: SNMP-Traps
  Link type: Half-Duplex
  Physical info: Unspecified
  Hold-times: Up 0 ms, Down 0 ms
  Current address: 00:00:5E:00:53:89, Hardware address: 00:00:5E:00:53:89
  Alternate link address: Unspecified
  Last flapped: Never
  Statistics last cleared: Never
  Traffic statistics:
    Input bytes: 6678904
    Output bytes: 169657
    Input packets: 83946
    Output packets: 1127
  Input errors:
    Errors: 12, Drops: 0, Framing errors: 0, Runts: 0, Giants: 0,
    Policed discards: 0, Resource errors: 0
  Output errors:
    Carrier transitions: 0, Errors: 0, Drops: 0, MTU errors: 0,
    Resource errors: 0

Logical interface fxp0.0 (Index 2) (SNMP ifIndex 13) (Generation 1)
  Flags: SNMP-Traps Encapsulation: ENET2
  Protocol inet, MTU: 1500, Generation: 6, Route table: 0
  Flags: Is-Primary
  Addresses, Flags: Is-Preferred Is-Primary
    Destination: 192.168.64/21, Local: 192.168.70.143,
    Broadcast: 192.168.71.255, Generation: 1

Interfaces Fundamentals for Routing Devices
show interfaces (PPPoE)

**Syntax**

```
show interfaces pp0.logical
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

(M120 routers, M320 routers, and MX Series routers only). Display status information about the PPPoE interface.

**Options**

- `pp0.logical`—Display standard status information about the PPPoE interface.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about PPPoE interfaces.
- `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.
- `statistics`—(Optional) Display PPPoE interface statistics.

**Required Privilege**

`view`

**List of Sample Output**

- `show interfaces (PPPoE)` on page 1499
- `show interfaces (PPPoE over Aggregated Ethernet)` on page 1499
- `show interfaces brief (PPPoE)` on page 1500
- `show interfaces detail (PPPoE)` on page 1500
- `show interfaces extensive (PPPoE on M120 and M320 Routers)` on page 1501

**Output Fields**

Table 45 on page 1493 lists the output fields for the `show interfaces (PPPoE)` command. Output fields are listed in the approximate order in which they appear.

**Table 45: show interfaces (PPPoE) Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical Interface</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Physical interface</td>
<td>Name of the physical interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Enabled</td>
<td>State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1152.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
### Table 45: show interfaces (PPPoE) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface index</td>
<td>Physical interface index number, which reflects its initialization sequence.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>SNMP ifIndex</td>
<td>SNMP index number for the physical interface.</td>
<td>none</td>
</tr>
<tr>
<td>Generation</td>
<td>Unique number for use by Juniper Networks technical support only.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Type</td>
<td>Physical interface type (PPPoE).</td>
<td>All levels</td>
</tr>
<tr>
<td>Link-level type</td>
<td>Encapsulation on the physical interface (PPPoE).</td>
<td>All levels</td>

<tr>
<td></td>
<td>- <strong>Input packets</strong>—Number of packets received on the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Output packets</strong>—Number of packets transmitted on the interface.</td>
<td></td>
</tr>
<tr>
<td>Input errors</td>
<td>Input errors on the interface:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>- <strong>Errors</strong>—Sum of incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager ASIC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Framing errors</strong>—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Runt</strong>s—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Giants</strong>—Number of frames received that are larger than the giant threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Policed discards</strong>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Resource errors</strong>—Sum of B chip Tx drops and IXP Tx net transmit drops.</td>
<td></td>
</tr>
<tr>
<td>Output errors</td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>- <strong>Carrier transitions</strong>—Number of times the interface has gone from down to up.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>MTU errors</strong>—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Resource errors</strong>—Sum of B chip Tx drops and IXP Tx net transmit drops.</td>
<td></td>
</tr>

show interfaces (PTX Series Packet Transport Routers)

Syntax

show interfaces et-fpc/pic/port
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>

Release Information

Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Routers.

Description

(PTX Series Packet Transport Routers only) Display status information about the specified Ethernet interface.

Options

et-fpc/pic/port—Display standard information about the specified Ethernet interface.
brief | detail | extensive | terse—(Optional) Display the specified level of output.
descriptions—(Optional) Display interface description strings.
media—(Optional) Display media-specific information about network interfaces.
snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.
statistics—(Optional) Display static interface statistics.

Required Privilege Level

view

List of Sample Output

show interfaces brief (PTX5000 Packet Transport Router) on page 1513
show interfaces extensive (PTX5000 Packet Transport Router) on page 1513
show interfaces terse (PTX5000 Packet Transport Router) on page 1514
show interfaces extensive (Junos OS Evolved) on page 1517

Output Fields

See Table 46 on page 1504 for the output fields for the show interfaces (PTX Series Packet Transport Routers) command.

Table 46: show interfaces PTX Series Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output errors</td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Carrier transitions—Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Errors—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MTU errors—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Resource errors—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td>Egress queues</td>

</thead>
<tbody>
<tr>
<td>Active alarms and</td>
<td>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Active defects</td>
<td></td>
<td>none</td>
</tr>
<tr>
<td>• None—There are no active defects or alarms.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• LOCAL-FAULT—Link fault signaling operates between the remote PHY RS (Reconciliation sub-layer) and the local RS. A Local Fault is used to signal a detected fault between the remote RS and the local RS to the local Ethernet interface.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• REMOTE-FAULT—When the Local Fault status reaches an RS, the RS stops sending MAC data and continuously generates the Remote Fault status on the transmit data path.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MAC statistics</td>
<td>Receive and Transmit statistics reported by the PIC’s MAC subsystem, including the following:</td>
<td>extensive</td>
</tr>
<tr>
<td>• Total octets and</td>
<td>Total number of octets and packets.</td>
<td></td>
</tr>
<tr>
<td>total packets—Total number of octets and packets.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Unicast packets,</td>
<td>Number of unicast, broadcast, and multicast packets.</td>
<td></td>
</tr>
<tr>
<td>Broadcast packets,</td>
<td></td>
<td></td>
</tr>
<tr>
<td>and Multicast packets—Number of unicast, broadcast, and multicast packets.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• CRC/Align errors—</td>
<td>Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</td>
<td></td>
</tr>
<tr>
<td>• FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• MAC control frames—Number of MAC control frames.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• MAC pause frames—Number of MAC control frames with pause operational code.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Oversized frames—Number of frames that exceed 1518 octets.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Code violations—Number of times an event caused the PHY to indicate “Data reception error” or “Invalid data symbol error.”</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Table 46: show interfaces PTX Series Output Fields (continued)**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter statistics</td>
<td><strong>Receive</strong> and <strong>Transmit</strong> statistics reported by the PIC’s MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet’s source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Input packet count</strong>—Number of packets received from the MAC hardware that the filter processed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input packet rejects</strong>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input DA rejects</strong>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input SA rejects</strong>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet count</strong>—Number of packets that the filter has given to the MAC hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet pad count</strong>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet error count</strong>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>CAM destination filters, CAM source filters</strong>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</td>
<td></td>
</tr>

show interfaces (SONET/SDH)

Syntax

show interfaces so-fpc/pic/port
<br/>&lt;brief | detail | extensive | terse&gt;
<br/>&lt;descriptions&gt;
<br/>&lt;media&gt;
<br/>&lt;snmp-index snmp-index&gt;
<br/>&lt;statistics&gt;

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified SONET/SDH interface.

Options

so-fpc/pic/port—Display standard information about the specified SONET/SDH interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege

view

</tr>
</tbody>
</table>

Input errors

Input errors on the interface whose definitions are as follows:

- **Errors**—Sum of the incoming frame aborts and FCS errors.
- **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.
- **Framing errors**—Number of packets received with an invalid frame checksum (FCS).
- **Runts**—Number of frames received that are smaller than the runt threshold.
- **Giants**—Number of frames received that are larger than the giant threshold.
- **Bucket Drops**—Drops resulting from the traffic load exceeding the interface transmit/receive leaky bucket configuration. The default is **off**.
- **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.
- **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded.
- **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame.
- **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.
- **H5 link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.
- **H5 link FIFO overflows**—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.
Table 47: SONET/SDH show interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Carrier transitions</strong>—Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Aged packets</strong>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>H5 link FIFO underflows</strong>—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MTU errors</strong>—Number of packets whose size exceeds the MTU of the interface.</td>
<td></td>
</tr>

show interfaces (Serial)

**Syntax**

```show interfaces interface-type
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

Display status information about serial interfaces, including RS-232, RS-422/449, EIA-530, X.21, and V.35.

**Options**

- `interface-type`—On M Series and T Series routers, the interface type is `se-fpc/pic/port`.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about network interfaces.
- `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

**Required Privilege**

- view

**List of Sample Output**

- `show interfaces (Serial, EIA-530)` on page 1553
- `show interfaces brief (Serial, EIA-530)` on page 1553
- `show interfaces detail (Serial, EIA-530)` on page 1554
- `show interfaces extensive (Serial, EIA-530)` on page 1554
- `show interfaces (Serial, V.35)` on page 1556
- `show interfaces brief (Serial, V.35)` on page 1556
- `show interfaces detail (Serial, V.35)` on page 1556
- `show interfaces extensive (Serial, V.35)` on page 1557
- `show interfaces statistics detail (RS 449)` on page 1558

**Output Fields**

Table 48 on page 1547 lists the output fields for the `show interfaces` (Serial) command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical Interface</td>
<td>Name of the physical interface.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
### Table 48: show interfaces (Serial) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1152.</td>
<td>All levels</td>
</tr>
<tr>
<td>Interface index</td>
<td>Physical interface's index number, which reflects its initialization sequence.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td>SNMP ifIndex</td>
<td>SNMP index number for the physical interface.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td>Generation</td>
<td>Unique number for use by Juniper Networks technical support only.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Type</td>
<td>Type of interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Link-level type</td>
<td>Encapsulation being used on the physical interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>MTU</td>
<td>Maximum transmission unit (MTU) size on the physical interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Maximum speed</td>
<td>Maximum speed. The nonconfigurable value is 16,384 kbps.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td>Device flags</td>
<td>Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1152.</td>
<td>All levels</td>
</tr>
<tr>
<td>Interface flags</td>
<td>Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1152.</td>
<td>All levels</td>
</tr>
<tr>
<td>Link flags</td>
<td>Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1152.</td>
<td>All levels</td>
</tr>
<tr>
<td>Hold-times</td>
<td>Current interface hold-time up and hold-time down, in milliseconds.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Keepalive settings</td>
<td>(PPP and HDLC) Configured settings for keepalive packets.</td>
<td>All levels</td>
</tr>
<tr>
<td>• Interval seconds</td>
<td>Time between successive keepalive requests. The range of values, in seconds, is 10 to 32,767. The default value is 10.</td>
<td></td>
</tr>
<tr>
<td>• Up-count number</td>
<td>Number of keepalive packets a destination must receive to change a link’s status from down to up. The range of values is 1 to 255. The default value is 1.</td>
<td></td>
</tr>
<tr>
<td>• Down-count number</td>
<td>Number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 to 255. The default value is 3.</td>
<td></td>
</tr>
<tr>
<td>Keepalive</td>
<td>(PPP and HDLC) Information about keepalive packets.</td>
<td>brief</td>
</tr>
<tr>
<td>• Input: number (hh:mm:ss ago)</td>
<td>Number of keepalive packets received by PPP and the time since the last keepalive packet was received.</td>
<td></td>
</tr>
<tr>
<td>• Output: number (hh:mm:ss ago)</td>
<td>Number of keepalive packets sent by PPP and the time since the last keepalive packet was sent.</td>
<td></td>
</tr>
</tbody>
</table>
### Table 48: `show interfaces (Serial)` Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Keepalive statistics</strong></td>
<td>(PPP and HDLC) Information about keepalive packets.</td>
<td>detail extensive</td>

<tr>
<td></td>
<td>• <strong>Not-configured</strong> — NCP is not configured on the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Opened</strong> — NCP negotiation is successful.</td>
<td></td>
</tr>
<tr>
<td><strong>CHAP state</strong></td>
<td>(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td></td>
<td>• <strong>Chap-Chal-received</strong> — Challenge was received but response not yet sent.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Chap-Chal-sent</strong> — Challenge was sent.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Chap-Resp-received</strong> — Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Chap-Resp-sent</strong> — Response was sent for the challenge received.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Closed</strong> — CHAP authentication is incomplete.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Failure</strong> — CHAP authentication failed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Not-configured</strong> — CHAP is not configured on the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Success</strong> — CHAP authentication was successful.</td>
<td></td>
</tr>
<tr>
<td><strong>CoS queues</strong></td>
<td>Number of CoS queues configured.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td><strong>Last flapped</strong></td>
<td>Date, time, and how long ago the interface went from down to up. The format is <code>Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago)</code>. For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).</td>
<td>detail extensive none</td>
</tr>
<tr>
<td><strong>Input Rate</strong></td>
<td>Input rate in bits per second (bps) and packets per second (pps).</td>
<td>None specified</td>
</tr>
<tr>
<td><strong>Output Rate</strong></td>
<td>Output rate in bps and pps.</td>
<td>None specified</td>

<td>----------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td><strong>Statistics last cleared</strong></td>
<td>Time when the statistics for the interface were last set to zero.</td>
<td><strong>detail extensive</strong></td>
</tr>
<tr>
<td><strong>Traffic statistics</strong></td>
<td>Number and rate of bytes and packets received and transmitted on the physical interface.</td>
<td><strong>detail extensive</strong></td>
</tr>
<tr>
<td>• <strong>Input bytes</strong>—Number of bytes received on the interface.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Output bytes</strong>—Number of bytes transmitted on the interface.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Input packets</strong>—Number of packets received on the interface.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Output packets</strong>—Number of packets transmitted on the interface.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Input errors</strong></td>
<td>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td><strong>extensive</strong></td>
</tr>
<tr>
<td>• <strong>Errors</strong>—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Framing errors</strong>—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Runt</strong>s—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Giants</strong>—Number of frames received that are larger than the giant threshold.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Policed discards</strong>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td><strong>extensive</strong></td>
</tr>
<tr>
<td>• <strong>Carrier transitions</strong>—Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>.</td>
<td>This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>MTU errors</strong>—Number of packets whose size exceeds the MTU of the interface.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Egress queues supported</strong></td>
<td>Total number of egress queues supported on the specified interface. Displayed with the <strong>statistics</strong> option.</td>
<td><strong>detail extensive</strong></td>
</tr>
<tr>
<td><strong>Egress queues in use</strong></td>
<td>Total number of egress queues in use on the specified interface. Displayed with the <strong>statistics</strong> option.</td>
<td><strong>detail extensive</strong></td>
</tr>
</tbody>

show interfaces (T1, E1, or DS)

Syntax

show interfaces interface-type
  <brief | detail | extensive | terse>
  <descriptions>
  <media>
  <snmp-index snmp-index>
  <statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display status information about the specified T1, E1, or DS interface.

Options

interface-type—On ACX Series, M Series, MX Series, and T Series routers, the T1 interface type is t1-fpc/pic/port, whereas the E1 interface type is e1-fpc/pic/port, and DS interface type is ds-fpc/pic/port:<channel>.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

show interfaces (T3 or E3)

Syntax

```
show interfaces interface-type
  <brief | detail | extensive | terse>
  <descriptions>
  <media>
  <snmp-index snmp-index>
  <statistics>
```

Release Information
Command introduced before Junos OS Release 7.4.

Description
Display status information about the specified T3 or E3 interface.

Options
- `interface-type`—On M Series and T Series routers, the T3 interface type is `t3-fpc/pic/port`, whereas the E3 interface type is `e3-fpc/pic/port`.

- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.

- `descriptions`—(Optional) Display interface description strings.

- `media`—(Optional) Display media-specific information about network interfaces.

- `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

Required Privilege
view

List of Sample Output
- `show interfaces (T3, PPP)` on page 1594
- `show interfaces detail (T3, PPP)` on page 1595
- `show interfaces extensive (T3, PPP)` on page 1596
- `show interfaces (E3, Frame Relay)` on page 1597
- `show interfaces detail (E3, Frame Relay)` on page 1598
- `show interfaces extensive (E3, Frame Relay)` on page 1600

Output Fields
Table 50 on page 1585 lists the output fields for the `show interfaces` (T3 or E3) command. Output fields are listed in the approximate order in which they appear.

Table 50: T3 or E3 show interfaces Output Fields

</tr>
</tbody>
</table>

Keepalive settings (PPP and HDLC) Configured settings for keepalives.

- **interval seconds**—Time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds.
- **down-count number**—Number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3.
- **up-count number**—Number of keepalive packets a destination must receive to change a link’s status from down to up. The range is 1 through 255, with a default of 1.

<tr>
<td></td>
<td>• L2 mismatch timeouts—Number of malformed or short packets that caused</td>
<td></td>
</tr>
<tr>
<td></td>
<td>the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• H5 link CRC errors—Number of errors on the high-speed links between the</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ASICS responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• SRAM errors—Number of hardware errors that occurred in the static RAM (SRAM)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>on the PIC or PIM. If the value of this field increments, the PIC or PIM</td>
<td></td>
</tr>
<tr>
<td></td>
<td>is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Resource errors—Sum of transmit drops.</td>
<td></td>
</tr>
</tbody>
</table>
### Table 50: T3 or E3 show interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Carrier transitions</strong>—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Aged packets</strong>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MTU errors</strong>—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td><strong>Queue counters</strong></td>
<td>CoS queue number and its associated user-configured forwarding class name.</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Queued packets</strong>—Number of queued packets.</td>
<td></td>

show interfaces demux0 (Demux Interfaces)

Syntax
show interfaces demux0.logical-interface-number
  <brief | detail | extensive | terse>
  <descriptions>
  <media>
  <snmp-index snmp-index>
  <statistics>

Release Information
Command introduced in Junos OS Release 9.0.

Description
(MX Series and M Series routers only) Display status information about the specified demux interface.

Options
  none—Display standard information about the specified demux interface.
  brief | detail | extensive | terse—(Optional) Display the specified level of output.
  descriptions—(Optional) Display interface description strings.
  media—(Optional) Display media-specific information about network interfaces.
  snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.
  statistics—(Optional) Display static interface statistics.

Required Privilege
view

### Table 51: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input errors</strong></td>
<td>Input errors on the interface whose definitions are as follows:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Framing errors</strong>—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Runt</strong>s—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Giants</strong>—Number of frames received that are larger than the giant packet threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Policed discards</strong>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td><strong>Input Rate</strong></td>
<td>Input rate in bits per second (bps) and packets per second (pps).</td>
<td>none</td>
</tr>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Carrier transitions</strong>—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MTU errors</strong>—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>

**IPv6 Transit statistics**

Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.

**NOTE:** The packet and byte counts in these fields include traffic that is dropped and does not leave the router.

- Input bytes—Number of bytes received on the interface.
- Output bytes—Number of bytes transmitted on the interface.
- Input packets—Number of packets received on the interface.
- Output packets—Number of packets transmitted on the interface.

AC Name: nbc
show interfaces extensive

**Syntax**

```
show interfaces extensive
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
- Command introduced in Junos OS Release 17.2 for PT1000 and PTX10008 Packet Transport Routers.

**Description**

Display extensive information about all interfaces configured on the router.
NOTE:

- At some times, the cumulative byte counters displayed with the show interfaces extensive command on the 10-Gigabit Ethernet MPC with SFP+ is not always increasing and cumulative and does not give the correct results. There is a time lag in collecting these statistics, during which the display might decrease or go from a nonzero number to zero. Eventually, the counter will display the correct result.

- When the show interfaces extensive command is executed on a router with an MPC or a T4000 Type 5 FPC, the Input packet rejects counter of the Filter statistics field also displays statistics related to the following packet errors:
  - Invalid VLAN range
  - Tagged packet received on an untagged interface

- When the show interfaces extensive command is executed on an interface that is configured on a T4000 Type 5 FPC, the IPv6 transit statistics field displays:
  - Total statistics (sum of transit and local statistics) at the physical interface level
  - Transit statistics at the logical interface level

- When the show interfaces extensive command is executed on an aggregate interface in a T1600 Core Router, the IPv6 Input bytes is displayed for an aggregate interface. However, the IPv6 Input bytes is always zero on a member link of an aggregated bundle even when there is IPv6 transit traffic on the member link. This is because the logical interface index of the aggregate logical interface is updated but not the logical interface of the member links in the channel lookup table.

- The Output packets field under the Traffic statistics section in the output of the show interfaces extensive command includes both IPv4 and IPv6 packets. For example, in a scenario in which both IPv4 and IPv6 packets are being mirrored on the same interface and when you deactivate an IPv4 port-mirroring instance on the chassis, the output of the show interfaces extensive command shows a value in the Output packets field of the Traffic statistics section, which is the value of IPv6 packets that are mirrored and not of the IPv4 packets. This behavior is expected.

- For IQ2 PIC interfaces, the output of the show interfaces extensive command displays byte statistics that includes Layer 2 headers.

- If there are active OTN defects when an ISSU is performed, and the defect persists after the upgrade completes, the OTN alarm count is incremented by 1. For example, if an OTN alarm is active with a count of 1 and the defect remains after ISSU, the alarm count is incremented to 2. This behavior is expected.

Output Fields
For more information, see the output fields table for the particular interface type in which you are interested. For information about destination class and source class statistics, see the "Destination Class Field" section and the "Source Class Field" section under "Common Output Fields Description" on page 1152. For sample output for specific interfaces, see the other topics in this collection.

Sample Output
show interfaces extensive (Circuit Emulation)

If a Circuit Emulation (CE) PIC is configured for SAToP pseudowire, then pseudowire statistics are displayed in the CE information section of the show interface extensive output. If SAToP pseudowire is not configured on the CE PIC, then all CE information counters display 0 (zero).

**show interfaces lsi (Label-Switched Interface)**

**Syntax**

```
show interfaces interface-type
  <brief | detail | extensive | terse>
  <descriptions>
  <media>
  <routing-instance instance-name>
  <snmp-index snmp-index>
  <statistics>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

Display status information about the specified label-switched interface (LSI).

**Options**

- `interface-type`—On most routers, the interface type is `lt-fpc/pic/port`.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about network interfaces.
- `routing-instance instance-name`—(Optional) Display information for the specified routing instance.
- `snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

show interfaces media

Syntax

show interfaces media

Release Information

Description

Display media-specific information about all configured network interfaces.

NOTE: show interfaces media lists details for all interfaces, whereas show interfaces media interface-name lists details only for the specified interface.

NOTE: For the QFX5200 line of switches, there are no validation checks for the supported values of the optical properties. You must ensure that you configure the correct values. The optical properties are supported only on 100 Gigabit Ethernet interface.

Options

This command has no options.

Additional Information

Output from both the show interfaces interface-name detail and the show interfaces interface-name extensive commands includes all the information displayed in the output from the show interfaces media command.

Required Privilege Level

view

List of Sample Output

show interfaces media (SONET/SDH) on page 1662
show interfaces media (MX Series Routers) on page 1662
show interfaces media (PTX Series Packet Transport Routers) on page 1663
show interfaces media (QFX5200 Line of Switches) on page 1663

Output Fields

The output from the show interfaces media command includes fields that display interface media-specific information. These fields are also included in the show interfaces interface-name command for each particular interface type, and the information provided in the fields is unique to each interface type.

One field unique to the show interfaces media command is interface-type errors (for example, SONET errors). This field appears for channelized E3, channelized T3,
channelized OC, E1, E3, SONET, T1, and T3 interfaces. The information provided in this output field is also provided in the output from the `show interfaces interface-name` command. (For example, for SONET interfaces, these fields are SONET section, SONET line, and SONET path). For a description of errors, see the chapter with the particular interface type in which you are interested.

Sample Output

**show interfaces media (SONET/SDH)**

The following example displays the output fields unique to the `show interfaces media` command for a SONET interface (with no level of output specified):

```plaintext
user@host> show interfaces media so-4/1/2
Physical interface: so-4/1/2, Enabled, Physical link is Up
   Interface index: 168, SNMP ifIndex: 495

**show interfaces terse**

**Syntax**
```
show interfaces terse
```

**Release Information**
Command introduced before Junos OS Release 7.4.

**Description**
Display summary information about interfaces.

**Options**
This command has no options.

**Additional Information**
Interfaces are always displayed in numerical order, from the lowest to the highest FPC slot number. Within that slot, the lowest PIC slot is shown first. On an individual PIC, the lowest port number is always first.

**Required Privilege**
view

ANCP Operational Commands

- clear ancp neighbor
- clear ancp statistics
- clear ancp subscriber
- request ancp oam interface
- request ancp oam neighbor
- show ancp cos
- show ancp neighbor
- show ancp statistics
- show ancp subscriber
- show ancp summary
- show ancp summary neighbor
- show ancp summary subscriber
clear ancp neighbor

Syntax

```
clear ancp neighbor
  <ip-address ip-address>
  <system-name mac-address>
```

Release Information

Command introduced in Junos OS Release 9.4.

Description

Clear the ANCP agent connection with all ANCP neighbors or with the specified ANCP neighbor. This command deletes information for subscribers associated with the neighbor, causing the adjusted traffic rates to revert to the configured rate for the subscriber interfaces. The neighbor remains configured (its administrative state is enabled) and can reestablish adjacencies.

This command initiates logout of ANCP-triggered dynamic VLAN sessions on the physical interface associated with the specified neighbor; conventionally autosensed dynamic VLAN sessions and their associated logical interfaces are not affected.

Options

- **none**—Clear all ANCP neighbors.
- **ip-address ip-address**—(Optional) Clear the ANCP neighbor specified by the IP address.
- **system-name mac-address**—(Optional) Clear the ANCP neighbor specified by the MAC address.

Required Privilege

```
clear
```

Related Documentation

- show ancp neighbor on page 1686

List of Sample Output

- clear ancp neighbor on page 1670
- show ancp neighbor on page 1671

Output Fields

When you enter this command, you are provided no feedback on the status of your request. You can enter the show ancp neighbor command before and after clearing the ANCP neighbors to verify the clear operation.

Sample Output

```
clear ancp neighbor
```

```
user@host> clear ancp neighbor
```

Copyright © 2019, Juniper Networks, Inc.
**show ancp neighbor**

The following sample output displays the connections with ANCP neighbors before and after the `clear ancp neighbor` command was issued.

```
user@host> show ancp neighbor

clear ancp statistics

Syntax

clear ancp statistics
<ip-address ip-address>
<system-name mac-address>

Release Information
Command introduced in Junos OS Release 13.3.

Description
Clear current statistics accumulated by the ANCP agent for all ANCP neighbors or the specified neighbor.

Options none—Clear all ANCP statistics.

ip-address ip-address—(Optional) Clear statistics for the ANCP neighbor specified by the IP address.

system-name mac-address—(Optional) Clear statistics for the ANCP neighbor specified by the MAC address.

Required Privilege
clear

**clear ancp subscriber**

**Syntax**

```plaintext
clear ancp subscriber
<identifier identifier>
<ip-address ip-address>
<system-name mac-address>
```

**Release Information**

Command introduced in Junos OS Release 11.4.

**Description**

Clear the ANCP agent connection with all ANCP subscribers or with the specified ANCP subscriber. This command deletes information for the subscribers, causing the adjusted traffic rate to revert to the configured rate for the subscriber interface, but otherwise has no affect on ANCP neighbors.

**Options**

- **none**—Clear all ANCP subscribers.
- **identifier identifier-string**—(Optional) Clear the ANCP subscriber identified by the access loop ID.
- **ip-address ip-address**—(Optional) Clear all ANCP subscribers on the neighbor specified by the IP address.
- **system-name mac-address**—(Optional) Clear all ANCP subscribers on the neighbor specified by the MAC address.

**Required Privilege Level**

clear

**Related Documentation**

- show ancp subscriber on page 1699

**List of Sample Output**

show ancp subscriber brief on page 1675

**Output Fields**

When you enter this command, you are provided no feedback on the status of your request. You can enter the `show ancp subscriber` command before and after clearing the ANCP neighbors to verify the clear operation.

**Sample Output**

show ancp subscriber brief

```
user@host> show ancp subscriber brief

clear ancp subscriber

user@host> clear ancp subscriber
**request ancp oam interface**

**Syntax**
```
request ancp oam interface
(interface-name | interface-set set-name)
<count count>
<timeout duration>
```

**Release Information**
Command introduced in Junos OS Release 11.4.

**Description**
Trigger the access node to run a loopback test on the local loop between the access node and the customer premises equipment. You must specify either an ANCP interface or an ANCP interface set. The access node responds to the NAS with the results of the test.

**Options**
- `interface-name`—Name of the ANCP interface on whose local loop the loopback test is run.
- `interface-set set-name`—Name of the ANCP interface set on whose local loop the loopback test is run.
- `count count`—(Optional) Number of times a loopback message is sent on the local loop. Range: 1 through 32. Default: 1.
- `timeout duration`—(Optional) Period of time in seconds that the NAS waits for a response to the OAM request. Range: 0 through 255. Default: 5.

**Required Privilege Level**
view

**Related Documentation**
- Triggering ANCP OAM to Test the Local Loop

**List of Sample Output**
request ancp oam interface on page 1677

**Output Fields**
When you enter this command, you are provided feedback on the status of your request, including the result of the test, the response code, and the response string returned with the OAM response in the event of failure, an error code is displayed.

**Sample Output**
```
request ancp oam interface
user@host> request ancp oam interface ge-1/0/4.12 count 5 timeout 40
request succeeded
0x503 : DSL line status showtime
DEFAULT RESPONSE
```
request ancp oam neighbor

Syntax
request ancp oam neighbor
(ip-address ip-address | system-name neighbor-name)
subscriber identifier-string
<count count>
<timeout duration>

Release Information
Command introduced in Junos OS Release 11.4.

Description
Trigger the access node to run a loopback test on the local loop between the access node and the customer premises equipment. You must specify both the access node and the subscriber. The access node responds to the NAS with the results of the test.

Options
ip-address ip-address—IP address that specifies the access node on whose local loop the loopback test is run.

system-name neighbor-name—System name that specifies the access node on whose local loop the loopback test is run.

subscriber identifier-string—Access identifier that specifies the subscriber on whose local loop the loopback test is run.

count count—(Optional) Number of times a loopback message is sent on the local loop.
Range: 1 through 32. Default: 1.

timeout duration—(Optional) Period of time in seconds that the NAS waits for a response to the OAM request.
Range: 0 through 255. Default: 5.

**show ancp neighbor**

**Syntax**

```
show ancp neighbor
  <brief | detail>
  <ip-address ip-address>
  <system-name mac-address>
```

**Release Information**

Command introduced in Junos OS Release 9.4.

**Description**

Display information about all ANCP neighbors or the specified ANCP neighbor, regardless of operational state.

**Options**

- `brief | detail`—(Optional) Display the specified level of detail.
- `ip-address ip-address`—(Optional) Display information about the neighbor (access node) specified by the IP address.
- `system-name mac-address`—(Optional) Display information about the neighbor (access node) specified by the MAC address.

**Required Privilege Level**

<td>Number that identifies whether partitions are used and how the ID is negotiated:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• 0—No partition.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 1—Fixed partition requested.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 2—Fixed partition assigned.</td>
<td></td>
</tr>
<tr>
<td>Partition Flag</td>
<td>Number that specifies the type of partition requested: 1 (new adjacency) or 2</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>(recovered adjacency).</td>
<td></td>
</tr>
<tr>
<td>Partition Identifier</td>
<td>Number that identifies a logical partition of an access node with which the ANCP</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>agent has formed an adjacency.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>A value of zero indicates that the agent supports each neighbor on an IP address</td>
<td></td>
</tr>
<tr>
<td></td>
<td>over a single TCP session with a partition ID of zero. This is the default support</td>
<td></td>
</tr>
<tr>
<td></td>
<td>case.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>A nonzero value indicates that the agent supports each neighbor on an IP address</td>
<td></td>
</tr>
<tr>
<td></td>
<td>over a single TCP session with a nonzero partition ID.</td>
<td></td>
</tr>
<tr>
<td>Partition Adjacencies</td>
<td>Number of adjacencies that share the partition.</td>
<td>detail</td>
</tr>
<tr>
<td>Dead Timer</td>
<td>Remaining period that the edge device waits for adjacency packets from a neighbor</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>before declaring the neighbor to be down. The maximum dead time value is three</td>
<td></td>
</tr>
<tr>
<td></td>
<td>times the configured adjacency timer value. This field displays the current value</td>
<td></td>
</tr>
<tr>
<td></td>
<td>based on the time that the last adjacency packet was received.</td>
<td></td>
</tr>
<tr>
<td>Received Syn Count</td>
<td>Number of synchronization messages received from neighbors to maintain adjacencies.</td>
<td>detail</td>

<tr>
<td>Received Ack Count</td>
<td>Number of acknowledgment messages periodically received from neighbors after an</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>adjacency has been established.</td>
<td></td>
</tr>
<tr>
<td>Received Port Up Count</td>
<td>Number of status messages received from neighbors indicating that a port has</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>transitioned to the up state.</td>
<td></td>
</tr>
<tr>
<td>Received Port Down Count</td>
<td>Number of status messages received from neighbors indicating that a port has</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>transitioned to the down state.</td>
<td></td>
</tr>
<tr>
<td>Received Generic Resp Count</td>
<td>Number of generic response messages received from neighbors.</td>
<td>detail</td>
</tr>
<tr>
<td>Received Adjacency Update Count</td>
<td>Number of adjacency update messages received from neighbors.</td>
<td>detail</td>
</tr>
<tr>
<td>Received OAM Count</td>
<td>Number of OAM responses received from neighbors in reply to request commands.</td>
<td>detail</td>
</tr>
</tbody>
</table>
Table 55: show ancp neighbor Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received Other Count</td>
<td>Number of all other ANCP message packets received from neighbors that do not fit into one of the other categories.</td>
<td>detail</td>
</tr>
<tr>
<td>Sent Syn Count</td>
<td>Number of synchronization messages sent to neighbors to maintain adjacencies.</td>
<td>detail</td>
</tr>
<tr>
<td>Sent Synack Count</td>
<td>Number of synchronization acknowledgment messages sent to neighbors in response to their synchronization messages.</td>
<td>detail</td>
</tr>
<tr>
<td>Sent Rstack Count</td>
<td>Number of messages sent to neighbors indicating that the link to the neighbor needs to be reset.</td>
<td>detail</td>
</tr>
<tr>
<td>Sent Ack Count</td>
<td>Number of acknowledgment messages periodically sent to neighbors after an adjacency has been established.</td>
<td>detail</td>
</tr>
<tr>
<td>Sent Generic Resp Count</td>
<td>Number of generic response messages sent to neighbors.</td>
<td>detail</td>
</tr>
<tr>
<td>Sent OAM Count</td>
<td>Number of OAM request commands sent to neighbors.</td>
<td>detail</td>
</tr>
<tr>
<td>Max Discovery Limit Exceed Count</td>
<td>Number of times that the maximum number of discovery table entries accepted from the neighbor has been exceeded.</td>
<td>detail</td>
</tr>
<tr>
<td>Result Codes</td>
<td>Number of generic response messages sent to neighbors that include each of the following result codes:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>- <strong>Invalid Request Message Count</strong>—A properly formed request message violated the protocol because of timing (such as a race condition) or direction of transmission.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Specified Port(s) Down Count</strong>—One or more of the specified ports are down because of a state mismatch between the router and an ANCP control application.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Out of Resources Count</strong>—ANCP is out of resources, probably not related to the access lines. This result code is sent only by an access node.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Request Msg Not Implemented Count</strong>—</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Malformed Msg Count</strong>—Message is malformed because it was corrupted in transit or there was an implementation error at either end of the connection.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>TLV Missing Count</strong>—One or more mandatory TLVs was missing from a request.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Invalid TLV Contents Count</strong>—The contents of one or more TLVs in the request do not match its required specification.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Non-Existent Port(s) Count</strong>—One or more of the ports specified in a request do not exist, possibly because of a configuration mismatch between the access node and the router or AAA.</td>
<td></td>
</tr>

**show ancp statistics**

**Syntax**

```
show ancp statistics
<ip-address ip-address>
<system-name mac-address>
```

**Release Information**

Command introduced in Junos OS Release 13.3.

**Description**

Display statistics for all ANCP neighbors (access nodes) or the specified ANCP neighbor.

**Options**

- `none`—Display statistics for all ANCP neighbors, including global statistics not show for individual neighbors.
- `ip-address ip-address`—(Optional) Display statistics for only the neighbor with the specified IP address.
- `system-name mac-address`—(Optional) Display statistics for only the neighbor with the specified MAC address.

**Required Privilege**

view

**Related Documentation**

- show ancp cos on page 1681
- show ancp neighbor on page 1686
- show ancp subscriber on page 1699

**List of Sample Output**

- show ancp statistics on page 1696
- show ancp statistics ip-address on page 1697
- show ancp statistics system-name on page 1697

**Output Fields**

Table 56 on page 1694 lists the output fields for the `show ancp statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 56: show ancp statistics Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of neighbors</td>
<td>Total count of ANCP neighbors.</td>
</tr>
<tr>
<td>Number of subscribers</td>
<td>Total count of ANCP subscribers.</td>
</tr>
<tr>
<td>Accept Count</td>
<td>Number of neighbor TCP/IP sessions accepted on listener socket.</td>
</tr>
</tbody>
</table>
Table 56: show ancp statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Fail Count</td>
<td>Number of neighbor TCP/IP sessions that failed due to one of the following causes: session already exists, maximum number of ANCP connections exceeded, creation of session or neighbor failed, or protocol start failed.</td>
</tr>
<tr>
<td>No Config Accept Deny Count</td>
<td>Number of neighbor TCP/IP sessions that failed because the neighbor was not configured.</td>
</tr>
<tr>
<td>Received Syn Count</td>
<td>Number of synchronization messages received from neighbors to maintain adjacencies.</td>
</tr>
<tr>
<td>Received Synack Count</td>
<td>Number of synchronization acknowledgment messages received from neighbors in response to the node's synchronization messages.</td>
</tr>
<tr>
<td>Received Rstack Count</td>
<td>Number of messages received from neighbors indicating that the link to the neighbor needs to be reset.</td>
</tr>
<tr>
<td>Received Ack Count</td>
<td>Number of acknowledgment messages periodically received from neighbors after an adjacency has been established.</td>
</tr>
<tr>
<td>Received Port Up Count</td>
<td>Number of status messages received from neighbors indicating that a port has transitioned to the up state.</td>
</tr>
<tr>
<td>Received Port Down Count</td>
<td>Number of status messages received from neighbors indicating that a port has transitioned to the down state.</td>
</tr>
<tr>
<td>Received Generic Resp Count</td>
<td>Number of generic response messages received from neighbors.</td>
</tr>
<tr>
<td>Received Adjacency Update Count</td>
<td>Number of adjacency update messages received from neighbors.</td>
</tr>
<tr>
<td>Received OAM Count</td>
<td>Number of OAM responses received from neighbors in reply to request commands.</td>
</tr>
<tr>
<td>Received Other Count</td>
<td>Number of all other ANCP message packets received from neighbors that do not fit into one of the other categories.</td>
</tr>
<tr>
<td>Sent Syn Count</td>
<td>Number of synchronization messages sent to neighbors to maintain adjacencies.</td>
</tr>
<tr>
<td>Sent Synack Count</td>
<td>Number of synchronization acknowledgment messages sent to neighbors in response to the their synchronization messages.</td>
</tr>
<tr>
<td>Sent Rstack Count</td>
<td>Number of messages sent to neighbors indicating that the link to the neighbor needs to be reset.</td>
</tr>
<tr>
<td>Sent Ack Count</td>
<td>Number of acknowledgment messages periodically sent to neighbors after an adjacency has been established.</td>
</tr>
<tr>
<td>Sent Generic Resp Count</td>
<td>Number of generic response messages sent to neighbors.</td>
</tr>
</tbody>
</table>
### Table 56: show ancp statistics Output Fields (continued)

<table>

</table>

#### Result Codes

Number of generic response messages sent to neighbors that include each of the following result codes:

- **Invalid Request Message Count**—A properly formed request messages violated the protocol because of timing (such as a race condition) or direction of transmission.
- **Specified Port(s) Down Count**—One or more of the specified ports are down because of a state mismatch between the router and an ANCP control application.
- **Out of Resources Count**—the ANCP agent is out of resources, probably not related to the access lines. This result code is sent only by an access node.
- **Request Msg Not Implemented Count**—
- **Malformed Msg Count**—Message is malformed because it was corrupted in transit or there was an implementation error at either end of the connection.
- **TLV Missing Count**—One or more mandatory TLVs was missing from a request.
- **Invalid TLV Contents Count**—The contents of one or more TLVs in the request do not match its required specification.
- **Non-Existent Port(s) Count**—One or more of the ports specified in a request do not exist, possibly because of a configuration mismatch between the access node and the router or AAA.

#### Sample Output

```plaintext
show ancp statistics

user@host> show ancp statistics

show ancp subscriber

Syntax

show ancp subscriber
<brief | detail>
<access-aggregation-circuit-id circuit-identifier>
<identifier identifier>
<ip-address ip-address>
<system-name mac-address>

Release Information

Command introduced in Junos OS Release 9.4.
neighbor option replaced with ip-address in Junos OS Release 16.1.
system-name option introduced in Junos OS Release 16.1.
access-aggregation-circuit-id option introduced in Junos OS Release 18.4R1.

Description

Display information about active subscribers regardless of the subscriber's operational state, for all subscribers (local access loops), the subscriber associated with the access line specified by an ACI, or the subscriber associated with the specified ANCP neighbor (access node).

After an ancpd restart, this command displays orphaned entries (marked with an o) for subscriber sessions that were established before the restart but which have not yet been reestablished. As sessions are reestablished, the number of orphaned entries displayed by the command decreases. The number reaches zero when all sessions are reestablished or when the orphaned-interface timer expires.

Options

none—Display information about all subscribers.
brief | detail—(Optional) Display the specified level of detail.
access-aggregation-circuit-id circuit-identifier—(Optional) Display information about ANCP subscribers whose Access-Aggregation-Circuit-ID-ASCII attribute (TLV 0x0003) matches the specified value.

A circuit-identifier that begins with the # character indicates a backhaul line identifier. You can specify a wildcard (*) anywhere in the string.

identifier identifier—(Optional) Display information about the subscriber associated with the access line (ACI) specified by the access identifier.
ip-address ip-address—(Optional) Display information about the subscribers connected to the access node specified by the IP address.

system-name mac-address—(Optional) Display information about the subscribers connected to the access node specified by the MAC address.

Output Fields

Table 57 on page 1700 lists the output fields for the **show ancp subscriber** command. Output fields are listed in the approximate order in which they appear.

**Table 57: show ancp subscriber Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loop Identifier</td>
<td>Access loop identifier as sent by the access node and configured to map the subscriber to an interface.</td>
<td>brief none</td>
</tr>
<tr>
<td></td>
<td>An asterisk (*) indicates that the information might be stale due to receiving a Port Down message with a DSL Line State of Idle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Two asterisks (**) indicate that the neighbor associated with the subscriber has lost its adjacency. In this case, the DSL Line State might be Established.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>An o indicates that the entry is for an orphaned interface and represents a previously established subscriber session that has not been reestablished after an ancpd restart.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The number of orphaned entries decreases as the ANCP neighbors reestablish adjacencies and the protocol subscriber sessions are reestablished. The command output indicates this by removing the o marker.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Eventually the number of orphaned entries reaches zero, because either all the adjacencies and subscriber sessions have been reestablished or any remaining orphaned entries are removed when the orphaned-interface timer expires.</td>
<td></td>
</tr>
<tr>
<td>DSL Line State</td>
<td>State of the DSL line: Idle, Showtime, or Silent.</td>
<td>brief detail</td>
</tr>
<tr>
<td>Access Type</td>
<td>Type of access line employed by the access node: ADSL1, ADSL2, ADSL2+, VDSL1, VDSL2, SDSL, G.fast, VDSL2 Annex Q, SDSL bonded, VDSL2 bonded, G.fast bonded VDSL2 Annex Q bonded or OTHER.</td>

BFD Operational Commands

- clear bfd adaptation
- clear bfd session
- show bfd session
### clear bfd adaptation

**Syntax**

```
clear bfd adaptation
<string>
<all>
<address session-address>
<discriminator discr-number>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

Clear adaptation for Bidirectional Forwarding Detection (BFD) sessions. BFD is a simple hello mechanism that detects failures in a network. Configured BFD interval timers can change, adapting to network situations. Use this command to return BFD interval timers to their configured values.

The `clear bfd adaptation` command is hitless, meaning that the command does not affect traffic flow on the routing device.

**Options**

- **all**—Clear adaptation for all BFD sessions.
- **address session-address**—(Optional) Clear adaptation for all BFD sessions matching the specified address.
- **discriminator discr-number**—(Optional) Clear adaptation for the local BFD session matching the specified discriminator.

**Additional Information**

For more information, see the description of the `bfd-liveness-detection` configuration statement in the *Junos Routing Protocols Configuration Guide*.

**Required Privilege Level**

`clear`

**Related Documentation**

- show bfd session on page 1717

**List of Sample Output**

- clear bfd adaptation on page 1714

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
clear bfd adaptation
```

```
user@host> clear bfd adaptation
```
clear bfd session

List of Syntax

Syntax

```
clear bfd session
<all>
<address session-address>
<discriminator discr-number>
<logical-system (all | logical-system-name)>
```

Syntax (EX Series Switch and QFX Series)

```
clear bfd session
<all>
<address session-address>
<discriminator discr-number>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for the QFX Series.

Description

Drop one or more Bidirectional Forwarding Detection (BFD) sessions.

Options

- `all`—Drop all BFD sessions.
- `address session-address`—(Optional) Drop all BFD sessions matching the specified address.
- `discriminator discr-number`—(Optional) Drop the local BFD session matching the specified discriminator.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

`clear`

Related Documentation

- `show bfd session` on page 1717

List of Sample Output

- `clear bfd session all` on page 1715

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear bfd session all
user@host> clear bfd session all
```
**show bfd session**

**List of Syntax**  
Syntax on page 1717  
Syntax (EX Series Switch and QFX Series) on page 1717

**Syntax**
```
show bfd session
  <brief | detail | extensive | summary>
  <address address>
  <client rsvp-oam (brief | detail | extensive | summary) | vpls-oam (brief | detail | extensive |
  instance instance-name | summary)>
  <discriminator discriminator>
  <logical-system (all | logical-system-name)>
  <prefix address>
  <subscriber (address destination-address | discriminator discriminator | extensive)>
```

**Syntax (EX Series Switch and QFX Series)**
```
show bfd session
  <brief | detail | extensive | summary>
  <address address>
  <client rsvp-oam (brief | detail | extensive | summary) | vpls-oam (brief | detail | extensive |
  instance instance-name | summary)>
  <discriminator discriminator>
  <prefix address>
```

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Options **discriminator** and **address** introduced in Junos OS Release 8.2.  
Option **prefix** introduced in Junos OS Release 9.0.  
Command introduced in Junos OS Release 12.1 for the QFX Series.  
Option **client** introduced in Junos OS Release 12.3R3.  
Option **subscriber** introduced in Junos OS Release 15.1 for the MX Series.

**Description**  
Display information about active Bidirectional Forwarding Detection (BFD) sessions.

**Options**
- **none**—(Same as **brief**) Display information about active BFD sessions.
- **brief** | **detail** | **extensive** | **summary**—(Optional) Display the specified level of output.
- **address address**—(Optional) Display information about the BFD session for the specified neighbor address.
- **client rsvp-oam**
  - (brief | detail | extensive | summary)
  - vpls-oam
    - (brief | detail | extensive | instance instance-name | summary)—(Optional) Display information about RSVP-OAM or VPLS-OAM BFD sessions in the specified level of output. For VPLS-OAM, display the specified level of output or display information about all of the BFD sessions for the specified VPLS routing instance.
**discriminator discriminator**—(Optional) Display information about the BFD session using the specified local discriminator.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**<subscriber (address destination-address | discriminator discriminator | extensive)>**—(Optional) Display information about all BFD sessions for subscribers, or for a single BFD subscriber session with a particular destination address, or with a particular denominator.

**Required Privilege Level**

`view`

Syntax (EX Series Switch and QFX Series)
clear bgp damping
<prefix>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description
Clear BGP route flap damping information.

Options
none—Clear all BGP route flap damping information.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix—(Optional) Clear route flap damping information for only the specified destination prefix.

Required Privilege
Level
clear

Related Documentation

  <soft-minimum-igp>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

- malformed-route option introduced in Junos OS Release 13.2.
- all option introduced in Junos OS Release 14.2.
- gracefully and stale-routes options introduced in Junos OS Release 15.1.

Description

Perform one of the following tasks:

- Change the state of one or more BGP neighbors to IDLE. For neighbors in the ESTABLISHED state, this command drops the TCP connection to the neighbors and then reestablishes the connection.

- (soft keyword only) Reapply export policies and send refresh updates to one or more BGP neighbors without changing their state.

- (soft-inbound keyword only) Send a route-refresh message to one or more BGP neighbors without changing their state, and reapply import policies on the received updates.

Options

- all—Change the state of all BGP neighbors to IDLE.
as as-number—(Optional) Apply this command only to neighbors in the specified autonomous system (AS).

gracefully—(Optional) Enable the BGP peer to start graceful-restart receiving-speaker mode. The receiving speaker also sends its own routes to the restarted speaker, and sends an End-of-RIB marker when it completes the update. The `clear bgp neighbor neighbor-address gracefully` command is the same as `clear bgp neighbor hard` (the default for `clear bgp neighbor`), but it does not use the new Hard Reset subcode on the Notify and Cease messages that are sent. This allows the neighbor to enter GR or LLGR helper mode, if negotiated. The session is still cleared on this router, and this router does not enter GR or LLGR helper mode.

instance instance-name—(Optional) Apply this command only to neighbors for the specified routing instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

malformed-route—(Optional) Remove malformed routes. If a specific neighbor is provided, Junos OS removes malformed routes for that particular neighbor. Otherwise, Junos OS removes malformed routes for all BGP neighbors. To find routes that have malformed attributes, run the `show route hidden` command, and look for routes marked with `MalformedAttr` in the AS path field.

neighbor—(Optional) IP address of a BGP peer. Apply this command only to the specified neighbor.

soft—(Optional) Reapply any export policies and send refresh updates to neighbors without clearing the state.

soft-inbound—(Optional) Send a route-refresh message to BGP neighbors and reapply import policies on the route updates received from the BGP neighbors without clearing the BGP state.

soft-minimum-igp—(Optional) Provide soft refresh of the outbound state when the interior gateway protocol (IGP) metric is reset.

stale-routes—(Optional) Any stale route currently being held for the specified neighbor because of BGP graceful restart (GR) or long-lived graceful restart (LLGR) receiver mode operations.

Required Privilege Level: clear

Related Documentation:
- `show bgp neighbor` on page 1748

List of Sample Output:
- `clear bgp neighbor` on page 1733

Output Fields:
When you enter this command, you are provided feedback on the status of your request.
Sample Output

clear bgp neighbor

user@host> clear bgp neighbor
clear bgp table

Syntax

```
Syntax (EX Series Switch and QFX Series)
clear bgp table table-name
logical-system (all | logical-system-name)
```

Release Information

- Command introduced in Junos OS Release 9.0.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Request that BGP refresh routes in a specified routing table.

Options

- `logical-system (all | logical-system-name)` — (Optional) Perform this operation on all logical systems or on a particular logical system.
- `table-name` — Request that BGP refresh routes in the specified table.

Additional Information

In some cases, a prefix limit is associated with a routing table for a VPN instance. When this limit is exceeded (for example, because of a network misconfiguration), some routes might not be inserted in the table. Such routes need to be added to the table after the network issue is resolved. Use the `clear bgp table` command to request that BGP refresh routes in a VPN instance table.

Required Privilege Level

- `clear`

List of Sample Output

- `clear bgp table private.inet.0 on page 1734`
- `clear bgp table inet.6 logical-system all on page 1734`
- `clear bgp table private.inet.6 logical-system ls1 on page 1735`
- `clear bgp table logical-system all inet.0 on page 1735`
- `clear bgp table logical-system ls2 private.inet.0 on page 1735`

Output Fields

This command produces no output.

Sample Output

```
clear bgp table private.inet.0
user@host> clear bgp table private.inet.0

clear bgp table inet.6 logical-system all
user@host> clear bgp table inet.6 logical-system all
```
clear bgp table private.inet.6 logical-system ls1
    user@host> clear bgp table private.inet.6 logical-system ls1

clear bgp table logical-system all inet.0
    user@host> clear bgp table logical-system all inet.0

clear bgp table logical-system ls2 private.inet.0
    user@host> clear bgp table logical-system ls2 private.inet.0
show bgp bmp

Syntax   show bgp bmp

Release Information Command introduced in Junos OS Release 9.5.
Command introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display information about the BGP Monitoring Protocol (BMP).

Options  This command has no options.

List of Sample Output show bgp bmp on page 1736

Output Fields Table 62 on page 1736 lists the output fields for the show bgp bmp command. Output fields are listed in the approximate order in which they appear.

Table 62: show bgp bmp Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BMP station address/port</td>
<td>IP address and port number of the monitoring station to which BGP Monitoring Protocol (BMP) statistics are sent.</td>
</tr>
<tr>
<td>BMP session state</td>
<td>Status of the BMP session: UP or DOWN.</td>
</tr>
<tr>
<td>Statistics timeout</td>
<td>Amount of time, in seconds, between transmissions of BMP data to the monitoring station.</td>
</tr>
</tbody>
</table>

Sample Output

show bgp bmp

user@host> show bgp bmp

BMP station address/port: 172.24.24.157+5454
BMP session state: DOWN
Statistics timeout: 15
show bgp group

List of Syntax  
Syntax on page 1737
Syntax (EX Series Switch and QFX Series) on page 1737

Syntax  
show bgp group
  <brief | detail | summary>
  <group-name>
  <exact-instance instance-name>
  <instance instance-name>
  <logical-system (all | logical-system-name)>
  <rtf>

Syntax (EX Series Switch and QFX Series)  
show bgp group
  <brief | detail | summary>
  <group-name>
  <exact-instance instance-name>
  <instance instance-name>

Release Information  
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
exact-instance option introduced in Junos OS Release 11.4.
From Junos OS release 18.4 onwards, show bgp group group-name does an exact match and displays groups with names matching exactly with that of the specified group-name.
For all Junos OS releases preceding 18.4, the implementation was performed using the prefix matches (example: if there are two groups grp1, grp2 and the CLI command show bgp group grp was issued, then both grp1, grp2 were displayed).

Description  
Display information about the configured BGP groups.

Options  none—Display group information about all BGP groups.

brief | detail | summary—(Optional) Display the specified level of output.

group-name—(Optional) Display group information for the specified group.

exact-instance instance-name—(Optional) Display information for the specified instance only.

instance instance-name—(Optional) Display information about BGP groups for all routing instances whose name begins with this string (for example, cust1, cust11, and cust111 are all displayed when you run the show bgp group instance cust1 command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.
logical-system (all | logical-system-name) — (Optional) Perform this operation on all logical systems or on a particular logical system.

rtf — (Optional) Display BGP group route targeting information.

```
**show bgp group traffic-statistics**

**Syntax**

```
show bgp group traffic-statistics
    <brief | detail>
    <group-name>
    <labeled-path label label>
    <logical-system (all | logical-system-name)>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**labeled-path** option introduced in Junos OS Release 18.1R1 for the MX Series.

**Description**

Display the traffic statistics for configured Border Gateway Protocol (BGP) groups.

**Options**

- **none**—Display traffic statistics for all BGP groups.
- **brief | detail**—(Optional) Display the specified level of output.
- **group-name**—(Optional) Display BGP traffic statistics for only the specified group.
- **labeled-path**—(Optional) Display labeled unicast traffic statistics at the ingress.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**

**Level**

view

**List of Sample Output**

- `show bgp group traffic-statistics (Per-Group-Label Not Configured) on page 1746`
- `show bgp group traffic-statistics (Per-Group-Label Configured) on page 1746`
- `show bgp group traffic-statistics labeled-path (Labeled Unicast) on page 1747`

**Output Fields**

Table 64 on page 1745 describes the output fields for the `show bgp group traffic-statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 64: show bgp group traffic-statistics Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group name</td>
<td>Name of a specific BGP group.</td>
</tr>
<tr>
<td>Group Index</td>
<td>Index number for the BGP group.</td>
</tr>
<tr>
<td>NLRI</td>
<td>Network layer reachability information (NLRI) indicating the source of the traffic statistics for the BGP group.</td>
</tr>
<tr>
<td>FEC</td>
<td>Forwarding equivalence classes (FECs) associated with the BGP group.</td>
</tr>
<tr>
<td>Packets</td>
<td>Number of packets sent through each FEC.</td>
</tr>
</tbody>
</table>
Table 64: show bgp group traffic-statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bytes</td>
<td>Number of bytes transmitted through each FEC.</td>
</tr>
<tr>
<td>EgressAS</td>
<td>Autonomous system (AS) number of the egress router.</td>
</tr>
<tr>
<td>AdvLabel</td>
<td>Label associated with each FEC.</td>
</tr>
</tbody>
</table>

### show bgp neighbor

**List of Syntax**
- Syntax on page 1748
- Syntax (EX Series Switch, QFX Series, and OCX Series) on page 1748

#### Syntax

```
show bgp neighbor
  <exact-instance instance-name>
  <instance instance-name>
  <logical-system (all | logical-system-name)>
  <neighbor-address>
  <output-queue>
  <orf (detail | neighbor-address)
```

#### Syntax (EX Series Switch, QFX Series, and OCX Series)

```
show bgp neighbor
  <instance instance-name>
  <exact-instance instance-name>
  <neighbor-address>
  <orf (neighbor-address | detail)
```

#### Release Information
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- Command introduced in Junos OS Release 14.1x53-D20 for the OCX Series.
- orf option introduced in Junos OS Release 9.2.
- exact-instance option introduced in Junos OS Release 11.4.
- output-queue option introduced in Junos OS Release 16.1
- `DontGRHelpFateSharingBfdDown` is added to the options field of the command output in Junos OS Release 18.3R1.

#### Description
Display information about BGP peers.

#### Options
- **none**—Display information about all BGP peers.
- **exact-instance instance-name**—(Optional) Display information for the specified instance only.
- **instance instance-name**—(Optional) Display information about BGP peers for all routing instances whose name begins with this string (for example, `cust1`, `cust11`, and `cust111` are all displayed when you run the `show bgp neighbor instance cust1` command).
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **neighbor-address**—(Optional) Display information for only the BGP peer at the specified IP address.
orf (detail | neighbor-address)—(Optional) Display outbound route-filtering information for all BGP peers or only for the BGP peer at the specified IP address. The default is to display brief output. Use the detail option to display detailed output.

output-queue—(Optional) Display information regarding the number of routes currently queued in the 17 prioritized BGP output queues.

Additional Information
For information about the local-address, nlri, hold-time, and preference statements, see the Junos OS Routing Protocols Library.

Output Fields
Table 65 on page 1749 describes the output fields for the show bgp neighbor command. Output fields are listed in the approximate order in which they appear.

Table 65: show bgp neighbor Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer</td>
<td>Address of the BGP neighbor. The address is followed by the neighbor port number.</td>
</tr>
<tr>
<td>AS</td>
<td>AS number of the peer.</td>
</tr>
<tr>
<td>Local</td>
<td>Address of the local routing device. The address is followed by the peer port number.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of peer: Internal or External.</td>
</tr>
</tbody>
</table>
**Table 65: show bgp neighbor Output Fields (continued)**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>State</strong></td>
<td>Current state of the BGP session:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Active</strong>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Connect</strong>—BGP is waiting for the transport protocol connection to be completed.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Established</strong>—The BGP session has been established, and the peers are exchanging update messages.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Idle</strong>—This is the first stage of a connection. BGP is waiting for a Start event.</td>
</tr>
<tr>
<td></td>
<td>• <strong>OpenConfirm</strong>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</td>
</tr>
<tr>
<td></td>
<td>• <strong>OpenSent</strong>—BGP has sent an open message and is waiting to receive an open message from the peer.</td>
</tr>
<tr>
<td></td>
<td>• <strong>route reflector client</strong>—The BGP session is established with a route reflector client.</td>
</tr>
<tr>
<td><strong>Flags</strong></td>
<td>Internal BGP flags:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Aggregate Label</strong>—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label.</td>
</tr>
<tr>
<td></td>
<td>• <strong>CleanUp</strong>—The peer session is being shut down.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Delete</strong>—This peer has been deleted.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Idled</strong>—This peer has been permanently idled.</td>
</tr>
<tr>
<td></td>
<td>• <strong>ImportEval</strong>—At the last commit operation, this peer was identified as needing to reevaluate all received routes.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Initializing</strong>—The peer session is initializing.</td>
</tr>
<tr>
<td></td>
<td>• <strong>SendRtn</strong>—Messages are being sent to the peer.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Sync</strong>—This peer is synchronized with the rest of the peer group.</td>
</tr>
<tr>
<td></td>
<td>• <strong>RSync</strong>—This peer in the backup Routing Engine is synchronized with the BGP peer in the master Routing Engine for nonstop active routing.</td>
</tr>
<tr>
<td></td>
<td>• <strong>TryConnect</strong>—Another attempt is being made to connect to the peer.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unconfigured</strong>—This peer is not configured.</td>
</tr>
<tr>
<td></td>
<td>• <strong>WriteFailed</strong>—An attempt to write to this peer failed.</td>
</tr>
<tr>
<td><strong>Last state</strong></td>
<td>Previous state of the BGP session:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Active</strong>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Connect</strong>—BGP is waiting for the transport protocol connection to be completed.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Established</strong>—The BGP session has been established, and the peers are exchanging update messages.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Idle</strong>—This is the first stage of a connection. BGP is waiting for a Start event.</td>
</tr>
<tr>
<td></td>
<td>• <strong>OpenConfirm</strong>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</td>
</tr>
</tbody>
</table>
|            | • **OpenSent**—BGP has sent an open message and is waiting to receive an open message from the peer.
### Table 65: show bgp neighbor Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Last event</strong></td>
<td>Last activity that occurred in the BGP session:</td>
</tr>
<tr>
<td></td>
<td>• Closed—The BGP session closed.</td>
</tr>
<tr>
<td></td>
<td>• ConnectRetry—The transport protocol connection failed, and BGP is trying again to connect.</td>
</tr>
<tr>
<td></td>
<td>• HoldTime—The session ended because the hold timer expired.</td>
</tr>
<tr>
<td></td>
<td>• KeepAlive—The local routing device sent a BGP keepalive message to the peer.</td>
</tr>
<tr>
<td></td>
<td>• Open—The local routing device sent a BGP open message to the peer.</td>
</tr>
<tr>
<td></td>
<td>• OpenFail—The local routing device did not receive an acknowledgment of a BGP open message from the peer.</td>
</tr>
<tr>
<td></td>
<td>• RecvKeepAlive—The local routing device received a BGP keepalive message from the peer.</td>
</tr>
<tr>
<td></td>
<td>• RecvNotify—The local routing device received a BGP notification message from the peer.</td>
</tr>
<tr>
<td></td>
<td>• RecvOpen—The local routing device received a BGP open message from the peer.</td>
</tr>
<tr>
<td></td>
<td>• RecvUpdate—The local routing device received a BGP update message from the peer.</td>
</tr>
<tr>
<td></td>
<td>• Start—The peering session started.</td>
</tr>
<tr>
<td></td>
<td>• Stop—The peering session stopped.</td>
</tr>
<tr>
<td></td>
<td>• TransportError—A TCP error occurred.</td>
</tr>
<tr>
<td><strong>Last error</strong></td>
<td>Last error that occurred in the BGP session:</td>
</tr>
<tr>
<td></td>
<td>• Cease—An error occurred, such as a version mismatch, that caused the session to close.</td>
</tr>
<tr>
<td></td>
<td>• Finite State Machine Error—In setting up the session, BGP received a message that it did not understand.</td>
</tr>
<tr>
<td></td>
<td>• Hold Time Expired—The session's hold time expired.</td>
</tr>
<tr>
<td></td>
<td>• Message Header Error—The header of a BGP message was malformed.</td>
</tr>
<tr>
<td></td>
<td>• Open Message Error—A BGP open message contained an error.</td>
</tr>
<tr>
<td></td>
<td>• None—No errors occurred in the BGP session.</td>
</tr>
<tr>
<td></td>
<td>• Update Message Error—A BGP update message contained an error.</td>
</tr>
<tr>
<td><strong>Export</strong></td>
<td>Name of the export policy that is configured on the peer.</td>
</tr>
<tr>
<td><strong>Import</strong></td>
<td>Name of the import policy that is configured on the peer.</td>
</tr>
<tr>
<td>Field Name</td>
<td>Field Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Options</td>
<td>Configured BGP options:</td>
</tr>
<tr>
<td></td>
<td>• AddressFamily—Configured address family: inet or inet-vpn.</td>
</tr>
<tr>
<td></td>
<td>• AdvertiseBGPStatic—Configured BGP static routes are advertised.</td>
</tr>
<tr>
<td></td>
<td>• AuthKeyChain—Authentication key change is enabled.</td>
</tr>
<tr>
<td></td>
<td>• BfdEnabled—Status of BFD.</td>
</tr>
<tr>
<td></td>
<td>• DontGRHelpFateSharingBfdDown—Status of the dont-help-shared-fate-bfd-down option. If this option is configured the device does not go into graceful restart helper mode.</td>
</tr>
<tr>
<td></td>
<td>• DropPathAttributes—Certain path attributes are configured to be dropped from neighbor updates during inbound processing.</td>
</tr>
<tr>
<td></td>
<td>• GracefulRestart—Graceful restart is configured.</td>
</tr>
<tr>
<td></td>
<td>• HoldTime—Hold time configured with the hold-time statement. The hold time is three times the interval at which keepalive messages are sent.</td>
</tr>
<tr>
<td></td>
<td>• IgnorePathAttributes—Certain path attributes are configured to be ignored in neighbor updates during inbound processing.</td>
</tr>
<tr>
<td></td>
<td>• Local Address—Address configured with the local-address statement.</td>
</tr>
<tr>
<td></td>
<td>• LLGR—BGP long-lived graceful restart capability is configured.</td>
</tr>
<tr>
<td></td>
<td>• LLGRHelperDisabled—BGP long-lived graceful restart is completely disabled for a neighbor.</td>
</tr>
<tr>
<td></td>
<td>• Multihop—Allow BGP connections to external peers that are not on a directly connected network.</td>
</tr>
<tr>
<td></td>
<td>• NLRI—Configured MBGP state for the BGP group: multicast, unicast, or both if you have configured nlri any.</td>
</tr>
<tr>
<td></td>
<td>• Peer AS—Configured peer autonomous system (AS).</td>
</tr>
<tr>
<td></td>
<td>• Preference—Preference value configured with the preference statement.</td>
</tr>
<tr>
<td></td>
<td>• Refresh—Configured to refresh automatically when the policy changes.</td>
</tr>
<tr>
<td></td>
<td>• Rib-group—Configured routing table group.</td>
</tr>
<tr>
<td></td>
<td>• RFC6514CompliantSafi129—Configured SAFI 129 according to RFC 6514 (BGP VPN multicast used to use SAFI 128).</td>
</tr>
<tr>
<td>Path-attributes dropped</td>
<td>Path attribute codes that are dropped from neighbor updates.</td>
</tr>
<tr>

Sample Output
show bgp neighbor

user@host > show bgp neighbor

For M Series, MX Series, and T Series routers running Junos OS Release 16.1 or later, the show bgp neighbor output includes the BGP group the peer belongs to, the routing instance (if any) that the peer is configured in, and the routing instance that the peer is using for the forwarding context (if applicable). An example follows.

Peer: 10.255.7.250+179 AS 10  Local: 10.255.7.248+63740 AS 10
Group: toAsbr2           Routing-Instance: master
Forwarding routing-instance: toAs2
  Type: Internal        State: Established      Flags: <Sync>
Last State: OpenConfirm Last Event: RecvKeepAlive
Last Error: None
Export: [ redist_static ]
Options: <Preference LocalAddress PeerAS Refresh>
Options: <AdvertiseBGPStatic>
Local Address: 10.255.7.248 Holdtime: 90 Preference: 170 Outbound Timer: 50
Number of flaps: 0
Peer ID: 10.255.7.250    Local ID: 10.255.7.248    Active Holdtime: 90
Keepalive Interval: 30   Group index: 0    Peer index: 0
BFD: disabled, down
NLRI for restart configured on peer: inet-unicast
NLRI advertised by peer: inet-unicast
NLRI for this session: inet-unicast
Peer supports Refresh capability (2)
Stale routes from peer are kept for: 300
Peer does not support Restarter functionality
NLRI that restart is negotiated for: inet-unicast
NLRI of received end-of-rib markers: inet-unicast
NLRI of all end-of-rib markers sent: inet-unicast
Peer supports 4 byte AS extension (peer-as 10)
Peer does not support Addpath
NLRI that we support extended nexthop encoding for: inet-unicast
NLRI that peer supports extended nexthop encoding for: inet-unicast

**show bgp replication**

**Syntax**

show bgp replication

**Release Information**

Command introduced in Junos OS Release 8.5.  
Command introduced in Junos OS Release 11.3 for the QFX Series.  
Support for logical-system option introduced in Junos OS Release 13.3.

**Description**

Displays the status of BGP state replication between the master and backup Routing Engines on devices that have nonstop active routing configured on them.

---

**CAUTION:** Before attempting nonstop active routing switchover, check the output of show bgp replication to confirm that BGP routing table synchronization has completed on the backup Routing Engine. The complete status in the output of show task replication only indicates that the socket replication has completed and the BGP synchronization is in progress.

To determine whether BGP synchronization is complete, you must check the Protocol state and Synchronization state fields in the output of show bgp replication on the master Routing Engine. The Protocol state must be idle and the Synchronization state must be complete. If you perform NSR switchover before the BGP synchronization has completed, the BGP session might flap.

**Options**

This command has no options.

**Required Privilege Level**

view

**Related Documentation**

- show bgp replication logical-system

**List of Sample Output**

show bgp replication (for Master) on page 1770  
show bgp replication (for Backup) on page 1770

**Output Fields**

Table 66 on page 1769 lists the output fields for the show bgp replication command. Output fields are listed in the approximate order in which they appear.
Table 66: show bgp replication Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Precision timer registration | State of BGP precision timer feature in the kernel.  
  • **Registered**—BGP registers with the precision-timer feature in the kernel for auto keepalive generation after switchover.  
  • **NotRegistered**—Keepalive format of BGP is not registered.  |
| session state            | State of the current internal BGP state replication session, Up or Down, and the duration for which the session has been in the indicated state.  |
| flaps                    | Total number of flaps that occurred.                                                                                                                |
| protocol state           | Current state of the protocol operation, Active, Connect, Idle, and the duration for which the protocol has been in the indicated state.  |
| synchronization state    | Synchronization state at the time of executing the command. The states can be:  
  • **Idle**  
  • **Neighbor**—Indicates that the neighbor state synchronization is in progress.  
  • **AckWait**—Indicates that the request processing is over.  
  • **ORF**—Indicates that the outbound routing filter synchronization is in progress.  
  • **RIB**—Indicates that the routing table synchronization is in progress.  
  • **Complete**  |
| number of peers waiting  | Total number of peers waiting for various messages:  
  • **AckWait**—Number of peers waiting for a connection establishment or completed acknowledgment messages.  
  • **SoWait**—Number of peers waiting for TCP socket-related operations.  
  • **Scheduled**—Number of peers being synchronized.  |
| messages sent            | Number of various types of messages that have been sent since internal replication session became active:  
  • **Open**—Number of Open messages sent.  
  • **Establish**—Number of connection establishment acknowledgment messages sent.  
  • **Update**—Number of update messages sent.  
  • **Error**—Number of error messages sent.  
  • **Complete**—Number of connection complete acknowledgment messages sent.  |
| messages received        | Total number of messages received:  
  • **Open**—Number of Open messages received.  
  • **Request**—Number of request messages received:  
    • **Wildcard**—Number of requests received that used wildcards in the target address.  
    • **Targeted**—Number of requests received that used a specific address.  
  • **EstablishAck**—Number of connection establishment acknowledgement messages received.  
  • **CompleteAck**—Number of connection completed acknowledgement messages received.  |
Sample Output

show bgp replication (for Master)

user@host> show bgp replication

Synchronization master:
  Precision timer registration: Registered
  Session state: Up, Since: 10:14
  Flaps: 1, Last flap reason: Backup closed connection
  Protocol state: Idle, Since: 10:14
  Synchronization state: Complete
  Number of peers waiting: AckWait: 0, SoWait: 0, Scheduled: 0
  Messages sent: Open 1, Establish 11, GrHelper 0, Update 0, GrStaleLabel 0 Error 0, Complete 1
  Messages received: Open 1, Request 1 wildcard 0 targeted, EstablishAck 11, GrHelperAck 0, CompleteAck 1

show bgp replication (for Backup)

user@host> show bgp replication

Synchronization backup:
  State: Established 13 ago
  , Unsynchronized timer: 2

  Unsynchronized entry queue:
    Instance: 0 Neighbor: 30.30.30.1 elapsed: 7
    Instance: 0 Neighbor: 40.40.40.3 elapsed: 7
    Instance: 0 Neighbor: 40.40.40.4 elapsed: 7
    Instance: 0 Neighbor: 40.40.40.5 elapsed: 7
    Instance: 0 Neighbor: 40.40.40.6 elapsed: 7

List of Syntax  Syntax on page 1771
Syntax (EX Series Switch and QFX Series) on page 1771

Syntax  show bgp summary
<exact-instance instance-name>
<group group-name>
<instance instance-name>
<logical-system (all | logical-system-name)>

Syntax (EX Series Switch and QFX Series)  show bgp summary
<instance instance-name>

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
exact-instance option introduced in Junos OS Release 11.4.
group option introduced in Junos OS Release 13.3.

Description  Display BGP summary information.

Options  none—Display BGP summary information for all routing instances.

exact-instance instance-name—(Optional) Display information for the specified instance only.

group—Display overview of bgp information for a particular group

instance instance-name—(Optional) Display information for all routing instances whose name begins with this string (for example, cust1, cust11, and cust111 are all displayed when you run the show bgp summary instance cust1 command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

<td>Number of times the BGP session has gone down and then come back up.</td>
</tr>
<tr>
<td>Last Up/Down</td>
<td>Last time since the neighbor transitioned to or from the established state.</td>
</tr>
</tbody>
</table>
Table 67: `show bgp summary` Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State/Active/Received/Accepted/Damped</td>
<td>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established on the main routing device or in a routing instance.</td>
</tr>
<tr>
<td>• If a peer is not established, the field shows the state of the peer session: <strong>Active</strong>, <strong>Connect</strong>, or <strong>Idle</strong>. In general, the Idle state is the first stage of a connection. BGP is waiting for a Start event. A session can be idle for other reasons as well. The reason that a session is idle is sometimes displayed. For example: <strong>Idle (Removal in progress)</strong> or <strong>Idle (LicenseFailure)</strong>.</td>
<td></td>
</tr>
<tr>
<td>• If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <em>inet.0</em> (main) and <em>inet.2</em> (multicast) routing tables. For example, <strong>8/10/10/2 and 2/4/4/0</strong> indicate the following:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <em>inet.0</em> routing table.</td>
</tr>
<tr>
<td></td>
<td>• 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <em>inet.2</em> routing table.</td>
</tr>
<tr>
<td>• If a BGP session is established in a routing instance, the field indicates the established (<strong>Establ</strong>) state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, <strong>Establ VPN-AB.inet.0: 2/4/0</strong> indicates the following:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The BGP session is established.</td>
</tr>
<tr>
<td></td>
<td>• Routes are received in the <strong>VPN-AB.inet.0</strong> routing table.</td>
</tr>
<tr>
<td></td>
<td>• The local routing device has two active routes, four received routes, and no damped routes from a BGP peer.</td>
</tr>
<tr>
<td></td>
<td>When a BGP session is established, the peers are exchanging update messages.</td>
</tr>
<tr>
<td>NOTE:</td>
<td>When graceful restart or LLGR helper mode is active, the RIB information is now displayed by the <code>show bgp summary</code> command. If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <em>inet.0</em> (main) and <em>inet.2</em> (multicast) routing tables. For example, <strong>8/10/10/2 and 2/4/4/0</strong> indicate the following:</td>
</tr>
<tr>
<td></td>
<td>• 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <em>inet.0</em> routing table.</td>
</tr>
<tr>
<td></td>
<td>• 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <em>inet.2</em> routing table.</td>
</tr>
</tbody>
</table>

**show policy damping**

**List of Syntax**
- Syntax on page 1777
- Syntax (EX Series Switch and QFX Series) on page 1777

**Syntax**
```
show policy damping
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and QFX Series)**
```
show policy damping
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**
Display information about BGP route flap damping parameters.

**Options**
- none—Display information about BGP route flap damping parameters.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Additional Information**
In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes.

**Required Privilege Level**
- view

**Related Documentation**

**List of Sample Output**
- show policy damping on page 1778

**Output Fields**
- Table 68 on page 1778 describes the output fields for the `show policy damping` command. Output fields are listed in the approximate order in which they appear.
Table 68: show policy damping Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Halflife</td>
<td>Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes.</td>
</tr>
<tr>
<td>Reuse merit</td>
<td>Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.</td>
</tr>
<tr>
<td>Suppress/cutoff merit</td>
<td>Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.</td>
</tr>
<tr>
<td>Maximum suppress time</td>
<td>Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.</td>
</tr>
<tr>
<td>Computed values</td>
<td>• Merit ceiling—Maximum merit that a flapping route can collect.</td>
</tr>
<tr>
<td></td>
<td>• Maximum decay—Maximum decay half-life, in minutes.</td>
</tr>
</tbody>
</table>

Sample Output

show policy damping

user@host> show policy damping

Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193

Damping information for "standard-damping":
  Halflife: 10 minutes
  Reuse merit: 4000 Suppress/cutoff merit: 8000
  Maximum suppress time: 30 minutes
  Computed values:
    Merit ceiling: 32120
    Maximum decay: 12453
CHAPTER 18

ES-IS Operational Commands

- clear esis adjacency
- clear esis statistics
- show esis adjacency
- show esis interface
- show esis statistics
clear esis adjacency

Syntax

```
clear esis adjacency
<instance instance-name>
<interface interface-name>
<neighbor>
```

Release Information
Command introduced before Junos OS Release 7.4.

Description

Options
- **none**—Clear all ES-IS adjacencies.
- **instance instance-name**—(Optional) Clear adjacencies for the specified routing instance only.
- **interface interface-name**—(Optional) Clear adjacencies for the specified interface only.
- **neighbor**—(Optional) Clear adjacencies for the specified neighbor only.

Required Privilege
- **clear**

Related Documentation
- [show esis adjacency on page 1782](#)

List of Sample Output
- [clear esis adjacency on page 1780](#)

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear esis adjacency

user@host> clear esis adjacency
```
clear esis statistics

Syntax

```
clear esis statistics
<instance instance-name>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

Options

- none—Clear ES-IS packet statistics for all routing instances.
- instance instance-name—(Optional) Clear ES-IS packet statistics for the specified routing instance only.

Required Privilege

```
clear
```

Related Documentation

- show esis statistics on page 1787

List of Sample Output

```
clear esis statistics on page 1781
```

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear esis statistics
```

```
user@host> clear esis statistics
```
show esis adjacency

**Syntax**

```
show esis adjacency
<brief | detail | extensive>
<esis-neighbor-id>
<instance instance-name>
<interface interface-name>)
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

Display End System-to-Intermediate System (ES-IS) adjacencies.

**Options**

- **none**—(Same as **brief**) Display all ES-IS adjacencies.
- **brief | detail | extensive**—(Optional) Display the specified level of output.
- **esis-neighbor-id**—(Optional) Display adjacencies for the specified neighbor's network service access point (NSAP) only.
- **instance instance-name**—(Optional) Display adjacencies for the specified routing instance only.
- **interface interface-name**—(Optional) Display adjacencies for the specified interface only.

**Required Privilege**

- **Level**

  - **view**

**Related Documentation**

show esis interface

Syntax

```
show esis interface
  <brief | detail | extensive>
  <instance instance-name>
  <interface interface-name>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

Options

- `none`—(Same as `brief`) Display information for all configured ES-IS interfaces.
- `brief | detail | extensive`—(Optional) Display the specified level of output.
- `instance instance-name`—(Optional) Display configured interfaces for the specified routing instance only.
- `interface interface-name`—(Optional) Display information about the specified interface only.

Required Privilege

`view`

List of Sample Output

clear amt statistics

**Syntax**

```
clear amt statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
```

**Release Information**

Command introduced in JUNOS Release 10.2.

**Description**

Clear Automatic Multicast Tunneling (AMT) statistics.

**Options**

- **none**—Clear the multicast statistics for all AMT tunnel interfaces.
- **instance instance-name**—(Optional) Clear AMT multicast statistics for the specified instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**

clear

**Related Documentation**

- show amt statistics on page 1830

**List of Sample Output**

- clear amt statistics on page 1792

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
clear amt statistics

user@host> clear amt statistics
```
clear amt tunnel

Syntax  

```plaintext
<gateway gateway-ip-addr> <port port-number>
<instance instance-name>
<logical-system (all | logical-system-name)>
<statistics>
<tunnel-interface interface-name>
```

Release Information  
Command introduced in JUNOS Release 10.2.

Description  
Clear the Automatic Multicast Tunneling (AMT) multicast state. Optionally, clear AMT protocol statistics.

Options  

- **none**—Clear multicast state for all AMT tunnel interfaces.

- **gateway gateway-ip-addr port port-number**—(Optional) Clear the AMT multicast state for the specified gateway address. If no port is specified, clear the AMT multicast state for all AMT gateways with the given IP address.

- **instance instance-name**—(Optional) Clear the AMT multicast state for the specified instance.

- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

- **statistics**—(Optional) Clear multicast statistics for all AMT tunnels or for specified tunnels.

- **tunnel-interface interface-name**—(Optional) Clear the AMT multicast state for the specified AMT tunnel interface.

Required Privilege  
Level clear

Related Documentation  
- show amt tunnel on page 1835

List of Sample Output  

- clear amt tunnel on page 1793

- clear amt tunnel statistics gateway-address on page 1794

Output Fields  
When you enter this command, you are provided feedback on the status of your request.

Sample Output  

clear amt tunnel

```
user@host> clear amt tunnel
```
clear amt tunnel statistics gateway-address

user@host> clear amt tunnel statistics gateway-address 100.31.21 port 4000
clear igmp membership

List of Syntax  Syntax on page 1795
Syntax (EX Series Switch and the QFX Series) on page 1795

Syntax

```
clear igmp membership
<all>
<group address-range>
<integer interface-name>
<logical-system (all | logical-system-name)>
```

Syntax (EX Series Switch and the QFX Series)

```
clear igmp membership
<group address-range>
<integer interface-name>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Clear Internet Group Management Protocol (IGMP) group members.

Options

```
all—Clear IGMP members for groups and interfaces in the master instance.

<group address-range>—(Optional) Clear all IGMP members that are in a particular address range. An example of a range is 233.252/16. If you omit the destination prefix length, the default is /32.

<integer interface-name>—(Optional) Clear all IGMP group members on an interface.

<logical-system (all | logical-system-name)>—(Optional) Perform this operation on all logical systems or on a particular logical system.
```

Required Privilege

```
clear
```

clear igmp snooping membership

Syntax

```
clear igmp snooping membership
  <vlan vlan-name >
  <group | source address>
  <instance instance-name>
  <interface interface-name>
  <learning-domain learning-domain-name>
  <logical-system logical-system-name>
  <vlan-id vlan-identifier>
```

Release Information

Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 18.1R1 for the SRX1500 devices.

Description

Clear IGMP snooping dynamic membership information from the multicast forwarding table.

Options

none—Clear IGMP snooping membership for all supported address families on all interfaces.

`vlan vlan-name`—(Optional) Clear dynamic membership information for the specified VLAN.

`group | source address`—(Optional) Clear IGMP snooping membership for the specified multicast group or source address.

`instance instance-name`—(Optional) Clear IGMP snooping membership for the specified instance.

`interface interface-name`—(Optional) Clear IGMP snooping membership on a specific interface.

`learning-domain learning-domain-name`—(Optional) Perform this operation on all learning domains or on a particular learning domain.

`logical-system logical-system-name`—(Optional) Display information about a particular logical system, or for all logical systems.

`vlan-id vlan-identifier`—(Optional) Perform this operation on a particular VLAN.

Required Privilege Level
clear

**clear msdp cache**

**Syntax**

```
clear msdp cache
<all>
<instance instance-name>
<logical-system (all | logical-system-name)>
<peer peer-address>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Clear the entries in the Multicast Source Discovery Protocol (MSDP) source-active cache.

**Options**

- **all**—Clear all MSDP source-active cache entries in the master instance.
- **instance instance-name**—(Optional) Clear entries for a specific MSDP instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **peer peer-address**—(Optional) Clear the MSDP source-active cache entries learned from a specific peer.

user@host> clear msdp statistics
clear multicast bandwidth-admission

Syntax

```
clear multicast bandwidth-admission
<group group-address>
/inet | inet6>
<instance instance-name>
<source source-address>
```

Release Information

- Command introduced in Junos OS Release 8.3.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- `inet6` and `instance` options introduced in Junos OS Release 10.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Reapply IP multicast bandwidth admissions.

Options

- **none**—Reapply multicast bandwidth admissions for all IPv4 forwarding entries in the master routing instance.

- **group group-address**—(Optional) Reapply multicast bandwidth admissions for the specified group.

- **inet**—(Optional) Reapply multicast bandwidth admission settings for IPv4 flows.

- **inet6**—(Optional) Reapply multicast bandwidth admission settings for IPv6 flows.

- **instance instance-name**—(Optional) Reapply multicast bandwidth admission settings for the specified instance. If you do not specify an instance, the command applies to the master routing instance.

- **interface interface-name**—(Optional) Examines the corresponding outbound interface in the relevant entries and acts as follows:
  
  - If the interface is congested, and it was admitted previously, it is removed.
  - If the interface was rejected previously, the `clear multicast bandwidth-admission` command enables the interface to be admitted as long as enough bandwidth exists on the interface.
  - If you do not specify an interface, issuing the `clear multicast bandwidth-admission` command readmits any previously rejected interface for the relevant entries as long as enough bandwidth exists on the interface.

  To manually reject previously admitted outbound interfaces, you must specify the interface.

- **source source-address**—(Optional) Use with the `group` option to reapply multicast bandwidth admission settings for the specified (source, group) entry.
Required Privilege Level  clear

Related Documentation  •  show multicast interface on page 1906

clear multicast forwarding-cache

**Syntax**
clear multicast forwarding-cache
<all>
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>

**Release Information**
Command introduced in Junos OS Release 12.2.

**Description**
Clear IP multicast forwarding cache entries.

This command is not supported for next-generation multiprotocol BGP multicast VPNs (MVPNs).

**Options**
- **all**—Clear all multicast forwarding cache entries in the master instance.
- **inet**—(Optional) Clear multicast forwarding cache entries for IPv4 family addresses.
- **inet6**—(Optional) Clear multicast forwarding cache entries for IPv6 family addresses.
- **instance instance-name**—(Optional) Clear multicast forwarding cache entries on a specific routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

```
clear multicast snooping statistics
  <instance instance-name>
  <interface interface-name>
  <logical-system (all | logical-system-name)>
```

Release Information

Command introduced in Junos OS Release 8.5.

Description

Clear IP multicast snooping statistics.

Options

- **none**—Clear multicast snooping statistics for all supported address families on all interfaces.
- **instance instance-name**—(Optional) Clear multicast snooping statistics for the specified instance.
- **interface interface-name**—(Optional) Clear multicast snooping statistics on a specific interface.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

- **clear**

clear multicast snooping statistics on page 1813

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear multicast snooping statistics

```
user@host> clear multicast snooping statistics
```
clear multicast statistics

**List of Syntax**

Syntax on page 1814
Syntax (EX Series Switch and the QFX Series) on page 1814
Syntax (EX4300 Switch) on page 1814

**Syntax**
clear multicast statistics

- `<inet | inet6>`
- `<instance instance-name>`
- `<interface interface-name>`
- `<logical-system (all | logical-system-name)>`

**Syntax (EX Series Switch and the QFX Series)**
clear multicast statistics

- `<inet | inet6>`
- `<instance instance-name>`
- `<interface interface-name>`

**Syntax (EX4300 Switch)**
clear system-packet-forwarding-options multicast-statistics

There are no available options for the EX4300.

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
`inet6` and `instance` options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Syntax added in Junos OS Release 19.2R1 for clearing multicast route statistics (EX4300 switches).

**Description**
Clear IP multicast statistics.

**Options**
- `none`—Clear multicast statistics for all supported address families on all interfaces.
- `inet`—(Optional) Clear multicast statistics for IPv4 family addresses.
- `inet6`—(Optional) Clear multicast statistics for IPv6 family addresses.
- `instance instance-name`—(Optional) Clear multicast statistics for the specified instance.
- `interface interface-name`—(Optional) Clear multicast statistics on a specific interface.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level
clear

user@host> clear multicast statistics
clear pim join

**List of Syntax**

Syntax (EX Series Switch and the QFX Series) on page 1816

```
Syntax clear pim join
<all>
<group-address>
<bidirectional | dense | sparse>
<exact>
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>
<rp ip-address/prefix | source ip-address/prefix>
<sg | star-g>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
*inet6* and *instance* options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Multiple new filter options introduced in Junos OS Release 13.2.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Clear the Protocol Independent Multicast (PIM) join and prune states.

**Options**

*all*—To clear PIM join and prune states for all groups and family addresses in the master instance, you must specify “all”.

*group-address*—(Optional) Clear the PIM join and prune states for a group address.

*bidirectional | dense | sparse*—(Optional) Clear PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

*exact*—(Optional) Clear only the group that exactly matches the specified group address.

*inet | inet6*—(Optional) Clear the PIM entries for IPv4 or IPv6 family addresses, respectively.
instance instance-name—(Optional) Clear the entries for a specific PIM-enabled routing instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

rp ip-address/prefix | source ip-address/prefix—(Optional) Clear the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

sg | star-g—(Optional) Clear PIM (S,G) or (*,G) entries.

Additional Information
The clear pim join command cannot be used to clear the PIM join and prune state on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege
Level
clear

List of Sample Output
clear pim join all on page 1817
clear pim join inet6 all on page 1817
clear pim join inet6 star-g all on page 1817

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear pim join all

user@host> clear pim join all
Cleared 8 Join/Prune states

clear pim join inet6 all

user@host> clear pim join inet6 all
Cleared 4 Join/Prune states

clear pim join inet6 star-g all

user@host> clear pim join inet6 star-g all
Cleared 1 Join/Prune states
clear pim join-distribution

Syntax

clear pim join-distribution
<all>
<instance instance-name>
<logical-system (all | logical-system-name)>

Release Information
Command introduced in Junos OS Release 10.0.

Description
Clear the PIM join-redistribute states.

Use the show pim source command to find out if there are multiple paths available for a source (for example, an RP).

When you include the join-load-balance statement in the configuration, the PIM join states are distributed evenly on available equal-cost multipath links. When an upstream neighbor link fails, Junos OS redistributes the PIM join states to the remaining links. However, when new links are added or the failed link is restored, the existing PIM joins are not redistributed to the new link. New flows will be distributed to the new links. However, in a network without new joins and prunes, the new link is not used for multicast traffic. The clear pim join-distribution command redistributes the existing flows to the new upstream neighbors. Redistributing the existing flows causes traffic to be disrupted, so we recommend that you run the clear pim join-distribution command during a maintenance window.

Options
all— (Optional) Clear the PIM join-redistribute states for all groups and family addresses in the master instance.

none— Automatically clear all PIM join/prune states.

instance instance-name— (Optional) Redistribute the join states for a specific PIM-enabled routing instance.

logical-system (all | logical-system-name)— (Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information
The clear pim join-distribution command cannot be used to redistribute the PIM join states on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege
Level

clear

Syntax (EX Series Switch and the QFX Series) clear pim register
<inet | inet6>
<instance instance-name>
<interface interface-name>

Syntax (PTX Series) clear pim register
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>

Release Information
Command introduced in Junos OS Release 7.6.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description
Clear Protocol Independent Multicast (PIM) register message counters.

Options
all—Required to clear the PIM register message counters for all groups and family addresses in the master instance.

inet | inet6—(Optional) Clear PIM register message counters for IPv4 or IPv6 family addresses, respectively.

instance instance-name—(Optional) Clear register message counters for a specific PIM-enabled routing instance.

interface interface-name—(Optional) Clear PIM register message counters for a specific interface.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
Additional Information: The `clear pim register` command cannot be used to clear the PIM register state on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege Level: clear

logical-system logical-system-name
<vlan-id vlan-id>
```

Release Information

Command introduced in Junos OS Release 13.2 for M Series Multiservice Edge devices.

Description

Clear information about Protocol Independent Multicast (PIM) snooping joins.

Options

- `none`—Display detailed information.
- `instance instance-name`—(Optional) Clear PIM snooping join information for the specified routing instance.
- `logical-system logical-system-name`—(Optional) Delete the IGMP snooping statistics for a given logical system or for all logical systems.
- `vlan-id vlan-identifier`—(Optional) Clear PIM snooping join information for the specified VLAN.

Required Privilege

- `view`

request pim multicast-tunnel rebalance

### List of Syntax
Syntax on page 1829
Syntax (EX Series Switches) on page 1829

```plaintext
Syntax
request pim multicast-tunnel rebalance
    <instance instance-name>
    <logical-system (all | logical-system-name>)

Syntax (EX Series Switches)
request pim multicast-tunnel rebalance
    <instance instance-name>
```

### Release Information
Command introduced in Junos OS Release 10.2.
Command introduced in Junos OS Release 10.2 for EX Series switches.

### Description
Rebalance the assignment of multicast tunnel encapsulation interfaces across available tunnel-capable PICs or across a configured list of tunnel-capable PICs. You can determine whether a rebalance is necessary by running the `show pim interfaces instance instance-name` command.

### Options
- **none**—Re-create and rebalance all tunnel interfaces for all routing instances.
- **instance instance-name**—Re-create and rebalance all tunnel interfaces for a specific instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

### Required Privilege Level
maintenance

### Related Documentation
- show pim interfaces on page 1958
- *Load Balancing Multicast Tunnel Interfaces Among Available PICs*

### Output Fields
This command produces no output. To verify the operation of the command, run the `show pim interface instance instance-name` before and after running the `request pim multicast-tunnel rebalance` command.
show amt statistics

Syntax

show amt statistics
<instance instance-name>
<logical-system (all | logical-system-name)>

Release Information

Command introduced in JUNOS Release 10.2.

Description

Display information about the Automatic Multicast Tunneling (AMT) protocol tunnel statistics.

Options

none—Display summary information about all AMT Protocol tunnels.
instance instance-name—(Optional) Display information for the specified instance only.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege

Table 73 on page 1833 describes the output fields for the show amt summary command. Output fields are listed in the approximate order in which they appear.

Table 73: show amt summary Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMT anycast prefix</td>
<td>Prefix advertised by unicast routing protocols to route AMT discovery messages to the router from nearby AMT gateways.</td>
<td>All levels</td>
</tr>
<tr>
<td>AMT anycast address</td>
<td>Anycast address configured from which the anycast prefix is derived.</td>
<td>All levels</td>
</tr>
<tr>
<td>AMT local address</td>
<td>Local unique AMT relay IP address configured. Used to send AMT relay advertisement messages, it is the IP source address of AMT control messages and the source address of the data tunnel encapsulation.</td>
<td>All levels</td>
</tr>
<tr>
<td>AMT tunnel limit</td>
<td>Maximum number of AMT tunnels that can be created.</td>
<td>All levels</td>
</tr>
<tr>
<td>active tunnels</td>
<td>Number of active AMT tunnel interfaces.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
Sample Output

show amt summary

```
user@host> show amt summary

  AMT anycast prefix : 20.0.0.4/32
  AMT anycast address : 20.0.0.4
  AMT local address : 20.0.0.4
  AMT tunnel limit : 1000, active tunnels : 2
```
show amt tunnel

Syntax

show amt tunnel
<brief | detail>
<gateway-address gateway-ip-address> <port port-number>
<instance instance-name>
<logical-system (all | logical-system-name)>
<tunnel-interface interface-name>

Release Information

Command introduced in Junos OS Release 10.2.

Description

Display information about the Automatic Multicast Tunneling (AMT) dynamic tunnels.

Options

none—Display summary information about all AMT protocol instances.

brief | detail—(Optional) Display the specified level of detail.

gateway-address gateway-ip-address port port-number—(Optional) Display information for the specified AMT gateway only. If no port is specified, display information for all AMT gateways with the given IP address.

instance instance-name—(Optional) Display information for the specified instance only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

tunnel-interface interface-name—(Optional) Display information for the specified AMT tunnel interface only.

show dvmrp prunes

**Syntax**

```
show dvmrp prunes
  <all | rx | tx>
  <logical-system (all | logical-system-name)>
```

**Release Information**

NOTE: Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

**Description**

Display information about active Distance Vector Multicast Routing Protocol (DVMRP) prune messages.

**Options**

- **none**—Display received and transmitted DVMRP prune information.
- **all**—(Optional) Display information about all received and transmitted prune messages.
- **rx**—(Optional) Display information about received prune messages.
- **tx**—(Optional) Display information about transmitted prune messages.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Output Fields**  
Table 80 on page 1854 describes the output fields for the `show igmp interface` command. Output fields are listed in the approximate order in which they appear.
Table 80: show igmp interface Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Name of the interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Querier</td>
<td>Address of the routing device that has been elected to send membership queries.</td>
<td>All levels</td>
</tr>
<tr>
<td>State</td>
<td>State of the interface: <strong>Up</strong> or <strong>Down</strong>.</td>
<td>All levels</td>
</tr>
<tr>
<td>SSM Map Policy</td>
<td>Name of the source-specific multicast (SSM) map policy that has been applied to the IGMP interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Timeout</td>
<td>How long until the IGMP querier is declared to be unreachable, in seconds.</td>
<td>All levels</td>
</tr>
<tr>
<td>Version</td>
<td>IGMP version being used on the interface: 1, 2, or 3.</td>
<td>All levels</td>
</tr>
<tr>
<td>Groups</td>
<td>Number of groups on the interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Group limit</td>
<td>Maximum number of groups allowed on the interface. Any joins requested after the limit is reached are rejected.</td>
<td>All levels</td>
</tr>
<tr>
<td>Group threshold</td>
<td>Configured threshold at which a warning message is generated.</td>
<td>All levels</td>
</tr>
<tr>
<td>Group log-interval</td>
<td>Time (in seconds) between consecutive log messages.</td>
<td>All levels</td>
</tr>
<tr>
<td>Immediate Leave</td>
<td>State of the immediate leave option:</td>
<td>All levels</td>
</tr>
<tr>
<td>Promiscuous Mode</td>
<td>State of the promiscuous mode option:</td>
<td>All levels</td>
</tr>
<tr>
<td>Distributed</td>
<td>State of IGMP, which, by default, takes place on the Routing Engine for MX Series routers but can be distributed to the Packet Forwarding Engine to provide faster processing of join and leave events.</td>
<td>All levels</td>
</tr>
</tbody>
</table>

- **On**—indicates that the router removes a host from the multicast group as soon as the router receives a leave group message from a host associated with the interface.
- **Off**—indicates that after receiving a leave group message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.

- **On**—indicates that the router can accept IGMP reports from subnetworks that are not associated with its interfaces.
- **Off**—indicates that the router can accept IGMP reports only from subnetworks that are associated with its interfaces.
Table 80: show igmp interface Output Fields (continued)

show igmp snooping interface

Syntax

show igmp snooping interface interface-name
<brief | detail>
<bridge-domain bridge-domain-name>
<logical-system logical-system-name>
<virtual-switch virtual-switch-name>
<vlan-id vlan-identifier>

Release Information

Command introduced in Junos OS Release 8.5.

Description

Display IGMP snooping interface information.

Options

none — Display detailed information.

brief | detail—(Optional) When applicable, this option lets you choose the how much detail to display.

bridge-domain bridge-domain-name—(Optional) Display information about a particular bridge domain.

logical-system logical-system-name—(Optional) Display information about a particular logical system, or type ‘all’.

virtual-switch virtual-switch-name—(Optional) Display information about a particular virtual switch.

vlan-id vlan-identifier—(Optional) Display information about a particular VLAN.

show igmp snooping membership

Syntax

```plaintext
show igmp snooping membership
  <brief | detail>
  <instance routing-instance-name>
  <interface interface-name>
  <vlan (vlan-id | vlan-name)>
  <bridge-domain bridge-domain-name>
  <group group-name>
  <logical-system logical-system-name>
  <virtual-switch virtual-switch-name>
  <vlan-id vlan-identifier>
```

Release Information

Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 18.1R1 for the SRX1500 devices.

Description

Display the multicast group membership information maintained by IGMP snooping.

Options

- **none**—Display the multicast group membership information about all VLANs on which IGMP snooping is enabled.
- **brief | detail**—(Optional) Display the specified level of output. The default is **brief**.

```
NOTE: On QFX Series switches, the output is the same for either brief or detail levels.
```

- **instance routing-instance-name**—(Optional) Display the multicast group membership information about the specified routing instance.
- **interface interface-name**—(Optional) Display the multicast group membership information about the specified interface.
- **vlan (vlan-id | vlan-name)**—(Optional) Display the multicast group membership for the specified VLAN.
- **bridge-domain bridge-domain-name**—(Optional) Display information about a particular bridge domain.
- **group group-name**—(Optional) Display information about this group address.
- **logical-system logical-system-name**—(Optional) Display information about a particular logical system, or type ‘all’.
- **virtual-switch virtual-switch-name**—(Optional) Display information about a particular virtual switch.
- **vlan-id vlan-identifier**—(Optional) Display information about a particular VLAN.

</table>
Table 82: `show igmp snooping membership` Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>(Not displayed on QFX Series switches) IP multicast address of the multicast group.</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>The following information is provided for the multicast group:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Last reporter—Last host to report membership for the multicast group.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Receiver count—Number of hosts on the interface that are members of the multicast group (field appears only if <code>immediate-leave</code> is configured on the VLAN), or number of interfaces that have membership in a multicast group.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Uptime—Length of time (in hours, minutes, and seconds) a multicast group has been active on the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• timeout—Time (in seconds) left until the entry for the multicast group is removed from the multicast group if no membership reports are received on the interface. This counter is reset to its maximum value when a membership report is received.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Flags—The lowest IGMP version in use by a host that is a member of the group on the interface.</td>
<td></td>

**show igmp snooping statistics**

**Syntax**

```
show igmp snooping statistics
<brief | detail>
<bridge-domain bridge-domain-name>
<logical-system logical-system-name>
<virtual-switch virtual-switch-name>
<vlan-id vlan-identifier>
```

**Release Information**

Command introduced in Junos OS Release 8.5.  
Command introduced in Junos OS Release 18.1R1 for the SR1500 devices.

**Description**

Display IGMP snooping statistics.

**Options**

- `none` — (Optional) Display detailed information.
- `brief | detail` — (Optional) Display the specified level of output.
- `bridge-domain bridge-domain-name` — (Optional) Display information about a particular bridge domain.
- `logical-system logical-system-name` — (Optional) Display information about a particular logical system, or type 'all'.
- `virtual-switch virtual-switch-name` — (Optional) Display information about a particular virtual switch.
- `vlan-id vlan-identifier` — (Optional) Display information about a particular VLAN.

**Required Privilege**

- `view` Level

**show igmp statistics**

**List of Syntax**

Syntax on page 1874
Syntax (EX Series Switch and the QFX Series) on page 1874

**Syntax**

```
show igmp statistics
  <brief | detail>
  <interface interface-name>
  <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and the QFX Series)**

```
show igmp statistics
  <brief | detail>
  <interface interface-name>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display Internet Group Management Protocol (IGMP) statistics.

**Options**

`none`—Display IGMP statistics for all interfaces.

`brief | detail`—(Optional) Display the specified level of output.

`interface interface-name`—(Optional) Display IGMP statistics about the specified interface only.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**

`view`

**Related Documentation**

show igmp statistics on page 1876
show igmp statistics interface on page 1876

**Output Fields**

Table 84 on page 1875 describes the output fields for the `show igmp statistics` command. Output fields are listed in the approximate order in which they appear.
Table 84: show igmp statistics Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGMP packet statistics</td>
<td>Heading for IGMP packet statistics for all interfaces or for the specified interface name.</td>
</tr>
<tr>
<td>IGMP Message type</td>
<td>Summary of IGMP statistics:</td>
</tr>
<tr>
<td></td>
<td>• Membership Query—Number of membership queries sent and received.</td>
</tr>
<tr>
<td></td>
<td>• V1 Membership Report—Number of version 1 membership reports sent and received.</td>
</tr>
<tr>
<td></td>
<td>• DVMRP—Number of DVMRP messages sent or received.</td>
</tr>
<tr>
<td></td>
<td>• PIM V1—Number of PIM version 1 messages sent or received.</td>
</tr>
<tr>
<td></td>
<td>• Cisco Trace—Number of Cisco trace messages sent or received.</td>
</tr>
<tr>
<td></td>
<td>• V2 Membership Report—Number of version 2 membership reports sent or received.</td>
</tr>
<tr>
<td></td>
<td>• Group Leave—Number of group leave messages sent or received.</td>
</tr>
<tr>
<td></td>
<td>• Mtrace Response—Number of Mtrace response messages sent or received.</td>
</tr>
<tr>
<td></td>
<td>• Mtrace Request—Number of Mtrace request messages sent or received.</td>
</tr>
<tr>
<td></td>
<td>• Domain Wide Report—Number of domain-wide reports sent or received.</td>
</tr>
<tr>
<td></td>
<td>• V3 Membership Report—Number of version 3 membership reports sent or received.</td>
</tr>
<tr>
<td></td>
<td>• Other Unknown types—Number of unknown message types received.</td>
</tr>
<tr>
<td></td>
<td>• IGMP v3 unsupported type—Number of messages received with unknown and unsupported IGMP version 3 message types.</td>
</tr>
<tr>
<td></td>
<td>• IGMP v3 source required for SSM—Number of IGMP version 3 messages received that contained no source.</td>
</tr>
<tr>
<td></td>
<td>• IGMP v3 mode not applicable for SSM—Number of IGMP version 3 messages received that did not contain a mode applicable for source-specific multicast (SSM). Beginning with certain releases, this type includes records received for groups in the SSM range of addresses and in which the mode is MODE_IS_EXCLUDE or CHANGE_TO_EXCLUDE_MODE. This includes records with a non-empty source list.</td>
</tr>
<tr>
<td>Received</td>
<td>Number of messages received.</td>
</tr>
<tr>
<td>Sent</td>
<td>Number of messages sent.</td>
</tr>
<tr>
<td>Rx errors</td>
<td>Number of received packets that contained errors.</td>
</tr>
<tr>
<td>Max Rx rate (pps)</td>
<td>Maximum number of IGMP packets received during 1 second interval.</td>
</tr>
<tr>
<td>IGMP Global Statistics</td>
<td>Summary of IGMP statistics for all interfaces.</td>
</tr>
<tr>
<td></td>
<td>• Bad Length—Number of messages received with length errors so severe that further classification could not occur.</td>
</tr>
<tr>
<td></td>
<td>• Bad Checksum—Number of messages received with a bad IP checksum. No further classification was performed.</td>
</tr>
<tr>
<td></td>
<td>• Bad Receive If—Number of messages received on an interface not enabled for IGMP.</td>
</tr>
<tr>
<td></td>
<td>• Rx non-local—Number of messages received from senders that are not local.</td>
</tr>
<tr>
<td></td>
<td>• Timed out—Number of groups that timed out as a result of not receiving an explicit leave message.</td>
</tr>
<tr>
<td></td>
<td>• Rejected Report—Number of reports dropped because of the IGMP group policy.</td>
</tr>
<tr>
<td></td>
<td>• Total Interfaces—Number of interfaces configured to support IGMP.</td>
</tr>
</tbody>
</table>
Sample Output

**show igmp statistics**

```plaintext
user@host> show igmp statistics

IGMP packet statistics for all interfaces
IGMP Message type       Received  Sent  Rx errors
Membership Query         8883      459    0
V1 Membership Report     0         0      0
DVMRP                    0         0      0
PIM V1                   0         0      0
Cisco Trace              0         0      0
V2 Membership Report     0         0      0
Group Leave              0         0      0
Mtrace Response          0         0      0
Mtrace Request           0         0      0
Domain Wide Report       0         0      0
V3 Membership Report     0         0      0
Other Unknown types      0
IGMP v3 unsupported type 0
IGMP v3 source required for SSM 0
IGMP v3 mode not applicable for SSM 0

IGMP Global Statistics
Bad Length                0
Bad Checksum              0
Bad Receive If            0
Rx non-local              1227
Timed out                 0
Rejected Report           0
Total Interfaces          2
Max Rx rate (pps)         1536
```

**show igmp statistics interface**

```plaintext
user@host> show igmp statistics interface fe-1/0/1.0

IGMP interface packet statistics for fe-1/0/1.0
IGMP Message type       Received  Sent  Rx errors
Membership Query         0         230    0
V1 Membership Report     0         0      0
```

```
show mld group

Syntax
show mld group
  <brief | detail>
  <group-name>
  <logical-system (all | logical-system-name)>

Release Information
Command introduced before Junos OS Release 7.4.

Description
Display information about Multicast Listener Discovery (MLD) group membership.

Options
none—Display standard information about all MLD groups.

brief | detail—(Optional) Display the specified level of output.

group-name—(Optional) Display MLD information about the specified group.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege
view

show mld group detail (Exclude Mode) on page 1880

Output Fields
Table 85 on page 1877 describes the output fields for the show mld group command. Output fields are listed in the approximate order in which they appear.

Table 85: show mld group Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Name of the interface that received the MLD membership report; local means that the local router joined the group itself.</td>
<td>All levels</td>
</tr>
<tr>
<td>Group</td>
<td>Group address.</td>
<td>All levels</td>
</tr>
<tr>
<td>Source</td>
<td>Source address.</td>
<td>All levels</td>
</tr>
<tr>
<td>Group Mode</td>
<td>Mode the SSM group is operating in: Include or Exclude.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
Table 85: show mld group Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last reported by</td>
<td>Address of the host that last reported membership in this group.</td>
<td>All levels</td>
</tr>
<tr>
<td>Source timeout</td>
<td>Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.</td>
<td>detail</td>
</tr>
<tr>
<td>Timeout</td>
<td>Time remaining until the group membership is removed.</td>
<td>brief none</td>
</tr>
<tr>
<td>Group timeout</td>
<td>Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer.</td>
<td>detail</td>
</tr>
<tr>
<td>Type</td>
<td>Type of group membership:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• Dynamic—Host reported the membership.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Static—Membership is configured.</td>
<td></td>
</tr>
</tbody>
</table>

Sample Output

show mld group
(Include Mode)

```
user@host> show mld group

Interface: fe-0/1/2.0
  Group: ff02::1:ff05:1a67
    Group mode: Include
    Source: ::
    Last reported by: fe80::2e0:81ff:fe05:1a67

**show mld interface**

**Syntax**

```
show mld interface
  <brief | detail>
  <interface-name>
  <logical-system (all | logical-system-name)>
```

**Release Information**
Command introduced before Junos OS Release 7.4.

**Description**
Display information about multipoint Listener Discovery (MLD)-enabled interfaces.

**Options**

- **none**—Display standard information about all MLD-enabled interfaces.
- **brief | detail**—(Optional) Display the specified level of output.
- **interface-name**—(Optional) Display information about the specified interface.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**

- **Level**
  - view

**Related Documentation**
- clear mld membership on page 1803

**List of Sample Output**

- show mld interface on page 1883
- show mld interface brief on page 1884
- show mld interface detail on page 1884
- show mld interface <interface-name> on page 1884

**Output Fields**

Table 86 on page 1881 describes the output fields for the `show mld interface` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Name of the interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Querier</td>
<td>Address of the router that has been elected to send membership queries.</td>
<td>All levels</td>
</tr>
<tr>
<td>State</td>
<td>State of the interface: <strong>Up</strong> or <strong>Down</strong>.</td>
<td>All levels</td>
</tr>
<tr>
<td>SSM Map Policy</td>
<td>Name of the source-specific multicast (SSM) map policy that has been applied to the interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>SSM Map Policy</td>
<td>Name of the source-specific multicast (SSM) map policy at the MLD interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Field Name</td>
<td>Field Description</td>
<td>Level of Output</td>
</tr>
<tr>
<td>------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>Timeout</td>
<td>How long until the MLD querier is declared to be unreachable, in seconds.</td>
<td>All levels</td>
</tr>
<tr>
<td>Version</td>
<td>MLD version being used on the interface: 1 or 2.</td>
<td>All levels</td>
</tr>
<tr>
<td>Groups</td>
<td>Number of groups on the interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Passive</td>
<td>State of the passive mode option:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• On—Indicates that the router can run IGMP or MLD on the interface but not send or receive control traffic such as IGMP or MLD reports, queries, and leaves.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Off—Indicates that the router can run IGMP or MLD on the interface and send or receive control traffic such as IGMP or MLD reports, queries, and leaves.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The passive statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the on state declaration:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• send-general-query—The interface sends general queries.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• send-group-query—The interface sends group-specific and group-source-specific queries.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• allow-receive—The interface receives control traffic</td>
<td></td>
</tr>
<tr>
<td>OIF map</td>
<td>Name of the OIF map associated to the interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>SSM map</td>
<td>Name of the source-specific multicast (SSM) map used on the interface, if configured.</td>
<td>All levels</td>
</tr>
<tr>
<td>Group limit</td>
<td>Maximum number of groups allowed on the interface. Any memberships requested after the limit is reached are rejected.</td>
<td>All levels</td>
</tr>
<tr>
<td>Group threshold</td>
<td>Configured threshold at which a warning message is generated.</td>
<td>All levels</td>
</tr>
<tr>
<td>Group log-interval</td>
<td>Time (in seconds) between consecutive log messages.</td>
<td>All levels</td>
</tr>
<tr>
<td>Immediate Leave</td>
<td>State of the immediate leave option:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• On—Indicates that the router removes a host from the multicast group as soon as the router receives a multicast listener done message from a host associated with the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Off—Indicates that after receiving a multicast listener done message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.</td>
<td></td>
</tr>
</tbody>
</table>
### Table 86: show mld interface Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distributed</td>
<td>State of MLD, which, by default, takes place on the Routing Engine for MX Series routers but can be distributed to the Packet Forwarding Engine to provide faster processing of join and leave events.</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• On—distributed MLD is enabled.</td>
<td></td>
</tr>
<tr>
<td>Configured Parameters</td>
<td>Information configured by the user.</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• MLD Query Interval (.1 secs)—Interval at which this router sends membership queries when it is the querier.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MLD Query Response Interval (.1 secs)—Time that the router waits for a report in response to a general query.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MLD Last Member Query Interval (.1 secs)—Time that the router waits for a report in response to a group-specific query.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MLD Robustness Count—Number of times the router retries a query.</td>
<td></td>
</tr>
<tr>
<td>Derived Parameters</td>
<td>Derived information.</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• MLD Membership Timeout (.1 secs)—Timeout period for group membership. If no report is received for these groups before the timeout expires, the group membership will be removed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MLD Other Querier Present Timeout (.1 secs)—Time that the router waits for the IGMP querier to send a query.</td>
<td></td>
</tr>
</tbody>
</table>

### Sample Output

```
show mld interface

  user@host> show mld interface

  Interface: fe-0/0/0
     Querier: None
     State: Up      Timeout: 0    Version: 1    Groups: 0
     SSM Map Policy: ssm-policy-A
  Interface: at-0/3/1.0
     Querier: 8038::c0a8:c345
     State: Up      Timeout: None   Version: 1    Groups: 0
     SSM Map Policy: ssm-policy-B
  Interface: fe-1/0/1.0
     Querier: ::192.168.195.73
     State: Up      Timeout: None   Version: 1    Groups: 3
     SSM Map Policy: ssm-policy-C
     SSM map: ipv6map1
  Immediate Leave: On
  Promiscuous Mode: Off
  Passive: Off
  Distributed: On

  Configured Parameters:
  MLD Query Interval (.1 secs): 1250
  MLD Query Response Interval (.1 secs): 100
  MLD Last Member Query Interval (.1 secs): 10
  MLD Robustness Count: 2
```
show mld interface brief

The output for the `show mld interface brief` command is identical to that for the `show mld interface` command. For sample output, see `show mld interface` on page 1883.

show mld interface detail

The output for the `show mld interface detail` command is identical to that for the `show mld interface` command. For sample output, see `show mld interface` on page 1883.

show mld interface <interface-name>

```
user@host# show mld interface ge-3/2/0.0
Interface: ge-3/2/0.0
     Querier: 203.0.113.111
     State: Up   Timeout: None  Version: 3  Groups: 1
     Group limit: 8
     Group threshold: 60
     Group log-interval: 10
     Immediate leave: Off
     Promiscuous mode: Off  Distributed: On
```
show mld statistics

Syntax

show mld statistics
<interface interface-name>
<logical-system (all | logical-system-name)>

Release Information
Command introduced before Junos OS Release 7.4.

Description
Display information about Multicast Listener Discovery (MLD) statistics.

Options

none—Display MLD statistics for all interfaces.

interface interface-name—(Optional) Display statistics about the specified interface.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege
view

```
**show msdp**

**Syntax**

```
show msdp
  <brief | detail>
  <instance instance-name>
  <logical-system (all | logical-system-name)>
  <peer peer-address>
```

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 12.1 for the QFX Series.  
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display Multicast Source Discovery Protocol (MSDP) information.

**Options**

- **none**—Display standard MSDP information for all routing instances.
- **brief | detail**—(Optional) Display the specified level of output.
- **instance instance-name**—(Optional) Display information for the specified instance only.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **peer peer-address**—(Optional) Display information about the specified peer only.

**Required Privilege Level**

- **view**

**Related Documentation**

**Output Fields**

Table 88 on page 1888 describes the output fields for the `show msdp` command. Output fields are listed in the approximate order in which they appear.

### Table 88: show msdp Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer address</td>
<td>IP address of the peer.</td>
<td>All levels</td>
</tr>
<tr>
<td>Local address</td>
<td>Local address of the peer.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
Table 88: show msdp Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>Status of the MSDP connection: Listen, Established, or Inactive.</td>
<td>All levels</td>
</tr>
<tr>
<td>Last up/down</td>
<td>Time at which the most recent peer-state change occurred.</td>
<td>All levels</td>
</tr>
<tr>
<td>Peer-Group</td>
<td>Peer group name.</td>
<td>All levels</td>
</tr>
<tr>
<td>SA Count</td>
<td>Number of source-active cache entries advertised by each peer that were accepted, compared to the number that were received, in the format number-accepted/number-received.</td>
<td>All levels</td>
</tr>
<tr>
<td>Peer Connect Retries</td>
<td>Number of peer connection retries.</td>
<td>detail</td>
</tr>
<tr>
<td>State timer expires</td>
<td>Number of seconds before another message is sent to a peer.</td>
<td>detail</td>
</tr>
<tr>
<td>Peer Times out</td>
<td>Number of seconds to wait for a response from the peer before the peer is declared unavailable.</td>
<td>detail</td>
</tr>
<tr>
<td>SA accepted</td>
<td>Number of entries in the source-active cache accepted from the peer.</td>
<td>detail</td>
</tr>
<tr>
<td>SA received</td>
<td>Number of entries in the source-active cache received by the peer.</td>
<td>detail</td>
</tr>
</tbody>
</table>

Sample Output

show msdp

```
user@host> show msdp
Peer address    Local address   State       Last up/down Peer-Group SA Count
198.32.8.193    198.32.8.195    Established  5d 19:25:44 North23    120/150

198.32.8.198    198.32.8.195    Established  3d 19:33:04 North23    2305/3000
```

show msdp brief

The output for the show msdp brief command is identical to that for the show msdp command. For sample output, see show msdp on page 1889.

show msdp detail

```
user@host> show msdp detail
Peer: 10.255.70.15
Local address: 10.255.70.19
State: Established
Peer Connect Retries: 0
State timer expires: 22
Peer Times out: 49
```
SA accepted: 0
SA received: 0
show msdp source

**Syntax**

`show msdp source
<instance instance-name>
<logical-system (all | logical-system-name)>
<source-address>`

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display multicast sources learned from Multicast Source Discovery Protocol (MSDP).

**Options**

none—Display standard MSDP source information for all routing instances.

_instance instance-name_—(Optional) Display information for the specified instance only.

_logical-system (all | logical-system-name)_—(Optional) Perform this operation on all logical systems or on a particular logical system.

_source-address_—(Optional) IP address and optional prefix length. Display information for the specified source address only.

**Required Privilege Level**

### show msdp statistics

**Syntax**

```
show msdp statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
<peer peer-address>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 12.1 for the QFX Series.
- Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display statistics about Multicast Source Discovery Protocol (MSDP) peers.

**Options**

- `none`—Display statistics about all MSDP peers for all routing instances.
- `instance instance-name`—(Optional) Display statistics about a specific MSDP instance.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.
- `peer peer-address`—(Optional) Display statistics about a particular MSDP peer.

**Required Privilege**

- **Level**: `view`

**Related Documentation**

- clear msdp statistics on page 1806
- show msdp statistics on page 1898
- show msdp statistics peer on page 1898

**List of Sample Output**

- show msdp statistics on page 1898
- show msdp statistics peer on page 1898

**Output Fields**

Table 91 on page 1896 describes the output fields for the `show msdp statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 91: show msdp statistics Output Fields**

<table>
<thead>

**show multicast backup-pe-groups**

**Syntax**

```
show multicast backup-pe-groups
<address pe-address>
<group group-name>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

**Release Information**

Command introduced in Junos OS Release 9.0.

**Description**

Display backup PE router group information when ingress PE redundancy is configured. Ingress PE redundancy provides a backup resource when point-to-multipoint LSPs are configured for multicast distribution.

**Options**

- none—Display standard information about all backup PE groups.
- address pe-address—(Optional) Display the groups that a PE address is associated with.
- group group—(Optional) Display the backup PE group information for a particular group.
- instance instance-name—(Optional) Display backup PE group information for a specific multicast instance.
- logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**show multicast forwarding-cache statistics**

**Syntax**
```
show multicast forwarding-cache statistics
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

**Release Information**
Command introduced in Junos OS Release 12.2.
Starting in Junos OS Release 16.1, output includes general and rendezvous-point tree (RPT) suppression states.

**Description**
Display IP multicast forwarding cache statistics.

**Options**
- **none**—Display multicast forwarding cache statistics for all supported address families for all routing instances.
- **inet | inet6**—(Optional) Display multicast forwarding cache statistics for IPv4 or IPv6 family addresses, respectively.
- **instance instance-name**—(Optional) Display multicast forwarding cache statistics for a specific routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

<td>Amount of bandwidth, in bits per second, remaining on the interface.</td>
</tr>
</tbody>
</table>
Table 95: show multicast interface Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Mapped bandwidth deduction (bps) | Amount of bandwidth, in bits per second, used by any flows that are mapped to the interface.  

**NOTE:** Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface.  

This field does not appear in the output when the no QoS adjustment feature is disabled.

| Local bandwidth deduction (bps) | Amount of bandwidth, in bits per second, used by any mapped flows that are traversing the interface.  

**NOTE:** Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface.  

This field does not appear in the output when the no QoS adjustment feature is disabled.

| Reverse OIF mapping | State of the reverse OIF mapping feature (on or off).  

**NOTE:** This field does not appear in the output when the no QoS adjustment feature is disabled.

| Reverse OIF mapping no QoS adjustment | State of the no QoS adjustment feature (on or off) for interfaces that are using reverse OIF mapping.  

**NOTE:** This field does not appear in the output when the no QoS adjustment feature is disabled.

| Leave timer | Amount of time a mapped interface remains active after the last mapping ends.  

**NOTE:** This field does not appear in the output when the no QoS adjustment feature is disabled.

| No QoS adjustment | State (on) of the no QoS adjustment feature when this feature is enabled.  

**NOTE:** This field does not appear in the output when the no QoS adjustment feature is disabled.

Sample Output

show multicast interface

```
user@host> show multicast interface

*Interfaces Fundamentals for Routing Devices*
show multicast mrinfo

Syntax

show multicast mrinfo

<host>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display configuration information about IP multicast networks, including neighboring multicast router addresses.

Options

none—Display configuration information about all multicast networks.

host—(Optional) Display configuration information about a particular host. Replace host with a hostname or IP address.

Required Privilege Level

view

List of Sample Output

show multicast mrinfo on page 1910

Output Fields

Table 96: show multicast mrinfo Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-address</td>
<td>Query address, hostname (DNS name or IP address of the source address), and multicast protocol version or the software version of another vendor.</td>
</tr>
<tr>
<td>ip-address-1→ip-address-2</td>
<td>Queried router interface address and directly attached neighbor interface address, respectively.</td>
</tr>
<tr>
<td>(name or ip-address)</td>
<td>Name or IP address of neighbor.</td>
</tr>
<tr>
<td>[metric/threshold/type/flags]</td>
<td>Neighbor’s multicast profile:</td>
</tr>
<tr>
<td></td>
<td>• metric—Always has a value of 1, because mrinfo queries the directly connected interfaces of a device.</td>
</tr>
<tr>
<td></td>
<td>• threshold—Multicast threshold time-to-live (TTL). The range of values is 0 through 255.</td>
</tr>
<tr>
<td></td>
<td>• type—Multicast connection type: pim or tunnel.</td>
</tr>
<tr>
<td></td>
<td>• flags—Flags for this route:</td>
</tr>
<tr>
<td></td>
<td>• querier—Queried router is the designated router for the neighboring session.</td>
</tr>
<tr>
<td></td>
<td>• leaf—Link is a leaf in the multicast network.</td>
</tr>
<tr>
<td></td>
<td>• down—Link status indicator.</td>
</tr>
</tbody>
</table>
Sample Output

code

```
show multicast mrinfo 10.35.4.1
```

```
user@host> show multicast mrinfo 10.35.4.1

10.35.4.1 (10.35.4.1) [version 12.0]:
192.168.195.166 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
10.38.20.1 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
10.47.1.1 -> 10.47.1.2 (10.47.1.2) [1/5/pim]
0.0.0.0 -> 0.0.0.0 (local) [1/0/pim/down]
```
**show multicast next-hops**

**List of Syntax**
- Syntax on page 1911
- Syntax (EX Series Switch and the QFX Series) on page 1911

**Syntax**
```
show multicast next-hops
  <brief | detail | terse>
  <identifier-number>
  <inet | inet6>
  <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and the QFX Series)**
```
show multicast next-hops
  <brief | detail>
  <identifier-number>
  <inet | inet6>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- `inet6` option introduced in Junos OS Release 10.0 for EX Series switches.
- `detail` option display of next-hop ID number introduced in Junos OS Release 11.1 for M Series and T Series routers and EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- Support for bidirectional PIM added in Junos OS Release 12.1.
- Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
- `terse` option introduced in Junos OS Release 16.1 for the MX Series.

**Description**
Display the entries in the IP multicast next-hop table.

**Options**
- `none`—Display standard information about all entries in the multicast next-hop table for all supported address families.
- `brief | detail | terse`—(Optional) Display the specified level of output. Use `terse` to display the total number of outgoing interfaces (as opposed to listing them). When you include the `detail` option on M Series and T Series routers and EX Series switches, the downstream interface name includes the next-hop ID number in parentheses, in the form `fe-0/1/2.0-(1048574)`, where `1048574` is the next-hop ID number.

Starting in Junos OS release 16.1, the `show multicast next-hops` statement shows the hierarchical next hops contained in the top-level next hop.

- `identifier-number`—(Optional) Show a particular next hop by ID number. The range of values is 1 through 65,535.
- `inet | inet6`—(Optional) Display entries for IPv4 or IPv6 family addresses, respectively.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

Syntax (EX Series Switch and the QFX Series)

show multicast pim-to-igmp-proxy
       <instance instance-name>

Release Information

Command introduced in Junos OS Release 9.6 for EX Series switches.
instance option introduced in Junos OS Release 10.3.
instance option introduced in Junos OS Release 10.3 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display configuration information about PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy.

Options

none—Display configuration information about PIM-to-IGMP message translation for all routing instances.

instance instance-name—(Optional) Display configuration information about PIM-to-IGMP message translation for a specific multicast instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show multicast route

List of Syntax

Syntax

show multicast route
  <brief | detail | extensive | summary>
  <active | all | inactive>
  <group group>
  <inet | inet6>
  <instance instance name>
  <logical-system (all | logical-system-name)>
  <oif-count>
  <regular-expression>
  <source-prefix source-prefix>

Syntax (EX Series Switch and the QFX Series)

show multicast route
  <brief | detail | extensive | summary>
  <active | all | inactive>
  <group group>
  <inet | inet6>
  <instance instance name>
  <regular-expression>
  <source-prefix source-prefix>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
<oif-count> option introduced in Junos OS Release 16.1 for the MX Series.
Support for PIM NSR support for VXLAN added in Junos OS Release 16.2.
Support for multicast traffic counters added in Junos OS 19.2R1 for EX4300 switches.

Description

Display the entries in the IP multicast forwarding table. You can display similar information with the show route table inet.1 command.

NOTE: On all SRX Series devices, when a multicast route is not available, pending sessions are not torn down, and subsequent packets are queued. If no multicast route resolve comes back, then the traffic flow has to wait for the pending session to timed out. Then packets can trigger new pending session create and route resolve.
### Options

- **none**—Display standard information about all entries in the multicast forwarding table for all routing instances.
- **brief | detail | extensive | summary**—(Optional) Display the specified level of output.
- **active | all | inactive**—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.
- **group group**—(Optional) Display the cache entries for a particular group.
- **inet | inet6**—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.
- **instance instance-name**—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **oif-count**—(Optional) Display a count of outgoing interfaces rather than listing them.
- **regular-expression**—(Optional) Display information about the multicast forwarding table entries that match a UNIX OS-style regular expression.
- **source-prefix source-prefix**—(Optional) Display the cache entries for a particular source prefix.

<summary>

Syntax (EX Series Switch and the QFX Series)
show multicast rpf

<inet | inet6>

<instance instance-name>
<prefix>
<summary>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description
Display information about multicast reverse-path-forwarding (RPF) calculations.

Options
none—Display RPF calculation information for all supported address families.

inet | inet6—(Optional) Display the RPF calculation information for IPv4 or IPv6 family addresses, respectively.

instance instance-name—(Optional) Display information about multicast RPF calculations for a specific multicast instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix—(Optional) Display the RPF calculation information for the specified prefix.

summary—(Optional) Display a summary of all multicast RPF information.

show multicast rpf prefix on page 1933
show multicast rpf summary on page 1933
Output Fields  

Table 101 on page 1931 describes the output fields for the `show multicast rpf` command. Output fields are listed in the approximate order in which they appear.

```
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the routing instance. (Displayed when multicast is configured within a routing instance.)</td>
</tr>
<tr>
<td>Source prefix</td>
<td>Prefix and length of the source as it exists in the multicast forwarding table.</td>
</tr>
<tr>
<td>Protocol</td>
<td>How the route was learned.</td>
</tr>
<tr>
<td>Interface</td>
<td>Upstream RPF interface.</td>
</tr>
<tr>
<td>Neighbor</td>
<td>Upstream RPF neighbor.</td>
</tr>
</tbody>
</table>
```

NOTE: The displayed interface information does not apply to bidirectional PIM RP addresses. This is because the `show multicast rpf` command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF interface information, always use the `show pim join extensive` command when bidirectional PIM is configured.

NOTE: The displayed neighbor information does not apply to bidirectional PIM. This is because the `show multicast rpf` command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF neighbor information, always use the `show pim join extensive` command when bidirectional PIM is configured.

```
show multicast snooping next-hops

**Syntax**
```
show multicast snooping next-hops
  <brief | detail>
  <identifier next-hop-ID>
  <inet>
  <inet6>
  <logical-system logical-system-name>
```

**Release Information**
Command introduced in Junos OS Release 11.2.

**Description**
Display information about the IP multicast snooping next-hops.

**Options**
- `brief | detail`—(Optional) Display the specified level of output.
- `inet`—(Optional) Display information for IPv4 multicast next hops only. If a family is not specified, both IPv4 and IPv6 results will be shown.
- `inet6`—(Optional) Display information for IPv6 multicast next hops only. If a family is not specified, both IPv4 and IPv6 results will be shown.
- `logical-system logical-system-name`—(Optional) Display information about a particular logical system, or type 'all'.

**Required Privilege Level**
view

**List of Sample Output**
- show multicast snooping next-hops on page 1938
- show multicast snooping next-hops (IGMP snooping enabled on a VPLS) on page 1938

**Output Fields**
Table 103 on page 1936 describes the output fields for the `show multicast snooping next-hops` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Family</td>
<td>Protocol family for which multicast snooping next hops are displayed: INET or INET6.</td>
</tr>
<tr>
<td>Refcount</td>
<td>Number of cache entries that are using this next hop.</td>
</tr>
<tr>
<td>KRefcount</td>
<td>Kernel reference count for the next hop.</td>
</tr>
<tr>
<td>Downstream interface</td>
<td>Interface names associated with each multicast next-hop ID.</td>
</tr>
</tbody>
</table>
### Table 103: show multicast snooping next-hops Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Nexthop Id</strong></td>
<td>Identifier for the next-hop.</td>
</tr>
</tbody>
</table>

**NOTE:** To see the next-hop ID for a given PE mesh group, `igmp-snooping` must be enabled for the relevant VPLS routing instance. (Junos OS creates a default CE and VE mesh groups for each VPLS routing instance. The next hop of the VE mesh group is the set of VE mesh-group interfaces of the remaining PEs in the same VPLS routing instance.)
**Sample Output**

**show multicast snooping next-hops**

```
user@host> show multicast snooping next-hops

Family: INET
ID     Refcount KRefcount Downstream interface     Nexthop Id
1048574  4             1 ge-0/1/0.1000
ge-0/1/2.1000
ge-0/1/3.1000
1048574  4             1 ge-0/1/0.1000--(2000)
1048575  2             0 ge-0/1/2.1000--(2001)
ge-0/1/3.1000--(2002)
1048576  2             0 lsi.1048578--(2003)
lsi.1048579--(2004)
```

**show multicast snooping next-hops (IGMP snooping enabled on a VPLS)**

In this example, ID 1048585 is the VE next-hop ID created for the VE next hop that is holding VE interfaces for the routing instance. It only appears if igmp snooping is enabled on the VPLS.

```
user@host> show multicast snooping next-hops

Family: INET
ID     Refcount KRefcount Downstream interface     Addr
1048588  2             1 1048585

Release Information  Command introduced before Junos OS Release 7.4.
                      Command introduced in Junos OS Release 9.0 for EX Series switches.
                      Command introduced in Junos OS Release 11.3 for the QFX Series.
                      Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description  Display information about announced IP multicast sessions.

NOTE: On all SRX Series devices, only 100 packets can be queued during pending (S, G) route. However, when multiple multicast sessions enter the route resolve process at the same time, buffer resources are not sufficient to queue 100 packets for each session.

Options  none—Display standard information about all multicast sessions for all routing instances.
        brief | detail | extensive—(Optional) Display the specified level of output.
        logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
        regular-expression—(Optional) Display information about announced sessions that match a UNIX-style regular expression.

show multicast snooping route

Syntax

show multicast snooping route
<regexp>
<active>
<all>
<bridge-domain bridge-domain-name>
<brief>
<control>
<data>
<detail>
<extensive>
<group group>
<inactive>
/inet>
<inet6>
<instance instance-name>
<logical-system logical-system-name>
<mesh-group mesh-group-name>
<qualified-vlan vlan-id>
<source-prefix source-prefix>
<vlan vlan-id>

Release Information

Command introduced in Junos OS Release 8.5.
Support for control, data, qualified-vlan and vlan options introduced in Junos OS Release 13.3 for EX Series switches.

Description

Display the entries in the IP multicast snooping forwarding table. You can display some of this information with the show route table inet.1 command.

Options

none—Display standard information about all entries in the multicast snooping table for all virtual switches and all bridge domains.

active | all | inactive—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast snooping table.

bridge-domain bridge-domain—(Optional) Display the entries for a particular bridge domain.

brief | detail | extensive—(Optional) Display the specified level of output.

control—(Optional) Display control route entries.

data—(Optional) Display data route entries.

group group—(Optional) Display the entries for a particular group.

inet—(Optional) Display IPv4 information.

inet6—(Optional) Display IPv6 information.
instance instance-name—(Optional) Display the entries for a multicast instance.

logical-system logical-system-name—(Optional) Display information about a particular logical system, or type 'all'.

mesh-group mesh-group-name—(Optional) Display the entries for a particular mesh group.

qualified-vlan vlan-id—(Optional) Display the entries for a particular qualified VLAN.

regexp—(Optional) Display information about the multicast forwarding table entries that match a UNIX-style regular expression.

source-prefix source-prefix—(Optional) Display the entries for a particular source prefix.

vlan vlan-id—(Optional) Display the entries for a particular VLAN.

```

**show multicast statistics**

Syntax

```
show multicast statistics
/inet|/inet6>
(instance instance-name)>
(interface interface-name)>
(logical-system (all | logical-system-name)>
```

Release Information

Command introduced before Junos OS Release 7.4.
`interface` option introduced in Junos OS Release 16.1 for the MX Series.

Description

Display IP multicast statistics.

Options

- **none**—Display multicast statistics for all supported address families for all routing instances.
- **inet | inet6**—(Optional) Display multicast statistics for IPv4 or IPv6 family addresses, respectively.
- **instance instance-name**—(Optional) Display statistics for a specific routing instance.
- **interface interface-name**—(Optional) Display statistics for a specific interface.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

The input and output interface multicast statistics are consistent, but not timely. They are constructed from the forwarding statistics, which are gathered at 30-second intervals. Therefore, the output from this command always lags the true count by up to 30 seconds.

Output Fields

`Table 106 on page 1948` describes the output fields for the `show multicast statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 106: show multicast statistics Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the routing instance.</td>
</tr>
</tbody>
</table>
Table 106: `show multicast statistics` Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Family</td>
<td>Protocol family for which multicast statistics are displayed: INET or INET6.</td>
</tr>
<tr>
<td>Interface</td>
<td>Name of the interface for which statistics are being reported.</td>
</tr>
<tr>
<td>Routing Protocol</td>
<td>Primary multicast protocol on the interface: PIM, DVMRP for INET, or PIM for INET6.</td>
</tr>
<tr>
<td>Mismatch</td>
<td>Number of multicast packets that did not arrive on the correct upstream interface.</td>
</tr>
<tr>
<td>Kernel Resolve</td>
<td>Number of resolve requests processed by the primary multicast protocol on the interface.</td>
</tr>
<tr>
<td>Resolve No Route</td>
<td>Number of resolve requests that were ignored because there was no route to the source.</td>
</tr>
<tr>
<td>Resolve Filtered</td>
<td>Number of resolve requests filtered by policy if any policy is configured.</td>
</tr>
<tr>
<td>In Kbytes</td>
<td>Total accumulated incoming packets (in KB) since the last time the <code>clear multicast statistics</code> command was issued.</td>
</tr>
<tr>
<td>Out Kbytes</td>
<td>Total accumulated outgoing packets (in KB) since the last time the <code>clear multicast statistics</code> command was issued.</td>
</tr>
<tr>
<td>Mismatch error</td>
<td>Number of mismatches that were ignored because of internal errors.</td>
</tr>
<tr>
<td>Mismatch No Route</td>
<td>Number of mismatches that were ignored because there was no route to the source.</td>
</tr>
<tr>
<td>Routing Notify</td>
<td>Number of times that the multicast routing system has been notified of a new multicast source by a multicast routing protocol .</td>
</tr>
<tr>
<td>Resolve Error</td>
<td>Number of resolve requests that were ignored because of internal errors.</td>
</tr>
<tr>
<td>In Packets</td>
<td>Total number of incoming packets since the last time the <code>clear multicast statistics</code> command was issued.</td>
</tr>
<tr>
<td>Out Packets</td>
<td>Total number of outgoing packets since the last time the <code>clear multicast statistics</code> command was issued.</td>
</tr>
<tr>
<td>Resolve requests on interfaces not enabled for multicast n</td>
<td>Number of resolve requests on interfaces that are not enabled for multicast that have accumulated since the <code>clear multicast statistics</code> command was last issued.</td>
</tr>
<tr>
<td>Resolve requests with no route to source n</td>
<td>Number of resolve requests with no route to the source that have accumulated since the <code>clear multicast statistics</code> command was last issued.</td>

<inet | inet6>
<instance (instance-name | all)>
<logical-system (all | logical-system-name)>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Support for the instance all option added in Junos OS Release 12.1.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about the interfaces on which Protocol Independent Multicast (PIM) is configured.

Options

none—Display interface information for all family addresses for the main instance.

inet | inet6—(Optional) Display interface information for IPv4 or IPv6 family addresses, respectively.

instance (instance-name | all)—(Optional) Display information about interfaces for a specific PIM-enabled routing instance or for all routing instances.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show pim interfaces (PIM using point-to-multipoint mode) on page 1960

Output Fields

Table 109 on page 1959 describes the output fields for the show pim interfaces command. Output fields are listed in the approximate order in which they appear.
Table 109: show pim interfaces Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the routing instance.</td>
</tr>
<tr>
<td>Name</td>
<td>Interface name.</td>
</tr>
<tr>
<td>State</td>
<td>State of the interface. The state also is displayed in the <code>show interfaces</code> command.</td>
</tr>
<tr>
<td>Mode</td>
<td>PIM mode running on the interface:</td>
</tr>
<tr>
<td></td>
<td>• B—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers.</td>
</tr>
<tr>
<td></td>
<td>• S—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic.</td>
</tr>
<tr>
<td></td>
<td>• Dense—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.)</td>
</tr>
<tr>
<td></td>
<td>• Sparse-Dense—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as dense is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as sparse is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules. When sparse-dense mode is configured, the output includes both S and D. When bidirectional-sparse mode is configured, the output includes S and B. When bidirectional-sparse-dense mode is configured, the output includes B, S, and D.</td>
</tr>
<tr>
<td>IP</td>
<td>Version number of the address family on the interface: 4 (IPv4) or 6 (IPv6).</td>
</tr>
<tr>
<td>V</td>
<td>PIM version running on the interface: 1 or 2.</td>
</tr>
<tr>
<td>State</td>
<td>State of PIM on the interface:</td>
</tr>
<tr>
<td></td>
<td>• Active—Bidirectional mode is enabled on the interface and on all PIM neighbors.</td>
</tr>
<tr>
<td></td>
<td>• DR—Designated router.</td>
</tr>
<tr>
<td></td>
<td>• NotCap—Bidirectional mode is not enabled on the interface. This can happen when bidirectional PIM is not configured locally, when one of the neighbors is not configured for bidirectional PIM, or when one of the neighbors has not implemented the bidirectional PIM protocol.</td>
</tr>
<tr>
<td></td>
<td>• NotDR—Not the designated router.</td>
</tr>
<tr>
<td></td>
<td>• P2P—Point to point.</td>
</tr>
<tr>
<td>NbrCnt</td>
<td>Number of neighbors that have been seen on the interface.</td>
</tr>
<tr>
<td>JoinCnt(sg)</td>
<td>Number of (s,g) join messages that have been seen on the interface.</td>
</tr>
<tr>
<td>JointCnt(*g)</td>
<td>Number of (*g) join messages that have been seen on the interface.</td>
</tr>
<tr>
<td>DR address</td>
<td>Address of the designated router.</td>
</tr>
</tbody>
</table>

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
summary option introduced in Junos OS Release 9.6.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Support for bidirectional PIM added in Junos OS Release 12.1.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Multiple new filter options introduced in Junos OS Release 13.2.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
downstream-count option introduced in Junos OS Release 16.1.
Support for PIM NSR support for VXLAN added in Junos OS Release 16.2
Support for RFC 5496 (via rpf-vector) added in Junos OS Release 17.3R1.

Description  Display information about Protocol Independent Multicast (PIM) groups for all PIM modes.
For bidirectional PIM, display information about PIM group ranges (*G-range) for each active bidirectional RP group range, in addition to each of the joined (*,G) routes.

Options  none—Display the standard information about PIM groups for all supported family addresses for all routing instances.
brief | detail | extensive | summary—(Optional) Display the specified level of output.

bidirectional | dense | sparse—(Optional) Display information about PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

downstream-count—(Optional) Display the downstream count instead of a list.

exact—(Optional) Display information about only the group that exactly matches the specified group address.

inet | inet6—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.

instance instance-name—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

range—(Optional) Address range of the group, specified as prefix/prefix-length.

rp ip-address/prefix | source ip-address/prefix—(Optional) Display information about the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

sg | star-g—(Optional) Display information about PIM (S,G) or (*G) entries.

- Example: Configuring Multicast-Only Fast Reroute in a PIM Domain
- Example: Configuring Bidirectional PIM
- Example: Configuring PIM State Limits

List of Sample Output

- show pim join summary on page 1966
- show pim join (PIM Sparse Mode) on page 1966
- show pim join (Bidirectional PIM) on page 1966
- show pim join inet6 on page 1967
- show pim join inet6 star-g on page 1968
- show pim join instance <instance-name> on page 1969
- show pim join instance <instance-name> downstream-count on page 1968
- show pim join instance <instance-name> downstream-count extensive on page 1969
- show pim join detail on page 1969
- show pim join extensive (PIM Resolve TLV for Multicast in Seamless MPLS) on page 1969
- show pim join extensive (PIM Sparse Mode) on page 1970
- show pim join extensive (Bidirectional PIM) on page 1971
**Output Fields**  
Table 110 on page 1963 describes the output fields for the `show pim join` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the routing instance.</td>
<td>brief detail extensive summary none</td>
</tr>
<tr>
<td>Family</td>
<td>Name of the address family: <code>inet</code> (IPv4) or <code>inet6</code> (IPv6).</td>
<td>brief detail extensive summary none</td>
</tr>
<tr>
<td>Route type</td>
<td>Type of multicast route: <code>(S,G)</code> or <code>(*,G)</code>.</td>
<td>summary</td>
</tr>
<tr>
<td>Route count</td>
<td>Number of <code>(S,G)</code> routes and number of <code>(*,G)</code> routes.</td>
<td>summary</td>
</tr>
<tr>
<td>R</td>
<td>Rendezvous Point Tree.</td>
<td>brief detail extensive none</td>
</tr>
<tr>
<td>S</td>
<td>Sparse.</td>
<td>brief detail extensive none</td>
</tr>
<tr>
<td>W</td>
<td>Wildcard.</td>
<td>brief detail extensive none</td>
</tr>
<tr>
<td>Group</td>
<td>Group address.</td>
<td>brief detail extensive none</td>
</tr>
<tr>
<td>Bidirectional group prefix length</td>
<td>For bidirectional PIM, length of the IP prefix for RP group ranges.</td>
<td>All levels</td>
</tr>
<tr>
<td>Source</td>
<td>Multicast source:</td>
<td>brief detail extensive none</td>
</tr>
<tr>
<td></td>
<td>• <code>*</code> (wildcard value)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>ipv4-address</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>ipv6-address</code></td>
<td></td>
</tr>
<tr>
<td>RP</td>
<td>Rendezvous point for the PIM group.</td>
<td>brief detail extensive none</td>

<tr>
<td></td>
<td>• <code>bidirectional</code>—Bidirectional mode entry.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>dense</code>—Dense mode entry.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>rptree</code>—Entry is on the rendezvous point tree.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>sparse</code>—Sparse mode entry.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>spt</code>—Entry is on the shortest-path tree for the source.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>wildcard</code>—Entry is on the shared tree.</td>
<td></td>
</tr>
</tbody>
</table>
Table 110: show pim join Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upstream interface</td>
<td>RPF interface toward the source address for the source-specific state (S,G) or toward the rendezvous point (RP) address for the non-source-specific state (*G). For bidirectional PIM, RP Link means that the interface is directly connected to a subnet that contains a phantom RP address. A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</td>
<td>brief detail extensive none</td>
</tr>
<tr>
<td>Upstream neighbor</td>
<td>Information about the upstream neighbor: Direct, Local, Unknown, or a specific IP address. For bidirectional PIM, Direct means that the interface is directly connected to a subnet that contains a phantom RP address. The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</td>
<td>extensive</td>
</tr>
<tr>
<td>Upstream rpf-vector</td>
<td>Information about the upstream Reverse Path Forwarding (RPF) vector; appears in conjunction with the rpf-vector command.</td>
<td>extensive</td>
</tr>
<tr>
<td>Active upstream interface</td>
<td>When multicast-only fast reroute (MoFRR) is configured in a PIM domain, the upstream interface for the active path. A PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. Preference is given to two paths that do not converge to the same immediate upstream router. PIM installs appropriate multicast routes with upstream neighbors as RPF next hops with two (primary and backup) interfaces.</td>
<td>extensive</td>
</tr>
<tr>
<td>Active upstream neighbor</td>
<td>On the MoFRR primary path, the IP address of the neighbor that is directly connected to the active upstream interface.</td>
<td>extensive</td>
</tr>
<tr>
<td>MoFRR Backup upstream interface</td>
<td>The MoFRR upstream interface that is used when the primary path fails. When the primary path fails, the backup path is upgraded to primary, and traffic is forwarded accordingly. If there are alternate paths available, a new backup path is calculated and the appropriate multicast route is updated or installed.</td>
<td>extensive</td>
</tr>
<tr>
<td>MoFRR Backup upstream neighbor</td>
<td>IP address of the MoFRR upstream neighbor.</td>
<td>extensive</td>
</tr>
</tbody>
</table>
### Table 110: show pim join Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Upstream state</strong></td>
<td>Information about the upstream interface:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Join to RP</strong>—Sending a join to the rendezvous point.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Join to Source</strong>—Sending a join to the source.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Local RP</strong>—Sending neither join messages nor prune messages toward the RP, because this routing device is the rendezvous point.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Local Source</strong>—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>No Prune to RP</strong>—Automatically sent to RP when SPT and RPT are on the same path.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Prune to RP</strong>—Sending a prune to the rendezvous point.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Prune to Source</strong>—Sending a prune to the source.</td>
<td></td>
</tr>
<tr>
<td><strong>NOTE:</strong> RP group range entries have <strong>None</strong> in the Upstream state field because RP group ranges do not trigger actual PIM join messages between routing devices.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Downstream neighbors</strong></td>
<td>Information about downstream interfaces:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Interface</strong>—Interface name for the downstream neighbor.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>A pseudo PIM-SM interface appears for all IGMP-only interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>A pseudo multipoint LDP (Pseudo-MLDP) interface appears on ingress root nodes in M-LDP point-to-multipoint LSPs with inband signaling.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Interface address</strong>—Address of the downstream neighbor.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>State</strong>—Information about the downstream neighbor: <strong>join</strong> or <strong>prune</strong>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Flags</strong>—PIM join flags: <strong>R</strong> (RPtree), <strong>S</strong> (Sparse), <strong>W</strong> (Wildcard), or <strong>zero</strong>.</td>

**show pim mdt**

**Syntax**

```
show pim mdt instance instance-name
  <brief | detail | extensive>
  data-mdt-joins
  data-mdt-limit
  inet
  inet6
  <incoming | outgoing>
  <logical-system (all | logical-system-name)>
  <range>
```

**Release Information**

**Description**

Display information about Protocol Independent Multicast (PIM) default multicast distribution tree (MDT) and the data MDTs in a Layer 3 VPN environment for a routing instance.

**Options**

- `instance instance-name`—Display information about data-MDTs for a specific PIM-enabled routing instance.
- `brief | detail | extensive`—(Optional) Display the specified level of output.
- `data-mdt-joins`—Show received PIM data-mdt-joins.
- `data-mdt-limits`—Show received PIM data-mdt-limits.
- `incoming | outgoing`—(Optional) Display incoming or outgoing multicast data tunnels, respectively.
- `inet | inet6`—Display IPv4 or IPv6 multicast data tunnels.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.
- `range`—(Optional) Display information about an IP address with optional prefix length representing a particular multicast group.

**Required Privilege**

show pim mdt data-mdt-joins

Syntax

```
show pim mdt data-mdt-joins
<logical-system (all | logical-system-name)> instance instance-name
```

Release Information

Command introduced in Junos OS Release 11.2.

Description

In a draft-rosen Layer 3 multicast virtual private network (MVPN) configured with service provider tunnels, display the advertisements of new multicast distribution tree (MDT) group addresses cached by the provider edge (PE) routers in the specified VPN routing and forwarding (VRF) instance that is configured to use the Protocol Independent Multicast (PIM) protocol.

Options

- **instance instance-name**—Display data MDT join packets cached by PE routers in a specific PIM instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**NOTE:** Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

Output Fields

Table 112 on page 1982 describes the output fields for the `show pim mdt data-mdt-joins` command. Output fields are listed in the approximate order in which they appear.
Table 112: show pim mdt data-mdt-joins Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>C-Group</strong></td>
<td>IPv4 group address in the address space of the customer’s VPN-specific PIM-enabled routing instance of the multicast traffic destination. This 32-bit value is carried in the C-group field of the MDT join TLV packet.</td>
</tr>
<tr>
<td><strong>C-Source</strong></td>
<td>IPv4 address in the address space of the customer’s VPN-specific PIM-enabled routing instance of the multicast traffic source. This 32-bit value is carried in the C-source field of the MDT join TLV packet.</td>
</tr>
<tr>
<td><strong>P-Group</strong></td>
<td>IPv4 group address in the service provider’s address space of the new data MDT that the PE router will use to encapsulate the VPN multicast traffic flow (C-Source, C-Group). This 32-bit value is carried in the P-group field of the MDT join TLV packet.</td>
</tr>
<tr>
<td><strong>P-Source</strong></td>
<td>IPv4 address of the PE router.</td>
</tr>
<tr>
<td><strong>Timeout</strong></td>
<td>Timeout, in seconds, remaining for this cache entry. When the cache entry is created, this field is set to 180 seconds. After an entry times out, the PE router deletes the entry from its cache and prunes itself off the data MDT.</td>
</tr>
</tbody>
</table>

</table>
```
show pim mdt data-mdt-limit

Syntax

show pim mdt data-mdt-limit instance instance-name
<logical-system (all | logical-system-name)>

Release Information

Command introduced in Junos OS Release 12.2.

Description

Display the maximum number configured and the currently active data multicast distribution trees (MDTs) for a specific VPN routing and forwarding (VRF) instance.

Options

instance instance-name—Display data MDT information for the specified VRF instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

NOTE: Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

List of Syntax  Syntax on page 1985
Syntax (EX Series Switch and the QFX Series) on page 1985

Syntax  
show pim neighbors
  <brief | detail>
  <inet | inet6>
  <instance (instance-name | all)>
  <logical-system (all | logical-system-name)>

Syntax (EX Series Switch and the QFX Series)  
show pim neighbors
  <brief | detail>
  <inet | inet6>
  <instance (instance-name | all)>

Release Information  
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Support for the instance all option added in Junos OS Release 12.1.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Support for RFC 5496 (via rpf-vector) added in Junos OS Release 17.3R1.

Description  
Display information about Protocol Independent Multicast (PIM) neighbors.

Options  
none—(Same as brief) Display standard information about PIM neighbors for all supported family addresses for the main instance.
brief | detail—(Optional) Display the specified level of output.
inet | inet6—(Optional) Display information about PIM neighbors for IPv4 or IPv6 family addresses, respectively.
instance (instance-name | all)—(Optional) Display information about neighbors for the specified PIM-enabled routing instance or for all routing instances.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**List of Syntax**

Syntax on page 1990
Syntax (EX Series Switch and the QFX Series) on page 1990

**Syntax**

```
show pim rps
<brief | detail | extensive>
<group-address>
/inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and the QFX Series)**

```
show pim rps
<brief | detail | extensive>
<group-address>
/inet | inet6>
<instance instance-name>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display information about Protocol Independent Multicast (PIM) rendezvous points (RPs).

**Options**

none—Display standard information about PIM RPs for all groups and family addresses for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

group-address—(Optional) Display the RPs for a particular group. If you specify a group address, the output lists the routing device that is the RP for that group.

/inet | inet6—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

instance instance-name—(Optional) Display information about RPs for a specific PIM-enabled routing instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show pim snooping interfaces

Syntax

show pim snooping interfaces
  <brief | detail>
  <instance instance-name>
  <interface interface-name>
  <logical-system logical-system-name>
  <vlan-id vlan-identifier>

Release Information

Command introduced in Junos OS Release 13.2 for M Series Multiservice Edge devices.

Description

Display information about PIM snooping interfaces.

Options

none—Display detailed information.
b brief | detail—(Optional) Display the specified level of output.
instance <instance-name>—(Optional) Display PIM snooping interface information for the specified routing instance.
interface <interface-name>—(Optional) Display PIM snooping information for the specified interface only.
logical-system logical-system-name—(Optional) Display information about a particular logical system, or type ’all’.
vlan-id <vlan-identifier>—(Optional) Display PIM snooping interface information for the specified VLAN.

Required Privilege

**show pim snooping join**

**Syntax**
```
show pim snooping join
  <brief | detail | extensive>
  <instance instance-name>
  <logical-system logical-system-name>
  <vlan-id vlan-id>
```

**Release Information**
- Command introduced in Junos OS Release 13.2 for M Series Multiservice Edge devices.

**Description**
Display information about Protocol Independent Multicast (PIM) snooping joins.

**Options**
- `none`—Display detailed information.
- `brief | detail | extensive`—(Optional) Display the specified level of output.
- `instance instance-name`—(Optional) Display PIM snooping join information for the specified routing instance.
- `logical-system logical-system-name`—(Optional) Display information about a particular logical system, or type 'all'.
- `vlan-id vlan-identifier`—(Optional) Display PIM snooping join information for the specified VLAN.

**Required Privilege**
- `view`

**Related Documentation**
- *PIM Snooping for VPLS*

**show pim snooping statistics**

**Syntax**
```
show pim snooping statistics
  <instance instance-name>
  <interface interface-name>
  <logical-system logical-system-name>
  <vlan-id vlan-id>
```

**Release Information**
Command introduced in Junos OS Release 13.2 for M Series Multiservice Edge devices.

**Description**
Display Protocol Independent Multicast (PIM) snooping statistics.

**Options**
- `none`—Display PIM statistics.
- `instance instance-name`—(Optional) Display statistics for a specific routing instance enabled by Protocol Independent Multicast (PIM) snooping.
- `interface interface-name`—(Optional) Display statistics about the specified interface for PIM snooping.
- `logical-system logical-system-name`—(Optional) Display information about a particular logical system, or type 'all'.
- `vlan-id vlan-identifier`—(Optional) Display PIM snooping statistics information for the specified VLAN.

**Required Privilege Level**

- `<inet | inet6>`
- `<instance instance-name>`
- `<logical-system (all | logical-system-name)>`
- `<source-prefix>`

**Syntax (EX Series Switch and the QFX Series)**

show pim source

- `<brief | detail>`
- `<inet | inet6>`
- `<instance instance-name>`
- `<source-prefix>`

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display information about the Protocol Independent Multicast (PIM) source reverse path forwarding (RPF) state.

**Options**

- `none`—Display standard information about the PIM RPF state for all supported family addresses for all routing instances.

- `brief | detail`—(Optional) Display the specified level of output.

- `inet | inet6`—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

- `instance instance-name`—(Optional) Display information about the RPF state for a specific PIM-enabled routing instance.

- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

- `source-prefix`—(Optional) Display the state for source RPF states in the given range.

**List of Syntax**

Syntax (EX Series Switch and the QFX Series) on page 2018

Syntax

```
show pim statistics
<inet | inet6>  
<instance instance-name>
@interface interface-name>
<logical-system (all | logical-system-name)>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
`inet6` and `instance` options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display Protocol Independent Multicast (PIM) statistics.

**Options**

`none`—Display PIM statistics.

`inet | inet6`—(Optional) Display IPv4 or IPv6 PIM statistics, respectively.

`instance instance-name`—(Optional) Display statistics for a specific routing instance enabled by Protocol Independent Multicast (PIM).

`interface interface-name`—(Optional) Display statistics about the specified interface.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**

`view`

**Related Documentation**

- clear pim statistics on page 1826

show pim statistics on page 2025
show pim statistics inet interface <interface-name> on page 2027
show pim statistics inet6 interface <interface-name> on page 2027
show pim statistics instance <instance-name> on page 2028
Output Fields  

Table 121 on page 2019 describes the output fields for the `show pim statistics` command. Output fields are listed in the approximate order in which they appear.

*Table 121: show pim statistics Output Fields*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Instance       | Name of the routing instance. This field only appears if you specify an interface, for example:  
                    - `inet interface interface-name`  
                    - `inet6 interface interface-name`  
                    - `interface interface-name`  |
| Family         | Output is for IPv4 or IPv6 PIM statistics. INET indicates IPv4 statistics, and INET6 indicates IPv6 statistics. This field only appears if you specify an interface, for example:  
                    - `inet interface interface-name`  
                    - `inet6 interface interface-name`  
                    - `interface interface-name`  |
| PIM statistics | PIM statistics for all interfaces or for the specified interface.                  |
| PIM message type| Message type for which statistics are displayed.                                    |
| Received       | Number of received statistics.                                                     |
| Sent           | Number of messages sent of a certain type.                                         |
| Rx errors      | Number of received packets that contained errors.                                   |
| V2 Hello       | PIM version 2 hello packets.                                                       |
| V2 Register    | PIM version 2 register packets.                                                     |
| V2 Register Stop| PIM version 2 register stop packets.                                                |
| V2 Join Prune  | PIM version 2 join and prune packets.                                               |
| V2 Bootstrap   | PIM version 2 bootstrap packets.                                                    |
| V2 Assert      | PIM version 2 assert packets.                                                       |
| V2 Graft       | PIM version 2 graft packets.                                                        |
| V2 Graft Ack   | PIM version 2 graft acknowledgment packets.                                         |
| V2 Candidate RP| PIM version 2 candidate RP packets.                                                 |

<td>Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.</td>
</tr>
<tr>
<td>Rx BSR when BSR</td>
<td>Number of BSR messages received in which the PIM message type is Bootstrap.</td>
</tr>
<tr>
<td>Rx BSR not RPF if</td>
<td>Number of BSR messages received on an interface that is not the RPF interface.</td>
</tr>
<tr>
<td>Rx unknown hello opt</td>
<td>Number of PIM hello packets received with options that Junos OS does not support.</td>
</tr>
<tr>
<td>Rx data no state</td>
<td>Number of PIM control packets received for which the routing device has no state for the data type.</td>
</tr>
<tr>
<td>Rx RP no state</td>
<td>Number of PIM control packets received for which the routing device has no state for the RP.</td>
</tr>
<tr>
<td>Rx aggregate</td>
<td>Number of PIM aggregate MDT packets received.</td>
</tr>
<tr>
<td>Rx malformed packet</td>
<td>Number of PIM control packets received with a malformed IP unicast or multicast address family.</td>
</tr>
<tr>
<td>No RP</td>
<td>Number of PIM control packets received with no RP address.</td>
</tr>
<tr>
<td>No register encap if</td>
<td>Number of PIM register packets received when the first-hop routing device does not have an encapsulation interface.</td>
</tr>
<tr>
<td>No route upstream</td>
<td>Number of PIM control packets received when the routing device does not have a unicast route to the the interface used to reach the upstream routing device, toward the RP.</td>
</tr>
<tr>
<td>Nexthop Unusable</td>
<td>Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.</td>
</tr>
<tr>
<td>RP mismatch</td>
<td>Number of PIM control packets received for which the routing device has an RP mismatch.</td>
</tr>
</tbody>
</table>
### Table 121: show pim statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP mode mismatch</td>
<td>RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.</td>
</tr>
<tr>
<td>RPF neighbor unknown</td>
<td>Number of PIM control packets received for which the routing device has an unknown RPF neighbor for the source.</td>
</tr>
<tr>
<td>Rx Joins/Prunes filtered</td>
<td>The number of join and prune messages filtered because of configured route filters and source address filters.</td>
</tr>
<tr>
<td>Tx Joins/Prunes filtered</td>
<td>The number of join and prune messages filtered because of configured route filters and source address filters.</td>
</tr>
<tr>
<td>Embedded-RP invalid addr</td>
<td>Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.</td>
</tr>
<tr>
<td>Embedded-RP limit exceed</td>
<td>Number of times the limit configured with the <code>maximum-rps</code> statement is exceeded. The <code>maximum-rps</code> statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.</td>
</tr>
<tr>
<td>Embedded-RP added</td>
<td>Number of packets in which the embedded RP for IPv6 is added. The following receive events trigger extraction of an IPv6 embedded RP address on the routing device:</td>
</tr>
<tr>
<td></td>
<td>• Multicast Listener Discovery (MLD) report for an embedded RP multicast group address</td>
</tr>
<tr>
<td></td>
<td>• PIM join message with an embedded RP multicast group address</td>
</tr>
<tr>
<td></td>
<td>• Static embedded RP multicast group address associated with an interface</td>
</tr>
<tr>
<td></td>
<td>• Packets sent to an embedded RP multicast group address received on the DR</td>
</tr>
<tr>
<td></td>
<td>An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.</td>
</tr>
<tr>
<td>Embedded-RP removed</td>
<td>Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.</td>
</tr>
<tr>
<td>Rx Register msgs filtering</td>
<td>Number of received register messages dropped because of a filter configured for PIM register messages.</td>
</tr>
<tr>
<td>drop</td>
<td></td>
</tr>
<tr>
<td>Tx Register msgs filtering</td>
<td>Number of register messages dropped because of a filter configured for PIM register messages.</td>
</tr>
<tr>
<td>drop</td>
<td></td>
</tr>
<tr>
<td>Rx Bidir Join/Prune on non-Bidir if</td>
<td>Error counter for join and prune messages received on non-bidirectional PIM interfaces.</td>
</tr>
</tbody>
</table>
### Table 12: show pim statistics Output Fields (continued)

<table>
<thead>
<tr>

```
show sap listen

Syntax

```
show sap listen
<brief | detail>
<logical-system (all | logical-system-name)>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display the addresses that the router is listening to in order to receive multicast Session Announcement Protocol (SAP) session announcements.

Options

```
one—Display standard information about the addresses that the router is listening to in order to receive multicast SAP session announcements.
brief | detail—(Optional) Display the specified level of output.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
```

Required Privilege

view

List of Sample Output

```
show sap listen on page 2031
show sap listen brief on page 2032
show sap listen detail on page 2032
```

Output Fields

Table 122 on page 2031 describes the output fields for the `show sap listen` command. Output fields are listed in the approximate order in which they appear.

```
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group address</td>
<td>Address of the group that the local router is listening to for SAP messages.</td>
</tr>
<tr>
<td>Port</td>
<td>UDP port number used for SAP.</td>
</tr>
</tbody>
</table>
```

Sample Output

```
show sap listen

user@host> show sap listen

<table>
<thead>
<tr>
<th>Group address</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>224.2.127.254</td>
<td>9875</td>
</tr>
<tr>
<td>239.255.255.255</td>
<td>9875</td>
</tr>
</tbody>
</table>
```
show sap listen brief

The output for the show sap listen brief command is identical to that for the show sap listen command. For sample output, see show sap listen on page 2031.

show sap listen detail

The output for the show sap listen detail command is identical to that for the show sap listen command. For sample output, see show sap listen on page 2031.
test msdp

Syntax

```
test msdp (dependent-peers prefix | rpf-peer originator)
    <instance instance-name>
    <logical-system (all | logical-system-name)>
```

Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 12.1 for the QFX Series.
- Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Find Multicast Source Discovery Protocol (MSDP) peers.

Options

- **dependent-peers prefix**—Find downstream dependent MSDP peers.
- **rpf-peer originator**—Find the MSDP reverse-path-forwarding (RPF) peer for the originator.
- **instance instance-name**—(Optional) Find MSDP peers for the specified routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege

- **view**

List of Sample Output

- **test msdp dependent-peers on page 2033**

Output Fields

- When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
test msdp dependent-peers

user@host> test msdp dependent-peers 10.0.0.1/24
```
CHAPTER 20

IPv6 Operational Commands

- clear ipv6 neighbors
- clear ipv6 router-advertisement
- show ipv6 neighbors
- show ipv6 router-advertisement
clear ipv6 neighbors

Syntax

```
clear ipv6 neighbors
<all>
< host hostname>
< interface interface-name>
< logical-system logical-system-name>
< tenant name>
< vpn vpn-name>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.3 for EX Series switches.
Command introduced in Junos OS Release 12.2 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Clear IPv6 neighbor cache information.

NOTE: On Junos OS Evolved, issuing the `clear ipv6 neighbors` command clears the cache for IPv6 neighbors in a reachable state.

Options

- `none`—Clear all IPv6 neighbor cache information.
- `all`—(Optional) Clear all IPv6 neighbor cache information.
- `host hostname`—(Optional) Clear the information for the specified IPv6 neighbors.
- `interface interface-name`—(Optional) Clear the information about IPv6 for the specified logical interface.
- `logical-system logical-system-name`—(Optional) Clear the IPv6 entries for the specified logical system; only available in the main router context.
- `tenant name`—(Optional) Clear the IPv6 entries for the specified tenant system; only available in the main router context.
- `vpn vpn-name`—(Optional) Clear entries in the IPv6 table for the specified virtual private network’s (VPN) routing table.

Required Privilege

- Level: `view`

Related Documentation

- `show ipv6 neighbors` on page 2039

List of Sample Output

- `clear ipv6 neighbors` on page 2037
Output Fields  When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear ipv6 neighbors

user@host> clear ipv6 neighbors
**clear ipv6 router-advertisement**

**Syntax**
clear ipv6 router-advertisement
  <interface interface>
  <logical-system (all | logical-system-name)>

**Release Information**
Command introduced before Junos OS Release 7.4.

**Description**
Clear IPv6 router advertisement counters.

**Options**

- none—Clear IPv6 router advertisement counters for all interfaces.
- interface interface—(Optional) Clear IPv6 router advertisement counters for the specified interface.
- logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**
view

**Related Documentation**
- show ipv6 router-advertisement on page 2042

**List of Sample Output**
clear ipv6 router-advertisement on page 2038

**Output Fields**
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**
clear ipv6 router-advertisement

user@host> clear ipv6 router-advertisement
**show ipv6 neighbors**

**Syntax**

```
show ipv6 neighbors
<flags>
<hostname host-name>
<interface interface-name>
<logical-system logical-system-name>
<reference-count count>
<tenant name>
<vpn vpn-name>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.3 for EX Series switches.
Command introduced in Junos OS Release 12.2 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
`flags`, `hostname`, `interface`, `logical-system`, `reference-count`, `tenant`, and `vpn` options added
in Junos OS Release 18.3.

**Description**

Display information about the IPv6 neighbor cache.

---

**NOTE:** Starting with Junos OS Release 16.1, `show ipv6 neighbors` command

does not display the underlying ifl information if enhanced-convergence

statement at `[edit irb unit unit-number]` hierarchy level and enhanced-ip

statement at `[edit chassis network-services]` hierarchy level is configured for

the destination interface IRB.

---

**Options**

- **none**—Display the entries in the IPv6 table.
- **flags**—(Optional) Display the flags set, if any.
- **hostname host-name**—(Optional) Display the hostname.
- **interface interface-name**—(Optional) Display information about IPv6 for the specified

  logical interface
- **logical-system logical-system-name**—(Optional) Display the IPv6 entries for the specified

  logical system; only available on the main router context.
- **reference-count count**—(Optional) Display the IPv6 next-hop reference count.
- **tenant name**—(Optional) Displays the IPv6 entries for the specified tenant system; only

  available in the main router context.
- **vpn vpn-name**—(Optional) Display entries in the IPv6 table for the specified virtual private

  network’s (VPN) routing table.
**Required Privilege**  
- `view`

**Related Documentation**  
- clear ipv6 neighbors on page 2036

**List of Sample Output**  
- show ipv6 neighbors on page 2040
- show ipv6 neighbors on page 2040

**Output Fields**  
Table 123 on page 2040 describes the output fields for the `show ipv6 neighbors` command. Output fields are listed in the approximate order in which they appear.

**Table 123: show ipv6 neighbors Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 Address</td>
<td>Name of the IPv6 interface.</td>
</tr>
<tr>
<td>Linklayer Address</td>
<td>Link-layer address.</td>
</tr>
<tr>
<td>State</td>
<td>State of the link: up, down, incomplete, reachable, stale, or unreachable.</td>
</tr>
<tr>
<td>Exp</td>
<td>Number of seconds until the entry expires.</td>
</tr>
<tr>
<td>Rtr</td>
<td>Whether the neighbor is a routing device: yes or no.</td>
</tr>
<tr>
<td>Secure</td>
<td>Whether this entry was created using the Secure Neighbor Discovery (SEND) protocol: yes or no.</td>
</tr>
<tr>
<td>Interface</td>
<td>Name of the interface.</td>
</tr>
</tbody>
</table>

**Sample Output**

`show ipv6 neighbors`

```
user@host> show ipv6 neighbors
IPv6 Address          Linklayer Address  State   Exp  Rtr  Secure
Interface
2001:db8:0:1:2a0:a514:0:24c 00:05:85:8f:8c:bd  stale  546 yes no
fe-1/2/0.1
fe80::2a0:a514:0:24c 00:05:85:8f:8c:bd  stale  258 yes no
fe-1/2/0.1
fe80::2a0:a514:0:64c 00:05:85:8f:8c:bd  stale  111 yes no
fe-1/2/1.5
fe80::2a0:a514:0:4c 00:05:85:8f:8c:bd  stale  327 yes no
fe-1/2/2.9
```

`show ipv6 neighbors`

The command displaying the underlying l2 ifl information when `enhanced-convergence` statement and `enhanced-ip` statement is not configured.
<table>
<thead>
<tr>
<th>IPv6 Address</th>
<th>Linklayer Address</th>
<th>State</th>
<th>Exp Rtr</th>
<th>Secure</th>
</tr>
</thead>
<tbody>
<tr>
<td>23::23:0:0:2</td>
<td>00:00:23:00:00:02</td>
<td>reachable</td>
<td>0</td>
<td>no</td>
</tr>
<tr>
<td>xe-2/2/0.0</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The command not displaying the underlying l2if information when `enhanced-convergence` statement and `enhanced-ip` statement is configured.
### show ipv6 router-advertisement

**Syntax**
```
show ipv6 router-advertisement
<conflicts>
<interface interface>
<logical-system (all | logical-system-name)>
<prefix prefix/prefix length>
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.2 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**
Display information about IPv6 router advertisements, including statistics about messages sent and received on interfaces, and information received from advertisements from other routers.

**Options**
- **none**—Display all IPv6 router advertisement information for all interfaces.
- **conflicts**—(Optional) Display only the IPv6 router advertisement information that is conflicting.
- **interface interface**—(Optional) Display IPv6 router advertisement information for the specified interface.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **prefix prefix/prefix length**—(Optional) Display IPv6 router advertisement information for the specified prefix.

**Additional Information**
The display identifies conflicting information by enclosing the value the router is advertising in brackets.

**Required Privilege Level**
view

**Related Documentation**
- clear ipv6 router-advertisement on page 2038

**List of Sample Output**
- show ipv6 router-advertisement on page 2043

### clear isis overload

**List of Syntax**

Syntax on page 2050  
Syntax (EX Series Switches and QFX Series) on page 2050

**Syntax**

- clear isis overload  
  - `<instance instance-name>`  
  - `<logical-system (all | logical-system-name)>`

**Syntax (EX Series Switches and QFX Series)**

- clear isis overload  
  - `<instance instance-name>`

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 12.1 for the QFX Series.  
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Reset the IS-IS dynamic overload bit. This command can appear to not work, continuing to display overload after execution. The bit is reset only if the root cause is corrected by configuration remotely or locally.

When other routers detect that the overload bit is set, they do not use this routing device for transit traffic, but they do use it for packets destined to the overloaded routing device's directly connected networks and IP prefixes.

**Options**

- **none**—Reset the IS-IS dynamic overload bit.  
  - `instance instance-name`—(Optional) Reset the IS-IS dynamic overload bit for the specified routing instance.  
  - `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

- clear

**Related Documentation**

**Output Fields**
`Table 128 on page 2063` lists the output fields for the `show isis backup label-switched-path` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backup MPLS LSPs</td>
<td>List of MPLS LSPs designated as backup paths for IS-IS routes.</td>
</tr>
<tr>
<td>Egress</td>
<td>IP address of the egress routing device for the LSP.</td>
</tr>
</tbody>
</table>
Table 128: show isis backup label-switched-path Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>State of the LSP:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Up</strong>—The routing device can detect RSVP hello messages from the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Down</strong>—The routing device has received one of the following indications:</td>
</tr>
<tr>
<td></td>
<td>• Communication failure from the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• Communication from IGP that the neighbor is unavailable.</td>
</tr>
<tr>
<td></td>
<td>• Change in the sequence numbers in the RSVP hello messages sent by the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Deleted</strong>—LSP is no longer available as a backup path.</td>
</tr>
<tr>
<td>Last change</td>
<td>Time elapsed since the neighbor state changed either from up to down or from down to up. The format is $hh:mm:ss$.</td>
</tr>
<tr>
<td>TE-metric</td>
<td>Configured traffic engineering metric.</td>
</tr>
<tr>
<td>Metric</td>
<td>Configured metric.</td>
</tr>
</tbody>
</table>

Sample Output

show isis backup label-switched-path

```
user@host> show isis backup label-switched-path
Backup MPLS LSPs:
f-to-g, Egress: 192.168.1.4, Status: up, Last change: 06:12:03
  TE-metric: 9, Metric: 0
```
## show isis backup spf results

**Syntax**

```
show isis backup spf results
<instance instance-name>
<level (1 | 2)>
<logical-system (all | logical-system-name)>
<no-coverage>
<topology (ipv4-unicast | ipv6-multicast | ipv6-unicast | unicast)>
```

**Syntax (EX Series Switches)**

```
show isis backup spf results
<instance instance-name>
<level (1 | 2)>
<no-coverage>
<topology (ipv4-unicast | unicast)>
```

**Release Information**

Command introduced in Junos OS Release 9.5.

**Description**

Display information about IS-IS shortest-path-first (SPF) calculations for backup paths.

**Options**

- **none**—Display information about IS-IS SPF calculations for all backup paths for all destination nodes.
  - **instance instance-name**—(Optional) Display SPF calculations for backup paths for the specified routing instance.
  - **level (1 | 2)**—(Optional) Display SPF calculations for the backup paths for the specified IS-IS level.
  - **logical-system logical-system-name**—(Optional) Display SPF calculations for the backup paths for all logical systems or on a particular logical system.
  - **no-coverage**—(Optional) Display SPF calculations only for destinations that do not have backup coverage.
  - **topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)**—(Optional) Display SPF calculations for backup paths for the specified topology only.

**Required Privilege**

Output Fields  
Table 129 on page 2066 lists the output fields for the show isis backup spf results command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-name</td>
<td>Name of the destination node.</td>
</tr>
<tr>
<td>Address</td>
<td>Address of the destination node.</td>
</tr>
<tr>
<td>Primary next-hop</td>
<td>Interface and name of the node of the primary next hop to reach the destination.</td>
</tr>
<tr>
<td>Root</td>
<td>Name of the next-hop neighbor.</td>
</tr>
<tr>
<td>Metric</td>
<td>Metric to the node.</td>
</tr>
<tr>
<td>Eligible</td>
<td>Indicates that the next-hop neighbor has been designated as a backup path to the destination.</td>
</tr>
<tr>
<td>Backup next-hop</td>
<td>Name of the interface of the backup next hop.</td>
</tr>
<tr>
<td>SNPA</td>
<td>Subnetwork point of attachment (MAC address of the next hop).</td>
</tr>
<tr>
<td>LSP</td>
<td>Name of the MPLS label-switched path (LSP) designated as a backup path.</td>
</tr>
<tr>
<td>Not eligible</td>
<td>Indicates that the next-hop neighbor cannot function as a backup path to the destination.</td>
</tr>
<tr>
<td>Reason</td>
<td>Describes why the next-hop neighbor is designated as Not eligible as a backup path.</td>
</tr>
</tbody>
</table>

show isis context-identifier

Syntax

show isis context-identifier
<brief | detail | extensive>
<identifier name>
<instance instance-name>
logical-system (all | logical-system-name)>

Release Information

Command introduced in Junos OS Release 10.4.

Description

Display IS-IS context identifier information.

Options

brief | detail | extensive—(Optional) Display the specified level of output.
identifier name—(Optional) Display information about the specified context identifier.
instance instance-name—(Optional) Display entries for the specified routing instance.
logical-system (all | logical-system-name)—(Optional) Display the context identifier information for all logical systems or for a particular logical system.

Required Privilege

show isis database

**List of Syntax**
Syntax on page 2071
Syntax (EX Series Switches and QFX Series) on page 2071

**Syntax**
show isis database
<system-id>
<brief | detail | extensive>
<instance instance-name>
<level (1 | 2)>
<logical-system (all | logical-system-name)>

**Syntax (EX Series Switches and QFX Series)**
show isis database
<system-id>
<brief | detail | extensive>
<level (1 | 2)>
<instance instance-name>

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Command introduced in Junos OS Release 15.1X53-D30 for the QFX10002 switch.

**Description**
Display the entries in the Intermediate System-to-Intermediate System (IS-IS) link-state database, which contains data about PDU packets.

**Options**
none—Display standard information about IS-IS link-state database entries for all routing instances.

system id—(Optional) Display IS-IS link-state database entries for the specified intermediate system.

brief | detail | extensive—(Optional) Display the specified level of output.

instance instance-name—(Optional) Display IS-IS link-state database entries for the specified routing instance.

level (1 | 2)—(Optional) Display IS-IS link-state database entries for the specified IS-IS level.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 131 on page 2072 describes the output fields for the show isis database command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your customer support representative.

Table 131: show isis database Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface name</td>
<td>Name of the interface on which the link-state PDU has been received; always IS-IS for this command.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
| level | Level of intermediate system:  
- 1—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system.  
- 2—Intermediate system routes between areas and toward other ASs. | All levels |
| LSP ID | Link-state PDU identifier. | All levels |
| Sequence | Sequence number of the link-state PDU. | All levels |
| Checksum | Checksum value of the link-state PDU. | All levels |
| Lifetime (secs) | Remaining lifetime of the link-state PDU, in seconds. | All levels |
| Attributes | Attributes of the specified database: L1, L2, Overload, or Attached (L1 only). | none brief |
| # LSPs | Total number of link-state PDUs in the specified link-state database. | none brief |
| IP prefix | Prefix advertised by this link-state PDU. | detail extensive |
| IS neighbor | IS-IS neighbor of the advertising system. | detail extensive |
| IP prefix | IPv4 prefix advertised by this link-state PDU. | detail extensive |
| V6 prefix | IPv6 prefix advertised by this link-state PDU. | detail extensive |
| Metric | Metric of the prefix or neighbor. | detail extensive |
Table 131: show isis database Output Fields (continued)

<table>

</tr>
</tbody>
</table>

TLVs

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Area Address—Area addresses that the routing device can reach.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Speaks—Supported routing protocols.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• IP routerid—ID of the routing device (usually the IP address).</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• IP address—IPv4 address.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Hostname—Assigned name of the routing device.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• IP prefix—IP prefix of the routing device.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Metric—IS-IS metric that measures the cost of the adjacency between the originating routing device and the advertised routing device.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• IP extended prefix—Extended IP prefix of the routing device.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• IS neighbor—Directly attached neighbor’s name and metric.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• IS extended neighbor—Directly attached neighbor’s name, metric, IP address, local interface index, and remote interface index.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Router Capability—ID of the routing device and flag.</td>
<td>extensive</td>
</tr>
</tbody>
</table>

Note: Router capability also specifies SPRING capability and SPRING algorithm when segment routing is enabled on the routing device.

Sample Output

tableau@host> show isis database

    IS-IS level 1 link-state database:

show isis hostname

**List of Syntax**

Syntax on page 2085
Syntax (EX Series Switches and QFX Series) on page 2085

**Syntax**

show isis hostname

<logical-system (all | logical-system-name)>

**Syntax (EX Series Switches and QFX Series)**

show isis hostname

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display IS-IS hostname database information.

This command displays the system ID-to-name cache. The output shows if the mapping has been learned by receipt of a Hostname TLV #137 (type dynamic) configured in Junos OS with the set system host-name command, or a static mapping defined in Junos OS with the set system static-host-mapping hostname sysid command (type static). The local router always has its type set to static even if static-host-mapping is not configured.

**Options**

none—Display IS-IS hostname database information.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

<td><strong>Type</strong></td>
<td>Type of mapping between system identifier and hostname.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Dynamic</strong>—Hostname mapping determined as described in RFC 2763, <em>Dynamic Hostname Exchange Mechanism for IS-IS</em>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Static</strong>—Hostname mapping configured by user.</td>
</tr>
</tbody>
</table>

---

**Sample Output**

```
show isis hostname
```

```
user@host> show isis hostname
IS-IS hostname database:
  System Id  Hostname        Type
  1921.6800.4201 isis1       Dynamic
  1921.6800.4202 isis2       Static
  1921.6800.4203 isis3       Dynamic
```
### show isis interface

#### List of Syntax
- Syntax: Syntax on page 2087
  - Syntax (EX Series Switches and QFX Series) on page 2087

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show isis interface &lt;brief</td>
<td>detail</td>
</tr>
</tbody>
</table>

#### Syntax (EX Series Switches and QFX Series)
- show isis interface <brief | detail | extensive> <interface-name>

#### Release Information
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 12.1 for the QFX Series.

#### Description

**NOTE:** If the configured metric for an IS-IS level is above 63, and the wide-metrics-only statement is not configured, the show isis interface detail command and the show isis interface extensive command display 63 as the metric value for that level. Configure the wide-metrics-only statement to generate metric values greater than 63 on a per IS-IS level basis.

The show isis interface command displays the configured metric value for an IS-IS level irrespective of whether is configured or not.

#### Options
- **none**—Display standard information about all IS-IS-enabled interfaces.
- **brief | detail | extensive**—(Optional) Display the specified level of output.
- **interface-name**—(Optional) Display information about the specified interface only.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

```

Release Information

Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display IS-IS overview information.

Options

- **none**—Display standard overview information about IS-IS for all routing instances.
- **instance instance-name**—(Optional) Display overview information for the specified routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

`view`

List of Sample Output

`show isis overview on page 2094`

Output Fields

Table 134 on page 2092 lists the output fields for the `show isis overview` command. Output fields are listed in the approximate order in which they appear.

**Table 134: show isis overview Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Name of the router.</td>
</tr>
<tr>
<td>Sysid</td>
<td>Part of the ISO address of the routing device.</td>
</tr>
<tr>
<td>Areaid</td>
<td>The area number of the routing device.</td>
</tr>
<tr>
<td>Instance</td>
<td>IS-IS routing instance.</td>
</tr>
<tr>
<td>Router ID</td>
<td>Router ID of the routing device.</td>
</tr>
<tr>
<td>Adjacency holddown</td>
<td>Adjacency holddown capability: enabled or disabled.</td>
</tr>
</tbody>
</table>
Table 134: show isis overview Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum Areas</td>
<td>Maximum number of IS-IS areas advertised by the routing device.</td>
</tr>
<tr>
<td>LSP lifetime</td>
<td>Lifetime of the link-state PDU, in seconds.</td>
</tr>
<tr>
<td>Filter low life time LSPs up to</td>
<td>LSPs with a lifetime lower than this value are filtered out.</td>
</tr>
<tr>
<td>Attached bit evaluation</td>
<td>Attached bit capability: enabled or disabled.</td>
</tr>
<tr>
<td>SPF delay</td>
<td>Delay before performing consecutive shortest-path-first (SPF) calculations.</td>
</tr>
<tr>
<td>SPF holddown</td>
<td>Delay before performing additional SPF calculations after the maximum number of consecutive SPF calculations is reached.</td>
</tr>
<tr>
<td>SPF rapid runs</td>
<td>Maximum number of SPF calculations that can be performed in succession before the holddown timer begins.</td>
</tr>
<tr>
<td>Overload bit at startup is set</td>
<td>Overload bit capability is enabled.</td>
</tr>
<tr>
<td>Overload high metrics</td>
<td>Overload high metrics capability: enabled or disabled.</td>

show isis route

**List of Syntax**

Syntax on page 2097
Syntax (EX Series Switches and QFX Series) on page 2097

**Syntax**

```
show isis route
<destination>
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>
```

**Syntax (EX Series Switches and QFX Series)**

```
show isis route
<destination>
<inet | inet6>
<instance instance-name>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display the routes in the IS-IS routing table.

**Options**

```
none—Display all routes in the IS-IS routing table for all supported address families for all routing instances.
```

```
destination—(Optional) Destination address for the route.
```

```
inet | inet6—(Optional) Display inet (IPv4) or inet6 (IPv6) routes, respectively.
```

```
instance instance-name—(Optional) Display routes for the specified routing instance only.
```

```
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
```

```
topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)—(Optional) Display routes for the specified topology only, or use unicast to display information, if available, for both IPv4 and IPv6 unicast topologies.
```

**Required Privilege Level**

```
view
```

**List of Sample Output**

```
show isis route logical-system on page 2098
show isis route floodgroup on page 2099
show isis route (CLNS) on page 2099
```
**show isis route on page 2099**

**Output Fields**  Table 135 on page 2098 describes the output fields for the `show isis route` command. Output fields are listed in the approximate order in which they appear.

**Table 135: show isis route Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current version</td>
<td>Number of the current version of the IS-IS routing table.</td>
</tr>
<tr>
<td>L1</td>
<td>Version of Level 1 SPF that was run.</td>

show isis spf

**List of Syntax**

Syntax on page 2102  
Syntax (EX Series Switches) on page 2102

**Syntax**

```
show isis spf (brief | log | results)
<instance instance-name>
<level (1 | 2)>
<logical-system (all | logical-system-name)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>
```

**Syntax (EX Series Switches)**

```
show isis spf (brief | log | results)
<instance instance-name>
<level (1 | 2)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>
```

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display information about IS-IS shortest-path-first (SPF) calculations.

**Options**

- **brief**—Display an overview of SPF calculations.
- **log**—Display the log of SPF calculations.
- **results**—Display the results of SPF calculations.
- **instance instance-name**—(Optional) Display SPF calculations for the specified routing instance.
- **level (1 | 2)**—(Optional) Display SPF calculations for the specified IS-IS level.
- **log**—Display the log of SPF calculations.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **results**—Display the results of SPF calculations.
- **topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)**—(Optional) Display SPF calculations for the specified topology only.

**Required Privilege**

Syntax (EX Series Switches and QFX Series)  show isis statistics
<instance instance-name>

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description  Display statistics about IS-IS traffic.

Options  none—Display IS-IS traffic statistics for all routing instances.

instance instance-name—(Optional) Display statistics for the specified routing instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all
logical systems or on a particular logical system.

Output Fields  Table 137 on page 2108 describes the output fields for the show isis statistics command.
Output fields are listed in the approximate order in which they appear.
### Table 137: show isis statistics Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PDU type</strong></td>
<td><strong>Field Description</strong></td>
</tr>
<tr>
<td>PDU type:</td>
<td><strong>Field Description</strong></td>
</tr>
<tr>
<td>• CSNP</td>
<td>Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU.</td>
</tr>
<tr>
<td>• IIH</td>
<td>IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems.</td>
</tr>
<tr>
<td>• LSP</td>
<td>Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area.</td>
</tr>
<tr>
<td>• PSNP</td>
<td>Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU.</td>
</tr>
<tr>
<td>• Unknown</td>
<td>The PDU type is unknown.</td>
</tr>
<tr>
<td><strong>Received</strong></td>
<td>Number of PDUs received since IS-IS started or since the statistics were set to zero.</td>
</tr>
<tr>
<td><strong>Processed</strong></td>
<td>Number of PDUs received less the number dropped.</td>
</tr>
<tr>
<td><strong>Drops</strong></td>
<td>Number of PDUs dropped.</td>
</tr>
<tr>
<td><strong>Sent</strong></td>
<td>Number of PDUs transmitted since IS-IS started or since the statistics were set to zero.</td>
</tr>
<tr>
<td><strong>Rexmit</strong></td>
<td>Number of PDUs retransmitted since IS-IS started or since the statistics were set to zero.</td>
</tr>
<tr>
<td><strong>Total packets received/sent</strong></td>
<td>Total number of PDUs received and transmitted since IS-IS started or since the statistics were set to zero.</td>
</tr>
<tr>
<td><strong>SNP queue length</strong></td>
<td>Number of CSPN and PSNP packets currently waiting in the queue for processing. This value is almost always 0.</td>

LLDP Operational Commands

- clear lldp neighbors
- clear lldp statistics
- show lldp
- show lldp local-information
- show lldp neighbors
- show lldp remote-global-statistics
- show lldp statistics
### clear lldp neighbors

**Syntax**

```
clear lldp neighbor
<interface interface-name>
```

**Release Information**

**Description**
Clear information regarding all Link Layer Discovery Protocol (LLDP) neighbors or LLDP neighbors of the specified interface.

For information about interface names, see “Interface Naming Overview” on page 16. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about interface names in the Junos Fusion technology, see *Understanding Junos Fusion Ports*.

**Options**

```
interface interface-name — (Optional) Clear the LLDP neighbors on the specified interface.
```

**Required Privilege Level**
clear

**Related Documentation**
- clear lldp statistics on page 2113

**List of Sample Output**
- clear lldp neighbors on page 2112
- clear lldp neighbors interface ge-0/1/1.0 on page 2112

**Output Fields**
When you enter this command, you are provided no feedback on the status of your request. You can enter the `show lldp neighbors` command before and after clearing the LLDP neighbors to verify the clear operation.

**Sample Output**

clear lldp neighbors

```
user@switch> clear lldp neighbors
```

clear lldp neighbors interface ge-0/1/1.0

```
user@switch> clear lldp neighbors interface ge-0/1/1.0
```
clear lldp statistics

Syntax  clear lldp neighbor
       <interface interface-name>

Description  Clear all Link Layer Discovery Protocols (LLDP) statistics or LLDP statistics associated
with the specified interface.

For information about interface names, see “Interface Naming Overview” on page 16. For
information about interface names for TX Matrix routers, see "TX Matrix Router Chassis and Interface Names."
For information about FPC numbering on TX Matrix routers, see "Routing Matrix with a TX Matrix Router FPC Numbering."

For information about interface names in the Junos Fusion technology, see "Understanding Junos Fusion Ports."

Options  interface interface-name—(Optional) Clear LLDP statistics on the specified interface.

Required Privilege  clear

Related Documentation  •  clear lldp neighbors on page 2112

List of Sample Output  clear lldp statistics on page 2113
                       clear lldp statistics interface ge-0/1/1.0 on page 2113

Output Fields  When you enter this command, you are provided no feedback on the status of your
request. You can enter the show lldp statistics command before and after clearing the
LLDP statistics to verify the clear operation.

Sample Output

clear lldp statistics

user@switch> clear lldp statistics

clear lldp statistics interface ge-0/1/1.0

user@switch> clear lldp statistics interface ge-0/1/1.0

show lldp neighbors

Syntax

show lldp neighbors
<interface interface-name>
detail

Release Information

detail option introduced in Junos OS Release 19.1R2.

Description

Display information about LLDP neighbors.

For information about interface names, see “Interface Naming Overview” on page 16. For information about interface names for TX Matrix routers, see TX Matrix Router Chassis and Interface Names. For information about FPC numbering on TX Matrix routers, see Routing Matrix with a TX Matrix Router FPC Numbering.

For information about extended port names in the Junos Fusion technology, see Understanding Junos Fusion Ports.

Options

interface interface-name—(Optional) Display the neighbor information about a particular physical interface.

detail—(Optional) Display detailed information about LLDP neighbors.

NOTE: Starting with Junos OS Release 14.2, you can also display LLDP neighbor details for management interfaces, such as fxp or me, on MX Series routers.

Required Privilege Level

view

show lldp remote-global-statistics

Syntax

show lldp remote-global-statistics

Release Information

Description

Display remote Link Layer Discovery Protocol (LLDP) global statistics.

Options

This command has no options.

Required Privilege Level

view

List of Sample Output

show lldp remote-global-statistics on page 2130

Output Fields

Table 142 on page 2129 describes the output fields for the show lldp remote-global-statistics command. Output fields are listed in the approximate order in which they appear.

Table 142: show lldp remote-global-statistics Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LLDP Remote Database Table Counters</td>
<td>Information about remote database table counters.</td>
</tr>
<tr>

</tr>
<tr>
<td>Inserts</td>
<td>Number of insertions made in the remote database table.</td>
</tr>
<tr>
<td>Deletes</td>
<td>Number of deletions made in the remote database table.</td>
</tr>
<tr>
<td>Drops</td>
<td>Number of LLDP frames dropped from the remote database table because of errors.</td>
</tr>
<tr>
<td>Ageouts</td>
<td>Number of remote database table entries that have aged out of the table.</td>
</tr>
</tbody>
</table>
Sample Output

```
user@host> show lldp remote-global-statistics

LLDP Remote Database Table Counters
LastchangeTime    Inserts    Deletes    Drops    Ageouts
00:00:76 (76 sec)    192        0          0        0
```

show lldp statistics

Syntax

show lldp statistics
<interface interface-name>

Release Information

Description

Display information about Link Layer Discovery Protocol (LLDP) statistics.

Options

interface interface-name—(Optional) Display the statistics about a particular physical interface.

NOTE: Starting with Junos OS Release 14.2, you can also display LLDP statistical details for management interfaces, such as fxp or me, on MX Series routers.

Required Privilege

Level view

CHAPTER 23

MVRP Operational Commands

- show mvrp
- show mvrp applicant-state
- show mvrp dynamic-vlan-memberships
- show mvrp interface
- show mvrp registration-state
- show mvrp statistics
**show mvrp**

Syntax  

```
show mvrp
```

**Release Information**  
Command introduced in Junos OS Release 10.0 for EX Series switches.  
Command introduced in Junos OS Release 10.1 for MX Series routers.  
Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.  
Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.

**Description**  
Display Multiple VLAN Registration Protocol (MVRP) configuration information.

**Required Privilege Level**  
view

**Related Documentation**  
- **Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches**
- **Verifying That MVRP Is Working Correctly on Switches**
  - show mvrp statistics on page 2148
  - show mvrp applicant-state on page 2139
  - show mvrp dynamic-vlan-memberships on page 2142
  - show mvrp interface on page 2144
  - show mvrp registration-state on page 2146
  - show mvrp statistics on page 2148
  - show mvrp applicant-state on page 2139
  - show mvrp dynamic-vlan-memberships on page 2142
  - show mvrp interface on page 2144
  - show mvrp registration-state on page 2146

**List of Sample Output**  
- `show mvrp (EX Series switches and MX Series routers) on page 2137`
- `show mvrp (SRX1500, SRX300, SRX550M, SRX345, SRX340 and SRX320) on page 2137`
- `show mvrp (EX Series switches) on page 2138`

**Output Fields**  
`Table 144 on page 2136 lists the output fields for the show mvrp command. Output fields are listed in the approximate order in which they appear.`

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVRP dynamic VLAN creation</td>
<td>Displays whether global MVRP dynamic VLAN creation is <strong>Enabled</strong> or <strong>Disabled</strong>.</td>
</tr>
</tbody>
</table>
Table 144: show mvrp Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global MVRP configuration</td>
<td>Displays global MVRP information:</td>
</tr>
<tr>
<td></td>
<td>• MVRP status—Displays whether MVRP is Enabled or Disabled.</td>
</tr>
<tr>
<td></td>
<td>• MVRP dynamic vlan creation—Displays whether global MVRP dynamic VLAN creation is Disabled or Enabled.</td>
</tr>
<tr>
<td>MVRP BPDU MAC address</td>
<td>Displays the multicast media access control (MAC) address for MVRP. If configured, the provider MVRP multicast MAC address is used; otherwise, the customer MVRP multicast MAC address is used.</td>
</tr>
<tr>
<td>MVRP timers (ms)</td>
<td>Displays MVRP timer information:</td>
</tr>
<tr>
<td></td>
<td>• Interface—The interface on which MVRP is configured.</td>
</tr>
<tr>
<td></td>
<td>• Join—The maximum number of milliseconds the interfaces must wait before sending VLAN advertisements.</td>
</tr>
<tr>
<td></td>
<td>• Leave—The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message.</td>
</tr>
<tr>
<td></td>
<td>• LeaveAll—The interval at which LeaveAll messages are sent on interfaces. LeaveAll messages maintain current MVRP VLAN membership information in the network.</td>
</tr>
<tr>
<td>Interface based configuration</td>
<td>Displays interface-specific MVRP information:</td>
</tr>
<tr>
<td></td>
<td>• Interface—The interface on which MVRP is configured.</td>
</tr>
<tr>
<td></td>
<td>• Status—Displays whether MVRP is Enabled or Disabled.</td>
</tr>
<tr>
<td></td>
<td>• Registration—Displays whether registration for the interface is Forbidden or Normal.</td>
</tr>
<tr>
<td></td>
<td>• Dynamic VLAN Creation—Displays whether interface dynamic VLAN creation is Enabled or Disabled.</td>
</tr>
</tbody>
</table>

Sample Output

show mvrp (EX Series switches and MX Series routers)

```
user@host> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)

MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (00-00-5E-00-53-00)
MVRP timers (ms)
```
## Sample Output

### show mvrp (EX Series switches)

```
user@switch> show mvrp

Global MVRP configuration
MVRP status               : Enabled
MVRP dynamic vlan creation: Enabled
MVRP Timers (ms):
  Interface        Join   Leave   LeaveAll
  --------------- ----   -----   --------
  all              200    600     10000
  xe-0/1/1.0       200    600     10000

Interface based configuration:
  Interface          Status     Registration   Dynamic VLAN Creation
  ---------------   --------   ------------   ---------------------
  all       Disabled   Normal    Enabled
  xe-0/1/1.0     Enabled    Normal         Enabled
```
show mvrp applicant-state

Syntax

show mvrp applicant-state

Release Information

Command introduced in Junos OS Release 10.1.
Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.

Description

For MX Series routers, EX Series switches, SRX1500, SRX300, SRX550M, SRX345, SRX340, and SRX320, display Multiple VLAN Registration Protocol (MVRP) applicant state information.

Required Privilege Level

view

</table>
```
**show mvrp dynamic-vlan-memberships**

**Syntax**

`show mvrp dynamic-vlan-memberships`

**Release Information**

Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 10.1 for MX Series routers.
Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.

**Description**

Display all VLANs that have been created dynamically using Multiple VLAN Registration Protocol (MVRP) on the router, switch, or SRX Series device.

**Required Privilege**

`clear`

**Related Documentation**

- Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches

- `show mvrp dynamic-vlan-memberships (EX Series)` on page 2143
- `show mvrp dynamic-vlan-memberships` on page 2143

**Output Fields**

Table 146 on page 2142 lists the output fields for the `show mvrp dynamic-vlan-memberships` command on MX Series routers and EX Series switches. Output fields are listed in the approximate order in which they appear.

**Table 146: show mvrp dynamic-vlan-memberships Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Id</td>
<td>The VLAN ID of the dynamically created VLAN.</td>
</tr>
<tr>
<td>Interfaces</td>
<td>The interface or interfaces that are bound to the dynamically created VLAN.</td>
</tr>
</tbody>
</table>
Sample Output (MX Series Routers and EX Series Switches)

show mvrp dynamic-vlan-memberships (MX Series and EX Series)

```
user@host> show mvrp dynamic-vlan-memberships
MVRP dynamic vlans for routing instance 'default-switch'
     (s) static vlan, (f) fixed registration

<table>
<thead>
<tr>
<th>VLAN Id</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 (s)</td>
<td>ge-11/3/0</td>
</tr>
<tr>
<td>200 (s)</td>
<td>ge-11/3/0</td>
</tr>
<tr>
<td>300 (s)</td>
<td></td>
</tr>
</tbody>
</table>
```

Sample Output (EX Series Switches)

show mvrp dynamic-vlan-memberships (EX Series)

```
user@switch> show mvrp dynamic-vlan-memberships

<table>
<thead>
<tr>
<th>VLAN Name</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>mvrp_100</strong></td>

Release Information

Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 13.2X50-D10 (ELS).
Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.

Description

Display Multiple VLAN Registration Protocol (MVRP) statistics in the form of Multiple Registration Protocol data unit (MRPDU) messages.

Options

```
none—Show MVRP statistics for all interfaces on the switch.
interface interface-name—(Optional) Show MVRP statistics for the specified interface.
```

Required Privilege Level

```
view
```

Release Information  Command introduced before Junos OS Release 7.4.
advertising-router router-id, netsummary, network, nssa, opaque-area, and router options added in Junos OS Release 8.3. You must use the purge command with these options.
area area-id option added in Junos OS Release 8.3.
Command introduced in Junos OS Release 9.0 for EX Series switches.
realm option added in Junos OS Release 9.2.

advertising-router (router-id | self) option added in Junos OS Release 9.5.

advertising-router (router-id | self) option introduced in Junos OS Release 9.5 for EX Series switches.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

purge option (and all options that are dependent on the purge option) hidden in Junos OS Release 13.3.

Description

With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine.

---

**CAUTION:** You can also use the purge command with any of the options to discard rather than delete the specified LSA entries. This command is useful only for testing. Use it with care, because it causes significant network disruption.

---

Options

- **all**—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state EXSTART or higher. The neighbors are then reacquired and the databases are synchronized.

- **advertising-router (router-id | self)**—(Optional) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.

- **area area-id**—(Optional) Discard entries for the LSAs in the specified area.

- **asbrsummary**—(Optional) Discard summary AS boundary router LSA entries.

- **external**—(Optional) Discard external LSAs.

- **instance instance-name**—(Optional) Delete or discard entries for the specified routing instance only.

- **inter-area-prefix**—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.

- **inter-area-router**—(OSPFv3 only) (Optional) Discard interarea router LSAs.

- **intra-area-prefix**—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.

- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

- **link-local**—(Optional) Delete link-local LSAs.

- **lsa-id lsa-id**—(Optional) Discard the LSA entries with the specified LSA identifier.

- **netsummary**—(Optional) Discard summary network LSAs.
network—(Optional) Discard network LSAs.

nssa—(Optional) Discard not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Discard opaque area-scope LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional)
  Delete the entries for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Discard router LSAs.

purge—(Optional) Discard all entries in the link-state advertisement database. All link-state advertisements are set to MAXAGE and are flooded. The database is repopulated when the originators of the link-state advertisements receive the MAXAGE link-state advertisements and reissue them.

Release Information

Command introduced in Junos OS Release 10.0.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about the level of backup coverage available for all the nodes and prefixes in the network.

Options

none—Display information about the level backup coverage for all OSPF routing instances in all logical systems.

logical-system (all | logical-system-name)—(Optional) Display information about the level of backup coverage for all logical systems or for a specific logical system.

instance instance-name—(Optional) Display information about the level of backup coverage for a specific OSPF routing instance.

realm (ipv4-unicast | ipv6-unicast)—(Optional) (OSPFv3 only) Display information about the level of backup coverage for the specific OSPFv3 realm, or address family.

topology (default | topology-name)—(Optional) (OSPFv2 only) Display information about the level of backup coverage for the specific OSPF topology.

show (ospf | ospf3) backup lsp

Syntax
```
show (ospf | ospf3) backup lsp
  <logical-system (all | logical-system-name)>
  <realm (ipv4-unicast | ipv6-unicast)>
```

Release Information
Command introduced in Junos OS Release 10.0.

Description
Display information about MPLS label-switched-paths (LSPs) designated as backup routes for OSPF routes.

**NOTE:** MPLS LSPs can be used as backup routes only for routes in the default OSPFV2 topology and not for any configured topology. Additionally, MPLS LSPs cannot be used as backup routes for nondefault instances either for OSPFV2 or OSPFV3.

Options
- none—Display information all MPLS LSPs designated as backup routes.
- `logical-system (all | logical-system-name)`—(Optional) Display information about MPLS LSPs designated as backup routes for all logical systems or a specific logical system.
- `realm (ipv4-unicast | ipv6-unicast)`—(Optional) (OSPFv3 only) Display information about MPLS LSPs designated as backup routes for a specific realm, or address family.

Required Privilege

<area area-id>
<instance instance-name>
<topology (default | ipv4-multicast | topology-name)>

Release Information
Command introduced in Junos OS Release 10.0.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description
Display the neighbors through which direct next hops for the backup paths are available.

Options
none—Display all neighbors that have direct next hops for backup paths.
area area-id—(Optional) Display the area information.
instance (default | instance-name)—(Optional) Display information about the default routing instance or a particular routing instance.
logical-system (default | ipv4-multicast | logical-system-name)—(Optional) Display information about the default logical system, IPv4 multicast logical system, or a particular logical system.
topology (default | ipv4-multicast | topology-name)—(OSPFv2 only) (Optional) Display information about the default topology, IPv4 multicast topology, or a particular topology.

List of Sample Output
show ospf backup neighbor on page 2170

Output Fields
Table 153 on page 2170 lists the output fields for the show (ospf | ospf3) backup neighbor command. Output fields are listed in the approximate order in which they appear.
### Table 153: show (ospf | ospf3) backup neighbor Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor to Self Metric</td>
<td>Metric from the backup neighbor to the OSPF node.</td>
<td>All levels</td>
</tr>
<tr>
<td>Self to Neighbor Metric</td>
<td>Metric from the OSPF node to the backup neighbor.</td>
<td>All levels</td>
</tr>
<tr>
<td>Direct next-hop</td>
<td>Interface and address of the direct next hop.</td>
<td>All levels</td>
</tr>
</tbody>
</table>

### Sample Output

**show ospf backup neighbor**

```
user@host> show ospf backup neighbor
Topology default backup neighbors:

Area 0.0.0.5 backup neighbors:

10.0.0.5
Neighbor to Self Metric: 5
Self to Neighbor Metric: 5
Direct next-hop: ge-4/0/0.111 via 10.0.175.5

10.0.0.6
Neighbor to Self Metric: 5
Self to Neighbor Metric: 5
Direct next-hop: ge-4/1/0.110 via 10.0.176.6
```
show (ospf | ospf3) backup spf

Syntax

show (ospf | ospf3) backup spf
  <brief | detail>
  <area area-id>
  <instance instance-name>
  <logical-system (all | logical-system-name)>
  <no-coverage>
  <node-id>
  <realm (ipv4–unicast | ipv6–unicast)>
  <topology (default | ipv4-mcast | topology-name)>

Syntax (QFX Series)

show (ospf | ospf3) backup spf
  <brief | detail>
  <area area-id>
  <instance instance-name>
  <no-coverage>
  <node-id>
  <topology (default | ipv4-mcast | topology-name)>

Release Information

Command introduced in Junos OS Release 10.0.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Display information about OSPF shortest-path-first calculations for backup paths.

Options

none—Display information about OSPF shortest-path-first (SPF) calculations for all
backup paths for all destination nodes.

brief | detail—(Optional) Display the specified level of output.

area area-id—(Optional) Display the area information.

instance instance-name—(Optional) Display information about the routing instance.

logical-system (all | logical-system-name)—(Optional) Display information about all
logical systems or a specific logical system.

no-coverage—(Optional) Display information if there is no backup coverage.

node-id—(Optional) Display information about the node specified.

realm (ipv4–unicast | ipv6–unicast)—(Optional) Display information about the ipv4 or
ipv6 realm.

topology (default | ipv4-mcast | topology-name)—(Optional) (OSPFv2 only) Display
information about the default topology, IPv4 multicast topology, or a specific topology.

Required Privilege

view
Sample Output

```
show ospf backup spf

user@host> show ospf backup spf

Topology default results:

Area 0.0.0.0 results:

# show ospf context-identifier

## List of Syntax

Syntax on page 2178
Syntax (EX Series Switches and QFX Series) on page 2178

```markdown
**Syntax**

`show ospf context-identifier`

- `<brief | detail>`
- `<area area-id>`
- `<context-id>`
- `<instance instance-name>`
- `<logical-system (all | logical-system-name)>`
```

## Syntax (EX Series Switches and QFX Series)

```markdown
**Syntax**

`show ospf context-identifier`

- `<brief | detail>`
- `<area area-id>`
- `<context-id>`
- `<instance instance-name>`
```

## Release Information

Command introduced in Junos OS Release 10.4.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

## Description

Display the context identifier information processed and advertised by Open Shortest Path First (OSPF) for egress protection.

## Options

- **none**—Display information about all context identifiers.
- **brief | detail**—(Optional) Display the specified level of output.
- **area area-id**—(Optional) Display information about the context identifier for the specified area.
- **context-id**—(Optional) Display information about the specified context identifier.
- **instance instance-name**—(Optional) Display information about the context identifier for the specified routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- `advertising-router self (address | self)` option introduced in Junos OS Release 9.5.
- `advertising-router self (address | self)` option introduced in Junos OS Release 9.5 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display the entries in the OSPF version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.

**Options**

- `none`—Display standard information about entries in the OSPFv2 link-state database for all routing instances.
brief | detail | extensive | summary—(Optional) Display the specified level of output.

advertising-router (address | self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

area area-id—(Optional) Display the LSAs in a particular area.

asbrsummary—(Optional) Display summary AS boundary router LSA entries.

external—(Optional) Display external LSAs.

instance instance-name—(Optional) Display all OSPF database information under the named routing instance.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id lsa-id—(Optional) Display the LSA with the specified LSA identifier.

netsummary—(Optional) Display summary network LSAs.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Display opaque area-scope LSAs.

router—(Optional) Display information about router LSAs.

**show ospf3 database**

**List of Syntax**  
Syntax on page 2191  
Syntax (EX Series Switches and QFX Series) on page 2191

**Syntax**
```
show ospf3 database
  <brief | detail | extensive | summary>
  <advertising-router (address | self)>
  <area area-id>
  <external>
  <instance instance-name>
  <inter-area-prefix>
  <inter-area-router>
  <intra-area-prefix>
  <link>
  <link-local>
  <logical-system (all | logical-system-name)>
  <lsa-id lsa-id>
  <network>
  <nssa>
  <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
  <router>
```

**Syntax (EX Series Switches and QFX Series)**
```
show ospf3 database
  <brief | detail | extensive | summary>
  <advertising-router (address | self)>
  <area area-id>
  <external>
  <instance instance-name>
  <inter-area-prefix>
  <inter-area-router>
  <intra-area-prefix>
  <link>
  <link-local>
  <logical-system (all | logical-system-name)>
  <lsa-id lsa-id>
  <network>
  <nssa>
  <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
  <router>
```

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
**realm** option introduced in Junos OS Release 9.2.  
**advertising-router (address | self)** option introduced in Junos Release 9.5.  
**advertising-router (address | self)** option introduced in Junos OS Release 9.5 for EX Series switches.  
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**  
Display the entries in the OSPF version 3 (OSPFv3) link-state database, which contains data about link-state advertisement (LSA) packets.
Options

none—Display standard information about all entries in the OSPFv3 link-state database.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

advertising-router (address | self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

area area-id—(Optional) Display the LSAs in a particular area.

external—(Optional) Display external LSAs.

instance instance-name—(Optional) Display all OSPF database information under the named routing instance.

inter-area-prefix—(Optional) Display information about inter-area-prefix LSAs.

inter-area-router—(Optional) Display information about inter-area-router LSAs.

intra-area-prefix—(Optional) Display information about intra-area-prefix LSAs.

link—(Optional) Display information about link LSAs.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id lsa-id—(Optional) Display the LSA with the specified LSA identifier.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the realm option to specify an address family other than IPv6 unicast, which is the default.

router—(Optional) Display information about router LSAs.

  <brief | detail | extensive>
  <area area-id>
  <interface-name>
  <instance instance-name>
  <logical-system (all | logical-system-name)>
  <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
```

**Syntax (EX Series Switches and QFX Series)**

```
show (ospf | ospf3) interface
  <brief | detail | extensive>
  <area area-id>
  <interface-name>
  <instance instance-name>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
area option introduced in Junos OS Release 9.2.
area option introduced in Junos OS Release 9.2 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display the status of OSPF interfaces.

**Options**

- **none**—Display standard information about the status of all OSPF interfaces for all routing instances
- **brief | detail | extensive**—(Optional) Display the specified level of output.
- **area area-id**—(Optional) Display information about the interfaces that belong to the specified area.
- **interface-name**—(Optional) Display information for the specified interface.
- **instance instance-name**—(Optional) Display all OSPF interfaces under the named routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Display information about the interfaces for the specified OSPFv3 realm, or address
family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Required Privilege Level**
- **view**

**List of Sample Output**
- `show ospf interface brief` on page 2205
- `show ospf interface detail` on page 2205
- `show ospf3 interface detail` on page 2205
- `show ospf interface detail (When Multiarea Adjacency Is Configured)` on page 2206
- `show ospf interface extensive (When Flooding Reduction Is Enabled)` on page 2207
- `show ospf interface extensive (When LDP Synchronization Is Configured)` on page 2207

**Output Fields**
Table 158 on page 2203 lists the output fields for the `show (ospf | ospf3) interface` command. Output fields are listed in the approximate order in which they appear.

**Table 158: show (ospf | ospf3) interface Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Name of the interface running OSPF version 2 or OSPF version 3.</td>
<td>All levels</td>
</tr>
<tr>
<td>State</td>
<td>State of the interface: BDR, Down, DR, DROther, Loop, PtToPt, or Waiting.</td>
<td>All levels</td>
</tr>
<tr>
<td>Area</td>
<td>Number of the area that the interface is in.</td>
<td>All levels</td>
</tr>
<tr>
<td>DR ID</td>
<td>Address of the area's designated router.</td>
<td>All levels</td>
</tr>
<tr>
<td>BDR ID</td>
<td>Backup designated router for a particular subnet.</td>
<td>All levels</td>
</tr>
<tr>
<td>Nbrs</td>
<td>Number of neighbors on this interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Type</td>
<td>Type of interface: LAN, NBMA, P2MP, P2P, or Virtual.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Address</td>
<td>IP address of the neighbor.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Mask</td>
<td>Netmask of the neighbor.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Prefix-length</td>
<td>(OSPFv3) IPv6 prefix length, in bits.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>OSPF3-Intf-index</td>
<td>(OSPFv3) OSPF version 3 interface index.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>MTU</td>
<td>Interface maximum transmission unit (MTU).</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Cost</td>
<td>Interface cost (metric).</td>
<td>detail extensive</td>
</tr>
<tr>
<td>DR addr</td>
<td>Address of the designated router.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>BDR addr</td>
<td>Address of the backup designated router.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>
### Table 158: show (ospf | ospf3) interface Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adj count</td>
<td>Number of adjacent neighbors.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Secondary</td>
<td>Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface for only one area.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Flood Reduction</td>
<td>Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the DoNotAge bit set. As a result, LSAs are refreshed only when a change occurs.</td>
<td>extensive</td>
</tr>
<tr>
<td>Priority</td>
<td>Router priority used in designated router (DR) election on this interface.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Flood list</td>
<td>List of link-state advertisements (LSAs) that might be about to flood this interface.</td>
<td>extensive</td>
</tr>
<tr>
<td>Ack list</td>
<td>Acknowledgment list. List of pending acknowledgments on this interface.</td>
<td>extensive</td>
</tr>
<tr>
<td>Descriptor list</td>
<td>List of packet descriptors.</td>
<td>extensive</td>
</tr>
<tr>
<td>Hello</td>
<td>Configured value for the hello timer.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Dead</td>
<td>Configured value for the dead timer.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Auth type</td>
<td>(OSPFv2) Authentication mechanism for sending and receiving OSPF protocol packets:</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>• MD5—The MD5 mechanism is configured in accordance with RFC 2328.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• None—No authentication method is configured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Password—A simple password (RFC 2328) is configured.</td>
<td></td>
</tr>
<tr>
<td>Topology</td>
<td>(Multiarea adjacency) Name of topology: default or name.</td>
<td></td>
</tr>
<tr>
<td>LDP sync state</td>
<td>(OSPFv2 and LDP synchronization) Current state of LDP synchronization: in sync. in holddown, and not supported.</td>
<td>extensive</td>
</tr>
<tr>
<td>reason</td>
<td>(OSPFv2 and LDP synchronization) Reason for the current state of LDP synchronization. The LDP session might be up or down, or adjacency might be up or down.</td>
<td>extensive</td>
</tr>
<tr>
<td>config holdtime</td>
<td>(OSPFv2 and LDP synchronization) Configured value of the hold timer.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>If the state is not synchronized, and the hold time is not infinity, the remaining field displays the number of seconds that remain until the configured hold timer expires.</td>
<td></td>
</tr>
<tr>
<td>IPSec SA name</td>
<td>(OSPFv2) Name of the IPSec security association name.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Active key ID</td>
<td>(OSPFv2 and MD5) Number from 0 to 255 that uniquely identifies an MD5 key.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>
### Table 158: show (ospf | ospf3) interface Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Start time</strong></td>
<td>(OSPFv2 and MD5) Time at which the routing device starts using an MD5 key to authenticate OSPF packets transmitted on the interface on which this key is configured. To authenticate received OSPF protocol packets, the key becomes effective immediately after the configuration is committed. If the start time option is not configured, the key is effective immediately for send and receive and is displayed as Start time 1970 Jan 01 00:00:00 PST.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>ReXmit</strong></td>
<td>Configured value for the Retransmit timer.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>Stub, Not Stub, or Stub NSSA</strong></td>
<td>Type of area.</td>
<td>detail extensive</td>

show (ospf | ospf3) log

**List of Syntax**
Syntax on page 2210
Syntax (EX Series Switch and QFX Series) on page 2210

**Syntax**

```plaintext
show (ospf | ospf3) log
  <instance instance-name>
  <logical-system (all | logical-system-name)>
  <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
  <topology topology-name>
```

**Syntax (EX Series Switch and QFX Series)**

```plaintext
show (ospf | ospf3) log
  <instance instance-name>
  <topology topology-name>
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
topology option introduced in Junos OS Release 9.0.
topology option introduced in Junos OS Release 9.0 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**
Display the entries in the Open Shortest Path First (OSPF) log of SPF calculations.

**Options**

- none—Display entries in the OSPF log of SPF calculations for all routing instances.
- instance instance-name—(Optional) Display entries for the specified routing instance.
- logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
- topology topology-name—(Optional) (OSPFv2 only) Display entries for the specified topology.
- realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display entries for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

show (ospf | ospf3) neighbor

List of Syntax  Syntax on page 2213
Syntax (EX Series Switches and QFX Series) on page 2213

Syntax

```
show (ospf | ospf3) neighbor
  <brief | detail | extensive>
  <area area-id>
  <instance (all | instance-name)>
  <interface interface-name>
  <logical-system (all | logical-system-name)>
  <neighbor>
  <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
```

Syntax (EX Series Switches and QFX Series)

```
show (ospf | ospf3) neighbor
  <brief | detail | extensive>
  <area area-id>
  <instance (all | instance-name)>
  <interface interface-name>
  <neighbor>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
instance all option introduced in Junos OS Release 9.1.
instance all option introduced in Junos OS Release 9.1 for EX Series switches.
area, interface, and realm options introduced in Junos OS Release 9.2.
area and interface options introduced in Junos OS Release 9.2 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about OSPF neighbors.

CPU utilization might increase while the device learns its OSPF neighbors. We recommend that you use the show (ospf | ospf3) neighbor command after the device learns and establishes OSPF neighbor adjacencies. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the show (ospf | ospf3) neighbor command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the CLI.

Options

none—Display standard information about all OSPF neighbors for all routing instances.
brief | detail | extensive—(Optional) Display the specified level of output.
area area-id—(Optional) Display information about the OSPF neighbors for the specified area.
instance (all | instance-name)—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.

interface interface-name—(Optional) Display information about OSPF neighbors for the specified logical interface.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Display information about the specified OSPF neighbor.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Output Fields**

Table 161 on page 2214 lists the output fields for the show (ospf | ospf3) neighbor command. Output fields are listed in the approximate order in which they appear.

**Table 161: show (ospf | ospf3) neighbor Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>Address of the neighbor.</td>
<td>All levels</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface through which the neighbor is reachable.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
### Table 161: `show ospf | ospf3 neighbor` Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>State</strong></td>
<td>State of the neighbor:</td>
<td>All levels</td>
</tr>
<tr>
<td>• Attempt—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Down—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the Down state, although at a reduced frequency.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Exchange—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• ExStart—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Full—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Init—A hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state may occur, for example, because the routing device itself did not appear in the neighbor’s hello packet.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Loading—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the Exchange state.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• 2Way—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state 2Way or greater.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ID</td>
<td>Router ID of the neighbor.</td>
<td>All levels</td>
</tr>
<tr>
<td>Pri</td>
<td>Priority of the neighbor to become the designated router.</td>
<td>All levels</td>
</tr>
<tr>
<td>Dead</td>
<td>Number of seconds until the neighbor becomes unreachable.</td>
<td>All levels</td>
</tr>
<tr>
<td>Link state acknowledgment list</td>
<td>Number of link-state acknowledgments received.</td>
<td>extensive</td>
</tr>
<tr>
<td>Link state retransmission list</td>
<td>Total number of link-state advertisements retransmitted. For extensive output only, the following information is also displayed:</td>
<td>detail extensive</td>
</tr>
<tr>
<td>• Type—Type of link advertisement: ASBR, Sum, Extern, Network, NSSA, OpaqArea, Router, or Summary.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• LSA ID—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Advrtr—Address of the routing device that sent the advertisement.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Seq—Link sequence number of the advertisement.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

show (ospf | ospf3) route

### List of Syntax

Syntax on page 2226
Syntax (EX Series Switch and QFX Series) on page 2226

#### Syntax

- `show (ospf | ospf3) route`
- `<brief | detail | extensive>`
- `<abr | asbr | extern | inter | intra>`
- `<destination>`
- `<instance (default | ipv4-multicast | instance-name)>`
- `<logical-system (default | ipv4-multicast | logical-system-name)>`
- `<network>`
- `<no-backup-coverage>`
- `<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)`
- `<router>`
- `<topology (default | ipv4-multicast | topology-name)`
- `<transit>`

#### Syntax (EX Series Switch and QFX Series)

- `show (ospf | ospf3) route`
- `<brief | detail | extensive>`
- `<abr | asbr | extern | inter | intra>`
- `<destination>`
- `<instance instance-name>`
- `<network>`
- `<no-backup-coverage>`
- `<router>`
- `<topology (default | ipv4-multicast | topology-name)`
- `<transit>`

### Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- `topology` option introduced in Junos OS Release 9.0.
- `realm` option introduced in Junos OS Release 9.2.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

### Description

Display the entries in the Open Shortest Path First (OSPF) routing table.

### Options

- `none`—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.
- `destination`—Display routes to the specified IP address (with optional destination prefix length).
- `brief | detail | extensive`—(Optional) Display the specified level of output.
- `abr`—(Optional) Display routes to area border routers.
- `asbr`—(Optional) Display routes to autonomous system border routers.
extern—(Optional) Display external routes.

inter—(Optional) Display interarea routes.

intra—(Optional) Display intra-area routes.

instance (default | ipv4-multicast | instance-name)—(Optional) Display entries for the default routing instance, the IPv4 multicast routing instance, or for the specified routing instance.

logical-system (default | ipv4-multicast | logical-system-name)—(Optional) Perform this operation on the default logical system, the IPv4 multicast logical system, or on a particular logical system.

network—(Optional) Display routes to networks.

no-backup-coverage—(Optional) Display routes with no backup coverage.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Display routes to all routers.

topology (default | ipv4-multicast | topology-name)—(OSPFv2 only) (Optional) Display routes for the default OSPF topology, IPv4 multicast topology, or for a particular topology.

transit—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

Required Privilege Level

view

</tbody>
</table>
Table 163: show (ospf | ospf3) route Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Output Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prefix</td>
<td>Destination of the route.</td>
<td>All levels</td>
</tr>
<tr>
<td>Path type</td>
<td>How the route was learned:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• Inter—Interarea route</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Ext1—External type 1 route</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Ext2—External type 2 route</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• intra—Intra-area route</td>
<td></td>
</tr>
<tr>
<td>Route type</td>
<td>The type of routing device from which the route was learned:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• AS BR—Route to AS border router.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Area BR—Route to area border router.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Area/AS BR—Route to router that is both an Area BR and AS BR.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Network—Network router.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Router—Route to a router that is neither an Area BR nor an AS BR.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Transit—(OSPFv3 only) Route to a pseudonode representing a transit network, LAN, or nonbroadcast multiaccess (NBMA) link.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Discard—Route to a summary discard.</td>
<td></td>
</tr>
<tr>
<td>NH Type</td>
<td>Next-hop type: LSP or IP.</td>
<td>All levels</td>
</tr>
<tr>
<td>Metric</td>
<td>Route's metric value.</td>
<td>All levels</td>
</tr>
<tr>
<td>NH-interface</td>
<td>(OSPFv3 only) Interface through which the route's next hop is reachable.</td>
<td>All levels</td>
</tr>
<tr>
<td>NH-addr</td>
<td>(OSPFv3 only) IPv6 address of the next hop.</td>
<td>All levels</td>
</tr>
<tr>
<td>NextHop Interface</td>
<td>(OSPFv2 only) Interface through which the route's next hop is reachable.</td>
<td>All levels</td>
</tr>
<tr>
<td>Nexthop addr/label</td>
<td>(OSPFv2 only) If the NH Type is IP, then it is the address of the next hop. If the NH Type is LSP, then it is the name of the label-switched path.</td>
<td>All levels</td>
</tr>
<tr>
<td>Area</td>
<td>Area ID of the route.</td>

show (ospf | ospf3) statistics
  <instance instance-name>
```

Release Information  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
realm option introduced in Junos OS Release 9.2.  
Command introduced in Junos OS Release 11.3 for the QFX Series.  
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description  
Display OSPF statistics.

Options  
none—Display OSPF statistics for all routing instances.

  instance instance-name—(Optional) Display all statistics for the specified routing instance.

  logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

  realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display all statistics for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

show as-path

List of Syntax  Syntax on page 2241
Syntax (EX Series Switches) on page 2241

Syntax  show as-path
       <brief | detail>
       <logical-system (all | logical-system-name)>

Syntax (EX Series Switches)  show as-path
       <brief | detail>

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description  Display the distribution of autonomous system (AS) paths that the local routing device
is using (usually through the routing table). Use this command to debug problems for
AS paths and to understand how AS paths have been manipulated through a policy
(through the as-path-prepend action) or through aggregation.

AS paths are stored in a hash table. A hash table is one method for fast lookup. Each
entry in the table is called a bucket. Junos OS computes a hash value that indicates in
which bucket the AS path is stored. The AS paths are dispersed among the hash buckets
so that a manageable number of AS paths is stored in each bucket. Only unique AS paths
are stored. Duplicate AS paths increase a reference count, but do not increase the number
of AS paths stored in the hash table.

Options  none—Display basic information about AS paths that the local routing device is using
(same as brief).

brief | detail—(Optional) Display the specified level of output.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all
logical systems or on a particular logical system.

Required Privilege Level  view

</tr>
<tr>
<td>Count</td>
<td>Number of AS path entries in this bucket.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
| **AS path** | AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:  
  - I—IGP.  
  - E—EGP.  
  - ?—Incomplete; typically, the AS path was aggregated.  
  - Atomic—Route is an aggregate of several route prefixes.  
  - Aggregator—Routing device has summarized a range of prefixes. | All levels |
| domain | Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain. | detail |
| neighbor as | AS peer address. | detail |
| length | Length of the AS path. | detail |
| segments | Length of the AS segment descriptor. | detail |
| unique-count | Number of unique autonomous systems (ASs) present in the AS path | detail |
| references | Path reference count. | detail |

<te-ipv4-prefix-ip te-ipv4-prefix-ip>
<te-ipv4-prefix-node-ip te-ipv4-prefix-node-ip>
<te-ipv4-prefix-node-iso te-ipv4-prefix-node-iso>

Syntax (EX Series Switches)  
show route
<all>
<destination-prefix>
<private>

Release Information  
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Option private introduced in Junos OS Release 9.5.
Option private introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.
Options te-ipv4-prefix-ip, te-ipv4-prefix-node-ip, and te-ipv4-prefix-node-iso introduced in Junos OS Release 17.2R1 on MX Series and PTX Series.

Description  
Display the active entries in the routing tables.

Options  
none—Display brief information about all active entries in the routing tables.

all—(Optional) Display information about all routing tables, including private, or internal, routing tables.

destination-prefix—(Optional) Display active entries for the specified address or range of addresses.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

private—(Optional) Display information only about all private, or internal, routing tables.

display-client-data—(Optional) Display client id and cookie information for routes installed by the routing protocol process client applications.
te-ipv4-prefix-ip  te-ipv4-prefix-ip—(Optional) Display IPv4 address of the traffic-engineering prefix, without the mask length if present in the routing table.

te-ipv4-prefix-node-ip  te-ipv4-prefix-node-ip—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 node addresses from the traffic-engineered routes in the Isdist.0 table.

te-ipv4-prefix-node-iso  te-ipv4-prefix-node-iso—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 routes with the specified ISO circuit ID from the Isdist.0 table.

Output Fields

Table 168 on page 2252 describes the output fields for the show route command. Output fields are listed in the approximate order in which they appear.

Table 168: show route Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routing-table-name</td>
<td>Name of the routing table (for example, inet.0).</td>
</tr>
</tbody>
</table>
Table 168: show route Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
</tr>
<tr>
<td>number routes</td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
</tr>
<tr>
<td></td>
<td>• active (routes that are active).</td>
</tr>
<tr>
<td></td>
<td>• holdown (routes that are in the pending state before being declared inactive). A holdown route</td>
</tr>
<tr>
<td></td>
<td>was once the active route and is no longer the active route. The route is in the holdown state</td>
</tr>
<tr>
<td></td>
<td>because a protocol still has interest in the route, meaning that the interest bit is set. A</td>
</tr>
<tr>
<td></td>
<td>protocol might have its interest bit set on the previously active route because the protocol is</td>
</tr>
<tr>
<td></td>
<td>still advertising the route. The route will be deleted after all protocols withdraw their</td>
</tr>
<tr>
<td></td>
<td>advertisement of the route and remove their interest bit. A persistent holdown state often means</td>
</tr>
<tr>
<td></td>
<td>that the interested protocol is not releasing its interest bit properly.</td>
</tr>
<tr>
<td></td>
<td>However, if you have configured advertisement of multiple routes (with the add-path or</td>
</tr>
<tr>
<td></td>
<td>advertise-inactive statement), the holdown bit is most likely set because BGP is advertising the</td>
</tr>
<tr>
<td></td>
<td>route as an active route. In this case, you can ignore the holdown state because nothing is wrong.</td>
</tr>
<tr>
<td></td>
<td>• hidden (routes that are not used because of a routing policy).</td>
</tr>
<tr>
<td>destination-prefix</td>
<td>Route destination (for example: 10.0.0.1/24). Sometimes the route information is presented in another</td>
</tr>
<tr>
<td></td>
<td>format, such as:</td>
</tr>
<tr>
<td></td>
<td>• MPLS-label (for example, 80001).</td>
</tr>
<tr>
<td></td>
<td>• interface-name (for example, ge-1/0/2).</td>
</tr>
<tr>
<td></td>
<td>• neighbor-address:control-word-status:encapsulation type:vc-id:source (Layer 2 circuit only. For</td>
</tr>
<tr>
<td></td>
<td>example, 10.11.195:NoCtrlWord:1:1:Local/96):</td>
</tr>
<tr>
<td></td>
<td>• neighbor-address—Address of the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• control-word-status—Whether the use of the control word has been negotiated for this virtual</td>
</tr>
<tr>
<td></td>
<td>circuit: NoCtrlWord or CtrlWord.</td>
</tr>
<tr>
<td></td>
<td>• encapsulation type—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2)</td>
</tr>
<tr>
<td></td>
<td>ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet,</td>
</tr>
<tr>
<td></td>
<td>(6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</td>
</tr>
<tr>
<td></td>
<td>• vc-id—Virtual circuit identifier.</td>
</tr>
<tr>
<td></td>
<td>• source—Source of the advertisement: Local or Remote.</td>
</tr>
<tr>
<td>protocol, preference</td>
<td>Protocol from which the route was learned and the preference value for the route.</td>
</tr>
<tr>
<td></td>
<td>• +—A plus sign indicates the active route, which is the route installed from the routing table into</td>
</tr>
<tr>
<td></td>
<td>the forwarding table.</td>
</tr>
<tr>
<td></td>
<td>• −—A hyphen indicates the last active route.</td>
</tr>
<tr>
<td></td>
<td>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk</td>
</tr>
<tr>
<td></td>
<td>before a to line indicates the best subpath to the route.</td>
</tr>
</tbody>
</table>

In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1’s complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.

| weeks:days hours:minutes:seconds | How long the route been known (for example, 2w4d 13:11:14, or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds). |
### Table 168: show route Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metric</td>
<td>Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.</td>
</tr>
<tr>
<td>localpref</td>
<td>Local preference value included in the route.</td>
</tr>
<tr>
<td>from</td>
<td>Interface from which the route was received.</td>
</tr>
</tbody>
</table>
| AS path    | AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:  
- I—IGP.  
- E—EGP.  
- ?—Incomplete; typically, the AS path was aggregated.  
When AS path numbers are included in the route, the format is as follows:  
- [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.  
- { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.  
- ( )—Parentheses enclose a confederation.  
- ( [ ] )—Parentheses and brackets enclose a confederation set.  
**NOTE:** In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance. |
| encapsulated | Extended next-hop encoding capability enabled for the specified BGP community for routing IPv4 traffic over IPv6 tunnels. When BGP receives routes without the tunnel community, IPv4-Over IPv6 tunnels are not created and BGP routes are resolved without encapsulation. |
| Route Labels | Stack of labels carried in the BGP route update. |
| validation-state | (BGP-learned routes) Validation status of the route:  
- Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.  
- Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database.  
- Unverified—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.  
- Valid—Indicates that the prefix and autonomous system pair are found in the database. |
| to          | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.  
If the destination is Discard, traffic is dropped. |
### Table 168: show route Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>via</strong></td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <strong>Selected</strong>. This field can also contain the following information:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Weight</strong>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Balance</strong>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</td>
</tr>
<tr>
<td></td>
<td>• <strong>lsp-path-name</strong>—Name of the LSP used to reach the next hop.</td>
</tr>
<tr>
<td></td>
<td>• <strong>label-action</strong>—MPLS label and operation occurring at the next hop. The operation can be <strong>pop</strong> (where a label is removed from the top of the stack), <strong>push</strong> (where another label is added to the label stack), or <strong>swap</strong> (where a label is replaced by another label). For VPNs, expect to see multiple <strong>push</strong> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</td>
</tr>
</tbody>
</table>

#### Private unicast

(Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes not managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.

#### balance

Distribution of the load based on the underlying operational interface bandwidth for equal-cost multipaths (ECMP) across the next-hop gateways in percentages.

### Sample Output

**show route**

```
user@host> show route

inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
  *[MVPN/70] 19:53:41, metric 2
  Indirect

1:65500:1:10.0.0.40/240
  *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
  AS path: I
  > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
  [BGP/170] 19:53:26, localpref 100, from 10.0.0.33
  AS path: I
  > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD

1:65500:1:10.0.0.60/240
  *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
  AS path: I
  > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
  [BGP/170] 19:53:25, localpref 100, from 10.0.0.33
  AS path: I
  > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
```
show route (VPN)

The following sample output shows a VPN route with composite next hops enabled. The first Push operation corresponds to the outer label. The second Push operation corresponds to the inner label.

```
user@host> show route 192.0.2.0

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0 hidden)

show route active-path

List of Syntax  Syntax on page 2273
Syntax (EX Series Switches) on page 2273

Syntax  
show route active-path
   <brief | detail | extensive | terse>
   <logical-system (all | logical-system-name)>

Syntax (EX Series Switches)  
show route active-path
   <brief | detail | extensive | terse>

Release Information  
Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Display all active routes for destinations. An active route is a route that is selected as the best path. Inactive routes are not displayed.

Options  
none—Display all active routes.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege  
view

List of Sample Output  
show route active-path on page 2273
show route active-path brief on page 2274
show route active-path detail on page 2274
show route active-path extensive on page 2275
show route active-path terse on page 2277

Output Fields  
For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

Sample Output  
show route active-path

user@host> show route active-path
inet.0: 7 destinations, 7 routes (6 active, 0 holddown, 1 hidden)
show route active-path brief

The output for the `show route active-path brief` command is identical to that for the `show route active-path` command. For sample output, see `show route active-path` on page 2273.

show route active-path detail

show route advertising-protocol

Syntax

show route advertising-protocol protocol neighbor-address
   <brief | detail | extensive | terse>
   <logical-system (all | logical-system-name)>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display the routing information as it has been prepared for advertisement to a particular neighbor of a particular dynamic routing protocol.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor-address—Address of the neighboring router to which the route entry is being transmitted.

protocol—Protocol transmitting the route:

- bgp—Border Gateway Protocol
- dvmrp—Distance Vector Multicast Routing Protocol
- msdp—Multicast Source Discovery Protocol
- pim—Protocol Independent Multicast
- rip—Routing Information Protocol
- ripng—Routing Information Protocol next generation

Additional Information

Routes displayed are routes that the routing table has exported into the routing protocol and that have been filtered by the associated protocol's export routing policy statements. Starting with Junos OS Release 13.3, you can display the routing instance table foo for any address family, on a VPN route reflector, or a VPN AS boundary router that is advertising local VPN routes. However, if you do not specify the table in the command, the output displays each VRF prefix twice.

Required Privilege

show route advertising-protocol bgp detail (Aggregate Extended Community Bandwidth) on page 2281
show route advertising-protocol bgp detail (Labeled Unicast) on page 2282
show route advertising-protocol bgp detail (Layer 2 VPN) on page 2282
show route advertising-protocol bgp detail (Layer 3 VPN) on page 2282
show route advertising-protocol bgp extensive all (Next Hop Self with RIB-out IP Address) on page 2283

Output Fields  Table 169 on page 2279 lists the output fields for the show route advertising-protocol command. Output fields are listed in the approximate order in which they appear.

Table 169: show route advertising-protocol Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>routing-table-name</td>
<td>Name of the routing table—for example, inet.0.</td>
<td>All levels</td>
</tr>
<tr>
<td>number destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
| number routes           | Number of routes in the routing table and total number of routes in the following states:  
  • active (routes that are active)  
  • hold down (routes that are in the pending state before being declared inactive)  
  • hidden (routes that are not used because of a routing policy) | All levels      |
| Prefix                  | Destination prefix.                                                              | brief none      |
| destination-prefix      | Destination prefix. The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination. | detail extensive |
| BGP group and type      | BGP group name and type (Internal or External).                                   | detail extensive |
| Route Distinguisher     | Unique 64-bit prefix augmenting each IP subnet.                                   | detail extensive |
| Advertised Label        | Incoming label advertised by the Label Distribution Protocol (LDP). When an IP packet enters a label-switched path (LSP), the ingress router examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label. | detail extensive |
| Label-Base, range       | First label in a block of labels and label block size. A remote PE router uses this first label when sending traffic toward the advertising PE router. | detail extensive |
| VPN Label               | Virtual private network (VPN) label. Packets are sent between CE and PE routers by advertising VPN labels. VPN labels transit over either a Resource Reservation Protocol (RSVP) or a Label Distribution Protocol (LDP) label-switched path (LSP) tunnel. | detail extensive |
### Table 169: show route advertising-protocol Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Nexthop</strong></td>
<td>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route. If the next-hop advertisement to the peer is <strong>Self</strong>, and the RIB-out next hop is a specific IP address, the RIB-out IP address is included in the extensive output. See show route advertising-protocol bgp extensive all (Next Hop Self with RIB-out IP Address) on page 2283.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>MED</strong></td>
<td>Multiple exit discriminator value included in the route.</td>
<td><strong>brief</strong></td>
</tr>
<tr>
<td><strong>Lclpref or Localpref</strong></td>
<td>Local preference value included in the route.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>Queued</strong></td>
<td>When BGP route prioritization is enabled and a route is present in a priority queue, this shows which priority queue the route is in.</td>
<td>All levels except <strong>brief</strong></td>
</tr>
</tbody>
</table>
| **AS path** | AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:  
  - I—IGP.  
  - E—EGP.  
  - ?—Incomplete; typically, the AS path was aggregated.  
  When AS path numbers are included in the route, the format is as follows:  
  - [ ]—Brackets enclose the local AS number associated with the AS path if configured on the router, or if AS path prepending is configured.  
  - { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.  
  - ( )—Parentheses enclose a confederation.  
  - ( [ ])—Parentheses and brackets enclose a confederation set.  
  **NOTE:** In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance. | All levels |
| **Route Labels** | Stack of labels carried in the BGP route update. | **detail extensive** |
| **Cluster list** | (For route reflected output only) Cluster ID sent by the route reflector. | **detail extensive** |
| **Originator ID** | (For route reflected output only) Address of routing device that originally sent the route to the route reflector. | **detail extensive** |
| **Communities** | Community path attribute for the route. See the output field table for the show route detail command for all possible values for this field. | **detail extensive** |
| **AIGP** | Accumulated interior gateway protocol (AIGP) BGP attribute. | **detail extensive** |

### show route all

**List of Syntax**
- Syntax on page 2284
- Syntax (EX Series Switches) on page 2284

**Syntax**
```
  show route all
  <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**
- show route all

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display information about all routes in all routing tables, including private, or internal, tables.

**Options**
- `none`—Display information about all routes in all routing tables, including private, or internal, tables.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**
- view

**Related Documentation**
- show route brief on page 2291
- show route detail on page 2304

**List of Sample Output**
- show route all on page 2284

**Output Fields**
In Junos OS Release 9.5 and later, only the output fields for the `show route all` command display all routing tables, including private, or hidden, routing tables. The output field table of the `show route` command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later.

**Sample Output**
```
show route all
```

The following example displays a snippet of output from the `show route` command and then displays the same snippet of output from the `show route all` command:
```
user@host> show route
```
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete

**show route aspath-regex**

**List of Syntax**  
Syntax on page 2286  
Syntax (EX Series Switches) on page 2286

**Syntax**  
`show route aspath-regex regular-expression`  
`<logical-system (all | logical-system-name)>`

**Syntax (EX Series Switches)**  
`show route aspath-regex regular-expression`

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.

**Options**  
`regular-expression`—Regular expression that matches an entire AS path.  
`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Additional Information**  
You can specify a regular expression as:

- An individual AS number
- A period wildcard used in place of an AS number
- An AS path regular expression that is enclosed in parentheses

You also can include the operators described in the table of AS path regular expression operators in the *Junos Policy Framework Configuration Guide*. The following list summarizes these operators:

- `{m,n}`—At least `m` and at most `n` repetitions of the AS path term.
- `{m}`—Exactly `m` repetitions of the AS path term.
- `{m,}`—`m` or more repetitions of the AS path term.
- `*`—Zero or more repetitions of an AS path term.
- `+`—One or more repetitions of an AS path term.
- `?`—Zero or one repetition of an AS path term.
- `aspath_term | aspath_term`—Match one of the two AS path terms.

When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:
show route aspath-regex ".*234.*"

**Required Privilege**

show route best

List of Syntax

Syntax on page 2288
Syntax (EX Series Switches) on page 2288

Syntax

show route best destination-prefix
  <brief | detail | extensive | terse>
  <logical-system (all | logical-system-name)>

Syntax (EX Series Switches)

show route best destination-prefix
  <brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the route in the routing table that is the best route to the specified address or range of addresses. The best route is the longest matching route.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

destination-prefix—Address or range of addresses.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show route community

**List of Syntax**
- Syntax on page 2295
- Syntax (EX Series Switches) on page 2295

**Syntax**
```
show route community as-number:community-value
  <brief | detail | extensive | terse>
  <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**
```
show route community as-number:community-value
  <brief | detail | extensive | terse>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.

**Options**
- **as-number:community-value**—One or more community identifiers. **as-number** is the AS number, and **community-value** is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.

  For example:

  ```
  user@host> show route table inet.0 protocol bgp community "12083:6015"
  community "12083:65551"
  
  or
  
  user@host> show route table inet.0 protocol bgp community [12083:6014 12083:65551]
  
  brief | detail | extensive | terse—(Optional) Display the specified level of output.
  logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
```

**Additional Information**
Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.

**Required Privilege**

instance1.inet6.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
**show route damping**

**List of Syntax**

Syntax (EX Series Switch and QFX Series) on page 2299

Syntax

show route damping (decayed | history | suppressed)

<brief | detail | extensive | terse>

<logical-system (all | logical-system-name)>

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display the BGP routes for which updates might have been reduced because of route flap damping.

**Options**

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

decayed—Display route damping entries that might no longer be valid, but are not suppressed.

history—Display entries that have already been withdrawn, but have been logged.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

suppressed—Display entries that have been suppressed and are no longer being installed into the forwarding table or exported by routing protocols.

**Required Privilege**

view

Output Fields  Table 170 on page 2300 lists the output fields for the `show route damping` command. Output fields are listed in the approximate order in which they appear.

Table 170: `show route damping` Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>routing-table-name</code></td>
<td>Name of the routing table—for example, <code>inet.0</code>.</td>
<td>All levels</td>
</tr>
<tr>
<td>destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
<td>All levels</td>
</tr>
<tr>
<td>number routes</td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• active</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• holddown (routes that are in a pending state before being declared inactive)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• hidden (the routes are not used because of a routing policy)</td>
<td></td>
</tr>
<tr>
<td>destination-prefix</td>
<td>Destination prefix. The <code>entry</code> value is the number of routes for this destination, and the <code>announced</code> value is the number of routes being announced for this destination.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>(entry, announced)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>[protocol, preference]</td>
<td>Protocol from which the route was learned and the preference value for the route.</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• -—A hyphen indicates the last active route.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>In every routing metric except for the BGP <code>LocalPref</code> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <code>LocalPref</code> value in the <code>Preference2</code> field. For example, if the <code>LocalPref</code> value for Route 1 is 100, the <code>Preference2</code> value is -101. If the <code>LocalPref</code> value for Route 2 is 155, the <code>Preference2</code> value is -156. Route 2 is preferred because it has a higher <code>LocalPref</code> value and a lower <code>Preference2</code> value.</td>
<td></td>
</tr>
<tr>
<td>Next-hop reference count</td>
<td>Number of references made to the next hop.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Source</td>
<td>IP address of the route source.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Next hop</td>
<td>Network layer address of the directly reachable neighboring system.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>via</td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <code>Selected</code>.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Protocol next hop</td>
<td>Network layer address of the remote routing device that advertised the prefix.</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>This address is used to derive a forwarding next hop.</td>
<td></td>
</tr>
<tr>
<td>Indirect next hop</td>
<td>Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>
Table 170: `show route damping` Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>Flags for this route. For a description of possible values for this field, see the output field table for the <code>show route detail</code> command.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Local AS</td>
<td>AS number of the local routing device.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Peer AS</td>
<td>AS number of the peer routing device.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Age</td>
<td>How long the route has been known.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Metric</td>
<td>Metric for the route.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Task</td>
<td>Name of the protocol that has added the route.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Announcement bits</td>
<td>List of protocols that announce this route. <code>n-Resolve inet</code> indicates that the route is used for route resolution for next hops found in the routing table. <code>n</code> is an index used by Juniper Networks customer support only.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>AS path</td>
<td>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• I—IGP.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• E—EGP.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• ?—Incomplete; typically, the AS path was aggregated.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>When AS path numbers are included in the route, the format is as follows:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• ( )—Parentheses enclose a confederation.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• ( [ ] )—Parentheses and brackets enclose a confederation set.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</td>
<td></td>
</tr>
<tr>
<td>to</td>
<td>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</td>
<td>brief none</td>
</tr>
<tr>
<td>via</td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <code>Selected</code>.</td>
<td>brief none</td>
</tr>
<tr>
<td>Communities</td>
<td>Community path attribute for the route. See the output field table for the <code>show route detail</code> command.</td>
<td>detail extensive</td>
</tr>

**Syntax**  
```
show route detail
<destination-prefix>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**  
```
show route detail
<destination-prefix>
```

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.  
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**  
Display detailed information about the active entries in the routing tables.

**Options**  
- `none`—Display all active entries in the routing table on all systems.  
  - `destination-prefix`—(Optional) Display active entries for the specified address or range of addresses.  
  - `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**  
- `view`

**List of Sample Output**  
- show route detail on page 2315  
- show route detail (with BGP Multipath) on page 2321  
- show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 2322  
- show route label detail (Multipoint LDP with Multicast-Only Fast Reroute) on page 2322  
- show route detail (Flexible VXLAN Tunnel Profile) on page 2323

**Output Fields**  
Table 171 on page 2304 describes the output fields for the `show route detail` command. Output fields are listed in the approximate order in which they appear.

**Table 171: show route detail Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>routing-table-name</code></td>
<td>Name of the routing table (for example, inet.0).</td>
</tr>
<tr>
<td><code>number destinations</code></td>
<td>Number of destinations for which there are routes in the routing table.</td>
</tr>
</tbody>
</table>
### Table 171: show route detail Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>number routes</strong></td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
</tr>
<tr>
<td></td>
<td>• <strong>active</strong> (routes that are active)</td>
</tr>
<tr>
<td></td>
<td>• <strong>hold down</strong> (routes that are in the pending state before being declared inactive)</td>
</tr>
<tr>
<td></td>
<td>• <strong>hidden</strong> (routes that are not used because of a routing policy)</td>
</tr>
<tr>
<td><strong>route-destination</strong></td>
<td>Route destination (for example: 10.0.0.1/24). The <strong>entry</strong> value is the number of routes for this destination, and the <strong>announced</strong> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</td>
</tr>
<tr>
<td>(entry, announced)</td>
<td>• <strong>MPLS-label</strong> (for example, 80001).</td>
</tr>
<tr>
<td></td>
<td>• <strong>interface-name</strong> (for example, ge-1/0/2).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address; control-word-status; encapsulation type; vc-id; source</strong> (Layer 2 circuit only; for example, 10.1.1.195: NoCtrlWord: 11: Local/96).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address</strong> — Address of the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>control-word-status</strong> — Whether the use of the control word has been negotiated for this virtual circuit: <strong>NoCtrlWord</strong> or <strong>CtrlWord</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>encapsulation type</strong> — Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</td>
</tr>
<tr>
<td></td>
<td>• <strong>vc-id</strong> — Virtual circuit identifier.</td>
</tr>
<tr>
<td></td>
<td>• <strong>source</strong> — Source of the advertisement: <strong>Local</strong> or <strong>Remote</strong>.</td>
</tr>
<tr>
<td><strong>label stacking</strong></td>
<td>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</td>
</tr>
<tr>
<td></td>
<td>• <strong>S=0 route</strong> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</td>
</tr>
<tr>
<td></td>
<td>• If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</td>
</tr>
<tr>
<td>Field Name</td>
<td>Field Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>[protocol, preference]</td>
<td>Protocol from which the route was learned and the preference value for the route.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1’s complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value.</td>
<td>Preference2 values are signed integers, that is, Preference2 values can be either positive or negative values. However, Junos OS evaluates Preference2 values as unsigned integers that are represented by positive values. Based on the Preference2 values, Junos OS evaluates a preferred route differently in the following scenarios:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Level</td>
<td>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</td>
</tr>
<tr>
<td>PMSI</td>
<td>Provider multicast service interface (MVPN routing table).</td>
</tr>
<tr>
<td>Field Name</td>
<td>Field Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Next-hop type</td>
<td>Type of next hop. For a description of possible values for this field, see Table 172 on page 2310.</td>
</tr>
<tr>
<td>Next-hop reference count</td>
<td>Number of references made to the next hop.</td>
</tr>
<tr>
<td>Flood next-hop branches exceed maximum message</td>
<td>Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.</td>
</tr>
<tr>
<td>Source</td>
<td>IP address of the route source.</td>
</tr>
<tr>
<td>Next hop</td>
<td>Network layer address of the directly reachable neighboring system.</td>
</tr>
<tr>
<td>via</td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected. This field can also contain the following information:</td>
</tr>
<tr>
<td></td>
<td>• Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td></td>
<td>• Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</td>
</tr>
<tr>
<td>Label-switched-path lsp-path-name</td>
<td>Name of the LSP used to reach the next hop.</td>
</tr>
<tr>
<td>Label operation</td>
<td>MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).</td>
</tr>
<tr>
<td>Interface</td>
<td>(Local only) Local interface name.</td>
</tr>
<tr>
<td>Protocol next hop</td>
<td>Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.</td>
</tr>
<tr>
<td>Indirect next hop</td>
<td>Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.</td>
</tr>
<tr>
<td>State</td>
<td>State of the route (a route can be in more than one state). See Table 173 on page 2312.</td>
</tr>
<tr>
<td>Local AS</td>
<td>AS number of the local routing device.</td>
</tr>
<tr>
<td>Age</td>
<td>How long the route has been known.</td>
</tr>
<tr>
<td>AIGP</td>
<td>Accumulated interior gateway protocol (AIGP) BGP attribute.</td>
</tr>
</tbody>
</table>
### Table 171: show route detail Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Metric</strong></td>
<td>Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.</td>
</tr>
<tr>
<td><strong>MED-plus-IGP</strong></td>
<td>Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.</td>
</tr>
<tr>
<td><strong>TTL-Action</strong></td>
<td>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances. For sample output, see show route table.</td>
</tr>
<tr>
<td><strong>Task</strong></td>
<td>Name of the protocol that has added the route.</td>
</tr>
<tr>
<td><strong>Announcement bits</strong></td>
<td>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the KRT for installing the route into the Packet Forwarding Engine, to a resolve tree, a L2 VC, or even a VPN. For example, n-Resolve inet indicates that the specified route is used for route resolution for next hops found in the routing table.</td>
</tr>
<tr>
<td>• n</td>
<td>An index used by Juniper Networks customer support only.</td>
</tr>
<tr>
<td><strong>AS path</strong></td>
<td>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</td>
</tr>
<tr>
<td>• I</td>
<td>IGP.</td>
</tr>
<tr>
<td>• E</td>
<td>EGP.</td>
</tr>
<tr>
<td>• Recorded</td>
<td>The AS path is recorded by the sample process (sampled).</td>
</tr>
<tr>
<td>• ?</td>
<td>Incomplete; typically, the AS path was aggregated.</td>
</tr>
<tr>
<td>When AS path numbers are included in the route, the format is as follows:</td>
<td></td>
</tr>
<tr>
<td>• [ ]</td>
<td>Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</td>
</tr>
<tr>
<td>• [ ]</td>
<td>If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</td>
</tr>
<tr>
<td>• [ ]</td>
<td>Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</td>
</tr>
<tr>
<td>• ()</td>
<td>Parentheses enclose a confederation.</td>
</tr>
<tr>
<td>• ( [ ] )</td>
<td>Parentheses and brackets enclose a confederation set.</td>
</tr>
</tbody>
</table>

**NOTE:** In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.
### Table 171: show route detail Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validation-state</td>
<td>(BGP-learned routes) Validation status of the route:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Invalid</strong>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unknown</strong>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unverified</strong>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Valid</strong>—Indicates that the prefix and autonomous system pair are found in the database.</td>
</tr>
<tr>
<td>ORR Generation-ID</td>
<td>Displays the optimal route reflection (ORR) generation identifier. ISIS and OSPF interior gateway protocol (IGP) updates filed whenever any of the corresponding ORR route has its metric valued changed, or if the ORR route is added or deleted.</td>
</tr>
<tr>
<td>FECs bound to route</td>
<td>Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.</td>
</tr>
<tr>
<td>Primary Upstream</td>
<td>When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.</td>
</tr>
<tr>
<td>RPF Nexthops</td>
<td>When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.</td>
</tr>
<tr>
<td>Label</td>
<td>Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.</td>
</tr>
<tr>
<td>weight</td>
<td>Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td>VC Label</td>
<td>MPLS label assigned to the Layer 2 circuit virtual connection.</td>
</tr>
<tr>
<td>MTU</td>
<td>Maximum transmission unit (MTU) of the Layer 2 circuit.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>VLAN identifier of the Layer 2 circuit.</td>
</tr>
<tr>
<td>Prefixes bound to route</td>
<td>Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.</td>
</tr>
<tr>
<td>Communities</td>
<td>Community path attribute for the route. See Table 174 on page 2314 for all possible values for this field.</td>
</tr>
<tr>
<td>Layer2-info: encaps</td>
<td>Layer 2 encapsulation (for example, VPLS).</td>
</tr>
<tr>
<td>control flags</td>
<td>Control flags: none or Site Down.</td>
</tr>
<tr>
<td>mtu</td>
<td>Maximum transmission unit (MTU) information.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label-Base, range</td>
<td>First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.</td>
</tr>
<tr>
<td>status vector</td>
<td>Layer 2 VPN and VPLS network layer reachability information (NLRI).</td>
</tr>
<tr>
<td>Accepted Multipath</td>
<td>Current active path when BGP multipath is configured.</td>
</tr>
<tr>
<td>Accepted LongLivedStale</td>
<td>The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.</td>
</tr>
<tr>
<td>Accepted LongLivedStaleImport</td>
<td>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag. Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table.</td>
</tr>
<tr>
<td>ImportAccepted LongLivedStaleImport</td>
<td>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table. The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</td>
</tr>
<tr>
<td>Accepted MultipathContrib</td>
<td>Path currently contributing to BGP multipath.</td>
</tr>
<tr>
<td>Localpref</td>
<td>Local preference value included in the route.</td>
</tr>
<tr>
<td>Router ID</td>
<td>BGP router ID as advertised by the neighbor in the open message.</td>
</tr>
<tr>
<td>Primary Routing Table</td>
<td>In a routing table group, the name of the primary routing table in which the route resides.</td>
</tr>
<tr>
<td>Secondary Tables</td>
<td>In a routing table group, the name of one or more secondary tables in which the route resides.</td>
</tr>
</tbody>
</table>

Table 172 on page 2310 describes all possible values for the Next-hop Types output field.

Table 172: Next-hop Types Output Field Values

<table>
<thead>
<tr>
<th>Next-Hop Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Broadcast (bcast)</td>
<td>Broadcast next hop.</td>
</tr>
<tr>
<td>Deny</td>
<td>Deny next hop.</td>
</tr>
<tr>
<td>Discard</td>
<td>Discard next hop.</td>
</tr>
<tr>
<td>Dynamic List</td>
<td>Dynamic list next hop.</td>
</tr>
</tbody>
</table>
### Table 172: Next-hop Types Output Field Values (continued)

<table>
<thead>
<tr>
<th>Next-Hop Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Flood</strong></td>
<td>Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.</td>
</tr>
<tr>
<td><strong>Hold</strong></td>
<td>Next hop is waiting to be resolved into a unicast or multicast type.</td>
</tr>
<tr>
<td><strong>Indexed (idxd)</strong></td>
<td>Indexed next hop.</td>
</tr>
<tr>
<td><strong>Indirect (indr)</strong></td>
<td>Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.</td>
</tr>
<tr>
<td><strong>Local (local)</strong></td>
<td>Local address on an interface. This next-hop type causes packets with this destination address to be received locally.</td>
</tr>
<tr>
<td><strong>Multicast (mcst)</strong></td>
<td>Wire multicast next hop (limited to the LAN).</td>
</tr>
<tr>
<td><strong>Multicast discard (mdsc)</strong></td>
<td>Multicast discard.</td>
</tr>
<tr>
<td><strong>Multicast group (mgrp)</strong></td>
<td>Multicast group member.</td>
</tr>
<tr>
<td><strong>Receive (recv)</strong></td>
<td>Receive.</td>
</tr>
<tr>
<td><strong>Reject (rjct)</strong></td>
<td>Discard. An ICMP unreachable message was sent.</td>
</tr>
<tr>
<td><strong>Resolve (rlsv)</strong></td>
<td>Resolving next hop.</td>
</tr>
<tr>
<td><strong>Routed multicast (mcrt)</strong></td>
<td>Regular multicast next hop.</td>
</tr>
<tr>
<td><strong>Router</strong></td>
<td>A specific node or set of nodes to which the routing device forwards packets that match the route prefix. To qualify as next-hop type router, the route must meet the following criteria:</td>
</tr>
<tr>
<td></td>
<td>• Must not be a direct or local subnet for the routing device.</td>
</tr>
<tr>
<td></td>
<td>• Must have a next hop that is directly connected to the routing device.</td>
</tr>
</tbody>
</table>
Table 172: Next-hop Types Output Field Values (continued)

<table>
<thead>
<tr>
<th>Next-Hop Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Next hop added to the Routing Engine forwarding table for remote IP addresses with prefix /32 for Junos OS Evolved only.</td>
</tr>
<tr>
<td>Table</td>
<td>Routing table next hop.</td>
</tr>
<tr>
<td>Unicast (ucst)</td>
<td>Unicast.</td>
</tr>
<tr>
<td>Unilist (ulst)</td>
<td>List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</td>
</tr>
</tbody>
</table>

Table 173 on page 2312 describes all possible values for the State output field. A route can be in more than one state (for example, `<Active NoReadvt Int Ext>`).

Table 173: State Output Field Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounting</td>
<td>Route needs accounting.</td>
</tr>
<tr>
<td>Active</td>
<td>Route is active.</td>
</tr>
<tr>
<td>Always Compare MED</td>
<td>Path with a lower multiple exit discriminator (MED) is available.</td>
</tr>
<tr>
<td>AS path</td>
<td>Shorter AS path is available.</td>
</tr>
<tr>
<td>Cisco Non-deterministic MED selection</td>
<td>Cisco nondeterministic MED is enabled, and a path with a lower MED is available.</td>
</tr>
<tr>
<td>Clone</td>
<td>Route is a clone.</td>
</tr>
<tr>
<td>Cluster list length</td>
<td>Length of cluster list sent by the route reflector.</td>
</tr>
<tr>
<td>Delete</td>
<td>Route has been deleted.</td>
</tr>
<tr>
<td>Ex</td>
<td>Exterior route.</td>
</tr>
<tr>
<td>Ext</td>
<td>BGP route received from an external BGP neighbor.</td>
</tr>
<tr>
<td>FlashAll</td>
<td>Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.</td>
</tr>
<tr>
<td>Hidden</td>
<td>Route not used because of routing policy.</td>
</tr>
<tr>
<td>IfCheck</td>
<td>Route needs forwarding RPF check.</td>
</tr>
</tbody>
</table>
Table 173: State Output Field Values (continued)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGP metric</td>
<td>Path through next hop with lower IGP metric is available.</td>
</tr>
<tr>
<td>Inactive reason</td>
<td>Flags for this route, which was not selected as best for a particular destination.</td>
</tr>
<tr>
<td>Initial</td>
<td>Route being added.</td>
</tr>
<tr>
<td>Int</td>
<td>Interior route.</td>
</tr>
<tr>
<td>Int Ext</td>
<td>BGP route received from an internal BGP peer or a BGP confederation peer.</td>
</tr>
<tr>
<td>Interior &gt; Exterior &gt; Exterior via Interior</td>
<td>Direct, static, IGP, or EBGP path is available.</td>
</tr>
<tr>
<td>Local Preference</td>
<td>Path with a higher local preference value is available.</td>
</tr>
<tr>
<td>Martian</td>
<td>Route is a martian (ignored because it is obviously invalid).</td>
</tr>
<tr>
<td>MartianOK</td>
<td>Route exempt from martian filtering.</td>
</tr>
<tr>
<td>Next hop address</td>
<td>Path with lower metric next hop is available.</td>
</tr>
<tr>
<td>No difference</td>
<td>Path from neighbor with lower IP address is available.</td>
</tr>
<tr>
<td>NoReadvrt</td>
<td>Route not to be advertised.</td>
</tr>
<tr>
<td>NotBest</td>
<td>Route not chosen because it does not have the lowest MED.</td>
</tr>
<tr>
<td>Not Best in its group</td>
<td>Incoming BGP AS is not the best of a group (only one AS can be the best).</td>
</tr>
<tr>
<td>NotInstall</td>
<td>Route not to be installed in the forwarding table.</td>
</tr>
<tr>
<td>Number of gateways</td>
<td>Path with a greater number of next hops is available.</td>
</tr>
<tr>
<td>Origin</td>
<td>Path with a lower origin code is available.</td>
</tr>
<tr>
<td>Pending</td>
<td>Route pending because of a hold-down configured on another route.</td>
</tr>
<tr>
<td>Programmed</td>
<td>Route installed programatically by on-box or off-box applications using API.</td>
</tr>
<tr>
<td>Release</td>
<td>Route scheduled for release.</td>
</tr>
<tr>
<td>RIB preference</td>
<td>Route from a higher-numbered routing table is available.</td>
</tr>
</tbody>
</table>
Table 173: State Output Field Values (continued)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route Distinguisher</td>
<td>64-bit prefix added to IP subnets to make them unique.</td>
</tr>
<tr>
<td>Route Metric or MED comparison</td>
<td>Route with a lower metric or MED is available.</td>
</tr>
<tr>
<td>Route Preference</td>
<td>Route with lower preference value is available</td>
</tr>
<tr>
<td>Router ID</td>
<td>Path through a neighbor with lower ID is available.</td>
</tr>
<tr>
<td>Secondary</td>
<td>Route not a primary route.</td>
</tr>
<tr>
<td>Unusable path</td>
<td>Path is not usable because of one of the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• The route is damped.</td>
</tr>
<tr>
<td></td>
<td>• The route is rejected by an import policy.</td>
</tr>
<tr>
<td></td>
<td>• The route is unresolved.</td>
</tr>
<tr>
<td>Update source</td>
<td>Last tiebreaker is the lowest IP address value.</td>
</tr>
<tr>
<td>ProtectionCand</td>
<td>Indicates paths requesting protection.</td>
</tr>
<tr>
<td>ProtectionPath</td>
<td>Indicates the route entry that can be used as a protection path.</td>
</tr>
</tbody>
</table>

Table 174 on page 2314 describes the possible values for the Communities output field.

Table 174: Communities Output Field Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>area-number</td>
<td>4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.</td>
</tr>
<tr>
<td>bandwidth: local AS number:link-bandwidth-number</td>
<td>Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.</td>
</tr>
<tr>
<td>domain-id</td>
<td>Unique configurable number that identifies the OSPF domain.</td>
</tr>
<tr>
<td>domain-id-vendor</td>
<td>Unique configurable number that further identifies the OSPF domain.</td>
</tr>
<tr>
<td>link-bandwidth-number</td>
<td>Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).</td>
</tr>
<tr>
<td>local AS number</td>
<td>Local AS number: from 1 through 65,535.</td>
</tr>
<tr>
<td>options</td>
<td>1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.</td>
</tr>
</tbody>
</table>
Table 174: Communities Output Field Values (continued)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>origin</td>
<td>(Used with VPNs) Identifies where the route came from.</td>
</tr>
<tr>
<td>ospf-route-type</td>
<td>1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.</td>
</tr>
<tr>
<td>route-type-vendor</td>
<td>Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000. The format is area-number: ospf-route-type: options.</td>
</tr>
<tr>
<td>rte-type</td>
<td>Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306. The format is area-number: ospf-route-type: options.</td>
</tr>
<tr>
<td>target</td>
<td>Defines which VPN the route participates in; target has the format 32-bit IP address: 16-bit number. For example, 10.19.0.0:100.</td>
</tr>
<tr>
<td>unknown IANA</td>
<td>Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized.</td>
</tr>
<tr>
<td>unknown OSPF vendor community</td>
<td>Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized.</td>
</tr>
</tbody>
</table>

**show route export**

**List of Syntax**  
Syntax on page 2327  
Syntax (EX Series Switches) on page 2327

**Syntax**  
`show route export`  
`<brief | detail>`  
`<instance <instance-name> | routing-table-name>`  
`<logical-system (all | logical-system-name)>`

**Syntax (EX Series Switches)**  
`show route export`  
`<brief | detail>`  
`<instance <instance-name> | routing-table-name>`

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.

**Options**  
`none`—(Same as `brief`.) Display standard information about policy-based export for all instances and routing tables on all systems.  
`brief | detail`—(Optional) Display the specified level of output.  
`instance <instance-name>`—(Optional) Display a particular routing instance for which policy-based export is currently enabled.  
`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.  
`routing-table-name`—(Optional) Display information about policy-based export for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the `show route export inet` command).

**Required Privilege Level**  
`view`

**List of Sample Output**  
show route export on page 2328  
show route export detail on page 2328  
show route export instance detail on page 2329

**Output Fields**  
Table 175 on page 2328 lists the output fields for the `show route export` command. Output fields are listed in the approximate order in which they appear.
### Table 175: show route export Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table or table-name</td>
<td>Name of the routing tables that either import or export routes.</td>
<td>All levels</td>
</tr>
<tr>
<td>Routes</td>
<td>Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one.</td>
<td>brief none</td>
</tr>
<tr>
<td>Export</td>
<td>Whether the table is currently exporting routes to other tables: Y or N (Yes or No).</td>
<td>brief none</td>
</tr>
<tr>
<td>Import</td>
<td>Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)</td>
<td>detail</td>
</tr>
<tr>
<td>Flags</td>
<td>(instance keyword only) Flags for this feature on this instance:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• config auto-policy—The policy was deduced from the configured IGP export policies.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• cleanup—Configuration information for this instance is no longer valid.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• config—The instance was explicitly configured.</td>
<td></td>
</tr>
<tr>
<td>Options</td>
<td>(instance keyword only) Configured option displays the type of routing tables the feature handles:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• unicast—Indicates instance.inet.0.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• multicast—Indicates instance.inet.2.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• unicast multicast—Indicates instance.inet.0 and instance.inet.2.</td>
<td></td>
</tr>
<tr>
<td>Import policy</td>
<td>(instance keyword only) Policy that route export uses to construct the import-export matrix. Not displayed if the instance type is vrf.</td>
<td>detail</td>
</tr>
<tr>
<td>Instance</td>
<td>(instance keyword only) Name of the routing instance.</td>
<td>detail</td>
</tr>
<tr>
<td>Type</td>
<td>(instance keyword only) Type of routing instance: forwarding, non-forwarding, or vrf.</td>
<td>detail</td>
</tr>
</tbody>
</table>

### Sample Output

</tr>
<tr>
<td>black</td>
<td>non-forwarding</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>red</td>
<td>non-forwarding</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**show route export vrf-target**

**Syntax**

```
show route export vrf-target
  <brief | detail>
  <community community--regular-expression>
  <logical-system (all | logical-system-name)>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

Display the VPN routing and forwarding (VRF) target communities for which policy-based route export is currently distributing routes. This command is relevant when there are overlapping virtual private networks (VPNs).

**Options**

- **none**—Display standard information about all target communities.
- **brief | detail**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.
- **community community--regular-expression**—(Optional) Display information about the specified community.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**

view

**List of Sample Output**

- show route export vrf-target on page 2331
- show route export vrf-target community on page 2331
- show route export vrf-target detail on page 2331

**Output Fields**

Table 176 on page 2330 lists the output fields for the `show route export vrf-target` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route target</td>
<td>Target communities for which auto-export is currently distributing routes.</td>
<td>brief none</td>
</tr>
<tr>
<td>Family</td>
<td>Routing table entries for the specified family.</td>
<td>brief none</td>
</tr>
<tr>
<td>type-of-routing-table(s)</td>
<td>Type of routing tables the feature handles:</td>
<td>brief none</td>
</tr>
<tr>
<td></td>
<td>• unicast—Indicates instance.inet.0.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• multicast—Indicates instance.inet.2.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• unicast multicast—Indicates instance.inet.0 and instance.inet.2.</td>
<td></td>
</tr>
</tbody>
</table>
Table 176: show route export vrf-target Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Import</strong></td>
<td>Number of routing tables that are currently importing routes with this target</td>
<td>brief none</td>
</tr>
<tr>
<td></td>
<td>community. Omitted for tables that are not importing routes.</td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>to line indicates the best subpath to the route.</td>
</tr>
</tbody>
</table>

In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1’s complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.
Table 177: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</td>
</tr>
<tr>
<td>Route Distinguisher</td>
<td>IP subnet augmented with a 64-bit prefix.</td>
</tr>
<tr>
<td>PMSI</td>
<td>Provider multicast service interface (MVPN routing table).</td>
</tr>
<tr>
<td>Next-hop type</td>
<td>Type of next hop. For a description of possible values for this field, see the Output Field table in the show route detail command.</td>
</tr>
<tr>
<td>Next-hop reference count</td>
<td>Number of references made to the next hop.</td>
</tr>
<tr>
<td>Flood next-hop branches exceed maximum message</td>
<td>Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.</td>
</tr>
<tr>
<td>Source</td>
<td>IP address of the route source.</td>
</tr>
<tr>
<td>Next hop</td>
<td>Network layer address of the directly reachable neighboring system.</td>
</tr>
<tr>
<td>via</td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected. This field can also contain the following information:</td>
</tr>
<tr>
<td></td>
<td>• Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td></td>
<td>• Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</td>
</tr>
<tr>
<td>Label-switched-path</td>
<td>Name of the LSP used to reach the next hop.</td>
</tr>
<tr>
<td>lsp-path-name</td>
<td></td>
</tr>
<tr>
<td>Label operation</td>
<td>MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).</td>
</tr>
<tr>
<td>Offset</td>
<td>Whether the metric has been increased or decreased by an offset value.</td>
</tr>
<tr>
<td>Interface</td>
<td>(Local only) Local interface name.</td>
</tr>
<tr>
<td>Protocol next hop</td>
<td>Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.</td>
</tr>
</tbody>
</table>
### Table 177: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>label-operation</strong></td>
<td>MPLS label and operation occurring at this routing device. The operation can be <strong>pop</strong> (where a label is removed from the top of the stack), <strong>push</strong> (where another label is added to the label stack), or <strong>swap</strong> (where a label is replaced by another label).</td>
</tr>
</tbody>
</table>
| **Indirect next hops** | When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.  
When BGP PIC Edge is enabled, the output lines that contain **indirect next hop: weight** follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:  
• 0x1 indicates active next hops.  
• 0x4000 indicates passive next hops. |
| **State** | State of the route (a route can be in more than one state). See the Output Field table in the **show route detail** command. |
| **Session ID** | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA). |
| **Weight** | Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.  
For sample output, see **show route table**. |
### Table 177: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Inactive reason</strong></td>
<td>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</td>
</tr>
<tr>
<td></td>
<td>• Active preferred—Currently active route was selected over this route.</td>
</tr>
<tr>
<td></td>
<td>• Always compare MED—Path with a lower multiple exit discriminator (MED) is available.</td>
</tr>
<tr>
<td></td>
<td>• AS path—Shorter AS path is available.</td>
</tr>
<tr>
<td></td>
<td>• Cisco Non-deterministic MED selection—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</td>
</tr>
<tr>
<td></td>
<td>• Cluster list length—Path with a shorter cluster list length is available.</td>
</tr>
<tr>
<td></td>
<td>• Forwarding use only—Path is only available for forwarding purposes.</td>
</tr>
<tr>
<td></td>
<td>• IGP metric—Path through the next hop with a lower IGP metric is available.</td>
</tr>
<tr>
<td></td>
<td>• IGP metric type—Path with a lower OSPF link-state advertisement type is available.</td>
</tr>
<tr>
<td></td>
<td>• Interior &gt; Exterior &gt; Exterior via Interior—Direct, static, IGP, or EBGP path is available.</td>
</tr>
<tr>
<td></td>
<td>• Local preference—Path with a higher local preference value is available.</td>
</tr>
<tr>
<td></td>
<td>• Next hop address—Path with a lower metric next hop is available.</td>
</tr>
<tr>
<td></td>
<td>• No difference—Path from a neighbor with a lower IP address is available.</td>
</tr>
<tr>
<td></td>
<td>• Not Best in its group—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</td>
</tr>
<tr>
<td></td>
<td>• Number of gateways—Path with a higher number of next hops is available.</td>
</tr>
<tr>
<td></td>
<td>• Origin—Path with a lower origin code is available.</td>
</tr>
<tr>
<td></td>
<td>• OSPF version—Path does not support the indicated OSPF version.</td>
</tr>
<tr>
<td></td>
<td>• RIB preference—Route from a higher-numbered routing table is available.</td>
</tr>
<tr>
<td></td>
<td>• Route destinguisher—64-bit prefix added to IP subnets to make them unique.</td>
</tr>
<tr>
<td></td>
<td>• Route metric or MED comparison—Route with a lower metric or MED is available.</td>
</tr>
<tr>
<td></td>
<td>• Route preference—Route with a lower preference value is available.</td>
</tr>
<tr>
<td></td>
<td>• Router ID—Path through a neighbor with a lower ID is available.</td>
</tr>
<tr>
<td></td>
<td>• Unusable path—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</td>
</tr>
<tr>
<td></td>
<td>• Update source—Last tiebreaker is the lowest IP address value.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Local AS</strong></th>
<th>Autonomous system (AS) number of the local routing device.</th>
</tr>
</thead>
<tbody>

<td><strong>Age</strong></td>
<td>How long the route has been known.</td>
</tr>
<tr>
<td><strong>AIGP</strong></td>
<td>Accumulated interior gateway protocol (AIGP) BGP attribute.</td>
</tr>
<tr>
<td><strong>Metric</strong></td>
<td>Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.</td>
</tr>
<tr>
<td><strong>MED-plus-IGP</strong></td>
<td>Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.</td>
</tr>
<tr>
<td><strong>TTL-Action</strong></td>
<td>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</td>
</tr>
</tbody>
</table>

For sample output, see `show route table`. 
## Table 177: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
<td>Name of the protocol that has added the route.</td>
</tr>
</tbody>
</table>
| Announcement bits| List of protocols that are consumers of the route. Using the following output as an example, Announcement bits (3): 0-KRT 5-Resolve tree 2 BGP RT Background there are (3) announcement bits to reflect the three clients (protocols) that have state for this route: Kernel (0-KRT), 5 (resolution tree process 2), and 8 (BGP).

The notation n-Resolve inet indicates that the route is used for route resolution for next hops found in the routing table. n is an index used by Juniper Networks customer support only.

### AS path

AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:

- I—IGP.
- E—EGP.
- Recorded—The AS path is recorded by the sample process (sampled).
- ?—Incomplete; typically, the AS path was aggregated.

When AS path numbers are included in the route, the format is as follows:

- [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.
- { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.
- ()—Parentheses enclose a confederation.
- ( [ ])—Parentheses and brackets enclose a confederation set.

**NOTE:** In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.

### validation-state

(BGP-learned routes) Validation status of the route:

- Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.
- Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database.
- Unverified—Indicates that origin validation is not enabled for the BGP peers.
- Valid—Indicates that the prefix and autonomous system pair are found in the database.

### FECs bound to route

Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.

### AS path: I <Originator>

(For route reflected output only) Originator ID attribute set by the route reflector.
### Table 177: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>route status</strong></td>
<td>Indicates the status of a BGP route:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Accepted</strong>—The specified BGP route is imported by the default BGP policy.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Import</strong>—The route is imported into a Layer 3 VPN routing instance.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Import-Protect</strong>—A remote instance egress that is protected.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Multipath</strong>—A BGP multipath active route.</td>
</tr>
<tr>
<td></td>
<td>- <strong>MultipathContrib</strong>—The route is not active but contributes to the BGP multipath.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Protect</strong>—An egress route that is protected.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Stale</strong>—A route that is marked stale due to graceful restart.</td>
</tr>
</tbody>
</table>

- **Primary Upstream**: When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.

- **RPF Nexthops**: When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.

- **Label**: Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.

- **weight**: Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.

- **VC Label**: MPLS label assigned to the Layer 2 circuit virtual connection.

- **MTU**: Maximum transmission unit (MTU) of the Layer 2 circuit.

- **VLAN ID**: VLAN identifier of the Layer 2 circuit.

- **Cluster list**: (For route reflected output only) Cluster ID sent by the route reflector.

- **Originator ID**: (For route reflected output only) Address of router that originally sent the route to the route reflector.

- **Prefixes bound to route**: Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.

- **Communities**: Community path attribute for the route. See the Output Field table in the `show route detail` command for all possible values for this field.

- **Layer2-info: encaps**: Layer 2 encapsulation (for example, VPLS).

- **control flags**: Control flags: `none` or Site Down.

- **mtu**: Maximum transmission unit (MTU) information.

- **Label-Base, range**: First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.

  <brief | detail>
  <ip-prefix>
  <table table-name>

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  Display flow route information.

Options  none—Display flow route information.
  brief | detail—(Optional) Display the specified level of output. If you do not specify a
  level of output, the system defaults to brief.
  ip-prefix—(Optional) IP address for the flow route.
  logical-system (all | logical-system-name)—(Optional) Perform this operation on all
  logical systems or on a particular logical system.
  table table-name—(Optional) Display flow route information for all routing tables whose
  name begins with this string (for example, inet.0 and inet6.0 are both displayed
  when you run the show route flow validation inet command).

Required Privilege  view

List of Sample Output  show route flow validation on page 2352
show route flow validation (IPv6) on page 2352

Output Fields  Table 178 on page 2352 lists the output fields for the show route flow validation command. Output fields are listed in the approximate order in which they appear.

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Option `bridge-domain` introduced in Junos OS Release 7.5  
Option `learning-vlan-id` introduced in Junos OS Release 8.4  
Options `all` and `vlan` introduced in Junos OS Release 9.6.  
Command introduced in Junos OS Release 11.3 for the QFX Series.  
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**  
Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

---

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the `show pfe route` command.

---

**Options**

- `none`—Display the routes in the forwarding tables. By default, the `show route forwarding-table` command does not display information about private, or internal, forwarding tables.

- `detail | extensive | summary`—(Optional) Display the specified level of output.

- `all`—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

- `bridge-domain (all | bridge-domain-name)`—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

- `ccc interface-name`—(Optional) Display route entries for the specified circuit cross-connect interface.

- `destination destination-prefix`—(Optional) Destination prefix.

- `family family`—(Optional) Display routing table entries for the specified family: `bridge (ccc | destination | detail | extensive | interface-name | label | learning-vlan-id | matching | multicast | summary | table | vlan | vpn), ethernet-switching, evpn, fibre-channel, fmembers, inet, inet6, iso, mcsnoop-inet, mcsnoop-inet6, mpls, satellite-inet, satellite-inet6, satellite-vpls, tnp, unix, vpls, or vlan-classification`.

- `interface-name interface-name`—(Optional) Display routing table entries for the specified interface.

- `label name`—(Optional) Display route entries for the specified label.

- `lcc number`—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the
specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id**—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching**—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table**—(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the `show route instance` command.

**vlan (all | vlan-name)**—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn vpn**—(Optional) Display routing table entries for a specified VPN.

show route forwarding-table table logical-system-name/routing-instance-name on page 2370
show route forwarding-table vpn on page 2371

Output Fields
Table 179 on page 2357 lists the output fields for the show route forwarding-table command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the detail keyword is used instead of the extensive keyword.

Table 179: show route forwarding-table Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logical system</td>
<td>Name of the logical system. This field is displayed if you specify the table logical-system-name/routing-instance-name option on a device that is configured for and supports logical systems.</td>
<td>All levels</td>
</tr>
<tr>
<td>Routing table</td>
<td>Name of the routing table (for example, inet, inet6, mpls).</td>
<td>All levels</td>
</tr>
</tbody>
</table>
Table 179: show route forwarding-table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled protocols</td>
<td>The features and protocols that have been enabled for a given routing table.</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>This field can contain the following values:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• BUM hashing—BUM hashing is enabled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MAC Stats—Mac Statistics is enabled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Bridging—Routing instance is a normal layer 2 bridge.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• No VLAN—No VLANs are associated with the bridge domain.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• All VLANs—The <code>vlan-id all</code> statement has been enabled for this bridge domain.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Single VLAN—Single VLAN ID is associated with the bridge domain.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MAC action drop—New MACs will be dropped when the MAC address limit is reached.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Dual VLAN—Dual VLAN tags are associated with the bridge domain</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• No local switching—No local switching is enabled for this routing instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Learning disabled—Layer 2 learning is disabled for this routing instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• VPLS—The VPLS protocol is enabled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• No IRB l2-copy—The no-irb-layer-2-copy feature is enabled for this routing instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• ACKed by all peers—All peers have acknowledged this routing instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• BUM Pruning—BUM pruning is enabled on the VPLS instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Def BD VXLAN—VXLAN is enabled for the default bridge domain.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• EVPN—EVPN protocol is enabled for this routing instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Def BD OVSDB—Open vSwitch Database (OVSDB) is enabled on the default bridge domain.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• L2 backhaul—Layer 2 backhaul is enabled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FRR optimize—Fast reroute optimization</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MAC pinning—MAC pinning is enabled for this bridge domain.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MAC Aging Timer—The MAC table aging time is set per routing instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• PBBN—This routing instance is configured as a provider backbone bridged network.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• PBN—This routing instance is configured as a provider bridge network.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• ETREE—The ETREE protocol is enabled on this EVPN routing instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Def BEVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• MPLS control word—Control word is enabled for this MPLS routing instance.</td>
<td></td>
</tr>
<tr>
<td>Address family</td>
<td>Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).</td>
<td>All levels</td>
</tr>
<tr>
<td>Destination</td>
<td>Destination of the route.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>
### Table 179: show route forwarding-table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
</table>
| Route Type (Type)   | How the route was placed into the forwarding table. When the `detail` keyword is used, the route type might be abbreviated (as shown in parentheses):
  - `cloned (clon)`—(TCP or multicast only) Cloned route.                                    | All levels      |
  - `destination (dest)`—Remote addresses directly reachable through an interface.            |                 |
  - `destination down (iddn)`—Destination route for which the interface is unreachable.       |                 |
  - `interface cloned (ifcl)`—Cloned route for which the interface is unreachable.           |                 |
  - `route down (ifdn)`—Interface route for which the interface is unreachable.               |                 |
  - `ignore (ignr)`—Ignore this route.                                                       |                 |
  - `interface (intf)`—Installed as a result of configuring an interface.                     |                 |
  - `permanent (perm)`—Routes installed by the kernel when the routing table is initialized. |                 |
  - `user`—Routes installed by the routing protocol process or as a result of the configuration. |                 |
| Route Reference (RtRef) | Number of routes to reference.                                                                                                                                                                                             | `detail extensive` |
| Flags               | Route type flags:                                                                                                                                                                                                               | `extensive`     |
  - `none`—No flags are enabled.                                                                                                                   |                 |
  - `accounting`—Route has accounting enabled.                                                                                                   |                 |
  - `cached`—Cache route.                                                                                                                         |                 |
  - `incoming-interface interface-number`—Check against incoming interface.                                                                         |                 |
  - `prefix load balance`—Load balancing is enabled for this prefix.                                                                           |                 |
  - `rt nh decoupled`—Route has been decoupled from the next hop to the destination.                                                             |                 |
  - `sent to PFE`—Route has been sent to the Packet Forwarding Engine.                                                                           |                 |
  - `static`—Static route.                                                                                                                        |                 |
| Next hop            | IP address of the next hop to the destination.                                                                                                                                                                                   | `detail extensive` |

**NOTE:** For static routes that use point-to-point (P2P) outgoing interfaces, the next-hop address is not displayed in the output.
Table 179: show route forwarding-table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Next hop Type</td>
<td>Next-hop type. When the <strong>detail</strong> keyword is used, the next-hop type might be</td>
<td><strong>detail extensive</strong></td>
</tr>
<tr>
<td>(Type)</td>
<td>abbreviated (as indicated in parentheses):</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• broadcast (bcst)—Broadcast.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• deny—Deny.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• discard (dscd)—Discard.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• hold—Next hop is waiting to be resolved into a unicast or multicast type.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• indexed (idxd)—Indexed next hop.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• indirect (indr)—Indirect next hop.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• local (loc)—Local address on an interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• routed multicast (mcrt)—Regular multicast next hop.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• multicast (mcst)—Wire multicast next hop (limited to the LAN).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• multicast discard (mdsc)—Multicast discard.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• multicast group (mgrp)—Multicast group member.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• receive (recv)—Receive.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• reject (rjct)—Discard. An ICMP unreachable message was sent.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• resolve (rslv)—Resolving the next hop.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• unicast (ucst)—Unicast.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• unilist (ulst)—List of unicast next hops. A packet sent to this next hop goes</td>
<td></td>
</tr>
<tr>
<td></td>
<td>to any next hop in the list.</td>
<td></td>
</tr>
<tr>
<td>Index</td>
<td>Software index of the next hop that is used to route the traffic for a given</td>
<td><strong>detail extensive</strong></td>
</tr>
<tr>
<td></td>
<td>prefix.</td>
<td><strong>none</strong></td>
</tr>
<tr>
<td>Route</td>
<td>Logical interface index from which the route is learned. For example, for interface</td>
<td><strong>extensive</strong></td>
</tr>
<tr>
<td>interface-index</td>
<td>routes, this is the logical interface index of the route itself. For static routes,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>this field is zero. For routes learned through routing protocols, this is the</td>
<td></td>
</tr>
<tr>
<td></td>
<td>logical interface index from which the route is learned.</td>
<td></td>

show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
    unit 0 {
        family inet {
            rpf-check;
            address 192.0.2.2/30;
        }
    }
```
user@host> show route forwarding-table extensive
Routing table: inet [Index 0]
Internet: ...
...
Destination: 192.0.2.3/32
  Route type: destination
  Route reference: 0
  Flags: sent to PFE
  Next-hop: 192.0.2.3
  Next-hop type: broadcast
  Index: 328
  Reference: 1
  Next-hop interface: so-1/1/0.0
  RPF interface: so-1/1/0.0

show route forwarding-table extensive (PIM using point-to-multipoint mode)

user@host> show route forwarding-table extensive
Destination: 198.51.100.0/24
  Route type: user
  Route reference: 0
  Multicast RPF nh index: 0
  P2mpidx: 0
  Flags: cached, check incoming interface, accounting, sent to PFE, rt nh decoupled
  Next-hop type: indirect
  Index: 1048575
  Reference: 4
  Nexthop: 
  Next-hop type: composite

  Next-hop interface: st0.1, 192.0.2.0

show route forwarding-table (dynamic list next hop)

The show route forwarding table output shows the two next hop elements for a multihomed EVPN destination.

user@host> show route forwarding-table label 299952 extensive
MPLS:

Destination: 299952
  Route type: user
  Route reference: 0
  Multicast RPF nh index: 0
  P2mpidx: 0
  Flags: sent to PFE, rt nh decoupled
  Next-hop type: indirect
  Index: 1048575
  Reference: 2
  Nexthop: 
  Next-hop type: composite
  Index: 601
  Reference: 2
  Next-hop type: indirect
  Index: 1048574
  Reference: 3
  Nexthop: 1.0.0.4
  Next-hop type: Push 301632, Push 299776(top)
  Index: 600
  Reference: 2
  Load Balance Label: None
After one of the PE router has been disabled in the EVPN multihomed network, the same `show route forwarding table` output command shows one next hop element and one empty next hop element.

```

show route forwarding-table interface-name

Syntax

show route forwarding-table interface-name interface-name
<detail | extensive>
<all>

Release Information

Description
Display the interfaces in the Routing Engine’s forwarding table.

Options
none—Display information for the specified interface.
detail | extensive—(Optional) Display the specified level of output.
all—(Optional) Display all interfaces in the routing table.

Required Privilege
view

List of Sample Output
show route forwarding-table interface-name fe-0/1/1 on page 2373
show route forwarding-table interface-name all on page 2373
show route forwarding-table interface-name all detail on page 2374

Output Fields
Table 180 on page 2372 lists the output fields for the show route forwarding-table interface-name command. Output fields are listed in the approximate order in which they appear.

Table 180: show route forwarding-table interface-name Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the interface (for example fe-0/1/1, lo0, ae0, and so on).</td>
<td>All levels</td>
</tr>
<tr>
<td>MTU</td>
<td>Interface’s maximum transmission unit (MTU).</td>
<td>All levels</td>
</tr>
<tr>
<td>Afam</td>
<td>Configured address family (for example inet, tnp, inet6, and so on).</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Network</td>
<td>Network information:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• &lt;Link&gt;—Physical interface, not a logical interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• &lt;PtoP&gt;—Point-to-point network.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• ipaddress—Network address.</td>
<td></td>
</tr>
<tr>
<td>Address</td>
<td>Address of the interface. The address can be a MAC address, IPv4 address, IPv6 address, and so on.</td>
<td>All levels</td>
</tr>
<tr>
<td>IPkts</td>
<td>Number of packets received on the interface.</td>
<td>All levels</td>
</tr>
<tr>
<td>Ierr</td>
<td>Number of packets received on the interface with errors.</td>
<td>All levels</td>

show route hidden

Syntax
show route hidden
  <brief | detail | extensive | terse>
  <logical-system (all | logical-system-name)>

Release Information
Command introduced before Junos OS Release 7.4.

Description
Display only hidden route information. A hidden route is unusable, even if it is the best path.

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege
view

Related Documentation
• Understanding Hidden Routes

List of Sample Output
show route hidden on page 2375
show route hidden detail on page 2376
show route hidden extensive on page 2376
show route hidden terse on page 2377

Output Fields
For information about output fields, see the output field table for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

Sample Output
show route hidden

user@host> show route hidden

Syntax (EX Series Switches)  show route inactive-path
        <brief | detail | extensive | terse>

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  Display routes for destinations that have no active route. An inactive route is a route that
was not selected as the best path.

Options  none—Display all inactive routes.
brief | detail | extensive | terse—(Optional) Display the specified level of output. If you
do not specify a level of output, the system defaults to brief.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all
logical systems or on a particular logical system.

Required Privilege  view

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display routing instance information.

Options

none—(Same as brief) Display standard information about all routing instances.

brief | detail | summary—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief. (These options are not available with the operational keyword.)

instance-name—(Optional) Display information for all routing instances whose name begins with this string (for example, cust1, cust11, and cust111 are all displayed when you run the show route instance cust1 command).

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

operational—(Optional) Display operational routing instances.

show route label label 
<brief | detail | extensive | terse> 
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)  
show route label label 
<brief | detail | extensive | terse>

Release Information  Command introduced before Junos OS Release 7.4. 
Command introduced in Junos OS Release 9.5 for EX Series switches.

Description  Display the routes based on a specified Multiprotocol Label Switching (MPLS) label value.

Options  
label—Value of the MPLS label. 
brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief. 
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show route label extensive

The output for the show route label extensive command is identical to that of the show route label detail command. For sample output, see show route label detail on page 2393.
show route label-switched-path

**List of Syntax**
- Syntax on page 2397
- Syntax (EX Series Switches) on page 2397

**Syntax**
```
show route label-switched-path path-name
  <brief | detail | extensive | terse>
  <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**
```
show route label-switched-path path-name
  <brief | detail | extensive | terse>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description**
Display the routes used in an MPLS label-switched path (LSP).

**Options**
- **brief | detail | extensive | terse**—(Optional) Display the specified level of output.
  - **path-name**—LSP tunnel name.
  - **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**
- view

**List of Sample Output**
- show route label-switched-path on page 2397

**Output Fields**
For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

**Sample Output**
```
show route label-switched-path sf-to-ny

inet.0: 29 destinations, 29 routes (29 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1.1.1.1/32          [MPLS/7] 00:00:06, metric 0
> to 111.222.1.9 via s0-0/0/0, label-switched-path sf-to-ny

3.3.3.3/32         *[MPLS/7] 00:00:06, metric 0
> to 111.222.1.9 via s0-0/0/0, label-switched-path sf-to-ny

inet.3: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```
2.2.2.2/32         *[MPLS/7] 00:00:06, metric 0
        > to 111.222.1.9 via s0-0/0/0, label-switched-path sf-to-ny

4.4.4.4/32         *[MPLS/7] 00:00:06, metric 0
        to 111.222.1.9 via s0-0/0/0, label-switched-path abc
        > to 111.222.1.9 via s0-0/0/0, label-switched-path xyz
        to 111.222.1.9 via s0-0/0/0, label-switched-path sf-to-ny

111.222.1.9/32    *[MPLS/7] 00:00:06, metric 0
        > to 111.222.1.9 via s0-0/0/0, label-switched-path sf-to-ny

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
  + = Active Route, - = Last Active, * = Both

mpls.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
  + = Active Route, - = Last Active, * = Both
**show route localization**

**Syntax**

```
show route localization
```

**Release Information**

- Command introduced in Junos OS Release 11.4 for T-Series routers.
- Command introduced in Junos OS Release 12.3 for MX Series routers.

**Description**

(T320, T640, and T1600 routers only) Display route localization details.

**Options**

- `detail`—Display detailed output.

**Required Privilege**

- View

**Related Documentation**

- [Example: Configuring Packet Forwarding Engine FIB Localization](#)

**Output Fields**

Table 182 on page 2399 lists the output fields for the `show route localization` command. Output fields are listed in the approximate order in which they appear.

### Table 182: show route localization Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FIB-local</td>
<td>FPCs configured as FIB-local.</td>
</tr>
<tr>
<td>FIB-remote</td>
<td>FPCs configured as FIB-remote.</td>
</tr>
<tr>
<td>Normal</td>
<td>FPCs neither configured as FIB-local or FIB-remote.</td>
</tr>
<tr>
<td>Protocols</td>
<td>IPv4 (inet) or IPv6 (inet6) traffic configured for route localization.</td>
</tr>
</tbody>
</table>

**Sample Output**

```
user@R0> show route localization
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
  FIB-local:  FPC2(4,5)
  FIB-remote: FPC0, FPC1
  Normal:     FPC3, FPC4, FPC5, FPC6, FPC7

user@R0> show route localization detail
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
  FIB-local:  FPC2(4,5)
  FIB-remote: FPC0, FPC1
  Normal:     FPC3, FPC4, FPC5, FPC6, FPC7
  FIB localization configuration
```
Protocols: inet, inet6
FIB-local: FPC2
FIB-remote: FPC0, FPC1
Forwarding Engine addresses
  FPC0: 1
  FPC1: 2
  FPC2: 4, 5
  FPC3: 6
  FPC4: 8
  FPC5: 11
  FPC6: 13
  FPC7: 15
**show route martians**

### List of Syntax
Syntax on page 2401  
Syntax (EX Series Switches) on page 2401

### Syntax
show route martians  
<logical-system (all | logical-system-name)>  
<table routing-table-name>

### Syntax (EX Series Switches)
show route martians  
<table routing-table-name>

### Release Information
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

### Description
Display the martian (invalid and ignored) entries associated with each routing table.

### Options
- **none**—Display standard information about route martians for all routing tables.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **table routing-table-name**—(Optional) Display information about route martians for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the `show route martians table inet` command).

### Required Privilege
- **view**

### Related Documentation

**show route match-prefix**

**Syntax**

```
show route match-prefix match-prefix;
```

**Release Information**

Command introduced in Junos OS Release 11.4.

**Description**

Allows you to search for routes using regular expressions based on the extended (modern) regular expressions as defined in POSIX 1003.2.

**Options**

- `match-prefix`—Regular expression to match formatted prefix.

**Additional Information**

**Required Privilege**

- Level view

**Related Documentation**

- Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies

**List of Sample Output**

- `show route match-prefix *:10.255.2.200:6:*` (Show all routes matching route distributor 10.255.2.200:6) on page 2404
- `show route match-prefix 7*` (Show all mvpn type-7 routes) on page 2404
- `show route match-prefix *:224.*` (Show all routes matching group 224/4) on page 2404

**Output Fields**

For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

**Sample Output**

```plaintext
user@host> show route match-prefix *:10.255.2.200:6:*

show route match-prefix 7* (Show all mvpn type-7 routes)
user@host> show route table blue.mvpn.0 match-prefix 7*
Paste router command output here

show route match-prefix *:224.* (Show all routes matching group 224/4)
user@host> show route match-prefix *:224.*
```
show route next-hop

List of Syntax  Syntax on page 2405

Syntax              show route next-hop next-hop
                   <brief | detail | extensive | terse>
                   <logical-system (all | logical-system-name)>

Syntax (EX Series
Switches)          show route next-hop next-hop
                   <brief | detail | extensive | terse>

Release Information
                   Command introduced before Junos OS Release 7.4.
                   Command introduced in Junos OS Release 9.0 for EX Series switches.

Description       Display the entries in the routing table that are being sent to the specified next-hop
                   address.

Options            brief | detail | extensive | terse—(Optional) Display the specified level of output.
                   logical-system (all | logical-system-name)—(Optional) Perform this operation on all
                   logical systems or on a particular logical system.

next-hop—Next-hop address.

Required Privilege
                   Level
                   view

List of Sample Output
                   show route next-hop on page 2405

show route output

List of Syntax  Syntax on page 2414
Syntax (EX Series Switches) on page 2414

Syntax  show route output (address ip-address | interface interface-name) <brief | detail | extensive | terse> <logical-system (all | logical-system-name)>

Syntax (EX Series Switches)  show route output (address ip-address | interface interface-name) <brief | detail | extensive | terse>

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  Display the entries in the routing table learned through static routes and interior gateway protocols that are to be sent out the interface with either the specified IP address or specified name.

To view routes advertised to a neighbor or received from a neighbor for the BGP protocol, use the show route advertising-protocol bgp and show route receive-protocol bgp commands instead.

Options  address ip-address—Display entries in the routing table that are to be sent out the interface with the specified IP address.
brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.
interface interface-name—Display entries in the routing table that are to be sent out the interface with the specified name.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show route protocol

**List of Syntax**
- Syntax on page 2419
- Syntax (EX Series Switches) on page 2419

**Syntax**
```
show route protocol protocol
  <brief | detail | extensive | terse>
  <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**
```
show route protocol protocol
  <brief | detail | extensive | terse>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
  - `ospf2` and `ospf3` options introduced in Junos OS Release 9.2.
  - `ospf2` and `ospf3` options introduced in Junos OS Release 9.2 for EX Series switches.
  - `flow` option introduced in Junos OS Release 10.0.
  - `flow` option introduced in Junos OS Release 10.0 for EX Series switches.

**Description**
Display the route entries in the routing table that were learned from a particular protocol.

**Options**
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to `brief`.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

- `protocol`—Protocol from which the route was learned:
  - `access`—Access route for use by DHCP application
  - `access-internal`—Access-internal route for use by DHCP application
  - `aggregate`—Locally generated aggregate route
  - `arp`—Route learned through the Address Resolution Protocol
  - `dvmrp`—Asynchronous Transfer Mode virtual private network
  - `bgp`—Border Gateway Protocol
  - `ccc`—Circuit cross-connect
  - `direct`—Directly connected route
  - `dvmrp`—Distance Vector Multicast Routing Protocol
  - `esis`—End System-to-Intermediate System
  - `flow`—Locally defined flow-specification route
  - `frr`—Precomputed protection route or backup route used when a link goes down
- **isis**—Intermediate System-to-Intermediate System
- **ldp**—Label Distribution Protocol
- **l2circuit**—Layer 2 circuit
- **l2vpn**—Layer 2 virtual private network
- **local**—Local address
- **mpls**—Multiprotocol Label Switching
- **msdp**—Multicast Source Discovery Protocol
- **ospf**—Open Shortest Path First versions 2 and 3
- **ospf2**—Open Shortest Path First versions 2 only
- **ospf3**—Open Shortest Path First version 3 only
- **pim**—Protocol Independent Multicast
- **rip**—Routing Information Protocol
- **ripng**—Routing Information Protocol next generation
- **rsvp**—Resource Reservation Protocol
- **rtarget**—Local route target virtual private network
- **static**—Statically defined route
- **tunnel**—Dynamic tunnel
- **vpn**—Virtual private network

**NOTE:** EX Series switches run a subset of these protocols. See the switch CLI for details.

**Required Privilege Level**

show route range

List of Syntax  Syntax on page 2433
Syntax (EX Series Switches) on page 2433

Syntax  show route range
        <brief | detail | extensive | terse>
        <destination-prefix>
        <logical-system (all | logical-system-name)>

Syntax (EX Series Switches)  show route range
        <brief | detail | extensive | terse>
        <destination-prefix>

Release Information  Command introduced before Junos OS Release 7.4.
                     Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  Display routing table entries using a prefix range.

Options  none—Display standard information about all routing table entries using a prefix range.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

destination-prefix—Destination and prefix mask for the range.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege
Level  view

logical-system (all | logical-system-name)

**Syntax (EX Series Switches)**  
show route receive-protocol protocol neighbor-address  
<brief | detail | extensive | terse>

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Display the routing information as it was received through a particular neighbor using a particular dynamic routing protocol.

**Options**  
brief | detail | extensive | terse—(Optional) Display the specified level of output.  
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.  
protocol neighbor-address—Protocol transmitting the route (bgp, dvmrp, msdp, pim, rip, or ripng) and address of the neighboring router from which the route entry was received.

**Additional Information**  
The output displays the selected routes and the attributes with which they were received, but does not show the effects of import policy on the routing attributes.

**Required Privilege Level**

**show route resolution**

**List of Syntax**

Syntax (EX Series Switches) on page 2448

**Syntax**

```
show route resolution
  <brief | detail | extensive | summary>
  <index index>
  <logical-system (all | logical-system-name)>
  <prefix>
  <table routing-table-name>
  <unresolved>
```

**Syntax (EX Series Switches)**

```
show route resolution
  <brief | detail | extensive | summary>
  <index index>
  <prefix>
  <table routing-table-name>
  <unresolved>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table.

**Options**

- `none`—Display standard information about all entries in the next-hop resolution database.
- `brief | detail | extensive | summary`—(Optional) Display the specified level of output.
- `index index`—(Optional) Show the index of the resolution tree.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.
- `prefix network/destination-prefix`—(Optional) Display database entries for the specified address.
- `table routing-table-name`—(Optional) Display information about a particular routing table (for example, `inet.0`) where policy-based export is currently enabled.
- `unresolved`—(Optional) Display routes that could not be resolved.

**Required Privilege Level**

view

**Related Documentation**

- Example: Configuring Route Resolution on PE Routers
List of Sample Output

- show route resolution detail on page 2450
- show route resolution (Multipath Resolution) on page 2451
- show route resolution summary on page 2452
- show route resolution unresolved on page 2452
### Output Fields

Table 185 on page 2450 describes the output fields for the `show route resolution` command. Output fields are listed in the approximate order in which they appear.

#### Table 185: show route resolution Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routing-table-name</td>
<td>Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.</td>
</tr>
<tr>
<td>Tree index</td>
<td>Tree index identifier.</td>
</tr>
<tr>
<td>Nodes</td>
<td>Number of nodes in the tree.</td>
</tr>
<tr>
<td>Reference count</td>
<td>Number of references made to the next hop.</td>
</tr>
<tr>
<td>Contributing routing tables</td>
<td>Routing tables used for next-hop resolution.</td>
</tr>
<tr>
<td>Originating RIB</td>
<td>Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of <code>inet.0</code> resolving through <code>inet.0</code> and <code>inet.3</code>, this field indicates which routing table, <code>inet.0</code> or <code>inet.3</code>, provided the best path for a particular prefix.</td>
</tr>
<tr>
<td>Metric</td>
<td>Metric associated with the forwarding next hop.</td>
</tr>
<tr>
<td>Node path count</td>
<td>Number of nodes in the path.</td>
</tr>
<tr>
<td>Forwarding next hops</td>
<td>Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.</td>
</tr>
<tr>
<td>Merged</td>
<td>Merged—Merged next hops when recursive resolution of multipath is configured.</td>
</tr>
</tbody>
</table>

### Sample Output

**show route resolution detail**

**show route snooping**

**Syntax**
```
show route snooping
    <brief | detail | extensive | terse>
    <all>
    <best address/prefix>
    <exact address>
    <logical-system logical-system-name>
    <range prefix-range>
    <summary>
    <table table-name>
```

**Release Information**
Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display the entries in the routing table that were learned from snooping.

**Options**
- `none`—Display the entries in the routing table that were learned from snooping.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to `brief`.
- `all`—(Optional) Display all entries, including hidden entries.
- `best address/prefix`—(Optional) Display the longest match for the provided address and optional prefix.
- `exact address/prefix`—(Optional) Display exact matches for the provided address and optional prefix.
- `logical-system logical-system-name`—(Optional) Display information about a particular logical system, or type `all`.
- `range prefix-range`—(Optional) Display information for the provided address range.
- `summary`—(Optional) Display route snooping summary statistics.
- `table table-name`—(Optional) Display information for the named table.

**Required Privilege Level**
`view`

**List of Sample Output**
- `show route snooping detail on page 2454`
- `show route snooping logical-system all on page 2454`

**Output Fields**
For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

show route source-gateway

List of Syntax  Syntax on page 2456  
Syntax (EX Series Switches) on page 2456

Syntax  show route source-gateway address  
<brief | detail | extensive | terse>  
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)  show route source-gateway address  
<brief | detail | extensive | terse>

Release Information  Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  Display the entries in the routing table that were learned from a particular address. The Source field in the show route detail command output lists the source for each route, if known.

Options  brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

address—IP address of the system.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level  view

**show route summary**

**List of Syntax**  
Syntax on page 2462  
Syntax (EX Series Switches) on page 2462

**Syntax**  
`show route summary`  
`<logical-system (all | logical-system-name)>`  
`<table routing-table-name>`

**Syntax (EX Series Switches)**  
`show route summary`

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Display summary statistics about the entries in the routing table.

CPU utilization might increase while the device learns routes. We recommend that you use the `show route summary` command after the device learns and enters the routes into the routing table. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the `show route summary` command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the command-line interface (CLI).

**Options**  
`none`—Display summary statistics about the entries in the routing table.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

`table routing-table-name`—(Optional) Display summary statistics for all routing tables whose name begins with this string (for example, `inet.0` and `inet6.0` are both displayed when you run the `show route summary table inet` command). If you only want to display statistics for a specific routing table, make sure to enter the exact name of that routing table.

**Required Privilege Level**  
`view`

**List of Sample Output**  
`show route summary` on page 2464  
`show route summary table` on page 2464  
`show route summary table (with Route Limits Configured for the Routing Table)` on page 2465

**Output Fields**  
Table 186 on page 2463 lists the output fields for the `show route summary` command. Output fields are listed in the approximate order in which they appear.
**Table 186: show route summary Output Fields**

   <logical-system (all | logical-system-name)>

Syntax (EX Series Switches, QFX Series Switches)
show route table routing-table-name
   <brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Show route table evpn statement introduced in Junos OS Release 15.1X53-D30 for QFX Series switches.

Description
Display the route entries in a particular routing table.

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

routing-table-name—Display route entries for all routing tables whose names begin with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route table inet command).

Required Privilege
view

Table 187: show route table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>route-destination</strong></td>
<td>Route destination (for example: 10.0.0.1/24). The <em>entry</em> value is the number of routes for this destination, and the <em>announced</em> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</td>
</tr>
<tr>
<td>(entry, announced)</td>
<td>• <strong>MPLS-label</strong> (for example, 80001).</td>
</tr>
<tr>
<td></td>
<td>• <strong>interface-name</strong> (for example, ge-1/0/2).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address;control-word-status;encapsulation type;vc-id;source</strong> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1::Local/96).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address</strong>—Address of the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>control-word-status</strong>—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord.</td>
</tr>
<tr>
<td></td>
<td>• <strong>encapsulation type</strong>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</td>
</tr>
<tr>
<td></td>
<td>• <strong>vc-id</strong>—Virtual circuit identifier.</td>
</tr>
<tr>
<td></td>
<td>• <strong>source</strong>—Source of the advertisement: Local or Remote.</td>
</tr>
<tr>
<td></td>
<td>• <strong>inclusive multicast Ethernet tag route</strong>—Type of route destination represented by (for example, 3:100.100.100.10:100::0::100.100.100.10/384):</td>
</tr>
<tr>
<td></td>
<td>• <strong>route distinguisher</strong>—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Ethernet tag ID</strong>—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>IP address length</strong>—(1 octet) Length of IP address in bits.</td>
</tr>
<tr>
<td></td>
<td>• <strong>originating router's IP address</strong>—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.</td>
</tr>
<tr>
<td><strong>label stacking</strong></td>
<td>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</td>
</tr>
<tr>
<td></td>
<td>• <strong>S=0 route</strong> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</td>
</tr>
<tr>
<td></td>
<td>• If there is no <strong>S=</strong> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</td>
</tr>
<tr>
<td><strong>[protocol, preference]</strong></td>
<td>Protocol from which the route was learned and the preference value for the route.</td>
</tr>
<tr>
<td></td>
<td>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</td>
</tr>
<tr>
<td></td>
<td>• -—A hyphen indicates the last active route.</td>
</tr>
<tr>
<td></td>
<td>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</td>
</tr>
</tbody>
</table>

In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.
Table 187: show route table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</td>
</tr>
<tr>
<td>Route Distinguisher</td>
<td>IP subnet augmented with a 64-bit prefix.</td>
</tr>
<tr>
<td>PMSI</td>
<td>Provider multicast service interface (MVPN routing table).</td>
</tr>
<tr>
<td>Next-hop type</td>
<td>Type of next hop. For a description of possible values for this field, see Table 172 on page 2310.</td>
</tr>
<tr>
<td>Next-hop reference count</td>
<td>Number of references made to the next hop.</td>
</tr>
<tr>
<td>Flood next hop branches exceed maximum message</td>
<td>Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.</td>
</tr>
<tr>
<td>Source</td>
<td>IP address of the route source.</td>
</tr>
<tr>
<td>Next hop</td>
<td>Network layer address of the directly reachable neighboring system.</td>
</tr>
<tr>
<td>via</td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected. This field can also contain the following information:</td>
</tr>
<tr>
<td></td>
<td>• Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td></td>
<td>• Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</td>
</tr>
<tr>
<td>Label-switched-path lsp-path-name</td>
<td>Name of the LSP used to reach the next hop.</td>
</tr>
<tr>
<td>Label operation</td>
<td>MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).</td>
</tr>
<tr>
<td>Interface</td>
<td>(Local only) Local interface name.</td>
</tr>
<tr>
<td>Protocol next hop</td>
<td>Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.</td>
</tr>
<tr>
<td>Indirect next hop</td>
<td>Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.</td>
</tr>
<tr>
<td>State</td>
<td>State of the route (a route can be in more than one state). See Table 173 on page 2312.</td>
</tr>
</tbody>
</table>
### Table 187: show route table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local AS</td>
<td>AS number of the local routing devices.</td>
</tr>
<tr>
<td>Age</td>
<td>How long the route has been known.</td>
</tr>
<tr>
<td>AIGP</td>
<td>Accumulated interior gateway protocol (AIGP) BGP attribute.</td>
</tr>
<tr>
<td>Metricn</td>
<td>Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.</td>
</tr>
<tr>
<td>MED-plus-IGP</td>
<td>Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.</td>
</tr>
<tr>
<td>TTL-Action</td>
<td>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</td>
</tr>
<tr>
<td>Task</td>
<td>Name of the protocol that has added the route.</td>
</tr>
<tr>
<td>Announcement bits</td>
<td>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, n-Resolve inet indicates that the specified route is used for route resolution for next hops found in the routing table.</td>
</tr>
<tr>
<td>AS path</td>
<td>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</td>
</tr>
<tr>
<td></td>
<td>• I—IGP.</td>
</tr>
<tr>
<td></td>
<td>• E—EGP.</td>
</tr>
<tr>
<td></td>
<td>• Recorded—The AS path is recorded by the sample process (sampled).</td>
</tr>
<tr>
<td></td>
<td>• ?—Incomplete; typically, the AS path was aggregated.</td>
</tr>
</tbody>
</table>

When AS path numbers are included in the route, the format is as follows:

- [ ]—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.
- [ ]—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.
- { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.
- ()—Parentheses enclose a confederation.
- ( [ ] )—Parentheses and brackets enclose a confederation set.

**NOTE:** In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.
### Table 187: show route table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validation-state</td>
<td>(BGP-learned routes) Validation status of the route:</td>
</tr>
<tr>
<td>• Invalid</td>
<td>Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</td>
</tr>
<tr>
<td>• Unknown</td>
<td>Indicates that the prefix is not among the prefixes or prefix ranges in the database.</td>
</tr>
<tr>
<td>• Unverified</td>
<td>Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</td>
</tr>
<tr>
<td>• Valid</td>
<td>Indicates that the prefix and autonomous system pair are found in the database.</td>
</tr>
<tr>
<td>FECs bound to route</td>
<td>Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.</td>
</tr>
<tr>
<td>Primary Upstream</td>
<td>When multipoint LDP with multicast-only fast route (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.</td>
</tr>
<tr>
<td>RPF Nexthops</td>
<td>When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.</td>
</tr>
<tr>
<td>Label</td>
<td>Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.</td>
</tr>
<tr>
<td>weight</td>
<td>Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td>VC Label</td>
<td>MPLS label assigned to the Layer 2 circuit virtual connection.</td>
</tr>
<tr>
<td>MTU</td>
<td>Maximum transmission unit (MTU) of the Layer 2 circuit.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>VLAN identifier of the Layer 2 circuit.</td>
</tr>
<tr>
<td>Prefixes bound to route</td>
<td>Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.</td>
</tr>
<tr>
<td>Communities</td>
<td>Community path attribute for the route. See Table 174 on page 2314 for all possible values for this field.</td>
</tr>
<tr>
<td>Layer2-info: encaps</td>
<td>Layer 2 encapsulation (for example, VPLS).</td>
</tr>
<tr>
<td>control flags</td>
<td>Control flags: none or Site Down.</td>
</tr>
<tr>
<td>mtu</td>
<td>Maximum transmission unit (MTU) information.</td>
</tr>
<tr>
<td>Label-Base, range</td>
<td>First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.</td>
</tr>
<tr>
<td>status vector</td>
<td>Layer 2 VPN and VPLS network layer reachability information (NLRI).</td>
</tr>
</tbody>
</table>
Table 187: show route table Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accepted Multipath</td>
<td>Current active path when BGP multipath is configured.</td>
</tr>
<tr>
<td>Accepted LongLivedStale</td>
<td>The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</td>
</tr>
<tr>
<td>Accepted LongLivedStaleImport</td>
<td>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag. Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table.</td>
</tr>
<tr>
<td>ImportAccepted LongLivedStaleImport</td>
<td>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table. The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</td>
</tr>
<tr>
<td>Accepted Multipath Contrib</td>
<td>Path currently contributing to BGP multipath.</td>
</tr>
<tr>
<td>Localpref</td>
<td>Local preference value included in the route.</td>
</tr>
<tr>
<td>Router ID</td>
<td>BGP router ID as advertised by the neighbor in the open message.</td>
</tr>
<tr>
<td>Primary Routing Table</td>
<td>In a routing table group, the name of the primary routing table in which the route resides.</td>
</tr>
<tr>
<td>Secondary Tables</td>
<td>In a routing table group, the name of one or more secondary tables in which the route resides.</td>
</tr>
</tbody>
</table>

Table 172 on page 2310 describes all possible values for the Next-hop Types output field.

Table 188: Next-hop Types Output Field Values

<table>
<thead>
<tr>
<th>Next-Hop Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Broadcast (bcast)</td>
<td>Broadcast next hop.</td>
</tr>
<tr>
<td>Deny</td>
<td>Deny next hop.</td>
</tr>
<tr>
<td>Discard</td>
<td>Discard next hop.</td>
</tr>
<tr>
<td>Flood</td>
<td>Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.</td>
</tr>
<tr>
<td>Next-Hop Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hold</td>
<td>Next hop is waiting to be resolved into a unicast or multicast type.</td>
</tr>
<tr>
<td>Indexed (idxd)</td>
<td>Indexed next hop.</td>
</tr>
<tr>
<td>Indirect (indr)</td>
<td>Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.</td>
</tr>
<tr>
<td>Interface</td>
<td>Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.</td>
</tr>
<tr>
<td>Local (locl)</td>
<td>Local address on an interface. This next-hop type causes packets with this destination address to be received locally.</td>
</tr>
<tr>
<td>Multicast (mcst)</td>
<td>Wire multicast next hop (limited to the LAN).</td>
</tr>
<tr>
<td>Multicast discard (mdsc)</td>
<td>Multicast discard.</td>
</tr>
<tr>
<td>Multicast group (mgrp)</td>
<td>Multicast group member.</td>
</tr>
<tr>
<td>Receive (recv)</td>
<td>Receive.</td>
</tr>
<tr>
<td>Reject (rjct)</td>
<td>Discard. An ICMP unreachable message was sent.</td>
</tr>
<tr>
<td>Resolve (rslv)</td>
<td>Resolving next hop.</td>
</tr>
<tr>
<td>Routed multicast (mcrt)</td>
<td>Regular multicast next hop.</td>
</tr>
<tr>
<td>Router</td>
<td>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</td>
</tr>
<tr>
<td></td>
<td>To qualify as a next-hop type router, the route must meet the following criteria:</td>
</tr>
<tr>
<td></td>
<td>• Must not be a direct or local subnet for the routing device.</td>
</tr>
<tr>
<td></td>
<td>• Must have a next hop that is directly connected to the routing device.</td>
</tr>
<tr>
<td>Table</td>
<td>Routing table next hop.</td>
</tr>
<tr>
<td>Unicast (ucst)</td>
<td>Unicast.</td>
</tr>
<tr>
<td>Unilist (ulst)</td>
<td>List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</td>
</tr>
</tbody>
</table>
Table 173 on page 2312 describes all possible values for the State output field. A route can be in more than one state (for example, `<Active NoReadvrt Int Ext>`).

**Table 189: State Output Field Values**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounting</td>
<td>Route needs accounting.</td>
</tr>
<tr>
<td>Active</td>
<td>Route is active.</td>
</tr>
<tr>
<td>Always Compare MED</td>
<td>Path with a lower multiple exit discriminator (MED) is available.</td>
</tr>
<tr>
<td>AS path</td>
<td>Shorter AS path is available.</td>
</tr>
<tr>
<td>Cisco Non-deterministic MED selection</td>
<td>Cisco nondeterministic MED is enabled, and a path with a lower MED is available.</td>
</tr>
<tr>
<td>Clone</td>
<td>Route is a clone.</td>
</tr>
<tr>
<td>Cluster list length</td>
<td>Length of cluster list sent by the route reflector.</td>
</tr>
<tr>
<td>Delete</td>
<td>Route has been deleted.</td>
</tr>
<tr>
<td>Ex</td>
<td>Exterior route.</td>
</tr>
<tr>
<td>Ext</td>
<td>BGP route received from an external BGP neighbor.</td>
</tr>
<tr>
<td>FlashAll</td>
<td>Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.</td>
</tr>
<tr>
<td>Hidden</td>
<td>Route not used because of routing policy.</td>
</tr>
<tr>
<td>IfCheck</td>
<td>Route needs forwarding RPF check.</td>
</tr>
<tr>
<td>IGP metric</td>
<td>Path through next hop with lower IGP metric is available.</td>
</tr>
<tr>
<td>Inactive reason</td>
<td>Flags for this route, which was not selected as best for a particular destination.</td>
</tr>
<tr>
<td>Initial</td>
<td>Route being added.</td>
</tr>
<tr>
<td>Int</td>
<td>Interior route.</td>
</tr>
<tr>
<td>Int Ext</td>
<td>BGP route received from an internal BGP peer or a BGP confederation peer.</td>

<td>64-bit prefix added to IP subnets to make them unique.</td>
</tr>
<tr>
<td>Route Metric or MED comparison</td>
<td>Route with a lower metric or MED is available.</td>
</tr>
<tr>
<td>Route Preference</td>
<td>Route with lower preference value is available.</td>
</tr>
<tr>
<td>Router ID</td>
<td>Path through a neighbor with lower ID is available.</td>
</tr>
<tr>
<td>Secondary</td>
<td>Route not a primary route.</td>
</tr>
<tr>
<td>Unusable path</td>
<td>Path is not usable because of one of the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• The route is damped.</td>
</tr>
<tr>
<td></td>
<td>• The route is rejected by an import policy.</td>
</tr>
<tr>
<td></td>
<td>• The route is unresolved.</td>
</tr>
<tr>
<td>Update source</td>
<td>Last tiebreaker is the lowest IP address value.</td>
</tr>
</tbody>
</table>
Table 174 on page 2314 describes the possible values for the Communities output field.

### Table 190: Communities Output Field Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>area-number</td>
<td>4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.</td>
</tr>
<tr>
<td>bandwidth: local AS number: link-bandwidth-number</td>
<td>Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.</td>
</tr>
<tr>
<td>domain-id</td>
<td>Unique configurable number that identifies the OSPF domain.</td>
</tr>
<tr>
<td>domain-id-vendor</td>
<td>Unique configurable number that further identifies the OSPF domain.</td>
</tr>
<tr>
<td>link-bandwidth-number</td>
<td>Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).</td>
</tr>
<tr>
<td>local AS number</td>
<td>Local AS number: from 1 through 65,535.</td>
</tr>
<tr>
<td>options</td>
<td>1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.</td>
</tr>
<tr>
<td>origin</td>
<td>(Used with VPNs) Identifies where the route came from.</td>
</tr>
<tr>
<td>ospf-route-type</td>
<td>1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.</td>
</tr>
<tr>
<td>route-type-vendor</td>
<td>Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000. The format is area-number:ospf-route-type:options.</td>
</tr>
<tr>
<td>rte-type</td>
<td>Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306. The format is area-number:ospf-route-type:options.</td>
</tr>
<tr>
<td>target</td>
<td>Defines which VPN the route participates in; target has the format 32-bit IP address:16-bit number. For example, 10.19.0.0:100.</td>
</tr>
<tr>
<td>unknown IANA</td>
<td>Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized.</td>
</tr>
<tr>
<td>unknown OSPF vendor community</td>
<td>Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized.</td>
</tr>
<tr>
<td>evpn-mcast-flags</td>
<td>Identifies the value in the multicast flags extended community and whether snooping is enabled. A value of 0x1 indicates that the route supports IGMP proxy.</td>
</tr>
</tbody>
</table>
Table 190: Communities Output Field Values (continued)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>evpn-l2-info</td>
<td>Identifies whether Multihomed Proxy MAC and IP Address Route Advertisement is enabled. A value of 0x20 indicates that the proxy bit is set. Use the show bridge mac-ip-table extensive statement to determine whether the MAC and IP address route was learned locally or from a PE device.</td>
</tr>
</tbody>
</table>

show route terse

List of Syntax  Syntax on page 2509  
Syntax (EX Series Switches) on page 2509

Syntax  
show route terse 
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)  show route terse

Release Information  Command introduced before Junos OS Release 7.4. 
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  Display a high-level summary of the routes in the routing table.

NOTE: For BGP routes, the show route terse command displays the local 
preference attribute and MED instead of the metric1 and metric2 values. This 
ismostly dueto historical reasons.

To display the metric1 and metric2 value of a BGP route, use the show route 
extensive command.

Options  none—Display a high-level summary of the routes in the routing table.  
logical-system (all | logical-system-name)—(Optional) Perform this operation on all 
logical systems or on a particular logical system.

Required Privilege  view

List of Sample Output  show route terse on page 2511

Output Fields  Table 191 on page 2509 describes the output fields for the show route terse command.  
Output fields are listed in the approximate order in which they appear.

Table 191: show route terse Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routing-table-name</td>
<td>Name of the routing table (for example, inet.0).</td>
</tr>
<tr>
<td>number destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
</tr>
</tbody>
</table>
Table 191: show route terse Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number routes</td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
</tr>
<tr>
<td></td>
<td>• active (routes that are active)</td>
</tr>
<tr>
<td></td>
<td>• holdown (routes that are in the pending state before being declared inactive)</td>
</tr>
<tr>
<td></td>
<td>• hidden (routes that are not used because of a routing policy)</td>
</tr>
<tr>
<td>route key</td>
<td>Key for the state of the route:</td>
</tr>
<tr>
<td></td>
<td>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</td>
</tr>
<tr>
<td></td>
<td>• -—A hyphen indicates the last active route.</td>
</tr>
<tr>
<td></td>
<td>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</td>
</tr>
<tr>
<td>A</td>
<td>Active route. An asterisk (*) indicates this is the active route.</td>
</tr>
<tr>
<td>V</td>
<td>Validation status of the route:</td>
</tr>
<tr>
<td></td>
<td>• ?—Not evaluated. Indicates that the route was not learned through BGP.</td>
</tr>
<tr>
<td></td>
<td>• I—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</td>
</tr>
<tr>
<td></td>
<td>• N—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database.</td>
</tr>
<tr>
<td></td>
<td>• V—Valid. Indicates that the prefix and autonomous system pair are found in the database.</td>
</tr>
<tr>
<td>Destination</td>
<td>Destination of the route.</td>
</tr>
<tr>
<td>P</td>
<td>Protocol through which the route was learned:</td>
</tr>
<tr>
<td></td>
<td>• A—Aggregate</td>
</tr>
<tr>
<td></td>
<td>• B—BGP</td>
</tr>
<tr>
<td></td>
<td>• C—CCC</td>
</tr>
<tr>
<td></td>
<td>• D—Direct</td>
</tr>
<tr>
<td></td>
<td>• G—GMPLS</td>
</tr>
<tr>
<td></td>
<td>• I—I-IS-IS</td>
</tr>
<tr>
<td></td>
<td>• L—L2CKT, L2VPN, LDP, Local</td>
</tr>
<tr>
<td></td>
<td>• K—Kernel</td>
</tr>
<tr>
<td></td>
<td>• M—MPLS, MSDP</td>
</tr>
<tr>
<td></td>
<td>• O—OSPF</td>
</tr>
<tr>
<td></td>
<td>• P—PIM</td>
</tr>
<tr>
<td></td>
<td>• R—RIP, RIPng</td>
</tr>
<tr>
<td></td>
<td>• S—Static</td>
</tr>
<tr>
<td></td>
<td>• T—Tunnel</td>
</tr>
<tr>
<td>Prf</td>
<td>Preference value of the route. In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</td>
</tr>
</tbody>
</table>
Table 191: show route terse Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric 1</td>
<td>First metric value in the route. For routes learned from BGP, this is the MED metric.</td>
</tr>
<tr>
<td>Metric 2</td>
<td>Second metric value in the route. For routes learned from BGP, this is the IGP metric.</td>
</tr>
<tr>
<td>Next hop</td>
<td>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</td>
</tr>
</tbody>
</table>
| AS path    | AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:  
• I—IGP.  
• E—EGP.  
• ?—Incomplete; typically, the AS path was aggregated. |

clear rip general-statistics

List of Syntax  Syntax on page 2514
  Syntax (EX Series Switches and QFX Series) on page 2514

Syntax  clear rip general-statistics
  <logical-system (all | logical-system-name)>

Syntax (EX Series Switches and QFX Series)  clear rip general-statistics

Release Information  Command introduced before Junos OS Release 7.4.
  Command introduced in Junos OS Release 9.0 for EX Series switches.
  Command introduced in Junos OS Release 12.1 for the QFX Series.
  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description  Clear RIP general statistics.

Options  none—Clear RIP general statistics.

  logical-system (all | logical-system-name)—(Optional) Perform this operation on all
  logical systems or on a particular logical system.

Required Privilege  clear

Related Documentation  •  show rip general-statistics on page 2517

</table>
Sample Output

show rip general-statistics

```
user@host> show rip general-statistics

RIPv2 I/O info:
bad msgs       :   0
no recv intf   :   0
curr memory   :   0
max memory     :   0
```
**show rip neighbor**

**List of Syntax**

Syntax on page 2519
Syntax (EX Series Switches and QFX Series) on page 2519

**Syntax**

`show rip neighbor`

- `<instance (all | instance-name) >`
- `<logical-system (all | logical-system-name) >`
- `<name`

**Syntax (EX Series Switches and QFX Series)**

`show rip neighbor`

- `<instance (all | instance-name) >`
- `<name`

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

Display information about RIP neighbors.

**Options**

`none`—Display information about all RIP neighbors for all instances.

- `<instance (all | instance-name) >`—(Optional) Display RIP neighbor information for all instances or for only the specified routing instance.

- `<logical-system (all | logical-system-name) >`—(Optional) Perform this operation on all logical systems or on a particular logical system.

- `<name>`—(Optional) Display detailed information about only the specified RIP neighbor.

**Required Privilege Level**

`view`

**List of Sample Output**

- `show rip neighbor on page 2520`
- `show rip neighbor (With Demand Circuits Configured) on page 2520`

**Output Fields**

Table 193 on page 2520 lists the output fields for the `show rip neighbor` command. Output fields are listed in the approximate order in which they appear.
Table 193: show rip neighbor Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor</td>
<td>Name of the RIP neighbor.</td>
</tr>
</tbody>
</table>

**NOTE:** Beginning with Junos OS Release 11.1, when you configure demand circuits, the output displays a demand circuit (DC) flag next to neighbor interfaces configured for demand circuits.

If you configure demand circuits at the [edit protocols rip group group-name neighbor neighbor-name] hierarchy level, the output shows only the neighboring interface that you specifically configured as a demand circuit. If you configure demand circuits at the [edit protocols rip group group-name] hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits.

RIPvng Operational Commands

- clear ripng general-statistics
- clear ripng statistics
- show ripng general-statistics
- show ripng neighbor
- show ripng statistics
clear ripng general-statistics

List of Syntax  Syntax on page 2526
               Syntax (EX Series Switches) on page 2526

Syntax  clear ripng general-statistics
       <logical-system (all | logical-system-name)>

Syntax (EX Series Switches)  clear ripng general-statistics

Release Information  Command introduced before Junos OS Release 7.4.
                      Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  Clear RIP next generation (RIPng) general statistics.

Options  none—Clear RIPng general statistics.
         logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level  clear

Related Documentation  •  show ripng general-statistics on page 2528

        <instance | name>
        <logical-system (all | logical-system-name)>

Syntax (EX Series
Switch)  clear ripng statistics
        <instance | name>

Release Information  Command introduced before Junos OS Release 7.4.
                      Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  Clear RIP next-generation (RIPng) statistics.

Options  
        none—Reset RIPng counters for all neighbors for all routing instances.
        instance—(Optional) Reset RIPng counters for the specified instance.
        logical-system (all | logical-system-name)—(Optional) Perform this operation on all
                      logical systems or on a particular logical system.
        name—(Optional) Reset RIPng counters for the specified neighbor.

Required Privilege  clear

CHAPTER 28

Firewall Filter Operational Commands

- clear firewall
- show firewall
- show firewall filter version
- show firewall log
- show firewall prefix-action-stats
- show firewall templates-in-use
- show policer
clear firewall

List of Syntax

Syntax on page 2536
Syntax (EX Series Switches) on page 2536

Syntax

clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name ) | logical-system logical-system-name)

Syntax (EX Series Switches)
clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name) | policer counter (all | counter-id counter-index))

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
logical-system option introduced in Junos OS Release 9.3.
log option introduced before Junos OS Release 11.4.

Description

Clear statistics about configured firewall filters.

When you clear the counters of a filter, this impacts not only the counters shown by the CLI, but also the ones tracked by SNMP2.

Subscriber management uses firewall filters to capture and report the volume-based service accounting counters that are used for subscriber billing. The clear firewall command also clears the service accounting counters that are reported to the RADIUS accounting server. For this reason, you must be cautious in specifying which firewall statistics you want to clear.

NOTE: The clear firewall command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover (GRES).

If you clear statistics for firewall filters that are applied to Trio-based DPCs and that also use the prefix-action action on matched packets, wait at least 5 seconds before you enter the show firewall prefix-action-stats command. A 5-second pause between issuing the clear firewall and show firewall prefix-action-stats commands avoids a possible timeout of the show firewall prefix-action-stats command.

Options

all—Clear the packet and byte counts for all filters. On EX Series switches, this option also clears the packet counts for all policer counters.

counter counter-name—Clear the packet and byte counts for a filter counter that has been configured with the counter firewall filter action.

filter filter-name—Clear the packet and byte counts for the specified firewall filter.
log (all | logical-system-name) — Clear log entries for IPv4 firewall filters that have then log as an action. Use log all to clear all log entries or log logical-system-name to clear log entries for the specified logical system.

logical-system logical-system-name — Clear the packet and byte counts for the specified logical system.

policer counter (all | counter-id counter-index) — (EX8200 switches only) Clear all policer counters using the policer counter all command, or clear a specific policer counter using the policer counter counter-id counter-index command. The value of counter-index can be 0, 1, or 2.

Required Privilege Level

Sample Output

clear firewall all

    user@host> clear firewall all

clear firewall (counter counter-name)

    user@host> clear firewall counter port-filter-counter

clear firewall (filter filter-name)

    user@host> clear firewall filter ingress-port-filter

clear firewall (policer counter all) (EX8200 Switch)

    user@switch> clear firewall policer counter all

clear firewall (policer counter counter-id counter-index) (EX8200 Switch)

    user@switch> clear firewall policer counter counter-id 0
show firewall

List of Syntax  Syntax on page 2538
Syntax (EX Series Switches) on page 2538

Syntax  show firewall
  <application (CFM | eswd | RMPS)>
  <counter counter-name>
  <detail>
  <filter filter-name>
  <filter regex regular-expression>
  <logical-system (all | logical-system-name)>
  <terse>

Syntax (EX Series Switches)  show firewall
  <application (CFM | eswd | RMPS)>
  <counter counter-name>
  <detail>
  <filter filter-name>
  <filter regex regular-expression>
  <log < (detail | interface interface-name)>
  <policer counters < (detail | counter-id counter-index <detail>)>
  <terse>

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Option logical-system introduced in Junos OS Release 9.3.
Option terse introduced in Junos OS Release 9.4.
Option policer counters introduced in Junos OS Release 12.2 for EX Series switches.
Option detail introduced in Junos OS Release 12.3 for EX Series switches.
Option detail introduced in Junos OS Release 14.1 for MX Series routers.
Option regex regular-expression introduced in Junos OS Release 14.2.
Option lsp introduced in Junos OS Evolved Release 18.3R1.

Description  Display enhanced statistics and counters for all configured firewall filters.

If you query for options on the `show firewall filter` command, on Junos OS systems, you will see this output, which includes the configured Flowspec filters:

```
show firewall filter ?
```

Possible completions:

<table>
<thead>
<tr>
<th>Completion</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;filtername&gt;</td>
<td>Filter name</td>
</tr>
<tr>
<td><strong>flowspec_default_inet</strong></td>
<td># Flowspec filter name</td>
</tr>
<tr>
<td>application</td>
<td>Owner application</td>
</tr>
<tr>
<td>counter</td>
<td>Counter name</td>
</tr>
<tr>
<td>logical-system</td>
<td>Name of logical system, or 'all'</td>
</tr>
<tr>
<td>regex</td>
<td>Show filter using regular expression</td>
</tr>
<tr>
<td>version</td>
<td>Show filter version installed</td>
</tr>
</tbody>
</table>
However, on Junos OS Evolved systems, the Flowspec filters names are not shown here. To view Flowspec filters, use the `show firewall application routing` command.

**Options**

- `none`—(Optional) Display statistics and counters for all configured firewall filters and counters. For EX Series switches, this command also displays statistics about all configured policers.
- `application (CFM | eswd | RMPS)`—(Optional) Show firewall elements owned by the selected software component:
  - Connectivity Fault Management (CFM)
  - Ethernet switching daemon (eswd)—Shows only on devices that support it.
  - Resource Management and Packet Steering (RMPS)
- `counter counter-name`—(Optional) Name of a filter counter.
- `detail`—(EX Series switches and MX Series routers only) (Optional) Display firewall filter statistics and enhanced policer statistics and counters.
- `filter filter-name`—(Optional) Name of a configured filter.
- `filter regex regular-expression`—(Optional) Regular expression that matches the names of a subset of filters.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.
- `log`—(Optional) Display log entries for firewall filters.
- `log < (detail | interface interface-name) >`—(EX Series switches only) (Optional) Display detailed log entries of firewall activity or log information about a specific interface.
- `policer counters < (detail | counter-id counter-index <detail>) >`—(EX8200 switches only) (Optional) Display enhanced policer counter statistics in brief or in detail.
- `terse`—(Optional) Display firewall filter names only.

**Required Privilege**

### List of Sample Output
- show firewall filter (MX Series Router and EX Series Switch) on page 2542
- show firewall filter (non MX Series Router and EX Series Switch) on page 2542
- show firewall filter (Dynamic Input Filter) on page 2542
- show firewall (Logical Systems) on page 2542
- show firewall (counter counter-name) on page 2543
- show firewall log on page 2543
- show firewall policer counters (EX8200 Switch) on page 2543
- show firewall policer counters (detail) (EX8200 Switch) on page 2544
- show firewall policer counters (counter-id counter-index) (EX8200 Switch) on page 2544
- show firewall policer counters (counter-id counter-index detail) (EX8200 Switch) on page 2544
- show firewall detail on page 2545
- show firewall application cfm (Junos OS Evolved) on page 2545

### Output Fields
Table 198 on page 2540 lists the output fields for the `show firewall` command. Output fields are listed in the approximate order in which they appear.

**Table 198: show firewall Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter</td>
<td>Name of a filter that has been configured with the <code>filter</code> statement at the <code>[edit firewall]</code> hierarchy level.</td>
</tr>
<tr>
<td></td>
<td>Except on EX Series switches:</td>
</tr>
<tr>
<td></td>
<td>- When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either <code>-i</code> for an input filter or <code>-o</code> for an output filter.</td>
</tr>
<tr>
<td></td>
<td>- When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either <code>-in</code> for an input filter or <code>-out</code> for an output filter. When a logical system-specific filter is displayed, the name of the filter is prefixed with two underscore (<code>_</code>) characters and the name of the logical system (for example, <code>_ls1/filter1</code>).</td>
</tr>
<tr>
<td></td>
<td>- When a service filter is displayed that uses a service set, the separator between the service-set name and the service-filter name is a semicolon (<code>;</code>).</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> For bridge family filter, the <code>ip-protocol</code> match criteria is supported only for IPv4 and not for IPv6. This is applicable for line cards that support the Junos Trio chipset, such as the MX 3D MPC line cards.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Counters</th>
<th>Display filter counter information:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Name—Name of a filter counter that has been configured with the <code>counter</code> firewall filter action.</td>
</tr>
<tr>
<td></td>
<td>- Bytes—Number of bytes that match the filter term under which the <code>counter</code> action is specified.</td>
</tr>
<tr>
<td></td>
<td>- Packets—Number of packets that matched the filter term under which the <code>counter</code> action is specified.</td>
</tr>
</tbody>
</table>

**NOTE:** On M and T Series routers, firewall filters cannot count `ip-options` packets on a per option type and per interface basis. A limited workaround is to use the `show pfe statistics ip options` command to see `ip-options` statistics on a per Packet Forwarding Engine (PFE) basis. See `show pfe statistics ip` for sample output.
Table 198: show firewall Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policers</td>
<td>Display policer information:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Name</strong>—Name of policer.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Bytes</strong>—(For two-color policers on MX Series routers and EX Series switches, and for hierarchical policers on interfaces hosted on MICs and MPCs in MX Series routers) Number of bytes that match the filter term under which the policer action is specified. This is only the number out-of-specification (out-of-spec) byte counts, not all the bytes in all packets policed by the policer. For other combinations of policer type, device, and line card type, this field is blank.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Packets</strong>—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.</td>
</tr>
<tr>
<td>Policer Counter Index</td>
<td>(EXB200 switch only) Global management counter ID. The counter ID value (counter-index) can be 0, 1, or 2.</td>
</tr>
<tr>
<td>Green</td>
<td>(EXB200 switch only) Number of packets within the limits. The number of packets is smaller than the committed information rate (CIR).</td>
</tr>
<tr>
<td>Yellow</td>
<td>(EXB200 switch only) Number of packets partially within the limits. The number of packets is greater than the CIR, but the burst size is within the excess burst size (EBS) limit.</td>
</tr>
<tr>
<td>Discard</td>
<td>(EXB200 switch only) Number of discarded packets.</td>
</tr>
<tr>
<td>Bytes</td>
<td>(EXB200 switch only) Number of green, yellow, red, or discarded packets in bytes.</td>
</tr>
<tr>
<td>Packets</td>
<td>(EXB200 switch only) Number of green, yellow, red, or discarded packets.</td>
</tr>
<tr>
<td>Filter name</td>
<td>(EXB200 switch only) Name of the filter with a term associated to a policer.</td>
</tr>
<tr>
<td>Term name</td>
<td>(EXB200 switch only) Name of the term associated with a policer.</td>
</tr>
<tr>
<td>Policer name</td>
<td>(EXB200 switch only) Name of the policer that is associated with a global management counter.</td>
</tr>
<tr>
<td>P1-t1</td>
<td>• OOS packet statistics for packets that are marked out-of-specification (out-of-spec) by the policer. Changes to all packets that have out-of-spec actions, such as discard, color marking, or forwarding-class, are included in this counter.</td>
</tr>
<tr>
<td></td>
<td>• Offered packet statistics for traffic subjected to policing.</td>
</tr>
<tr>
<td></td>
<td>• Transmitted packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the in-spec statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.</td>

show firewall filter version

**Syntax**
```
show firewall filter version <filter-name>
```

**Release Information**
Command introduced in Junos OS Release 10.2R2.

**Description**
Display the version number of the installed firewall filter in the Routing Engine.

**Options**
- `none`—(Optional) Display the version number of all installed firewall filters.
- `filter-name`—(Optional) Name of a configured filter. If you specify the name of a filter, only the version number of that filter is displayed.

**Additional Information**
The initial version number is 1. This number increments by one when you modify the firewall filter settings or an associated prefix action. The maximum version number is 4,294,967,295. When the version number reaches 4,294,967,295, this number is reset to 1.

**Required Privilege**
`view`

**List of Sample Output**
`show firewall filter version on page 2546`

**Output Fields**
Table 199 on page 2546 lists the output fields for the `show firewall filter version` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter</td>
<td>Name of a filter that has been configured with the <code>filter</code> statement at the <code>[edit firewall]</code> hierarchy level.</td>
</tr>
<tr>
<td>Version</td>
<td>Display the version number of the firewall filter.</td>
</tr>
</tbody>
</table>

**Sample Output**
`show firewall filter version`
```
user@host> show firewall filter version
Filter version information :
Filter  Version
test   10
```

Syntax (EX Series Switches)
show firewall log
<interface interface-name>

Release Information
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
extensive option introduced in Junos OS Release 16.1.  
logical-system option introduced in Junos OS Release 9.3.

Description
Display log information about firewall filters.

Options
none—Display log information about firewall filters.
detail—(Optional) Display detailed information.
extensive—(Optional) Display hex dump of packet captured by log action.
interface interface-name—(Optional) Display log information about a specific interface.
logical-system (logical-system-name | all)—(Optional) Perform this operation on all logical systems or on a particular system.

Required Privilege
view

</thead>
<tbody>
<tr>
<td>Time of Log</td>
<td>Time that the event occurred.</td>
</tr>
</tbody>
</table>
### Table 200: show firewall log Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Filter              | • Displays the name of a configured firewall filter or service filter only if the packet hit the filter's log action in a kernel filter (in the control plane). For any traffic that reaches the Routing Engine, the packets hit the log action in the kernel.  
• For all other logged packets (packet hit the filter's log action in the Packet Forwarding Engine), this field displays pfe instead of a configured filter name. |
| Filter Action       | Filter action:                                                                                                                                                                                                      |
|                     | • A—Accept                                                                                                                                                                                                          |
|                     | • D—Discard                                                                                                                                                                                                         |
|                     | • R—Reject                                                                                                                                                                                                         |
| Name of interface   | • Displays a physical interface name if the packet arrived at a port on a line card.                                                                                                                                  |
|                     | • Displays local if the packet was generated by the device's internal Ethernet interface, em1 or fxp1, which connects the Routing Engine with the router's packet-forwarding components.                                       |
| Name of protocol    | Packet's protocol name: egp, gre, icmp, ipip, ospf, pim, rsvp, tcp, or udp.                                                                                                                                          |
| Packet length       | Length of the packet.                                                                                                                                                                                                |
| Source address      | Packet's source address.                                                                                                                                                                                              |
| Destination address | Packet's destination address and port.                                                                                                                                                                               |

<from number to number>
<logical-system (logical-system-name | all)>

Release Information
Command introduced before Junos OS Release 7.4.
logical-system option introduced in Junos OS Release 9.3.

Description
Display prefix action statistics about configured firewall filters.

If you clear statistics for firewall filters that are applied to MPCs and that also use the prefix-action action on matched packets, wait at least 5 seconds before you enter the show firewall prefix-action-stats command. A 5-second pause between issuing the clear firewall and show firewall prefix-action-stats commands avoids a possible timeout of the show firewall prefix-action-stats command.

By default, policers operate in term-specific mode.

See Filter-Specific Policer Overview for information about how to configure policers in filter-specific mode.

Options
filter filter-name—Name of a filter.
prefix-action prefix-action-name—Name of a prefix action.
from number to number—(Optional) Starting and ending counter or policer.
logical-system (logical-system-name | all)—(Optional) Perform this operation on all logical systems or on a particular system.

List of Sample Output
show firewall prefix-action-stats on page 2551
Output Fields  Table 201 on page 2551 lists the output fields for the show firewall prefix-action-stats command. Output fields are listed in the approximate order in which they appear.

Table 201: show firewall prefix-action-stats Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter</td>
<td>Filter name.</td>
</tr>
</tbody>
</table>

Filters configured for logical systems include the name of the filter prefixed with the two underscore characters (__) and the name of the logical system (for example, __ls1/filter1).

Sample Output

The following sample output assumes that the policer act1 is in term mode and that there is a term named term1 configured in the firewall filter test.

```bash
user@host> show firewall prefix-action-stats filter test prefix-action act1-term1 from 0 to 9
Filter: test
Counters:
Name       | Bytes | Packets |
---------- |------- |---------|
act1-0     | 0      | 0        |
act1-1     | 0      | 0        |
act1-2     | 0      | 0        |
act1-3     | 0      | 0        |
act1-4     | 0      | 0        |
act1-5     | 0      | 0        |
act1-6     | 0      | 0        |
act1-7     | 0      | 0        |
act1-8     | 0      | 0        |
act1-9     | 0      | 0        |
Policers:
Name       | Bytes | Packets |
---------- |------- |---------|
act1-0     | 0      | 0        |
act1-1     | 0      | 0        |

```
show policer

Syntax

show policer
<detail>
<policer-name>

Release Information

Command introduced before Junos OS Release 7.4.
The command show policer detail was introduced in Junos OS Release 12.3.

Description

Display the number of policed packets for a given policer or an aggregate policer. An aggregate policer is an aggregate of different policers on the same logical interface.

Options
detail—(Optional) Display additional statistics and counters. Requires the enhanced-policer statement to be enabled at the [edit chassis] hierarchy level.

NOTE: show policer detail is not available for the following counters:
three color policers, hierarchical policers, prefix-specific actions, LSP policers and other nexthop policers, and fast-update-filters on devices running MPC1 or MPC2 line cards.

policer-name—(Optional) Display the number of policed packets for the specified policer.
<null>—Displays the number of policed packets for all configured policers.

Required Privilege Level

view

List of Sample Output

show policer (MX Series) on page 2555
show policer (non-MX Series Router) on page 2555
show policer (Aggregate Policer, non MX Series Router) on page 2556
show policer detail (MX Series Router running MPC 1 or MPC 2 line cards) on page 2556

Output Fields

Table 203 on page 2555 lists the output fields for the show policer command. Output fields are listed in the approximate order in which they appear.
Table 203: show policer Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the policer. Policier detail also includes the following statistics:</td>
</tr>
<tr>
<td></td>
<td>OOS—Packet statistics for packets that are marked out-of-specification by the policer. Changes to all packets that have out-of-specification actions, such as discard, color marking, or forwarding-class, are included in this counter.</td>
</tr>
<tr>
<td></td>
<td>Offered—Packet statistics for traffic subjected to policing.</td>
</tr>
<tr>
<td></td>
<td>Transmitted—Packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the within-specification statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.</td>
</tr>
<tr>
<td>Bytes</td>
<td>• (For two-color policers on MX Series routers, and for hierarchical policers on MS-DPC, MIC, and MPC interfaces on MX Series routers)—Total number of bytes policed by the specified policer. For other combinations of policer type, device, and line card type, this field is blank.</td>
</tr>
<tr>
<td></td>
<td>• (T Series and M10i)—Not applicable. The Bytes information is not displayed.</td>
</tr>
<tr>
<td>Packets</td>
<td>Total number of packets policed by the specified policer.</td>
</tr>
</tbody>
</table>

Sample Output

**show policer (MX Series)**

```
user@host> show policer
Policers:
Name                                                Bytes              Packets

### clear bridge mac-table

**Syntax**

```
clear bridge mac-table
  <bridge-domain (all | bridge-domain-name)>
  <instance instance-name>
  <interface interface-name>
  <learning-vlan id (all-vlan | learning-vlan-id)>
  <mac-address>
```

**Release Information**

Command introduced in Junos OS Release 8.4.

**Description**

(MX Series routers only) Clear learned Layer 2 address information from the media access control (MAC) address table.

**Options**

- **none**—Clear all learned Layer 2 address information from the MAC address table.
- **bridge-domain (all | bridge-domain-name)**—(Optional) Clear learned Layer 2 MAC addresses for all bridging domains or for the specified bridging domain.
- **instance instance-name**—(Optional) Clear learned Layer 2 MAC addresses for the specified routing instance.
- **interface interface-name**—(Optional) Clear learned Layer 2 MAC addresses for the specified interface.
- **learning-vlan-id (all-vlan | learning-vlan-id)**—(Optional) Clears learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.
- **mac-address**—(Optional) Clear the specified learned Layer 2 address from the MAC address table.

**Required Privilege Level**

clear

**List of Sample Output**

| clear bridge mac-table on page 2558 |

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
clear bridge mac-table

user@host> clear bridge mac-table
```

### clear error bpdu interface

**List of Syntax**  
- MX Series on page 2559  
- QFX Series, EX Series, NFX Series on page 2559

**MX Series**  
`clear error bpdu interface interface-name`

**QFX Series, EX Series, NFX Series**  
`clear error bpdu interface (all | interface-name)`

**Release Information**  
- Command introduced in Junos OS Release 9.4.  
- Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.  
- Command supports `all` option in Junos OS Release 15.1 for EX Series switches.

**Description**  
Clear a bridge protocol data unit (BPDU) error condition caused by the detection of a possible bridging loop from Spanning Tree Protocol (STP) operation.

**Required Privilege**  
`clear`

**Related Documentation**  
- `Configuring BPDU Protection on ACX Router, EX Switch and MX Router Edge Ports`
- `Unblocking a Switch Interface That Receives BPDUs in Error (CLI Procedure)`

**List of Sample Output**  
`clear error bpdu interface ge-1/1/1 on page 2559`

**Output Fields**  
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
clear error bpdu interface ge-1/1/1
user@host> clear error bpdu interface ge-1/1/1
```
clear error mac-rewrite

Syntax  
clear error mac-rewrite
<interface interface-name>

Release Information  
Command introduced in Junos OS Release 9.1.
Command introduced in Junos OS Release 14.1X53-D10 and 17.3R1 for EX4300 switches.
Command introduced in Junos OS Release 15.1X53-D55 and 18.2R1 for EX2300 and EX3400 switches.
Command introduced in Junos OS Release 17.4R1 for EX4600 switches.
Command introduced in Junos OS Release 19.1R1 for QFX5200 switches.

Description  
Clear a MAC rewrite error condition caused by the reception of tunneled protocol packets on an interface with Layer 2 protocol tunneling enabled.

On interfaces with L2PT configured, customer-facing ports should not receive packets with the L2PT MAC address as the destination address unless there is a network topology or configuration error. Any such interface receiving an L2PT packet becomes “Disabled”, and must subsequently be re-enabled by clearing the error with this command.

Options  
interface interface-name — (Optional) Clear the MAC rewrite error condition for the specified interface.

Required Privilege Level  
clear

show bridge flood

Syntax

show bridge flood
  <brief | detail | extensive>
  <bridge-domain domain-name>
  <event-queue>
  <instance instance-name>
  <route (all-ce-flood | all ve-flood | alt-root-flood | bd-flood | mlp-flood | re-flood)>

Release Information

Command introduced in Junos OS Release 8.4.

Description

(MX Series routers only) Display bridging flooding information.

Options

none—Display all bridging flooding information for all bridging domains.

brief | detail | extensive—(Optional) Display the specified level of output.

bridge-domain domain-name—(Optional) Display bridging flooding information for the specified bridge domain.

event-queue—(Optional) Display the queue of pending bridge flood events.

instance instance-name—(Optional) Display bridging flooding information for the specified routing instance.

route (all-ce-flood | all ve-flood | alt-root-flood | bd-flood | mlp-flood | re-flood)—(Optional) Display the following:

  • all-ce-flood—Display the route for flooding traffic to all customer edge routers if no-local-switching is enabled.
  • all-ve-flood—Display the route for flooding traffic to all VPLS edge routers if no-local-switching is enabled.
  • alt-root-flood—Display the Spanning Tree Protocol (STP) alt-root flooding route used for the interface.
  • bd-flood—Display the route for flooding traffic of a bridge domain if no-local-switching is not enabled.
  • mlp-flood—Display the route for flooding traffic to MAC learning chips.
  • re-flood—Display the route for Routing Engine flooding to all interfaces.

**show bridge mac-table**

**Syntax**

```plaintext
show bridge mac-table
  <age>
  <brief | count | detail | extensive>
  <bridge-domain (all | bridge-domain-name)>
  <global-count>
  <instance instance-name>
  <interface interface-name>
  <mac-address>
  <instance instance-name>
  <vlan-id (all-vlan | vlan-id)>
```

**Release Information**

- Command introduced in Junos OS Release 8.4.
- Command introduced in Junos OS Release 15.1
- Support for PBB-EVPN instance added in Junos OS Release 16.1
- MAC Flag P to indicate a MAC Pinned interface introduced in Junos OS 16.2

**Description**

(MX Series routers only) Display Layer 2 MAC address information.

**Options**

- **none**—Display all learned Layer 2 MAC address information.
- **age**—(Optional) Display age of a single mac-address.
- **brief | count | detail | extensive**—(Optional) Display the specified level of output.
- **bridge-domain (all | bridge-domain-name)**—(Optional) Display learned Layer 2 MAC addresses for all bridging domains or for the specified bridging domain.
- **global-count**—(Optional) Display the total number of learned Layer 2 MAC addresses on the system.
- **instance instance-name**—(Optional) Display learned Layer 2 MAC addresses for the specified routing instance.
- **interface interface-name**—(Optional) Display learned Layer 2 MAC addresses for the specified interface.
- **mac-address**—(Optional) Display the specified learned Layer 2 MAC address information.
- **vlan-id (all-vlan | vlan-id)**—(Optional) Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.

**Additional Information**

When Layer 2 protocol tunneling is enabled, the tunneling MAC address 01:00:0c:cd:cd:d0 is installed in the MAC table. When the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunk Protocol (VTP) is configured for Layer 2 protocol tunneling on an interface, the corresponding protocol MAC address is installed in the MAC table.

**show l2-learning global-mac-count**

**Syntax**

`show l2-learning global-mac-count`

**Release Information**

Command introduced in Junos OS Release 9.3.

**Description**

(MX Series routers only) Display the total number of dynamic and static MAC addresses learned for the entire router.

**Options**

This command has no options.

**Required Privilege Level**

`view`

**List of Sample Output**

`show l2-learning global-mac-count on page 2581`

**Output Fields**

Displays the total number of dynamic and static MAC addresses learned for the entire router.

**Sample Output**

```
user@host> show l2-learning global-mac-count
100 dynamic and static MAC addresses learned globally
```
show l2-learning instance

Syntax

show l2-learning instance

Release Information

(MX Series routers only) Command introduced in Junos OS Release 8.4.

Description

Display Layer 2 learning properties for all the configured routing instances.

Options

This command has no options.

Required Privilege Level

view

List of Sample Output

show l2-learning instance on page 2583

Output Fields

Table 206 on page 2582 describes the output fields for the show l2-learning instance command. Output fields are listed in the approximate order in which they appear.

Table 206: show l2-learning instance Output Fields

<table>

show mac-rewrite interface

Syntax

```
show mac-rewrite interface
  <brief | detail>
  <interface-name>
```

Release Information

Command introduced in Junos OS Release 9.1.
Command introduced in Junos OS Release 14.1X53-D10 and 17.3R1 for EX4300 switches.
Command introduced in Junos OS Release 15.1X53-D55 and 18.2R1 for EX2300 and EX3400 switches.
Command introduced in Junos OS Release 17.4R1 for EX4600 switches.
Statement introduced in Junos OS Release 19.1R1 for QFX5200 switches.

Description

Display Layer 2 protocol tunneling (L2PT) information.

Options

```
brief | detail—(Optional) Display the specified level of output.

interface interface-name—(Optional) Display L2PT information for the specified interface.
```

Required Privilege Level

CHAPTER 30

VPN Operational Commands

• clear vpls mac-address
• clear vpls mac-table
• request l2circuit-switchover
• show dynamic-tunnels database
• show hfr profiles
• show ingress-replication mvpn
• show l2circuit connections
• show l2vpn connections
• show mvpn c-multicast
• show mvpn instance
• show mvpn neighbor
• show vpls connections
• show vpls flood event-queue
• show vpls flood instance
• show vpls flood route
• show vpls mac-table
• show vpls statistics
clear vpls mac-address

Syntax

```
clear vpls mac-address
<instance instance-name >
<logical-system (all | logical-system-name)>
<mac-address>
```

Release Information

Command introduced before Junos OS Release 7.4.

Description

(T Series and M Series routers, except for the M160 router) Clear media access control (MAC) address entries from the virtual private LAN service (VPLS) table.

Options

- **none**—Clear all MAC address entries from the VPLS table for all routing instances.
- **instance instance-name**—(Optional) Clear all MAC address entries for a VPLS instance from the VPLS table.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **mac-address**—(Optional) Clear a specific MAC address in a VPLS instance from the VPLS table.

Required Privilege Level

maintenance

List of Sample Output

clear vpls mac-address on page 2590

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear vpls mac-address

```
user@host> clear vpls mac-address
```
clear vplsl mac-table

**Syntax**
clear vplsmac-table
<instance instance-name>
<interface interface-name>
<logical-system (all | logical-system-name)>
<mac-address>
<vlan-id>

**Release Information**
Command introduced before Junos OS Release 9.5.

**Description**
(MX Series routers) Clear media access control (MAC) addresses from the virtual private LAN service (VPLS) MAC table.

**Options**
- **none**—Clear all MAC addresses from the VPLS table for all routing instances.
- **instance instance-name**—(Optional) Clear all MAC addresses for a VPLS instance from the VPLS table.
- **interface interface-name**—(Optional) Clear all MAC addresses for a VPLS interface from the VPLS table.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **mac-address**—(Optional) Clear a specific MAC address in a VPLS instance from the VPLS table.
- **vlan-id**—(Optional) Clear MAC addresses on a specified VLAN (0 through 4095).

**Required Privilege Level**
maintenance

**List of Sample Output**
clear vplsmac-table on page 2591

**Output Fields**
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**
clear vplsmac-table

user@host> clear vplsmac-table
request l2circuit-switchover

Syntax
request l2circuit-switchover
<logical-system (all | logical-system-name)>
<neighbor address>
<virtual-circuit-id identifier>

Release Information
Command introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.

Description
Manually trigger a switch from the active pseudowire to the redundant pseudowire. This command can be useful when performing network maintenance.

Options
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
neighbor address—(Optional) Trigger a switch of all of the active pseudowire connections with the specified neighbor to their respective redundant pseudowires.
virtual-circuit-id identifier—(Optional) Trigger a switch from the active pseudowire connection of the specified Layer 2 circuit to its redundant pseudowire.

Required Privilege
maintenance

request l2circuit-switchover virtual-circuit-id on page 2592

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output
request l2circuit-switchover virtual-circuit-id

user@host>request l2circuit-switchover virtual-circuit-id 12
show dynamic-tunnels database

Syntax

show dynamic-tunnels database
<destination>
<logical-system (all | logical-system-name)>
<table routing-table-name>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display dynamic tunnel database information.

Options

none—Display dynamic tunnel database information for all destinations and routing tables.

destination—(Optional) Display database entries for the specified IP address (with optional destination prefix length) only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table routing-table-name—(Optional) Display database entries for the specified table only.

Required Privilege

view

show dynamic-tunnels database (Tunnel Is Up) on page 2594
show dynamic-tunnels database (No Tunnel PIC) on page 2595
show dynamic-tunnels database (Tunnel Is Expiring) on page 2595
show dynamic-tunnels database (Destination Specified) on page 2595
show dynamic-tunnels database (Localization) on page 2595
show dynamic-tunnels database (MPLS-over-UDP Dynamic Tunnels on PTX Series Routers and QFX Series Switches) on page 2596
show dynamic-tunnels database (Segment Routing LSPs) on page 2596

Output Fields

Table 209 on page 2593 lists the output fields for the show dynamic-tunnels database command. Output fields are listed in the approximate order in which they appear.

Table 209: show dynamic-tunnels database Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the routing table (for example, inet.0).</td>
</tr>
<tr>
<td>Destination-network</td>
<td>Destination IP address and subnet.</td>
</tr>
<tr>
<td>Tunnel to</td>
<td>Destination IP address and prefix of the tunnel.</td>
</tr>
</tbody>
</table>
Table 209: show dynamic-tunnels database Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>State of the tunnel: Up, Up (expires in nn:nn:nn seconds), or Dn (down).</td>
</tr>
<tr>
<td>Reference count</td>
<td>Number of routes across the dynamic tunnel that are currently being resolved.</td>
</tr>
</tbody>
</table>
| Next-hop type | Type of tunnel: GRE or UDP (BGP-Signal).  
  • GRE or UDP (BGP signal)  
  • SRTE—Segment routing traffic-engineered LSP. |
| Source address | Source IP address of the tunnel. |
| Next-hop     | IP address of the destination interface. |
| VPN Label    | The label provided by the peer device to identify the VPN through which the packet needs to go. This label is used to identify the VRF for route lookup. |
| Ingress Route | The IGP route along with the corresponding metric that has been selected for forwarding the tunnel-encapsulated packet. |
| Localized PFE | Packet Forwarding Engine interface which is the anchor Packet Forwarding Engine for the localized next-hop-based dynamic tunnels.  
  When the anchor Packet Forwarding Engine of the tunnel goes down, it is represented by a # near the Packet Forwarding Engine name. |
| LSP template name | Name of the segment routing traffic-engineered template configured for dynamic creation of segment routing LSPs. |
| State         | State of the destination interface: Up, Dn, or Dn (no tunnel pic). |
| Status        | Status of the dynamic segment routing LSP. |

show hfr profiles

Syntax

```
show hfr profiles
<brief | extensive>
```

Release Information

Command introduced in Junos OS Release 12.2.

Description

Display host fast reroute (HFRR) profile information.

HFRR adds a precomputed protection path into the Packet Forwarding Engine, such that if a link between a provider edge device and a server farm becomes unusable for forwarding, the Packet Forwarding Engine can use another path without having to wait for the router or the protocols to provide updated forwarding information.

Options

- none—Display information about HFRR profiles.
- brief | extensive—(Optional) Display the specified level of output.

Required Privilege

view

show l2vpn connections

Syntax

```show l2vpn connections
<brief | extensive>
<down | up | up-down>
<history>
<instance instance>
<instance-history>
<local-site local-site>
<logical-system (all | logical-system-name)>
<remote-site remote-site>
<status>
<summary>
```

Release Information
Command introduced before Junos OS Release 7.4.
`instance-history` option introduced in Junos OS Release 12.3R2.

Description
Display Layer 2 virtual private network (VPN) connections.

Options
- `none`—Display all Layer 2 VPN connections for all routing instances.
- `brief | extensive`—(Optional) Display the specified level of output.
- `down | up | up-down`—(Optional) Display nonoperational, operational, or both kinds of connections.
- `history`—(Optional) Display information about connection history.
- `instance instance`—(Optional) Display connections for the specified routing instance only.
- `instance-history`—(Optional) Display information about connection history for a particular instance.
- `local-site local-site`—(Optional) Display connections for the specified Layer 2 VPN local site name or ID only.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.
- `remote-site remote-site`—(Optional) Display connection for the specified Layer 2 VPN remote site ID only.
- `status`—(Optional) Display information about the connection and interface status.
- `summary`—(Optional) Display summary of all Layer 2 VPN connections information.

Required Privilege
- Level `view`
List of Sample Output

- show l2vpn connections extensive on page 2614
- show l2vpn connections extensive (VPWS) on page 2614

Output Fields

Table 213 on page 2610 lists the output fields for the `show l2vpn connections` command. Output fields are listed in the approximate order in which they appear.

Table 213: show l2vpn connections Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of Layer 2 VPN instance.</td>
</tr>
<tr>
<td>L2vpn-id</td>
<td>For BGP autodiscovery, a globally unique Layer 2 VPN community identifier for the instance.</td>
</tr>
<tr>
<td>Local-ID</td>
<td>BGP <code>local-address</code> assigned to the local routing device.</td>
</tr>
<tr>
<td>Local site</td>
<td>Name of local site.</td>
</tr>
<tr>
<td>Local source-attachment-id</td>
<td>For FEC 129, the VPWS source attachment identifier. The point-to-point nature of VPWS requires that you specify the source access individual identifier (SAII) and the target access individual identifier (TAII). This SAII-TAII pair defines a unique pseudowire between two PE devices.</td>
</tr>
<tr>
<td>Target-attachment-id</td>
<td>For FEC 129, the VPWS target attachment identifier. If the configured target identifier matches a source identifier advertised by a remote PE device by way of a BGP auto-discovery message, the pseudowire between that source-target pair is signaled. If there is no match between an advertised source identifier and the configured target identifier, the pseudowire is not established.</td>
</tr>
<tr>
<td>Interface name</td>
<td>Name of interface.</td>
</tr>
<tr>
<td>Remote Site ID</td>
<td>Remote site ID.</td>
</tr>
<tr>
<td>Label Offset</td>
<td>Numbers within the label block that are skipped to find the next label base.</td>
</tr>
<tr>
<td>Label-base</td>
<td>Advertises the first label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.</td>
</tr>
<tr>
<td>Range</td>
<td>Advertises the label block size.</td>
</tr>
<tr>
<td>status-vector</td>
<td>Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of 0 indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of 1 indicates either one or both are down.</td>
</tr>
<tr>
<td>connection-site</td>
<td>Name of the connection site.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of connection: <code>loc</code> (local) or <code>rmt</code> (remote).</td>
</tr>
<tr>
<td>St</td>
<td>Status of the connection. (For a list of possible values, see the Legend for connection status (St) field.)</td>
</tr>
</tbody>
</table>
### Table 213: show l2vpn connections Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time last up</td>
<td>Time that the connection was last in the Up condition.</td>
</tr>
<tr>
<td># Up trans</td>
<td>Number of transitions from Down to Up condition.</td>
</tr>
<tr>
<td>Local circuit</td>
<td>Address and status of local circuit.</td>
</tr>
<tr>
<td>Remote circuit</td>
<td>Address and status of remote circuit.</td>
</tr>
</tbody>
</table>

**St**

Status of the Layer 2 VPN connection (corresponds with Legend for Connection Status):

- **EI**—The local Layer 2 VPN interface is configured with an encapsulation that is not supported.
- **EM**—The encapsulation type received on this Layer 2 VPN connection from the neighbor does not match the local Layer 2 VPN connection interface encapsulation type.
- **VC-Dn**—The virtual circuit is currently down.
- **CM**—The two routers do not agree on a control word, which causes a control word mismatch.
- **CN**—The virtual circuit is not provisioned properly.
- **OR**—The label associated with the virtual circuit is out of range.
- **OL**—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit.
- **LD**—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established.
- **RD**—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established.
- **LN**—The local site has lost path selection to the remote site and therefore no pseudowires can be established from this local site.
- **RN**—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site.
- **XX**—The Layer 2 VPN connection is down for an unn reason. This is a programming error.
- **NC**—The interface encapsulation is not configured as an appropriate CCC, TCC, or Layer 2 VPN encapsulation.
- **WE**—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the Layer 2 VPN routing instance.
- **NP**—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance.
- **->**—Only the outbound connection is up.
- **<--**—Only the inbound connection is up.
- **Up**—The Layer 2 VPN connection is operational.
- **Dn**—The Layer 2 VPN connection is down.
- **CF**—The router cannot find enough bandwidth to the remote router to satisfy the Layer 2 VPN connection bandwidth requirement.
### Table 213: `show l2vpn connections` Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SC</strong></td>
<td>The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers.</td>
</tr>
<tr>
<td><strong>LM</strong></td>
<td>The local site identifier is not the minimum designated, meaning it is not the lowest. There is another local site with a lower site identifier. Pseudowires are not being established to this local site, and the associated local site identifier is not being used to distribute Layer 2 VPN label blocks. However, this is not an error state. Traffic continues to be forwarded to the PE router interfaces connected to the local sites when the local sites are in this state.</td>
</tr>
<tr>
<td><strong>RM</strong></td>
<td>The remote site identifier is not the minimum designated, meaning it is not the lowest. There is another remote site connected to the same PE router which has lower site identifier. The PE router cannot establish a pseudowire to this remote site and the associated remote site identifier cannot be used to distribute VPLS label blocks. However, this is not an error state. Traffic can continue to be forwarded to the PE router interface connected to this remote site when the remote site is in this state.</td>
</tr>
<tr>
<td><strong>IL</strong></td>
<td>The incoming packets for the Layer 2 VPN connection have no MPLS label.</td>
</tr>
<tr>
<td>Remote PE</td>
<td>Address of the remote provider edge router.</td>
</tr>
<tr>
<td>Incoming label</td>
<td>Name of the incoming label.</td>
</tr>
<tr>
<td>Outgoing label</td>
<td>Name of the outgoing label.</td>
</tr>
<tr>
<td>Egress Protection</td>
<td>Whether the given PVC is protected by connection protection logic using egress protection for BGP signaled layer 2 services.</td>
</tr>
<tr>
<td>Flow Label Receive</td>
<td>Capability to pop the flow label in the receive direction to the remote provider edge (PE) router</td>
</tr>
<tr>
<td>Flow Label Transmit</td>
<td>Capability to push the flow label in the transmit direction to the provider edge (PE) router</td>
</tr>
<tr>
<td>Time</td>
<td>Date and time of Layer 2 VPN connection event.</td>
</tr>
<tr>
<td>Event</td>
<td>Type of event.</td>
</tr>
<tr>
<td>Interface/Lbl/PE</td>
<td>Interface, label, or PE router.</td>
</tr>
</tbody>
</table>

Release Information

Command introduced in Junos OS Release 8.4.
Additional details in output for extensive option introduced in Junos OS Release 15.1.

Description

Display the multicast VPN routing instance information according the options specified.

Options

- **instance-name**—(Optional) Display statistics for the specified routing instance, or press Enter without specifying an instance name to show output for all instances.

- **display-tunnel-name**—(Optional) Display the ingress provider tunnel name rather than the attribute.

- **extensive | summary**—(Optional) Display the specified level of output.

- **inet | inet6**—(Optional) Display output for the specified IP type.

- **logical-system**—(Optional) Display details for the specified logical system, or type “all”.

Required Privilege

- **Level** view

**show mvpn neighbor**

**Syntax**

```
show mvpn neighbor
  <extensive | summary>
  <inet | inet6>
  <instance instance-name | neighbor-address address>
  <logical-system logical-system-name>
```

**Release Information**

Command introduced in Junos OS Release 8.4.

**Description**

Display multicast VPN neighbor information.

**Options**

- `extensive | summary`—(Optional) Display the specified level of output for all multicast VPN neighbors.
- `inet | inet6`—(Optional) Display IPv4 or IPv6 information for all multicast VPN neighbors.
- `instance instance-name | neighbor-address address`—(Optional) Display multicast VPN neighbor information for the specified instance or the specified neighbor.
- `logical-system logical-system-name`—(Optional) Display multicast VPN neighbor information for the specified logical system.

**Required Privilege**

```
view
```

**List of Sample Output**

show vpls connections

Syntax

```
show vpls connections
  <brief | extensive>
  <down | up | up-down>
  <history>
  <instance instance-name local-site local-site-name remote-site remote-site-name>
  <instance-history>
  <logical-system (all | logical-system-name)>
  <status>
  <summary>
```

Release Information

Command introduced before Junos OS Release 7.4.

`instance-history` option introduced in Junos OS Release 12.3R2.

Description

(T Series and M Series routers, except for the M160 router) Display virtual private LAN service (VPLS) connection information.

Options

```
one—Display information about all VPLS connections for all routing instances.
brief | extensive—(Optional) Display the specified level of output.
down | up | up-down—(Optional) Display nonoperational, operational, or both types of connections.
history—(Optional) Display information about connection history.
instance instance-name—(Optional) Display the VPLS connections for the specified routing instance only.
instance-history—(Optional) Display information about connection history for a particular instance.
local-site local-site-name—(Optional) Display the VPLS connections for the specified local site name or ID only.
remote-site remote-site-name—(Optional) Display the VPLS connections for the specified remote site name or ID only. Label block size information is always shown as 0 when using this option.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
status—(Optional) Display information about the connection and interface status.
summary—(Optional) Display summary of all VPLS connections information.
```

Required Privilege

View
List of Sample Output

- `show vpls connections on page 2633`
- `show vpls connections (with FEC128 and FEC129 in the same routing-instance) on page 2635`
- `show vpls connections (with multiple pseudowires) on page 2636`
- `show vpls connections extensive (Static VPLS Neighbors) on page 2637`

Output Fields

Table 217 on page 2629 lists the output fields for the `show vpls connections` command. Output fields are listed in the approximate order in which they appear.

**Table 217: show vpls connections Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the VPLS instance.</td>
</tr>
<tr>
<td>Local site</td>
<td>Name of the local site.</td>
</tr>
<tr>
<td>VPLS-id</td>
<td>Identifier for the VPLS site.</td>
</tr>
<tr>
<td>Number of local interfaces</td>
<td>Number of interfaces configured for the local site.</td>
</tr>
<tr>
<td>Number of local interfaces up</td>
<td>Number of interfaces configured for the local site that are currently up.</td>
</tr>
<tr>
<td>IRB interface present</td>
<td>Indicates whether or not an integrated routing and bridging (IRB) interface is present (yes or no).</td>
</tr>
</tbody>
</table>
| Intf                | List of all of the interfaces configured for the local site. The types of interfaces can include VPLS virtual loopback tunnel interfaces and label-switched interfaces. Any interface that supports VPLS could be listed here. Virtual loopback tunnel interfaces are displayed using the `vt-fpc/pic/port.nnnnn` format. Label-switched interfaces are displayed using the `lsi.nnnnn` format. In both cases, `nnnnn` is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain. Each interface might include the following information:  
  - Identification as a VPLS interface  
  - Name of the associated VPLS routing instance  
  - Local site number  
  - Remote site number  
  - VPLS neighbor address  
  - VPLS identifier  
<table>
<thead>
<tr>
<th>Interface flags</th>
<th>Flag associated with the interface. Can include the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>VC-Down</td>
<td>The virtual circuit associated with this interface is down.</td>
</tr>
<tr>
<td>Label-base</td>
<td>First label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.</td>
</tr>
</tbody>
</table>
### Table 217: show vpls connections Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offset</td>
<td>Displays the VPLS Edge (VE) block offset in the Layer 2 VPN NLRI. The VE block offset is used to identify a label block from which a particular label value is selected to setup a pseudowire for a remote site. The block offset value itself indicates the starting VE ID that maps to the label base contained in the VPLS NLRI advertisement.</td>
</tr>
<tr>
<td>Size</td>
<td>Label block size. A configurable value that represents the number of label blocks required to cover all the pseudowires for the remote peer. Acceptable configuration values are: 2, 4, 8 and 16. The default value is 2. A value of 0 will be displayed when using the remote-site option.</td>
</tr>
<tr>
<td>Range</td>
<td>Label block range. A value that keeps track of the numbers of remote sites discovered within each label block.</td>
</tr>
<tr>
<td>Preference</td>
<td>Preference value advertised for a VPLS site. When multiple PE routers are assigned the same VE ID for multihoming, you might need to specify that a particular PE router acts as the designated forwarder by configuring the site preference value. The site preference indicates the degree of preference for a particular customer site. The site preference is one of the tie-breaking criteria used in a designated forwarder election.</td>
</tr>
<tr>
<td>status-vector</td>
<td>Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of 0 indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of 1 indicates either one or both are down.</td>
</tr>
<tr>
<td>connection-site</td>
<td>Name of the connection site.</td>
</tr>
<tr>
<td>Neighbor</td>
<td>IP address and VPLS identifier for the VPLS neighbor. If multiple pseudowires have been configured, the IP address will also show the PW-specific vpls-id-list, for example, 203.0.113.144 (vpls-id 200).</td>
</tr>
<tr>
<td>Type</td>
<td>Type of connection: loc (local) or rmt (remote).</td>
</tr>
</tbody>
</table>
### Table 217: `show vpls connections Output Fields (continued)`

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>St</strong></td>
<td>Status of the VPLS connection (corresponds with Legend for Connection Status):</td>
</tr>
<tr>
<td></td>
<td>• EI—The local VPLS interface is configured with an encapsulation that is not supported.</td>
</tr>
<tr>
<td></td>
<td>• EM—The encapsulation type received on this VPLS connection from the neighbor does not match the local VPLS connection interface encapsulation type.</td>
</tr>
<tr>
<td></td>
<td>• VC-Dn—The virtual circuit is currently down.</td>
</tr>
<tr>
<td></td>
<td>• CM—The two routers do not agree on a control word, which causes a control word mismatch.</td>
</tr>
<tr>
<td></td>
<td>• CN—The virtual circuit is not provisioned properly.</td>
</tr>
<tr>
<td></td>
<td>• OR—The label associated with the virtual circuit is out of range.</td>
</tr>
<tr>
<td></td>
<td>• OL—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit.</td>
</tr>
<tr>
<td></td>
<td>• LD—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established.</td>
</tr>
<tr>
<td></td>
<td>• RD—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established.</td>
</tr>
<tr>
<td></td>
<td>• LN—The local site has lost path selection to the remote site and therefore no pseudowires can be established from this local site.</td>
</tr>
<tr>
<td></td>
<td>• RN—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site.</td>
</tr>
</tbody>
</table>

In a multihoming configuration, one multihomed PE site displays the state **LN**, and the other multihomed PE site displays the state **RN** in the following circumstances:

- The multihomed links are both configured to be the backup site.
- The two multihomed PE routers have the same site ID, but have a peering relationship with a route reflector (RR) that has a different site ID.
- **XX**—The VPLS connection is down for an unreason. This is a programming error.
- **MM**—The MTU for the local site and the remote site do not match.
- **BK**—The router is using a backup connection.
- **PF**—Profile parse failure.
- **RS**—The remote site is in a standby state.
- **NC**—The interface encapsulation is not configured as an appropriate CCC, TCC, or VPLS encapsulation.
- **WE**—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the VPLS routing instance.
Table 217: show vpls connections Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NP</td>
<td>The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance.</td>
</tr>
<tr>
<td>--&gt;</td>
<td>Only the outbound connection is up.</td>
</tr>
<tr>
<td>&lt;--</td>
<td>Only the inbound connection is up.</td>
</tr>
<tr>
<td>Up</td>
<td>The VPLS connection is operational.</td>
</tr>
<tr>
<td>Dn</td>
<td>The VPLS connection is down.</td>
</tr>
<tr>
<td>CF</td>
<td>The router cannot find enough bandwidth to the remote router to satisfy the VPLS connection bandwidth requirement.</td>
</tr>
<tr>
<td>SC</td>
<td>The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers.</td>
</tr>
<tr>
<td>LM</td>
<td>The local site identifier is not the minimum designated, meaning it is not the lowest. There is another local site with a lower site identifier. Pseudowires are not being established to this local site. the associated local site identifier is not being used to distribute VPLS label blocks. However, this is not an error state. Traffic continues to be forwarded to the PE router interfaces connected to the local sites when the local sites are in this state.</td>
</tr>
<tr>
<td>RM</td>
<td>The remote site identifier is not the minimum designated, meaning it is not the lowest. There is another remote site connected to the same PE router which has lower site identifier. The PE router cannot establish a pseudowire to this remote site and the associated remote site identifier cannot be used to distribute VPLS label blocks. However, this is not an error state. Traffic can continue to be forwarded to the PE router interface connected to this remote site when the remote site is in this state.</td>
</tr>
<tr>
<td>IL</td>
<td>The incoming packets for the VPLS connection have no MPLS label.</td>
</tr>
<tr>
<td>MI</td>
<td>The configured mesh group identifier is in use by another system in the network.</td>
</tr>
<tr>
<td>ST</td>
<td>The router has switched to a standby connection.</td>
</tr>
<tr>
<td>PB</td>
<td>Profile busy.</td>
</tr>
<tr>
<td>SN</td>
<td>The VPLS neighbor is static.</td>
</tr>
</tbody>
</table>

**Time last up**  
Time connection was last in the **Up** condition.

**# Up trans**  
Number of transitions from **Down** to **Up** condition.

**Status**  
Status of the (local or remote circuit) local interface:

- **Up**—Operational
- **Dn**—Down
- **NP**—Not present
- **DS**—Disabled
- **WE**—Wrong encapsulation
- **UN**—Uninitialized

**Encapsulation**  
Type of encapsulation: **VPLS**.

**Remote PE**  
Address of the remote provider edge router.
Table 217: show vpls connections Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>

show vpls flood event-queue

**Syntax**
```plaintext
show vpls flood event-queue
```

**Release Information**
Command introduced in Junos OS Release 8.0.

**Description**
Display the pending events in the VPLS flood queue.

**Options**
This command has no options.

**Required Privilege Level**
`view`

**List of Sample Output**
`show vpls flood event-queue` on page 2640

**Output Fields**
Table 218 on page 2639 lists the output fields for the `show vpls flood event-queue` command. Output fields are listed in the approximate order in which they appear.

*Table 218: show vpls flood event-queue Output Fields*

<table>
<thead>
<tr>
<th>Field Name</th>

show vpls flood instance

Syntax

show vpls flood instance
  <brief | detail | extensive>
  <instance-name>
  <logical-system logical-system-name>

Release Information

Command introduced in Junos OS Release 8.0.

Description

Display VPLS information related to the flood process.

Options

none—Display VPLS information related to the flood process for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

instance-name—(Optional) Display VPLS information related to the flood process for the specified routing instance.

logical-system logical-system-name—(Optional) Display VPLS information related to the flood process for the specified logical system.

Required Privilege

view

List of Sample Output

show vpls flood instance on page 2642
show vpls flood instance logical-system-name on page 2642
show vpls flood instance detail on page 2642

Output Fields

Table 219 on page 2641 lists the output fields for the show vpls flood instance command. Output fields are listed in the approximate order in which they appear.

Table 219: show vpls flood instance Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logical system</td>
<td>Name of the logical system.</td>

</tbody>
</table>
**show vpls flood route**

**Syntax**

```
show vpls flood route
(all-ce-flood instance-name instance-name <logical-system-name logical-system-name>
| ce-flood interface interface-name)
```

**Release Information**

Command introduced in Junos OS Release 8.0.

**Description**

Display VPLS route information related to the flood process for either the specified routing instance or the specified interface.

**Options**

- `all-ce-flood`—Display the flood next-hop route for all customer edge routers for traffic coming from the core of the network.
- `ce-flood interface interface-name`—Display the flood next-hop route for traffic coming from the specified customer edge interface.
- `instance-name instance-name`—Display the flood routes for the specified instance.
- `logical-system-name logical-system-name`—(Optional) Specify the logical system whose flood routes you want to display. You can only specify the default logical system name for VPLS. The default logical system name is `__example_ls1__` (the name must be entered in the command with the underscore characters).

**Required Privilege Level**

**show vpls mac-table**

**Syntax**

```
show vpls mac-table
  <age>
  <brief | detail | extensive | summary>
  <bridge-domain bridge-domain-name>
  <instance instance-name>
  <interface interface-name>
  <logical-system (all | logical-system-name)>
  <mac-address>
  <vlan-id vlan-id-number>
```

**Release Information**

Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 15.1.

**Description**

Display learned virtual private LAN service (VPLS) media access control (MAC) address information.

**Options**

- **none**—Display all learned VPLS MAC address information.
- **age**—(Optional) Display age of a single mac-address.
- **brief | detail | extensive | summary**—(Optional) Display the specified level of output.
- **bridge-domain bridge-domain-name**—(Optional) Display learned VPLS MAC addresses for the specified bridge domain.
- **instance instance-name**—(Optional) Display learned VPLS MAC addresses for the specified instance.
- **interface interface-name**—(Optional) Display learned VPLS MAC addresses for the specified instance.
- **logical-system (all | logical-system-name)**—(Optional) Display learned VPLS MAC addresses for all logical systems or for the specified logical system.
- **mac-address**—(Optional) Display the specified learned VPLS MAC address information.
- **vlan-id vlan-id-number**—(Optional) Display learned VPLS MAC addresses for the specified VLAN.

**Required Privilege**

Table 221 on page 2646 describes the output fields for the `show vpls mac-table` command. Output fields are listed in the approximate order in which they appear.

**Table 221: show vpls mac-table Output fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Age</td>
<td>Age of a single mac-address.</td>
</tr>
<tr>
<td>Routing instance</td>
<td>Name of the routing instance.</td>
</tr>
<tr>
<td>Bridging domain</td>
<td>Name of the bridging domain.</td>
</tr>
<tr>
<td>MAC address</td>
<td>MAC address or addresses learned on a logical interface.</td>
</tr>
<tr>
<td>MAC flags</td>
<td>Status of MAC address learning properties for each interface:</td>
</tr>
<tr>
<td></td>
<td>• S—Static MAC address configured.</td>
</tr>
<tr>
<td></td>
<td>• D—Dynamic MAC address learned.</td>
</tr>
<tr>
<td></td>
<td>• SE—MAC accounting is enabled.</td>
</tr>
<tr>
<td></td>
<td>• NM—Nonconfigured MAC.</td>
</tr>
<tr>
<td>Logical interface</td>
<td>Name of the logical interface.</td>
</tr>
<tr>
<td>MAC count</td>
<td>Number of MAC addresses learned on a specific routing instance or interface.</td>
</tr>
<tr>
<td>Learning interface</td>
<td>Logical interface or logical Label Switched Interface (LSI) the address is learned on.</td>
</tr>
<tr>
<td>Base learning interface</td>
<td>Base learning interface of the MAC address. This field is introduced in Junos OS Release 14.2.</td>
</tr>
<tr>
<td>Learn VLAN ID/VLAN</td>
<td>VLAN ID of the routing instance or bridge domain in which the MAC address was learned.</td>
</tr>
<tr>
<td>VXLAN ID/VXLAN</td>
<td>VXLAN Network Identifier (VNI)</td>
</tr>
<tr>
<td>Layer 2 flags</td>
<td>Debugging flags signifying that the MAC address is present in various lists.</td>
</tr>
<tr>
<td>Epoch</td>
<td>Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.</td>
</tr>
<tr>
<td>Sequence number</td>
<td>Sequence number assigned to this MAC address. Used for debugging.</td>
</tr>
<tr>
<td>Learning mask</td>
<td>Mask of Packet Forwarding Engines where this MAC address was learned. Used for debugging.</td>
</tr>
<tr>
<td>IPC generation</td>
<td>Creation time of the logical interface when this MAC address was learned. Used for debugging.</td>
</tr>
</tbody>
</table>
### Sample Output

**show vpls mac-table**

**show vpls statistics**

**Syntax**

```
show vpls statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

(T Series and M Series routers, except for the M160 router) Display virtual private LAN service (VPLS) statistics.

**Options**

- `none`—Display VPLS statistics for all routing instances.
- `instance instance-name`—(Optional) Display VPLS statistics for a specific VPLS routing instance only.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

view

**List of Sample Output**

- `show vpls statistics on page 2652`
- `show vpls statistics instance on page 2653`

**Output Fields**

Table 222 on page 2651 lists the output fields for the `show vpls statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 222: show vpls statistics Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the VPLS instance.</td>
</tr>
<tr>
<td>Local interface</td>
<td>Name of the local VPLS virtual loopback tunnel interface, vt-fpc/pic/port.nnnn, where nnnn is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain.</td>
</tr>
<tr>
<td>Index</td>
<td>Number associated with the next hop.</td>
</tr>
<tr>
<td>Remote provider edge router</td>
<td>Address of the remote provider edge router.</td>
</tr>
<tr>
<td>Multicast packets</td>
<td>Number of multicast packets received.</td>
</tr>
<tr>
<td>Multicast bytes</td>
<td>Number of multicast bytes received.</td>
</tr>
<tr>
<td>Flood packets</td>
<td>Number of VPLS flood packets received.</td>
</tr>
</tbody>
</table>
