## Part 1

### Chapter 1

**Router Interfaces** .......................................................... 3

**Router Interfaces Overview** ............................................. 4

**Types of Interfaces Overview** .......................................... 4

**Understanding Permanent Interfaces** ................................... 5

**Understanding Transient Interfaces** ................................... 5

**Understanding Services Interfaces** ..................................... 7

**Understanding Container Interfaces** .................................... 8
  
  **Understanding Traditional APS Concept** .............................. 8
  **Container Interfaces Concept** ......................................... 9
  **APS Support for Container-Based Interfaces** .......................... 9
  **Autocopy of APS Parameters** .......................................... 9

**Understanding Management Ethernet Interfaces**........................ 10

**Understanding Interfaces on ACX Series Universal Metro Routers** .... 10

  **T1 and E1 Time-Division Multiplexing (TDM) Interfaces** .......... 11
  **Inverse Multiplexing for ATM (IMA)** ................................ 12
  **Gigabit Ethernet interfaces** ....................................... 12

**TX Matrix Plus and T1600 Router (Routing Matrix) Management Ethernet Interfaces** ........................................ 13

**Understanding Internal Ethernet Interfaces** ........................... 14

**T1600 Routers (Routing Matrix) Internal Ethernet Interfaces** ....... 16

**Interface Naming Overview** ............................................. 16

  **Physical Part of an Interface Name** ................................... 17
  **Logical Part of an Interface Name** .................................. 23
  **Separators in an Interface Name** .................................... 23
  **Channel Part of an Interface Name** .................................. 23

**Interface Naming for a Routing Matrix Based on a TX Matrix Router** ................................................. 24

**Interface Naming for a Routing Matrix Based on a TX Matrix Plus Router** .................................................. 26

**Chassis Interface Naming** ............................................... 28
Unicast RPF with Routing Asymmetry ........................................ 229
Configuring Unicast RPF Strict Mode .................................... 229
Configuring Unicast RPF Loose Mode ................................... 231
Configuring Unicast RPF Loose Mode with Ability to Discard Packets .... 233
Configuring Unicast RPF on a VPN ............................................ 234
Configuring Unicast RPF ......................................................... 235
Understanding and Preventing Unknown Unicast Forwarding .................... 236
Verifying That Unknown Unicast Packets Are Forwarded to a Single Interface .................................................. 236
Configuring Unknown Unicast Forwarding (ELS) ................................. 237
Configuring Unknown Unicast Forwarding on EX4300 Switches .................. 238
Configuring Unknown Unicast Forwarding on EX9200 Switches .................. 238
Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface .................................................. 240
Configuring Unknown Unicast Forwarding (CLI Procedure) ...................... 241
Enabling Source Class and Destination Class Usage .................................. 241
Source Class and Destination Class Usage .................................... 241
Enabling Source Class and Destination Class Usage .................................. 245
Understanding Targeted Broadcast ............................................. 250
Configuring Targeted Broadcast .............................................. 251
Configuring Targeted Broadcast and Its Options .................................. 251
Display Targeted Broadcast Configuration Options ............................... 252
Forward IP Packets On the Egress Interface and To the Routing Engine ........................... 253
Forward IP Packets On the Egress Interface Only .................................. 253

Chapter 5 Configuring Circuit and Translational Cross-Connects ............ 255
Circuit and Translational Cross-Connects Overview .............................. 255
Defining the Encapsulation for Switching Cross-Connects ...................... 257
Defining the Encapsulation for Switching Cross-Connects ...................... 258
Configuring PPP or Cisco HDLC Circuits ..................................... 258
Configuring ATM Circuits ...................................................... 258
Configuring Frame Relay Circuits .............................................. 259
Configuring Ethernet CCC Circuits ............................................ 260
Configuring Ethernet VLAN Circuits .......................................... 260
Defining the Connection for Switching Cross-Connects ............................ 261
Configuring MPLS for Switching Cross-Connects .................................. 261
Configuring IS-IS or MPLS Traffic for TCC Interfaces ......................... 262
Configuring ATM-to-Ethernet Interworking ...................................... 262
ATM-to-Ethernet Interworking ................................................. 263
Enabling ATM-to-Ethernet Interworking ...................................... 263
Configuring the Ethernet Interface ............................................. 264
Configuring Ethernet Encapsulation .......................................... 264
Configuring the Outer VLAN Identifier ...................................... 264
Configuring the Inner VLAN Identifier Range .................................. 264
Configuring the Physical Interface VPI ...................................... 265
Configuring the ATM Logical Interface ...................................... 265
Configuring the Protocol Family ............................................... 265
Configuring the Logical Interface VPI ...................................... 266
### Table of Contents

- Configuring the Logical Interface VCI ........................................ 266
- ATM-To-Ethernet Interworking on ATM MICs ............................... 267
  - Limitations ............................................................................. 267
- Example: Configuring a CCC over Frame Relay Encapsulated Interface ... 268
- Example: Configuring a TCC ....................................................... 269
- Example: Configuring CCC over Aggregated Ethernet .................... 270
- Example: Configuring a Remote LSP CCC over Aggregated Ethernet ... 272
- Example: Configuring ATM-to-Ethernet Interworking .................... 274
- Example: Configuring ATM-to-Ethernet Interworking on ATM MIC .... 275
- Verifying ATM-to-Ethernet Interworking Configuration on ATM MICs ... 281
  - Verifying That The ATM Interface on Router1 Is Configured Correctly ... 281
  - Verifying The Status of the MIC on Router1 ............................... 282
  - Verify That OSPF Configuration on Router1 Is Accurate ................ 282
  - Verify That LDP Configuration on Router1 Is Accurate .................. 283
  - Verify That Layer 2 Virtual Circuit Session Configuration on Router1 Is Accurate .............................................. 283
  - Verifying That the Ethernet Interface on Router2 Is Configured Correctly ... 284
  - Verifying the Status of the MIC on Router2 ............................... 284
  - Verify That OSPF Configuration on Router2 Is Accurate ................. 284
  - Verify That LDP Configuration on Router2 Is Accurate ................. 285
  - Verify That Layer 2 Virtual Circuit Session Configuration on Router2 Is Accurate .............................................. 285

### Part 2 Special Router Interfaces

#### Chapter 6 Configuring Discard Interfaces ............................. 289
- Discard Interfaces Overview .................................................... 289
- Understanding Discard Interfaces ............................................. 289
- Guidelines to Follow When Configuring a Discard Interface .......... 289
- Configuring Discard Interfaces ............................................... 290
- Configuring and Usage of Discard Interface .............................. 290
- Configure an Output Filter with Output policy ........................... 291

#### Chapter 7 Configuring IP Demultiplexing Interfaces ............... 293
- Demultiplexing Interface Overview .......................................... 293
- IP Demux Interface Overview ............................................... 293
- VLAN Demux Interface Overview ......................................... 294
- Guidelines to Remember When Configuring A Demux Interface ...... 294
  - Points to Remember When Configuring an IP Demux Interface ...... 295
  - Points to Remember When Configuring a VLAN Demux Interface ... 295
- MAC Address Validation on Static Demux Interfaces .................. 295
  - Loose .................................................................................... 295
  - Strict ...................................................................................... 296
- Configuring an IP Demultiplexing Interface ................................ 296
- Configuring an IP Demux Underlying Interface .......................... 297
- Configuring the IP Demux Interface ....................................... 298
- Configuring MAC Address Validation on Static IP Demux Interfaces ... 300
- Configuring a VLAN Demultiplexing Interface ............................ 301
- Configuring a VLAN Demux Underlying Interface ...................... 301
- Configuring the VLAN Demux Interface .................................. 303

### Chapter 14 Interface Operational Commands

| Common Output Fields Description | 1152 |
| Damping Field | 1152 |
| Destination Class Field | 1152 |
| Enabled Field | 1153 |
| Filters Field | 1153 |
| Flags Fields | 1153 |
| Addresses, Flags Field | 1154 |
| Device Flags Field | 1154 |
| Family Flags Field | 1155 |
| Interface Flags Field | 1156 |
| Link Flags Field | 1156 |
| Logical Interface Flags Field | 1157 |
| Label-Switched Interface Traffic Statistics Field | 1157 |
| Policer Field | 1158 |
| Protocol Field | 1158 |
| RPF Failures Field | 1159 |
| Source Class Field | 1159 |

**Improvements to Interface Transmit Statistics Reporting** | 1160

*show interfaces* | 1161
*show interfaces (ATM)* | 1244
*show interfaces (Channelized DS3-to-DS0)* | 1280
*show interfaces (Channelized DS3-to-DS1)* | 1291
*show interfaces (Channelized E1 IQ)* | 1294
*show interfaces (Channelized E1)* | 1298
*show interfaces (Channelized OC12 IQ and IQE)* | 1309

## Chapter 15: ANCP Operational Commands

- clear ancp neighbor .......................................................... 1670
- clear ancp statistics ......................................................... 1672
- clear ancp subscriber ....................................................... 1675
- request ancp oam interface ............................................... 1677
- request ancp oam neighbor ............................................... 1679
- show ancp cos ............................................................... 1681
- show ancp neighbor ......................................................... 1686
- show ancp statistics ......................................................... 1694
- show ancp subscriber ....................................................... 1699
- show ancp summary ......................................................... 1706
- show ancp summary neighbor ............................................ 1708
- show ancp summary subscriber .......................................... 1710

## Chapter 16: BFD Operational Commands

- clear bfd adaptation .......................................................... 1714
- clear bfd session ............................................................. 1715
- show bfd session ............................................................. 1717

## Chapter 17: BGP Operational Commands

- clear bgp damping ............................................................ 1730
- clear bgp neighbor ........................................................... 1731
- clear bgp table ............................................................... 1734
- show bgp bmp ................................................................. 1736
- show bgp group ............................................................... 1737
- show bgp group traffic-statistics ........................................ 1745
- show bgp neighbor ........................................................... 1748
- show bgp replication ........................................................ 1768
- show bgp summary ........................................................... 1771
- show policy damping ........................................................ 1777

## Chapter 18: ES-IS Operational Commands

- clear esis adjacency ......................................................... 1780
- clear esis statistics .......................................................... 1781
- show esis adjacency ........................................................ 1782
- show esis interface .......................................................... 1785
- show esis statistics .......................................................... 1787

## Chapter 19: IP Multicast Operational Commands

- clear amt statistics .......................................................... 1792
- clear amt tunnel .............................................................. 1793
- clear igmp membership ..................................................... 1795
- clear igmp snooping membership ........................................ 1798
- clear igmp snooping statistics ............................................. 1800
- clear igmp statistics ........................................................ 1801
- clear mld membership ...................................................... 1803
- clear mld statistics .......................................................... 1804
- clear msdp cache ............................................................. 1805
- clear msdp statistics ......................................................... 1806
- clear multicast bandwidth-admission ................................. 1807

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at https://www.juniper.net/documentation/.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at https://www.juniper.net/books.

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the `load merge` or the `load merge relative` command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a full example. In this case, use the `load merge` command.

If the example configuration does not start at the top level of the hierarchy, the example is a snippet. In this case, use the `load merge relative` command. These procedures are described in the following sections.
Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file `ex-script.conf`. Copy the `ex-script.conf` file to the `/var/tmp` directory on your routing platform.

```
system {
    scripts {
        commit {
            file ex-script.xsl;
        }
    }
}
```

```
interfaces {
    fxp0 {
        disable;
        unit 0 {
            family inet {
                address 10.0.0.1/24;
            }
        }
    }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the `load merge` configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file `ex-script-snippet.conf`. Copy the `ex-script-snippet.conf` file to the `/var/tmp` directory on your routing platform.

```
commit {
    file ex-script-snippet.xsl; }
```
2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the load merge relative configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the load command, see CLI Explorer.

**Documentation Conventions**

**Documentation Feedback**

We encourage you to provide feedback so that we can improve our documentation. You can use either of the following methods:

- Online feedback system—Click TechLibrary Feedback, on the lower right of any page on the Juniper Networks TechLibrary site, and do one of the following:
  - Click the thumbs-up icon if the information on the page was helpful to you.
  - Click the thumbs-down icon if the information on the page was not helpful to you or if you have suggestions for improvement, and use the pop-up form to provide feedback.
  - E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

**Requesting Technical Support**

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active Juniper Care or Partner Support Services support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- Product warranties—For product warranty information, visit https://www.juniper.net/support/warranty/.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.
Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: https://www.juniper.net/customers/support/
- Search for known bugs: https://prsearch.juniper.net/
- Find product documentation: https://www.juniper.net/documentation/
- Find solutions and answer questions using our Knowledge Base: https://kb.juniper.net/
- Download the latest versions of software and review release notes: https://www.juniper.net/customers/csc/software/
- Search technical bulletins for relevant hardware and software notifications: https://kb.juniper.net/InfoCenter/
- Join and participate in the Juniper Networks Community Forum: https://www.juniper.net/company/communities/
- Create a service request online: https://myjuniper.juniper.net

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: https://entitlementsearch.juniper.net/entitlementsearch/

Creating a Service Request with JTAC

You can create a service request with JTAC on the Web or by telephone.

- Visit https://myjuniper.juniper.net.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see https://support.juniper.net/support/requesting-support/.

Router Interfaces Overview

Routers typically contain several different types of interfaces suited to various functions. For the interfaces on a router to function, you must configure them. Specify the interface location (that is, the slot where the Flexible PIC Concentrator [FPC], Dense Port Concentrator [DPC], or Modular Port Concentrator [MPC] is installed. You must also specify the location of the Physical Interface Card [PIC] or Modular Interface Card [MIC] , and the interface type, for example, SONET/SDH, Asynchronous Transfer Mode [ATM], or Ethernet). Finally, you must specify the encapsulation type and any interface-specific properties that may apply.

You can configure interfaces that are currently present in the router, as well as interfaces that are not currently present but that are expected to be added in the future. Junos OS detects the interface once the hardware has been installed and applies the pre-set configuration to it.

To see which interfaces are currently installed in the router, issue the `show interfaces terse` operational mode command. If an interface is listed in the output, it is physically installed in the router. If an interface is not listed in the output, it is not installed in the router.

For information about which interfaces are supported on your router, see your router’s Interface Module Reference.

You can configure Junos OS class-of-service (CoS) properties to provide a variety of classes of service for different applications, including multiple forwarding classes for managing packet transmission, congestion management, and CoS-based forwarding. For more information about configuring CoS properties, see the Class of Service Feature Guide (Routers and EX9200 Switches).

Related Documentation

• Interfaces Fundamentals for Routing Devices

Types of Interfaces Overview

Interfaces can be permanent or transient, and are used for networking or services:

• Permanent interfaces—Interfaces that are always present in the router.

• Transient interfaces—Interfaces that can be inserted into or removed from the router depending on your network configuration needs.

• Networking interfaces—Interfaces, such as Ethernet or SONET/SDH interfaces, that primarily provide traffic connectivity.

• Services interfaces—Interfaces that provide specific capabilities for manipulating traffic before it is delivered to its destination.

• Container interfaces—Interfaces that support automatic protection switching (APS) on physical SONET links using a virtual container infrastructure.
Junos OS internally generates nonconfigurable interfaces which are described in *Interfaces Command Reference* and *Services Interfaces*.

  - E1 Interfaces Overview and E3 Interfaces Overview
  - Ethernet Interfaces Overview
  - Frame Relay Overview
  - SONET/SDH Interfaces Overview
  - T1 Interfaces Overview and T3 Interfaces Overview

### Understanding Permanent Interfaces

Permanent interfaces in the router consist of management Ethernet interfaces and internal Ethernet interfaces, which are described separately in the following topics:

- Understanding Management Ethernet Interfaces on page 10
- Understanding Internal Ethernet Interfaces on page 14

### Understanding Transient Interfaces

The M Series, MX Series, and T Series routers contain slots for installing Flexible PIC Concentrator [FPC] or Dense Port Concentrator [DPC] (for MX Series routers) or Modular Port Concentrator [MPC] (for MX Series routers). Physical Interface Card [PIC] can be installed in FPCs. Modular Interace Card [MIC] can be inserted into MPCs.

The number of PICs that can be installed varies by router and type of FPC. The PICs provide the actual physical interfaces to the network. The MX Series routers contain slots for installing either DPC boards that provide the physical interfaces to the network or for installing FPCs in which PICs can be installed.

You can insert any DPC or FPC into any slot that supports them in the appropriate router. Typically, you can place any combination of PICs, compatible with your router, in any location on an FPC. (You are limited by the total FPC bandwidth, and by the fact that
some PICs physically require two or four of the PIC locations on the FPC. In some cases, power limitations or microcode limitations may also apply.) To determine DPC and PIC compatibility, see the see your router’s *Interface Module Reference*.

You can insert MPC into any slot that supports them in the appropriate router. You can install up to two MICs of different media types in the same MPC as long as the MPC supports those MICs.

These physical interfaces are transient interfaces of the router. They are referred to as transient because you can hot-swap a DPC or FPC or MPC and its PICs or MICs at any time.

You must configure each transient interface based on the slot in which the FPC or DPC or MPC is installed, the location in which the PIC or MIC is installed, and for multiple port PICs or MICs, the port to which you are connecting.

You can configure the interfaces on PICs or MICs that are already installed in the router as well as interfaces on PICs or MICs that you plan to install later. The Junos OS detects which interfaces are actually present, so when the software activates its configuration, it activates only the present interfaces and retains the configuration information for the interfaces that are not present. When the Junos OS detects that an FPC containing PICs or MPC containing MICs has been inserted into the router, the software activates the configuration for those interfaces.

Understanding Services Interfaces

Services interfaces enable you to incrementally add services to your network. The Junos OS supports the following services PICs:

- **Adaptive Services (AS) PICs**—Allow you to provide multiple services on a single PIC by configuring a set of services and applications. The AS PICs offer a special range of services you configure in one or more service sets.

- **ES PIC**—Provides a security suite for the IP version 4 (IPv4) and IP version 6 (IPv6) network layers. The suite provides functionality such as authentication of origin, data integrity, confidentiality, replay protection, and nonrepudiation of source. It also defines mechanisms for key generation and exchange, management of security associations, and support for digital certificates.

- **Monitoring Services PICs**—Enable you to monitor traffic flow and export the monitored traffic. Monitoring traffic allows you to gather and export detailed information about IPv4 traffic flows between source and destination nodes in your network; sample all incoming IPv4 traffic on the monitoring interface and present the data in cflowd record format; perform discard accounting on an incoming traffic flow; encrypt or tunnel outgoing cflowd records, intercepted IPv4 traffic, or both; and direct filtered traffic to different packet analyzers and present the data in its original format. On a Monitoring Services PIC, you can configure either monitoring interfaces or collector interfaces. A collector interface allows you to combine multiple cflowd records into a compressed ASCII data file and export the file to an FTP server.

- **Multilink Services, MultiServices, Link Services, and Voice Services PICs**—Enable you to split, recombine, and sequence datagrams across multiple logical data links. The goal of multilink operation is to coordinate multiple independent links between a fixed pair of systems, providing a virtual link with greater bandwidth than any of the members.

- **Tunnel Services PIC**—By encapsulating arbitrary packets inside a transport protocol, tunneling provides a private, secure path through an otherwise public network. Tunnels connect discontinuous subnetworks and enable encryption interfaces, virtual private networks (VPNs), and Multiprotocol Label Switching (MPLS).

- **On M Series and T Series routers, logical tunnel interfaces allow you to connect logical systems, virtual routers, or VPN instances. For more information about VPNs, see the Junos OS VPNs Library for Routing Devices. For more information about configuring tunnels, see the Junos OS Services Interfaces Library for Routing Devices.**

- Types of Interfaces Overview on page 4
Understanding Container Interfaces

Container interfaces provide the following features:

- Automatic protection switching (APS) on SONET/SDH and ATM links are supported using the container infrastructure.
- Container physical interfaces and logical interfaces remain up on switchover.
- APS parameters are auto-copied from the container interface to the member links.

NOTE: Paired groups and true unidirectional APS are not currently supported.

For more information on SONET/SDH configuration, see Configuring Container Interfaces for APS on SONET Links.

Container interfaces features are described in the following sections:

- Understanding Traditional APS Concept on page 8
- Container Interfaces Concept on page 9
- APS Support for Container-Based Interfaces on page 9
- Autocopy of APS Parameters on page 9

Understanding Traditional APS Concept

Traditional APS is configured on two independent physical SONET/SDH interfaces: one configured as the working circuit and the other as the protect circuit (see Figure 1 on page 8). The circuit, named Circuit X in the figure, is the link between the two SONET interfaces.

Figure 1: APS Interface

Traditional APS uses routing protocols that run on each individual SONET/SDH interface (since circuit is an abstract construct, instead of being an actual interface). When the working link goes down, the APS infrastructure brings up the protect link and its underlying logical interfaces, and brings down the working link and its underlying logical interfaces.
causing the routing protocols to reconverge. This consumes time and leads to traffic loss even though the APS infrastructure has performed the switch quickly.

**Container Interfaces Concept**

To solve this problem, the Junos OS provides a soft interface construct called a container interface (see Figure 2 on page 9).

*Figure 2: Container Interface*

![](container-interface.png)

The container interface allows routing protocols to run on the logical interfaces associated with a virtual *container interface* instead of on the physical SONET/SDH and ATM interfaces. When APS switches the underlying physical link based on a fault condition, the container interface remains up, and the logical interface on the container interface does not flap. The routing protocols remain unaware of the APS switching.

**APS Support for Container-Based Interfaces**

With the container interface, APS is configured on the container interface itself. Individual member SONET/SDH and ATM links are either marked as primary (corresponding to the working circuit) or standby (corresponding to the protect circuit) in the configuration. No circuit or group name is specified in the container interface model; physical SONET/SDH and ATM links are put in an APS group by linking them to a single container interface. APS parameters are specified at the container interface level, and are propagated to the individual SONET/SDH and ATM links by the APS daemon.

**Autocopy of APS Parameters**

Typical applications require copying APS parameters from the working circuit to the protect circuit, since most of the parameters must be the same for both circuits. This is automatically done in the container interface. APS parameters are specified only once under the container physical interface configuration, and are internally copied over to the individual physical SONET/SDH and ATM links.

Understanding Management Ethernet Interfaces

Management interfaces are the primary interfaces for accessing the device remotely. Typically, a management interface is not connected to the in-band network, but is connected instead to the device's internal network. Through a management interface you can access the device over the network using utilities such as ssh and telnet and configure the device from anywhere, regardless of its physical location. SNMP can use the management interface to gather statistics from the device.

A management interface lets authorized users and management systems connect to the device over the network. Some Juniper Networks devices have a dedicated management port on the front panel. For other types of platforms, you can configure a management interface on one of the network interfaces. This interface can be dedicated to management or shared with other traffic. Before users can access the management interface, you must configure it. Information required to set up the management interface includes its IP address and prefix. In many types of Junos OS devices (or recommended configurations), it is not possible to route traffic between the management interface and the other ports. Therefore, you should select an IP address in a separate (logical) network, with a separate prefix (netmask).

For Junos OS Evolved, use re0:mgmt-* for Routing Engine 0 and re1:mgmt-* for Routing Engine 1 management interfaces.

Understanding Interfaces on ACX Series Universal Metro Routers

The ACX Series routers support time-division multiplexing (TDM) T1 and E1 interfaces and Ethernet (1 GbE copper, 1GbE, 10 GbE, and 40 GbE fiber) interfaces to support both the legacy and evolution needs of the mobile network. Support for Power over Ethernet (PoE+) at 65 watts per port mitigates the need for additional electrical cabling for microwaves or other access interfaces.

The ACX Series routers support the following:

- **TDM T1 and E1 ports:**
  - The ACX1000 router contains eight T1 or E1 ports.
  - The ACX2000 router contains 16 T1 or E1 ports.
  - Inverse Multiplexing for ATM (IMA)

  **NOTE:** ACX5048 and ACX5096 routers do not support T1 or E1 ports and Inverse Multiplexing for ATM (IMA).

- **Gigabit Ethernet ports:**
  - The ACX1000 router contains eight Gigabit Ethernet ports. The ACX1000 router also supports either four RJ45 (Cu) ports or installation of four Gigabit Ethernet small form-factor pluggable (SFP) transceivers.
The ACX2000 router contains 16 Gigabit Ethernet ports and two PoE ports. The ACX2000 router also supports installation of two Gigabit Ethernet SFP transceivers and two 10-Gigabit Ethernet SFP+ transceivers.

The ACX5448 router is a 10-Gigabit Ethernet enhanced small form-factor pluggable (SFP+) top-of-rack router with 48 SFP+ ports, and four 100-Gigabit Ethernet QSFP28 ports. Each SFP+ port can operate as a native 10-Gigabit Ethernet port, or as a 1-Gigabit Ethernet port when 1-Gigabit optics are inserted. The 48 ports on ACX5448 router can be configured as 1GE or 10GE modes and these ports are represented by \( \text{xe} \) interface type. The PIC 1 of FPC 0 has 4x100GE ports, where each port can be channelized as 1x100GE, or 1x40GE, or 4x25GE modes and these ports are represented by \( \text{et} \) interface type. By default, the port speed in PIC 1 is 100GE.

**NOTE:** The ACX5448 router do not support Pseudowire Services interface.

**NOTE:** 40GbE is supported only on ACX5048, ACX5096, and ACX5448 routers. ACX5448 router support 40GbE channeling to 10GbE.

**T1 and E1 Time-Division Multiplexing (TDM) Interfaces**

On the ACX Series routers, existing Junos OS TDM features are supported without changes to statements or functionality. The following key TDM features for T1 (\( \text{ct1} \)) interfaces and E1 (\( \text{ce1} \)) interfaces are supported:

- T1 and E1 channelization
- T1 and E1 encapsulation
- Alarms, defects, and statistics
- External and internal loopback
- TDM class of service (CoS)

T1 and E1 mode selection is at the PIC level. To set the T1 or E1 mode at the PIC level, include the `framing` statement with the `t1` or `e1` option at the `[chassis fpc slot-number pic slot-number]` hierarchy level. All ports can be T1 or E1. Mixing T1s and E1s is not supported.

**T1 or E1 BITS Interface (ACX2000)**

The ACX2000 router has a T1 or E1 building-integrated timing supply (BITS) interface that you can connect to an external clock. After you connect the interface to the external clock, you can configure the BITS interface so that the BITS interface becomes a candidate source for chassis synchronization to the external clock. The frequency of the BITS interface depends on the Synchronous Ethernet equipment slave clock (EEC) selected with the `network-option` statement at the `[edit chassis synchronization]` hierarchy level.
NOTE: The ACX1000 router does not support the BITS interface.

Inverse Multiplexing for ATM (IMA)

Defined by the ATM Forum, IMA specification version 1.1 is a standardized technology used to transport ATM traffic over a bundle of T1 and E1 interfaces, also known as an IMA group. Up to eight links per bundle and 16 bundles per PIC are supported. The following key IMA features are supported:

• IMA Layer 2 encapsulation
• ATM CoS
• ATM policing and shaping
• Denied packets counter in the output for the `show interfaces at-fpc/pic/port extensive` command

Gigabit Ethernet interfaces

On the ACX Series routers, existing Junos OS Ethernet features are supported without changes to statements or functionality. The following key features are supported:

• Media type specification (ACX1000 router with Gigabit Ethernet SFP and RJ45 interfaces)
• Autonegotiation for RJ45 Gigabit Ethernet interfaces
• Event handling of SFP insertion and removal
• Explicit disabling of the physical interface
• Flow control

NOTE: The ACX Series router does not support flow control based on PAUSE frames.

• Loopback
• Loss of signal (LOS) alarm
• Media access control (MAC) layer features
• Maximum transmission unit (MTU)
• Remote fault notification for 10-Gigabit Ethernet interfaces
• Statistics collection and handling
• Power over Ethernet (PoE) (ACX2000 router)
• High power mode
The Gigabit Ethernet ports on the router have the capacity to work as a 1 or 10-Gigabit Ethernet interface, depending on the type of small form-factor pluggable (SFP) transceiver inserted. When you insert an SFP+ transceiver, the interface works at the 10-Gigabit speed. When you insert an SFP transceiver, the interface works at the 1-Gigabit speed. Configuration is not required because the speed is determined automatically based on the type of inserted SFP transceiver. The dual-speed interface is automatically created with the `xe` prefix, for example, `xe-4/0/0`.

The same configuration statements are used for both speeds and CoS parameters are scaled as a percentage of the port speed. To configure a dual-speed Gigabit Ethernet interface, include the `interface xe-fpc/pic/port` statement at the `[edit interfaces]` hierarchy level. To display the interface speed and other details, issue the `show interfaces` command.

NOTE: You need to use industrial grade of SFP below 0dC for ACX 1100 and ACX 2100 boards.

TX Matrix Plus and T1600 Router (Routing Matrix) Management Ethernet Interfaces

For TX Matrix Plus Routers and for T1600 Core Routers with RE-C1800 configured in a routing matrix, the Junos OS automatically creates the router's management Ethernet interface, `em0`. To use `em0` as a management port, you must configure its logical port, `em0.0`, with a valid IP address.

When you enter the `show interfaces` command on a TX Matrix Plus router, the management Ethernet interfaces (and logical interfaces) are displayed:

```
user@host> show interfaces ?
... em0 em0.0 ...
```

NOTE: The Routing Engines in the TX Matrix Plus router and in the T1600 routers with RE-C1800 configured in a routing matrix do not support the management Ethernet interface `fxp0`, or the internal Ethernet interfaces `fxp1` or `fxp2`.

Related Documentation
- Understanding Internal Ethernet Interfaces on page 14
- T1600 Routers (Routing Matrix) Internal Ethernet Interfaces on page 16
Understanding Internal Ethernet Interfaces

Within a router or packet transport router, internal Ethernet interfaces provide communication between the Routing Engine and the Packet Forwarding Engines. The Junos OS automatically configures internal Ethernet interfaces when the Junos OS boots. The Junos OS boots the packet-forwarding component hardware. When these components are running, the Control Board uses the internal Ethernet interface to transmit hardware status information to the Routing Engine. Information transmitted includes the internal router temperature, the condition of the fans, whether an FPC has been removed or inserted, and information from the LCD on the craft interface.

To determine the supported internal Ethernet interfaces for your router, see Supported Routing Engines by Router.

**NOTE:** Do not modify or remove the configuration for the internal Ethernet interface that the Junos OS automatically configures. If you do, the router or packet transport router will stop functioning.

- **M Series, and MX Series routers and T Series routers**—The Junos OS creates the internal Ethernet interface. The internal Ethernet interface connects the Routing Engine re0 to the Packet Forwarding Engines.

  If the router has redundant Routing Engines, another internal Ethernet interface is created on each Routing Engine (re0 and re1) in order to support fault tolerance, two physical links between re0 and re1 connect the independent control planes. If one of the links fails, both Routing Engines can use the other link for IP communication.

- **TX Matrix Plus routers**—On a TX Matrix Plus router, the Routing Engine and Control Board function as a unit, or host subsystem. For each host subsystem in the router, the Junos OS automatically creates two internal Ethernet interfaces, ixgbe0 and ixgbe1. The ixgbe0 and ixgbe1 interfaces connect the TX Matrix Plus Routing Engine to the Routing Engines of every line-card chassis (LCC) configured in the routing matrix.

  The TX Matrix Plus Routing Engine connects to a high-speed switch through a 10-Gbps link within the host subsystem. The switch provides a 1-Gbps link to each T1600 Routing Engine. The 1-Gbps links are provided through the UTP Category 5 Ethernet cable connections between the TXP-CBs and the LCC-CBs in the LCCs.

  - The TX Matrix Plus Routing Engine connects to a high-speed switch in the local Control Board through a 10-Gbps link within the host subsystem.

  - The Gigabit Ethernet switch connects the Control Board to the remote Routing Engines of every LCC configured in the routing matrix.
If a TX Matrix Plus router contains redundant host subsystems, the independent control planes are connected by two physical links between the two 10-Gigabit Ethernet ports on their respective Routing Engines.

- The primary link to the remote Routing Engine is at the ixgbe0 interface; the 10-Gigabit Ethernet switch on the local Control Board also connects the Routing Engine to the 10-Gigabit Ethernet port accessed by the ixgbe1 interface on the remote Routing Engine.

- The alternate link to the remote Routing Engine is the 10-Gigabit Ethernet port at the ixgbe1 interface. This second port connects the Routing Engine to the 10-Gigabit Ethernet switch on the remote Control Board, which connects to the 10-Gigabit Ethernet port at the ixgbe0 interface on the remote Routing Engine.

If one of the two links between the host subsystems fails, both Routing Engines can use the other link for IP communication.

- LCC in a routing matrix—On an LCC configured in a routing matrix, the Routing Engine and Control Board function as a unit, or host subsystem. For each host subsystem in the LCC, the Junos OS automatically creates two internal Ethernet interfaces, bcm0 and em1, for the two Gigabit Ethernet ports on the Routing Engine.

  The bcm0 interface connects the Routing Engine in each LCC to the Routing Engines of every other LCC configured in the routing matrix.

  - The Routing Engine connects to a Gigabit Ethernet switch on the local Control Board through a.
  
  - The switch connects the Control Board to the remote Routing Engines of every other LCC configured in the routing matrix.

If an LCC in a routing matrix contains redundant host subsystems, the independent control planes are connected by two physical links between the Gigabit Ethernet ports on their respective Routing Engines.

- The primary link to the remote Routing Engine is at the bcm0 interface; the Gigabit Ethernet switch on the local Control Board also connects the Routing Engine to the Gigabit Ethernet port accessed by the em1 interface on the remote Routing Engine.

- The alternate link to the remote Routing Engine is at the em1 interface. This second port connects the Routing Engine to the Gigabit Ethernet switch on the remote Control Board, which connects to the Gigabit Ethernet port at the bcm0 interface on the remote Routing Engine.

If one of the two links between the host subsystems fails, both Routing Engines can use the other link for IP communication.

Each router also has two serial ports, labeled console and auxiliary, for connecting tty type terminals to the router using standard PC-type tty cables. Although these ports are not network interfaces, they do provide access to the router.

Related Documentation

- Understanding Permanent Interfaces on page 5
- Supported Routing Engines by Router
On a T1600 router configured in a routing matrix, the Routing Engine (RE-TXP-LCC) and Control Board (LCC-CB) function as a unit, or host subsystem. For each host subsystem in the router, the Junos OS automatically creates two internal Ethernet interfaces, bcm0 and em1, for the two Gigabit Ethernet ports on the Routing Engine.

Interface Naming Overview

Each interface has an interface name, which specifies the media type, the slot in which the FPC or DPC is located, the location on the FPC where the PIC is installed, and the PIC or DPC port. The interface name uniquely identifies an individual network connector in the system. You use the interface name when configuring interfaces and when enabling various functions and properties, such as routing protocols, on individual interfaces. The system uses the interface name when displaying information about the interface, for example, in the `show interfaces` command.

The interface name is represented by a physical part, a channel part, and a logical part in the following format:

```
physical<:channel>.logical
```

The channel part of the name is optional for all interfaces except channelized DS3, E1, OC12, and STM1 interfaces.

The EX Series, QFX Series, NFX Series, OCX1100, QFabric System, and EX4600 devices use a naming convention for defining the interfaces that are similar to that of other platforms running under Juniper Networks Junos OS. For more information, see `Understanding Interface Naming Conventions`.

For more information on the Routing Engines that each chassis supports, the first supported release for the Routing Engine in the specified chassis, the management Ethernet interface, and the internal Ethernet interfaces for each Routing Engine, please refer the link titled **Supported Routing Engines by Chassis** under Related Documentation section.

---

This part of the interface name has the following format:

```
type-fpc/pic/port
```
type is the media type, which identifies the network device that can be one of the following:

- **ae**—Aggregated Ethernet interface. This is a virtual aggregated link and has a different naming format from most PICs; for more information, see *Aggregated Ethernet Interfaces Overview*.

- **as**—Aggregated SONET/SDH interface. This is a virtual aggregated link and has a different naming format from most PICs; for more information, see *Configuring Aggregated SONET/SDH Interfaces*.

- **at**—ATMI or ATM2 intelligent queuing (IQ) interface or a virtual ATM interface on a circuit emulation (CE) interface.

- **bcm**—The bcm0 internal Ethernet process is supported on specific Routing engines for various M series and T series routers. For more information please refer the link titled *Supported Routing Engines by Chassis* under Related Documentation section.

- **cau4**—Channelized AU-4 IQ interface (configured on the Channelized STMI IQ or IQE PIC or Channelized OC12 IQ and IQE PICs).

- **cel**—Channelized E1 IQ interface (configured on the Channelized E1 IQ PIC or Channelized STMI IQ or IQE PIC).

- **ci**—Container interface.

- **coc1**—Channelized OC1 IQ interface (configured on the Channelized OC12 IQ and IQE or Channelized OC3 IQ and IQE PICs).

- **coc3**—Channelized OC3 IQ interface (configured on the Channelized OC3 IQ and IQE PICs).

- **coc12**—Channelized OC12 IQ interface (configured on the Channelized OC12 IQ and IQE PICs).

- **coc48**—Channelized OC48 interface (configured on the Channelized OC48 and Channelized OC48 IQE PICs).

- **cp**—Collector interface (configured on the Monitoring Services II PIC).

- **cstm1**—Channelized STMI IQ interface (configured on the Channelized STMI IQ or IQE PIC).

- **cstm4**—Channelized STM4 IQ interface (configured on the Channelized OC12 IQ and IQE PICs).

- **cstm16**—Channelized STM16 IQ interface (configured on the Channelized OC48/STM16 and Channelized OC48/STM16 IQE PICs).

- **ct1**—Channelized T1 IQ interface (configured on the Channelized DS3 IQ and IQE PICs, Channelized OC3 IQ and IQE PICs, Channelized OC12 IQ and IQE PICs, or Channelized T1 IQ PIC).

- **ct3**—Channelized T3 IQ interface (configured on the Channelized DS3 IQ and IQE PICs, Channelized OC3 IQ and IQE PICs, or Channelized OC12 IQ and IQE PICs).

- **demux**—Interface that supports logical IP interfaces that use the IP source or destination address to demultiplex received packets. Only one demux interface (*demux0*) exists
per chassis. All demux logical interfaces must be associated with an underlying logical interface.

- **dfc**—Interface that supports dynamic flow capture processing on T Series or M320 routers containing one or more Monitoring Services III PICs. Dynamic flow capture enables you to capture packet flows on the basis of dynamic filtering criteria. Specifically, you can use this feature to forward passively monitored packet flows that match a particular filter list to one or more destinations using an on-demand control protocol.

- **ds**—DS0 interface (configured on the Multichannel DS3 PIC, Channelized E1 PIC, Channelized OC3 IQ and IQE PICs, Channelized OC12 IQ and IQE PICs, Channelized DS3 IQ and IQE PICs, Channelized E1 IQ PIC, Channelized ST1 IQ or IQE PIC, or Channelized T1 IQ).

- **dsc**—Discard interface.

- **e1**—E1 interface (including channelized STM1-to-E1 interfaces).

- **e3**—E3 interface (including E3 IQ interfaces).

- **em**—Management and internal Ethernet interfaces. For M Series routers, MX Series routers, T Series routers, and TX Series routers, you can use the `show chassis hardware` command to display hardware information about the router, including its Routing Engine model. To determine which management interface is supported on your router and Routing Engine combination, see “Understanding Management Ethernet Interfaces” on page 10 and Supported Routing Engines by Router.

- **es**—Encryption interface.

- **et**—100-Gigabit Ethernet interfaces (10, 40, and 100-Gigabit Ethernet interface for PTX Series Packet Transport Routers only).

- **fe**—Fast Ethernet interface.

- **fxp**—Management and internal Ethernet interfaces. For M Series routers, MX Series routers, T Series routers, and TX Series routers, you can use the `show chassis hardware` command to display hardware information about the router, including its Routing Engine model. To determine which management interface is supported on your router and Routing Engine combination, see “Understanding Management Ethernet Interfaces” on page 10 and Supported Routing Engines by Router.

- **ge**—Gigabit Ethernet interface.
NOTE:

- The XENPAK 10-Gigabit Ethernet interface PIC, which is supported only on M series routers, is configured using the ge interface naming convention instead of the xe interface naming convention. Refer the following show commands for more information:

```bash
user@host> show chassis hardware
```

```

- In MX and SRX series devices, the 1 and 10-Gigabit SFP or SFP+ optical interfaces are always named as xe even if a 1-Gigabit SFP is inserted. However, in EX and QFX series devices, the interface name is shown as ge or xe based on the speed of the optical device inserted.

- `gr`—Generic routing encapsulation (GRE) tunnel interface.

- `gre`—Internally generated interface that is configurable only as the control channel for Generalized MPLS (GMPLS). For more information about GMPLS, see the MPLS Applications Feature Guide.

NOTE: You can configure GRE interfaces (gre-x/y/z) only for GMPLS control channels. GRE interfaces are not supported or configurable for other applications.

- `ip`—IP-over-IP encapsulation tunnel interface.

- `ipip`—Internally generated interface that is not configurable.

- `ixgbe`—The internal Ethernet process ixgbe0 and ixgbe1 are used by the RE-DUO-C2600-16G Routing Engine, which is supported on TX Matrix Plus and PTX5000.

- `iw`—Logical interfaces associated with the endpoints of Layer 2 circuit and Layer 2 VPN connections (pseudowire stitching Layer 2 VPNs). For more information about VPNs, see the Junos OS VPNs Library for Routing Devices.

- `lc`—Internally generated interface that is not configurable.
• **lo**—Loopback interface. The Junos OS automatically configures one loopback interface (**lo0**). The logical interface **lo0.16383** is a nonconfigurable interface for router control traffic.

• **ls**—Link services interface.

• **lsi**—Internally generated interface that is not configurable.

• **ml**—Multilink interface (including Multilink Frame Relay and MLPPP).

• **mo**—Monitoring services interface (including monitoring services and monitoring services II). The logical interface **mo-fpc/pic/port.16383** is an internally generated, nonconfigurable interface for router control traffic.

• **ms**—Multiservices interface.

• **mt**—Multicast tunnel interface (internal router interface for VPNs). If your router has a Tunnel PIC, the Junos OS automatically configures one multicast tunnel interface (**mt**) for each virtual private network (VPN) you configure. Although it is not necessary to configure multicast interfaces, you can use the **multicast-only** statement to configure the unit and family so that the tunnel can transmit and receive multicast traffic only. For more information, see **multicast-only**.

• **mtun**—Internally generated interface that is not configurable.

• **oc3**—OC3 IQ interface (configured on the Channelized OC12 IQ and IQE PICs or Channelized OC3 IQ and IQE PICs).

• **pd**—Interface on the rendezvous point (RP) that de-encapsulates packets.

• **pe**—Interface on the first-hop PIM router that encapsulates packets destined for the RP router.

• **pimd**—Internally generated interface that is not configurable.

• **pime**—Internally generated interface that is not configurable.

• **rlsq**—Container interface, numbered from 0 through 127, used to tie the primary and secondary LSQ PICs together in high availability configurations. Any failure of the primary PIC results in a switch to the secondary PIC and vice versa.

• **rms**—Redundant interface for two multiservices interfaces.

• **rsp**—Redundant virtual interface for the adaptive services interface.

• **se**—Serial interface (including EIA-530, V.35, and X.21 interfaces).

• **si**—Services-inline interface, which is hosted on a Trio-based line card.

• **so**—SONET/SDH interface.

• **sp**—Adaptive services interface. The logical interface **sp-fpc/pic/port.16383** is an internally generated, nonconfigurable interface for router control traffic.

• **stm1**—STM1 interface (configured on the OC3/STM1 interfaces).

• **stm4**—STM4 interface (configured on the OC12/STM4 interfaces).

• **stm16**—STM16 interface (configured on the OC48/STM16 interfaces).
• **t1**—T1 interface (including channelized DS3-to-DS1 interfaces).
• **t3**—T3 interface (including channelized OC12-to-DS3 interfaces).
• **tap**—Internally generated interface that is not configurable.
• **umd**—USB modem interface.
• **vsp**—Voice services interface.
• **vc4**—Virtually concatenated interface.
• **vt**—Virtual loopback tunnel interface.
• **xe**—10-Gigabit Ethernet interface. Some older 10-Gigabit Ethernet interfaces use the *ge* media type (rather than *xe*) to identify the physical part of the network device.
• **xt**—Logical interface for Protected System Domains to establish a Layer 2 tunnel connection.

**fpc** identifies the number of the FPC or DPC card on which the physical interface is located. Specifically, it is the number of the slot in which the card is installed.

M40, M40e, M160, M320, M120, T320, T640, and T1600 routers each have eight FPC slots that are numbered 0 through 7, from left to right as you are facing the front of the chassis. For information about compatible FPCs and PICs, see the hardware guide for your router.

On PTX1000 routers, the FPC number is always 0.

The M20 router has four FPC slots that are numbered 0 through 3, from top to bottom as you are facing the front of the chassis. The slot number is printed adjacent to each slot.

MX Series routers support DPCs, FPCs, and Modular Interface Cards (MICs). For information about compatible DPCs, FPCs, PICs, and MICs, see the *MX Series Interface Module Reference*.

For M5, M7i, M10, and M10i routers, the FPCs are built into the chassis; you install the PICs into the chassis.

The M5 and M7i routers have space for up to four PICs. The M7i router also comes with an integrated Tunnel PIC, or an optional integrated AS PIC, or an optional integrated MS PIC.

The M10 and M10i routers have space for up to eight PICs.

A routing matrix can have up to 32 FPCs (numbered 0 through 31).

For more information about interface naming for a routing matrix, see "Interface Naming for a Routing Matrix Based on a TX Matrix Router" on page 24.

**pic** identifies the number of the PIC on which the physical interface is located. Specifically, it is the number of the PIC location on the FPC. FPCs with four PIC slots are numbered 0 through 3. FPCs with three PIC slots are numbered 0 through 2. The PIC location is printed
on the FPC carrier board. For PICs that occupy more than one PIC slot, the lower PIC slot number identifies the PIC location.

*port* identifies a specific port on a PIC or DPC. The number of ports varies depending on the PIC. The port numbers are printed on the PIC.

### Logical Part of an Interface Name

The logical unit part of the interface name corresponds to the logical unit number. The range of number available varies for different interface types. See *unit* for current range values.

In the virtual part of the name, a period (.) separates the port and logical unit numbers:

- Other platforms:
  
  
  **type-fpc/pic/port.logical**

### Separators in an Interface Name

There is a separator between each element of an interface name.

In the physical part of the name, a hyphen (-) separates the media type from the FPC number, and a slash (/) separates the FPC, PIC, and port numbers.

In the virtual part of the name, a period (.) separates the channel and logical unit numbers.

A colon (:) separates the physical and virtual parts of the interface name.

### Channel Part of an Interface Name

The channel identifier part of the interface name is required only on channelized interfaces. For channelized interfaces, channel 0 identifies the first channelized interface. For channelized IQ and channelized IQE interfaces, channel 1 identifies the first channelized interface. A nonconcatenated (that is, channelized) SONET/SDH OC48 interface has four OC12 channels, numbered 0 through 3.

To determine which types of channelized PICs are currently installed in the router, use the `show chassis hardware` command from the top level of the command-line interface (CLI). Channelized IQ and IQE PICs are listed in the output with “intelligent queuing IQ” or “enhanced intelligent queuing IQE” in the description. For more information, see *Channelized Interfaces Overview*.

For ISDN interfaces, you specify the B-channel in the form `bc-pim/0/port:n`. *n* is the B-channel ID and can be 1 or 2. You specify the D-channel in the form `dc-pim/0/port:0`.

**NOTE:** For ISDN, the B-channel and D-channel interfaces do not have any configurable parameters. However, when interface statistics are displayed, B-channel and D-channel interfaces have statistical values.
NOTE: In the Junos OS implementation, the term *logical interfaces* generally refers to interfaces you configure by including the unit statement at the [edit interfaces *interface-name*] hierarchy level. Logical interfaces have the `.logical` descriptor at the end of the interface name, as in `ge-0/0/0.1` or `t1-0/0/0:0.1`, where the logical unit number is 1.

Although channelized interfaces are generally thought of as logical or virtual, the Junos OS sees T3, T1, and NxDS0 interfaces within a channelized IQ or IQE PIC as physical interfaces. For example, both `t3-0/0/0` and `t3-0/0/0:1` are treated as physical interfaces by the Junos OS. In contrast, `t3-0/0/0.2` and `t3-0/0/0:1.2` are considered logical interfaces because they have the `.2` at the end of the interface names.

### Interface Naming for a Routing Matrix Based on a TX Matrix Router

A routing matrix based on a Juniper Networks TX Matrix router is a multichassis architecture composed of one TX Matrix router and from one to four interconnected T640 routers. From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix router controls all the T640 routers, as shown in Figure 3 on page 24.

*Figure 3: Routing Matrix*

A TX Matrix router is also referred to as a *switch-card chassis* (SCC). The CLI uses `scc` to refer to the TX Matrix router. A T640 router in a routing matrix is also referred to as a *line-card chassis* (LCC). The CLI uses `lcc` as a prefix to refer to a specific T640 router.

LCCs are assigned numbers 0 through 3, depending on the hardware setup and connectivity to the TX Matrix router. For more information, see the *TX Matrix Router Hardware Guide*. A routing matrix can have up to four T640 routers, and each T640 router has up to eight FPCs. Therefore, the routing matrix as a whole can have up to 32 FPCs (0 through 31).
In the Junos OS CLI, an interface name has the following format:

```
type-fpc/pic/port
```

When you specify the `fpc` number for a T640 router in a routing matrix, the Junos OS determines which T640 router contains the specified FPC based on the following assignment:

- On LCC 0, FPC hardware slots 0 through 7 are configured as 0 through 7.
- On LCC 1, FPC hardware slots 0 through 7 are configured as 8 through 15.
- On LCC 2, FPC hardware slots 0 through 7 are configured as 16 through 23.
- On LCC 3, FPC hardware slots 0 through 7 are configured as 24 through 31.

For example, the `1` in `se-1/0/0` refers to FPC hardware slot 1 on the T640 router labeled `lcc0`. The `11` in `t1-11/2/0` refers to FPC hardware slot 3 on the T640 router labeled `lcc1`. The `20` in `so-20/0/1` refers to FPC hardware slot 4 on the T640 router labeled `lcc2`. The `31` in `t3-31/1/0` refers to FPC hardware slot 7 on the T640 router labeled `lcc3`.

Table 3 on page 25 summarizes the FPC numbering for a T640 router in a routing matrix.

### Interface Naming for a Routing Matrix Based on a TX Matrix Plus Router

A routing matrix based on a Juniper Networks TX Matrix Plus Router is a multichassis architecture composed of one TX Matrix Plus router and from one to four interconnected T1600 routers. From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix Plus router controls all the T1600 routers, as shown in Figure 4 on page 26.

**Figure 4: Routing Matrix Based on a TX Matrix Plus Router**

A TX Matrix Plus router is also referred to as a *switch-fabric chassis* (SFC). The CLI uses `sfc` to refer to the TX Matrix Plus router. A T1600 router in a routing matrix is also referred to as a *line-card chassis* (LCC). The CLI uses `lcc` as a prefix to refer to a specific T1600 router.
LCCs are assigned numbers, 0 through 3, depending on the hardware setup and connectivity to the TX Matrix Plus router. For more information, see the TX Matrix Plus Router Hardware Guide. A routing matrix based on a TX Matrix Plus router can have up to four T1600 routers, and each T1600 router has up to eight FPCs. Therefore, the routing matrix as a whole can have up to 32 FPCs (0 through 31).

In the Junos OS CLI, an interface name has the following format:

\[ \text{type-fpc/pic/port} \]

When you specify the fpc number for a T1600 router in a routing matrix, the Junos OS determines which T1600 router contains the specified FPC based on the following assignment:

- On LCC 0, FPC hardware slots 0 through 7 are configured as 0 through 7.
- On LCC 1, FPC hardware slots 0 through 7 are configured as 8 through 15.
- On LCC 2, FPC hardware slots 0 through 7 are configured as 16 through 23.
- On LCC 3, FPC hardware slots 0 through 7 are configured as 24 through 31.

For example, the 1 in \text{se-1/0/0} refers to FPC hardware slot 1 on the T1600 router labeled \text{lcc0}. The 11 in \text{t1-11/2/0} refers to FPC hardware slot 3 on the T1600 router labeled \text{lcc1}. The 20 in \text{so-20/0/1} refers to FPC hardware slot 4 on the T1600 router labeled \text{lcc2}. The 31 in \text{t3-31/1/0} refers to FPC hardware slot 7 on the T1600 router labeled \text{lcc3}.

Table 5 on page 27 summarizes the FPC numbering for a routing matrix based on a TX Matrix Plus router.

**Table 5: FPC Numbering for T1600 Routers in a Routing Matrix**

<table>
<thead>
<tr>
<th>LCC Numbers Assigned to the T1600 Router</th>
<th>Configuration Numbers</th>
</tr>
</thead>
<tbody>

Chassis Interface Naming

You configure some PIC properties, such as framing, at the [edit chassis] hierarchy level. Chassis interface naming varies depending on the routing hardware.

- To configure PIC properties for a standalone router, you must specify the FPC and PIC numbers, as follows:

  ```
  [edit chassis]
  fpc slot-number {
    pic pic-number {
      ...
    }
  }
  ```

- To configure PIC properties for a T640 or T1600 router configured in a routing matrix, you must specify the LCC, FPC, and PIC numbers, as follows:

  ```
  [edit chassis]
  lcc lcc-number {
    fpc slot-number { # Use the hardware FPC slot number
      pic pic-number {
        ...
      }
    }
  }
  ```
For the FPC slot in a T640 router in a routing matrix, specify the actual hardware slot number, as labeled on the T640 router chassis. Do not use the corresponding software FPC configuration numbers shown in Table 4 on page 25.

For the FPC slot in a T1600 router in a routing matrix, specify the actual hardware slot number, as labeled on the T1600 router chassis. Do not use the corresponding software FPC configuration numbers shown in Table 5 on page 27.

For more information about the [edit chassis] hierarchy, see the Junos OS Administration Library.

Examples: Interface Naming

This section provides examples of naming interfaces. For an illustration of where slots, PICs, and ports are located, see Figure 5 on page 29.

Figure 5: Interface Slot, PIC, and Port Locations

For an FPC in slot 1 with two OC3 SONET/SDH PICs in PIC positions 0 and 1, each PIC with two ports uses the following names:

- so-1/0/0.0
- so-1/0/1.0
- so-1/1/0.0
- so-1/1/1.0

An OC48 SONET/SDH PIC in slot 1 and in concatenated mode appears as a single FPC with a single PIC, which has a single port. If this interface has a single logical unit, it has the following name:

- so-1/0/0.0
An OC48 SONET/SDH PIC in slot 1 and in channelized mode has a number for each channel. For example:

so-1/0/0:0
so-1/0/0:1

For an FPC in slot 1 with a Channelized OC12 PIC in PIC position 2, the DS3 channels have the following names:

t3-1/2/0:0
t3-1/2/0:1
t3-1/2/0:2
...
t3-1/2/0:11

For an FPC in slot 1 with four OC12 ATM PICs (the FPC is fully populated), the four PICs, each with a single port and a single logical unit, have the following names:

at-1/0/0.0
at-1/1/0.0
at-1/2/0.0
at-1/3/0.0

In a routing matrix on the T640 router labeled lcc1, for an FPC in slot 5 with four SONET OC192 PICs, the four PICs, each with a single port and a single logical unit, have the following names:

so-13/0/0.0
so-13/1/0.0
so-13/2/0.0
so-13/3/0.0

For an FPC in slot 1 with one 4-port ISDN BRI interface card, port 4 has the following name:

br-1/0/4

The first B-channel, the second B-channel, and the control channel have the following names:

bc-1/0/4:1
bc-1/0/4:2
dc-1/0/4:0

</tbody>
</table>

NOTE: You can configure GRE interfaces (gre-x/y/z) only for GMPLS control channels. GRE interfaces are not supported or configurable for other applications. For more information about GMPLS, see the MPLS Applications Feature Guide.
When you configure an interface, you are effectively specifying the properties for a physical interface descriptor. In most cases, the physical interface descriptor corresponds to a single physical device and consists of the following parts:

- The interface name, which defines the media type
- The slot in which the FPC or DPC is located
- The location on the FPC in which the PIC is installed
- The PIC or DPC port
- The interface’s channel and logical unit numbers (optional)

Each physical interface descriptor can contain one or more logical interface descriptors. These allow you to map one or more logical (or virtual) interfaces to a single physical device. Creating multiple logical interfaces is useful for ATM, Frame Relay, and Gigabit Ethernet networks, in which you can associate multiple virtual circuits, data-link connections, or virtual LANs (VLANs) with a single interface device.

Each logical interface descriptor can have one or more family descriptors to define the protocol family that is associated with and allowed to run over the logical interface.

The following protocol families are supported:

- Internet Protocol version 4 (IPv4) suite (inet)
- Internet Protocol version 6 (IPv6) suite (inet6)
- Circuit cross-connect (CCC)
- Translational cross-connect (TCC)
- International Organization for Standardization (ISO)
- Multilink Frame Relay end-to-end (MLFR end-to-end)
- Multilink Frame Relay user-to-network interface network-to-network interface (MLFR UNI NNI)
- Multilink Point-to-Point Protocol (MLPPP)
- Multiprotocol Label Switching (MPLS)
- Trivial Network Protocol (TNP)
- (M Series, T Series, and MX Series routers only) Virtual private LAN service (VPLS)
Finally, each family descriptor can have one or more address entries, which associate a
network address with a logical interface and hence with the physical interface.

You configure the various interface descriptors as follows:

- You configure the physical interface descriptor by including the `interfaces interface-name`
  statement.

- You configure the logical interface descriptor by including the `unit` statement within
  the `interfaces interface-name` statement or by including the `logical` descriptor at the
  end of the interface name, as in`t3-0/0/0.1`, where the logical unit number is 1, as shown
  in the following examples:

  ```
  [edit]
  user@host# set interfaces t3-0/0/0 unit 1
  [edit]
  user@host# edit interfaces t3-0/0/0.1
  [edit interfaces t3-0/0/0]
  user@host# set unit 1
  ```

- You configure the family descriptor by including the `family` statement within the `unit`
  statement.

- You configure address entries by including the `address` statement within the `family`
  statement.

- You configure tunnels by including the `tunnel` statement within the `unit` statement.

  **NOTE:** The address of a logical interface cannot be the same as a tunnel
  interface's source or destination address. If you try to configure a logical
  interface with a tunnel interface's address or vice versa, a commit failure will
  occur.

  - Router Interfaces Overview on page 4

**Physical Part of an Interface Name**

- Interface Names for ACX Series Universal Metro Routers on page 43
- Interface Names for M Series and T Series Routers on page 44
- MX Series Router Interface Names on page 44
- Interface Names for PTX Series Routers on page 45

**Interface Names for ACX Series Universal Metro Routers**

ACX Series routers do not have actual PIC devices. Instead they have built-in network
ports on the front panel of the router. These ports are named using the same naming
convention used for routers with PIC devices with the understanding that the FPC, PIC
and port are pseudo devices. When you display information about one of these ports,
you specify the interface type, the slot for the Flexible PIC Concentrator (FPC), the slot on the FPC for the Physical Interface Card (PIC), and the configured port number.

In the physical part of the interface name, a hyphen (-) separates the media type from the FPC number, and a slash (/) separates the FPC, PIC, and port numbers:

\texttt{type-fpc(pic/port)}

**See Also**

- Understanding Encapsulation on an Interface
- Configuring Inverse Multiplexing for ATM (IMA) on ACX Series

**Interface Names for M Series and T Series Routers**

On M Series and T Series routers, when you display information about an interface, you specify the interface type, the slot in which the Flexible PIC Concentrator (FPC) is installed, the slot on the FPC in which the Physical Interface Card (PIC) is located, and the configured port number.

In the physical part of the interface name, a hyphen (-) separates the media type from the FPC number, and a slash (/) separates the FPC, PIC, and port numbers:

\texttt{type-fpc(pic/port)}

\textbf{NOTE:} Exceptions to the \texttt{type-fpc(pic/port)} physical description include the aggregated Ethernet and aggregated SONET/SDH interfaces, which use the syntax \texttt{ae number} and \texttt{as number}, respectively.

**MX Series Router Interface Names**

On MX Series routers when you display information about an interface, you specify the interface type, the Dense Port Concentrator (DPC), Flexible PIC Concentrator (FPC), or Modular Port Concentrator (MPC) slot, the PIC or MIC slot, and the configured port number.

\textbf{NOTE:} Although the MX Series routers use DPCs, FPCs, MPCs, MICs, and PICs, command syntax in this book is shown as \texttt{fpc(pic/port)} for simplicity.

In the physical part of the interface name, a hyphen (-) separates the media type from the FPC number, and a slash (/) separates the DPC, FPC or MPC, MIC or PIC, and port numbers:

\texttt{type-fpc(pic/port)}

- \texttt{fpc}—Slot in which the DPC, FPC, or MPC is installed.
- \texttt{pic}—Slot on the FPC in which the PIC is located.
For DPCs, MICs, and the 16-port MPC, the PIC value is a logical grouping of ports and varies on different platforms.

- **port**—Port number on the DPC, PIC, MPC, or MIC.

### Interface Names for PTX Series Routers

On PTX Series Packet Transport Routers, when you display information about an interface, you specify the interface type, the slot in which the Flexible PIC Concentrator (FPC) is installed, the slot on the FPC in which the Physical Interface Card (PIC) is located, and the configured port number.

**NOTE:**

- The PTX router supports Ethernet type interfaces only. The media type portion of the physical interface name, `type`, supports the Ethernet interface type only: `et`.
- In the CLI, all PTX3000 PICs are represented as `pic0`. For more information, see [PTX3000 PIC Description](#).

In the physical part of the interface name, a hyphen (-) separates the media type (`et`) from the FPC number, and a slash (/) separates the FPC, PIC, and port numbers:

```
type-fpc/pic/port
```

### Displaying Interface Configurations Overview

To display a configuration, use either the `show` command in configuration mode or the `show configuration` top-level command. Interfaces are listed in numerical order, from lowest to highest slot number, then from lowest to highest PIC number, and finally from lowest to highest port number.

Physical Interface Configuration Statements Overview

The software driver for each network media type sets reasonable default values for general interface properties, such as the interface’s maximum transmission unit (MTU) size, receive and transmit leaky bucket properties, link operational mode, and clock source.

M Series, MX Series, and T Series routers are factory configured according to the specific router, its features, and its physical interfaces. This section includes a default configuration example showing the statements used to configure the physical interfaces properties. Additional statements are used to set properties for specific interface types and are described in “Physical Interfaces Properties Statements List” on page 58.

To modify any of the default general interface properties, include the appropriate statements at the [edit interfaces interface-name] hierarchy level:

```
interfaces {
traceoptions {
    file filename <filesnumber> <match regular-expression> <size size> <world-readable | no-world-readable >; 
    flag flag <disable>;
}
interface-name {
    accounting-profile name;
    aggregated-ether-options {

```

NOTE: The following configuration hierarchy and its included statements are shown only as an example of a configuration statement hierarchy and should not be referenced for resolving actual configurations. For information on a specific hierarchy level, see the hierarchy level document for that specific hierarchy, for example [edit interfaces] Hierarchy Level.

Configuring Interface Ranges

NOTE: This task uses Junos OS for EX Series switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see Configuring Interface Ranges for EX Series Switches with ELS. For ELS details, see Using the Enhanced Layer 2 Software CLI.

The Junos OS allows you to group a range of identical interfaces into an *interface range*. You first specify the group of identical interfaces in the interface range. Then you can apply a common configuration to the specified interface range, reducing the number of configuration statements required and saving time while producing a compact configuration.

- Configuring Interface Ranges on page 74
- Expanding Interface Range Member and Member Range Statements on page 78
- Configuration Inheritance for Member Interfaces on page 80
- Member Interfaces Inheriting Configuration from Configuration Groups on page 81
- Interfaces Inheriting Common Configuration on page 82
- Configuring Inheritance Range Priorities on page 82
- Configuration Expansion Where Interface Range Is Used on page 83

### Configuring Interface Ranges

To configure an interface range, include the `interface-range` statement at the [edit interfaces] hierarchy level.

The `interface-range` statement accepts only physical networking interface names in its definition. The following interface types are supported and example CLI descriptors are shown:

- ATM—`at-fpc/pic/port`
- Channelized—`(coc | cstm)n-fpc/pic/port`
- DPC—`xe-fpc/pic/port`
Interfaces can be grouped either as a range of interfaces or using a number range under the interface-range statement definition.

Interfaces in an interface-range definition can be added as part of a member range or as individual members or multiple members using a number range.

To specify a member range, use the member-range statement at the [edit interfaces interface-range name] hierarchy level.

To specify interfaces in lexical order, use the member-range start-range to end-range statement.

A range for a member statement should contain the following:

- *—All, specifies sequential interfaces from 0 through 47.

  **CAUTION:** The wildcard * in a member statement does not take into account the interface numbers supported by a specific interface type. Irrespective of the interface type, * includes interface numbers ranging from 0 through 47 to the interface group. Therefore, use * in a member statement with caution.

- num—Number, specifies one specific interface by its number.

- [low-high]—Numbers between low to high, specifies a range of sequential interfaces.

- [num1, num2, num3]—Numbers num1, num2, and num3 specify multiple specific interfaces.

**Example: Specifying an Interface Range Member Range**

```plaintext
member-range ge-0/0/0 to ge-4/0/40;
```

To specify one or multiple members, use the member statement at the [edit interfaces interface-range name] hierarchy level.

To specify the list of interface range members individually or for multiple interfaces using regex, use the member list of interface names statement.
Example: Specifying an Interface Range Member

member ge-0/0/0;
member ge-0/*/*
member ge-0/[1-10]/0;
member ge-0/[1,2,3]/3;

Regex or wildcards are not supported for interface-type prefixes. For example, prefixes ge, fe, and xe must be mentioned explicitly.

An interface-range definition can contain both member and member-range statements within it. There is no maximum limit on the number of member or member-range statements within an interface-range. However, at least one member or member-range statement must exist within an interface-range definition.

Example: Interface Range Common Configuration

Configuration common to an interface range can be added as a part of the interface-range definition, as follows:

[edit]
interfaces {
    + interface-range foo {
        + member-range ge-1/0/0 to ge-4/0/40;
        + member ge-0/1/1;
        + member ge-5/[1-10]/4;
        /*Common configuration is added as part of interface-range definition*/
        mtu 256;
        hold-time up 10;
        ether-options {
            flow-control;
            speed {
                100m;
            }
            802.3ad primary;
        }
    }
}

An interface-range definition having just member or member-range statements and no common configurations statements is valid.

These defined interface ranges can be used in other configuration hierarchies, in places where an interface node exists.

Example: Interface-Range foo Used Under the Protocols Hierarchy

protocols {
    dot1x {
        authenticator {
            interface foo{
                retries 1;
            }
        }
    }
}
foo should be an `interface-range` defined at the `[interfaces]` hierarchy level. In the above example, the `interface` node can accept both individual interfaces and interface ranges.

**TIP:** To view an interface range in expanded configuration, use the `(show | display inheritance)` command. For more information, see the *CLI User Guide*.

By default, `interface-range` is not available to configure in the CLI where the `interface` statement is available. The following locations are supported; however, some of the hierarchies shown in this list are product specific:

- `protocols dot1x authentication interface`
- `protocols dvmrp interface`
- `protocols oam ethernet lmi interface`
- `protocols esis interface`
- `protocols igmp interface`
- `protocols igmp-host client num interface`
- `protocols mid-host client num interface`
- `protocols router-advertisement interface`
- `protocols isis interface`
- `protocols ldp interface`
- `protocols oam ethernet link-fault-management interface`
- `protocols ldp interface`
- `protocols link-management peer lmp-control-channel interface`
- `protocols link-management peer control-channel`
- `protocols link-management te-link name interface`
- `protocols mld interface`
- `protocols ospf area id interface`
- `protocols pim interface`
- `protocols router-discovery interface`
- `protocols rip group name neighbour`
- `protocols ripng group name neighbour`
- `protocols rsvp interface`
- `protocols snmp interface`
- `protocols layer2-control bpdu-block interface`
- `protocols layer2-control mac-rewrite interface`

Expanding Interface Range Member and Member Range Statements

All member and member-range statements in an interface range definition are expanded to generate the final list of interface names for the specified interface range.
Example: Expanding Interface Range Member and Member Range Statements

[edit]
interfaces {
  interface-range range-1 {
    member-range ge-0/0/0 to ge-4/0/20;
    member ge-10/1/1;
    member ge-5/[0-5]/*;
    /*Common configuration is added part of the interface-range definition*/
    mtu 256;
    hold-time up 10;
    ether-options {
      flow-control;
      speed {
        100m;
      }
      802.3ad primary;
    }
  }
}

For the member-range statement, all possible interfaces between start-range and end-range are considered in expanding the members. For example, the following member-range statement:

member-range ge-0/0/0 to ge-4/0/20

expands to:

[ge-0/0/0, ge-0/0/1 ... ge-0/0/max_ports
 ge-0/1/0 ge-0/1/1 ... ge-0/1/max_ports
 ge-0/2/0 ge-0/2/1 ... ge-0/2/max_ports
   ...
 ge-0/MAX_PICS/0 ... ge-0/max_pics/max_ports
 ge-1/0/0 ge-1/0/1 ... ge-1/0/max_ports
   ...
 ge-1/MAX_PICS/0 ... ge-1/max_pics/max_ports
   ...
 ge-4/0/0 ge-4/0/1 ... ge-4/0/max_ports]

The following member statement:

ge-5/[0-5]/*

expands to:

ge-5/0/0 ... ge-5/0/max_ports
ge-5/1/0 ... ge-5/0/max_ports
  ...
ge-5/5/0 ... ge-5/5/max_ports

The following member statement:
**Configuration Inheritance for Member Interfaces**

When the Junos OS expands the `member` and `member-range` statements present in an `interface-range`, it creates interface objects if they are not explicitly defined in the configuration. The common configuration is copied to all its member interfaces in the `interface-range`.

**Example:**

Foreground interface configuration takes priority compared to configuration inherited by the interface through the `interface-range`.

```
interfaces {
  interface-range range-1 {
    member-range ge-1/0/0/0 to ge-10/0/47;
    mtu 256;
  }
  ge-1/0/1 {
    mtu 1024;
  }
}
```

In the preceding example, interface `ge-1/0/1` will have an MTU value of 1024.

This can be verified with output of the `show interfaces | display inheritance` command, as follows:

```
user@host: # show interfaces | display inheritance
## 'ge-1/0/0' was expanded from interface-range 'range-1'
##
ge-1/0/0 {
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
}
ge-1/0/1 {
  mtu 1024;
}
##
## 'ge-1/0/2' was expanded from interface-range 'range-1'
##
ge-1/0/2 {
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
}
```
Member Interfaces Inheriting Configuration from Configuration Groups

Interface range member interfaces inherit the config-groups configuration like any other foreground configuration. `interface-range` is similar to any other foreground configuration statement. The only difference is that the `interface-range` goes through a member interfaces expansion before Junos OS reads this configuration.

groups {
    global {
        interfaces {
            <*> {
                hold-time up 10;
            }
        }
    }
}
apply-groups [global];
interfaces {
    interface-range range-1 {
        member-range ge-1/0/0 to ge-10/0/47;
        mtu 256;
    }
}

The `hold-time` configuration is applied to all members of `interface-range range-1`.

This can be verified with `show interfaces | display inheritance` as follows:

```
user@host# show interfaces | display inheritance
ge-1/0/0 {
    ## '256' was expanded from interface-range 'range-1'
    ## mtu 256;
    ## 'hold-time' was inherited from group 'global'
    ## '10' was inherited from group 'global'
    ## hold-time up 10;
}
ge-1/0/1 {
    ##
    ## '256' was expanded from interface-range 'range-1'
```
See Also • Using Wildcards with Configuration Groups

Interfaces Inheriting Common Configuration

If an interface is a member of several interface ranges, that interface will inherit the common configuration from all of those interface ranges.

```
[edit]
interfaces {
    interface-range range-1 {
        member-range ge-1/0/0 to ge-10/0/47;
        mtu 256;
    }
}
```

In this example, interfaces ge-10/0/0 through ge-10/0/47 will have both hold-time and mtu.

Configuring Inheritance Range Priorities

The interface ranges are defined in the order of inheritance priority, with the first interface range configuration data taking priority over subsequent interface ranges.

```
[edit]
interfaces {
    interface-range int-grp-one {
        member-range ge-0/0/0 to ge-4/0/40;
        member ge-1/1/1;
    }
}
/*Common config is added part of the interface-range definition*/
mtu 256;
hold-time up 10;
}
}
} interfaces {
interface-range int-grp-two {
   member-range ge-5/0/0 to ge-10/0/40;
   member ge-1/1/1;
   mtu 1024;
}
}
}
}

Interface ge-1/1/1 exists in both interface-range int-grp-one and interface-range int-grp-two. This interface inherits mtu 256 from interface-range int-grp-one because it was defined first.

Configuration Expansion Where Interface Range Is Used

In this example, interface-range range-1 is used under the protocols hierarchy:

[edit]
interfaces {
   interface-range range-1 {
      member ge-10/1/1;
      member ge-5/5/1;
      mtu 256;
      hold-time up 10;
      ether-options {
         flow-control;
         speed {
            100m;
         }
         802.3ad primary;
      }
   }
   protocols {
      dot1x {
         authenticator {
            interface range-1 {
               retries 1;
            }
         }
      }
   }
}

The interface node present under authenticator is expanded into member interfaces of the interface-range range-1 as follows:

protocols {
   dot1x {
      authenticator {
         interface ge-10/1/1 {

The `interface range` statement is expanded into two interfaces, `ge-10/1/1` and `ge-5/5/1`, and configuration `retries 1` is copied under those two interfaces.

This configuration can be verified using the `show protocols dot1x | display inheritance` command.

### Specifying an Aggregated Interface

The M Series, MX Series, and T Series routers support aggregated interfaces. To specify an aggregated interface assign a number with the aggregated interface name. For example, configure `aex` at the `[edit interfaces]` hierarchy level, where `x` is an integer ranging 0 through 127 for M Series and T Series routers and 0 through 479 on MX Series routers.

For aggregated SONET/SDH interfaces, configure `asx` at the `[edit interfaces]` hierarchy level.

**NOTE:** SONET/SDH aggregation is proprietary to the Junos OS and might not work with other software.

If you are configuring VLANs for aggregated Ethernet interfaces, you must include the `vlan-tagging` statement at the `[edit interfaces aex]` hierarchy level to complete the association.

### Media MTU Overview

The media maximum transmission unit (MTU) is the largest data unit that can be forwarded without fragmentation.

The default media MTU size used on a physical interface depends on the encapsulation used on that interface. In some cases, the default IP Protocol MTU depends on whether the protocol used is IP version 4 (IPv4) or International Organization for Standardization (ISO).
The default media MTU is calculated as follows:

\[
\text{Default media MTU} = \text{Default IP MTU} + \text{encapsulation overhead}
\]

When you are configuring point-to-point connections, the MTU sizes on both sides of the connections must be the same. Also, when you are configuring point-to-multipoint connections, all interfaces in the subnet must use the same MTU size.

NOTE: The actual frames transmitted also contain cyclic redundancy check (CRC) bits, which are not part of the media MTU. For example, the media MTU for a Gigabit Ethernet Version 2 interface is specified as 1514 bytes, but the largest possible frame size is actually 1518 bytes; you need to consider the extra bits in calculations of MTUs for interoperability.

The physical MTU for Ethernet interfaces does not include the 4-byte frame check sequence (FCS) field of the Ethernet frame.

A SONET/SDH interface operating in concatenated mode has a “c” added to the rate descriptor. For example, a concatenated OC48 interface is referred to as OC48c.

If you do not configure an MPLS MTU, the Junos OS derives the MPLS MTU from the physical interface MTU. From this value, the software subtracts the encapsulation-specific overhead and space for the maximum number of labels that might be pushed in the Packet Forwarding Engine. Currently, the software provides for three labels of four bytes each, for a total of 12 bytes.

In other words, the formula used to determine the MPLS MTU is the following:

\[
\text{MPLS MTU} = \text{physical interface MTU} - \text{encapsulation overhead} - 12
\]

Media MTU Sizes by Interface Type

The media maximum transmission unit (MTU) is the largest data unit that can be forwarded without fragmentation.

If you change the size of the media MTU, you must ensure that the size is equal to or greater than the sum of the protocol MTU and the encapsulation overhead.

**NOTE:** Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E
NOTE: Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E

Starting in Junos OS Release 16.1R1, the MTU size has been increased to 16,000 bytes for certain MPCs. The MTU size for the following MPCs has been increased to 16000 bytes:

- MPC7E (MPC7E-MRATE and MP7E-10G)
- MPC8E (MX2K-MPC8E)
- MPC9E (MX2K-MPC9E)

Starting in Junos OS Release 17.3R1, the MTU size for MX10003 MPC is 16,000 bytes.

Starting in Junos OS Release 17.4R1, the MTU size for MX204 is 16,000 bytes.

In all Junos OS releases, the maximum MTU size for MX5, MX10, MX40, and MX80 routers is 9192 bytes.

In all Junos OS releases, the maximum MTU size for MPC2E-NG and MPC3E-NG is 9500 bytes.

NOTE: On ACX Series routers, you can configure the protocol MTU by including the mtu statement at the [edit interfaces interface-name unit logical-unit-number family inet] or [edit interfaces interface-name unit logical-unit-number family inet6] hierarchy level.

- If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
- If you are configuring the protocol MTU for both inet and inet6 families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for inet and inet6 families that are configured on the same logical interface.

- Configuring the Media MTU on page 99
- Media MTU Overview on page 84
Media MTU Overview

The default media MTU size used on a physical interface depends on the encapsulation used on that interface. In some cases, the default IP Protocol MTU depends on whether the protocol used is IP version 4 (IPv4) or International Organization for Standardization (ISO).

The default media MTU is calculated as follows:

\[
\text{Default media MTU} = \text{Default IP MTU} + \text{encapsulation overhead}
\]

When you are configuring point-to-point connections, the MTU sizes on both sides of the connections must be the same. Also, when you are configuring point-to-multipoint connections, all interfaces in the subnet must use the same MTU size. For details about encapsulation overhead, see “Encapsulation Overhead by Encapsulation Type” on page 95.

NOTE: The actual frames transmitted also contain cyclic redundancy check (CRC) bits, which are not part of the media MTU. For example, the media MTU for a Gigabit Ethernet Version 2 interface is specified as 1514 bytes, but the largest possible frame size is actually 1518 bytes; you need to consider the extra bits in calculations of MTUs for interoperability.

The physical MTU for Ethernet interfaces does not include the 4-byte frame check sequence (FCS) field of the Ethernet frame.

If you do not configure an MPLS MTU, the Junos OS derives the MPLS MTU from the physical interface MTU. From this value, the software subtracts the encapsulation-specific overhead and space for the maximum number of labels that might be pushed in the Packet Forwarding Engine. Currently, the software provides for three labels of four bytes each, for a total of 12 bytes.

In other words, the formula used to determine the MPLS MTU is the following:

\[
\text{MPLS MTU} = \text{physical interface MTU} - \text{encapsulation overhead} - 12
\]

If you configure an MTU value by including the mtu statement at the [edit interfaces interface-name unit logical-unit-number family mpls] hierarchy level, the configured value is used. Junos OS Release 16.2R1.6 and later releases do not support family mpls MTU.
How to Configure the Media MTU

To modify the default media MTU size for a physical interface, include the `mtu` statement at the `[edit interfaces interface-name]` hierarchy level:

```
[edit interfaces interface-name]
mtu bytes;
```

If you change the size of the media MTU, you must ensure that the size is equal to or greater than the sum of the protocol MTU and the encapsulation overhead.

**NOTE:** Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

You configure the protocol MTU by including the `mtu` statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family inet]`
- `[edit interfaces interface-name unit logical-unit-number family inet6]`

If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.

**NOTE:** If you are configuring the protocol MTU for both inet and inet6 families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for inet and inet6 families that are configured on the same logical interface.

Configuring Interface Description

You can include a text description of each physical interface in the configuration file. Any descriptive text you include is displayed in the output of the `show interfaces` commands, and is also exposed in the `ifAlias` Management Information Base (MIB) object. It has no impact on the interface's configuration.

To add a text description, include the `description` statement at the `[edit interfaces interface-name]` hierarchy level:

```
[edit]
user@host# set interfaces interface-name description text
```

For example:

```
[edit]
user@host# set interfaces fe-0/0/1 description "Backbone connection to PHL01"
```

The description can be a single line of text. If the text contains spaces, enclose it in quotation marks.

---

**NOTE:** You can configure the extended DHCP relay to include the interface description in the option 82 Agent Circuit ID suboption. See *Using DHCP Relay Agent Option 82 Information* in the *Junos OS Broadband Subscriber Management and Services Library*.

---

For information about describing logical units, see “Adding a Logical Unit Description to the Configuration” on page 172.

To display the description from the router or switch CLI, use the `show interfaces` command:

```
user@host> show interfaces fe-0/0/1
Physical interface: fe-0/0/1, Enabled, Physical link is Up
   Interface index: 129, SNMP ifIndex: 23
   Description: Backbone connection to PHL01
```

To display the interface description from the interfaces MIB, use the `snmpwalk` command from a server. To isolate information for a specific interface, search for the interface index.
shown in the **SNMP ifIndex** field of the **show interfaces** command output. The **ifAlias** object is in IFXTable.

```plaintext
user-server> snmpwalk host-fxp0.mylab public ifXTable | grep -e '\.23'

```

```plaintext
  ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifName.23 = fe-0/0/1
  ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifInMulticastPkts.23 = Counter32: 0
  ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifInBroadcastPkts.23 = Counter32: 0

- [Adding a Logical Unit Description to the Configuration on page 172](#)

## Configuring the Media MTU

The media maximum transmission unit (MTU) is the largest data unit that can be forwarded without fragmentation. The default media MTU size used on a physical interface depends on the encapsulation being used on that interface. For a listing of MTU sizes for each encapsulation type, see “Media MTU Sizes by Interface Type” on page 85.

To configure the media-MTU size:

1. In configuration mode, go to the `[edit interfaces interface-name]` hierarchy level.

   ```plaintext
   [edit ]
   user@host# [edit interfaces interface-name]
   ```

2. Include the `mtu` statement.

   ```plaintext
   [edit interfaces interface-name]
   mtu bytes;
   ```

   - If you change the size of the media MTU, you must ensure that the size is equal to or greater than the sum of the protocol MTU and the encapsulation overhead. You
configure the protocol MTU by including the `mtu` statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]`

**NOTE:**
- Changing the media MTU or protocol MTU causes an interface to be deleted and added again.
- Because tunnel services interfaces are considered logical interfaces, you cannot configure the MTU setting for the physical interface. This means you cannot include the `mtu` statement at the `[edit interfaces interface-name]` hierarchy level for the following interface types: generic routing encapsulation (gr-), IP-IP (ip-), loopback (lo-), link services (ls-), multilink services (ml-), and multicast (pe-, pd-). You can, however, configure the protocol MTU on all tunnel interfaces except virtual tunnel (vt) interfaces. Starting in Junos OS Release 17.1R3, you cannot configure the maximum transmission unit (MTU) size for vt interfaces because the `mtu bytes` option is deprecated for vt interfaces. Junos OS sets the MTU size for vt interfaces by default to unlimited.
- If you configure an MTU value by including the `mtu` statement at the `[edit interfaces interface-name unit logical-unit-number family mpls]` hierarchy level, the configured value is used.

- Encapsulation Overhead by Interface Encapsulation Type on page 97

**Configuring the Interface Speed**

You can configure the interface speed in following ways:

- Configuring the Interface Speed on Ethernet Interfaces on page 100
- Configuring Aggregated Ethernet Link Speed on page 102
- Configuring SONET/SDH Interface Speed on page 104

**Configuring the Interface Speed on Ethernet Interfaces**

For M Series and T Series Fast Ethernet 12-port and 48-port PIC interfaces, the management Ethernet interface (`fxp0` or `em0`), and the MX Series Tri-Rate Ethernet copper interfaces, you can explicitly set the interface speed. The Fast Ethernet, `fxp0`, and `em0` interfaces can be configured for 10 Mbps or 100 Mbps (`10m` | `100m`). The MX Series Tri-Rate Ethernet copper interfaces can be configured for 10 Mbps, 100 Mbps, or 1 Gbps.
(10m | 100m | 1g). For information about management Ethernet interfaces and to
determine the management Ethernet interface type for your router, see “Understanding
Management Ethernet Interfaces” on page 10 and Supported Routing Engines by RouterMX
Series routers, with MX-DPC and Tri-Rate Copper SFPs, support 20x1 Copper to provide
backwards compatibility with 100/10BASE-T and 1000BASE-T operation through an
Serial Gigabit Media Independent Interface (SGMII) interface.

1. In configuration mode, go to the [edit interfaces interface-name] hierarchy level.

   [edit ]
   user@host# edit interfaces interface-name

2. To configure the speed, include the speed statement at the [edit interfaces
   interface-name] hierarchy level.

   [edit interfaces interface-name]
   user@host# set speed (10m | 100m | 1g | auto | auto-10m-100m);
NOTE:

- By default, the M Series and T Series routers management Ethernet interface autonegotiates whether to operate at 10 megabits per second (Mbps) or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the no-concatenate statement in the [edit chassis] configuration hierarchy.

- Starting with Junos OS Release 14.2 the auto-10m-100m option allows the fixed tri-speed port to auto negotiate with ports limited by 100m or 10m maximum speed. This option must be enabled only for Tri-rate MPC port, that is, 3D 40x 1GE (LAN) RJ45 MIC on MX platform. This option does not support other MICs on MX platform.

- When you manually configure Fast Ethernet interfaces on the M Series and T Series routers, link mode and speed must both be configured. If both these values are not configured, the router uses autonegotiation for the link and ignores the user-configured settings.

- If the link partner does not support autonegotiation, configure either Fast Ethernet port manually to match its link partner's speed and link mode. When the link mode is configured, autonegotiation is disabled.

- On MX Series routers with tri-rate copper SFP interfaces, if the port speed is negotiated to the configured value and the negotiated speed and interface speed do not match, the link will not be brought up.

- When you configure the Tri-Rate Ethernet copper interface to operate at 1Gbps, autonegotiation must be enabled.

- Starting with Junos OS Release 11.4, half-duplex mode is not supported on Tri-Rate Ethernet copper interfaces. When you include the speed statement, you must include the link-mode full-duplex statement at the same hierarchy level.

See Also  speed on page 1008

Configuring Aggregated Ethernet Link Speed

On aggregated Ethernet interfaces, you can set the required link speed for all interfaces included in the bundle. Generally, all interfaces that make up a bundle must have the same speed. If you include in the aggregated Ethernet interface an individual link that has a speed different from the speed that you specify in the link-speed parameter, an error message is logged. However, there are exceptions.

Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers. For example, these mixes are supported:

- Member links of different modes (WAN and LAN) for 10-Gigabit Ethernet links.
• Member links of different rates: 10-Gigabit Ethernet, 40-Gigabit Ethernet, 50-Gigabit Ethernet, 100-Gigabit Ethernet, and OC192 (10-Gigabit Ethernet WAN mode)

Starting with Junos OS Release 14.1R1 and 14.2, support for mixed rates on aggregated Ethernet bundles is extended to MX240, MX480, MX960, MX2010, and MX2020 routers.

Starting with Junos OS Release 14.2, aggregated Ethernet supports mixed link speeds on PTX Series Packet Transport Routers.

NOTE:
• Member links of 50-Gigabit Ethernet can only be configured using the 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP (PD-ICE-CFP-FPC4).

• Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP. This 100-Gigabit Ethernet member link can be included in an aggregated Ethernet link that includes member links of other interfaces as well. In releases before Junos OS Release 13.2, the 100-Gigabit Ethernet member link configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP cannot be included in an aggregated Ethernet link that includes member links of other interfaces.

To configure member links of mixed rates and mixed modes on T640, T1600, T4000, TX Matrix Plus, and PTX routers, you need to configure the mixed option for the [edit interfaces aex aggregated-ether-options link-speed] statement.

To set the required link speed:

1. Specify that you want to configure the aggregated Ethernet options.

   user@host# edit interfaces interface-name aggregated-ether-options

2. Configure the link speed.

   [edit interfaces interface-name aggregated-ether-options ]
   user@host# set link-speed speed

   speed can be in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

   Aggregated Ethernet interfaces on the M120 router can have one of the following speeds:

   • 100m—Links are 100 Mbps.
   • 10g—Links are 10 Gbps.
• 1g—Links are 1 Gbps.
• oc192—Links are OC192 or STM64c.

Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:

• 10m—Links are 10 Mbps.
• 100m—Links are 100 Mbps.
• 1g—Links are 1 Gbps.
• 10g—Links are 10 Gbps.
• 50g—Links are 50 Gbps.

Aggregated Ethernet links on T Series, MX Series, PTX Series routers, and QFX5100, QFX10002, QFX10008, and QFX10016 switches can be configured to operate at one of the following speeds:

• 100g—Links are 100 Gbps.
• 100m—Links are 100 Mbps.

Configuring SONET/SDH Interface Speed

To configure the speed of SONET/SDH interfaces in concatenated mode:

1. In configuration mode, go to the [edit interfaces interface-name] hierarchy level, where the interface-name is so-fpc/pic/port.

   [edit]
   user@host# edit interfaces so-fpc/pic/port

2. Configure interface speed in concatenated mode.

   For example, each port of 4-port OC12 PIC can be configured to be in OC3 or OC12 speed independently when this PIC is in 4xOC12 concatenated mode.
To configure the speed of SONET/SDH interfaces in nonconcatenated mode:

1. In configuration mode, go to the `[edit interfaces interface-name]` hierarchy level, where the `interface-name` is `so-fpc/pic/port`.

   ```
   [edit]
   user@host# edit interfaces so-fpc/pic/port
   ```

2. Configure interface speed in nonconcatenated mode.
   For example, each port of 4-port OC12 PIC can be configured to be in OC3 or OC12 speed independently when this PIC is in 4xOC12 concatenated mode.

   ```
   [edit interfaces so-fpc/pic/port]
   user@host# set speed (oc3 | oc12 | oc48)
   ```

To configure the PIC to operate in channelized (multiplexed) mode:

1. In configuration mode, go to the `[edit chassis fpc slot-number pic pic-number]` hierarchy level.

   ```
   [edit]
   user@host# [edit chassis fpc slot-number pic pic-number]
   ```

2. Configure the `no-concatenate` option.

   ```
   [edit interfaces so-fpc/pic/port]
   user@host# set no-concatenate
   ```

**NOTE:** On SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP, you cannot set the interface speed at the `[edit interfaces]` hierarchy level. To enable the speed on these MICs, you need to set the port speed at the `[edit chassis fpc slot-number pic pic-number port port-number]` hierarchy level.

For more information about using the non-concatenate statement, see the Junos OS Administration Library.

Release History Table

<table>
<thead>
<tr>
<th>Release</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>14.2</td>
<td>Starting with Junos OS Release 14.2 the auto-10m-100m option allows the fixed tri-speed port to auto-negotiate with ports limited by 100m or 10m maximum speed. This option must be enabled only for Tri-rate MPC port, that is, 3D 40x 1GE (LAN) RJ45 MIC on MX platform. This option does not support other MICs on MX platform.</td>
</tr>
<tr>
<td>14.2</td>
<td>Starting with Junos OS Release 14.2, aggregated Ethernet supports mixed link speeds on PTX Series Packet Transport Routers.</td>
</tr>
<tr>
<td>14.1</td>
<td>Starting with Junos OS Release 14.1R1 and 14.2, support for mixed rates on aggregated Ethernet bundles is extended to MX240, MX480, MX960, MX2010, and MX2020 routers.</td>
</tr>
<tr>
<td>13.2</td>
<td>Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers.</td>
</tr>
<tr>
<td>13.2</td>
<td>Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP.</td>
</tr>
<tr>
<td>11.4</td>
<td>Starting with Junos OS Release 11.4, half-duplex mode is not supported on Tri-Rate Ethernet copper interfaces. When you include the speed statement, you must include the link-mode full-duplex statement at the same hierarchy level.</td>
</tr>
</tbody>
</table>

Related Documentation

Configuring the Link Characteristics

By default, the router’s management Ethernet interface, fxp0 or em0, autonegotiates whether to operate in full-duplex or half-duplex mode. Fast Ethernet interfaces can operate in either full-duplex or half-duplex mode, and all other interfaces can operate only in full-duplex mode. For Gigabit Ethernet, the link partner must also be set to full duplex.

---

**NOTE:** When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled.

---

**NOTE:** When you manually configure Fast Ethernet interfaces on the M Series and T Series routers, link mode and speed must both be configured. If both these values are not configured, the router uses autonegotiation for the link and ignores the user-configured settings.
NOTE: When the Fast Ethernet interface on Juniper Networks routers with autonegotiation enabled interoperates with a device configured to operate in half-duplex mode (autonegotiation disabled), the interface defaults to half-duplex mode after the PIC is taken offline and brought back online. This results in packet loss and cyclic redundancy check (CRC) errors.

To explicitly configure an Ethernet interface to operate in either full-duplex or half-duplex mode, include the link-mode statement at the [edit interfaces interface-name] hierarchy level:

```plaintext
[edit interfaces interface-name]
link-mode (full-duplex | half-duplex);
```

### Interface Alias Names Overview

You can configure a textual description of a logical unit on a physical interface to be the alias of an interface name. Interface aliasing is supported only at the unit level. If you configure an alias name, the alias name is displayed instead of the interface name in the output of all show, show interfaces, and other operational mode commands. In Junos OS Release 12.3R8 and later, display of the alias can be suppressed in favor of the actual interface name by using the display no-interface-alias parameter along with the show command. Configuring an alias for a logical unit of an interface has no effect on how the interface on the router or switch operates.

When you configure the alias name of an interface, the CLI saves the alias name as the value of the interface-name variable in the configuration database. To enable backward compatibility with Junos OS releases in which the support for interface aliases is not available, when the Junos OS processes query the configuration database for the interface-name variable, the actual, exact value of the interface-name variable is returned instead of the alias name for system operations and computations.

This capability to define interface alias names for physical and logical interfaces is useful in a Junos Node Unifier (JNU) environment that contains a Juniper Networks MX Series 5G Universal Routing Platform as a controller and EX Series Ethernet switches, QFX Series devices, and ACX Series Universal Metro Routers as satellite devices. The following are the benefits of configuring an alias name, which enables a meaningful, single, and easily identifiable name to be allocated to an interface:

- You can group physical interfaces as one aggregated interface (link aggregation group or LAG bundle) and name that bundle as a satellite connection interface (for example, sat1).
- You can select a logical interface as a member of the LAG bundle or the entire LAG, and name that interface to represent a satellite device port or a service instance (for example, ge-0/0/1).
- You can combine the satellite name and the interface name aliases to wholly represent the satellite port name (for example, sat1:ge-0/0/1 or ge-sat1/0/0/1 or ge-1/0/0/1)
the most easily distinguishable format that denotes a combination of port and satellite parts of the name.

To specify an interface alias, you can use the alias statement at the [edit interfaces interface-name unit logical-unit-number] and [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number] hierarchy levels.

NOTE: In Juniper Networks M Series Multiservice Edge Routers, if the same alias name is configured on more than one logical interface, the router displays an error message and commit fails.

Example: Adding an Interface Alias Name

This example shows how to add an alias to the logical unit of an interface. Using an alias to identify interfaces as they appear in the output for operational commands can allow for more meaningful naming conventions and easier identification.

- Requirements on page 108
- Overview on page 108
- Configuration on page 108
- Verification on page 111

Requirements

This example uses the following hardware and software components:

- One MX Series router that acts as a controller
- One EX4200 switch that acts as a satellite device
- Junos OS Release 13.3R1 or later

Overview

You can create an alias for each logical unit on a physical interface. The descriptive text you define for the alias is displayed in the output of the show interfaces commands. In Junos OS Release 12.3R8 and later, display of the alias can be suppressed in favor of the actual interface name by using the display no-interface-alias parameter along with the show command. The alias configured for a logical unit of an interface has no effect on how the interface on the router or switch operates — it is only a cosmetic label.

Configuration

Consider a scenario in which alias names are configured on the interfaces of a JNU controller that are connected to a satellite, sat1, in the downlink direction in the JNU
management network by using two links. The alias names enable effective, streamlined identification of these interfaces in the operational mode commands that are run on the controller and satellites.

- Configuring Alias Names for the Controller Interfaces on page 109
- Results on page 110

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
set interfaces ae0 unit 0 alias "controller-sat1-downlink1"
set interfaces ae0.0 family inet address 10.0.0.1/24
set interfaces ae1 unit 0 alias "controller-sat1-downlink1"
set interfaces ae0.0 family inet address 192.0.2.128/25
set interfaces ge-0/0/0 vlan-tagging
set interfaces ge-0/0/0 unit 0 alias "ge-to-corp-gw1"
set interfaces ge-0/0/0.0 vlan-id 101
set interfaces ge-0/1/0 gigether-options 802.3adae0
set interfaces ge-0/1/1 gigether-options 802.3adae0
set protocols rip group corporate-firewall neighbor ge-to-corp-gw1
```

### Configuring Alias Names for the Controller Interfaces

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see Using the CLI Editor in Configuration Mode in the CLI User Guide.

To add an alias name to the controller interfaces that are used to connect to the satellite devices in the downlink direction:

1. Configure an alias name for the logical unit of an aggregated Ethernet interface that is used to connect to a satellite, sat1, in the downlink direction. Configure inet family and address for the interface.

   ```
   [edit]
   user@host# set interfaces ae0 unit 0 alias "controller-sat1-downlink1"
   user@host# set interfaces ae0.0 family inet address 10.0.0.1/24
   ```

2. Configure an alias name for the logical unit of another aggregated Ethernet interface that is used to connect to the same satellite, sat1, in downlink direction. Configure INET family and address for the interface.

   ```
   [edit]
   user@host# set interfaces ae0 unit 1 alias "controller-sat1-downlink2"
   user@host# set interfaces ae0.0 family inet address 10.0.0.3/24
   ```
3. Configure an alias name for the Gigabit Ethernet interface on the controller and configure its parameters.

```
[edit]
user@host# set interfaces ge-0/0/0 vlan-tagging
user@host# set interfaces ge-0/0/0 unit 0 alias "ge-to-corp-gw1"
user@host# set interfaces ge-0/0/0/0 vlan-id 101
user@host# set interfaces ge-0/0/0/0 family inet address 1.1.1.1/23
```

4. Configure Gigabit Ethernet interfaces to be member links of an ae- logical interface.

```
[edit]
user@host# set interfaces ge-0/1/0 gigether-options 802.3ad ae0
user@host# set interfaces ge-0/1/1 gigether-options 802.3ad ae0
```

5. Configure RIP in the network between the controller and the firewall gateway.

```
[edit]
user@host# set protocols rip group corporate-firewall neighbor ge-to-corp-gw1
```

**Results**

In configuration mode, confirm your configuration by entering the `show` command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
interfaces {
    ae0 {
        unit 0 {
            alias "controller-sat1-downlink1";
            family inet {
                address 10.0.0.1/24;
            }
        }
        unit 1 {
            alias "controller-sat1-downlink2";
            family inet {
                address 10.0.0.3/24;
            }
        }
    }
    ge-0/0/0 {
        vlan-tagging;
        unit 0 {
            alias "ge-to-corp-gw1";
            vlan-id 101;
            family inet {
                address 1.1.1.1/23;
            }
        }
    }
}
```
After you have confirmed that the interfaces are configured, enter the **commit** command in configuration mode.

**NOTE:** In Juniper Networks M Series Multiservice Edge Routers, if the same alias name is configured on more than one logical interface, the router displays an error message and commit fails.

### Verification

To verify that the alias name is displayed instead of the interface name, perform these steps:

1. Verifying the Configuration of the Alias Name for the Controller Interfaces on page 111

#### Verifying the Configuration of the Alias Name for the Controller Interfaces

**Purpose**

Verify that the alias name is displayed instead of the interface name.

**Action**

Display information about all RIP neighbors.

```
user@router> show rip neighbor
```

<table>
<thead>
<tr>
<th>Neighbor</th>
<th>Local State</th>
<th>Source Address</th>
<th>Destination Address</th>
<th>Send Mode</th>
<th>Receive Mode</th>
<th>In Met</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-to-corp-gw1</td>
<td>DN (null)</td>
<td>255.255.255.255 mcast</td>
<td>both</td>
<td>1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Meaning**

The output displays the details of the benchmarking test that was performed. For more information about the **show rip neighbor** operational command, see **show rip neighbor** in the CLI Explorer.
Clock Source Overview

For both the router and interfaces, the clock source can be an external clock that is received on the interface or the router’s internal Stratum 3 clock.

For example, interface A can transmit on interface A’s received clock (external, loop timing) or the Stratum 3 clock (internal, line timing, or normal timing). Interface A cannot use a clock from any other source. For interfaces such as SONET/SDH that can use different clock sources, you can configure the source of the transmit clock on each interface.

The clock source resides on the System Control Board (SCB) for M40 routers, the System and Switch Board (SSB) for M20 routers, the Control Board (CB) for M120 routers, and the Miscellaneous Control Subsystem (MCS) for M40e and M160 routers. M7i and M10i routers have a clock source on the Compact Forwarding Engine Board (CFEB) and Enhanced Compact Forwarding Engine Board (CFEB-E).

For T Series and MX Series, the clock source internal Stratum 3 clock resides on the SONET Clock Generator and Switch Control Board (SCB) respectively. By default, the 19.44-MHz Stratum 3 reference clock generates the clock signal for all serial PICs (SONET/SDH) and Plesiochronous Digital Hierarchy (PDH) PICs. PDH PICs include DS3, E3, T1, and E1 PICs.

NOTE: M7i and M10i routers do not support external clocking of SONET interfaces.

For information about clocking on channelized interfaces, see Channelized IQ and IQE Interfaces Properties. Also see Configuring the Clock Source on SONET/SDH Interfaces and Configuring the Channelized T3 Loop Timing.

For information about configuring an external synchronization interface that can be used to synchronize the internal Stratum 3 clock to an external source on the M40e, M120, M320, routers and T Series routers, see Junos OS Administration Library, Configuring Junos OS to Support an External Clock Synchronization Interface for M Series, MX Series, and T Series Routers.

For information about configuring Synchronous Ethernet on MX 80, MX240, MX480, and MX960 Universal Routing Platforms, see Junos OS Administration Library, Synchronous Ethernet Overview and Configuring Clock Synchronization Interface on MX Series Routers.

Related Documentation
- Interface Alias Names Overview on page 107
- alias on page 418
- Configuring an External Synchronization Interface
- Configuring the Clock Source on page 113
**Configuring the Clock Source**

For both the router and interfaces, the clock source can be an external clock that is received on the interface or the router’s internal Stratum 3 clock.

To set the clock source as external or internal:

1. In configuration mode, go to the `edit interfaces interface-name` hierarchy level:

   ```
   [edit]
   user@host# edit interfaces interface-name
   ```

2. Configure the `clocking` option as external or internal.

   ```
   [edit interfaces interface-name]
   user@host# set clocking (external | internal)
   ```

---

**NOTE:** M7i and M10i routers do not support external clocking of SONET interfaces.

**NOTE:** On Channelized SONET/SDH PICs, if you set the parent (or the master) controller clock to external, then you must set the child controller clocks to the default value—that is, internal.

For example, on the Channelized STM1 PIC, if the clock on the Channelized STM1 interface (which is the master controller) is set to external, then you must not configure the CE1 interface (which is the child controller) clock to external. Instead you must configure the CE1 interface clock to internal.

For information about clocking on channelized interfaces, see *Channelized IQ and IQE Interfaces Properties*. Also see *Configuring the Clock Source on SONET/SDH Interfaces* and *Configuring the Channelized T3 Loop Timing*.

For information about configuring an external synchronization interface that can be used to synchronize the internal Stratum 3 clock to an external source on the M40e, M120, and M320 routers and on the T Series routers, see *Junos OS Administration Library, Configuring Junos OS to Support an External Clock Synchronization Interface for M Series, MX Series, and T Series Routers*.
For information about configuring Synchronous Ethernet on MX80, MX240, MX480, and MX960 Universal Routing Platforms, see Junos OS Administration Library, Synchronous Ethernet Overview and Configuring Clock Synchronization Interface on MX Series Routers.

**Configuring Interface Encapsulation on Physical Interfaces**

- Understanding Interface Encapsulation on Physical Interfaces on page 114
- Encapsulation Capabilities of Physical Interfaces on page 114
- Configuring the Encapsulation on a Physical Interface on page 115
- Displaying the Encapsulation on a Physical SONET/SDH Interface on page 116

**Understanding Interface Encapsulation on Physical Interfaces**

Point-to-Point Protocol (PPP) encapsulation is the default encapsulation type for physical interfaces. You need not configure encapsulation for any physical interfaces that support PPP encapsulation. If you do not configure encapsulation, PPP is used by default.

For physical interfaces that do not support PPP encapsulation, you must configure an encapsulation to use for packets transmitted on the interface. You can optionally configure an encapsulation on a logical interface, which is the encapsulation used within certain packet types.

**Encapsulation Capabilities of Physical Interfaces**

When you configure a point-to-point encapsulation (such as PPP or Cisco HDLC) on a physical interface, the physical interface can have only one logical interface (that is, only one `unit` statement) associated with it. When you configure a multipoint encapsulation (such as Frame Relay), the physical interface can have multiple logical units, and the units can be either point-to-point or multipoint.

Ethernet CCC encapsulation for Ethernet interfaces with standard TPID tagging requires that the physical interface have only a single logical interface. Ethernet interfaces in VLAN mode can have multiple logical interfaces.
For Ethernet interfaces in VLAN mode, VLAN IDs are applicable as follows:

- VLAN ID 0 is reserved for tagging the priority of frames.
- For encapsulation type `vlan-ccc`, VLAN IDs 1 through 511 are reserved for normal VLANs. VLAN IDs 512 and above are reserved for VLAN CCCs.
- For encapsulation type `vlan-vpls`, VLAN IDs 1 through 511 are reserved for normal VLANs, and VLAN IDs 512 through 4094 are reserved for VPLS VLANs. For 4-port Fast Ethernet interfaces, you can use VLAN IDs 512 through 1024 for VPLS VLANs.
- For Gigabit Ethernet interfaces and Gigabit Ethernet IQ and IQE PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), you can configure flexible Ethernet services encapsulation on the physical interface. For interfaces with `flexible-ethernet-services` encapsulation, all VLAN IDs are valid. VLAN IDs from 1 through 511 are not reserved.
- For encapsulation types `extended-vlan-ccc` and `extended-vlan-vpls`, all VLAN IDs are valid.

The upper limits for configurable VLAN IDs vary by interface type.

When you configure a TCC encapsulation, some modifications are needed to handle VPN connections over unlike Layer 2 and Layer 2.5 links and terminate the Layer 2 and Layer 2.5 protocol locally.

The router performs the following media-specific changes:

- PPP TCC—Both Link Control Protocol (LCP) and Network Control Protocol (NCP) are terminated on the router. Internet Protocol Control Protocol (IPCP) IP address negotiation is not supported. The Junos OS strips all PPP encapsulation data from incoming frames before forwarding them. For output, the next hop is changed to PPP encapsulation.
- Cisco HDLC TCC—Keepalive processing is terminated on the router. The Junos OS strips all Cisco HDLC encapsulation data from incoming frames before forwarding them. For output, the next hop is changed to Cisco HDLC encapsulation.
- Frame Relay TCC—All Local Management Interface (LMI) processing is terminated on the router. The Junos OS strips all Frame Relay encapsulation data from incoming frames before forwarding them. For output, the next hop is changed to Frame Relay encapsulation.
- ATM—Operation, Administration, and Maintenance (OAM) and Interim Local Management Interface (ILMI) processing is terminated at the router. Cell relay is not supported. The Junos OS strips all ATM encapsulation data from incoming frames before forwarding them. For output, the next hop is changed to ATM encapsulation.

### Configuring the Encapsulation on a Physical Interface

By default, PPP is the encapsulation type for physical interfaces. To configure the encapsulation on a physical interface, include the encapsulation statement at the `[edit interfaces interface-name]` hierarchy level:
To configure encapsulation on a physical interface:

1. In configuration mode, go to the `[edit interfaces interface-name]` hierarchy level.
   ```
   [edit]
   user@host# set interfaces so-fpc/pic/port
   ```

2. Configure the encapsulation type as described in `encapsulation`.
   ```
   [edit interfaces mo-fpc/pic/port]
   user@host# set encapsulation encapsulation-type
   ```

   **NOTE:**
   - When you configure a point-to-point encapsulation (such as PPP or Cisco HDLC) on a physical interface, the physical interface can have only one logical interface (that is, only one unit statement) associated with it. When you configure a multipoint encapsulation (such as Frame Relay), the physical interface can have multiple logical units, and the units can be either point-to-point or multipoint.
   - When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.
   - When `vlan-vpls` encapsulation is set at the physical interface level, commit check will validate that there should not be any inet family configured within it.

### Displaying the Encapsulation on a Physical SONET/SDH Interface

**Purpose**
To display the configured encapsulation and its associated set options on a physical interface when the following are set at the `[edit interfaces interface-name]` hierarchy level:

- `interface-name`—so-7/0/0
- Encapsulation—`ppp`
- Unit—0
- Family—`inet`
- Address—192.168.1.113/32
- Destination—192.168.1.114
- Family—`iso` and `mpls`

**Action**
Run the `show` command at the `[edit interfaces interface-name]` hierarchy level.

```
[edit interfaces so-7/0/0]
user@host# show encapsulation ppp:
```
unit 0 {
    point-to-point;
    family inet {
        address 192.168.1.113/32 {
            destination 192.168.1.114;
        }
    }
    family iso;
    family mpls;
}

**Meaning**
The configured encapsulation and its associated set options are displayed as expected. Note that the second set of two `family` statements allow IS-IS and MPLS to run on the interface.

**Related Documentation**
- encapsulation on page 571
- Configuring the Media MTU on page 99

## Configuring Interface Encapsulation on PTX Series Packet Transport Routers

This topic describes how to configure interface encapsulation on PTX Series Packet Transport Routers. Use the `flexible-ethernet-services` configuration statement to configure different encapsulation for different logical interfaces under a physical interface. With flexible Ethernet services encapsulation, you can configure each logical interface encapsulation without range restrictions for VLAN IDs.

Supported encapsulations for physical interfaces include:
- `flexible-ethernet-services`
- `ethernet-ccc`
- `ethernet-tcc`

Supported encapsulations for logical interfaces include:
- `ethernet`
- `vlan-ccc`
- `vlan-tcc`

---

**NOTE:** PTX Series Packet Transport Routers do not support extended-vlan-cc and extended-vlan-tcc encapsulation on logical interfaces. Instead, you can configure a tag protocol ID (TPID) value of 0x9100 to achieve the same results.
To configure flexible Ethernet services encapsulation, include the `encapsulation flexible-ethernet-services` statement at the `[edit interfaces et-fpc/pic/port]` hierarchy level. For example:

```conf
interfaces {
  et-fpc/pic/port {
    vlan-tagging;
    encapsulation flexible-ethernet-services;
    unit 0 {
      vlan-id 1000;
      family inet {
        address 11.0.0.20/24;
      }
    }
    unit 1 {
      encapsulation vlan-ccc;
      vlan-id 1010;
    }
    unit 2 {
      encapsulation vlan-tcc;
      vlan-id 1020;
      family tcc {
        proxy {
          inet-address 11.0.2.160;
        }
        remote {
          inet-address 11.0.2.10;
        }
      }
    }
  }
}
```

Related Documentation

- Configuring Interface Encapsulation on Physical Interfaces on page 114

**Configuring Keepalives**

By default, physical interfaces configured with Cisco HDLC or PPP encapsulation send keepalive packets at 10-second intervals. The Frame Relay term for keepalives is LMI packets; the Junos OS supports both ANSI T1.617 Annex D LMIs and ITU Q933 Annex A LMIs. On ATM networks, OAM cells perform the same function. You configure OAM cells at the logical interface level; for more information, see Defining the ATM OAM F5 Loopback Cell Period.

To disable the sending of keepalives:

1. In configuration mode, go to the `[edit interfaces interface-name]` hierarchy level.

   ```conf
   [edit]
   user@host# edit interfaces interface-name
   ```
2. Include the `no-keepalives` statement at the `[edit interfaces interface-name]` hierarchy level.

   [edit interfaces interface-name]
   no-keepalives;

To disable the sending of keepalives on a physical interface configured with Cisco HDLC encapsulation for a translational cross-connection:

1. In configuration mode, go to the `[edit interfaces interface-name]` hierarchy level.

   [edit ]
   user@host# edit interfaces interface-name

2. Include the `no-keepalives` statement with the `encapsulation cisco-hdlc-tcc` statement at the `[edit interfaces interface-name]` hierarchy level.

   [edit interfaces interface-name]
   encapsulation cisco-hdlc-tcc;
   no-keepalives;

To disable the sending of keepalives on a physical interface configured with PPP encapsulation for a translational cross-connection:

1. In configuration mode, go to the `[edit interfaces interface-name]` hierarchy level.

   [edit ]
   user@host# edit interfaces interface-name

2. Include the `no-keepalives` statement with the `encapsulation ppp-tcc` statement at the `[edit interfaces interface-name]` hierarchy level.

   [edit interfaces interface-name]
   encapsulation ppp-tcc;
   no-keepalives;

For more information about translation cross-connections, see Circuit and Translational Cross-Connects Overview.

When you configure PPP over ATM or Multilink PPP over ATM encapsulation, you can enable or disable keepalives on the logical interface. For more information, see Configuring PPP over ATM2 Encapsulation.

To explicitly enable the sending of keepalives:

1. In configuration mode, go to the `[edit interfaces interface-name]` hierarchy level.

   [edit ]
user@host# edit interfaces interface-name

2. Include the `keepalives` statement at the `[edit interfaces interface-name]` hierarchy level.

   ```
   [edit interfaces interface-name]
   keepalives;
   ```

To change one or more of the default keepalive values:

1. In configuration mode, go to the `[edit interfaces interface-name]` hierarchy level.

   ```
   [edit ]
   user@host# edit interfaces interface-name
   ```

2. Include the `keepalives` statement with the appropriate option as `interval seconds`, `down-count number`, and the `up-count number`:

   ```
   [edit interfaces interface-name]
   keepalives;
   keepalives <interval seconds> <down-count number> <up-count number>;
   ```

On interfaces configured with Cisco HDLC or PPP encapsulation, you can include the following three keepalive statements; note that Frame Relay encapsulation is not affected by these statements:

- **interval seconds**—The time in seconds between successive keepalive requests. The range is from 1 second through 32767 seconds, with a default of 10 seconds.

- **down-count number**—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is from 1 through 255, with a default of 3.

- **up-count number**—The number of keepalive packets a destination must receive to change a link’s status from down to up. The range is from 1 through 255, with a default of 1.

---

**CAUTION:** If interface keepalives are configured on an interface that does not support the `keepalives` configuration statement (for example, 10-Gigabit Ethernet), the link layer may go down when the PIC is restarted. Avoid configuring the keepalives on interfaces that do not support the `keepalives` configuration statement.

---

For information about Frame Relay keepalive settings, see Configuring Frame Relay Keepalives.
On MX Series routers with Modular Port Concentrators/Modular Interface Cards (MPCs/MICs), the Packet Forwarding Engine on an MPC/MIC processes and responds to Link Control Protocol (LCP) Echo-Request keepalive packets that the PPP subscriber (client) initiates and sends to the router. The mechanism by which LCP Echo-Request packets are processed by the Packet Forwarding Engine instead of by the Routing Engine is referred to as **PPP fast keepalive**. For more information about how PPP fast keepalive works on an MX Series router with MPCs/MICs, see the *Junos OS Subscriber Access Configuration Guide*.

### Configuring the PPP Challenge Handshake Authentication Protocol

- *PPP Challenge Handshake Authentication Protocol on page 121*
- *Configuring the PPP Challenge Handshake Authentication Protocol on page 121*
- *Displaying the Configured PPP Challenge Handshake Authentication Protocol on page 123*

#### PPP Challenge Handshake Authentication Protocol

For interfaces with PPP encapsulation, you can configure interfaces to support the PPP Challenge Handshake Authentication Protocol (CHAP), as defined in RFC 1994, **PPP Challenge Handshake Authentication Protocol (CHAP)**. When you enable CHAP on an interface, the interface can authenticate its peer and can be authenticated by its peer. By default, PPP CHAP is disabled. If CHAP is not explicitly enabled, the interface makes no CHAP challenges and denies all incoming CHAP challenges. To enable CHAP, you must create an access profile, and you must configure the interfaces to use CHAP.

#### Configuring the PPP Challenge Handshake Authentication Protocol

When you configure an interface to use CHAP, you must assign an access profile to the interface. When an interface receives CHAP challenges and responses, the access profile in the packet is used to look up the shared secret, as defined in RFC 1994. If no matching access profile is found for the CHAP challenge that was received by the interface, the optionally configured default CHAP secret is used. The default CHAP secret is useful if the CHAP name of the peer is unknown, or if the CHAP name changes during PPP link negotiation.
To enable CHAP, you must create an access profile, and you must configure the interfaces to use PAP. For more information on how to configure access profile, see Configuring Access Profiles for L2TP or PPP Parameters.

To configure the PPP challenge handshake authentication protocol, on each physical interface with PPP encapsulation, perform the following steps.

1. To assign an access profile to an interface, include the `access-profile` statement at the `[edit interfaces interface-name ppp-options chap]` hierarchy level.

```
[edit interfaces interface-name ppp-options chap]
user@host# set access-profile name
```

**NOTE:** You must include the `access-profile` statement when you configure the CHAP authentication method. If an interface receives a CHAP challenge or response from a peer that is not in the applied access profile, the link is immediately dropped unless a default CHAP secret has been configured.

2. The default CHAP secret is used when no matching CHAP access profile exists, or if the CHAP name changes during PPP link negotiation. To configure a default CHAP secret for an interface, include the `default-chap-secret` statement at the `[edit interfaces interface-name ppp-options chap]` hierarchy level.

```
[edit interfaces interface-name ppp-options chap]
user@host# set default-chap-secret name
```

3. To configure the name the interface uses in CHAP challenge and response packets, include the `local-name` statement at the `[edit interfaces interface-name ppp-options chap]` hierarchy level:

```
[edit interfaces interface-name ppp-options chap]
user@host# set local-name name
```

**NOTE:**
- The local name is any string from 1 through 32 characters in length, starting with an alphanumeric or underscore character, and including only the following characters:
  
  `a-zA-Z 0-9 % @ / \ _ -`

- By default, when CHAP is enabled on an interface, the interface uses the router's system hostname as the name sent in CHAP challenge and response packets.
4. You can configure the interface not to challenge its peer, and only respond when challenged. To configure the interface not to challenge its peer, include the `passive` statement at the `[edit interfaces interface-name ppp-options chap]` hierarchy level:

```bash
[edit interfaces interface-name ppp-options chap]
user@host# set passive;
```

**NOTE:** By default, when CHAP is enabled on an interface, the interface always challenges its peer and responds to challenges from its peer.

**See Also**
- Configuring the PPP Authentication Protocol

### Displaying the Configured PPP Challenge Handshake Authentication Protocol

**Purpose**
To display the configured PPP CHAP at the `[edit access]` and `[edit interfaces]` hierarchy levels.

- Access profile—`pe-A-ppp-clients`
- default CHAP secret data—"$ABC123"
- hostname for the CHAP challenge and response packets—"pe-A-so-1/1/1"
- Interface—so-1/1/2

**Action**
- Run the `show` command at the `[edit access]` hierarchy level.

```bash
profile pe-A-ppp-clients;
client cpe-1 chap-secret "$ABC123";
# SECRET-DATA
[edit interfaces so-1/2/0]
encapsulation ppp;
ppp-options {
  chap {
    access-profile pe-A-ppp-clients;
    default-chap-secret "$ABC123";
    local-name "pe-A-so-1/1/1";
  }
}
```

- Run the `show` command at the `[edit interfaces s0-1/1/2]` hierarchy level.

```bash
ppp-options {
  chap {
    access-profile pe-A-ppp-clients;
    default-chap-secret "$ABC123";
    local-name "pe-A-so-1/1/2";
  }
}
```
Meaning  The configured CHAP and its associated set options are displayed as expected.

Configuring the PPP Password Authentication Protocol On a Physical Interface

- Understanding PPP Password Authentication Protocol on page 124
- Configuring the PPP Password Authentication Protocol On a Physical Interface on page 124
- Configuring the PPP Password Authentication Protocol On a Logical Interface on page 126

Understanding PPP Password Authentication Protocol

For interfaces with PPP encapsulation, you can configure interfaces to support the Password Authentication Protocol (PAP), as defined in RFC 1334, PAP Authentication Protocols. If authentication is configured, the PPP link negotiates using CHAP or PAP protocol for authentication during the Link Control Protocol (LCP) negotiation phase. PAP is only performed after the link establishment phase (LCP up) portion of the authentication phase.

During authentication, the PPP link sends a PAP authentication-request packet to the peer with an ID and password. The authentication-request packet is sent every 2 seconds, similar to the CHAP challenge, until a response is received (acknowledgment packet, nonacknowledgment packet). If an acknowledgment packet is received, the PPP link transitions to the next state, the network phase. If a nonacknowledgment packet is received, an LCP terminate request is sent, and the PPP link goes back to the link establishment phase. If no response is received, and an optional retry counter is set to true, a new request acknowledgment packet is resent. If the retry counter expires, the PPP link transitions to the LCP negotiate phrase.

You can configure the PPP link with PAP in passive mode. By default, when PAP is enabled on an interface, the interface expects authenticate-request packets from the peer. However, the interface can be configured to send authentication request packets to the peer by configuring PAP to operate in passive mode. In PAP passive mode, the interface sends the authenticate-request packets to the peer only if the interface receives the PAP option from the peer during LCP negotiation—in passive mode, the interface does not authenticate the peer.

Configuring the PPP Password Authentication Protocol On a Physical Interface

When you configure an interface to use PAP, you must assign an access profile to the interface. When an interface receives PAP authentication requests, the access profile in the packet is used to look up the password.

To enable PAP, you must create an access profile, and you must configure the interfaces to use PAP. For more information on how to configure access profile, see Configuring Access Profiles for L2TP or PPP Parameters.
To configure the PPP password authentication protocol, on each physical interface with PPP encapsulation, perform the following steps.

1. To assign an access profile to an interface, include the `access-profile` statement at the `[edit interfaces interface-name ppp-options pap]` hierarchy level.

```
[edit interfaces interface-name ppp-options pap]
user@host# set access-profile name
```

2. To configure the name the interface uses in PAP request and response packets, include the `local-name` statement at the `[edit interfaces interface-name ppp-options pap]` hierarchy level:

```
[edit interfaces interface-name ppp-options pap]
user@host# set local-name name
```

3. You need to configure the password to be used for authentication. To configure the host password for sending PAP requests, include the `local-password` statement at the `[edit interfaces interface-name ppp-options pap]` hierarchy level:

```
[edit interfaces interface-name ppp-options pap]
user@host# set local-password password
```

   **NOTE:** By default, when PAP is enabled on an interface, the interface uses the router’s system hostname as the name sent in PAP request and response packets.

4. To configure the interface to authenticate with PAP in passive mode, include the `passive` statement at the `[edit interfaces interface-name ppp-options pap]` hierarchy level:

```
[edit interfaces interface-name ppp-options pap]
user@host# set passive
```

   **NOTE:** By default, when PAP is enabled on an interface, the interface expects authenticate-request packets from the peer. However, the interface can be configured to send authentication request packets to the peer by configuring PAP to operate in passive mode. In PAP passive mode, the interface sends the authenticate-request packets to the peer only if the interface receives the PAP option from the peer during LCP negotiation—in passive mode, the interface does not authenticate the peer.

**See Also**  
- *Configuring the PPP Authentication Protocol*
Configuring the PPP Password Authentication Protocol On a Logical Interface

When you configure an interface to use PAP, you must assign an access profile to the interface. When an interface receives PAP authentication requests, the access profile in the packet is used to look up the password. If no matching access profile is found for the PAP authentication request that was received by the interface, the optionally configured default PAP password is used.

To configure the PPP password authentication protocol, on each logical interface with PPP encapsulation, perform the following steps.

1. To configure the default PAP password, include the `pap-password` statement at the
   `[edit interfaces interface-name unit logical-unit-number ppp-options pap]` hierarchy level:

   ```
   [edit interfaces interface-name unit logical-unit-number ppp-options pap]
   user@host# set default-pap-password password
   ```

2. To configure the name the interface uses in PAP request and response packets, include
   the `local-name` statement at the `[edit interfaces interface-name unit logical-unit-number
   ppp-options pap]` hierarchy level:

   ```
   [edit interfaces interface-name ppp-options pap]
   user@host# set local-name name
   ```

3. You need to configure the password to be used for authentication. To configure the
   host password for sending PAP requests, include the `local-password` statement at
   the `[edit interfaces interface-name ppp-options pap]` hierarchy level:

   ```
   [edit interfaces interface-name unit logical-unit-number ppp-options pap]
   user@host# set local-password password
   ```

   **NOTE:** By default, when PAP is enabled on an interface, the interface uses
   the router's system hostname as the name sent in PAP request and
   response packets.

4. To configure the interface to authenticate with PAP in passive mode, include the
   `passive` statement at the `[edit interfaces interface-name unit logical-unit-number
   ppp-options pap]` hierarchy level:

   ```
   [edit interfaces interface-name unit logical-unit-number ppp-options pap]
   user@host# set passive
   ```
NOTE: By default, when PAP is enabled on an interface, the interface expects authenticate-request packets from the peer. However, the interface can be configured to send authentication request packets to the peer by configuring PAP to operate in passive mode. In PAP passive mode, the interface sends the authenticate-request packets to the peer only if the interface receives the PAP option from the peer during LCP negotiation—in passive mode, the interface does not authenticate the peer.

PPP Encapsulation on ACX Series Routers

You can configure Point-to-Point Protocol (PPP) encapsulation on physical interfaces on ACX Series routers. PPP provides a standard method for transporting multiprotocol datagrams over a point-to-point link. PPP uses the High-Speed Data Link Control (HDLC) protocol for its physical interface and provides a packet-oriented interface for the network-layer protocols.

PPP is supported on the following MICs on ACX Series routers:

• On ACX1000 routers with 8-port built-in T1/E1 TDM MICs.
• On ACX2000, ACX2100, ACX2200, and ACX4000 routers with 16-port built-in T1/E1 TDM MICs.
• On ACX4000 routers with 16-Port Channelized E1/T1 Circuit Emulation MICs.

Starting with Release 12.3X54, you can configure Point-to-Point Protocol (PPP) encapsulation on physical interfaces on Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP on ACX4000 Series routers.

On ACX Series routers, E1, T1, and NxDS0 interfaces support PPP encapsulation.

PPP is the default encapsulation type for physical interfaces. You need not configure encapsulation for any physical interfaces that support PPP encapsulation. If you do not configure encapsulation, PPP is used by default. For physical interfaces that do not support PPP encapsulation, you must configure an encapsulation to use for packets transmitted on the interface.

To configure the encapsulation on a physical interface, include the encapsulation ppp statement at the [edit interfaces interface-name] hierarchy level.

IP class of service (CoS) is not supported on PPP interfaces. All the traffic is sent to the best effort queue (queue 0) and CoS code points are not processed. Also, fixed classifiers are not supported. Circuit cross-connect (CCC) version of PPP (ppp-ccc option) and translational cross-connect (TCC) version of PPP (ppp-tcc option) are not supported for configuration with the encapsulation statement.
PPP is supported only for IPv4 networks. If you configure PPP encapsulation, you can configure an INET family by including the family inet statement at the [edit interfaces interface-name unit logical-unit-number] hierarchy level. MPLS family is not supported on logical interfaces if you configured PPP encapsulation. On interfaces with PPP encapsulation, configure PPP-specific interface properties by including the ppp-options statement at the [edit interfaces interface-name] hierarchy level. For interfaces with PPP encapsulation, you can configure interfaces to support the PPP Challenge Handshake Authentication Protocol (CHAP) and Password Authentication Protocol (PAP).

For full T1/E1 interfaces on which PPP encapsulation needs to be enabled, create the T1/E1 interfaces out of channelized T1/E1 interfaces (CT1/CE1) by including the framing statement at the [edit chassis fpc fpc-slot pic pic-slot] hierarchy level:

```
[edit chassis fpc fpc-slot pic pic-slot]
user@host# set framing (t1 | e1);
```

Configure a CT1 port down to a T1 channel. On the CT1 interface, set the no-partition option and then set the interface type as T1.

```
[edit interfaces ct1-fpc-slot/mic-slot/port-number]
user@host# set no-partition interface-type t1
```

Configure a CE1 port down to an E1 channel. On the CE1 interface, set the no-partition option and then set the interface type as E1.

```
[edit interfaces ce1-fpc-slot/mic-slot/port-number]
user@host# set no-partition interface-type e1
```

For NxDS0 interfaces on which PPP encapsulation needs to be enabled, partition the CE1 and CT1 interfaces by including the cel-x/y/z partition partition-number timeslots interface-type ds and ct1-x/y/z partition partition-number timeslots interface-type ds statements at the [edit interfaces interface-name] hierarchy level.

The following operational mode commands can be used to view PPP configuration settings and statistical details:

- The show ppp address-pool command is used to display PPP address pool information.
- The show ppp interface command is used to display PPP session information for an interface.
- The show ppp statistics command is used to display PPP session statistics.
- The show ppp summary command is used to display summary information about PPP-configured interfaces.
- The show interfaces e1-fpc/pic/port, show interfaces t1-fpc/pic/port, and show interfaces ds-fpc/pic/port commands are used to display the PPP settings of a specific E1, T1, and DS interface, respectively.

Related Documentation

- Configuring Interface Encapsulation on Physical Interfaces in ACX Series on page 129
Configuring Interface Encapsulation on Physical Interfaces in ACX Series

Point-to-Point Protocol (PPP) encapsulation is the default encapsulation type for physical interfaces. You need not configure encapsulation for any physical interfaces that support PPP encapsulation. If you do not configure encapsulation, PPP is used by default. For physical interfaces that do not support PPP encapsulation, you must configure an encapsulation to use for packets transmitted on the interface.

You can optionally configure an encapsulation on a logical interface, which is the encapsulation used within certain packet types. For more information about logical interface encapsulation, see Configuring Interface Encapsulation on Logical Interfaces.

This section contains the following topics:

- Configuring the Encapsulation on a Physical Interface on page 129
- Encapsulation Capabilities on page 131

Configuring the Encapsulation on a Physical Interface

By default, PPP is the encapsulation type for physical interfaces. To configure the encapsulation on a physical interface, include the `encapsulation` statement at the [edit interfaces interface-name] hierarchy level:

```
[edit interfaces interface-name]
```

**NOTE:** ACX Series routers do not support `cisco-hdlc` encapsulation.

The physical interface encapsulation can be one of the following:

- **ATM CCC cell relay**—Connects two remote virtual circuits or ATM physical interfaces with a label-switched path (LSP). Traffic on the circuit is ATM cells.
  
  For more information, see the Junos OS Administration Library.

- **ATM PVC**—Defined in RFC 2684, Multiprotocol Encapsulation over ATM Adaptation Layer 5. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the
ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).

- Ethernet cross-connect—Ethernet interfaces without VLAN tagging can use Ethernet CCC encapsulation. Two related versions are supported:
  - CCC version (ethernet-ccc)—Ethernet interfaces with standard Tag Protocol ID (TPID) tagging can use Ethernet CCC encapsulation. When you use this encapsulation type, you can configure the ccc family only.
  - TCC version (ethernet-tcc)—Similar to CCC, but used for circuits with different media on either side of the connection.

  For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.

- VLAN CCC (vlan-ccc)—Ethernet interfaces with VLAN tagging enabled can use VLAN CCC encapsulation. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the ccc family only.

- Extended VLAN cross-connect—Gigabit Ethernet interfaces with VLAN 802.1Q tagging enabled can use extended VLAN cross-connect encapsulation. (Ethernet interfaces with standard TPID tagging can use VLAN CCC encapsulation.) Two related versions of extended VLAN cross-connect are supported:
  - CCC version (extended-vlan-ccc)—Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the ccc family only.
  - TCC version (extended-vlan-tcc)—Similar to CCC, but used for circuits with different media on either side of the connection.

  For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC and extended VLAN TCC are not supported.

  **NOTE:** In ACX Series routers, VPLS is supported only on ACX5048 and ACX5096 routers.

- Ethernet VPLS (ethernet-vpls)—Ethernet interfaces with VPLS enabled can use Ethernet VPLS encapsulation. For more information about VPLS, see the Junos OS VPNs Library for Routing Devices.

- Ethernet VLAN VPLS (vlan-vpls)—Ethernet interfaces with VLAN tagging and VPLS enabled can use Ethernet VLAN VPLS encapsulation. For more information about VPLS, see the Junos OS VPNs Library for Routing Devices.

- Extended VLAN VPLS (extended-vlan-vpls)—Ethernet interfaces with VLAN 802.1Q tagging and VPLS enabled can use Ethernet Extended VLAN VPLS encapsulation. (Ethernet interfaces with standard TPID tagging can use Ethernet VLAN VPLS encapsulation.) Extended Ethernet VLAN VPLS encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. For more information about VPLS, see the Junos OS VPNs Library for Routing Devices.
Flexible Ethernet services (flexible-ethernet-services)—Gigabit Ethernet and Gigabit Ethernet IQ and IQE PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router) can use flexible Ethernet services encapsulation. Aggregated Ethernet bundles can use this encapsulation type. You use this encapsulation type when you want to configure multiple per-unit Ethernet encapsulations. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

PPP—Defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.

**NOTE:** When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

In ACX Series routers, VPLS is supported only on ACX5048 and ACX5096 routers.

**Encapsulation Capabilities**

When you configure a point-to-point encapsulation (such as PPP or Cisco HDLC) on a physical interface, the physical interface can have only one logical interface (that is, only one `unit` statement) associated with it. When you configure a multipoint encapsulation (such as Frame Relay), the physical interface can have multiple logical units, and the units can be either point-to-point or multipoint.

Ethernet CCC encapsulation for Ethernet interfaces with standard TPID tagging requires that the physical interface have only a single logical interface. Ethernet interfaces in VLAN mode can have multiple logical interfaces.

For Ethernet interfaces in VLAN mode, VLAN IDs are applicable as follows:

- VLAN ID 0 is reserved for tagging the priority of frames.
- For encapsulation type `vlan-ccc`, VLAN IDs 1 through 511 are reserved for normal VLANs. VLAN IDs 512 and above are reserved for VLAN CCCs.

When you configure Ethernet virtual LAN (VLAN) encapsulation on CCC circuits (by using the `encapsulation vlan-ccc` statement at the `[edit interfaces interface-name]` hierarchy level), you can bind a list of VLAN IDs to the interface by using the `vlan-id-list [ vlan-id-numbers ]` statement to configure a CCC for multiple VLANs. Configuring this statement creates a CCC for:

- Each VLAN listed—for example, `vlan-id-list [ 100 200 300 ]`
- Each VLAN in a range—for example, `vlan-id-list [ 100-200 ]`
Each VLAN in a list and range combination—for example, `vlan-id-list [50, 100-200, 300]`

• For encapsulation type `vlan-vpls`, VLAN IDs 1 through 511 are reserved for normal VLANs, and VLAN IDs 512 through 4094 are reserved for VPLS VLANs. For 4-port Fast Ethernet interfaces, you can use VLAN IDs 512 through 1024 for VPLS VLANs.

• For Gigabit Ethernet interfaces and Gigabit Ethernet IQ and IQE PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), you can configure flexible Ethernet services encapsulation on the physical interface. For interfaces with `flexible-ethernet-services` encapsulation, all VLAN IDs are valid. VLAN IDs from 1 through 511 are not reserved.

• For encapsulation types `extended-vlan-ccc` and `extended-vlan-vpls`, all VLAN IDs are valid.

The upper limits for configurable VLAN IDs vary by interface type.

When you configure a TCC encapsulation, some modifications are needed to handle VPN connections over unlike Layer 2 and Layer 2.5 links and terminate the Layer 2 and Layer 2.5 protocol locally.

The router performs the following media-specific change:

• ATM—Operation, Administration, and Maintenance (OAM) and Interim Local Management Interface (ILMI) processing is terminated at the router. Cell relay is not supported. The Junos OS strips all ATM encapsulation data from incoming frames before forwarding them. For output, the next hop is changed to ATM encapsulation.

**Example: Configuring the Encapsulation on a Physical Interface**

Configure PPP encapsulation on a SONET/SDH interface. The second and third `family` statements allow Intermediate System-to-Intermediate System (IS-IS) and MPLS to run on the interface.

```plaintext
[edit interfaces]
so-7/0/0 {
  encapsulation ppp;
  unit 0 {
    point-to-point;
    family inet {
      address 192.168.1.113/32 {
        destination 192.168.1.114;
      }
    }
    family iso;
    family mpls;
  }
}
```

**Related Documentation**

- Configuring Interface Encapsulation on Logical Interfaces
Configuring PPP Address and Control Field Compression

For interfaces with PPP, PPP CCC, or PPP TCC encapsulation, you can configure compression of the Data Link Layer address and control fields, as defined in RFC 1661, *The Point-to-Point Protocol (PPP)*. By default, the address and control fields are not compressed. This means PPP-encapsulated packets are transmitted with two 1-byte fields (0xff and 0x03). If you configure address and control field compression (ACFC) and ACFC is successfully negotiated with the local router’s peer, the local router transmits packets without these 2 bytes. ACFC allows you to conserve bandwidth by transmitting less data.

On M320, M120, and T Series routers, ACFC is not supported for any ISO family protocols. Do not include the `acfc` statement at the `[edit interfaces interface-name ppp-options]` hierarchy level when you include the `family iso` statement at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level.

**NOTE:** The address and control fields cannot be compressed in Link Control Protocol (LCP) packets.

The PPP session restarts when you configure or modify compression options.

To configure ACFC:

1. In configuration mode, go to the `[edit interfaces interface-name ppp-options]` hierarchy level.

   ```
   [edit ]
   user@host# edit interfaces interface-name ppp-options
   ```

2. Include the `compression` statement at the `[edit interfaces interface-name ppp-options]` hierarchy level, and specify `acfc`.

   ```
   [edit interfaces interface-name ppp-options]
   compression acfc;
   ```

To monitor the configuration, issue the `show interfaces interface-name` command. Configured options are displayed in the `link flags` field for the physical interface. Successfully negotiated options are displayed in the `flags` field for the logical interface. In this example, both ACFC and PFC are configured, but neither compression feature has been successfully negotiated.

```
user@router# run show interfaces so-0/1/1
Physical interface: so-0/1/1, Enabled, Physical link is Up
   Interface index: 133, SNMP ifIndex: 27
   Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC3,
   Loopback: None, FCS: 16
   Payload scrambler: Enabled
```
This configuration causes the local router to try to negotiate ACFC with its peer. If ACFC is successfully negotiated, the local router sends packets with compressed address and control fields. When you include the `compression acfc` statement in the configuration, the PPP session restarts, and the local router sends the ACFC option in the LCP Configure-Request packet. The ACFC option informs the local router's peer that the local router can receive packets with compression. If the peer indicates that it, too, can receive packets with compression, then ACFC is negotiated. If ACFC is successfully negotiated, the local router can receive packets with or without the address and control bytes included.

- ppp-options on page 910
- compression on page 478
- acfc on page 397
Configuring the PPP Protocol Field Compression

For interfaces with PPP, PPP CCC, or PPP TCC encapsulation, you can configure protocol field compression. By default, the protocol field is not compressed. This means PPP-encapsulated packets are transmitted with a two-byte protocol field. For example, IPv4 packets are transmitted with the protocol field set to 0x0021, and MPLS packets are transmitted with the protocol field set to 0x0281.

For all protocols with identifiers in the range 0x0000 through 0x00ff, you can configure the router to compress the protocol field to one byte, as defined in RFC 1661, The Point-to-Point Protocol (PPP). Protocol field compression (PFC) allows you to conserve bandwidth by transmitting less data.

NOTE: The protocol field cannot be compressed in Link Control Protocol (LCP) packets.

The PPP session restarts when you configure or modify compression options.

To configure PFC:

1. In configuration mode, go to the [edit interfaces interface-name ppp-options] hierarchy level.

   [edit]
   user@host# edit interfaces interface-name ppp-options

2. Include the compression statement at the [edit interfaces interface-name ppp-options] hierarchy level, and specify pfc.

   [edit interfaces interface-name ppp-options]
   compression pfc;

To monitor the configuration, issue the show interfaces interface-name command. Configured options are displayed in the link flags field for the physical interface. Successfully negotiated options are displayed in the flags field for the logical interface. In this example, both ACFC and PFC are configured, but neither compression feature has been successfully negotiated.

user@router# run show interfaces so-0/1/1

Physical interface: so-0/1/1, Enabled, Physical link is Up
Interface index: 133, SNMP ifIndex: 27
Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC3, Loopback: None, FCS: 16,
Payload scrambler: Enabled
Device flags : Present Running
Interface flags: Point-To-Point SNMP-Traps 16384
Link flags : No-Keepalives ACFC PFC
LCP state: Opened
This configuration causes the local router to try to negotiate PFC with its peer. If PFC is successfully negotiated, the local router sends packets with compressed protocol fields. When you include the `compression pfc` statement in the configuration, the PPP session restarts, and the local router sends the PFC option in the LCP Configure-Request packet. The PFC option informs the local router’s peer that the local router can receive packets with compression. If the peer indicates that it, too, can receive packets with compression, then PFC is negotiated. If PFC is successfully negotiated, the local router can receive packets with either 2-byte (uncompressed) or 1-byte (compressed) protocol fields.

- compression on page 478
- pfc on page 887

### Monitoring a PPP Session

You can monitor PPP packet exchanges. When monitoring is enabled, packets exchanged during a session are logged by default to `/var/log/pppd`, or to the file specified in the `traceoptions` statement.

To monitor a PPP session:

1. In configuration mode, go to the `[edit protocols ppp]` hierarchy level.

   ```
   [edit]
   user@host# edit protocols ppp
   ```

2. Include the `monitor-session` statement.

   ```
   [edit protocols ppp]
   user@host# monitor-session (interface-name | all);
   ```
When monitoring is configured, the operational mode commands `show ppp summary` and `show ppp interface` display a Monitored flag in the Session flags column or line.

Related Documentation: `monitor-session` on page 794

### Tracing Operations of the pppd Process

You can trace the operations of the router's pppd process.

To trace the router's pppd process:

1. In configuration mode, go to the `[edit protocols ppp]` hierarchy level.

   ```
   [edit ]
   user@host# edit protocols ppp
   ```

2. Include the `traceoptions` statement.

   ```
   [edit protocols ppp]
   traceoptions {
   file filename <files number> <match regular-expression> <size size> <world-readable | no-world-readable>; flag flag; level severity-level; no-remote-trace;
   }
   ```

   - To specify more than one tracing operation, include multiple `flag` statements.

   You can specify the following flags in the `traceoptions` statement:

   - **access**—Trace access code
   - **address-pool**—Trace address pool code
   - **all**—Trace all areas of code
   - **auth**—Trace authentication code
   - **chap**—Trace challenge handshake authentication protocol code
   - **ci**—Trace CI code
   - **config**—Trace configuration code
   - **ifdb**—Trace interface database code
   - **lcp**—Trace LCP state machine code
   - **memory**—Trace memory management code
   - **message**—Trace message processing code
   - **mlppp**—Trace multilink point-to-point protocol code
By default, when you configure an interface with Frame Relay encapsulation, the routing platform is assumed to be data terminal equipment (DTE). That is, the routing platform is assumed to be at a terminal point on the network.

When you configure the router to be a data circuit-terminating equipment (DCE), keepalives are disabled by default.

To configure the router to be DCE:

1. In configuration mode, go to the [edit interfaces interface-name] hierarchy level:

   ```
   [edit]
   user@host# edit interfaces interface-name
   ```

2. Configure the dce option to respond to Frame Relay status enquiry messages.

   ```
   [edit interfaces interface-name]
   user@host# set dce
   ```

Perform one of the following tasks for back-to-back Frame Relay connections:

- Disable sending of keepalives on both sides of the connection.

- Configure one side of the connection as a DTE (the default Junos configuration) by removing the dce statement from the configuration and the other as a DCE.
Receive and Transmit Leaky Bucket Properties Overview

Congestion control is particularly difficult in high-speed networks with high volumes of traffic. When congestion occurs in such a network, it is usually too late to react. You can avoid congestion by regulating the flow of packets into your network. Smoother flows prevent bursts of packets from arriving at (or being transmitted from) the same interface and causing congestion.

For all interface types except ATM, Fast Ethernet, Gigabit Ethernet, and channelized IQ and IQE, you can configure leaky bucket properties, which allow you to limit the amount of traffic received on and transmitted by a particular interface. You effectively specify what percentage of the interface's total capacity can be used to receive or transmit packets. You might want to set leaky bucket properties to limit the traffic flow from a link that is known to transmit high volumes of traffic.

**NOTE:** Instead of configuring leaky bucket properties, you can limit traffic flow by configuring policers. Policers work on all interfaces. For more information, see the [Routing Policies, Firewall Filters, and Traffic Policers Feature Guide](#).

The leaky bucket is used at the host-network interface to allow packets into the network at a constant rate. Packets might be generated in a bursty manner, but after they pass through the leaky bucket, they enter the network evenly spaced. In some cases, you might want to allow short bursts of packets to enter the network without smoothing them out. By controlling the number of packets that can accumulate in the bucket, the threshold property controls burstiness. The maximum number of packets entering the network in time units is $threshold + rate * t$.

By default, leaky buckets are disabled and the interface can receive and transmit packets at the maximum line rate.

For each DS3 channel on a channelized OC12 interface, you can configure unique receive and transmit buckets.

**NOTE:** HDLC payload scrambling conflicts with traffic shaping configured using leaky bucket properties. If you configure leaky bucket properties, you must disable payload scrambling, because the Junos OS rejects configurations that have both features enabled. For more information, see [Configuring SONET/SDH HDLC Payload Scrambling for Link Stability](#).

Configuring Receive and Transmit Leaky Bucket Properties to Reduce Network Congestion

You can configure leaky bucket properties which allow you to limit the amount of traffic received on and transmitted by a particular interface. You can specify what percentage of the interface’s total capacity can be used to receive or transmit packets. You might want to set leaky bucket properties to limit the traffic flow from a link that is known to transmit high volumes of traffic.

To configure leaky bucket properties:

1. In configuration mode, go to the [edit interfaces interface-name] hierarchy level.

   [edit]
   user@host# edit interfaces interface-name

2. Configure the receive-bucket statement.

   [edit interfaces interface-name]
   user@host# set receive-bucket

3. Configure the overflow option, the threshold option, and the rate option for the receive leaky bucket, which specifies what percentage of the interface’s total capacity can be used to receive packets.

   [edit interfaces interface-name receive-bucket]
   user@host# set overflow (discard | tag)
   user@host# set threshold bytes
   user@host# set rate percentage

4. Configure the transmit-bucket statement.

   [edit interfaces interface-name]
   user@host# set transmit-bucket

5. Configure the overflow option, the threshold option, and the rate option for the transmit leaky bucket, which specifies what percentage of the interface’s total capacity can be used to transmit packets.

   [edit interfaces interface-name transmit-bucket]
   user@host# set overflow (discard | tag)
   user@host# set threshold bytes
   user@host# set rate percentage
Understanding Unidirectional Traffic Flow on Physical Interfaces

By default, physical interfaces are bidirectional; that is, they both transmit and receive traffic. You can configure unidirectional link mode on a 10-Gigabit Ethernet interface that creates two new physical interfaces that are unidirectional. The new transmit-only and receive-only interfaces operate independently, but both are subordinate to the original parent interface.

The unidirectional interfaces enable the configuration of a unidirectional link topology. Unidirectional links are useful for applications such as broadband video services where almost all traffic flow is in one direction, from the provider to the user. Unidirectional link mode conserves bandwidth by enabling it to be differentially dedicated to transmit and receive interfaces. In addition, unidirectional link mode conserves ports for such applications because the transmit-only and receive-only interfaces act independently. Each can be connected to different routers, for example, reducing the total number of ports required.

NOTE: Unidirectional link mode is currently supported on only the following hardware:

- 4-port 10-Gigabit Ethernet DPC on the MX960 router
- 10-Gigabit Ethernet IQ2 PIC and 10-Gigabit Ethernet IQ2E PIC on the T Series router

The transmit-only interface is always operationally up. The operational status of the receive-only interface depends only on local faults; it is independent of remote faults and of the status of the transmit-only interface.

On the parent interface, you can configure attributes common to both interfaces, such as clocking, framing, gigether-options, and sonet-options. On each of the unidirectional interfaces, you can configure encapsulation, MAC address, MTU size, and logical interfaces.

Unidirectional interfaces support IP and IPv6. Packet forwarding takes place by means of static routes and static ARP entries, which you can configure independently on both unidirectional interfaces.

Only transmit statistics are reported on the transmit-only interface (and shown as zero on the receive-only interface). Only receive statistics are reported on the receive-only interface (and shown as zero on the transmit-only interface). Both transmit and receive statistics are reported on the parent interface.
Enabling Unidirectional Traffic Flow on Physical Interfaces

By default, physical interfaces are bidirectional; that is, they both transmit and receive traffic. You can configure unidirectional link mode on a 10-Gigabit Ethernet interface that creates two new physical interfaces that are unidirectional. The new transmit-only and receive-only interfaces operate independently, but both are subordinate to the original parent interface.

To enable unidirectional link mode on a physical interface, perform the following steps:

1. In configuration mode, go to the [edit interfaces interface-name] hierarchy level:

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the unidirectional option to create two new, unidirectional (transmit-only and receive-only) physical interfaces subordinate to the original parent interface.

```
[edit interfaces interface-name]
user@host# set unidirectional
```

**NOTE:** Unidirectional link mode is currently supported on only the following hardware:

- 4-port 10–Gigabit Ethernet DPC on the MX960 router
- 10–Gigabit Ethernet IQ2 PIC and 10–Gigabit Ethernet IQ2E PIC on the T Series router

Physical Interface Damping Overview

Physical interface damping limits the advertisement of the up and down transitions (flapping) on an interface. Each time a transition occurs, the interface state is changed, which generates an advertisement to the upper-level routing protocols. Damping helps reduce the number of these advertisements.

From the viewpoint of network deployment, physical interface flaps fall into the following categories:

- Nearly instantaneous multiple flaps of short duration (milliseconds).
- Periodic flaps of long duration (seconds).

Figure 6 on page 143 is used to describe these types of interface flaps and the damping configuration that you can use in each case.

**Figure 6: Two Router Interfaces Connected Through Transport Equipment**

![Diagram of two router interfaces connected through transport equipment.]

**NOTE:** We recommend that you use similar damping configurations on both ends of the physical interface. Configuring damping on one end and not having interface damping on the other end can result in undesired behavior.

The following sections describe the types of interface damping depending upon the transition time length.

- Damping Overview for Shorter Physical Interface Transitions on page 143
- Damping Overview for Longer Physical Interface Transitions on page 144

**Damping Overview for Shorter Physical Interface Transitions**

Figure 6 on page 143 shows two routers with two transport devices between them. If a redundant link between the two transport devices fails, link switching is performed. Link switching takes a number of milliseconds. As shown in Figure 7 on page 144, during switching, both router interfaces might encounter multiple flaps with an up-and-down duration of several milliseconds. These multiple flaps, if advertised to the upper-level routing protocols, might result in undesired route updates. This is why you might want to damp these interface flaps.

**NOTE:** Damping is suitable only with routing protocols.
For shorter physical interface transitions, you configure interface damping with the **hold-time** statement on the interface. The hold timer enables interface damping by not advertising interface transitions until the hold timer duration has passed. When a hold-down timer is configured and the interface goes from up to down, the down hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still down, then the router begins to advertise the interface as being down. Similarly, when a hold-up timer is configured and an interface goes from down to up, the up hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still up, then the router begins to advertise the interface as being up.

*Figure 7: Multiple Flaps of Short Duration (Milliseconds)*

---

**Damping Overview for Longer Physical Interface Transitions**

When the link between a router interface and the transport devices is not stable, this can lead to periodic flapping, as shown in *Figure 8 on page 145*. Flaps occur in the order of seconds or more, with an up-and-down flap duration in the order of a second or more. In this case, using the hold timer feature might not produce optimal results as it cannot suppress the relatively longer and repeated interface flaps. Increasing the hold time duration to seconds still allows the system to send route updates on the flapping interface, so fails to suppress periodically flapping interfaces on the system.
For longer periodic interface flaps, you configure interface damping with the `damping` statement on the interface. This damping method uses an exponential back-off algorithm to suppress interface up-and-down event reporting to the upper-level protocols. Every time an interface goes down, a penalty is added to the interface penalty counter. If at some point the accumulated penalty exceeds the suppress level, the interface is placed in the suppress state, and further interface link up and down events are not reported to the upper-level protocols.

**NOTE:**
- Only PTX Series routers, T Series routers, MX960 routers, MX480 routers, MX240 routers, MX80 routers, and M10i routers support interface damping for longer periodic interface flaps on all the line cards.
- Penalty added on every interface flap is 1000.
- The system does not indicate whether an interface is down because of suppression or that is the actual state of the physical interface. Because of this, SNMP link traps and Operation, Administration, and Maintenance (OAM) protocols cannot differentiate the damped version of the link state from the real version. Therefore, the traps and protocols might not work as expected.
- You can verify suppression by viewing the information in the Damping field of the show interface extensive command output.

At all times, the interface penalty counter follows an exponential decay process. Figure 9 on page 147 and Figure 10 on page 148 show the decay process as it applies to recovery when the physical level link is down or up. As soon as the accumulated penalty reaches the lower boundary of the reuse level, the interface is marked as unsuppressed.
and further changes in the interface link state are again reported to the upper-level protocols. You use the `max-suppress` option to configure the maximum time for restricting the accumulation of the penalty beyond the value of the maximum penalty. The value of the maximum penalty is calculated by the software. The maximum penalty corresponds to the time it would take max-suppress to decay and reach the reuse level. The penalty continues to decay after crossing the reuse level.

*Figure 9 on page 147 and Figure 10 on page 148* show the accumulated penalty, and the decay over time as a curve. Whenever the penalty is below the reuse level and the physical level link changes state, state changes are advertised to the system and cause SNMP state changes.

*Figure 9 on page 147* shows the penalty dropping below the reuse level when the physical link is down. The system is notified of a state change only after the physical level link transitions to up.
Figure 9: Physical-Level Link Is Down When the Penalty Falls Below the Reuse Level

Figure 10 on page 148 shows the penalty dropping below the reuse level when the physical link is up. The system is notified of a state change immediately.
Figure 10: Physical-Level Link Is Up When the Penalty Falls Below the Reuse Level

### Damping Shorter Physical Interface Transitions

By default, when an interface changes from being up to being down, or from down to up, this transition is advertised immediately to the hardware and Junos OS. In some situations—for example, when an interface is connected to an add/drop multiplexer (ADM) or wavelength-division multiplexer (WDM), or to protect against SONET/SDH framer holes—you might want to damp interface transitions. This means not advertising the interface's transition until a certain period of time has passed, called the **hold-time**. When you have damped interface transitions and the interface goes from up to down, the down hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still **down**, then the router begins to advertise the interface as being down. Similarly, when an interface goes from down to up, the up hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still **up**, then the router begins to advertise the interface as being up. For information about physical interface damping, see “Physical Interface Damping Overview” on page 143.

This task applies to damping shorter physical interface transitions in milliseconds. To damp longer physical interface transitions in seconds, see “Damping Longer Physical Interface Transitions” on page 150.

To configure damping of shorter physical interface transitions:

1. Select the interface to damp, where the interface name is `interface-type-fpc/pic/port`:
   ```
   [edit]
   user@host# edit interfaces interface-name
   ```

2. Configure the hold-time for link up and link down.
   ```
   [edit interfaces interface-name]
   user@host# set hold-time up milliseconds down milliseconds
   ```

   The hold time can be a value from 0 through 4,294,967,295 milliseconds. The default value is 0, which means that interface transitions are not damped. Junos OS advertises the transition within 100 milliseconds of the time value you specify.

   For most Ethernet interfaces, hold timers are implemented using a one-second polling algorithm. For 1-port, 2-port, and 4-port Gigabit Ethernet interfaces with small form-factor pluggable transceivers (SFPs), hold timers are interrupt-driven.

   **NOTE:** The hold-time option is not available for controller interfaces.

---

**Related Documentation**
- Physical Interface Damping Overview on page 143
- Damping Longer Physical Interface Transitions on page 150
Damping Longer Physical Interface Transitions

Physical interface damping limits the advertisement of the up and down transitions (flapping) on an interface. An unstable link between a router interface and the transport devices can lead to periodic flapping. Longer flaps occur with a period of about five seconds or more, with an up-and-down duration of one second. For these longer periodic interface flaps, you configure interface damping with the `damping` statement on the interface. This damping method uses an exponential back-off algorithm to suppress interface up and down event reporting to the upper-level protocols. Every time an interface goes down, a penalty is added to the interface penalty counter. If at some point the accumulated penalty exceeds the suppress level `max-suppress`, the interface is placed in the suppress state, and further interface state up and down transitions are not reported to the upper-level protocols.

**NOTE:**
- Only PTX Series routers, T Series routers, MX2010 routers, MX2020 routers, MX960 routers, MX480 routers, MX240 routers, MX80 routers, and M10i routers support interface damping for longer periodic interface flaps.
- The system does not indicate whether an interface is down because of suppression or that is the actual state of the physical interface. Because of this, SNMP link traps and Operation, Administration, and Maintenance (OAM) protocols cannot differentiate the damped version of the link state from the real version. Therefore, the traps and protocols might not work as expected.
- You can verify suppression by viewing the information in the Damping field of the `show interface extensive` command output.

You can view the damping parameters with the `show interfaces extensive` command.

To configure damping of longer physical interface transitions:

1. Select the interface to damp, where the interface name is `interface-type-fpc/pic/port` or an interface range:

   ```
   [edit]
   user@host# edit interfaces interface-name
   ```

2. Enable longer interface transition damping on a physical interface:

   ```
   [edit interfaces interface-name damping]
   ```
3. (Optional) Set the maximum time in seconds that an interface can be suppressed no matter how unstable the interface has been.

   NOTE: Configure max-suppress to a value that is greater than the value of half-life; otherwise, the configuration is rejected.

   [edit interfaces interface-name damping]
   user@host# set max-suppress maximum-seconds

4. (Optional) Set the decay half-life in seconds, which is the interval after which the accumulated interface penalty counter is reduced by half if the interface remains stable.

   NOTE: Configure max-suppress to a value that is greater than the value of half-life; otherwise, the configuration is rejected.

   [edit interfaces interface-name damping]
   user@host# set half-life seconds

5. (Optional) Set the reuse threshold (no units). When the accumulated interface penalty counter falls below this value, the interface is no longer suppressed.

   [edit interfaces interface-name damping]
   user@host# set reuse number

6. (Optional) Set the suppression threshold (no units). When the accumulated interface penalty counter exceeds this value, the interface is suppressed.

   [edit interfaces interface-name damping]
   user@host# set suppress number

Example: Configuring Physical Interface Damping

This example shows how to configure damping for a physical interface on a PTX Series Packet Transport Router.

• Requirements on page 152
• Overview on page 152
• Configuration on page 153
• Verification on page 153

Requirements

This example uses the following hardware and software components:

• One PTX Series Packet Transport Router
• One or more routers that provide input packets and receive output packets
• Junos OS Release 14.1 or later

Overview

Physical interface damping provides a smoothing of the up and down transitions (flapping) on an interface. Each time a transition occurs, the interface state is changed, which generates an advertisement to the upper-level routing protocols. Damping helps reduce the number of these advertisements.

From the viewpoint of network deployment, physical interface flaps fall into these categories:

• Nearly instantaneous multiple flaps of short duration (milliseconds). For shorter physical interface transitions, you configure interface damping with the **hold-time** statement on the interface. The hold timer enables interface damping by not advertising interface transitions until the hold timer duration has passed. When a hold-down timer is configured and the interface goes from up to down, the interface is not advertised to the rest of the system as being down until it has remained down for the hold-down timer period. Similarly, when a hold-up timer is configured and an interface goes from down to up, it is not advertised as being up until it has remained up for the hold-up timer period.

• Periodic flaps of long duration (seconds). For longer periodic interface flaps, you configure interface damping with the **damping** statement on the interface. This damping method uses an exponential back-off algorithm to suppress interface up and down event reporting to the upper-level protocols. Every time an interface goes down, a penalty is added to the interface penalty counter. If at some point the accumulated penalty exceeds the suppress level, the interface is placed in the suppress state, and further interface state up transitions are not reported to the upper-level protocols.
Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces xe-6/0/0 damping half-life 11 max-suppress 2222 reuse 3333 suppress 4444
```

Step-by-Step Procedure

To configure damping on the PTX Series Packet Transport Router:

1. Enable damping on the interface, set the half-life interval, maximum suppression, reuse, and suppress values:

   ```
   [edit interface]
   user@router# set xe-6/0/0 damping half-life 11 max-suppress 2222 reuse 3333 suppress 4444
   ```

2. Commit configuration:

   ```
   [edit]
   user@router# commit
   ```

Results

From configuration mode, confirm your configuration by entering the `show interfaces` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@router# show interfaces
xe-6 {
    damping {
        half-life 11;
        max-suppress 2222;
        reuse 3333;
        suppress 4444;
    }
}
```

Verification

To confirm that the configuration is working properly, perform this task:

- Verifying Interface Damping on xe6 on page 154
Verifying Interface Damping on xe6

**Purpose**

Verify that damping is enabled on the interface and that the damping parameter values are correctly set.

**Action**

From operational mode, run the `show interfaces extensive` command.

```
user@router# run show interfaces xe-6/0/0 extensive
```

Physical interface: xe-6/0/0, Enabled, Physical link is Up
Interface index: 158, SNMP ifIndex: 535, Generation: 161
Link-level type: Ethernet, MTU: 1514, LAN-PHY mode, Speed: 10Gbps, BPDU Error: None, Loopback: None,
Source filtering: Disabled, Flow control: Enabled
Device flags : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
Link flags : None
CoS queues : 8 supported, 8 maximum usable queues
Hold-times : Up 0 ms, Down 0 ms
Damping : half-life: 11 sec, max-suppress: 2222 sec, reuse: 3333, suppress: 4444, state: unsuppressed

**Meaning**

Damping is enabled and configured successfully on the xe-6 interface.

Configuring Multiservice Physical Interface Properties

The adaptive services (AS), collector, monitoring services, and monitoring services II interfaces are multiservice interfaces specifically designed to enable IP services. To configure multiservice physical interface properties on the collector, monitoring services, and AS interfaces, include the `multiservice-options` statement:

```
multiservice-options {
    (core-dump | no-core-dump);
    (syslog | no-syslog);
    flow-control-options {
      down-on-flow-control;
      dump-on-flow-control;
      reset-on-flow-control;
    }
}
```

You can include these statements at the following hierarchy levels:

- `[edit interfaces cp-fpc/pic/port]`
Enabling or Disabling SNMP Notifications on Physical Interfaces

By default, Simple Network Management Protocol (SNMP) notifications are sent when the state of an interface or a connection changes. You can enable or disable these notification based on your requirements.

To explicitly enable sending SNMP notifications on the physical interface, perform the following steps:

1. In configuration mode, go to the [edit interfaces interface-name] hierarchy level:

   ```
   [edit]
   user@host# edit interfaces interface-name
   ```

2. Configure the `traps` option to enable sending of Simple Network Management Protocol (SNMP) notifications when the state of the connection changes.

   ```
   [edit interfaces interface-name]
   user@host# set traps
   ```

To disable sending SNMP notifications on the physical interface, perform the following steps:

1. In configuration mode, go to the [edit interfaces interface-name] hierarchy level:

   ```
   [edit]
   user@host# edit interfaces interface-name
   ```

2. Configure the `no-traps` option to disable sending of Simple Network Management Protocol (SNMP) notifications when the state of the connection changes.

   ```
   [edit interfaces interface-name]
   user@host# set no-traps
   ```

**Accounting Profiles Overview**

Juniper Networks routers and switches can collect various kinds of data about traffic passing through the router and switch. You can set up one or more accounting profiles that specify some common characteristics of this data, including the following:

- The fields used in the accounting records
- The number of files that the router or switch retains before discarding, and the number of bytes per file
- The polling period that the system uses to record the data

You configure the profiles and define a unique name for each profile using statements at the [edit accounting-options] hierarchy level. There are two types of accounting profiles: interface profiles and filter profiles. You configure interface profiles by including the interface-profile statement at the [edit accounting-options] hierarchy level. You configure filter profiles by including the filter-profile statement at the [edit accounting-options] hierarchy level. For more information, see the Network Management and Monitoring Guide.

You apply filter profiles by including the accounting-profile statement at the [edit firewall filter filter-name] and [edit firewall family family filter filter-name] hierarchy levels. For more information, see the Routing Policies, Firewall Filters, and Traffic Policers Feature Guide.

**Configuring Accounting for the Physical Interface**

**Before you begin**

You must configure a profile to collect error and statistic information for input and output packets on a particular physical interface. An accounting profile specifies what statistics should be collected and written to a log file. For more information on how to configure an accounting-data log file, see the Configuring Accounting-Data Log Files.

An interface profile specifies the information collected and written to a log file. You can configure a profile to collect error and statistic information for input and output packets on a particular physical interface.

1. To configure which statistics should be collected for an interface, include the fields statement at the [edit accounting-options interface-profile profile-name] hierarchy level.

   [edit accounting-options interface-profile profile-name]
   user@host# set fields field-name
2. Each accounting profile logs its statistics to a file in the /var/log directory. To configure which file to use, include the file statement at the [edit accounting-options interface-profile profile-name] hierarchy level.

   [edit accounting-options interface-profile profile-name]
   user@host# set file filename

   **NOTE:** You must specify a file statement for the interface profile that has already been configured at the [edit accounting-options] hierarchy level. For more information, see the Configuring Accounting-Data Log Files

3. Each interface with an accounting profile enabled has statistics collected once per interval time specified for the accounting profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the interval statement at the [edit accounting-options interface-profile profile-name] hierarchy level.

   [edit accounting-options interface-profile profile-name]
   user@host# set interval minutes

   **NOTE:** The minimum interval allowed is 1 minute. Configuring a low interval in an accounting profile for a large number of interfaces might cause serious performance degradation.

4. To configure the interfaces on which the accounting needs to be performed, apply the interface profile to a physical interface by including the accounting-profile statement at the [edit interfaces interface-name] hierarchy level.

   [edit interfaces]
   user@host# set interface-name accounting-profile profile-name

   **See Also** • Configuring Accounting-Data Log Files

**Displaying Accounting Profile for the Physical Interface**

**Purpose** To display the configured accounting profile a particular physical interface at the [edit accounting-options interface-profile profile-name] hierarchy level:

- interface-name—ge-1/0/1
- Interface profile —if_profile
- File name—if_stats
- Interval—15 minutes
**Action**  
- Run the `show` command at the `[edit edit interfaces ge-1/0/1]` hierarchy level.

```
[edit interfaces ge-1/0/1]
accounting-profile if_profile;
```

- Run the `show` command at the `[edit accounting-options]` hierarchy level.

```
interface-profile if_profile {
  interval 15;
  file if_stats {
    fields {
      input-bytes;
      output-bytes;
      input-packets;
      output-packets;
      input-errors;
      output-errors;
    }
  }
}
```

**Meaning**  
The configured accounting and its associated set options are displayed as expected.

---

**Disabling a Physical Interface**

- Disabling a Physical Interface on page 158
- Example: Disabling a Physical Interface on page 159
- Effect of Disabling Interfaces on T series PICs on page 160

**Disabling a Physical Interface**

You can disable a physical interface, marking it as being down, without removing the interface configuration statements from the configuration.

---

**CAUTION:** Dynamic subscribers and logical interfaces use physical interfaces for connection to the network. The Junos OS allows you to set the interface to disable and commit the change while dynamic subscribers and logical interfaces are still active. This action results in the loss of all subscriber connections on the interface. Use care when disabling interfaces.

---

To disable a physical interface:

1. In configuration mode, go to `[edit interfaces interface-name]` hierarchy level.

```
[edit]
user@host# edit interfaces ge-fpc/pic/port
```

2. Include the `disable` statement.
NOTE: On the router, when you use the disable statement at the edit interfaces hierarchy level, depending on the PIC type, the interface might or might not turn off the laser. Older PIC transceivers do not support turning off the laser, but newer Gigabit Ethernet PICs with SFP and XFP transceivers do support it and the laser will be turned off when the interface is disabled.

WARNING: Do not stare into the laser beam or view it directly with optical instruments even if the interface has been disabled.

Example: Disabling a Physical Interface

Sample interface configuration:

```
[edit interfaces]
user@host# show
ge-0/3/2 {
    unit 0 {
        description CE2-to-PE1;
        family inet {
            address 20.1.1.6/24;
        }
    }
}
```

Disabling the interface:

```
[edit interfaces ge-0/3/2]
user@host# set disable
```

Verifying the interface configuration:

```
[edit interfaces ge-0/3/2]
user@host# show
disable; # Interface is marked as disabled.
unit 0 {
    description CE2-to-PE1;
    family inet {
        address 20.1.1.6/24;
    }
}
```
Effect of Disabling Interfaces on T series PICs

The following table describes the effect of using the `set interfaces disable <interface_name>` statement on T series PICs.

**Table 21: Effect of set interfaces disable <interface_name> on T series PICs**

Logical Interfaces Configuration Properties Overview

For a physical interface device to function, you must configure at least one logical interface on that device. For each logical interface, you must specify the protocol family that the interface supports. You can also configure other logical interface properties. These vary by Physical Interface Card (PIC) and encapsulation type, but include the IP address of the interface, and whether the interface supports multicast traffic, data-link connection
identifiers (DLCIs), virtual channel identifiers (VCIs) and virtual path identifiers (VPIs), and traffic shaping.

Logical Interfaces Configuration Statements

To configure logical interface properties, include the following statements:

```
unit logical-unit-number {
  accept-source-mac {
    mac-address mac-address {
      policer {
        input cos-policer-name;
        output cos-policer-name;
      }
    }
  }
  accounting-profile name;
  allow-any-vci;
  atm-scheduler-map (map-name | default);
  backup-options {
    interface interface-name;
  }
  bandwidth rate;
  cell-bundle-size cells;
  clear-dont-fragment-bit;
  compression {
    rtp {
      f-max-period number;
      queues [ queue-numbers ];
      port {
        minimum port-number;
        maximum port-number;
      }
    }
  }
  compression-device interface-name;
  copy-tos-to-outer-ip-header;
  demux-destination family;
  demux-source family;
  demux-options {
    underlying-interface interface-name;
  }
  description text;
  interface {
    l2tp-interface-id name:
    (dedicated | shared);
  }
  dialer-options {
    activation-delay seconds;
    callback;
  }
```
callback-wait-period time;

Specifying the Logical Interface Number

Each logical interface must have a logical unit number. The logical unit number corresponds to the logical unit part of the interface name. For more information, see “Interface Naming Overview” on page 16.

Point-to-Point Protocol (PPP), Cisco High-level Data Link Control (HDLC), and Ethernet circuit cross-connect (CCC) encapsulations support only a single logical interface, whose logical unit number must be 0. Frame Relay and ATM encapsulations support multiple logical interfaces, so you can configure one or more logical unit numbers.

You specify the logical unit number by including the unit statement:

```
unit logical-unit-number {
  ...
}
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name ]`
- `[edit logical-systems logical-system-name interfaces interface-name ]`

The range of number available for the logical unit number varies for different interface types. See unit for current range values.

Adding a Logical Unit Description to the Configuration

You can include a text description of each logical unit in the configuration file. Any descriptive text you include is displayed in the output of the show interfaces commands, and is also exposed in the ifAlias Management Information Base (MIB) object. It has no impact on the interface’s configuration. To add a text description, include the description statement:

```
description text;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number ]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ]`

The description can be a single line of text. If the text contains spaces, enclose it in quotation marks.

---

**NOTE:** You can configure the extended DHCP relay to include the interface description in the option 82 Agent Circuit ID suboption. See “Using DHCP Relay Agent Option 82 Information” in the Junos OS Broadband Subscriber Management and Services Library.
For information about describing physical interfaces, see “Configuring Interface Description” on page 98.

Configuring the Interface Bandwidth

By default, the Junos OS uses the physical interface’s speed for the MIB-II object, ifSpeed. You can configure the logical unit to populate the ifSpeed variable by configuring a bandwidth value for the logical interface. The bandwidth statement sets an informational-only parameter; you cannot adjust the actual bandwidth of an interface with this statement.

NOTE: We recommend that you be careful when setting this value. Any interface bandwidth value that you configure using the bandwidth statement affects how the interface cost is calculated for a dynamic routing protocol, such as OSPF. By default, the interface cost for a dynamic routing protocol is calculated using the following formula:

\[
\text{cost} = \frac{\text{reference-bandwidth}}{\text{bandwidth}},
\]

where bandwidth is the physical interface speed. However, if you specify a value for bandwidth using the bandwidth statement, that value is used to calculate the interface cost, rather than the actual physical interface bandwidth.

To configure the bandwidth value for a logical interface, include the bandwidth statement:

```
bandwidth rate;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces interface-name unit logical-unit-number]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

rate is the peak rate, in bps or cps. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation c; values expressed in cells per second are converted to bits per second using the formula 1 cps = 384 bps. The value can be any positive integer. The bandwidth statement is valid for all logical interfaces, except multilink interfaces.

Configuring Interface Encapsulation on Logical Interfaces

- Understanding Interface Encapsulation on Logical Interfaces on page 174
- Configuring the Encapsulation on a Logical Interface on page 174
- Displaying the Encapsulation on a Logical Interface on page 175
Understanding Interface Encapsulation on Logical Interfaces

You can configure an encapsulation on a logical interface, which is the encapsulation used within certain packet types.

The following restrictions apply to logical interface encapsulation:

- With the atm-nlpid, atm-cisco-nlpid, and atm-vc-mux encapsulations, you can configure the inet family only.
- With the CCC circuit encapsulations, you cannot configure a family on the logical interface.
- A logical interface cannot have frame-relay-ccc encapsulation unless the physical device also has frame-relay-ccc encapsulation.
- A logical interface cannot have frame-relay-tcc encapsulation unless the physical device also has frame-relay-tcc encapsulation. In addition, you must assign this logical interface a DLCI from 512 through 1022 and configure it as point-to-point.
- A logical interface cannot have frame-relay-ether-type or frame-relay-ether-type-tcc encapsulation unless the physical interface has flexible-frame-relay encapsulation and is on an IQ or IQE PIC.
- For frame-relay-ether-type-tcc encapsulation, you must assign this logical interface a DLCI from 512 through 1022.
- For interfaces that carry IP version 6 (IPv6) traffic, you cannot configure ether-over-atm-llc encapsulation.
- When you use ether-over-atm-llc encapsulation, you cannot configure multipoint interfaces.
- A logical interface cannot have vlan-ccc or vlan-vpls encapsulation unless the physical device also has vlan-ccc or vlan-vpls encapsulation, respectively. In addition, you must assign this logical interface a VLAN ID from 512 through 1023; if the VLAN ID is 511 or lower, it is subject to the normal destination filter lookups in addition to source address filtering. For more information, see Configuring VLAN and Extended VLAN Encapsulation.
- You can create an ATM cell-relay circuit by configuring an entire ATM physical device or an individual virtual circuit (VC). When you configure an entire device, only cell-relay encapsulation is allowed on the logical interfaces. For more information, see Configuring an ATM Cell-Relay Circuit Overview.

Configuring the Encapsulation on a Logical Interface

Generally, you configure an interface’s encapsulation at the [edit interfaces interface-name] hierarchy level. However, for some encapsulation types, such as Frame Relay, ATM, and Ethernet virtual local area network (VLAN) encapsulations, you can also configure the encapsulation type that is used inside the Frame Relay, ATM, or VLAN circuit itself.
To configure encapsulation on a logical interface:

1. In configuration mode, go to the [edit interfaces interface-name unit logical-unit-number] or [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number] hierarchy level.

   [edit]
   user@host# set interfaces at-fpc/pic/port unit logical-unit-number

2. Configure the encapsulation type as described in encapsulation (Logical Interface).

   [edit interfaces at-fpc/pic/port unit logical-unit-number]
   user@host# set encapsulation encapsulation-type

Configuring Interface Encapsulation on PTX Series Packet Transport Routers

This topic describes how to configure interface encapsulation on PTX Series Packet Transport Routers. Use the flexible-ethernet-services configuration statement to configure different encapsulation for different logical interfaces under a physical interface. With
flexible Ethernet services encapsulation, you can configure each logical interface encapsulation without range restrictions for VLAN IDs.

Supported encapsulations for physical interfaces include:

- **flexible-ethernet-services**
- **ethernet-ccc**
- **ethernet-tcc**

Supported encapsulations for logical interfaces include:

- **ethernet**
- **vlan-ccc**
- **vlan-tcc**

**NOTE:** PTX Series Packet Transport Routers do not support extended-vlan-ccc and extended-vlan-tcc encapsulation on logical interfaces. Instead, you can configure a tag protocol ID (TPID) value of 0x9100 to achieve the same results.

To configure flexible Ethernet services encapsulation, include the `encapsulation flexible-ethernet-services` statement at the `[edit interfaces et-fpc/.pic/port ]` hierarchy level. For example:

```plaintext
interfaces {
    et-fpc/.pic/port {
        vlan-tagging;
        encapsulation flexible-ethernet-services;
        unit 0 {
            vlan-id 1000;
            family inet {
                address 11.0.0.20/24;
            }
        }
        unit 1 {
            encapsulation vlan-ccc;
            vlan-id 1010;
        }
        unit 2 {
            encapsulation vlan-tcc;
            vlan-id 1020;
            family tcc {
                proxy {
                    inet-address 11.0.2.160;
                }
                remote {
                    inet-address 11.0.2.10;
                }
            }
        }
    }
}
```
By default, all interfaces are assumed to be point-to-point connections. You must ensure that the maximum transmission unit (MTU) sizes on both sides of the connection are the same.

For all interfaces except aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet, you can explicitly configure an interface to be a point-to-point connection by including the `point-to-point` statement:

```
point-to-point;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`

### Configuring a Multipoint Connection

By default, all interfaces are assumed to be point-to-point connections. To configure an interface to be a multipoint connection, include the `multipoint` statement:

```
multipoint;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`

### Configuring the PPP Restart Timers

You can configure a restart timer for the Link Control Protocol (LCP) and Network Control Protocol (NCP) components of a PPP session. You can configure the LCP restart timer on interfaces with PPP, PPP TCC, PPP over Ethernet, PPP over ATM, and PPP over Frame Relay encapsulations. You can configure the NCP restart timer on interfaces with PPP and PPP TCC encapsulations and on multilink PPP bundle interfaces.

To configure the restart timer for the NCP component of a PPP session, include the `ncp-restart-timer` statement, and specify the number of milliseconds.
To configure the restart timer for the LCP component of a PPP session, include the `lcp-restart-timer` statement, and specify the number of milliseconds:

```
lcp-restart-timer milliseconds;
ncp-restart-timer milliseconds;
```

You can include these statements at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number ppp-options]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options]`

To monitor the configuration, issue the `show interfaces interface-name` command. Configured options are displayed in the `PPP parameters` field for the physical interface.

```
user@host> run show interfaces t1-0/0/0:1:1.0 detail

Logical interface t1-0/0/0:1:1.0 (Index 67) (SNMP ifIndex 40)
(Generation 156)
  Flags: Hardware-Down Device-Down Point-To-Point SNMP-Traps 0x4000
  Encapsulation: PPP
  PPP parameters:
    LCP restart timer: 2000 msec
    NCP restart timer: 2000 msec
  Protocol inet, MTU: 1500, Generation: 163, Route table: 0
  Flags: Protocol-Down
  Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
    Destination: 1.1.1/24, Local: 1.1.1.2, Broadcast: 1.1.1.255
```

Configuring the PPP Clear Loop Detected Timer

When a Point-to-Point Protocol (PPP) session detects a loop, the loop detected flag is set. If the flag is not cleared by the protocol after the loopback is cleared, the clear loop detected timer clears the flag after the specified time has elapsed.

To configure the clear loop detected timer for the LCP component of a PPP session, include the `loopback-clear-timer` statement, and specify the number of seconds.

```
loopback-clear-timer seconds;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number ppp-options]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options]`

To monitor the configuration, issue the `show interfaces interface-name extensive` command.

Configuring the LCP Configure-Request Maximum Sent

Link Control Protocol (LCP) Configure-Request is used to establish a link. You can configure the maximum number of LCP Configure-Requests to send. The router stops
sending LCP Configure-Requests after the specified maximum number is sent. To configure the LCP Configure-Request maximum, use the `lcp-max-conf-req` statement at the `[edit interfaces interface-name unit number ppp-options]` hierarchy level. The `number` range is from 0 to 65,535; where 0 specifies no limit and the LCP Configure-Request is sent indefinitely. The default is 254.

### Related Documentation
- `lcp-max-conf-req` on page 727

#### Configuring the NCP Configure-Request Maximum Sent

Network Control Protocol (NCP) Configure-Request is used to establish a link. You can configure the maximum number of NCP Configure-Requests to send. The router stops sending NCP Configure-Requests after the specified maximum number is sent. To configure the NCP Configure-Request maximum, use the `ncp-max-conf-req` statement at the `[edit interfaces interface-name unit number ppp-options]` hierarchy level. The `number` range is from 0 to 65,535; where 0 specifies no limit and NCP Configure-Request is sent indefinitely. The default is 254.

### Related Documentation
- `ncp-max-conf-req` on page 727

#### Configuring Dynamic Profiles for PPP

A dynamic profile acts as a template that enables you to create, update, or remove a configuration that includes attributes for client access (for example, interface or protocol) or service (for example, IGMP). Using these profiles you can consolidate all of the common attributes of a client (and eventually a group of clients) and apply the attributes simultaneously.

After they are created, the profiles reside in a profile library on the router. You can then use the `dynamic-profile` statement to attach profiles to interfaces. To assign a dynamic profile to a PPP interface, you can include the `dynamic-profile` statement at the `[edit interfaces interface-name unit logical-unit-number ppp-options]` hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number ppp-options]
dynamic-profile profile-name;
```

To monitor the configuration, issue the `show interfaces interface-name` command.

For information about dynamic profiles, see `Dynamic Profiles Overview` in the *Junos Subscriber Access Configuration Guide*.

For information about creating dynamic profiles, see `Configuring a Basic Dynamic Profile` in the *Junos Subscriber Access Configuration Guide*.

For information about assigning a dynamic profile to a PPP interface, see `Attaching Dynamic Profiles to Static PPP Subscriber Interfaces` in the *Junos Subscriber Access Configuration Guide*.
For information about using dynamic profiles to authenticate PPP subscribers, see *Configuring Dynamic Authentication for PPP Subscribers*.

**NOTE:** Dynamic profiles for PPP subscribers are supported only on PPPoE interfaces for this release.

### Configuring PPP CHAP Authentication

For interfaces with PPP encapsulation, you can configure interfaces to support the PPP Challenge Handshake Authentication Protocol (CHAP), as defined in RFC 1994, *PPP Challenge Handshake Authentication Protocol (CHAP)*. When you enable CHAP on an interface, the interface can authenticate its peer and can be authenticated by its peer.

For information about configuring CHAP, see “Configuring the PPP Challenge Handshake Authentication Protocol” on page 121.

### Configuring the PPP Password Authentication Protocol On a Logical Interface

- Understanding PPP Password Authentication Protocol on page 180
- Configuring the PPP Password Authentication Protocol On a Logical Interface on page 181

### Understanding PPP Password Authentication Protocol

The Password Authentication Protocol (PAP) provides a simple method for the peer to establish its identity using a two-way handshake. This is done only upon initial link establishment.

After the link is established, an ID and password pair is repeatedly sent by the peer to the authenticator until authentication is acknowledged or the connection is terminated.

For interfaces with PPP encapsulation, you can configure interfaces to support the Password Authentication Protocol (PAP), as defined in RFC 1334, *PAP Authentication Protocols*. If authentication is configured, the PPP link negotiates using CHAP or PAP protocol for authentication during the Link Control Protocol (LCP) negotiation phase. PAP is only performed after the link establishment phase (LCP up) portion of the authentication phase.

During authentication, the PPP link sends a PAP authentication-request packet to the peer with an ID and password. The authentication-request packet is sent every 2 seconds, similar to the CHAP challenge, until a response is received (acknowledgment packet, nonacknowledgment packet). If an acknowledgment packet is received, the PPP link transitions to the next state, the network phase. If a nonacknowledgment packet is received, an LCP terminate request is sent, and the PPP link goes back to the link establishment phase. If no response is received, and an optional retry counter is set to **true**, a new request acknowledgment packet is resent. If the retry counter expires, the PPP link transitions to the LCP negotiate phrase.
You can configure the PPP link with PAP in passive mode. By default, when PAP is enabled on an interface, the interface expects authenticate-request packets from the peer. However, the interface can be configured to send authentication request packets to the peer by configuring PAP to operate in passive mode. In PAP passive mode, the interface sends the authenticate-request packets to the peer only if the interface receives the PAP option from the peer during LCP negotiation—in passive mode, the interface does not authenticate the peer.

**Configuring the PPP Password Authentication Protocol On a Logical Interface**

When you configure an interface to use PAP, you must assign an access profile to the interface. When an interface receives PAP authentication requests, the access profile in the packet is used to look up the password. If no matching access profile is found for the PAP authentication request that was received by the interface, the optionally configured default PAP password is used.

To configure the PPP password authentication protocol, on each logical interface with PPP encapsulation, perform the following steps.

1. The default PAP password is used when no matching PAP access profile exists, or if the PAP access profile name changes during PPP link negotiation. To configure the default PAP password, include the `pap-password` statement at the `[edit interfaces interface-name unit logical-unit-number ppp-options pap]` hierarchy level:

   ```
   user@host# set default-pap-password password
   ```

2. To configure the name the interface uses in PAP request and response packets, include the `local-name` statement at the `[edit interfaces interface-name unit logical-unit-number ppp-options pap]` hierarchy level:

   ```
   user@host# set local-name name
   ```

   **NOTE:** By default, when PAP is enabled on an interface, the interface uses the router’s system hostname as the name sent in PAP request and response packets.

3. You need to configure the password to be used for authentication. To configure the host password for sending PAP requests, include the `local-password` statement at the `[edit interfaces interface-name unit logical-unit-number ppp-options pap]` hierarchy level:

   ```
   user@host# set local-password password
   ```
4. To configure the interface to authenticate with PAP in passive mode, include the `passive` statement at the `[edit interfaces interface-name unit logical-unt-number ppp-options pap]` hierarchy level:

```plaintext
[edit interfaces interface-name unit logical-unt-number ppp-options pap]
user@host# set passive
```

**NOTE:** By default, when PAP is enabled on an interface, the interface expects authenticate-request packets from the peer. However, the interface can be configured to send authentication request packets to the peer by configuring PAP to operate in passive mode. In PAP passive mode, the interface sends the authenticate-request packets to the peer only if the interface receives the PAP option from the peer during LCP negotiation—in passive mode, the interface does not authenticate the peer.

**See Also**  
*Configuring the PPP Authentication Protocol*

### Configuring Accounting for the Logical Interface

- Accounting Profiles Overview on page 182
- Configuring Accounting for the Logical Interface on page 183
- Displaying Accounting Profile for the Logical Interface on page 184

#### Accounting Profiles Overview

Juniper Networks routers and switches can collect various kinds of data about traffic passing through the router and switch. You can set up one or more accounting profiles that specify some common characteristics of this data, including the following:

- The fields used in the accounting records
- The number of files that the router or switch retains before discarding, and the number of bytes per file
- The polling period that the system uses to record the data

You configure the profiles and define a unique name for each profile using statements at the `[edit accounting-options]` hierarchy level. There are two types of accounting profiles: interface profiles and filter profiles. You configure interface profiles by including the `interface-profile` statement at the `[edit accounting-options]` hierarchy level. You configure filter profiles by including the `filter-profile` statement at the `[edit accounting-options]` hierarchy level. For more information, see the Network Management and Monitoring Guide.

You apply filter profiles by including the `accounting-profile` statement at the `[edit firewall filter filter-name]` and `[edit firewall family family filter filter-name]` hierarchy levels. For more information, see the Routing Policies, Firewall Filters, and Traffic Policers Feature Guide.
Configuring Accounting for the Logical Interface

Before you begin

You must configure a profile to collect error and statistic information for input and output packets on a particular logical interface. An accounting profile specifies what statistics should be collected and written to a log file. For more information on how to configure an accounting-data log file, see the Configuring Accounting-Data Log Files.

An interface profile specifies the information collected and written to a log file. You can configure a profile to collect error and statistic information for input and output packets on a particular logical interface.

1. To configure which statistics should be collected for an interface, include the fields statement at the [edit accounting-options interface-profile profile-name] hierarchy level.

   [edit accounting-options interface-profile profile-name]
   user@host# set fields field-name

2. Each accounting profile logs its statistics to a file in the /var/log directory. To configure which file to use, include the file statement at the [edit accounting-options interface-profile profile-name] hierarchy level.

   [edit accounting-options interface-profile profile-name]
   user@host# set file filename

   **NOTE:** You must specify a file statement for the interface profile that has already been configured at the [edit accounting-options] hierarchy level. For more information, see the Configuring Accounting-Data Log Files.

3. Each interface with an accounting profile enabled has statistics collected once per interval time specified for the accounting profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the interval statement at the [edit accounting-options interface-profile profile-name] hierarchy level.

   [edit accounting-options interface-profile profile-name]
   user@host# set interval minutes

   **NOTE:** The minimum interval allowed is 1 minute. Configuring a low interval in an accounting profile for a large number of interfaces might cause serious performance degradation.
4. To configure the interfaces on which the accounting needs to be performed, apply 
the interface profile to a logical interface by including the `accounting-profile` statement 
at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level.

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number accounting-profile profile-name
```

**See Also**
- Accounting Options Overview
- Configuring Accounting-Data Log Files

**Displaying Accounting Profile for the Logical Interface**

**Purpose**
To display the configured accounting profile a particular logical interface at the `[edit
accounting-options interface-profile profile-name]` hierarchy level:

- interface-name—ge-1/0/1
- Logical unit number—1
- Interface profile —if_profile
- File name—if_stats
- Interval—15 minutes

**Action**
- Run the `show` command at the `[edit interfaces ge-1/0/1 unit 1]` hierarchy level.

```
[edit interfaces ge-1/0/1 unit 1]
accounting-profile if_profile;
```

- Run the `show` command at the `[edit accounting-options]` hierarchy level.

```
interface-profile if_profile {
  interval 15;
  file if_stats {
    fields {
      input-bytes;
      output-bytes;
      input-packets;
      output-packets;
      input-errors;
      output-errors;
    }
  }
}
```

**Meaning**
The configured accounting and its associated set options are displayed as expected.
Enabling or Disabling SNMP Notifications on Logical Interfaces

By default, Simple Network Management Protocol (SNMP) notifications are sent when the state of an interface or a connection changes. To explicitly enable these notifications on the logical interface, include the `traps` statement; to disable these notifications on the logical interface, include the `no-traps` statement:

```
(traps | no-traps);
```

You can include these statements at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`

Disabling a Logical Interface

You can unconfigure a logical interface, effectively disabling that interface, without removing the logical interface configuration statements from the configuration. To do this, include the `disable` statement:

```
disable;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`

When an interface is disabled, a route (pointing to the reserved target “REJECT”) with the IP address of the interface and a 32–bit subnet mask is installed in the routing table. See Routing Protocols.

Example: Disabling a Logical Interface

Sample interface configuration:

```
[edit interfaces]
user@host# show
et-2/1/1 { 
  vlan-tagging;
  encapsulation flexible-ethernet-services;
  unit 0 { 
    vlan-id 1000;
    family inet { 
      address 11.0.0.20/24; 
      }
  }
}
```
Disabling the interface:

[edit interfaces et-2/1/1 unit 0]
user@host# set disable

Verifying the interface configuration:

[edit interfaces et-2/1/1]
user@host# show disable
disable; # Interface is marked as disabled.
unit 0 {
  vlan-id 1000;
  family inet {
    address 11.0.0.20/24;
  }
}

Configuring Logical System Interface Properties

With Junos OS, you can partition a single physical router into multiple logical devices that perform independent routing tasks. Because logical systems perform a subset of the tasks once handled by the physical router, logical systems offer an effective way to maximize the use of a single router.

1. Configure the physical interface that needs to be partitioned into multiple logical systems.

   [edit]
   user@host# set interfaces interface-name description description

2. Create the logical system interface on the logical unit.

   [edit]
   user@host# set logical-systems name interfaces interface-name unit logical-unit-number description description

3. Configure the required properties for the logical system.

   [edit logical-systems name]
   user@host# set interfaces interface-name unit logical-unit-number family name address address

Protocol Family Configuration and Interface Address Statements

For each logical interface, you must configure one or more protocol families. You can also configure interface address properties. To do this, include the following statements:

```plaintext
family family {
  accounting {
    destination-class-usage;
  }
}
```
source-class-usage {
    direction;
}
}

address address {
    destination address;
}

bundle interface-name;

filter {
    dialer filter-name;
    input filter-name;
    output filter-name;
    group filter-group-number;
}

interface-mode (access | trunk);

ipsec-sa sa-name;

keep-address-and-control;

mtu bytes;

multicast-only;

negociate-address;

no-redirects:

policer {
    arp policer-template-name;
    input policer-template-name;
    output policer-template-name;
}

primary;

protocols [inet isompls];

proxy inet-address address;

receive-options-packets;

receive-ttl-exceeded;

remote (inet-address address | mac-address address);

rpf-check <fail-filter filter-name>;

sampling {
    direction;
}

service {
    input {
        service-set service-set-name <service-filter filter-name>;
        post-service-filter filter-name;
    }
}

output {
    service-set service-set-name <service-filter filter-name>;
}

}

targeted-broadcast {
    forward-and-send-to-re;
    forward-only;
}

(translate-discard-eligible | no-translate-discard-eligible);

## Configuring the Protocol Family

A protocol family is a group of logical properties within an interface configuration. Protocol families include all the protocols that make up a protocol suite. To use a protocol within a particular suite, you must configure the entire protocol family as a logical property for an interface.

Junos OS protocol families include the following common protocol suites:

- Inet—Supports IP protocol traffic, including OSPF, BGP, and Internet Control Message Protocol (ICMP).
- Inet6—Supports IPv6 protocol traffic, including RIP for IPv6 (RIPng), IS-IS, and BGP.
- ISO—Supports IS-IS traffic.
- MPLS—Supports MPLS.

In addition to the common protocol suites, JUNOS protocol families sometimes use the following protocol suites. For more information see, `family`.

To configure the logical interface’s protocol family, include the `family` statement, specifying the selected family. To configure the protocol family, following are the minimum configuration tasks under the `[edit interfaces interface-name unit logical-unit-number family family]` hierarchy.

Configuring the Interface Address

You assign an address to an interface by specifying the address when configuring the protocol family. For the **inet** or **inet6** family, configure the interface IP address. For the **iso** family, configure one or more addresses for the loopback interface. For the **ccc**, **ethernet-switching**, **tcc**, **mpls**, **tnp**, and **vpls** families, you never configure an address.

**NOTE:** The point-to-point (PPP) address is taken from the loopback interface address that has the primary attribute. When the loopback interface is configured as an unnumbered interface, it takes the primary address from the donor interface.

To assign an address to an interface, perform the following steps:
1. Configure the interface address at the [edit interfaces interface-name unit logical-unit-number family family] hierarchy level.
   - To configure an IPv4 address on routers and switches running Junos OS, use the interface interface-name unit number family inet address a.b.c.d/nn statement at the [edit interfaces] hierarchy level.

   You can also assign multiple IPv4 addresses on the same interface.

   [edit interfaces ]
   user@host# set interface-name unit logical-unit-number family inet address a.b.c.d/nn

   NOTE:
   - Juniper Networks routers and switches support /31 destination prefixes when used in point-to-point Ethernet configurations; however, they are not supported by many other devices, such as hosts, hubs, routers, or switches. You must determine if the peer system also supports /31 destination prefixes before configuration.
   - You can configure the same IPv4 address on multiple physical interfaces. When you assign the same IPv4 address to multiple physical interfaces, the operational behavior of those interfaces differs, depending on whether they are implicitly or explicitly point-to-point.
   - By default, all interfaces are assumed to be point-to-point (PPP) interfaces. For all interfaces except aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet, you can explicitly configure an interface to be a point-to-point connection.
   - If you configure the same IP address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration. The remaining IP address configurations are ignored, leaving some interfaces without an assigned address. Interfaces without an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

   [edit interfaces ]
   user@host# set interface-name unit logical-unit-number family inet6 address aaaa:bbbb:...:zzzz/nn

   NOTE:
   - To configure an IPv6 address on routers and switches running Junos OS, use the interface interface-name unit number family inet6 address aaaa:bbbb:...:zzzz/nn statement at the [edit interfaces] hierarchy level.

   [edit interfaces ]
   user@host# set interface-name unit logical-unit-number family inet6 address aaaa:bbbb:...:zzzz/nn

   NOTE:
   - You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values. The double colon (::) represents all bits set to 0.
• You must manually configure the router or switch advertisement and advertise the default prefix for autoconfiguration to work on a specific interface.

2. [Optional] Set the broadcast address on the network or subnet.

   [edit interfaces interface-name unit logical-unit-number family family address address],
   user@host# set broadcast address

   NOTE: The broadcast address must have a host portion of either all ones or all zeros. You cannot specify the addresses 0.0.0.0 or 255.255.255.255

3. [Optional] specify the remote address of the connection for the encrypted, PPP-encapsulated, and tunnel interfaces.

   [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]
   user@host# set destination address

4. [Optional] For interfaces that carry IP version 6 (IPv6) traffic, configure the host to assign itself a unique 64-Bit IP Version 6 interface identifier (EUI-64).

   [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]
   user@host# set eui-64

Configuring Default, Primary, and Preferred Addresses and Interfaces

• Default, Primary, and Preferred Addresses and Interfaces on page 193
• Configuring the Primary Interface for the Router on page 194
• Configuring the Primary Address for an Interface on page 194
• Configuring the Preferred Address for an Interface on page 195

Default, Primary, and Preferred Addresses and Interfaces

The router has a default address and a primary interface, and interfaces have primary and preferred addresses.

The default address of the router is used as the source address on unnumbered interfaces. The routing protocol process tries to pick the default address as the router ID, which is used by protocols, including OSPF and internal BGP (IBGP).
The primary interface for the router is the interface that packets go out when no interface name is specified and when the destination address does not imply a particular outgoing interface.

An interface’s primary address is used by default as the local address for broadcast and multicast packets sourced locally and sent out the interface. An interface’s preferred address is the default local address used for packets sourced by the local router to destinations on the subnet.

The default address of the router is chosen using the following sequence:

1. The primary address on the loopback interface lo0 that is not 127.0.0.1 is used.
2. The primary address on the primary interface is used.

Configuring the Primary Interface for the Router

The primary interface for the router has the following characteristics:

- It is the interface that packets go out when you type a command such as ping 255.255.255.255—that is, a command that does not include an interface name (there is no interface type-0/0/0.0 qualifier) and where the destination address does not imply any particular outgoing interface.
- It is the interface on which multicast applications running locally on the router, such as Session Announcement Protocol (SAP), do group joins by default.
- It is the interface from which the default local address is derived for packets sourced out an unnumbered interface if there are no non-127 addresses configured on the loopback interface, lo0.

By default, the multicast-capable interface with the lowest-index address is chosen as the primary interface. If there is no such interface, the point-to-point interface with the lowest index address is chosen. Otherwise, any interface with an address could be picked. In practice, this means that, on the router, the fxp0 or em0 interface is picked by default.

To configure a different interface to be the primary interface, include the primary statement:

```
primary;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces interface-name unit logical-unit-number family family]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]

Configuring the Primary Address for an Interface

The primary address on an interface is the address that is used by default as the local address for broadcast and multicast packets sourced locally and sent out the interface. For example, the local address in the packets sent by a ping interface so-0/0/0.0
255.255.255.255 command is the primary address on interface so-0/0/0. The primary address flag also can be useful for selecting the local address used for packets sent out unnumbered interfaces when multiple non-127 addresses are configured on the loopback interface, lo0. By default, the primary address on an interface is selected as the numerically lowest local address configured on the interface.

To set a different primary address, include the primary statement:

```
primary;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces interface-name unit logical-unit-number family family address address]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]

### Configuring the Preferred Address for an Interface

The preferred address on an interface is the default local address used for packets sourced by the local router to destinations on the subnet. By default, the numerically lowest local address is chosen. For example, if the addresses 172.16.1.1/12, 172.16.1.2/12, and 172.16.1.3/12 are configured on the same interface, the preferred address on the subnet (by default, 172.16.1.1) would be used as a local address when you issue a ping 172.16.1.5 command.

To set a different preferred address for the subnet, include the preferred statement:

```
preferred;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces interface-name unit logical-unit-number family family address address]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]

### Operational Behavior of Interfaces When the Same IPv4 Address Is Assigned to Them

You can configure the same IPv4 address on multiple physical interfaces. When you assign the same IPv4 address to multiple physical interfaces, the operational behavior of those interfaces differs, depending on whether they are implicitly or explicitly point-to-point.
NOTE: By default, all interfaces are assumed to be point-to-point (PPP) interfaces. For all interfaces except aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet, you can explicitly configure an interface to be a point-to-point connection.

NOTE: If you configure the same IP address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration. The remaining IP address configurations are ignored, leaving some interfaces without an assigned address. Interfaces without an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

In the following example, the IP address configuration for interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
}
```

The following examples show the sample configuration of assigning the same IPv4 address to implicitly and explicitly point-to-point interfaces, and their corresponding `show interfaces terse` command outputs to see their operational status.

```
[edit]
user@host# show
ge-0/1/0 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
ge-3/0/1 {
  unit 0 {
    family inet {
```
address 200.1.1.1/24;
}
}
}

The sample output shown below for the above configuration reveals that only ge-0/1/0.0 was assigned the same IPv4 address 200.1.1.1/24 and its link state was **up**, while ge-3/0/1.0 was not assigned the IPv4 address, though its link state was **up**, which means that it will be operational only when it gets a unique IPv4 address other than 200.1.1.1/24.

```bash
user@host> show interfaces terse ge*
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>Admin</th>
<th>Link</th>
<th>Proto</th>
<th>Local</th>
<th>Remote</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/1/0</td>
<td>up</td>
<td>up</td>
<td>up</td>
<td>inet</td>
<td>200.1.1.1/24</td>
</tr>
<tr>
<td>ge-0/1/0.0</td>
<td>up</td>
<td>up</td>
<td>inet</td>
<td>200.1.1.1/24</td>
<td></td>
</tr>
<tr>
<td>ge-0/1/1</td>
<td>up</td>
<td>down</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ge-3/0/0</td>
<td>up</td>
<td>down</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ge-3/0/1</td>
<td>up</td>
<td>up</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ge-3/0/1.0</td>
<td>up</td>
<td>up</td>
<td>inet</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

[edit]
user@host# show
so-0/0/0 { 
    unit 0 { 
        family inet { 
            address 200.1.1.1/24; 
        } 
    } 
}

The sample output shown below for the above configuration reveals that both so-0/0/0.0 and so-0/0/3.0 were assigned the same IPv4 address 200.1.1.1/24 and that their link states were down, which means that to make them operational at least one of them will have to be configured with a unique IPv4 address other than 200.1.1.1/24.

```bash
user@host> show interfaces terse so*
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>Admin</th>
<th>Link</th>
<th>Proto</th>
<th>Local</th>
<th>Remote</th>
</tr>
</thead>
<tbody>
<tr>
<td>so-0/0/0</td>
<td>up</td>
<td>up</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>so-0/0/0.0</td>
<td>up</td>
<td>down</td>
<td>inet</td>
<td>200.1.1.1/24</td>
<td></td>
</tr>
<tr>
<td>so-0/0/1</td>
<td>up</td>
<td>up</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>so-0/0/2</td>
<td>up</td>
<td>down</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>so-0/0/3</td>
<td>up</td>
<td>up</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>so-0/0/3.0</td>
<td>up</td>
<td>down</td>
<td>inet</td>
<td>200.1.1.1/24</td>
<td></td>
</tr>
<tr>
<td>so-1/1/0</td>
<td>up</td>
<td>down</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Configuring ICCP for MC-LAG

For multichassis link aggregation (MC-LAG), you must configure Inter-Control Center Communications Protocol (ICCP) to exchange information between two MC-LAG peers.

To enable ICCP, include the `iccp` statement at the `[edit protocols]` hierarchy level:

```
[edit protocols]
iccp {
    authentication-key string;
    local-ip-addr ipv4-address;
    peer ip-address {
        authentication-key string;
        liveness-detection {
            detection-time {
                threshold milliseconds;
            }
            minimum-interval milliseconds;
            minimum-receive-interval milliseconds;
            multiplier number;
            no-adaptation;
            transmit-interval {
                minimum-interval milliseconds;
                threshold milliseconds;
            }
            version (1 | automatic);
        }
        local-ip-addr ipv4-address;
        redundancy-group-id-list [ redundancy-groups ];
        session-establishment-hold-time value;
    }
    session-establishment-hold-time value;
    traceoptions;
}
```

The `local-ip-address` statement sets the source address. This could be a specified address or interface address. The `session-establishment-hold-time` statement determines whether a chassis takes over as the master at the ICCP session.
The **authentication-key** statement is provided by TCP Message Digest 5 (md5) option for an ICCP TCP session. The **redundancy-group-id-list** statement specifies the redundancy groups between ICCP peers and the **liveness-detection** hierarchy configures Bidirectional Forwarding Detection (BFD) protocol options.

**NOTE:** ICCP is based on TCP and it uses IP routes to reach the MC-LAG peer. To ensure that the ICCP session is as resilient as possible, we recommend that you configure alternative routes between the ICCP end-point IP addresses. Alternatively, configure a LAG interface that has two or more interfaces between the MC-LAG pairs to prevent session failure when there are no alternative routes.

For Inter-Control Center Communications Protocol (ICCP) in a multichassis link aggregation group (MC-LAG) configured in an active-active bridge domain, you must ensure that you configure the same peer IP address hosting the MC-LAG by including the **peer ip-address** statement at the [edit protocols iccp] hierarchy level and the **multi-chassis-protection peer ip-address** statement at the [edit interfaces interface-name] hierarchy level. Multichassis protection reduces the configuration at the logical interface level for MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces. If the ICCP is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer active-active node specified by the **peer** statement.

For example, the following statements illustrate how the same peer IP address can be configured for both the ICCP peer and multichassis protection link:

```
set interfaces ae1 unit 0 multi-chassis-protection 10.255.34.112 interface ae0
set protocols iccp peer 10.255.34.112 redundancy-group-id-list 1
```

Although you can commit an MC-LAG configuration with various parameters defined for it, you can configure multichassis protection between two peers without configuring the ICCP peer address. You can also configure multiple ICCP peers and commit such a configuration.

**Related Documentation**
Configuring IPCP Options for Interfaces with PPP Encapsulation

For interfaces with PPP encapsulation, you can configure IPCP to negotiate IP address assignments and to pass network-related information such as Windows Name Service (WINS) and Domain Name System (DNS) servers, as defined in RFC 1877, *PPP Internet Protocol Control Protocol Extensions for Name Server Addresses*.

When you enable a PPP interface, you can configure an IP address, enable the interface to negotiate an IP address assignment from the remote end, or allow the interface to be unnumbered. You can also assign a destination profile to the remote end. The destination profile includes PPP properties, such as primary and secondary DNS and NetBIOS Name Servers (NBNSs). These options are described in the following sections:

**NOTE:** The Junos OS does not request name servers from the remote end; the software does, however, send name servers to the remote end if requested.

Before you begin

You must configure the PPP encapsulation on the interface before configuring the IPCP option. On the logical interface, the following PPP encapsulation types are supported:

- atm-mippp-llc
- atm-ppp-llc
- atm-ppp-vc-mux
- multilink-ppp

For more information about PPP encapsulation, see “Configuring Interface Encapsulation on Logical Interfaces” on page 173 and *Configuring ATM Interface Encapsulation*.

- To configure an IP address for the interface, include the `address` statement in the configuration. For more information, see “Configuring the Interface Address” on page 191.

If you include the `address` statement in the configuration, you cannot include the `negotiate-address` or `unnumbered-address` statement in the configuration.

When you include the `address` statement in the interface configuration, you can assign PPP properties to the remote end.

**NOTE:** The option to negotiate an IP address is not allowed in MLFR and MFR encapsulations.

- To enable the interface to obtain an IP address from the remote end, include the `negotiate-address` statement at the `[edit interfaces interface-name unit logical-unit-number family inet]` hierarchy level.
NOTE: If you include the `negotiate-address` statement in the configuration, you cannot include the `address` or `unnumbered-address` statement in the configuration.

- To configure an interface to be unnumbered, include the `unnumbered-address` and `destination` statements in the configuration.

```plaintext
[edit interfaces interface-name unit logical-unit-number family inet]
user@host# set negotiate-address
```

```plaintext
[edit interfaces interface-name unit logical-unit-number family inet]
user@host# set unnumbered-address interface-name
user@host# set destination address
```

NOTE:
- The `unnumbered-address` statement enables the local address to be derived from the specified interface. The interface name must include a logical unit number and must have a configured address (see “Configuring the Interface Address” on page 191). Specify the IP address of the remote interface with the `destination` statement.
- If you include the `unnumbered-address` statement in the configuration, you cannot include the `address` or `negotiate-address` statement in the interface configuration.

- To assign PPP properties to the remote end include the `destination-profile` statement:

```plaintext
[edit interfaces interface-name unit logical-unit-number family inet address address]
user@host# set destination-profile name
```

```plaintext
[edit interfaces interface-name unit logical-unit-number family inet unnumbered-address interface-name]
user@host# set destination-profile name
```

NOTE:
- You can assign PPP properties to the remote end, after you include the `address` or `unnumbered-address` statement in the interface configuration.
- You define the profile at the [edit access group-profile name ppp] hierarchy level. For more information, see Example: PPP MP for L2TP

Overview of Unnumbered Interfaces

When you need to conserve IP addresses, you can configure unnumbered interfaces. Setting up an unnumbered interface enables IP processing on the interface without assigning an explicit IP address to the interface. For IPv6, in which conserving addresses is not a major concern, you can configure unnumbered interfaces to share the same subnet across multiple interfaces. IPv6 unnumbered interfaces are only supported on Ethernet interfaces. The statements you use to configure an unnumbered interface depend on the type of interface you are configuring: a point-to-point interface or an Ethernet interface:

Configuring an Unnumbered Point-to-Point Interface

1. In configuration mode, go to the `edit interfaces interface-name unit logical-unit-number` hierarchy level.
   
   ```
   [edit ]
   user@host# edit interfaces interface-name unit logical-unit-number
   ```

2. To configure an unnumbered point-to-point interface, configure the protocol family, but do not include the `address` statement.
   
   ```
   [edit interfaces interface-name unit logical-unit-number]
   user@host# set family
   ```
NOTE:

- For interfaces with PPP encapsulation, you can configure an unnumbered interface by including the `unnumbered-interface` statement in the configuration. For more information, see “Configuring IPCP Options for Interfaces with PPP Encapsulation” on page 200.

- When configuring unnumbered interfaces, you must ensure that a source address is configured on some interface in the router. This address is the default address. We recommend that you do this by assigning an address to the loopback interface (lo0), as described in “Loopback Interface Configuration” on page 310. If you configure an address (other than a martian) on the lo0 interface, that address is always the default address, which is preferable because the loopback interface is independent of any physical interfaces and therefore is always accessible.

Configuring an Unnumbered Ethernet or Demux Interface

1. In configuration mode, go to the `[edit interfaces interface-name unit logical-unit-number family family-name]` hierarchy level.
   
   [edit ]
   user@host# edit interfaces interface-name unit logical-unit-number family family-name

2. To configure an unnumbered Ethernet or demultiplexing interface, include the `unnumbered-address` statement in the configuration.
   
   [edit interfaces interface-name unit logical-unit-number family family-name]
   user@host# set unnumbered-address interface-name

3. (Optional) To specify the unnumbered Ethernet interface as the next-hop interface for a configured static route, include the `qualified-next-hop` statement at the `[edit routing-options static route destination-prefix]` hierarchy level. This feature enables you to specify independent preferences and metrics for static routes on a next-hop basis.
   
   [edit routing-options static route destination-prefix]
   user@host# set qualified-next-hop (address | interface-name)
**NOTE:**

- The **unnumbered-address** statement currently supports configuration of unnumbered demux interfaces only for the IPv4 address family. You can configure unnumbered Ethernet interfaces for both IPv4 and IPv6 address families.

- The interface that you configure to be unnumbered **borrows** an assigned IP address from another interface, and is referred to as the **borrower interface**. The interface from which the IP address is borrowed is referred to as the **donor interface**. In the **unnumbered-address** statement, `interface-name` specifies the donor interface. For an unnumbered Ethernet interface, the donor interface can be an Ethernet, ATM, SONET, or loopback interface that has a logical unit number and configured IP address and is not itself an unnumbered interface. For an unnumbered IP demultiplexing interface, the donor interface can be an Ethernet or loopback interface that has a logical unit number and configured IP address and is not itself an unnumbered interface. In addition, for either Ethernet or demux, the donor interface and the borrower interface must be members of the same routing instance and the same logical system.

- When you configure an unnumbered Ethernet or demux interface, the IP address of the donor interface becomes the source address in packets generated by the unnumbered interface.

- You can configure a host route that points to an unnumbered Ethernet or demux interface. For information about host routes, see the *MPLS Applications Feature Guide*.

---

**Configuring a Preferred Source Address for Unnumbered Ethernet or Demux Interfaces**

When a loopback interface with multiple secondary IP addresses is configured as the donor interface for an unnumbered Ethernet or demux interface, you can optionally specify any one of the loopback interface's secondary addresses as the preferred source address for the unnumbered Ethernet or demux interface. This feature enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet or demux interfaces in your network.

1. In configuration mode, go to the `edit interfaces interface-name unit logical-unit-number family family-name` hierarchy level.

   ```
   [edit ]
   user@host# edit interfaces interface-name unit logical-unit-number family family-name
   ```

2. To configure a secondary address on a loopback donor interface as the preferred source address for an unnumbered Ethernet or demux interface, include the `preferred-source-address` option in the `unnumbered-address` statement:

   ```
   [edit interfaces interface-name unit logical-unit-number family family-name]
   ```
user@host# set unnumbered-address interface-name <preferred-source-address>

NOTE:
The following considerations apply when you configure a preferred source address on an unnumbered Ethernet or demux interface:

- The unnumbered-address statement currently supports the configuration of a preferred source address only for the IPv4 address family for demux interfaces, and for IPv4 and IPv6 address families for Ethernet interfaces.
- If you do not specify the preferred source address, the router uses the default primary IP address of the donor interface.
- You cannot delete an address on a donor loopback interface while it is being used as the preferred source address for an unnumbered Ethernet or demux interface.

Restrictions for Configuring Unnumbered Ethernet Interfaces

The following restrictions apply when you configure unnumbered Ethernet interfaces:

- The unnumbered-address statement currently supports the configuration of unnumbered Ethernet interfaces for IPv4 and IPv6 address families.
- You cannot assign an IP address to an Ethernet interface that is already configured as an unnumbered interface.
- The donor interface for an unnumbered Ethernet interface must have one or more configured IP addresses.
- The donor interface for an unnumbered Ethernet interface cannot be configured as unnumbered.
- An unnumbered Ethernet interface does not support configuration of the following address statement options: arp, broadcast, primary, preferred, and vrrp-group. For information about these options, see “Configuring the Interface Address” on page 191.
- Running IGMP and PIM are supported only on unnumbered Ethernet interfaces that directly face the host and have no downstream PIM neighbors. IGMP and PIM are not supported on unnumbered Ethernet interfaces that act as upstream interfaces in a PIM topology.
- Running OSPF and IS-IS on unnumbered Ethernet interfaces is not supported. However, you can run OSPF over unnumbered Ethernet interfaces configured as a Point-to-Point connection.

For link-state distribution using an interior gateway protocol (IGP), ensure that OSPF is enabled on the donor interface for an unnumbered interface configuration, so the donor IP address is reachable to establish OSPF sessions.
NOTE: If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```conf
textcolor:gray
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
}
```

For more information on configuring the same address on multiple interfaces, see "Configuring the Interface Address" on page 191.

Displaying the Unnumbered Ethernet Interface Configuration

**Purpose** To display the configured unnumbered interface at the [edit interfaces interface-name unit logical-unit-number] hierarchy level:

- Unnumbered interface —ge-1/0/0
- Donor interface —ge-0/0/0
- Donor interface address —4.4.4.1/24

The unnumbered interface "borrows" an IP address from the donor interface.

**Action** Run the show command at the [edit] hierarchy level.

```conf
textcolor:gray
interfaces {
  ge-0/0/0 {
    unit 0 {
      family inet {
        address 4.4.4.1/24;
      }
    }
  }
  ge-1/0/0 {
```
Meaning

The sample configuration that is described works correctly on M and T Series routers. For unnumbered interfaces on MX Series routers, you must additionally configure static routes on an unnumbered Ethernet interface by including the `qualified-next-hop` statement at the `[edit routing-options static route destination-prefix]` hierarchy level to specify the unnumbered Ethernet interface as the next-hop interface for a configured static route.

Displaying the Configured Preferred Source Address for an Unnumbered Ethernet Interface

**Purpose**

To display the configuration of preferred source address for an unnumbered interface at the `[edit interfaces interface-name unit logical-unit-number family inet]` hierarchy level:

- Unnumbered interface — `ge-4/0/0`
- Donor interface — `lo0`
- Donor interface primary address — `2.2.2.1/32`
- Donor interface secondary address — `3.3.3.1/32`

**Action**

Run the `show` command at the `[edit]` hierarchy level.

```plaintext
interfaces {
    lo0 {
        unit 0 {
            family inet {
                address 2.2.2.1/32;
                address 3.3.3.1/32;
            }
        }
    }
    interfaces {
        ge-4/0/0 {
            unit 0 {
                family inet {
                    unnumbered-address lo0.0 preferred-source-address 3.3.3.1;
                }
            }
        }
    }
}
```
Meaning  The loopback interface lo0 is the donor interface from which unnumbered Ethernet interface ge-4/0/0 “borrows” an IP address.

The example shows one of the loopback interface’s secondary addresses, 3.3.3.1, as the preferred source address for the unnumbered Ethernet interface.

Displaying the Configuration for Unnumbered Ethernet Interface as the Next Hop for a Static Route

Purpose  To display the unnumbered interface configured as the next hop for the static route at the [edit interfaces interface-name unit logical-unit-number family inet] hierarchy level:

- Unnumbered interface —ge-0/0/0
- Donor interface —lo0
- Donor interface primary address—5.5.5.1/32
- Donor interface secondary address—6.6.6.1/32
- Static route—7.7.7.1/32

Action  • Run the show command at the [edit] hierarchy level.

```bash
interfaces {
  ge-0/0/0 {
    unit 0 {
      family inet {
        unnumbered-address lo0.0;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 5.5.5.1/32;
        address 6.6.6.1/32;
      }
    }
  }
}

static {
  route 7.7.7.1/32 {
    qualified-next-hop ge-0/0/0.0;
  }
}
```

• The following configuration enables the kernel to install a static route to address 7.7.7.1/32 with a next hop through unnumbered interface ge-0/0/0.0.
Meaning

In this example, `ge-0/0/0` is the unnumbered interface and a loopback interface, `lo0`, is the donor interface from which `ge-0/0/0` “borrows” an IP address. The example also configures a static route to `7.7.7.1/32` with a next hop through unnumbered interface `ge-0/0/0.0`.

Setting the Protocol MTU

When you initially configure an interface, the protocol maximum transmission unit (MTU) is calculated automatically. If you subsequently change the media MTU, the protocol MTU on existing address families automatically changes.

For a list of default protocol MTU values, see “Media MTU Sizes by Interface Type” on page 85.

To modify the MTU for a particular protocol family, include the `mtu` statement:

```
mtu bytes;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]`

If you increase the size of the protocol MTU, you must ensure that the size of the media MTU is equal to or greater than the sum of the protocol MTU and the encapsulation overhead. For a list of encapsulation overhead values, see “Encapsulation Overhead by Interface Encapsulation Type” on page 97. If you reduce the media MTU size, but there are already one or more address families configured and active on the interface, you must also reduce the protocol MTU size. (You configure the media MTU by including the `mtu` statement at the `[edit interfaces interface-name]` hierarchy level.)

NOTE: Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

The maximum number of data-link connection identifiers (DLCIs) is determined by the MTU on the interface. If you have keepalives enabled, the maximum number of DLCIs is 1000, with the MTU set to 5012.

The actual frames transmitted also contain cyclic redundancy check (CRC) bits, which are not part of the MTU. For example, the default protocol MTU for a Gigabit Ethernet interface is 1500 bytes, but the largest possible frame size is actually 1504 bytes; you need to consider the extra bits in calculations of MTUs for interoperability.

Related Documentation

- Media MTU Overview on page 84
**Disabling the Removal of Address and Control Bytes**

For Point-to-Point Protocol (PPP) CCC-encapsulated interfaces, the address and control bytes are removed by default before the packet is encapsulated into a tunnel.

You can disable the removal of address and control bytes. To do this, include the `keep-address-and-control` statement:

```
keep-address-and-control;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family ccc]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family ccc]`

**Related Documentation**
- `keep-address-and-control` on page 717

**Disabling the Transmission of Redirect Messages on an Interface**

By default, the interface sends protocol redirect messages. To disable the sending of these messages on an interface, include the `no-redirects` statement:

```
no-redirects;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]`

To disable the sending of protocol redirect messages for the entire router or switch, include the `no-redirects` statement at the `[edit system]` hierarchy level.

**Related Documentation**
- `no-redirects` on page 840

**Applying Policers**

- Overview of Applying Policers on page 211
- Applying Aggregate Policers on page 212
- Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs on page 214
- Configuring Hierarchical Policers on page 216
- Configuring a Single-Rate Two-Color Policer on page 217
Overview of Applying Policers

Policers allow you to perform simple traffic policing on specific interfaces or Layer 2 virtual private networks (VPNs) without configuring a firewall filter. To apply policers, include the `policer` statement:

```plaintext
policer {
  arp policer-template-name;
  input policer-template-name;
  output policer-template-name;
}
```

You can include these statements at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]`

In the `family` statement, the protocol family can be `ccc`, `inet`, `inet6`, `mpls`, `tcc`, or `vpls`.

In the `arp` statement, list the name of one policer template to be evaluated when Address Resolution Protocol (ARP) packets are received on the interface. By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the `family inet` statement. If you want more stringent or lenient policing of ARP packets, you can configure an interface-specific policer and apply it to the interface. You configure an ARP policer just as you would configure any other policer, at the `[edit firewall policer]` hierarchy level. If you apply this policer to an interface, the default ARP packet policer is overridden. If you delete this policer, the default policer takes effect again.

In the `input` statement, list the name of one policer template to be evaluated when packets are received on the interface.

In the `output` statement, list the name of one policer template to be evaluated when packets are transmitted on the interface.

**NOTE:** To use policing on a CCC or TCC interface, you must configure the CCC or TCC protocol family.

You can configure a different policer on each protocol family on an interface, with one input policer and one output policer for each family. When you apply policers, you can configure the family `ccc`, `inet`, `inet6`, `mpls`, `tcc`, or `vpls` only, and one ARP policer for the family `inet` protocol only. Each time a policer is referenced, a separate copy of the policer is installed on the packet forwarding components for that interface.
If you apply both policers and firewall filters to an interface, input policers are evaluated before input firewall filters, and output policers are evaluated after output firewall filters.

If you apply the policer to the interface lo0, it is applied to packets received or transmitted by the Routing Engine.

On T Series, M120, and M320 platforms, if the interfaces are on the same FPC, the filters or policers do not act on the sum of traffic entering and exiting the interfaces.

For more information about policers, see the Routing Policies, Firewall Filters, and Traffic Policers Feature Guide.

Applying Aggregate Policers

• Applying Aggregate Policers on page 212

Applying Aggregate Policers

By default, if you apply a policer to multiple protocol families on the same logical interface, the policer restricts traffic for each protocol family individually. For example, a policer with a 50 Mbps bandwidth limit applied to both IPv4 and IPv6 traffic would allow the interface to accept 50 Mbps of IPv4 traffic and 50 Mbps of IPv6 traffic. If you apply an aggregate policer, the policer would allow the interface to receive only 50 Mbps of IPv4 and IPv6 traffic combined.

To configure an aggregate policer, include the logical-interface-policer statement at the [edit firewall policer policer-template-name] hierarchy level:

[edit firewall policer policer-template-name]
logical-interface-policer;

For the policer to be treated as an aggregate, you must apply it to multiple protocol families on a single logical interface by including the policer statement:

policer {
    arp policer-template-name;
    input policer-template-name;
    output policer-template-name;
}

You can include these statements at the following hierarchy levels:

• [edit interfaces interface-name unit logical-unit-number family family]
• [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]

In the family statement, the protocol family can be ccc, inet, inet6, mpls, tcc, or vpls.

The protocol families on which you do not apply the policer are not affected by the policer. For example, if you configure a single logical interface to accept MPLS, IPv4, and IPv6 traffic and you apply the logical interface policer policer1 to only the IPv4 and IPv6 protocol families, MPLS traffic is not subject to the constraints of policer1.
If you apply `policer1` to a different logical interface, there are two instances of the policer. This means the Junos OS polices traffic on separate logical interfaces separately, not as an aggregate, even if the same logical-interface policer is applied to multiple logical interfaces on the same physical interface port.

**Example: Applying Aggregate Policers**

Configure two logical interface policers: `aggregate_police1` and `aggregate_police2`. Apply `aggregate_police1` to IPv4 and IPv6 traffic received on logical interface `fe-0/0/0.0`. Apply `aggregate_police2` to CCC and MPLS traffic received on logical interface `fe-0/0/0.0`. This configuration causes the software to create only one instance of `aggregate_police1` and one instance of `aggregate_police2`.

Apply `aggregate_police1` to IPv4 and IPv6 traffic received on another logical interface `fe-0/0/0.1`. This configuration causes the software to create a new instance of `aggregate_police1`, one that applies to unit 0 and another that applies to unit 1.

```bash
[edit firewall]
policer aggregate_police1 {
    logical-interface-policer;
    if-exceeding {
        bandwidth-limit 100m;
        burst-size-limit 500k;
    }
    then {
        discard;
    }
}
policer aggregate_police2 {
    logical-interface-policer;
    if-exceeding {
        bandwidth-limit 10m;
        burst-size-limit 200k;
    }
    then {
        discard;
    }
}
[edit interfaces fe-0/0/0]
unit 0 {
    family inet {
        policer {
            input aggregate_police1;
        }
    }
    family inet6 {
        policer {
            input aggregate_police1;
        }
    }
    family ccc {
        policer {
            input aggregate_police2;
        }
    }
}`
Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs

- Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs on page 214

Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs

M40e, M120, and M320 edge routers and T Series core routers with Enhanced Intelligent Queuing (IQE) PICs support hierarchical policers in the ingress direction and allow you to apply a hierarchical policer for the premium and aggregate (premium plus normal) traffic levels to an interface. Hierarchical policers provide cross-functionality between the configured physical interface and the Packet Forwarding Engine.

Before you begin, there are some general restrictions that apply to hierarchical policers:

- Only one type of policer can be configured for a logical or physical interface. For example, a hierarchical policer and a regular policer in the same direction for the same logical interface is not allowed.
- The chaining of the policers—that is, applying policers to both a port and the logical interfaces of that port—is not allowed.
- There is a limit of 64 policers per interface in case there is no BA classification, providing a single policer per DLCI.
- Only one kind of policer can be applied on a physical or logical interface.
- The policer should be independent of BA classification. Without BA classification, all traffic on an interface will be treated either as EF or non-EF, based on the configuration. With BA classification, an interface can support up to 64 policers. Again, the interface here may be a physical interface or logical interface (for example, DLCI).
- With BA classification, the miscellaneous traffic (the traffic not matching with any of the BA classification DSCP/EXP bits) will be policed as non-EF traffic. No separate policers will be installed for this traffic.
Hierarchical Policer Overview

Hierarchical policing uses two token buckets, one for aggregate (non-EF) traffic and one for premium (EF) traffic. Which traffic is EF and which is non-EF is determined by the class-of-service configuration. Logically, hierarchical policing is achieved by chaining two policers.

Figure 11: Hierarchical Policer

+ EF Traffic + Premium Policer

+ non-EF Traffic + Aggregate Policer

In the example in Figure 11 on page 215, EF traffic is policed by Premium Policer and non EF traffic is policed by Aggregate Policer. What that means is, for EF traffic the out-of-spec action will be the one that is configured for Premium Policer, but the in-spec EF traffic will still consume the tokens from the Aggregate Policer.

But EF traffic will never be submitted to the out-of-spec action of the Aggregate Policer. Also, if the out-of-spec action of the Premium Policer is not set to Discard, those out-of-spec packets will not consume the tokens from the Aggregate Policer. Aggregate Policer only polices the non-EF traffic. As you can see, the Aggregate Policer token bucket can go negative, if all the tokens are consumed by the non-EF traffic and then you get bursts of EF traffic. But that will be for a very short time, and over a period of time it will average out. For example:

- **Premium Policer**: Bandwidth 2 Mbps, OOS Action: Discard
- **Aggregate Policer**: Bandwidth 10 Mbps, OOS Action: Discard

In the above case, EF traffic is guaranteed 2 Mbps and the non-EF traffic will get from 8 Mbps to 10 Mbps, depending on the input rate of the EF traffic.

Hierarchical Policing Characteristics

Hierarchical token bucket features include:

- Ingress traffic is first classified into EF and non-EF traffic prior to applying a policer:
  - Classification is performed by Q-tree lookup
- Channel number selects a shared token bucket policer:
  - Dual token bucket policer is divided into two single bucket policers:
    - Policer1—EF traffic
    - Policer2—non-EF traffic
- Shared token bucket is used to police the traffic as follows:
  - Policer1 is set to EF rate (for example, 2 Mbps)
  - Policer2 is set to aggregate interface policed rate (for example, 10 Mbps).
• EF traffic gets applied to Policer1.
  • If traffic is in-spec it is allowed to pass and decrement from both Policer1 and Policer2.
  • If traffic is out-of-spec it can be discarded or marked with a new FC or loss priority. Policer2 will not do anything with out-of-spec EF traffic.

• Non-EF traffic gets applied only to Policer2.
  • If traffic is in-spec it is allowed to pass through and decremented Policer2.
  • If traffic is out-of-spec it is discarded or marked with a new FC or set with a new drop priority.

• Rate-limit the port speed to a desired rate at Layer 2
• Rate-limit the EF traffic
• Rate-limit the non-EF traffic
• Policing drops counted per color

See Also • Class of Service Feature Guide (Routers and EX9200 Switches)

Configuring Hierarchical Policers

To configure a hierarchical policer, apply the policing-priority statement to the proper forwarding class and configure a hierarchical policer for the aggregate and premium level. For more information about class of service, see the Class of Service Feature Guide (Routers and EX9200 Switches).

NOTE: Hierarchical policers can only be configured on SONET physical interfaces hosted on an IQE PIC. Only aggregate and premium levels are supported.

CoS Configuration of Forwarding Classes for Hierarchical Policers

[edit class-of-service forwarding-classes]
class fc1 queue-num 0 priority high policing-priority premium;
class fc2 queue-num 1 priority low policing-priority normal;
class fc3 queue-num 2 priority low policing-priority normal;
class fc4 queue-num 3 priority low policing-priority normal;

For detailed information on class-of-service configuration and statements, see the Class of Service Feature Guide (Routers and EX9200 Switches).

Firewall Configuration for Hierarchical Policers

[edit firewall hierarchical-policer foo]
aggregate {
  if-exceeding {
    bandwidth-limit 70m;
    burst-size-limit 1500;
  }
You can apply the hierarchical policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-hierarchical-policer foo;
```

You also have the option to apply the policer at the physical port level as follows:

```
[edit interfaces so-0/1/0 layer2-policer]
input-hierarchical-policer foo;
```

### Configuring a Single-Rate Two-Color Policer

You can configure a single-rate two-color policer as follows:

```
[edit firewall policer foo]
if-exceeding {
    bandwidth-limit 50m;
    burst-size-limit 1500;
}
then {
    discard;
}
```

You can apply the policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-policer foo;
```

You also have the option to apply the policer at the physical port level as follows:

```
[edit interfaces so-0/1/0 layer2-policer]
input-policer foo;
```

### Configuring a Single-Rate Color-Blind Policer

This section describes single-rate color blind and color aware policers.

You can configure a single-rate color blind policer as follows:
You can apply the single-rate color blind policer as follows:

[edit firewall three-color-policer foo]
  single-rate {
    color-blind;
    committed-information-rate 50m;
    committed-burst-size 1500;
    excess-burst-size 1500;
  }

You can apply the single-rate color-aware policer as follows:

[edit firewall three-color-policer bar]
  single-rate {
    color-aware;
    committed-information-rate 50m;
    committed-burst-size 1500;
    excess-burst-size 1500;
  }

You can configure a single-rate color-aware policer as follows:

[edit interfaces so-0/1/0 unit 0 layer2-policer]
  input-three-color foo;

You also have the option to apply the policer at the physical port level as follows:

[edit interfaces so-0/1/0 layer2-policer]
  input-three-color bar;

**Configuring a Two-Rate Tricolor Marker Policer**

Ingress policing is implemented using a two-rate tricolor marker (trTCM). This is done with a dual token bucket (DTB) that maintains two rates, committed, and a peak. Egress static policing also uses a token bucket.

The token buckets perform the following ingress policing functions:

- (1K) trTCM - Dual token bucket (red, yellow, and green marking)
- Policing is based on Layer 2 packet size:
  - After +/- byte adjust offset
- Marking is color aware and color blind:
  - Color aware needs to have the color set by q-tree lookup based on:
    - ToS
**EXP**

- Programmable marking actions:
  - **Color** (red, yellow, green)
  - Drop based on color and congestion profile

- Policer is selected based on the arriving channel number:
  - Channel number LUT produces policer index and queue index
  - Multiple channels can share the same policer (LUT produces same policer index)

- Support ingress policing and trTCM at the following levels:
  - Queue
  - Logical interface (ifl/DLCI)
  - Physical interface (ifd)
  - Physical port (controller ifd)
  - Any combinations of logical interface, physical interface, and port

- Support percentage of interface speed and bits per second

Rate limits may be applied to selected queues on ingress and on predefined queues at egress. The token bucket operates in color aware and color blind modes (specified by RFC 2698).

### Configuring a Color-Blind trTCM

```plaintext
[edit firewall three-color-policer foo]
two-rate {
  color-blind;
  committed-information-rate 50m;
  committed-burst-size 1500;
  peak-information-rate 100m;
  peak-burst-size 3k;
}
```

You can apply the three-color two-rate color-blind policer as follows:

```plaintext
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-three-color foo;
```

You also have the option to apply the policer at the physical port level as follows:

```plaintext
[edit interfaces so-0/1/0 layer2-policer]
input-three-color foo;
```

### Configuring a Color-Aware trTCM

```plaintext
[edit firewall three-color-policer bar]
two-rate {
  color-aware;
  committed-information-rate 50m;
}
```
committed-burst-size 1500;
peak-information-rate 100m;
peak-burst-size 3k;
}

You can apply the three-color two-rate color-aware policer as follows:

[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-three-color bar;

You also have the option to apply the policer at the physical port level as follows:

[edit interfaces so-0/1/0 layer2-policer]
input-three-color bar;

Applying a Filter to an Interface

• Defining Interface Groups in Firewall Filters on page 220
• Applying a Filter to an Interface on page 221

Defining Interface Groups in Firewall Filters

When applying a firewall filter, you can define an interface to be part of an interface group. Packets received on that interface are tagged as being part of the group. You can then match these packets using the interface-group match statement, as described in the Routing Policies, Firewall Filters, and Traffic Policers Feature Guide.

To define the interface to be part of an interface group, include the group statement:

    group filter-group-number;

You can include this statement at the following hierarchy levels:

• [edit interfaces interface-name unit logical-unit-number family family filter]
• [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family filter]

NOTE: The number 0 is not a valid interface group number.

Filter-Based Forwarding on the Output Interface

If port-mirrored packets are to be distributed to multiple monitoring or collection interfaces, based on patterns in packet headers, it is helpful to configure a filter-based forwarding (FBF) filter on the port-mirroring egress interface.
When an FBF filter is installed as an output filter, a packet that is forwarded to the filter has already undergone at least one route lookup. After the packet is classified at the egress interface by the FBF filter, it is redirected to another routing table for additional route lookup. To avoid packet looping inside the Packet Forwarding Engine, the route lookup in the latter routing table (designated by an FBF routing instance) must result in a different next hop from any next hop specified in a table that has already been applied to the packet.

If an input interface is configured for FBF, the source lookup is disabled for those packets headings to a different routing instance, since the routing table is not set up to handle the source lookup.

For more information about FBF configuration, see the Junos OS Routing Protocols Library. For more information about port mirroring, see the Junos OS Services Interfaces Library for Routing Devices.

Applying a Filter to an Interface

To apply firewall filters to an interface, include the `filter` statement:

```plaintext
filter {
  group filter-group-number;
  input filter-name;
  input-list [ filter-names ];
  output filter-name;
  output-list [ filter-names ];
}
```

To apply a single filter, include the `input` statement:

```plaintext
filter {
  input filter-name;
}
```

To apply a list of filters to evaluate packets received on an interface, include the `input-list` statement.

```plaintext
filter {
  input-list [ filter-names ];
}
```

Up to 16 filter names can be included in an input list.

To apply a list of filters to evaluate packets transmitted on an interface, include the `output-list` statement.

```plaintext
filter {
  output-list [ filter-names ];
}
```
When you apply filters using the `input-list` statement or the `output-list` statement, a new filter is created with the name `<interface-name>.<unit-direction>`. This filter is exclusively interface-specific.

You can include these statements at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]`

In the `family` statement, the protocol family can be `ccc`, `inet`, `inet6`, `mpls`, or `vpls`.

In the `group` statement, specify the interface group number to associate with the filter.

In the `input` statement, list the name of one firewall filter to be evaluated when packets are received on the interface.

In the `input-list` statement, list the names of filters to evaluate when packets are received on the interface. You can include up to 16 filter names.

In the `output` statement, list the name of one firewall filter to be evaluated when packets are transmitted on the interface.

In the `output-list` statement, list the names of filters to evaluate when packets are transmitted on the interface. You can include up to 16 filter names.

You can use the same filter one or more times. On M Series routers (except the M320 and M120 routers), if you apply a firewall filter or policer to multiple interfaces, the filter or policer acts on the sum of traffic entering or exiting those interfaces.

On T Series, M120, and M320 routers, interfaces are distributed among multiple packet forwarding components. Therefore, on these routers, if you apply a firewall filter or policer to multiple interfaces, the filter or policer acts on the traffic stream entering or exiting each interface, regardless of the sum of traffic on the multiple interfaces.
For more information on Understanding Ethernet Frame Statistics, see the MX Series Layer 2 Configuration Guide.

If you apply the filter to the interface lo0, it is applied to packets received or transmitted by the Routing Engine. You cannot apply MPLS filters to the management interface (fxp0 or em0) or the loopback interface (lo0).

Filters applied at the [set interfaces lo0 unit 0 family any filter input] hierarchy level are not installed on T4000 Type 5 FPCs.

For more information about firewall filters, see the Routing Policies, Firewall Filters, and Traffic Policers Feature Guide. For more information about MPLS filters, see the MPLS Applications Feature Guide.

Example: Input Filter for VPLS Traffic

For M Series and T Series routers only, apply an input filter to VPLS traffic. Output filters do not work for broadcast and multicast traffic, including VPLS traffic. Note that on MX Series routers with MPC/MIC interfaces, the VPLS filters on the egress is applicable to broadcast, multicast, and unknown unicast traffic.

```plaintext
[edit interfaces]
fe-2/2/3 {
    vlan-tagging;
    encapsulation vlan-vpls;
    unit 601 {
        encapsulation vlan-vpls;
        vlan-id 601;
        family vpls {
            filter {
                input filter1; # Works for multicast destination MAC address
                output filter1; # Does not work for multicast destination MAC address
            }
        }
    }
}
[edit firewall]
family vpls {
    filter filter1 {
        term 1 {
            from {
                destination-mac-address {
                    01:00:0c:cc:cc:cd/48;
                }
            }
            then {
                discard;
            }
        }
        term 2 {
            then {
                accept;
            }
        }
    }
}
```
Example: Filter-Based Forwarding at the Output Interface

The following example illustrates the configuration of filter-based forwarding at the output interface. In this example, the packet flow follows this path:

1. A packet arrives at interface \textit{fe-1/2/0.0} with source and destination addresses 10.50.200.1 and 10.50.100.1 respectively.
2. The route lookup in routing table \textit{inet.0} points to the egress interface \textit{so-0/0/3.0}.
3. The output filter installed at \textit{so-0/0/3.0} redirects the packet to routing table \textit{fbf.inet.0}.
4. The packet matches the entry 10.50.100.0/25 in the \textit{fbf.inet.0} table, and finally leaves the router from interface \textit{so-2/0/0.0}.

```plaintext
[edit interfaces]
so-0/0/3 {  
  unit 0 {  
    family inet {  
      filter {  
        output fbf;  
      }  
      address 10.50.10.2/25;  
    }  
  }  
}  
fe-1/2/0 {  
  unit 0 {  
    family inet {  
      address 10.50.50.2/25;  
    }  
  }  
}  
so-2/0/0 {  
  unit 0 {  
    family inet {  
      address 10.50.20.2/25;  
    }  
  }  
}  
[edit firewall]
filter fbf {  
  term 0 {  
    from {  
      source-address {  
        10.50.200.0/25;  
      }  
    }  
    then routing-instance fbf;  
  }  
  term d {  
    then count d;  
  }  
}  
[edit routing-instances]
fbf {
```
Guidelines for Configuring Unicast RPF on ACX Series Routers

Observe the following guidelines while configuring unicast RPF on ACX Series routers:

- Support for physical interfaces impacts inet families only.
- The RPF check to be used when routing is asymmetrical is not supported because the `unicast-reverse-path (active-paths | feasible-paths)` statement at the `[edit routing-instances routing-instance-name instance-type name routing-options forwarding-table]` hierarchy level is not supported.
- Even if uRPF checking is enabled, the reverse path checking is not performed if the following conditions apply:
  - The destination IP address is not a unicast address. This applies for both IPV4 and IPV6 packets.
  - The source IP address is IPV6 and the address is a link local address (FE80::/10)
  - The received packet is a BOOTP/DHCP packet (SIP=0.0.0.0 and DIP=255.255.255.255)
- If you enable/disable unicast RPF on live traffic, some packets are dropped while the packet forwarding components are updating. This behavior occurs because route reinstallation is initiated while you enable or disable uRPF.
- uRPF is supported at the logical interface level. Due to hardware limitations, support is available only at the logical interface level.
- Strict mode on ECMP routes is not supported in ACX. This condition occurs because the hardware treats ECMP routes as Loose Mode although the port is configured as Strict mode. Because ECMP uses multiple physical paths for the route the reverse path check results in utilizing many paths (routes) and the source port validation method.
is not used in case of Strict mode. As a result, such a network scenario operates in the same manner as loose mode.

- When the strict mode is enabled on the interface, if the packet is coming with an SIP address which ARP resolution is pending will be dropped as it points to RESOLVE_NH.
- uRPF fail filter can be configured for family `<inet | inet6>` in ACX.

NOTE: The uRPF fail filter cannot match packets failed at ingress port check (strict mode).

The uRPF fail filter can match packets failing source IP lookup but cannot match packets failing the input interface check (strict mode).

The uRPF fail filter applies only to interface-specific instances of the firewall filter.

The uRPF fail filters do not support reject and routing-instance actions.

- uRPF can be configured for family `<inet | inet6>` on IRB interfaces in ACX.
- uRPF implementation in ACX does not consider all feasible paths for reverse path verification and only active path based verification is supported.
- uRPF failure packets statistics are not supported in ACX.
- You can use either the `show interfaces extensive` command or the `show interfaces detail` command to verify that unicast RPF is enabled and working on the interface. In the Flags section of the output, if unicast reverse-path forwarding (RPF) is explicitly configured on the specified interface, the uRPF flag is displayed. If unicast RPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag is not displayed even though unicast RPF is enabled.
- The uRPF detail in the Flags section of the output of the `show interfaces (detail | extensive)` commands is displayed only for logical interfaces on which uRPF is configured. Otherwise, this information is not shown.

Related Documentation

Understanding Unicast RPF (Routers)

For interfaces that carry IPv4 or IPv6 traffic, you can reduce the impact of denial of service (DoS) attacks by configuring unicast reverse path forwarding (RPF). Unicast RPF helps determine the source of attacks and rejects packets from unexpected source addresses on interfaces where unicast RPF is enabled.
NOTE:

- You can protect a network by applying unicast RPF check feature at the edge (on customer facing interfaces) of the network. In an ISP environment, this can impact the network which can impose on a scaled setup. In case if you have already protected the edge of your network, a packet with a spoofed IP source address would not even appear in a core facing interface. In this case, unicast RPF check is not necessary. Enabling unicast RPF feature can impact the control plane performance, so use it where it is required. So it is strongly recommended not to enable this feature on the network core (internal) interfaces.

**Unicast RPF and Default Route**

When the active route cannot be chosen from the routes in a routing table, the router chooses a default route. A default route is equivalent to an IP address of 0.0.0.0/0. If you configure a default route, and you configure unicast RPF on an interface that the default route uses, unicast RPF behaves differently than it does otherwise. For information about configuring default routes, see the *Junos OS Routing Protocols Library*.

To determine whether the default route uses an interface, enter the `show route` command:

```
user@host> show route address
```

*address* is the next-hop address of the configured default route. The default route uses the interfaces shown in the output of the `show route` command.

The following sections describe how unicast RPF behaves when a default route uses an interface and when a default route does not use an interface:

- Unicast RPF Behavior with a Default Route on page 228
- Unicast RPF Behavior Without a Default Route on page 228
- Unicast RPF with Routing Asymmetry on page 229
### Unicast RPF Behavior with a Default Route

On all routers except those with MPCs and the MX80 router, unicast RPF behaves as follows if you configure a default route that uses an interface configured with unicast RPF:

- **Loose mode**—All packets are automatically accepted. For this reason, we recommend that you not configure unicast RPF loose mode on interfaces that the default route uses.
- **Strict mode**—The packet is accepted when the source address of the packet matches any of the routes (either default or learned) that can be reached through the interface. Note that routes can have multiple destinations associated with them; therefore, if one of the destinations matches the incoming interface of the packet, the packet is accepted.

On all routers with MPCs and the MX80 router, unicast RPF behaves as follows if you configure a default route that uses an interface configured with unicast RPF:

- **Loose mode**—All packets except the packets whose source is learned from the default route are accepted. All packets whose source is learned from the default route are dropped at the Packet Forwarding Engine. The default route is treated as if the route does not exist.
- **Strict mode**—The packet is accepted when the source address of the packet matches any of the routes (either default or learned) that can be reached through the interface. Note that routes can have multiple destinations associated with them; therefore, if one of the destinations matches the incoming interface of the packet, the packet is accepted.

On all routers, the packet is not accepted when either of the following is true:

- The source address of the packet does not match a prefix in the routing table.
- The interface does not expect to receive a packet with this source address prefix.

### Unicast RPF Behavior Without a Default Route

If you do not configure a default route, or if the default route does not use an interface configured with unicast RPF, unicast RPF behaves as described in “Configuring Unicast RPF Strict Mode” on page 229 and “Configuring Unicast RPF Loose Mode” on page 231. To summarize, unicast RPF without a default route behaves as follows:

- **Strict mode**—The packet is not accepted when either of the following is true:
  - The packet has a source address that does not match a prefix in the routing table.
  - The interface does not expect to receive a packet with this source address prefix.
- **Loose mode**—The packet is not accepted when the packet has a source address that does not match a prefix in the routing table.
Unicast RPF with Routing Asymmetry

In general, we recommend that you not enable unicast RPF on interfaces that are internal to the network because internal interfaces are likely to have routing asymmetry. Routing asymmetry means that a packet’s outgoing and return paths are different. Routers in the core of the network are more likely to have asymmetric reverse paths than routers at the customer or provider edge. Figure 12 on page 229 shows unicast RPF in an environment with routing asymmetry.

Figure 12: Unicast RPF with Routing Asymmetry

In Figure 12 on page 229, if you enable unicast RPF on interface so-0/0/0, traffic destined for Router A is not rejected. If you enable unicast RPF on interface so-1/0/1, traffic from Router A is rejected.

If you need to enable unicast RPF in an asymmetric routing environment, you can use fail filters to allow the router to accept incoming packets that are known to be arriving by specific paths. For an example of a fail filter that accepts packets with a specific source and destination address, see “Configuring Unicast RPF” on page 235.

Configuring Unicast RPF Strict Mode

In strict mode, unicast RPF checks whether the incoming packet has a source address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source address prefix.

If the incoming packet fails the unicast RPF check, the packet is not accepted on the interface. When a packet is not accepted on an interface, unicast RPF counts the packet and sends it to an optional fail filter. If the fail filter is not configured, the default action is to silently discard the packet.

The optional fail filter allows you to apply a filter to packets that fail the unicast RPF check. You can define the fail filter to perform any filter operation, including accepting, rejecting, logging, sampling, or policing.

When unicast RPF is enabled on an interface, Bootstrap Protocol (BOOTP) packets and Dynamic Host Configuration Protocol (DHCP) packets are not accepted on the interface. To allow the interface to accept BOOTP packets and DHCP packets, you must apply a fail filter that accepts all packets with a source address of 0.0.0.0 and a destination address of 255.255.255.255. For a configuration example, see “Configuring Unicast RPF” on page 235.

For more information about unicast RPF, see the Junos OS Routing Protocols Library. For more information about defining fail filters, see the Routing Policies, Firewall Filters, and Traffic Policers Feature Guide.
To configure unicast RPF, include the `rpf-check` statement:

```
rpf-check <fail-filter filter-name>;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family (inet | inet6)]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family (inet | inet6)]`

Using unicast RPF can have several consequences when implemented with traffic filters:

- RPF fail filters are evaluated after input filters and before output filters.
- If you configure a filter counter for packets dropped by an input filter, and you want to know the total number of packets dropped, you must also configure a filter counter for packets dropped by the RPF check.
- To count packets that fail the RPF check and are accepted by the RPF fail filter, you must configure a filter counter.
- If an input filter forwards packets anywhere other than the inet.0 or inet6.0 routing tables, the unicast RPF check is not performed.
- If an input filter forwards packets anywhere other than the routing instance the input interface is configured for, the unicast RPF check is not performed.

Configure unicast RPF strict mode, and apply a fail filter that allows the interface to accept BOOTP packets and DHCP packets. The filter accepts all packets with a source address of `0.0.0.0` and a destination address of `255.255.255.255`.

To configure unicast RPF in strict mode:

1. Configure the fail filter:

```
[edit firewall]
filter rpf-special-case-dhcp-bootp {
    term allow-dhcp-bootp {
        from {
            source-address {
                0.0.0.0/32;
            } address {
                255.255.255.255/32;
            }
        }
        then {
            count rpf-dhcp-bootp-traffic;
            accept;
        }
    }
    term default {
        then {
            log;
        }
    }
}
```
2. Configure unicast RPF on interfaces:

```plaintext
[edit]
interfaces {
  so-0/0/0 {
    unit 0 {
      family inet {
        rpf-check fail-filter rpf-special-case-dhcp-bootp;
      }
    }
  }
}
```

3. Commit the configuration.

```plaintext
[edit]
commit;
```

Configuring Unicast RPF Loose Mode

By default, unicast RPF uses strict mode. Unicast RPF loose mode is similar to unicast RPF strict mode and has the same configuration restrictions. The only check in loose mode is whether the packet has a source address with a corresponding prefix in the routing table; loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. If a corresponding prefix is not found, unicast RPF loose mode does not accept the packet. As in strict mode, loose mode counts the failed packet and optionally forwards it to a fail filter, which either accepts, rejects, logs, samples, or polices the packet.

To configure unicast RPF loose mode, include the `mode`:

1. `mode loose;`

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family (inet | inet6) rpf-check <fail-filter filter-name>]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family (inet | inet6) rpf-check <fail-filter filter-name>]`

2. For example:

   In this example, no special configuration beyond device initialization is required.
Configure unicast RPF loose mode, and apply a fail filter that allows the interface to accept BOOTP packets and DHCP packets. The filter accepts all packets with a source address of **0.0.0.0** and a destination address of **255.255.255.255**.

To configure unicast RPF in loose mode:

a. Configure the fail filter:

```
[edit firewall]
filter rpf-special-case-dhcp-bootp {
    term allow-dhcp-bootp {
        from {
            source-address {
                0.0.0.0/32;
            }
            address {
                255.255.255.255/32;
            }
        }
        then {
            count rpf-dhcp-bootp-traffic;
            accept;
        }
    }
    term default {
        then {
            log;
            reject;
        }
    }
}
```

b. Configure unicast RPF on interfaces:

```
[edit]
interfaces {
    so-0/0/0 {
        unit 0 {
            family inet {
                rpf-check fail-filter rpf-special-case-dhcp-bootp;
                mode loose;
            }
        }
    }
}
```

c. Commit the configuration.

```
[edit]
commit;
```
Configuring Unicast RPF Loose Mode with Ability to Discard Packets

Starting with Junos OS Release 12.1, unicast RPF loose mode has the ability to discard packets with the source address pointing to the discard interface. This feature is supported on MX Series routers and on T Series routers with Type 1 FPCs, Type 2 FPCs, and Type 3 FPCs. Using unicast RPF loose mode, along with Remote Triggered Black Hole (RTBH) filtering, provides an efficient way to discard packets coming from known attack sources. BGP policies in edge routers ensure that packets with untrusted source addresses have their next hop set to a discard route. When a packet arrives at the router with an untrusted source address, unicast RPF performs a route lookup of the source address. Because the source address route points to a discard next hop, the packet is dropped and a counter is incremented. This feature is supported on both IPv4 (inet) and IPv6 (inet6) address families.

To configure unicast RPF loose mode with the ability to discard packets, include the `rpf-loose-mode-discard family inet` statement at the [edit forwarding-options] hierarchy level:

```
rpf-loose-mode-discard {
    family {
        inet;
    }
}
```

In this example, no special configuration beyond device initialization is required.

Configure unicast RPF loose mode, and apply a fail filter that allows the interface to accept BOOTP packets and DHCP packets. The filter accepts all packets with a source address of 0.0.0.0 and a destination address of 255.255.255.255.

To configure unicast RPF loose mode with the ability to discard packets:

1. **Configure the fail filter:**

   ```
   [edit firewall]
   filter rpf-special-case-dhcp-bootp {
     term allow-dhcp-bootp {
       from {
         source-address {
           0.0.0.0/32;
         }
         address {
           255.255.255.255/32;
         }
       }
       then {
         count rpf-dhcp-bootp-traffic;
         accept;
       }
     }
     term default {
       then {
   ```
2. Configure unicast RPF on interfaces:

```
[edit]
interfaces {  
  so-0/0/0 {  
    unit 0 {  
      family inet {  
        rpf-check fail-filter rpf-special-case-dhcp-bootp;  
        mode loose;  
        }  
      }  
    }  
  }  
}
```

3. Configure the ability to discard packets.

```
[edit]
forwarding-options{  
  rpf-loose-mode-discard {  
    family {  
      inet;  
    }  
  }  
}
```

4. Commit the configuration.

```
[edit]
commit;
```

Configuring Unicast RPF on a VPN

You can configure unicast RPF on a VPN interface by enabling unicast RPF on the interface and including the `interface` statement at the `[edit routing-instances routing-instance-name]` hierarchy level.

You can configure unicast RPF only on the interfaces you specify in the routing instance. This means the following:

- For Layer 3 VPNs, unicast RPF is supported on the CE router interface.
- Unicast RPF is not supported on core-facing interfaces.
For virtual-router routing instances, unicast RPF is supported on all interfaces you specify in the routing instance.

If an input filter forwards packets anywhere other than the routing instance the input interface is configured for, the unicast RPF check is not performed.

For more information about VPNS and virtual-router routing instances, see the Junos OS VPNs Library for Routing Devices. For more information about FBF, see the Junos OS Routing Protocols Library.

Configure unicast RPF on a Layer 3 VPN interface:

```
[edit interfaces]
so-0/0/0 {
  unit 0 {
    family inet {
      rpf-check;
    }
  }
}
[edit routing-instance]
VPN-A {
  interface so-0/0/0;
}
```

**Configuring Unicast RPF**

Configure unicast RPF strict mode, and apply a fail filter that allows the interface to accept BOOTP packets and DHCP packets. The filter accepts all packets with a source address of 0.0.0.0 and a destination address of 255.255.255.255.

```
[edit firewall]
filter rpf-special-case-dhcp-bootp {
  term allow-dhcp-bootp {
    from {
      source-address {
        0.0.0.0/32;
      }
      address {
        255.255.255.255/32;
      }
    }
    then {
      count rpf-dhcp-bootp-traffic;
      accept;
    }
  }
  term default {
    then {
      log;
      reject;
    }
  }
}
```
[edit]
interfaces {
  so-0/0/0 {
    unit 0 {
      family inet {
        rpf-check fail-filter rpf-special-case-dhcp-bootp;
      }
    }
  }
}

Understanding and Preventing Unknown Unicast Forwarding

Unknown unicast traffic consists of unicast packets with unknown destination MAC addresses. By default, the switch floods these unicast packets that traverse a VLAN to all interfaces that are members of that VLAN. Forwarding this type of traffic can create unnecessary traffic that leads to poor network performance or even a complete loss of network service. This flooding of packets is known as a traffic storm.

To prevent a traffic storm, you can disable the flooding of unknown unicast packets to all VLAN interfaces by configuring specific VLANs or all VLANs to forward all unknown unicast traffic traversing them to a specific interface. You can configure multiple VLANs to forward unknown unicast packets to the same interface or configure different interfaces for different VLANs. This channels the unknown unicast traffic traversing VLANs to specific interfaces instead of flooding all interfaces.

•  Verifying That Unknown Unicast Packets Are Forwarded to a Single Interface on page 236
•  Configuring Unknown Unicast Forwarding (ELS) on page 237
•  Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface on page 240
•  Configuring Unknown Unicast Forwarding (CLI Procedure) on page 241

Verifying That Unknown Unicast Packets Are Forwarded to a Single Interface

Purpose  Verify that a VLAN is forwarding all unknown unicast packets (those with unknown destination MAC addresses) to a single interface instead of flooding unknown unicast packets across all interfaces that are members of that VLAN.

NOTE:  This procedure uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, See: “Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface” on page 240. For ELS details see: Using the Enhanced Layer 2 Software CLI.
**Action**  
(EX4300 Switches) Display the forwarding interface for unknown unicast packets for a VLAN (here, the VLAN name is v1):

```
user@switch> show configuration switch-options

unknown-unicast-forwarding {
  vlan v1 {
    interface ge-0/0/7.0;
  }
}
```

(EX9200 Switches) Display the forwarding interface for unknown unicast packets:

```
user@switch> show forwarding-options

next-hop-group uuf-nhg {
  group-type layer-2;
  interface ge-0/0/7.0;
}
```

**Meaning**  
The sample output from the `show` commands show that the unknown unicast forwarding interface for VLAN v1 is interface `ge-0/0/7`.

**Configuring Unknown Unicast Forwarding (ELS)**

![NOTE:](image)

**NOTE:** This task uses Junos OS for EX Series switches or QFX Series with support for the Enhanced Layer 2 Software (ELS) configuration style. If your EX Series switch runs software that does not support ELS, see “Configuring Unknown Unicast Forwarding (CLI Procedure)” on page 241. For ELS details, see Using the Enhanced Layer 2 Software CLI

Unknown unicast traffic consists of packets with unknown destination MAC addresses. By default, the switch floods these packets that traverse a VLAN to all interfaces associated with that VLAN. This flooding of packets is known as a traffic storm and can negatively impact network performance.

To prevent flooding unknown unicast traffic across the switch, configure unknown unicast forwarding to direct all unknown unicast packets within a VLAN to a specific interface. You can configure each VLAN to divert unknown unicast traffic to a different interface or use the same interface for multiple VLANs.

- Configuring Unknown Unicast Forwarding on EX4300 Switches on page 238
- Configuring Unknown Unicast Forwarding on EX9200 Switches on page 238
Configuring Unknown Unicast Forwarding on EX4300 Switches

To configure unknown unicast forwarding options on EX4300 switches:

- Configure unknown unicast forwarding for a specific VLAN and specify the interface to which all unknown unicast traffic will be forwarded:

  ```
  [edit switch-options]
  user@switch# set unknown-unicast-forwarding vlan vlan-name interface interface-name
  ```

- Configure unknown unicast forwarding for all VLANs and specify the interface to which all unknown unicast traffic will be forwarded:

  ```
  [edit switch-options]
  user@switch# set unknown-unicast-forwarding vlan all interface interface-name
  ```

Configuring Unknown Unicast Forwarding on EX9200 Switches

To configure unknown unicast forwarding on EX9200 switches, you must configure a flood filter and apply it to VLANs for which you want to configure unknown unicast forwarding. Flood filters are firewall filters that are applied only to broadcast, unknown unicast, and multicast (BUM) traffic. If a flood filter is configured, only traffic packets that are of the packet type unknown-unicast are forwarded to the interface on which unicast forwarding is configured. A next-hop group redirects the packets according to the action specified in the flood filter.

To configure the next-hop group that receives Layer 2 packets and then configure the interface to which these packets are forwarded:

1. Configure the `next-hop-group` action for the Layer 2 interface expected to receive unknown unicast packets:

   ```
   [edit forwarding-options]
   user@switch# set next-hop-group next-hop-group-name group-type layer-2
   [edit forwarding-options]
   user@switch# set next-hop-group next-hop-group-name interface interface-name
   ```

   For example:

   ```
   [edit forwarding-options]
   user@switch# set next-hop-group uuf-nhg group-type layer-2
   [edit forwarding-options]
   user@switch# set next-hop-group uuf-nhg interface ge-3/1/7.0
   ```

2. Configure a firewall filter with family address type `ethernet-switching`:

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter filter-name
   ```

   For example:

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter uuf_filter
   ```
3. Configure a term in the firewall filter for the interface that receives unknown unicast packets (the interface specified in Step 1) to discard unknown unicast packets:

```
[edit firewall family ethernet-switching filter filter-name]
user@switch# set term term-name from interface interface-name
user@switch# set term term-name from traffic-type unknown-unicast
user@switch# set term term-name then discard
```

For example:

```
[edit firewall family ethernet-switching filter uuf_filter]
user@switch# set term source-drop from interface ge-3/1/7.0
user@switch# set term source-drop from traffic-type unknown-unicast
user@switch# set term source-drop then discard
```

4. Configure a term in the firewall filter for unknown unicast packets to be flooded to the interface enabled for unknown unicast forwarding by using `next-hop-group` (in step 1):

```
[edit firewall family ethernet-switching filter filter-name]
user@switch# set term term-name from traffic-type unknown-unicast
user@switch# set term term-name then next-hop-group group-name
```

For example:

```
[edit firewall family ethernet-switching filter uuf_filter]
user@switch# set term uuf-flood from traffic-type unknown-unicast
user@switch# set term uuf-flood then next-hop-group uuf-nhg
```

5. Configure a default term for the firewall filter to forward packets other than unknown unicast packets:

```
[edit firewall family ethernet-switching filter filter-name]
user@switch# set term term-name then accept
```

For example:

```
[edit firewall family ethernet-switching filter uuf_filter]
user@switch# set term fwd-default then accept
```

6. Apply the filter as a flood filter on the VLAN that includes the interface which will receive unknown unicast packets:

```
[edit vlans vlan-name]
user@switch# set forwarding-options flood input filter-name
```

For example:

```
[edit vlans v1]
user@switch# set forwarding-options flood input uuf_filter
```
Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface

**Purpose**  Verify that a VLAN is forwarding all unknown unicast packets (those with unknown destination MAC addresses) to a single trunk interface instead of flooding unknown unicast packets across all interfaces that are members of the same VLAN.

**Action**  Display the forwarding interface for unknown unicast packets for a VLAN (here, the VLAN name is v1):

```
user@switch> show configuration ethernet-switching-options
unknown-unicast-forwarding {
    vlan v1 {
        interface ge-0/0/7.0;
    }
}
```

Display the Ethernet switching table:

```
user@switch> show ethernet-switching table vlan v1
Ethernet-switching table: 3 unicast entries
<table>
<thead>
<tr>
<th>VLAN</th>
<th>MAC address</th>
<th>Type</th>
<th>Age</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>v1</td>
<td>*</td>
<td>Flood</td>
<td></td>
<td>All-members</td>
</tr>
<tr>
<td>v1</td>
<td>00:01:09:00:00:00</td>
<td>Learn</td>
<td>24</td>
<td>ge-0/0/7.0</td>
</tr>
<tr>
<td>v1</td>
<td>00:11:09:00:01:00</td>
<td>Learn</td>
<td>37</td>
<td>ge-0/0/3.0</td>
</tr>
</tbody>
</table>
```

**Meaning**  The sample output from the `show configuration ethernet-switching-options` command shows that the unknown unicast forwarding interface for VLAN v1 is interface `ge-0/0/7`. The `show ethernet-switching table` command shows that an unknown unicast packet is received on interface `ge-0/0/3` with the destination MAC address (DMAC) `00:01:09:00:00:00` and the source MAC address (SMAC) of `00:11:09:00:01:00`. This shows that the SMAC of the packet is learned in the normal way (through the interface `ge-0/0/3.0`), while the DMAC is learned on interface `ge-0/0/7`.

**See Also**
Configuring Unknown Unicast Forwarding (CLI Procedure)

Unknown unicast traffic consists of packets with unknown destination MAC addresses. By default, the switch floods these packets to all interfaces associated with a VLAN. Forwarding such traffic to interfaces on the switch can create a security issue.

To prevent flooding unknown unicast traffic across the switch, configure unknown unicast forwarding to direct all unknown unicast packets within a VLAN out to a specific trunk interface. From there, the destination MAC address can be learned and added to the Ethernet switching table. You can configure each VLAN to divert unknown unicast traffic to different trunk interfaces or use one trunk interface for multiple VLANs.

NOTE: For Junos OS for EX Series switches or QFX Series with support for the Enhanced Layer 2 Software (ELS) configuration style, see “Configuring Unknown Unicast Forwarding (ELS)” on page 237.

To configure unknown unicast forwarding options:

NOTE: Before you can configure unknown unicast forwarding within a VLAN, you must first configure that VLAN.

1. Configure unknown unicast forwarding for a specific VLAN (here, the VLAN name is employee):

   ```
   [edit ethernet-switching-options]
   user@switch# set unknown-unicast-forwarding vlan employee
   ```

2. Specify the trunk interface to which all unknown unicast traffic will be forwarded:

   ```
   [edit ethernet-switching-options]
   user@switch# set unknown-unicast-forwarding vlan employee interface ge-0/0/3.0
   ```

Enabling Source Class and Destination Class Usage

- Source Class and Destination Class Usage on page 241
- Enabling Source Class and Destination Class Usage on page 245

Source Class and Destination Class Usage

For interfaces that carry IPv4, IPv6, MPLS, or peer AS billing traffic, you can maintain packet counts based on the entry and exit points for traffic passing through your network.
Entry and exit points are identified by source and destination prefixes grouped into disjoint sets defined as source classes and destination classes. You can define classes based on a variety of parameters, such as routing neighbors, autonomous systems, and route filters.

Source class usage (SCU) counts packets sent to customers by performing lookup on the IP source address. SCU makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. You must enable SCU accounting on both the inbound and outbound physical interfaces, and the route for the source of the packet must be in located in the forwarding table.

**NOTE:** SCU and DCU accounting do not work with directly connected interface routes. Source class usage does not count packets coming from sources with direct routes in the forwarding table because of software architecture limitations.

Destination class usage (DCU) counts packets from customers by performing lookup of the IP destination address. DCU makes it possible to track traffic originating from the customer edge and destined for specific prefixes on the provider core router.

**NOTE:** We recommend that you stop the network traffic on an interface before you modify the DCU or SCU configuration for that interface. Modifying the DCU or SCU configuration without stopping the traffic might corrupt the DCU or SCU statistics. Before you restart the traffic after modifying the configuration, enter the clear interfaces statistics command.

Figure 13 on page 242 illustrates an Internet service provider (ISP) network. In this topology, you can use DCU to count packets customers send to specific prefixes. For example, you can have three counters, one per customer, that count the packets destined for prefix 210.210/16 and 220.220/16.

You can use SCU to count packets the provider sends from specific prefixes. For example, you can count the packets sent from prefix 210.210/16 and 215.215/16 and transmitted on a specific output interface.

*Figure 13: Prefix Accounting with Source and Destination Classes*
You can configure up to 126 source classes and 126 destination classes. For each interface on which you enable destination class usage and source class usage, the Junos OS maintains an interface-specific counter for each corresponding class up to the 126 class limit.

**NOTE:** For transit packets exiting the router through the tunnel, forwarding path features, such as RPF, forwarding table filtering, source class usage, and destination class usage are not supported on the interfaces you configure as the output interface for tunnel traffic. For firewall filtering, you must allow the output tunnel packets through the firewall filter applied to input traffic on the interface that is the next-hop interface towards the tunnel destination.

**NOTE:**
Performing DCU accounting when an output service is enabled produces inconsistent behavior in the following configuration:

- Both SCU input and DCU are configured on the packet input interface.
- SCU output is configured on the packet output interface.
- Interface services is enabled on the output interface.

For an incoming packet with source and destination prefixes matching the SCU and DCU classes respectively configured in the router, both SCU and DCU counters will be incremented. This behavior is not harmful or negative. However, it is inconsistent with non-serviced packets, in that only the SCU count will be incremented (because the SCU class ID will override the DCU class ID in this case).

To enable packet counting on an interface, include the `accounting` statement:

```
accounting {
    destination-class-usage;
    source-class-usage {
        direction;
    }
}
```

`direction` can be one of the following:

- **input**—Configure at least one expected ingress point.
- **output**—Configure at least one expected egress point.
- **input output**—On a single interface, configure at least one expected ingress point and one expected egress point.

You can include these statements at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family (inet | inet6 | mpls)]`
• \texttt{[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family \{inet | inet6 | mpls\}]} For SCU to work, you must configure at least one input interface and at least one output interface.

The ability to count a single packet for both SCU and DCU accounting depends on the underlying physical interface.

• For traffic over MPC/MIC interfaces, a single incoming packet is counted for both SCU and DCU accounting if both SCU and DCU are configured. To ensure the outgoing packet is counted, include the \texttt{source-class-usage output} statements in the configuration of the outgoing interface.

• For traffic over DPC interfaces, an incoming packet is counted only once, and SCU takes priority over DCU. This means that when a packet arrives on an interface on which you include the \texttt{source-class-usage input} and \texttt{destination-class-usage} statements in the configuration, and when the source and destination both match accounting prefixes, the Junos OS associates the packet with the source class only.

For traffic over MPC interfaces, SCU and DCU accounting is performed after output filters are evaluated. If a packet matches a firewall filter match condition, the packet is included in SCU or DCU accounting except in the case where the action of the matched term is \texttt{discard}.

On T Series, M120, and M320 routers, the source class and destination classes are not carried across the router fabric. The implications of this are as follows:

• On T Series, M120, and M320 routers, SCU and DCU accounting is performed before the packet enters the fabric.

• On M7i, M10i, M120, and M320 routers, on MX Series routers with non-MPC, and on T Series routers, SCU and DCU accounting is performed before output filters are evaluated. Consequently, if a packet matches a firewall filter match condition, the packet is included in SCU or DCU accounting; the packet is counted for any term action (including the \texttt{discard} action).

• On M120, M320, and T Series routers, the \texttt{destination-class} and \texttt{source-class} statements are supported at the \texttt{[edit firewall family family-name filter filter-name term term-name from]} hierarchy level only for the filter applied to the forwarding table. On M7i, M10i, and MX Series routers, these statements are supported.

Once you enable accounting on an interface, the Junos OS maintains packet counters for that interface, with separate counters for \texttt{inet}, \texttt{inet6}, and \texttt{mpls} protocol families. You must then configure the source class and destination class attributes in policy action statements, which must be included in forwarding-table export policies.

\textbf{NOTE:} When configuring policy action statements, you can configure only one source class for each matching route. In other words, more than one source class cannot be applied to the same route.
In Junos OS Release 9.3 and later, you can configure SCU accounting for Layer 3 VPNs configured with the \texttt{vrf-table-label} statement. Include the \texttt{source-class-usage} statement at the \texttt{[edit routing-instances routing-instance-name vrf-table-label]} hierarchy level. The \texttt{source-class-usage} statement at this hierarchy level is supported only for the virtual routing and forwarding (VRF) instance type.

**NOTE:** DCU counters cannot be enabled on the label-switched interface (LSI) that is created dynamically when the \texttt{vrf-table-label} statement is configured within a VRF. For more information, see the Junos OS VPNs Library for Routing Devices.

For a complete discussion about source and destination class accounting profiles, see the Network Management and Monitoring Guide. For more information about MPLS, see the MPLS Applications Feature Guide.

### Enabling Source Class and Destination Class Usage

**Figure 14: Prefix Accounting with Source and Destination Classes**

Configure DCU and SCU output on one interface:

```plaintext
[edit]
interfaces {
  so-6/1/0 {
    unit 0 {
      family inet {
        accounting {
          destination-class-usage;
          source-class-usage {
            output;
          }
        }
        SCU output /DCU
      }
    }
  }
}
```
1. Source routers A and B use loopback addresses as the prefixes to be monitored. Most of the configuration tasks and actual monitoring occur on transit Router SCU.

The loopback address on Router A contains the origin of the prefix that is to be assigned to source class A on Router SCU. However, no SCU processing happens on this router. Therefore, configure Router A for basic OSPF routing and include your loopback interface and interface so-0/0/2 in the OSPF process.

2. 

```diff
[edit]
interfaces {
    so-0/0/2 {
        unit 0 {
            family inet {
                address 10.255.50.2/24;
            }
        }
    }
    lo0 {
        unit 0 {
            family inet {
                address 10.255.192.10/32;
            }
        }
    }
}
protocols {
    ospf {
        area 0.0.0.0 {
            interface so-0/0/2.0;
            interface lo0.0;
        }
    }
}
```

3. Last, apply the policy to the forwarding table.

Router SCU handles the bulk of the activity in this example. On Router SCU, enable source class usage on the inbound and outbound interfaces at the [edit interfaces interface-name unit unit-number family inet accounting] hierarchy level. Make sure you specify the expected traffic: input, output, or, in this case, both.

Next, configure a route filter policy statement that matches the prefixes of the loopback addresses from routers A and B. Include statements in the policy that classify packets from Router A in one group named scu-class-a and packets from Router B in a second class named scu-class-b. Notice the efficient use of a single policy containing multiple terms.

```diff
[edit]
interfaces {
    scu-class-a {
        route-filter apply;
    }
    scu-class-b {
        route-filter apply;
    }
```
so-0/0/1 {
  unit 0 {
    family inet {
      accounting {
        source-class-usage {
          input;
          output;
        }
        address 10.255.50.1/24;
      }
    }
  }
}

so-0/0/3 {
  unit 0 {
    family inet {
      accounting {
        source-class-usage {
          input;
          output;
        }
        address 10.255.10.3/24;
      }
    }
  }
}

lo0 {
  unit 0 {
    family inet {
      address 10.255.6.111/32;
    }
  }
}

protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/1.0;
      interface so-0/0/3.0;
    }
  }
}

routing-options {
  forwarding-table {
    export scu-policy;
  }
}

policy-options {
  policy-statement scu-policy {
    term 0 {
      from {
        route-filter 10.255.192.0/24 orlonger;
      }
      then source-class scu-class-a;
    }
  }
}
4. Just as Router A provides a source prefix, Router B's loopback address matches the prefix assigned to \texttt{scu-class-b} on Router SCU. Again, no SCU processing happens on this router, so configure Router B for basic OSPF routing and include your loopback interface and interface \texttt{so-0/0/4} in the OSPF process.

```bash
interfaces {
    so-0/0/4 {
        unit 0 {
            family inet {
                address 10.255.10.4/24;
            }
        }
    }
    lo0 {
        unit 0 {
            family inet {
                address 10.255.165.226/32;
            }
        }
    }
}
protocols {
    ospf {
        area 0.0.0.0 {
            interface so-0/0/0.0;
            interface lo0.0;
        }
    }
}
```

5. You can use SCU and DCU to count packets on Layer 3 VPNs. To enable packet counting for Layer 3 VPN implementations at the egress point of the MPLS tunnel, you must configure a virtual loopback tunnel interface (vt) on the PE router, map the virtual routing and forwarding (VRF) instance type to the virtual loopback tunnel interface, and send the traffic received from the VPN out the source class output interface, as shown in the following example:

Configure a virtual loopback tunnel interface on a provider edge router equipped with a tunnel PIC:

```bash
[edit interfaces]
vt-0/3/0 {
    unit 0 {
```
6. Map the VRF instance type to the virtual loopback tunnel interface.

In Junos OS Release 9.3 and later, you can configure SCU accounting for Layer 3 VPNs configured with the `vrf-table-label` statement. Include the `source-class-usage` statement at the `[edit routing-instances routing-instance-name vrf-table-label]` hierarchy level. The `source-class-usage` statement at this hierarchy level is supported only for the virtual routing and forwarding (VRF) instance type. DCU is not supported when the `vrf-table-label` statement is configured. For more information, see the Junos OS VPNs Library for Routing Devices.

   [edit routing-instances]
   VPN-A {
      instance-type vrf;
      interface at-2/1/1.0;
      interface vt-0/3/0.0;
      route-distinguisher 10.255.14.225:100;
      vrf-import import-policy-A;
      vrf-export export-policy-A;
      protocols {
         bgp {
            group to-r4 {
               local-address 10.27.253.1;
               peer-as 400;
               neighbor 10.27.253.2;
            }
         }
      }
   }

7. Send traffic received from the VPN out the source class output interface:

   [edit interfaces]
   at-2/1/0 {
      unit 0 {
         family inet {
            accounting {
               source-class-usage {
                  output;
               }
            }
         }
      }
   }

Targeted broadcast is a process of flooding a target subnet with Layer 3 broadcast IP packets originating from a different subnet. The intent of targeted broadcast is to flood the target subnet with the broadcast packets on a LAN interface without broadcasting to the entire network. Targeted broadcast is configured with various options on the egress interface of the router or switch and the IP packets are broadcast only on the LAN (egress) interface. Targeted broadcast helps you implement remote administration tasks such as backups and wake-on LAN (WOL) on a LAN interface, and supports virtual routing and forwarding (VRF) instances.

Regular Layer 3 broadcast IP packets originating from a subnet are broadcast within the same subnet. When these IP packets reach a different subnet, they are forwarded to the Routing Engine (to be forwarded to other applications). Because of this, remote administration tasks such as backups cannot be performed on a particular subnet through another subnet. As a workaround you can enable targeted broadcast, to forward broadcast packets that originate from a different subnet.

Layer 3 broadcast IP packets have a destination IP address that is a valid broadcast address for the target subnet. These IP packets traverse the network in the same way as unicast IP packets until they reach the destination subnet. In the destination subnet, if the receiving router has targeted broadcast enabled on the egress interface, the IP packets are forwarded to an egress interface and the Routing Engine or to an egress interface only. The IP packets are then translated into broadcast IP packets which flood the target subnet only through the LAN interface (if there is no LAN interface, the packets are discarded), and all hosts on the target subnet receive the IP packets. If targeted broadcast is not enabled on the receiving router, the IP packets are treated as regular Layer 3 broadcast IP packets and are forwarded to the Routing Engine. If targeted broadcast is enabled without any options, the IP packets are forwarded to the Routing Engine.
Targeted broadcast can be configured to forward the IP packets only to an egress interface, which is helpful when the router is flooded with packets to process, or to both an egress interface and the Routing Engine.

**NOTE:** Targeted broadcast does not work when the targeted broadcast option forward-and-send-to-re and the traffic sampling option sampling are configured on the same egress interface of an M320 router, a T640 router, or an MX960 router. To overcome this scenario, you must either disable one of the these options or enable the sampling option with the targeted broadcast option forward-only on the egress interface. For information about traffic sampling, see Configuring Traffic Sampling.

**NOTE:** Any firewall filter that is configured on the Routing Engine loopback interface (lo0) cannot be applied to IP packets that are forwarded to the Routing Engine as a result of a targeted broadcast. This is because broadcast packets are forwarded as flood next hop and not as local next hop traffic, and you can only apply a firewall filter to local next hop routes for traffic directed towards the Routing Engine.

## Configuring Targeted Broadcast

The following sections explain how to configure targeted broadcast on an egress interface and its options:

- Configuring Targeted Broadcast and Its Options on page 251
- Display Targeted Broadcast Configuration Options on page 252

### Configuring Targeted Broadcast and Its Options

You can configure targeted broadcast on an egress interface with different options. You can either allow the IP packets destined for a Layer 3 broadcast address to be forwarded on the egress interface and to send a copy of the IP packets to the Routing Engine or you can allow the IP packets to be forwarded on the egress interface only. Note that the packets are broadcast only if the egress interface is a LAN interface.

To configure targeted broadcast and its options:

1. Configure the physical interface.

   ```
   [edit]
   user@host# set interfaces interface-name
   ```

2. Configure the logical unit number at the [edit interfaces interface-name] hierarchy level.
[edit interfaces interface-name]
user@host# set unit logical-unit-number

3. Configure the protocol family as inet at the [edit interfaces interface-name unit interface-unit-number] hierarchy level.

[edit interfaces interface-name unit interface-unit-number]
user@host# set family inet

4. Configure targeted broadcast at the [edit interfaces interface-name unit interface-unit-number family inet] hierarchy level

[edit interfaces interface-name unit interface-unit-number family inet]
user@host# set targeted-broadcast

5. Specify one of the following options as per requirement:
   • To allow IP packets destined for a Layer 3 broadcast address to be forwarded on the egress interface and to send a copy of the IP packets to the Routing Engine.
     [edit interfaces interface-name unit interface-unit-number family inet targeted-broadcast]
     user@host# set forward-and-send-to-re
   • To allow IP packets to be forwarded on the egress interface only.
     [edit interfaces interface-name unit interface-unit-number family inet targeted-broadcast]
     user@host# set forward-only

---

NOTE: Targeted broadcast does not work when the targeted broadcast option forward-and-send-to-re and the traffic sampling option sampling are configured on the same egress interface of an M320 router, a T640 router, or an MX960 router. To overcome this scenario, you must either disable one of the these options or enable the sampling option with the targeted broadcast option forward-only on the egress interface. For information about traffic sampling, see Configuring Traffic Sampling.

---

Display Targeted Broadcast Configuration Options

The following topics display targeted broadcast configuration with its various options:

• Forward IP Packets On the Egress Interface and To the Routing Engine on page 253
• Forward IP Packets On the Egress Interface Only on page 253
Forward IP Packets On the Egress Interface and To the Routing Engine

**Purpose**
Display the configuration when targeted broadcast is configured on the egress interface to forward the IP packets on the egress interface and to send a copy of the IP packets to the Routing Engine.

**Action**
To display the configuration run the `show` command at the `[edit interfaces interface-name unit interface-unit-number family inet]` where the interface name is ge-2/0/0, the unit value is set to 0, the protocol family is set to inet.

```plaintext
[edit interfaces interface-name unit interface-unit-number family inet]
user@host#show
    targeted-broadcast {
        forward-and-send-to-re;
    }
```

Forward IP Packets On the Egress Interface Only

**Purpose**
Display the configuration when targeted broadcast is configured on the egress interface to forward the IP packets on the egress interface only.

**Action**
To display the configuration run the `show` command at the `[edit interfaces interface-name unit interface-unit-number family inet]` where the interface name is ge-2/0/0, the unit value is set to 0, the protocol family is set to inet.

```plaintext
[edit interfaces interface-name unit interface-unit-number family inet]
user@host#show
    targeted-broadcast {
        forward-only;
    }
```

Circuit and Translational Cross-Connects Overview

Circuit cross-connect (CCC) and translational cross-connect (TCC) allow you to configure transparent connections between two circuits, where a circuit can be a Frame Relay data-link connection identifier (DLCI), an Asynchronous Transfer Mode (ATM) virtual circuit (VC), a Point-to-Point Protocol (PPP) interface, a Cisco High-level Data Link Control (HDLC) interface, or a Multiprotocol Label Switching (MPLS) label-switched path (LSP).

Using CCC or TCC, packets from the source circuit are delivered to the destination circuit with, at most, the Layer 2 address being changed. No other processing, such as header checksums, time-to-live (TTL) decrementing, or protocol processing, is done.

To connect interfaces of the same type, use CCC. To connect unlike interfaces, use TCC.
CCC and TCC circuits fall into three categories: logical interfaces, which include ATM VCs and Frame Relay DLCIs; physical interfaces, which include PPP and Cisco HDLC; and paths, which include LSPs. The three circuit categories provide three types of cross-connect:

- **Layer 2 switching (interface-to-interface)**—Cross-connects between logical interfaces provide what is essentially Layer 2 switching.
- **MPLS tunneling (interface-to-LSP)**—Cross-connects between interfaces and LSPs allow you to connect two distant interface circuits by creating MPLS tunnels that use LSPs as the conduit.
- **LSP stitching (LSP-to-LSP)**—Cross-connects between LSPs provide a way to "stitch" together two label-switched paths, including paths that fall in two different traffic engineering database (TED) areas.

The cross-connect is bidirectional, so packets received on the first interface are transmitted out the second interface, and those received on the second interface are transmitted out the first interface.

For most CCC connections that connect interfaces, the interfaces must be of the same type; that is, ATM to ATM, Frame Relay to Frame Relay, PPP to PPP, or Cisco HDLC to Cisco HDLC.

ATM-to-Ethernet interworking cross-connect circuits connect logical interfaces configured on an ATM2 and Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet IQ2 and IQ2-E physical interfaces.

For all TCC connections that connect interfaces, the interfaces can be of unlike types. Mainly, TCC is used for Layer 2.5 virtual private networks (VPNs), but it can also be used as a simple “unlike circuit” switch.

Switching cross-connects join logical interfaces to form what is essentially Layer 2 switching.

**Figure 15 on page 256** illustrates a Layer 2 switching circuit cross-connect. In this topology, Router A and Router C have Frame Relay connections to Router B, which is a Juniper Networks router. CCC allows you to configure Router B to act as a Frame Relay (Layer 2) switch. To do this, configure a circuit from Router A to Router C that passes through Router B, effectively configuring Router B as a Frame Relay switch with respect to these routers. This configuration allows Router B to transparently switch packets (frames) between Router A and Router C without regard to the packets’ contents or the Layer 3 protocols. The only processing that Router B performs is to translate DLCI 600 to 750.

**Figure 15: Layer 2 Switching Circuit Cross-Connect**

---

Copyright © 2019, Juniper Networks, Inc.
If the Router A–to–Router B and Router B–to–Router C circuits are PPP, for example, the Link Control Protocol and Network Control Protocol exchanges occur between Router A and Router C. These messages are handled transparently by Router B, allowing Router A and Router C to use various PPP options (such as header or address compression and authentication) that Router B might not support. Similarly, Router A and Router C exchange keepalives, providing circuit-to-circuit connectivity status.

You can configure Layer 2 switching cross-connects on PPP, Cisco HDLC, Frame Relay, Ethernet CCC, Ethernet VLAN, and ATM circuits. With CCC, only like interfaces can be connected in a single cross-connect. With TCC, unlike interfaces can be connected in a single cross-connect. In Layer 2 switching cross-connects, the exchanges take place between point-to-point links.

This chapter discusses the Layer 2 switching cross-connect configuration tasks. For information about MPLS tunneling and LSP stitching, see the MPLS Applications Feature Guide.

For information about Layer 2 and Layer 2.5 VPNs, see the Junos OS VPNs Library for Routing Devices.

For restrictions for MPLS on QFX switches, see MPLS Feature Support on QFX Series and EX4600 Switches.

Defining the Encapsulation for Switching Cross-Connects

To configure Layer 2 or Layer 2.5 switching cross-connects, configure the CCC or TCC encapsulation on the router that is acting as the switch (Router B in Figure 15 on page 256).

NOTE: When you use CCC encapsulation, you can configure the ccc family only. Likewise, when you use TCC encapsulation, you can configure the tcc family only.

This section contains the following topics:

Configuring PPP or Cisco HDLC Circuits

For PPP or Cisco HDLC circuits, specify the encapsulation by including the `encapsulation` statement at the `[edit interfaces interface-name]` hierarchy level. This statement configures the entire physical device. For these circuits to work, you must configure a logical interface unit 0.

```
[edit interfaces interface-name]
encapsulation (ppp-ccc | cisco-hdlc-ccc | ppp-tcc | cisco-hdlc-tcc);
unit 0;
```

Configuring ATM Circuits

For ATM circuits, include the `vpi` statement `[edit interfaces interface-name atm-options]` hierarchy level:

```
[edit interfaces at-fpc/pic/port]
atm-options {
    vpi vpi-identifier;
}
```

On the logical interface, include the following statements:

```
point-to-point;
encapsulation (atm-ccc-cell-relay | atm-ccc-vc-mux | atm-tcc-vc-mux | atm-tcc-snap);
vci vpi-identifier.vci-identifier;
```

You can include the logical interface statements at the following hierarchy levels:

- `[edit interfaces at-fpc/pic/port unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces at-fpc/pic/port unit logical-unit-number]`

For each VC, configure whether it is a circuit or a regular logical interface. The default interface type is point-to-point.
Configuring Frame Relay Circuits

For Frame Relay circuits, include the encapsulation statement at the [edit interfaces interface-name] hierarchy level:

```
[edit interfaces interface-name]
encapsulation type;
```

On the logical interface, include the following statements:

```
point-to-point;
en encapsulation type;
unit dlci dlci-identifier;
```

You can include the logical interface statements at the following hierarchy levels:

- [edit interfaces interface-name unit logical-unit-number]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

The encapsulation type can be one of the following:

- Flexible Frame Relay (flexible-frame-relay)—Intelligent queuing (IQ) interfaces can use flexible Frame Relay encapsulation. You use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

- Frame Relay CCC version (frame-relay-ccc)—For E1, E3, SONET/SDH, T1, and T3 interfaces, this encapsulation type is the same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have frame-relay-ccc encapsulation. When you use this encapsulation type, you can configure the ccc family only.

- Frame Relay TCC version (frame-relay-tcc)—Similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

- Extended CCC version (extended-frame-relay-ccc)—This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. The logical interface must have frame-relay-ccc encapsulation. When you use this encapsulation type, you can configure the ccc family only.

- Extended TCC version (extended-frame-relay-tcc)—Similar to extended Frame Relay CCC, this encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC, which is used for circuits with different media on either side of the connection.

- Port CCC version (frame-relay-port-ccc)—Defined in the IETF document Frame Relay Encapsulation over Pseudo-Wires (expired December 2002). This encapsulation type allows you to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with
Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the ccc family only.

For each DLCI, configure whether it is a circuit or a regular logical interface. The DLCI for regular interfaces must be from 1 through 511. For CCC and TCC interfaces, it must be from 512 through 1022. This restriction does not apply to IQ interfaces. The default interface type is point to point.

Configuring Ethernet CCC Circuits

You can configure Ethernet CCC encapsulation on Fast Ethernet, Gigabit Ethernet, and aggregated Ethernet interfaces.

**NOTE:** CCC over aggregated Ethernet requires an M Series Enhanced Flexible PIC Concentrator (FPC).

For Ethernet CCC circuits, specify the encapsulation by including the `encapsulation` statement at the `[edit interfaces interface-name]` hierarchy level. This statement configures the entire physical device.

```
[edit interfaces interface-name]
encapsulation ethernet-ccc;
unit logical-unit-number {
    ...
}
[edit interfaces aex]
encapsulation ethernet-ccc;
unit logical-unit-number {
    ...
}
```

Configuring Ethernet VLAN Circuits

You can configure Ethernet virtual local area network (VLAN) circuits on Fast Ethernet, Gigabit Ethernet, and aggregated Ethernet interfaces. For Ethernet VLAN circuits, specify the encapsulation by including the `encapsulation` statement at the `[edit interfaces interface-name]` hierarchy level. This statement configures the entire physical device. You must also enable VLAN tagging. To do this, include the following statements:

```
[edit interfaces interface-name]
vlan-tagging;
encapsulation (extended-vlan-ccc | vlan-ccc);
[edit interfaces aex]
vlan-tagging;
encapsulation vlan-ccc;
```

On the logical interface, include the following statements:
encapsulation vlan-ccc;
  vlan-id number;

You can include the logical interface statements at the following hierarchy levels:

- [edit interfaces interface-name unit logical-unit-number]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Ethernet interfaces in VLAN mode can have multiple logical interfaces. For encapsulation type `vlan-ccc`, VLAN IDs 1 through 511 are reserved for normal VLANs, and VLAN IDs 512 through 1023 are reserved for CCC VLANs. For encapsulation type `extended-vlan-ccc`, VLAN IDs 1 through 4094 are valid. VLAN ID 0 is reserved for tagging the priority of frames.

- Circuit and Translational Cross-Connects Overview on page 255

**Defining the Connection for Switching Cross-Connects**

To configure Layer 2 switching cross-connects, define the connection between the two circuits. You configure this on the router that is acting as the switch (Router B in Figure 15 on page 256). The connection joins the interface that comes from the circuit’s source to the interface that leads to the circuit’s destination. When you specify the interface names, include the logical portion of the name, which corresponds to the logical unit number. The cross-connect is bidirectional, so packets received on the first interface are transmitted out the second interface, and those received on the second interface are transmitted out the first interface.

```
[edit protocols]
connections {
  remote-interface-switch connection-name {
    interface interface-name.unit-number;
  }
  lsp-switch connection-name {
    transmit-lsp lsp-number;
    receive-lsp lsp-number;
  }
}
```

**Configuring MPLS for Switching Cross-Connects**

For Layer 2 switching cross-connects to work, you must configure MPLS. The following is a minimal MPLS configuration:

```
[edit protocols]
mpls {
  interface (interface-name | all);
}
```
Configuring IS-IS or MPLS Traffic for TCC Interfaces

Layer 2.5 VPNs on T Series, M120, MX Series, and M320 routers support IPv4, IS-IS, and MPLS traffic types. By default, IPv4 traffic runs on T Series, M120, MX Series, and M320 routers and over TCC interfaces. To configure IS-IS (ISO traffic) or MPLS traffic on Layer 2.5 VPNs, you must configure the same traffic type on both ends of the Layer 2.5 VPN.

**NOTE:** Some platform and FPC combinations cannot pass TCC encapsulated ISO traffic. See Platforms/FPCs That Cannot Forward TCC Encapsulated ISO Traffic for details.

To specify which traffic can run over a TCC interface, include the protocols statement with the appropriate value (inet, mpls, and iso) at the [edit interfaces interface-name unit logical-unit-number family tcc] hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number family tcc]
protocols [inet iso mpls ];
```

**NOTE:** Layer 2.5 VPNs running on M Series Multiservice Edge Routers support only IPv4 traffic. IPv6 is not supported on Layer 2.5 VPNs.

When enabling ISO over a Layer 2.5 VPN that is configured on a CE Ethernet interface, you must also include the point-to-point statement at the [edit protocols isis interface interface-name] hierarchy level:

```
[edit protocols isis interface interface-name]
point-to-point;
```

For more information about Layer 2.5 VPNs, see the Junos OS VPNs Library for Routing Devices and the Translational Cross-Connect and Layer 2.5 VPNs Feature Guide.

Configuring ATM-to-Ethernet Interworking

- ATM-to-Ethernet Interworking on page 263
- Enabling ATM-to-Ethernet Interworking on page 263
- Configuring the Ethernet Interface on page 264
- Configuring Ethernet Encapsulation on page 264
- Configuring the Outer VLAN Identifier on page 264
- Configuring the Inner VLAN Identifier Range on page 264
ATM-to-Ethernet Interworking

The ATM-to-Ethernet interworking feature is useful where ATM2 interfaces are used to terminate ATM DSLAM traffic. The ATM traffic can be forwarded with encapsulation type ccc (circuit cross-connect) to a local or remote Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet IQ2 and IQ2-E interface or label-switched path (LSP). The ATM VPI and VCI are converted to stacked VLAN inner and outer VLAN tags.

These ATM-to-Ethernet interworking circuits can be mapped to individual logical interfaces configured on an ATM2 IQ interface and Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet IQ2 and IQ2-E physical interface.

The ATM-to-Ethernet interworking cross-connect essentially provides Layer 2 switching, and statistics are reported at the logical interface level.

During conversion from ATM to Ethernet, the least significant 12 bits of the ATM cell VCI are copied to the Ethernet frame inner VLAN tag. Cells received on an ATM logical interface configured with encapsulation type vlan-vci-ccc and falling within the configured VCI range are reassembled into packets and forwarded to a designated Ethernet logical interface that is configured with encapsulation type vlan-vci-ccc.

During conversion from Ethernet to ATM, the Ethernet frame inner VLAN tags that fall within the configured range, are copied to the least significant 12 bits of the ATM cell VCI. The ATM logical interface uses its configured VPI when segmenting the Ethernet packets into cells.

ATM-to-Ethernet interworking is supported on M120, M320, and T Series routers.

ATM-to-Ethernet interworking is supported on MX Series routers with aggregated Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces. This feature is available on all Enhanced Queuing (EQ) DPCs and Enhanced DPCS for MX Series routers.

NOTE: This feature is not supported on MX Series routers with ATM interfaces.

For more information on MX Series ATM-to-Ethernet interworking, see the MX Series Solutions Guide.

The following sections discuss ATM-to-Ethernet interworking:

Enabling ATM-to-Ethernet Interworking

To enable the ATM-to-Ethernet interworking cross-connect function, include the vlan-vci-tagging statement at the [edit interfaces interface-name] hierarchy level:
[edit interfaces interface-name]
  vlan-vci-tagging;

Configuring the Ethernet Interface

Configure the Ethernet or aggregated Ethernet physical interface by including the `encapsulation` statement with the `vlan-vci-ccc` option at the `[edit interfaces interface-name]` hierarchy level:

[edit interfaces interface-name]
  encapsulation vlan-vci-ccc;

When the encapsulation type `vlan-vci-ccc` is configured on the physical interface, all logical interfaces configured on the Ethernet interface must also have the encapsulation type set to `vlan-vci-ccc`.

Configuring Ethernet Encapsulation

Configure the Ethernet logical interface by including the `encapsulation` statement with the `vlan-vci-ccc` option at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level:

[edit interfaces interface-name unit logical-unit-number]
  encapsulation vlan-vci-ccc;

The chassis configuration cannot contain the `atm-l2circuit-mode` statement if any logical interfaces are configured with the `vlan-vci-ccc` encapsulation option.

Configuring the Outer VLAN Identifier

Configure the Ethernet logical interface outer VLAN ID by including the `vlan-id` statement specifying the outer VLAN ID at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level:

[edit interfaces interface-name unit logical-unit-number]
  vlan-id outer-vlan-identifier;

It is the administrator’s responsibility to ensure that the outer VLAN tag and VPI match and the inner VLAN tags fall within the VCI range of the VPI.

The allowable VPI range is from 0 to 255. So the outer VLAN tags must not be configured for values above 255.

Configuring the Inner VLAN Identifier Range

Configure the Ethernet logical interface inner VLAN ID range by including the `inner-vlan-id-range` statement and specifying the starting VLAN ID and ending VLAN ID at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level:

[edit interfaces interface-name unit logical-unit-number]
  inner-vlan-id-range start start-id end end-id;
VLAN IDs 0 and 4095 are reserved by IEEE 801.1q and must not be used for the inner or outer VLAN ID.

VCIs 0 through 31 are reserved for ATM management purposes by convention. Therefore inner VLAN IDs 1 through 31 should not be used.

VLAN ID 1 might be used by Ethernet switches for certain bridge management services, so using VLAN ID 1 for the inner or outer VLAN ID is discouraged.

**Configuring the Physical Interface VPI**

Configure the ATM physical interface VPI by including the `vpi` statement at the `[edit interfaces interface-name atm-options]` hierarchy level:

```
[edit interfaces interface-name atm-options]
vpi virtual-path-identifier;
```

VPI 0 is reserved, and must not be used.

ATM F4/F5 OAM is not supported for VPIs used in ATM-to-Ethernet interworking cross-connects. Any F4/F5 OAM cells received are discarded.

Only one logical interface may be declared per virtual path specified in the `atm-options` statement hierarchy.

It is not necessary to dedicate all the VPIs of an ATM2 interface for ATM-to-Ethernet interworking cross-connects.

**Configuring the ATM Logical Interface**

Configure the ATM logical interface by including the `encapsulation` statement and specifying the encapsulation type `vlan-vci-ccc` at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number]
encapsulation vlan-vci-ccc;
```

An ATM logical interface configured with the encapsulation type `vlan-vci-ccc` only supports the `epd-threshold`, `shaping`, `traps | no-traps`, `disable`, and `description` statements. No other configuration statements are supported. ATM interface CoS features are not supported by logical interfaces configured with the encapsulation type `vlan-vci-ccc`.

The ATM2 OC48 PIC does not support the encapsulation type `vlan-vci-ccc`.

The encapsulation type `vlan-vci-ccc` only supports the `ccc` protocol family. Attempts to configure any other interface protocol family are rejected.

**Configuring the Protocol Family**

Configure the ATM logical interface protocol family by including the `family` statement and specifying the `ccc` option at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level:
[edit interfaces interface-name unit logical-unit-number]
family ccc;

Configuring the Logical Interface VPI

Configure the ATM logical interface virtual path identifier by including the `vpi` statement at the [edit interfaces interface-name unit logical-unit-number] hierarchy level:

```plaintext
[edit interfaces interface-name unit logical-unit-number]
  vpi virtual-path-identifier;
```

VPI 0 is reserved, and must not be used.

It is the administrator’s responsibility to ensure the outer VLAN tag and VPI match and the inner VLAN tags fall within the VCI range of the VPI.

Once a VPI is used in an ATM-to-Ethernet interworking cross-connect, it cannot be used with any other logical interface, even if the `vpi.vci` value falls outside the VCI range for the cross-connect.

Configuring the Logical Interface VCI

Configure the ATM logical interface virtual channel identifier range by including the `vci-range` statement and specifying the starting VCI and ending VCI at the [edit interfaces interface-name unit logical-unit-number] hierarchy level:

```plaintext
[edit interfaces interface-name unit logical-unit-number]
  vci-range start start-vci end end-vci;
```

Do not use VCIs 0 through 31, which are reserved for ATM management purposes by convention.

ATM-To-Ethernet Interworking on ATM MICs

ATM-to-Ethernet interworking supports transmission of ATM packets over Ethernet. It specifically provides support for exchange of Layer 2 and Layer 3 Protocol Data Units (PDUs) between ATM and Ethernet domains. On MX Series 5G Universal Routing Platforms with ATM MICs, you can exchange Ethernet frames between ATM and Ethernet domains over a MPLS pseudowire or a Layer 2 cross-connect by using translational cross connect (TCC). For more information about TCC, see “Circuit and Translational Cross-Connects Overview” on page 255.

Consider the following basic ATM-to-Ethernet Interworking topology where the provider edge router PE1 is connected to an ATM domain and the Provider Edge router PE2 is connected to an Ethernet domain (see Figure 1). The customer edge routers CE1 and CE2 are customer-managed devices. The PE routers are connected by means of an MPLS pseudowire. The ATM traffic on the PE1–CE1 link can comprise untagged Ethernet frames over ATM format. The Ethernet traffic on PE2–CE2 link can comprise untagged, single-VLAN or double-VLAN tagged Ethernet frames depending on the configuration of the PE2 router.

For ATM-to-Ethernet Interworking, the virtual path identifier (VPI) and virtual circuit identifier (VCI) values on the ATM link are mapped to the outer and inner VLAN tag on the Ethernet link. Mapping implies that either the same value is copied or a one-to-one translation is performed. If VLAN translation is enabled, instead of copying the value, a one-to-one translation is performed on the Ethernet facing PE, using a lookup table.

ATM cells that are received on the PE1 router are reassembled into ATM Adaptation Layer 5 (AAL5) logical link control (LLC) frames. The router removes the header and footer and adds two VLAN tags (outer and inner) to the untagged Ethernet payload based on the configuration. The VLAN IDs must correspond to the VPI and VCI of the ATM cell. You must add an MPLS label before transmitting the dual-VLAN-tagged Ethernet frame over the MPLS pseudowire. You can also add other optional MPLS tags.

NOTE: If the AAL5 frame sent by CE1 is not encapsulated with LLC and if the untagged Ethernet payload includes the frame check sequence (FCS), PE1 rejects the AAL5 frame. Also, PE1 can transmit and receive only a dual VLAN-tagged Ethernet frame without FCS. Inclusion of FCS can result in packet drops or data corruption.

On the PE2 router, the MPLS label and optional MPLS tags are removed and the Ethernet frame is transmitted toward the CE2 router. You can modify or remove one or both VLAN tags before forwarding the frame to the CE2 router.

Limitations

Following are the limitations of the ATM-to-Ethernet interworking feature on MX Series routers with ATM MICs:
• The ATM-to-Ethernet interworking feature is not backward compatible or does not interoperate with the ATM-Ethernet interworking feature supported on M Series and T Series Routers. The functionality is the same but the implementation is different.

• The total number of VCIs supported is 4000 for the ATM MIC. This is an existing system limit.

• If an ATM logical interface is configured with vci-range of N VCIs, then N VCIs are deducted from the available pool of 4000 VCIs.

• ATM quality of service (QoS) is not supported with the vlan-vci-ccc encapsulation. If you use the vci-range statement then the vlan-vci-ccc encapsulation supports multiple VCIs on a single logical interface. This is a hardware limitation.

Example: Configuring CCC over Aggregated Ethernet

See the topology in Figure 18 on page 271. In this topology, CE Routers A and C have aggregated Ethernet connections to PE Router B. With CCC, you specify that the circuit from Router A is connected to the circuit from Router C. Router B functions as a cross-connect switch between the two circuits. For a back-to-back connection, all VLAN IDs must be the same on Router A through Router C. You configure Router A and Router
C as standard aggregated Ethernet interfaces. For more information about aggregated Ethernet, see "Aggregated Ethernet Interfaces Overview."

Figure 18: Interface-to-Interface Circuit Cross-Connect over Aggregated Ethernet Interfaces

}

Example: Configuring ATM-to-Ethernet Interworking

The following example shows the configuration of the ATM and Ethernet interfaces for an ATM-to-Ethernet interworking cross connect. In the example ATM DSLAM traffic is terminated on an ATM2 interface. The ATM traffic is forwarded using encapsulation type `vlan-vci-ccc` to a local Ethernet IQ2 and IQ2-E interface. See the topology in Figure 20 on page 274.

Figure 20: ATM-to-Ethernet Interworking

In this example, the ATM traffic comes from the DSLAM to the router on ATM interface `at-4/0/0` and is forwarded out on Ethernet interface `ge-2/2/1`.
[edit interfaces]
ge-2/2/1 {
  vlan-vci-tagging;
  encapsulation vlan-vci-ccc;
  unit 0 {
    encapsulation vlan-vci-ccc;
    vlan-id 100;
    inner-vlan-id-range start 100 end 500;
  }
}
at-4/0/0 {
  atm-options {
    vpi 100;
  }
  unit 0 {
    encapsulation vlan-vci-ccc;
    family ccc;
    vpi 100;
    vci-range start 100 end 500;
  }
}

Example: Configuring ATM-to-Ethernet Interworking on ATM MIC

This example shows how to configure the ATM and Ethernet interfaces for an ATM-to-Ethernet interworking cross-connect.

• Requirements on page 275
• Overview on page 275
• Configuration on page 276

Requirements

This example uses the following hardware and software components:

• One MX Series router with ATM MIC
• One MX Series router with Ethernet MIC
• Junos OS Release 16.1R1 or later release

Overview

Configuring ATM-to-Ethernet interworking enables exchange of Ethernet frames between an ATM domain and an Ethernet domain on MX Series routers with ATM MIC. The ATM domain can be connected to the Ethernet domain over an MPLS pseudowire.
Topology

Consider a sample topology in which provider edge (PE) router (ATMRouter) is an MX Series router with an ATM MIC and PE router (EthernetRouter) is an MX Series router with an Ethernet MIC. CE1 and CE2 are the customer edge routers or customer-managed devices. ATMRouter and EthernetRouter are connected by means of an MPLS pseudowire. The ATM traffic between ATMRouter and CE1 comprises untagged Ethernet over ATM cells. The Ethernet traffic between EthernetRouter and CE2 comprises double-VLAN-tagged Ethernet frames.

When a packet is sent from CE1 to CE2 (ATM-to-Ethernet), ATMRouter accepts ATM cells from CE1 with virtual circuit identifier (VCI) in the range 10/50 to 10/100 and reassembles ATM cells into AAL5 frames. ATMRouter extracts the Ethernet frame from the AAL5 frame payload. ATMRouter adds two VLAN tags with VLAN IDs corresponding to the virtual path identifier (VPI) and VCI of the received ATM cell. The dual-tagged-Ethernet frame is then encapsulated into a MPLS packet and sent over the pseudowire to EthernetRouter.

EthernetRouter strips the MPLS encapsulation and the dual-VLAN-tagged Ethernet frame is sent to CE2. The outer VLAN ID is rewritten to 20 and the inner VLAN ID remains the same. The packet arrives at CE2.

The reverse happens when a packet is sent from CE2 to CE1.

Configuration

To enable exchange of Ethernet frames between an ATM domain and an Ethernet domain according to the topology mentioned in the overview section, perform these tasks:

- Configuring ATMRouter on page 276
- Configuring EthernetRouter on page 279

Configuring ATMRouter

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see Using the CLI Editor in Configuration Mode in the CLI User Guide.

To configure the interfaces on ATMRouter:

1. To configure the MIC to use SONET framing, include the framing statement at the [edit chassis] hierarchy level.

   [edit chassis]
   user@host# set fpc 1 pic 0 framing sonet port 0 framing sonet speed oc3-stm1

2. In configuration mode, go to the [edit interfaces] hierarchy level. Configure the Ethernet core interface that connects ATMRouter to EthernetRouter and specify the description of the Ethernet interface for your reference.
3. Configure a logical unit for the Ethernet interface, specify the family as `/inet`, and assign an IP address to the interface. Also, specify the family as `/mpls` to enable ATMRouter to connect to EthernetRouter.

    [edit interfaces ge-1/0/0]
    user@host# edit unit 0
    user@host# set family inet address 192.0.0.1/24
    user@host# set family mpls
    user@host# top

4. In configuration mode, at the [edit interfaces] hierarchy level, configure the ATM interface that connects to CE1 and specify the description of the ATM interface for your reference. Also, define the virtual path identifier for this interface by using the `vpi` statement and specify a value from 1 through 255. The value zero (0) is reserved and must not be used.

    [edit]
    user@host# edit interfaces
    user@host# edit at-1/2/0
    user@host# set description CE1Facing
    user@host# set atm-options vpi 10

5. Configure a logical unit for the ATM interface. Also, configure the ATM logical interface by specifying the encapsulation and the protocol family. The encapsulation type `vlan-vci-vcc` supports only the `ccc` protocol family. Any attempts to configure any other interface protocol family is rejected.

    [edit interfaces at-1/2/0]
    user@host# edit unit 0
    user@host# set encapsulation vlan-vci-vcc family ccc

6. Configure the VPI and VCI for the logical interface. The VPI value 0 is reserved and must not be used. VCI values from 0 through 31 are reserved for ATM management purposes by convention.

    [edit interfaces at-1/2/0 unit 0]
    user@host# set vpi 10 vci-range start 100 end 110
    user@host# top

7. Configure the physical loopback interface at the [edit interfaces] hierarchy level.

    [edit]
8. Configure the route identifier that specifies the routing device's IP address. The router identifier is used by BGP and OSPF to identify the routing device from which a packet originated. The router identifier is usually the IP address of the local routing device. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used.

   [edit]
   user@host# set router-options router-id 198.51.100.1

9. At the [edit protocols] hierarchy level, configure the interface on which to configure MPLS as well as the loopback interface.

   [edit protocols]
   user@host# edit mpls
   user@host# set interface ge-1/0/0.0
   user@host# set interface lo0.0
   user@host# top

10. At the [edit protocols] hierarchy level, configure a single-area OSPF network by specifying the area ID and associated interfaces (Ethernet interface and the loopback interface).

    [edit protocols]
    user@host# edit ospf
    user@host# set area 0.0.0.0 interface ge-1/0/0.0
    user@host# set area 0.0.0.0 interface lo0.0
    user@host# top

11. Create an LDP instance on the Ethernet interface and the loopback interface at the [edit] hierarchy level. LDP is required as the signaling protocol for Layer 2 circuits.

    [edit]
    user@host# edit protocols ldp
    user@host# set interface ge-1/0/0.0
    user@host# set interface lo0.0
    user@host# top

12. Establish the Layer 2 circuit by specifying the l2circuit statement at the [edit protocols] hierarchy level. The neighbor parameter specifies the IP address of the PE neighbor. The interface name refers to the local CE-facing interface that forms the Layer 2 circuit. The VCI ID must match the ID of the PE neighbor.

    [edit]
    user@host# edit protocols l2circuit
Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see Using the CLI Editor in Configuration Mode in the CLI User Guide.

To configure the interfaces on EthernetRouter:

1. In configuration mode, go to the [edit interfaces] hierarchy level. Configure the Ethernet core interface that connects EthernetRouter to ATMRouter and specify the description of the Ethernet interface for your reference.

   ```
   [edit]
   user@host# edit interfaces
   user@host# edit ge-1/0/0
   user@host# set description PE1Facing
   ```

2. Configure a logical unit for the Ethernet interface and specify the family as inet and assign an IP address to the Ethernet interface. Also, specify the family as mpls to enable EthernetRouter to connect to ATMRouter.

   ```
   [edit interfaces ge-1/0/0]
   user@host# edit unit 0
   user@host# set family inet address 192.0.0.2/24
   user@host# set family mpls
   user@host# top
   ```

3. At the [edit interfaces] hierarchy level, configure the Ethernet interface that connects to CE2 and specify the description of the interface for your reference. Also, specify flexible-vlan-tagging to support transmission of 802.1Q VLAN single-tag and dual-tag frames on the same port. Specify extended-vlan-ccc as the encapsulation to enable tagging for translational cross-connect (TCC).

   ```
   [edit]
   user@host# edit interfaces
   user@host# edit ge-1/0/1
   user@host# set description CE2Facing
   user@host# set flexible-vlan-tagging
   user@host# set encapsulation extended-vlan-ccc
   user@host# set gigether-options ethernet-switch-profile tag-protocol-id [0x8100 0x9100 0x88a8]
   ```
4. Configure a logical unit for the Ethernet interface. Also, configure mixed tagging. Mixed tagging enables you to configure two logical interfaces on the same Ethernet port, one with single-tag framing and one with dual-tag framing. You can also specify the protocol family.

```
[edit interfaces ge-1/0/1]
user@host# edit unit 0
user@host# set vlan-tags outer 0x88a8.10 inner-range 0x8100.100-110
user2host# set family ccc;
```

5. Configure the physical loopback interface at the [edit interfaces] hierarchy level.

```
[edit]
user@host# set interfaces lo0 unit 0 family inet address 198.51.100.2/32
```

6. Configure the route identifier that specifies the routing device's IP address. The router identifier is used by BGP and OSPF to identify the routing device from which a packet originated. The router identifier is usually the IP address of the local routing device. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used.

```
[edit]
user@host # set router-options router-id 198.51.100.2
```

7. At the [edit protocols] hierarchy level, configure the interface on which to configure MPLS as well as the loopback interface.

```
[edit protocols]
user@host# edit mpls
user@host# set interface ge-1/0/0.0
user@host# set interface lo0.0
user@host# top
```

8. At the [edit protocols] hierarchy level, configure a single-area OSPF network by specifying the area ID and associated interfaces (Ethernet interface and the loopback interface).

```
[edit protocols]
user@host# edit ospf
user@host# set area 0.0.0.0 interface ge-1/0/0.0
user@host# set area 0.0.0.0 interface lo0.0
user@host# top
```

9. Create an LDP instance on the Ethernet interface and the loopback interface at the [edit] hierarchy level. LDP is required as the signaling protocol for Layer 2 circuits.

```
[edit]
```
user@host# edit protocols ldp
user@host# set interface ge-1/0/0.0
user@host# set interface lo0.0
user@host# top

10. Establish the Layer 2 circuit by specifying the l2circuit statement at the [edit protocols] hierarchy level. The neighbor parameter specifies the IP address of the PE neighbor. The interface name refers to the local CE-facing interface that forms the Layer 2 circuit. The VCI ID must match the ID of the PE neighbor.

[edit]
user@host# edit protocols l2circuit
user@host# edit neighbor 198.51.100.1 interface ge-1/0/1.0
user@host# set static incoming label 1000000 outgoing label 1000000
user@host# set virtual-circuit-id 5
user@host# set no-control-word
user@host# set ignore-encapsulation-mismatch
user@host# set ignore-mtu-mismatch

Meaning  The ATM interface on Router1 is operational.

**Verifying The Status of the MIC on Router1**

**Purpose**  To verify the status of the MIC.

Action  From operational mode, enter the `show chassis fpc pic-status` command.

```
user@host> show chassis fpc pic-status
```

```
Slot 0 Online
PIC 2 Online 10x 1GE(LAN) -EH SFP
PIC 3 Online 10x 1GE(LAN) -EH SFP
Slot 1 Online
PIC 0 Online 2xOC12/8xOC3 CC-CE
PIC 2 Online 10x 1GE(LAN) SFP
PIC 3 Online 10x 1GE(LAN) SFP
Slot 2 Online
PIC 0 Online 4x 10GE(LAN) SFP+
```

Meaning  ATM MIC on FPC slot 1 is online and operational.

**Verify That OSPF Configuration on Router1 Is Accurate**

**Purpose**  To verify that routers are adjacent and able to exchange OSPF data.

Action  From operational mode, enter the `show ospf neighbor` command.

```
user@host> show ospf neighbor
```

<table>

Meaning  The adjacent router is online and can accept OSPF data.
Verify That LDP Configuration on Router1 Is Accurate

**Purpose**
To view LDP session information.

**Action**
From operational mode, enter the `show ldp session` command.

```
user@host> show ldp session
Address State Connection Hold time Adv. Mode
198.51.100.2 Operational Open 26 DU
```

**Meaning**
The output indicates that the session is operational and that the connection is open. It also indicates that the session will close in 26 seconds.

---

Verify That Layer 2 Virtual Circuit Session Configuration on Router1 Is Accurate

**Purpose**
To view the Layer 2 virtual circuits from the local PE router (Router1) to its neighbors.

**Action**
From operational mode, enter the `show l2circuit connections` command.

```
user@host> show l2circuit connections

- Configuring the Loopback Interface on page 309
CHAPTER 6

Configuring Discard Interfaces

- Discard Interfaces Overview on page 289
- Configuring Discard Interfaces on page 290

Discard Interfaces Overview

The discard interface dsc is not a physical interface, but a virtual interface that discards packets.

The following sections explain discard interfaces in detail:

- Understanding Discard Interfaces on page 289
- Guidelines to Follow When Configuring a Discard Interface on page 289

Understanding Discard Interfaces

The discard interface allows you to identify the ingress point of a denial-of-service (DoS) attack. When your network is under attack, the target host IP address is identified, and the local policy forwards attacking packets to the discard interface. When traffic is routed out of the discard interface, the traffic is silently discarded.

The discard interface allows you to protect a network from DoS attacks by identifying the target IP address that is being attacked and configuring a policy to forward all packets to a discard interface. All packets forwarded to the discard interface are dropped. See Example: Forwarding Packets to the Discard Interface.

You can configure the inet family protocol on the discard interface, which allows you to apply an output filter to the interface. If you apply an output filter to the interface, the action specified by the filter is executed before the traffic is discarded.

Once you configure a discard interface, you must then configure a local policy to forward attacking traffic to the discard interface.

Guidelines to Follow When Configuring a Discard Interface

Keep the following guidelines in mind when configuring the discard interface:

- Only the logical interface unit 0 is supported.
- The filter and address statements are optional.
Although you can configure an input filter and a filter group, these configuration statements have no effect because traffic is not transmitted from the discard interface.

- The discard interface does not support class of service (CoS).

Related Documentation
- Configuring Discard Interfaces on page 290
- Example: Forwarding Packets to the Discard Interface

Configuring Discard Interfaces

The discard (dsc) interface is not a physical interface, but a virtual interface that discards packets. You can configure one discard interface. When your network is under attack, the target host IP address is identified, and the local policy forwards attacking packets to the discard interface. Traffic routed out of the discard interface is silently discarded.

The following sections explain how to configure a discard interface:

- Configuring and Usage of Discard Interface on page 290
- Configure an Output Filter with Output policy on page 291

Configuring and Usage of Discard Interface

To configure a discard interface:

1. In configuration mode, go to the [edit interfaces] hierarchy level.

   [edit]
   user@host# edit interfaces

2. Configure the discard interface. Note that you must use 'dsc' to configure discard interface and ensure that there is no discard interface already configured.

   [edit interfaces]
   user@host# edit dsc

3. Configure the logical interface and the protocol family.

   [edit interfaces dsc]
   user@host# edit unit 0 family family

4. If appropriate, apply an output filter to the discard interface.
   Input filters have no impact in this context.

   [edit interfaces dsc unit 0 family family]
   user@host# set filter output filter-name
5. Commit the configuration and go to the top of the hierarchy level.

[edit interfaces dsc unit 0 family family]
user@host# commit
user@host# top

**Configure an Output Filter with Output Policy**

You must configure an output policy to set up the community on the routes injected into the network.

To configure an output policy.

1. In configuration mode, go to the [edit policy-options] hierarchy level.

   [edit]
   user@host# edit policy-options

2. Configure a routing policy.

   [edit policy-options]
   user@host# edit policy-statement statement-name

3. Configure a policy term with a name.

   [edit policy-options policy-statement statement-name]
   user@host# edit term term-variable

4. Configure the list of prefix-lists of routes to match with a name.

   [edit policy-options policy-statement statement-name term term-variable]
   user@host# set from prefix-list name

5. Configure the action that is to be taken when the if and to conditions match with the then statement. In this case, configure the BGP community properties (set, add, and delete) associated with a route.

   [edit policy-options policy-statement statement-name term term-variable]
   user@host# set then community (set | add | delete) community-name

6. Commit the configuration and go to the top of the hierarchy level.

   [edit interfaces dsc unit 0 family family]
   user@host# commit
   user@host# top

Configuring IP Demultiplexing Interfaces

- Demultiplexing Interface Overview on page 293
- Configuring an IP Demultiplexing Interface on page 296
- Configuring a VLAN Demultiplexing Interface on page 301

Demultiplexing Interface Overview

Demultiplexing (demux) interfaces are logical interfaces that share a common, underlying interface. You can create logical subscriber interfaces using static or dynamic demultiplexing interfaces. In addition, you can use IP demultiplexing interfaces or VLAN demultiplexing interfaces when creating logical subscriber interfaces.

Demux interfaces are supported on M120 or MX Series routers only.

Demux interfaces support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, or aggregated Ethernet underlying interfaces.

NOTE: You can also configure demux interfaces dynamically. For information about how to configure dynamic IP demux or dynamic VLAN demux interfaces, see Configuring Dynamic Subscriber Interfaces Using IP Demux Interfaces in Dynamic Profiles or Configuring Dynamic Subscriber Interfaces Using VLAN Demux Interfaces in Dynamic Profiles.

To configure static demux interfaces, see “Configuring a VLAN Demultiplexing Interface” on page 301 and “Configuring an IP Demultiplexing Interface” on page 296.

- IP Demux Interface Overview on page 293
- VLAN Demux Interface Overview on page 294
- Guidelines to Remember When Configuring A Demux Interface on page 294
- MAC Address Validation on Static Demux Interfaces on page 295

IP Demux Interface Overview

IP demux interfaces use the IP source address or IP destination address to demultiplex received packets when the subscriber is not uniquely identified by a Layer 2 circuit.
To determine which IP demux interface to use, the destination or source prefix is matched against the destination or source address of packets that the underlying interface receives. The underlying interface family type must match the demux interface prefix type.

VLAN Demux Interface Overview

VLAN demux interfaces use the VLAN ID to demultiplex received packets when the subscriber is not uniquely identified. A VLAN demux interface uses an underlying logical interface to receive packets.

To determine which VLAN demux interface to use, the VLAN ID is matched against that which the underlying interface receives.

NOTE: VLAN demux subscriber interfaces over aggregated Ethernet physical interfaces are supported only for MX Series routers that have only Trio MPCs installed. If the router has other MPCs in addition to Trio MPCs, the CLI accepts the configuration but errors are reported when the subscriber interfaces are brought up.

Guidelines to Remember When Configuring A Demux Interface

Keep the following guidelines in mind when configuring the demux interface:

- Demux interfaces are supported on M120 or MX Series routers only.
- Only demux0 is supported. If you configure another demux interface, such as demux1, the configuration commit fails.
- You can configure only one demux0 interface per chassis, but you can define logical demux interfaces on top of it (for example, demux0.1, demux0.2, and so on).
- If the address in a received packet does not match any demux prefix, the packet is logically received on the underlying interface. For this reason, the underlying interface is often referred to as the primary interface.

- Points to Remember When Configuring an IP Demux Interface on page 295
- Points to Remember When Configuring a VLAN Demux Interface on page 295
Points to Remember When Configuring an IP Demux Interface

In addition to the guidelines in “Guidelines to Remember When Configuring A Demux Interface” on page 294, the following guidelines are to be noted when configuring an IP demux interface:

- You must associate demux interfaces with an underlying logical interface.

**NOTE:** IP demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces.

- The demux underlying interface must reside on the same logical system as the demux interfaces that you configure over it.
- IP demux interfaces currently supports the Internet Protocol version 4 (IPv4) suite inet and Internet Protocol version 6 (IPv6) suite inet6 family types.
- You can configure more than one demux prefix for a given demux unit. However, you cannot configure the exact same demux prefix on two different demux units with the same underlying interface.
- You can configure overlapping demux prefixes on two different demux units with the same underlying prefix. However, under this configuration, best match rules apply (in other words, the most specific prefix wins).

Points to Remember When Configuring a VLAN Demux Interface

In addition to the guidelines in “Guidelines to Remember When Configuring A Demux Interface” on page 294, the following guidelines are to be noted when configuring a VLAN demux interface:

- You must associate VLAN demux interfaces with an underlying logical interface.

**NOTE:** VLAN demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces.

- The demux underlying interface must reside on the same logical system as the demux interfaces that you configure over it.
- VLAN demux interfaces currently supports the Internet Protocol version 4 (IPv4) suite inet and Internet Protocol version 6 (IPv6) suite inet6 family types.

MAC Address Validation on Static Demux Interfaces

MAC address validation enables the router to validate that received packets contain a trusted IP source and an Ethernet MAC source address.
MAC address validation is supported on static demux interfaces on MX Series routers only.

There are two types of MAC address validation that you can configure:

- **Loose** on page 296
- **Strict** on page 296

**Loose**

Forwards packets when both the IP source address and the MAC source address match one of the trusted address tuples.

Drops packets when the IP source address matches one of the trusted tuples, but the MAC address does not support the MAC address of the tuple.

Continues to forward packets when the source address of the incoming packet does not match any of the trusted IP addresses.

**Strict**

Forwards packets when both the IP source address and the MAC source address match one of the trusted address tuples.

Drops packets when the MAC address does not match the tuple's MAC source address, or when IP source address of the incoming packet does not match any of the trusted IP addresses.

**Related Documentation**

- Associating VLAN IDs to VLAN Demux Interfaces
- Binding VLAN IDs to Logical Interfaces
- Configuring an IP Demultiplexing Interface on page 296
- Configuring a VLAN Demultiplexing Interface on page 301
- Subscriber Interfaces and Demultiplexing Overview

**Configuring an IP Demultiplexing Interface**

Demultiplexing (demux) interfaces are logical interfaces that share a common, underlying interface. You can configure IP demultiplexing interfaces or VLAN demultiplexing interfaces.

To configure an IP demux interface, you must configure the demux prefixes that are used by the underlying interface and then configure the IP demultiplexing interface as explained in the following tasks:

1. Configuring an IP Demux Underlying Interface on page 297
2. Configuring the IP Demux Interface on page 298
3. Configuring MAC Address Validation on Static IP Demux Interfaces on page 300
Configuring an IP Demux Underlying Interface

An IP demux interface uses an underlying logical interface to receive packets. To determine which IP demux interface to use, the destination or source prefix is matched against the destination or source address of packets that the underlying interface receives. The underlying interface family type must match the demux interface prefix type.

NOTE: IP demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces.

To configure a logical interface as an IP demux underlying interface with demux source:

1. In configuration mode, go to the [edit interfaces] hierarchy level:

   [edit]
   user@host# edit interfaces

2. Configure the interface as fe-x/y/z and the logical interface with the unit statement. Note that IP demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces. In this procedure, we show a Fast Ethernet interface as an example.

   [edit interfaces]
   user@host# edit fe-x/y/z unit logical-unit-number

3. Configure the logical demux source family type on the IP demux underlying interface as inet or inet6, or both.

   [edit interfaces fe-x/y/z unit logical-unit-number]
   user@host# set demux-source (inet | inet6)

   or

   [edit interfaces fe-x/y/z unit logical-unit-number]
   user@host# set demux-source [inet inet6]

4. (Optional) To improve datapath performance for DHCPv4 subscribers, specify that only subscribers with 32-bit prefixes are allowed to come up on the interface.

   [edit interfaces fe-x/y/z unit logical-unit-number]
   user@host# set host-prefix-only

NOTE: This step requires that you specify the demux-source as only inet. A commit error occurs if you specify only inet6 or both inet and inet6.
5. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces fe-x/y/z unit logial-unit-number]
user@host# commit
user@host# top
```

To configure a logical interface as an IP demux underlying interface with demux destination:

1. In configuration mode, go to the [edit interfaces] hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Configure the interface as fe-x/y/z and the logical interface with the unit statement. Note that IP demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces.

```
[edit interfaces]
user@host# edit fe-x/y/z unit logical-unit-number unit logical-unit-number
```

3. Configure the logical demux destination family type on the IP demux underlying interface as inet or inet6.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# set demux-destination (inet | inet6)
```

4. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# commit
user@host# top
```

### Configuring the IP Demux Interface

You can configure one or more logical demux source prefixes or destination prefixes after specifying an underlying interface for the static demux interface to use. This underlying interface must reside on the same logical system as the demux interface.

You configure demux prefixes for use by the underlying interface. The demux prefixes can represent individual hosts or networks. For a given demux interface unit, you can configure either demux source or demux destination prefixes but not both.

You can choose not to configure a demux source or demux destination prefix. This type of configuration results in a transmit-only interface.

To configure the IP demux interface with source prefix:

1. In configuration mode, go to the [edit interfaces] hierarchy level:
[edit]
user@host# edit interfaces

2. Configure the interface as a logical demux interface (for example, demux0 interface) and configure the logical interface with the unit statement.

NOTE: You can configure only one demux0 interface per chassis, but you can define logical demux interfaces on top of it (for example, demux0.1, demux0.2, and so on).

[edit interfaces]
user@host# edit demux0 unit logical-unit-number

3. Configure the underlying interface on which the demux interface is running under the demux-options statement.

[edit interfaces demux0 unit logical-unit-number]
user@host# set demux-options underlying-interface interface-name

4. Configure the protocol family.

[edit interfaces demux0 unit logical-unit-number]
user@host# edit family family

5. Configure one or more logical demux source prefixes (IP address). The prefixes are matched against the source address of packets that the underlying interface receives. When a match occurs, the packet is processed as if it was received on the demux interface.

[edit interfaces demux0 unit logical-unit-number family family]
user@host# set demux-source source-prefix

6. Save the configuration and move to top of the hierarchy level.

[edit interfaces demux0 unit logical-unit-number family family]
user@host# commit
user@host# top

To configure the IP demux interface with destination prefix:

1. In configuration mode, go to the [edit interfaces] hierarchy level:

[edit]
user@host# edit interfaces
2. Configure the interface as a logical demux interface (for example, demux0 interface) and configure the logical interface with the unit statement.

   ![NOTE:](image) You can configure only one demux0 interface per chassis, but you can define logical demux interfaces on top of it (for example, demux0.1, demux0.2, and so on).

   

   ```
   [edit interfaces]
   user@host# edit demux0 unit logical-unit-number
   ```

3. Configure the underlying interface on which the demux interface is running under the demux-options statement.

   ```
   [edit interfaces demux0 unit logical-unit-number]
   user@host# set demux-options underlying-interface interface-name
   ```

4. Configure the protocol family.

   ```
   [edit interfaces demux0 unit logical-unit-number]
   user@host# edit family family
   ```

5. Configure one or more logical demux destination prefixes. The prefixes are matched against the destination address of packets that the underlying interface receives. When a match occurs, the packet is processed as if it was received on the demux interface.

   ```
   [edit interfaces demux0 unit logical-unit-number family family]
   user@host# set demux-destination destination-prefix
   ```

6. Save the configuration and move to top of the hierarchy level.

   ```
   [edit interfaces demux0 unit logical-unit-number family family]
   user@host# commit
   user@host# top
   ```

### Configuring MAC Address Validation on Static IP Demux Interfaces

MAC address validation enables the router to validate that received packets contain a trusted IP source and an Ethernet MAC source address.

To configure MAC address validation for an IP demux interface:

1. In configuration mode, go to the `edit interfaces demux0 unit logical-unit-number` hierarchy level:

   ```
   [edit]
   ```
2. Configure the protocol family for the interface.

   
   [edit interfaces demux0 unit logical-unit-number]
   user@host# edit family family

3. Configure the `mac-validate` statement to validate source MAC address with loose or strict options.

   
   [edit interfaces demux0 unit logical-unit-number family family]
   user@host# set mac-validate (loose | strict)

4. Save the configuration and move to top of the hierarchy level.

   
   [edit interfaces demux0 unit logical-unit-number family family]
   user@host# commit
   user@host# top

**Related Documentation**

- Configuring a VLAN Demultiplexing Interface on page 301
- Demultiplexing Interface Overview on page 293

**Configuring a VLAN Demultiplexing Interface**

Demultiplexing (demux) interfaces are logical interfaces that share a common, underlying interface. You can configure IP demultiplexing interfaces or VLAN demultiplexing interfaces.

To configure a VLAN demux interface, you must configure the demux prefixes that are used by the underlying interface and then configure the VLAN demultiplexing interface as explained by the following tasks:

1. Configuring a VLAN Demux Underlying Interface on page 301
2. Configuring the VLAN Demux Interface on page 303
3. Configuring MAC Address Validation on Static VLAN Demux Interfaces on page 305
4. Verifying a Demux Interface Configuration on page 306

**Configuring a VLAN Demux Underlying Interface**

A VLAN demux interface uses an underlying logical interface to receive packets. To determine which VLAN demux interface to use, the VLAN ID is matched against that which the underlying interface receives.
NOTE: VLAN demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces.

VLAN demux subscriber interfaces over aggregated Ethernet physical interfaces are supported only for MX Series routers that have only Trio MPCs installed. If the router has other MPCs in addition to Trio MPCs, the CLI accepts the configuration but errors are reported when the subscriber interfaces are brought up.

To configure a logical interface as a VLAN demux underlying interface with demux source:

1. In configuration mode, go to the [edit interfaces] hierarchy level:

   [edit]
   user@host# edit interfaces

2. Configure the interface as fe-x/y/z and the logical interface with the unit option.

   [edit interfaces]
   user@host# edit fe-x/y/z unit logical-unit-number unit logical-unit-number

3. Configure the VLAN ID. The VLAN ID is used to determine which VLAN demux interface to use, that is the VLAN ID is matched against that which the underlying interface receives.

   [edit interfaces fe-x/y/z unit logical-unit-number]
   user@host# set vlan-id number

4. Configure the logical demux source family type on the VLAN demux underlying interface as inet or inet6.

   [edit interfaces fe-x/y/z unit logical-unit-number]
   user@host# set demux-source (inet | inet6)

5. Save the configuration and move to top of the hierarchy level.

   [edit interfaces fe-x/y/z unit logical-unit-number]
   user@host# commit
   user@host# top

To configure a logical interface as a VLAN demux underlying interface with demux destination:

1. In configuration mode, go to the [edit interfaces] hierarchy level:

   [edit]
2. Configure the interface as fe-x/y/z and the logical interface with the unit option.

   [edit interfaces]
   user@host# edit fe-x/y/z unit logical-unit-number unit logical-unit-number

3. Configure the VLAN ID. The VLAN ID is used to determine which VLAN demux interface to use, that is the VLAN ID is matched against that which the underlying interface receives.

   [edit interfaces fe-x/y/z unit logical-unit-number]
   user@host# set vlan-id number

4. Configure the logical demux destination family type on the VLAN demux underlying interface as inet or inet6.

   [edit interfaces fe-x/y/z unit logical-unit-number]
   user@host# set demux-destination (inet | inet6)

5. Save the configuration and move to top of the hierarchy level.

   [edit interfaces fe-x/y/z unit logical-unit-number]
   user@host# commit
   user@host# top

### Configuring the VLAN Demux Interface

You can configure one or more logical demux source prefixes or destination prefixes after specifying an underlying interface for the static demux interface to use. This underlying interface must reside on the same logical system as the demux interface.

You configure demux prefixes for use by the underlying interface. The demux prefixes can represent individual hosts or networks. For a given demux interface unit, you can configure either demux source prefix or demux destination prefixes but not both.

You can choose not to configure a demux source prefix or a demux destination prefix. This type of configuration results in a transmit-only interface.

To configure VLAN demux interface with demux source prefix:

1. In configuration mode, go to the [edit interfaces] hierarchy level:

   [edit]
   user@host# edit interfaces
2. Configure the interface as a logical demux interface (for example, demux0 interface) and configure the logical interface with the unit statement.

   NOTE: You can configure only one demux0 interface per chassis, but you can define logical demux interfaces on top of it (for example, demux0.1, demux0.2, and so on).

   ```
   [edit interfaces]
   user@host# edit demux0 unit logical-unit-number
   ```

3. Configure the underlying interface on which the demux interface is running under the demux-options statement.

   ```
   [edit interfaces demux0 unit logical-unit-number]
   user@host# set demux-options underlying-interface interface-name
   ```

4. Configure the protocol family for the interface.

   ```
   [edit interfaces demux0 unit logical-unit-number]
   user@host# edit family family
   ```

5. Configure one or more logical demux source prefixes. The prefixes are matched against the source address of packets that the underlying interface receives. When a match occurs, the packet is processed as if it was received on the demux interface.

   ```
   [edit interfaces demux0 unit logical-unit-number family family]
   user@host# set demux-source source-prefix
   ```

6. Save the configuration and move to top of the hierarchy level.

   ```
   [edit interfaces demux0 unit logical-unit-number]
   user@host# commit
   user@host# top
   ```

To configure VLAN demux interface with demux destination prefix:

1. In configuration mode, go to the [edit interfaces] hierarchy level:

   ```
   [edit]
   user@host# edit interfaces
   ```

2. Configure the interface as a logical demux interface (for example, demux0 interface) and configure the logical interface with the unit statement.
NOTE: You can configure only one demux0 interface per chassis, but you can define logical demux interfaces on top of it (for example, demux0.1, demux0.2, and so on).

```
[edit interfaces]
user@host# edit demux0 unit logical-unit-number
```

3. Configure the underlying interface on which the demux interface is running under the `demux-options` statement.

```
[edit interfaces demux0 unit logical-unit-number]
user@host# set demux-options underlying-interface interface-name
```

4. Configure the protocol family for the interface.

```
[edit interfaces demux0 unit logical-unit-number]
user@host# edit family family
```

5. Configure one or more logical demux destination prefixes. The prefixes are matched against the destination address of packets that the underlying interface receives. When a match occurs, the packet is processed as if it was received on the demux interface.

```
[edit interfaces demux0 unit logical-unit-number family family]
user@host# set demux-destination destination-prefix
```

6. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces demux0 unit logical-unit-number]
user@host# commit
user@host# top
```

**Configuring MAC Address Validation on Static VLAN Demux Interfaces**

MAC address validation enables the router to validate that received packets contain a trusted IP source and an Ethernet MAC source address.

To configure MAC address validation for a VLAN demux interface:

1. In configuration mode, go to the `[edit interfaces demux0 unit logical-unit-number]` hierarchy level:

```
[edit]
user@host# edit interfaces demux0 unit logical-unit-number
```
2. Configure the protocol family for the interface.

   [edit interfaces demux0 unit logical-unit-number]
   user@host# edit family family

3. Configure the `mac-validate` statement to validate source MAC address with loose or strict options.

   [edit interfaces demux0 unit logical-unit-number family family]
   user@host# set mac-validate (loose | strict)

4. Save the configuration and move to top of the hierarchy level.

   [edit interfaces demux0 unit logical-unit-number family family]
   user@host# commit
   user@host# top

**Verifying a Demux Interface Configuration**

**Purpose**  
Check the configuration of a demux interface and its underlying interface when the following are configured:

- Two VLANs are configured, where each VLAN consists of two IP demux interfaces.
- One VLAN demultiplexes based on the source address.
- The other VLAN demultiplexes based on the destination address.

**Action**  
From configuration mode on the MX Series router, run the `show interfaces fe-0/0/0` and `show interfaces demux0` configuration mode commands.

```
user@host> show interfaces fe-0/0/0

vlan-tagging;
unit 100 {
  vlan-id 100;
  demux-source inet; # Enable demux of inet prefixes
  family inet {
    address 10.1.1.1/24;
    filter {
      input vlan1-primary-in-filter;
      output vlan1-primary-out-filter;
    }
    mac-validate loose;
  }
}
unit 200 {
  vlan-id 200;
  demux-destination inet; # Enable demux of inet using destination addresses
  family inet {
    address 20.1.1.1/24;
  }
```
unit 300 {
    vlan-id 300;
    demux-source inet; # Enable demux of inet using source addresses
    family inet {
        address 20.1.2.1/24;
    }
}

user@host> show interfaces demux0

unit 101 {
    description vlan1-sub1;
    demux-options {
        underlying-interface fe-0/0/0.100;
    }
    family inet {
        demux-source 10.1.1.0/24;
        filter {
            input vlan1-sub1-in-filter;
            output vlan1-sub1-out-filter;
        }
        mac-validate loose;
    }
}
unit 102 {
    description vlan1-sub2;
    demux-options {
        underlying-interface fe-0/0/0.100;
    }
    family inet {
        demux-source {
            10.1.0.0/16;
            10.2.1.0/24;
        }
        filter {
            input vlan1-sub2-in-filter;
            output vlan1-sub2-out-filter;
        }
        mac-validate loose;
    }
}
unit 202 {
    description vlan2-sub2;
    demux-options {
        underlying-interface fe-0/0/0.200;
    }
    family inet {
        demux-destination 100.1.2.0/24;
    }
}
unit 302 {
    description vlan2-sub2;
    demux-options {
        underlying-interface fe-0/0/0.300;
    }
    family inet {
        demux-source 100.1.2.0/24;
    }

Understanding the Loopback Interface

The loopback address (lo0) has several uses, depending on the particular Junos feature being configured. It can perform the following functions:

- **Device identification**—The loopback interface is used to identify the device. While any interface address can be used to determine if the device is online, the loopback address is the preferred method. Whereas interfaces might be removed or addresses changed based on network topology changes, the loopback address never changes.

  When you ping an individual interface address, the results do not always indicate the health of the device. For example, a subnet mismatch in the configuration of two endpoints on a point-to-point link makes the link appear to be inoperable. Pinging the interface to determine whether the device is online provides a misleading result. An interface might be unavailable because of a problem unrelated to the device’s configuration or operation.

- **Routing information**—The loopback address is used by protocols such as OSPF to determine protocol-specific properties for the device or network. Further, some commands such as `ping mpls` require a loopback address to function correctly.

- **Packet filtering**—Stateless firewall filters can be applied to the loopback address to filter packets originating from, or destined for, the Routing Engine.

The Internet Protocol (IP) specifies a loopback network with the (IPv4) address 127.0.0.0/8. Most IP implementations support a loopback interface (lo0) to represent the loopback facility. Any traffic that a computer program sends on the loopback network is addressed to the same computer. The most commonly used IP address on the loopback network is 127.0.0.1 for IPv4 and ::1 for IPv6. The standard domain name for the address is `localhost`.

The device also includes an internal loopback address (lo0.16384). The internal loopback address is a particular instance of the loopback address with the logical unit number 16384. Junos OS creates the loopback interface for the internal routing instance. This interface prevents any filter on lo0.0 from disrupting internal traffic.
Loopback Interface Configuration

- Configuring the Loopback Interface on page 310
- Example: Configuring Two Addresses on the Loopback Interface with Host Routes on page 311
- Example: Configuring Two Addresses on the Loopback Interface with Subnetwork Routes on page 311
- Example: Configuring an IPv4 and an IPv6 Address on the Loopback Interface with Subnetwork Routes on page 312

Configuring the Loopback Interface

When specifying the loopback address, do not include a destination prefix. Also, in most cases, do not specify a loopback address on any unit other than unit 0.

NOTE: For Layer 3 virtual private networks (VPNs), you can configure multiple logical units for the loopback interface. This allows you to configure a logical loopback interface for each virtual routing and forwarding (VRF) routing instance. For more information, see the Junos OS VPNs Library for Routing Devices.

For some applications, such as SSL for Junos XML protocol, the address for the interface lo0.0 must be 127.0.0.1.

You can configure loopback interfaces using a subnetwork address for both inet and inet6 address families. Many protocols require a subnetwork address as their source address. Configuring a subnetwork loopback address as a donor interface enables these protocols to run on unnumbered interfaces.

If you configure the loopback interface, it is automatically used for unnumbered interfaces. If you do not configure the loopback interface, the router chooses the first interface to come online as the default. If you configure more than one address on the loopback interface, we recommend that you configure one to be the primary address to ensure that it is selected for use with unnumbered interfaces. By default, the primary address is used as the source address when packets originate from the interface.

On the router, you can configure one physical loopback interface, lo0, and one or more addresses on the interface.

1. To configure the physical loopback interface, include the following statements at the [edit interfaces] hierarchy level:

    [edit interfaces]
    lo0 {
        unit 0 {
    

Example: Configuring Two Addresses on the Loopback Interface with Host Routes

To configure two addresses on the loopback interface with host routes:

```
[edit]
user@host# edit interfaces lo0 unit 0 family inet
[edit interfaces lo0 unit 0 family inet]
user@host# set address 172.16.0.1
[edit interfaces lo0 unit 0 family inet]
user@host# set address 10.0.0.1
[edit interfaces lo0 unit 0 family inet]
user@host# top
[edit]
user@host# show
interfaces {
lo0 {
  unit 0 {
    family inet {
      10.0.0.1;
      127.0.0.1;
      172.16.0.1;
    }
  }
}
}
```

Example: Configuring Two Addresses on the Loopback Interface with Subnetwork Routes

To configure two addresses on the loopback interface with subnetwork routes:

```
[edit]
user@host# edit interfaces lo0 unit 0 family inet
[edit interfaces lo0 unit 0 family inet]
user@host# set address 192.16.0.1/24
[edit interfaces lo0 unit 0 family inet]
user@host# set address 10.2.0.1/16
[edit interfaces lo0 unit 0 family inet]
user@host# top
[edit]
user@host# show
interfaces {
```
Example: Configuring an IPv4 and an IPv6 Address on the Loopback Interface with Subnetwork Routes

To configure an IPv4 and an IPv6 address on the loopback interface with subnetwork routes:

```
[edit]
user@host# edit interfaces lo0 unit 0 family inet
[edit interfaces lo0 unit 0 family inet]
user@host# set address 192.16.0.1/24
[edit interfaces lo0 unit 0 family inet]
user@host# up
[edit interfaces lo0 unit 0 family]
user@host# edit interfaces lo0 unit 0 family inet6
[edit interfaces lo0 unit 0 family inet6]
user@host# set address 3ffe::1:200:f8ff:fe75:50df/64
[edit interfaces lo0 unit 0 family inet6]
user@host# top
[edit]
user@host# show
interfaces {
  lo0 {
    unit 0 {
      family inet {
        10.2.0.1/16;
        127.0.0.1/32;
        192.16.0.1/24;
      }
    }
    family inet6 {
      3ffe::1:200:f8ff:fe75:50df/64;
    }
  }
}
```

Serial Interfaces Overview

Devices that communicate over a serial interface are divided into two classes: data terminal equipment (DTE) and data circuit-terminating equipment (DCE). Juniper Networks Serial Physical Interface Cards (PICs) have two ports per PIC and support full-duplex data transmission. These PICs support DTE mode only. On the Serial PIC, you can configure three types of serial interfaces:

- **EIA-530**—An Electronics Industries Alliance (EIA) standard for the interconnection of DTE and DCE using serial binary data interchange with control information exchanged on separate control circuits.
- **V.35**—An ITU-T standard describing a synchronous, physical layer protocol used for communications between a network access device and a packet network. V.35 is most commonly used in the United States and in Europe.
- **X.21**—An ITU-T standard for serial communications over synchronous digital lines. The X.21 protocol is used primarily in Europe and Japan.

The following standards apply to serial interfaces:

- TIA/EIA Standard 530, *High-Speed 25-Position Interface for Data Terminal Equipment and Data Circuit-Terminating Equipment*, defines the signals on the cable and specifies the connector at the end of the cable.
- TIA/EIA Standard 232, *Interface between Data Terminal Equipment and Data Circuit-Terminating Equipment Employing Serial Binary Data Interchange*, describes the physical interface and protocol for serial data communication.
- ITU-T Recommendation V.35, *Data Transmission at 48 kbit/s Using 60-108 kHz Group Band Circuits*. Note that the Juniper Networks Serial PIC supports V.35 interfaces with speeds higher than 48 kilobits per second.

There are no serial interface-specific logical properties. For information about general logical properties that you can configure, see *Configuring Logical Interface Properties*. This
support on serial interfaces is the same as the existing LFI and MLPPP support on T1 and E1 interfaces.

Example: Physical Interface Configuration Statements for Serial Interfaces

To configure serial physical interface properties, include the `serial-options` statement at the [edit interfaces se-fpc/pic/port] hierarchy level.

```
[edit interfaces se-fpc/pic/port]
serial-options {
  clock-rate rate;
  clocking-mode (dce | internal | loop);
  control-polarity (negative | positive);
  cts-polarity (negative | positive);
  dcd-polarity (negative | positive);
  dce-options {
    control-signal (assert | de-assert | normal);
    cts (ignore | normal | require);
    dcd (ignore | normal | require);
    dsr (ignore | normal | require);
    dtr signal-handling-option;
    ignore-all;
    indication (ignore | normal | require);
    rts (assert | de-assert | normal);
    tm (ignore | normal | require);
  }
  dsr-polarity (negative | positive);
  dte-options {
    control-signal (assert | de-assert | normal);
    cts (ignore | normal | require);
  }
```

Configuring the Serial Line Protocol

- Configuring the Serial Line Protocol on page 318
- Serial Interface Default Settings on page 318

Configuring the Serial Line Protocol

By default, serial interfaces use the EIA-530 line protocol. You can configure each port on the PIC independently to use one of the following line protocols:

- EIA-530
- V.35
- X.21

To configure the serial line protocol:

1. Include the `line-protocol` statement, specifying the `eia530`, `v.35`, or `x.21` option:

```
line-protocol protocol;
```

You can include these statements at the following hierarchy levels:

- `[edit interfaces se-pim/0/port serial-options]`
- `[edit interfaces se-fpc/pic/port serial-options]`

For more information about serial interfaces, see the following sections:

Serial Interface Default Settings

- Serial Interface Default Settings on page 319
- Invalid Serial Interface Statements on page 320
Serial Interface Default Settings

- EIA-530 Interface Default Settings on page 319
- V.35 Interface Default Settings on page 319
- X.21 Interface Default Settings on page 320

**EIA-530 Interface Default Settings**

If you do not include the `line-protocol` statement or if you explicitly configure the default EIA-530 line protocol, the default settings are as follows:

```plaintext
dce-options | dte-options {
  cts normal;
  dcd normal;
  dsr normal;
  dtr normal;
  rts normal;
  tm normal;
}
clock-rate 16.384mhz;
clocking-mode loop;
cts-polarity positive;
dcd-polarity positive;
rsr-polarity positive;
dtr-circuit balanced;
dtr-polarity positive;
encoding nrz;
rts-polarity positive;
trm-polarity positive;
```

**NOTE:** On M Series routers, you can set the DCE clocking mode for EIA-530 interfaces and commit. An error message is not displayed and the CLI is not blocked.

You can include the `line-protocol` statement at the following hierarchy levels:

- `[edit interfaces se-pim/0/port serial-options]`
- `[edit interfaces se-fpc/pic/port serial-options]`

**V.35 Interface Default Settings**

If you include the `line-protocol v.35` statement, the default settings are as follows:

```plaintext
dce-options | dte-options {
  cts normal;
  dcd normal;
  dsr normal;
  dtr normal;
  rts normal;
}
```
clock-rate 16.384mhz;
clocking-mode loop;
ccts-polarity positive;
dcd-polarity positive;
dsr-polarity positive;
dtr-circuit balanced;
dtr-polarity positive;
encoding nrz;
rts-polarity positive;

You can include the line-protocol statement at the following hierarchy levels:

- [edit interfaces se-pim/0/port serial-options]
- [edit interfaces se-fpc/pic/port serial-options]

**X.21 Interface Default Settings**

If you include the line-protocol x.21 statement, the default settings are as follows:

```
dce-options | dte-options {
    control-signal normal;
    indication normal;
}
clock-rate 16.384mhz;
clocking-mode loop;
control-polarity positive;
encoding nrz;
indication-polarity positive;
```

You can include the line-protocol statement at the following hierarchy levels:

- [edit interfaces se-pim/0/port serial-options]
- [edit interfaces se-fpc/pic/port serial-options]

**Invalid Serial Interface Statements**

The following sections show the invalid configuration statements for each type of serial interface. If you include the following statements in the configuration, an error message indicates the location of the error and the configuration is not activated.

- Invalid EIA-530 Interface Statements on page 320
- Invalid V.35 interface Statements on page 321
- Invalid X.21 Interface Statements on page 321

**Invalid EIA-530 Interface Statements**

If you do not include the line-protocol statement or if you explicitly configure the default EIA-530 line protocol, the following statements are invalid:

```
dce-options | dte-options {
    control-signal (assert | de-assert | normal);
    indication (ignore | normal | require);
```
You can include the **line-protocol** statement at the following hierarchy levels:

- [edit interfaces se-pim/0/port serial-options]
- [edit interfaces se-fpc/pic/port serial-options]

### Invalid V.35 Interface Statements

If you include the **line-protocol v.35** statement, the following statements are invalid:

```plaintext
  dce-options | dte-options {
    control-signal (assert | de-assert | normal);
    indication (ignore | normal | require);
    tm (ignore | normal | require);
  }
  control-polarity (negative | positive);
  indication-polarity (negative | positive);
  loopback (dce-local | dce-remote);
  tm-polarity (negative | positive);
```

You can include the **line-protocol** statement at the following hierarchy levels:

- [edit interfaces se-pim/0/port serial-options]
- [edit interfaces se-fpc/pic/port serial-options]

### Invalid X.21 Interface Statements

If you include the **line-protocol x.21** statement, the following statements are invalid:

```plaintext
  dce-options | dte-options {
    cts (ignore | normal | require);
    dcd (ignore | normal | require);
    dsr (ignore | normal | require);
    dtr (assert | de-assert | normal);
    rts (assert | de-assert | normal);
    tm (ignore | normal | require);
    }
  clocking-mode (dce | internal);
  cts-polarity (negative | positive);
  dce-polarity (negative | positive);
  dsr-polarity (negative | positive);
  dtr-circuit (balanced | unbalanced);
  dtr-polarity (negative | positive);
  loopback (dce-local | dce-remote);
  rts-polarity (negative | positive);
  tm-polarity (negative | positive);
```

You can include the **line-protocol** statement at the following hierarchy levels:

- [edit interfaces se-pim/0/port serial-options]
Configuring the Serial Clocking Mode

By default, serial interfaces use loop clocking mode. For EIA-530 and V.35 interfaces, you can configure each port on the PIC independently to use loop, DCE, or internal clocking mode. For X.21 interfaces, only loop clocking mode is supported.

The three clocking modes work as follows:

- **Loop clocking mode**—Uses the DCE’s RX clock to clock data from the DCE to the DTE.
- **DCE clocking mode**—Uses the TXC clock, which is generated by the DCE specifically to be used by the DTE as the DTE’s transmit clock.
- **Internal clocking mode**—Also known as line timing, uses an internally generated clock. You can configure the speed of this clock by including the `clock-rate` statement at the `[edit interfaces se-fpc/pic/port serial-options]` or `[edit interfaces se-fpc/pic/port dte-options]` hierarchy levels. For more information about the DTE clock rate, see “Configuring the DTE Clock Rate” on page 323.

Note that DCE clocking mode and loop clocking mode use external clocks generated by the DCE.

Figure 21 on page 322 shows the clock sources of loop, DCE, and internal clocking modes.

Figure 21: Serial Interface Clocking Mode

To configure the clocking mode of a serial interface, include the `clocking-mode` statement:
clocking-mode \(\text{(dce | internal | loop)}\);

You can include this statement at the following hierarchy levels:

- [edit interfaces se-pim/0/port serial-options]
- [edit interfaces se-fpc/pic/port serial-options]

### Inverting the Serial Interface Transmit Clock

When an externally timed clocking mode (DCE or loop) is used, long cables might introduce a phase shift of the DTE-transmitted clock and data. At high speeds, this phase shift might cause errors. Inverting the transmit clock corrects the phase shift, thereby reducing error rates.

By default, the transmit clock is not inverted. To invert the transmit clock, include the `transmit-clock invert` statement:

```
transmit-clock invert;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces se-pim/0/port serial-options]
- [edit interfaces se-fpc/pic/port serial-options]

### Configuring the DTE Clock Rate

By default, the serial interface has a clock rate of 16.384 MHz. For EIA-530 and V.35 interfaces with internal clocking mode configured, you can configure the clock rate.

To configure the clock rate, include the `clock-rate` statement:

```
clock-rate rate;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces se-pim/0/port serial-options]
- [edit interfaces se-fpc/pic/port serial-options]

You can configure the following interface speeds:

- 2.048 MHz
- 2.341 MHz
- 2.731 MHz
- 3.277 MHz
- 4.096 MHz
- 5.461 MHz
• 8.192 MHz
• 16.384 MHz

Although the serial interface is intended for use at the default rate of 16.384 MHz, you might need to use a slower rate if any of the following conditions prevail:

• The interconnecting cable is too long for effective operation.
• The interconnecting cable is exposed to an extraneous noise source that might cause an unwanted voltage in excess of +1 volt measured differentially between the signal conductor and circuit common at the load end of the cable, with a 50-ohm resistor substituted for the generator.
• You need to minimize interference with other signals.
• You need to invert signals.

For detailed information about the relationship between signaling rate and interface cable distance, see the following standards:

• EIA-422-A, Electrical Characteristics of Balanced Voltage Digital Interface Circuits
• EIA-423-A, Electrical Characteristics of Unbalanced Voltage Digital Interface Circuits

Related Documentation
• Serial Interfaces Overview on page 315

Configuring the Serial Signal Handling

By default, normal signal handling is enabled for all signals. For each signal, the normal option applies to the normal signal handling for that signal, as defined by the following standards:

• TIA/EIA Standard 530
• ITU-T Recommendation V.35
• ITU-T Recommendation X.21

Table 24 on page 324 shows the serial interface modes that support each signal type.

Table 24: Signal Handling by Serial Interface Type

</tbody>
</table>

You configure serial interface signal characteristics by including the `dce-options` or `dte-options` statement:

```hll

dce-options | dte-options {
    control-signal (assert | de-assert | normal);
    cts (ignore | normal | require);
    dcd (ignore | normal | require);
    dsr (ignore | normal | require);
    dtr signal-handling-option;
    ignore-all;
    indication (ignore | normal | require);
    rts (assert | de-assert | normal);
    tm (ignore | normal | require);
}
```

You can include these statements at the following hierarchy levels:

- `[edit interfaces se-pim/0/port serial-options]`
- `[edit interfaces se-fpc/pic/port serial-options]`

For EIA-530 and V.35 interfaces, configure to-DCE signals by including the `dtr` and `rts` statements, specifying the `assert`, `de-assert`, or `normal` option:

```hll
dtr (assert | de-assert | normal);
rts (assert | de-assert | normal);
```

For X.21 interfaces, configure to-DCE signals by including the `control-signal` statement, specifying the `assert`, `de-assert`, or `normal` option:

```hll
control-signal (assert | de-assert | normal);
```

**Assertion** is when the positive side of a given signal is at potential high-level output voltage (Voh), while the negative side of the same signal is at potential low-level output voltage (Vol). **Deassertion** is when the positive side of a given signal is at potential Vol, while the negative side of the same signal is at potential Voh.
For the DTR signal, you can configure normal signal handling using the signal for automatic resynchronization by including the dtr statement, and specifying the auto-synchronize option:

```plaintext
dtr {
  auto-synchronize {
    duration milliseconds;
    interval seconds;
  }
}
```

The pulse duration of resynchronization can be from 1 through 1000 milliseconds. The offset interval for resynchronization can be from 1 through 31 seconds.

For EIA-530 and V.35 interfaces, configure from-DCE signals by including the cts, dcd, and dsr statements, specifying the ignore, normal, or require option:

```plaintext
ccts (ignore | normal | require);
dcd (ignore | normal | require);
dsr (ignore | normal | require);
```

For X.21 interfaces, configure from-DCE signals by including the indication statement, specifying the ignore, normal, or require option:

```plaintext
indication (ignore | normal | require);
```

For EIA-530 interfaces only, you can configure from-DCE test-mode (TM) signaling by including the tm statement, specifying the ignore, normal, or require option:

```plaintext
tm (ignore | normal | require);
```

To specify that the from-DCE signal must be asserted, include the require option in the configuration. To specify that the from-DCE signal must be ignored, include the ignore option in the configuration.

---

**NOTE:** For V.35 and X.21 interfaces, you cannot include the tm statement in the configuration.

For X.21 interfaces, you cannot include the cts, dcd, dsr, dtr, and rts statements in the configuration.

For EIA-530 and V.35 interfaces, you cannot include the control-signal and indication statements in the configuration.

For a complete list of serial options statements that are not supported by each serial interface mode, see “Invalid Serial Interface Statements” on page 320.

To return to the default normal signal handling, delete the require, ignore, assert, de-assert, or auto-synchronize statement from the configuration, as shown in the following example:
To explicitly configure normal signal handling, include the `control-signal` statement with the `normal` option:

```
control-signal normal;
```

You can configure the serial interface to ignore all control leads by including the `ignore-all` statement:

```
ignore-all;
```

You can include the `ignore-all` statement in the configuration only if you do not explicitly enable other signal handling options at the `[edit interfaces se-pim/0/port serial-options dce-options]` or `[edit interfaces se-fpc/pic/port serial-options dte-options]` hierarchy levels.

You can include the `control-signal`, `cts`, `dcd`, `dsr`, `dtr`, `indication`, `rts`, and `tm` statements at the following hierarchy levels:

- `[edit interfaces se-pim/0/port serial-options dte-options]`
- `[edit interfaces se-fpc/pic/port serial-options dte-options]`

### Configuring the Serial DTR Circuit

A balanced circuit has two currents that are equal in magnitude and opposite in phase. An unbalanced circuit has one current and a ground; if a pair of terminals is unbalanced, one side is connected to electrical ground and the other carries the signal. By default, the DTR circuit is balanced.

For EIA-530 and V.35 interfaces, configure the DTR circuit by including the `dtr-circuit` statement:

```
dtr-circuit (balanced | unbalanced);
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces se-pim/0/port serial-options]`
- `[edit interfaces se-fpc/pic/port serial-options]`

### Configuring Serial Signal Polarities

Serial interfaces use a differential protocol signaling technique. Of the two serial signals associated with a circuit, the one referred to as the A signal is denoted with a plus sign, and the one referred to as the B signal is denoted with a minus sign; for example, DTR+ and DTR−. If DTR is low, then DTR+ is negative with respect to DTR−. If DTR is high, then DTR+ is positive with respect to DTR−.
By default, all signal polarities are positive. You can reverse this polarity on a Juniper Networks serial interface. You might need to do this if signals are miswired as a result of reversed polarities.

For EIA-530 and V.35 interfaces, configure signal polarities by including the `cts-polarity`, `dcd-polarity`, `dsr-polarity`, `dtr-polarity`, `rts-polarity`, and `tm-polarity` statements:

- `cts-polarity` (negative | positive);
- `dcd-polarity` (negative | positive);
- `dsr-polarity` (negative | positive);
- `dtr-polarity` (negative | positive);
- `rts-polarity` (negative | positive);
- `tm-polarity` (negative | positive);

You can include these statements at the following hierarchy levels:

- `[edit interfaces se-pim/0/port serial-options]`
- `[edit interfaces se-fpc/pic/port serial-options]`

For X.21 interfaces, configure signal polarities by including the `control-polarity` and `indication-polarity` statements:

- `control-polarity` (negative | positive);
- `indication-polarity` (negative | positive);

You can include these statements at the following hierarchy levels:

- `[edit interfaces se-pim/0/port serial-options]`
- `[edit interfaces se-fpc/pic/port serial-options]`

### Configuring Serial Loopback Capability

From the router, remote line interface unit (LIU) loopback loops the TX (transmit) data and TX clock back to the router as RX (receive) data and RX clock. From the line, LIU loopback loops the RX data and RX clock back out the line as TX data and TX clock, as shown in Figure 22 on page 328.

*Figure 22: Serial Interface LIU Loopback*
DCE local and DCE remote control the EIA-530 interface-specific signals for enabling local and remote loopback on the link partner DCE. Local loopback is shown in Figure 23 on page 329.

**Figure 23: Serial Interface Local Loopback**

For EIA-530 interfaces, you can configure DCE local, DCE remote, local, and remote (LIU) loopback capability.

For V.35, you can configure remote LIU and local loopback capability. DCE local and DCE remote loopbacks are not supported on V.35 and X.21 interfaces. Local and remote loopbacks are not supported on X.21 interfaces.

To configure the loopback capability on a serial interface, include the `loopback` statement, specifying the `dce-local`, `dce-remote`, `local`, or `remote` option:

```
loopback mode;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces se-pim/O/port serial-options]`
- `[edit interfaces se-fpc/pic/port serial-options]`

To disable the loopback capability, remove the `loopback` statement from the configuration:

```
[edit]
user@host# delete interfaces se-fpc/pic/port serial-options loopback
```

You can determine whether there is an internal or external problem by checking the error counters in the output of the `show interface se-fpc/pic/port extensive` command:

```
user@host> show interfaces se-fpc/pic/port extensive
```

To Configure Serial Loopback Capability:

1. To determine the source of a problem, loop the packets on the local router, the local DCE, the remote DCE, and the remote line interface unit (LIU).
2. To do this, include the `no-keepalives` and `encapsulation cisco-hdlc` statements at the
[edit interfaces se-fpc/pic/port] hierarchy level, and the `loopback local` option at the
[edit interfaces se-pim/0/port serial-options] or [edit interfaces se-fpc/pic/port
serial-options] hierarchy level. With this configuration, the link stays up, so you can
loop ping packets to a remote router. The `loopback local` statement causes the
interface to loop within the PIC just before the data reaches the transceiver.

```
[edit interfaces]
se-1/0/0 {
  no-keepalives;
  encapsulation cisco-hdlc;
  serial-options {
    loopback local;
  }
  unit 0 {
    family inet {
      address 10.100.100.1/24;
    }
  }
}
```

Related Documentation

- Serial Interfaces Overview on page 315

Configuring Serial Line Encoding

By default, serial interfaces use non-return to zero (NRZ) line encoding. You can configure
non-return to zero inverted (NRZI) line encoding if necessary.

To have the interface use NRZI line encoding, include the `encoding` statement, specifying
the `nrzi` option:

```
encoding nrzi;
```

To explicitly configure the default NRZ line encoding, include the `encoding` statement,
specifying the `nrz` option:

```
encoding nrz;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces se-pim/0/port serial-options]
- [edit interfaces se-fpc/pic/port serial-options]

When setting the line encoding parameter, you must set the same value for paired ports.
Ports 0 and 1 must share the same value.
Specifying a USB Modem Interface on J Series Routers

The J Series routers contain two USB ports controlled by a single USB controller. One USB port can support USB devices, while the other one can act as a USB modem.

The USB modem provides a dial-in remote management interface, and supports dialer interface features by sharing the same dial pool as a dialer interface. The dial pool allows the logical dialer interface (dlIn) and the physical interface (umdo) to be bound together dynamically on a per-call basis.

The following dialer interface features are supported by the USB modem interface:

• Encapsulation PPP
• CoS
• NAT
• Interface statistics
• Packet capture
• GRE tunnel
• Stateful firewall
• Traffic sampling

To configure a USB modem interface, include the following statements at the [edit interfaces] hierarchy level:

```
[edit interfaces]
umdo {
    dialer-options {
        pool pool-name <priority priority> ;
    }
    modem-options {
        dialin (console | routable);
        init-command-string initialization-command-string;
    }
}
```

The pool name specified at the [edit interfaces umdo dialer-options pool] hierarchy level must be the same as the pool name specified at the [edit interfaces dlIn unit logical-unit-number dialer-options pool] hierarchy level.

Configure the USB modem to operate as a dial-in WAN backup interface by including the dialin statement and specifying the routable option. If the USB modem is to be used as a dial-in console, specify the console option in the dialin statement.
When the Services Router applies the modem AT commands configured in the *init-command-string* statement or the default sequence of initialization commands to the modem, it compares them to the initialization commands already configured on the modem and makes the following changes:

- If the commands are the same, the router overrides the existing modem values that do not match. For example, if the initialization commands on the modem include S0=0 and the router’s *init-command-string* configuration includes S0=2, the Services Router applies S0=2.

- If the initialization commands on the modem do not include a command in the router’s *init-command-string* statement configuration, the router adds it. For example, if the *init-command-string* statement includes the command L2, but the modem commands do not include it, the router adds L2 to the initialization commands configured on the modem.

Include the following statements at the [edit interfaces dln] hierarchy level to support a minimum configuration for a dialer interface connected to a USB modem:

```conf
[edit interfaces dln]
encapsulation ppp;
unit logical-unit-number;
dialer-options {
  dial-string dial-string-numbers;
  pool pool-name <priority priority>;
}
ppp-options {
  chap;
  access-profile name;
  local-name name;
  passive;
}
family inet {
  mtu bytes;
  address address {
    destination address;
  }
}
```

CHAPTER 11

Monitoring Interfaces

- Tracing Interface Operations Overview on page 335
- Tracing Operations of an Individual Router Interface on page 335
- Tracing Operations of the Interface Process on page 336
- Monitoring a PPP Session on page 338
- Tracing Operations of the pppd Process on page 338

Tracing Interface Operations Overview

You can trace the operations of individual router interfaces and those of the interface process (dcd). For a general discussion of tracing and of the precedence of multiple tracing operations, see the Junos OS Administration Library.

For information about the operations of Virtual Router Resolution Protocol (VRRP)-enabled interfaces, see the High Availability Feature Guide.

Tracing Operations of an Individual Router Interface

To trace the operations of individual router interfaces, perform the following steps:

1. In configuration mode, go to the [edit interfaces interface-name] hierarchy level:

   [edit]
   user@host# edit interfaces interface-name

2. Configure the traceoptions option.

   [edit interfaces interface-name]
   user@host# edit traceoptions

3. Configure the tracing flag.
You can specify the following interface tracing flags:

- **all**—Trace all interface operations.
- **event**—Trace all interface events.
- **ipc**—Trace all interface interprocess communication (IPC) messages.
- **media**—Trace all interface media changes.

The interfaces `traceoptions` statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system `syslog` files.

For more information about trace operations, see "Tracing Operations of the Interface Process" on page 336.

### Tracing Operations of the Interface Process

To trace the operations of the router or switch interface process, dcd, perform the following steps:

1. In configuration mode, go to the `[edit interfaces]` hierarchy level:

   ```
   [edit]
   user@host# edit interfaces
   ```

2. Configure the `traceoptions` statement.

   ```
   [edit interfaces]
   user@host# edit traceoptions
   ```

3. Configure the `no-remote-trace` option to disable remote tracing.

   ```
   [edit interfaces traceoptions]
   user@host# set no-remote-trace
   ```

4. Configure the `file filename` option.

   ```
   [edit interfaces traceoptions]
   user@host# edit file
   ```

5. Configure the `files number` option, `match regular-expression` option, `size size` option, and `world-readable | no-world-readable` option.
Configure the tracing flag.

[edit interfaces traceoptions]
user@host# set flag flag-option

7. Configure the disable option in flag flag-option statement to disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.

[edit interfaces traceoptions]
user@host# set flag flag-option disable

You can specify the following flags in the interfaces traceoptions statement:

- all—Enable all configuration logging.
- change-events—Log changes that produce configuration events.
- gres-events—Log the events related to GRES.
- resource-usage—Log the resource usage for different states.
- config-states—Log the configuration state machine changes.
- kernel—Log configuration IPC messages to kernel.
- kernel-detail—Log details of configuration messages to kernel.
- select-events—Log the events on select state machine.

By default, interface process operations are placed in the file named dcd and three 1-MB files of tracing information are maintained.

For general information about tracing, see the tracing and logging information in the Junos OS Administration Library.

Related Documentation
- Tracing Interface Operations Overview on page 335
- Tracing Operations of an Individual Router Interface on page 335
- traceoptions on page 1053
Monitoring a PPP Session

You can monitor PPP packet exchanges. When monitoring is enabled, packets exchanged during a session are logged by default to `/var/log/pppd`, or to the file specified in the `traceoptions` statement.

To monitor a PPP session:

1. In configuration mode, go to the `[edit protocols ppp]` hierarchy level.

   ```
   [edit ]
   user@host# edit protocols ppp
   ```

2. Include the `monitor-session` statement.

   ```
   [edit protocols ppp]
   user@host# monitor-session (interface-name | all);
   ```

When monitoring is configured, the operational mode commands `show ppp summary` and `show ppp interface` display a `Monitored` flag in the `Session flags` column or line.

Related Documentation

`monitor-session` on page 794

Tracing Operations of the pppd Process

You can trace the operations of the router’s pppd process.

To trace the router’s pppd process:

1. In configuration mode, go to the `[edit protocols ppp]` hierarchy level.

   ```
   [edit ]
   user@host# edit protocols ppp
   ```

2. Include the `traceoptions` statement.

   ```
   [edit protocols ppp]
   traceoptions {
     file filename <files number> <match regular-expression> <size size> <world-readable | no-world-readable>;
     flag flag;
     level severity-level;
     no-remote-trace;
   }
   ```

   • To specify more than one tracing operation, include multiple `flag` statements.
You can specify the following flags in the `traceoptions` statement:

- **access**—Trace access code
- **address-pool**—Trace address pool code
- **all**—Trace all areas of code
- **auth**—Trace authentication code
- **chap**—Trace challenge handshake authentication protocol code
- **ci**—Trace CI code
- **config**—Trace configuration code
- **ifdb**—Trace interface database code
- **lcp**—Trace LCP state machine code
- **memory**—Trace memory management code
- **message**—Trace message processing code
- **mlppp**—Trace multilink point-to-point protocol code
- **ncp**—Trace NCP state machine code
- **pap**—Trace password authentication protocol code
- **ppp**—Trace PPP protocol processing code
- **radius**—Trace RADIUS processing code
- **redundancy**—Trace redundancy code
- **rtsock**—Trace routing socket code
- **session**—Trace session management code
- **signal**—Trace signal handling code
- **timer**—Trace timer code
- **ui**—Trace user interface code

Configuring Interface Diagnostics Tools to Test the Physical Layer Connections

- Configuring Loopback Testing on page 341
- Configuring BERT Testing on page 343
- Starting and Stopping a BERT Test on page 347

Configuring Loopback Testing

Loopback testing allows you to verify the connectivity of a circuit. You can configure any of the following interfaces to execute a loopback test: aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, E1, E3, NxDS0, serial, SONET/SDH, T1, and T3.

The physical path of a network data circuit usually consists of segments interconnected by devices that repeat and regenerate the transmission signal. The transmit path on one device connects to the receive path on the next device. If a circuit fault occurs in the form of a line break or a signal corruption, you can isolate the problem by using a loopback test. Loopback tests allow you to isolate segments of the circuit and test them separately.

To do this, configure a line loopback on one of the routers. Instead of transmitting the signal toward the far-end device, the line loopback sends the signal back to the originating router. If the originating router receives back its own Data Link Layer packets, you have verified that the problem is beyond the originating router. Next, configure a line loopback farther away from the local router. If this originating router does not receive its own Data Link Layer packets, you can assume that the problem is on one of the segments between the local router and the remote router’s interface card. In this case, the next troubleshooting step is to configure a line loopback closer to the local router to find the source of the problem.

Copyright © 2019, Juniper Networks, Inc.
The following types of loopback testing are supported by Junos OS:

- **DCE local**—Loops packets back on the local data circuit-terminating equipment (DCE).
- **DCE remote**—Loops packets back on the remote DCE.
- **Local**—Useful for troubleshooting physical PIC errors. Configuring local loopback on an interface allows transmission of packets to the channel service unit (CSU) and then to the circuit toward the far-end device. The interface receives its own transmission, which includes data and timing information, on the local router's PIC. The data received from the CSU is ignored. To test a local loopback, issue the `show interfaces interface-name` command. If PPP keepalives transmitted on the interface are received by the PIC, the *Device Flags* field contains the output *Loop-Detected*.
- **Payload**—Useful for troubleshooting the physical circuit problems between the local router and the remote router. A payload loopback loops data only (without clocking information) on the remote router's PIC. With payload loopback, overhead is recalculated.
- **Remote**—Useful for troubleshooting the physical circuit problems between the local router and the remote router. A remote loopback loops packets, including both data and timing information, back on the remote router's interface card. A router at one end of the circuit initiates a remote loopback toward its remote partner. When you configure a remote loopback, the packets received from the physical circuit and CSU are received by the interface. Those packets are then retransmitted by the PIC back toward the CSU and the circuit. This loopback tests all the intermediate transmission segments.

Table 25 on page 342 shows the loopback modes supported on the various interface types.

To configure loopback testing, include the **loopback** statement:

```
user@host# loopback mode;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces interface-name aggregated-ether-options]
- [edit interfaces interface-name ds0-options]
- [edit interfaces interface-name e1-options]
- [edit interfaces interface-name e3-options]
- [edit interfaces interface-name fastether-options]
- [edit interfaces interface-name gigether-options]
- [edit interfaces interface-name serial-options]
- [edit interfaces interface-name sonet-options]
- [edit interfaces interface-name t1-options]
- [edit interfaces interface-name t3-options]

**Configuring BERT Testing**

To configure BERT:

- Configure the duration of the test.

  ```
  user@host#bert-period seconds;
  ```

You can configure the BERT period to last from 1 through 239 seconds on some PICs and from 1 through 240 seconds on other PICs. By default, the BERT period is 10 seconds.

- Configure the error rate to monitor when the inbound pattern is received.
[edit interfaces interface-name interface-type-options]
user@host# bert-error-rate rate;

rate is the bit error rate. This can be an integer from 0 through 7, which corresponds to a bit error rate from $10^{-0}$ (1 error per bit) to $10^{-7}$ (1 error per 10 million bits).

- Configure the bit pattern to send on the transmit path.

[edit interfaces interface-name interface-type-options]
user@host# bert-algorithm algorithm;

algorithm is the pattern to send in the bit stream. For a list of supported algorithms, enter a ? after the bert-algorithm statement; for example:

[edit interfaces t1-0/0/0 t1-options]
user@host# set bert-algorithm ?

Possible completions:
- pseudo-2e11-o152 Pattern is $2^{11} -1$ (per 0.152 standard)
- pseudo-2e15-o151 Pattern is $2^{15} - 1$ (per 0.152 standard)
- pseudo-2e20-o151 Pattern is $2^{20} - 1$ (per 0.151 standard)
- pseudo-2e20-o153 Pattern is $2^{20} - 1$ (per 0.153 standard)
  ...

For specific hierarchy information, see the individual interface types.

NOTE: The four-port E1 PIC supports only the following algorithms:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pseudo-2e11-o152</td>
<td>Pattern is $2^{11} -1$ (per 0.152 standard)</td>
</tr>
<tr>
<td>pseudo-2e15-o151</td>
<td>Pattern is $2^{15} - 1$ (per 0.152 standard)</td>
</tr>
<tr>
<td>pseudo-2e20-o151</td>
<td>Pattern is $2^{20} - 1$ (per 0.151 standard)</td>
</tr>
<tr>
<td>pseudo-2e23-o151</td>
<td>Pattern is $2^{23}$ (per 0.151 standard)</td>
</tr>
</tbody>
</table>

When you issue the help command from the CLI, all BERT algorithm options are displayed, regardless of the PIC type, and no commit check is available. Unsupported patterns for a PIC type can be viewed in system log messages.
### NOTE: The 12-port T1/E1 Circuit Emulation (CE) PIC supports only the following algorithms:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all-ones-repeating</td>
<td>Repeating one bits</td>
</tr>
<tr>
<td>all-zeros-repeating</td>
<td>Repeating zero bits</td>
</tr>
<tr>
<td>alternating-double-ones-zeros</td>
<td>Alternating pairs of ones and zeros</td>
</tr>
<tr>
<td>alternating-ones-zeros</td>
<td>Alternating ones and zeros</td>
</tr>
<tr>
<td>pseudo-2e11-o152</td>
<td>Pattern is $2^{11} - 1$ (per O.152 standard)</td>
</tr>
<tr>
<td>pseudo-2e15-o151</td>
<td>Pattern is $2^{15} - 1$ (per O.151 standard)</td>
</tr>
<tr>
<td>pseudo-2e20-o151</td>
<td>Pattern is $2^{20} - 1$ (per O.151 standard)</td>
</tr>
<tr>
<td>pseudo-2e7</td>
<td>Pattern is $2^7 - 1$</td>
</tr>
<tr>
<td>pseudo-2e9-o153</td>
<td>Pattern is $2^9 - 1$ (per O.153 standard)</td>
</tr>
<tr>
<td>repeating-1-in-4</td>
<td>1 bit in 4 is set</td>
</tr>
<tr>
<td>repeating-1-in-8</td>
<td>1 bit in 8 is set</td>
</tr>
<tr>
<td>repeating-3-in-24</td>
<td>3 bits in 24 are set</td>
</tr>
</tbody>
</table>

When you issue the help command from the CLI, all BERT algorithm options are displayed, regardless of the PIC type, and no commit check is available. Unsupported patterns for a PIC type can be viewed in system log messages.

### NOTE: The IQE PICs support only the following algorithms:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all-ones-repeating</td>
<td>Repeating one bits</td>
</tr>
<tr>
<td>all-zeros-repeating</td>
<td>Repeating zero bits</td>
</tr>
<tr>
<td>alternating-double-ones-zeros</td>
<td>Alternating pairs of ones and zeros</td>
</tr>
<tr>
<td>alternating-ones-zeros</td>
<td>Alternating ones and zeros</td>
</tr>
<tr>
<td>pseudo-2e9-o153</td>
<td>Pattern is $2^9 - 1$ (per O.153 (511 type) standard)</td>
</tr>
<tr>
<td>pseudo-2e11-o152</td>
<td>Pattern is $2^{11} - 1$ (per O.152 and O.153 (2047 type) standards)</td>
</tr>
<tr>
<td>pseudo-2e15-o151</td>
<td>Pattern is $2^{15} - 1$ (per O.151 standard)</td>
</tr>
<tr>
<td>pseudo-2e20-o151</td>
<td>Pattern is $2^{20} - 1$ (per O.151 standard)</td>
</tr>
<tr>
<td>pseudo-2e20-o153</td>
<td>Pattern is $2^{20} - 1$ (per O.153 standard)</td>
</tr>
<tr>
<td>pseudo-2e23-o151</td>
<td>Pattern is $2^{23} - 1$ (per O.151 standard)</td>
</tr>
<tr>
<td>repeating-1-in-4</td>
<td>1 bit in 4 is set</td>
</tr>
<tr>
<td>repeating-1-in-8</td>
<td>1 bit in 8 is set</td>
</tr>
<tr>
<td>repeating-3-in-24</td>
<td>3 bits in 24 are set</td>
</tr>
</tbody>
</table>

When you issue the help command from the CLI, all BERT algorithm options are displayed, regardless of the PIC type, and no commit check is available. Unsupported patterns for a PIC type can be viewed in system log messages.
NOTE: BERT is supported on the PDH interfaces of the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP and the DS3/E3 MIC. The following BERT algorithms are supported:

- all-ones-repeating
- all-zeros-repeating
- alternating-double-ones-zeros
- alternating-ones-zeros
- repeating-1-in-4
- repeating-1-in-8
- repeating-3-in-24
- pseudo-2e9-o153
- pseudo-2e11-o152
- pseudo-2e15-o151
- pseudo-2e20-o151
- pseudo-2e20-o153
- pseudo-2e23-o151

Repeating one bits
Repeating zero bits
Alternating pairs of ones and zeros
Alternating ones and zeros
1 bit in 4 is set
1 bit in 8 is set
3 bits in 24 are set
Pattern is $2^9 - 1$ (per 0.153 standard)
Pattern is $2^{11} - 1$ (per 0.152 standard)
Pattern is $2^{15} - 1$ (per 0.151 standard)
Pattern is $2^{20} - 1$ (per 0.151 standard)
Pattern is $2^{23}$ (per 0.151 standard)

Table 26 on page 346 shows the BERT capabilities for various interface types.

Table 26: BERT Capabilities by Interface Type

<table>

</table>
These limitations do not apply to channelized IQ interfaces. For information about BERT capabilities on channelized IQ interfaces, see Channelized IQ and IQE Interfaces Properties.

Starting and Stopping a BERT Test

Before you can start the BERT test, you must disable the interface. To do this, include the disable statement at the [edit interfaces interface-name] hierarchy level:

```
[edit interfaces interface-name]
disable;
```

After you configure the BERT properties and commit the configuration, begin the test by issuing the `test interface interface-name interface-type-bert-start` operational mode command:

```
user@host> test interface interface-name interface-type-bert-start
```

The test runs for the duration you specify with the `bert-period` statement. If you want to terminate the test sooner, issue the `test interface interface-name interface-type-bert-stop` command:

```
user@host> test interface interface-name interface-type-bert-stop
```

For example:

```
user@host> test interface t3-1/2/0 t3-bert-start
user@host> test interface t3-1/2/0 t3-bert-stop
```

To view the results of the BERT test, issue the `show interfaces extensive | find BERT` command:

```
user@host> show interfaces interface-name extensive | find BERT
```

For more information about running and evaluating the results of the BERT procedure, see the CLI Explorer.

**NOTE:** To exchange BERT patterns between a local router and a remote router, include the loopback remote statement in the interface configuration at the remote end of the link. From the local router, issue the test interface command.

**Related Documentation**

- `show interfaces diagnostics optics (Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, and Virtual Chassis Port)`
Troubleshooting: em0 Management Interface Link is Down

Problem  Description: Ethernet Link Down alarm is raised when you run the show chassis alarm operational mode command on a T640 router, a T1600 router, T4000 router, or a TX Matrix Plus router.

Diagnosis  Perform the following tests to check if the em0 management interface is down on the master Routing Engine or the backup Routing Engine:

1. Run the show chassis alarms command.

```
show chassis alarms
```

```
user@host0> show chassis alarms
1 alarms currently active
Alarm time  Class Description
2011-10-19 11:13:02  MYT Major Host 1 em0 : Ethernet Link Down
```

Is the alarm Ethernet Link Down displayed against the em0 interface of the master Routing Engine (Host 0)?

- **Yes:** Contact JTAC for further assistance.
- **No:** Continue to the next diagnostic test.

2. Run the show interfaces em0 and the show interfaces em0 terse operational mode commands.

```
show interfaces em0
```

```
user@host> show interfaces em0
Physical interface: em0, Enabled, Physical link is Up
Interface index: 1, SNMP ifIndex: 1
Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 100mbps
Device flags : Present Running
Interface flags: SNMP-Traps
...
```

```
show interfaces em0 terse
```

```
user@host> show interfaces em0 terse
Interface Admin Link Proto Local Remote
dem0 up up inet 10.100.100.1/30
```

Is the em0 interface on the master Routing Engine **up**?

- **Yes:** Continue to resolution.
Resolution  

To Resolve This Issue

From the aforementioned diagnosis, we ascertain that the chassis alarm has been raised for the em0 management interface in the backup Routing Engine (Host 1) and not for the master Routing Engine (Host 0).

Implement one of the following solutions on the backup Routing Engine to resolve this issue:

• Disable the em0 interface in the backup Routing Engine:
  1. In configuration mode, go to the [edit groups re1] hierarchy level.

     user@host1# edit groups re1

  2. Disable the em0 interface.

     [edit groups re1]
     user@host1# set interfaces em0 disable

• Ignore the alarm:
  1. In configuration mode, go to the [edit chassis] hierarchy level.

     user@host1# edit chassis

  2. Ignore the Ethernet link down alarm on the management interface by setting the management-ethernet link-down alarm option to ignore.

     [edit chassis]
     user@host1# set alarm management-ethernet link-down ignore

Troubleshooting: fxp0 Management Interface Link is Down

Problem  Description: Ethernet Link Down alarm is raised when you run the show chassis alarm operational mode command on an M Series router, an MX Series router, a T320 router, a T640 router, a T1600 router, or on a TX Matrix router.
**Diagnosis**

Perform the following tests to check if the fxp0 interface is down on the master Routing Engine or the backup Routing Engine:

1. Run the `show chassis alarms` command.

   ```
   user@host0> show chassis alarms
   1 alarms currently active
   Alarm time Class Description
   2011-10-19 11:13:02 MYT Major Host 1 fxp0 : Ethernet Link Down
   ```

   Is the alarm *Ethernet Link Down* displayed against the fxp0 interface of the master Routing Engine (Host 0)?
   - Yes: Contact JTAC for further assistance.
   - No: Continue to the next diagnostic test.

2. Run the `show interfaces fxp0` and the `show interfaces fxp0 terse` operational mode commands.

   ```
   user@host> show interfaces fxp0
   Physical interface: fxp0, Enabled, Physical link is Up
   Interface index: 1, SNMP ifIndex: 1
   Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 100mbps
   Device flags : Present Running
   Interface flags: SNMP-Traps
   ```

   ```
   user@host> show interfaces fxp0 terse
   Interface Admin Link Proto Local Remote
   fxp0 up up
   fxp0.0 up up inet 10.100.100.1/30
   ```

   Is the fxp0 interface on the master Routing Engine *up*?
   - Yes: Continue to resolution.
   - No: Contact JTAC for further assistance

**Resolution**

*To Resolve This Issue*

From the diagnosis, we ascertain that the chassis alarm has been raised for the fxp0 management interface in the backup Routing Engine (Host 1) and not for the master Routing Engine (Host 0).
Implement one of the following solutions on the backup Routing Engine to avoid this issue:

- Disable the fxp0 interface in the backup Routing Engine:
  1. In configuration mode, go to the [edit groups re1] hierarchy level.

     user@host1# edit groups re1

  2. Disable the fxp0 interface.

     [edit groups re1]
     user@host1# set interfaces fxp0 disable

- Ignore the alarm:
  1. In configuration mode, go to the [edit chassis] hierarchy level.

     user@host1# edit chassis

  2. Ignore the Ethernet link down alarm on the management interface by setting the management-ethernet link-down alarm option to ignore.

     [edit chassis]
     user@host1# set alarm management-ethernet link-down ignore

**Related Documentation**

**Troubleshooting: Faulty Ethernet Physical Interface on an M Series, an MX Series, or a T Series Router**

You can follow the basic troubleshooting checklist as explained in the following topics from one through five to troubleshoot an Ethernet physical interface on an M Series, MX Series, or a T Series router.

1. Checking the Cable Connection on page 352
2. Checking the Physical Link Status of the Interface on page 353
3. Checking the Interface Statistics in Detail on page 354
4. Performing the Loopback Diagnostic Test on page 356
5. Checking Other Possibilities on page 358
6. To Enable a Physical Interface on page 359
Checking the Cable Connection

**Problem Description:** Packets are not received or transmitted over the Ethernet physical interface.

**Diagnosis**

1. Is the correct cable connected to the correct port?
   - Yes: Continue to “Checking the Physical Link Status of the Interface” on page 353.
   - No: See “Resolving Cabling Issue” on page 352.

**Resolution**

*Resolving Cabling Issue*

Perform one or more of the following steps to resolve the cabling issue:

1. Connect the cable properly on the local and remote ends without any loose connections.

2. Swap the Ethernet cable for a known good cable if the existing cable is damaged.

3. Connect a single-mode fiber cable to a single-mode interface only and a multimode fiber cable to a multimode interface only. To check fiber optic cable integrity, see “Checking Fiber Optic Cable Integrity” on page 352.

4. Connect the correct small form-factor pluggable transceiver (SFP) on both sides of the cable.

*Checking Fiber Optic Cable Integrity*

To check the integrity of fiber optic cable with an external cable diagnostic testing tool:

**NOTE:** A single-mode fiber cable must be connected to a single-mode interface and a multi-mode fiber cable must be connected to a multi-mode interface.

1. Measure the received light level at the receiver (RX) port to see whether the received light level is within the receiver specification of the Ethernet interface.

2. Measure transmitted light level at the transmitter (TX) port to see whether the transmitted light level is within the transmitter specification of the Ethernet interface.
Checking the Physical Link Status of the Interface

Problem Description: Unable to transmit and receive packets on the Ethernet interface even though the cable connection is correct.

Solution
To display the physical link status of the interface, run the `show interface interface-name media` operational mode command. For example, on the ge-5/0/1 interface.

```
user@host> show interfaces ge-5/0/1 media
Physical interface: ge-5/0/1, Enabled, Physical link is Up
    Interface index: 317, SNMP ifIndex: 1602
    Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, BPDU Error: None,
    MAC-REWRITE Error: None, Loopback: Disabled,
    Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
    Remote fault: Online, Speed-negotiation: Disabled, Auto-MDI: Enabled
    Device flags : Present Running
    Interface flags: SNMP-Traps Internal: 0x4000
    Link flags   : None
    CoS queues   : 8 supported, 8 maximum usable queues
    Current address: 2c:6b:f5:4c:26:73, Hardware address: 2c:6b:f5:4c:26:73
    Last flapped : 2012-11-30 01:25:37 UTC (03:46:55 ago)
    Input rate   : 880 bps (1 pps)
    Output rate  : 312 bps (0 pps)
    Active alarms: None
    Active defects: None
    MAC statistics:
    Input bytes: 901296, Input packets: 9799, Output bytes: 976587, Output packets: 10451
    Filter statistics:
    Filtered packets: 68, Padded packets: 0, Output packet errors: 0
    Autonegotiation information:
    Negotiation status: Complete
    Link partner:
    Link mode: Full-duplex, Flow control: Symmetric/Asymmetric, Remote fault: OK
    Local resolution:
    Flow control: Symmetric, Remote fault: Link OK
    Interface transmit statistics: Disabled
```

For information about `show interfaces interface-name media`, see `show interfaces`.

Diagnosis
1. Are there any connectivity problems such as input errors and packet loss even though the Enabled field displays Physical link is Up status and the Active alarms and Active defect field displays None?
   - Yes: Go to “Checking the Interface Statistics in Detail” on page 354.
   - No: Continue to the next diagnostic test.
2. Does the Enabled field display Physical link is Down status and the Active alarms and Active defect field display Link?

- Yes: The interface is either not connected correctly or is not receiving a valid signal. Go to “Resolving Cabling Issue” on page 352.
- No: Continue.

Checking the Interface Statistics in Detail

**Problem Description:** The physical interface is not working even though the Enabled field displays Physical link is Up status and the Active alarms and Active defect field displays None.

**Solution** To display the interface statistics in detail, run the show interface interface-name extensive operational command. For example, on ge-5/0/1 interface.

```
user@host> show interfaces ge-5/0/1 extensive
Physical interface: ge-5/0/1, Enabled, Physical link is Up
   Interface index: 317, SNMP ifIndex: 1602, Generation: 322
   Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, BPDU Error: None,
   MAC-REWRITE Error: None, Loopback: Disabled,
   Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
   Remote fault: Online, Speed-negotiation: Disabled,
   Auto-MDIX: Enabled
   Device flags   : Present Running
   Interface flags: SNMP-Traps Internal: 0x4000
   Link flags     : None
   CoS queues     : 8 supported, 8 maximum usable queues
   Hold-times     : Up 0 ms, Down 0 ms
   Current address: 2c:6b:f5:4c:26:73, Hardware address: 2c:6b:f5:4c:26:73
   Last flapped   : 2012-11-30 01:25:37 UTC (04:38:32 ago)

For information about `show interfaces interface-name detail`, see `show interfaces`.

**Diagnosis**

1. Does the **Policed discards**, **L2 channel errors**, **Input DA rejects**, or the **Input SA rejects** field display any errors?

   For information about the errors, see `show interfaces`.
   - Yes: Resolve the errors as needed. Resolving these errors is beyond the scope of this topic.
   - No: Continue with “Performing the Loopback Diagnostic Test” on page 356.

**Performing the Loopback Diagnostic Test**

**Problem Description:** The interface cable is connected correctly and there are no alarms or errors associated with the Ethernet physical interface yet the interface is not working.

**Solution**

To check whether the Ethernet port or PIC is faulty, you must perform the internal loopback test and hardware loopback test.

To perform a internal loopback diagnostic test on an Ethernet interface, for example on ge-5/0/1 interface:

1. In configuration mode, go to the `[edit interfaces ge-5/0/1]` hierarchy level.

   ```plaintext
   [edit]
   user@host# edit interface ge-5/0/1
   ```

2. Set the `gigether-options` option as loopback, commit the configuration and quit configuration mode.

   ```plaintext
   [edit interfaces ge-5/0/1]
   user@host# set gigether-options loopback
   user@host# commit
   user@host# quit
   ```

3. In operational mode, execute the `show interfaces ge-5/0/1 media` command.
user@host> show interfaces ge-5/0/1 media
Physical interface: ge-5/0/1, Enabled, Physical link is Up
    Interface index: 317, SNMP ifIndex: 1602
    Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, BPDU Error: None,
    MAC-REWRITE Error: None, Loopback: Enabled,
    Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
    Remote fault: Online, Speed-negotiation: Disabled,
    Auto-MDIX: Enabled

    Link mode: Full-duplex, Flow control: Symmetric/Asymmetric, Remote
    fault: OK
    Local resolution:
        Flow control: Symmetric, Remote fault: Link OK
Interface transmit statistics: Disabled

NOTE: Delete the loopback statement after completing your diagnosis.

Execute one of the following steps for a hardware loopback diagnostic test as needed:

- For an Ethernet PIC with a fiber optic interface—Physically loop the T_x and R_x port
  and check the status of the physical link with the show interfaces interface-name media
  operational mode command.

- For an Ethernet PIC with an RJ-45 Ethernet interface—Build a loopback plug by crossing
  pin 1 (T_x +) to pin 3 (R_x +) together and pin 2 (T_x -) and pin 6 (R_x -) together and check
  the status of the physical link with the show interfaces interface-name media operational
  mode command.
NOTE: For information about loopback testing, see Performing Loopback Testing for Fast Ethernet and Gigabit Ethernet Interfaces.

Diagnosis

1. Does the Enabled field display Physical link is Up status and the Active alarms and Active defect field display None when you perform the loopback test?
   - Yes: Go to the “Checking Other Possibilities” on page 358 section.
   - No: Continue to the next diagnostic test.

2. When the Ethernet interface is connected to a remote Ethernet device over multiple patch panels, check to see whether the connection can be looped back at the different patch panels so you can conduct a loopback diagnostic test. Is the loopback diagnostic test successful?
   - Yes: Go to the “Checking Other Possibilities” on page 358 section.
   - No: Contact JTAC for further assistance.

Checking Other Possibilities

Problem Description: Loopback diagnostic test is successful but unable to transmit and receive packets on the Ethernet interface.

Solution

Use the following commands as needed to troubleshoot an Ethernet interface, for example, an ge-5/0/1 interface:

- Run the show interfaces interface-name terse operational command to check if the physical interface and logical interfaces are administratively disabled. For example, on ge-5/0/1 interface.

```
user@host> show interfaces ge-5/0/1 terse

Interface           Admin Link Proto    Local                 Remote
ge-5/0/1             up      up    inet     20.1.1.2/24
ge-5/0/1.0            up      up   inet        0.0.0.0
ge-5/0/1.1           up      up   inet        0.0.0.0
```

Diagnosis

1. Does the physical interface and its corresponding logical interfaces display down in the output of the show interfaces interface-name terse operational mode command?
   - Yes: Enable the interfaces as shown in “To Enable a Physical Interface” on page 359.
   - No: Continue to the next diagnostic test.
2. Are the speed, duplex, and auto-negotiation fields in the output of `show interfaces interface-name extensive` operational mode command correctly set for the interface?

   **NOTE:** Check if the associated Flexible PIC Concentrator (FPC), Modular Port Concentrator (MPC), or Dense Port Concentrator (DPC) and its Modular Interface Card (MIC) or PIC with its 10-gigabit small form-factor pluggable transceiver (XFP) or SFP supports speed and auto-negotiation settings.

   - Yes: Check Monitoring Fast Ethernet and Gigabit Ethernet Interfaces for more troubleshooting tips.
   - No: Contact JTAC for further assistance.

**To Enable a Physical Interface**

To enable a physical interface:

1. In configuration mode, go to the `[edit interfaces]` hierarchy level.

   ```
   [edit]
   user@host# edit interfaces
   ```

2. Check if the interface is administratively disabled by executing the `show` command on the interface. For example on ge-5/0/1 interface.

   ```
   user@host# show ge-5/0/1
   disable;
   ```

3. Enable the interface and commit.

   ```
   [edit interfaces
   user@host# delete interface-name disable
   user@host# commit
   ```

**Time Domain Reflectometry on ACX Series Routers Overview**

Time Domain Reflectometry (TDR) is a technology used for diagnosing copper cable states. This technique can be used to determine if cabling is at fault when you cannot establish a link. TDR detects the defects by sending a signal through a cable, and reflecting it from the end of the cable. Open circuits, short circuits, sharp bends and other defects
in the cable, reflects the signal back, at different amplitudes, depending on the severity of the defect.

Several factors that result in degraded or low-quality cable plants can cause packet loss, suboptimal connection speed, reduced network efficiency, and complete connection failures. These types of problems can occur because of poor cable construction, identification of pair twists, loose connectors, poor contacts between the points, and stretched or broken pairs of cables. Broadcom transceivers enable you to analyze the condition of the cable plant or topology and identify any problems that have occurred. This functionality is effectively used in the following scenarios:

- Troubleshooting during initial network equipment installation.
- Discovery of failures when network problems occur.
- Maintenance of optimally functioning cable plants.
- Fault determination during the testing of network equipment in production cable networks.

TDR supports the following capabilities for examination of cable faults on ACX Series routers:

- Cable status pair (open or short)—When the router operates in Gigabit Ethernet mode, all the four pairs (8 wires) are used. Only Pair-A and Pair-B are required to operate in 10/100BASE-T Ethernet mode. If either of these required pairs is open or short-circuited, the transceiver reports the following faults:
  - Any open wire
  - Wires of a particular pair that are shorted
- Distance to fault per pair—Distance at which an open or a short-circuit is detected in meters. This measurement is also termed as cable length. The transceiver reports the following faults:
  - Cable length when the cable status is normal
  - Distance to fault when the cable status is not normal
- Pair Swap—Swapping of twisted-pairs in straight-through and cross-over cable plants are detected.
- Polarity Swap—Each cable pair carries a differential signal from one end to the other end of the cable. Each wire within the pair is assigned a polarity. The wires in a pair are normally connected in a one-to-one form. This connection enables the transmitter at one end to be connected to the receiver at the other end with same polarity. Sometimes, the wiring within the pair is also swapped. This type of connection is called polarity swap. Broadcom transceivers can detect such swapping and automatically adjust the connection to enable the links to operate normally. However, the transceiver reports polarity swaps that it detects in the cable plant.

On 4-port Gigabit Ethernet and 8-port Gigabit Ethernet MICs with copper SFP transceivers (using BCM54880) and 4-port Gigabit Ethernet, 6-port Gigabit Ethernet, and 8-port Gigabit Ethernet MICs with copper and optical SFP transceivers (using BCM54640E
PHY), only 10BASE-T pair polarity is supported. 100BASE-T and 1000BASE-T polarities are not supported.

When the Gigabit Ethernet link cannot be established (for example, if only two pairs are present that are fully functional), TDR in the physical layer (PHY) brings down the link to a 100 MB link, which is called a downshift in the link. The physical layer might require 10-20 seconds for the link to come up if a downgrade in wire speed occurs because it attempts to connect at 1000 MB five times before it falls back to 100BASE-TX.

TDR diagnostics is supported only on copper interfaces and not on fiber interfaces.

Keep the following points in mind when you configure TDR:

- If you connect a port undergoing a TDR test to a Gigabit Ethernet interface that is enabled to automatically detect MDI (Media Dependent Interface) and MDIX (Media Dependent Interface with Crossover) port connections, the TDR result might be invalid.
- If you connect a port undergoing a TDR test to a 100BASE-T copper interface, the unused pairs are reported as faulty because the remote end does not terminate these pairs.
- You must not modify the port configuration while the TDR test is running.
- Because of cable characteristics, you need to run the TDR test multiple times to get accurate results.
- Do not change the port status (such as removing the cable at the near or far end) because such a change can result in inaccurate statistics in the results.
- While measuring the cable length or distance to fault (per pair), sometimes, a few cable length inconsistencies might be observed during a TDR test. Broadcom transceivers have the following cable length limitations:
  - For a properly-terminated good cable, the accuracy of the cable length reported is plus or minus 10 meters.
  - If a pair is open or short-circuited, the far-end termination does not affect the computed result for that pair.
  - The accuracy of the measured cable length, when open and short-circuit conditions are detected, is plus or minus 5 meters.
  - The accuracy of a good pair, when one or more pairs are open or short-circuited, is plus or minus 10 meters.
- Polarity swap detection is supported only in 10BASE-T mode.
- The TDR test does not impact the traffic if the interface operates at 10-Gigabit Ethernet per second of bandwidth, which is the default configuration. However, if the speed of the interface is configured to be other than 10-Gigabit Ethernet, running the TDR test affects the traffic.

TDR diagnostics might bring the link down and initialize the physical layer (PHY) with default configuration to perform its operation.

When the TDR validation test is completed, the PHY layer resumes operation in the same manner as before the cable diagnostics test was performed. However, link flaps
might be momentarily observed. We recommend that you run the TDR test at a speed of 1 gigabit per second, which is the default configuration, to obtain more accurate results.

TDR is supported on the following interfaces on ACX Series routers:

- On ACX1000 routers, 4 RJ45 (Cu) ports or 8-port Gigabit Ethernet MICs with small form-factor pluggable (SFP) transceivers and RJ45 connectors.
- On ACX1100 routers, 4-port or 8-port Gigabit Ethernet MICs with SFP transceivers and RJ45 connectors.
- On ACX2000 routers, 8-port Gigabit Ethernet MICs with SFP transceivers and RJ45 connectors.
- On ACX2100 and ACX22000 routers, 4-port Gigabit Ethernet MICs with SFP transceivers and RJ45 connectors.
- On ACX4000 routers, 4-port, 6-port, or 8-port Gigabit Ethernet MICs with SFP transceivers and RJ45 connectors.

You must select the media type as copper for the 1-Gigabit Ethernet interfaces. To specify the media type, include the `media-type` statement with the `copper` option at the `[edit interfaces interface-name]` hierarchy level. Media type selection is applicable to ports only in slot 2. When media-type is not set, the port accepts either type of connection. The media type is fiber if a transceiver is installed in the SFP connection. If no transceiver is installed, the media type is copper. The COMBO ports (combination ports) on ACX routers support both the copper and fiber-optic media types. On such ports or interfaces, you must configure the media type as copper to run the TDR test.

You can run the TDR test from operational mode and view the success or failure results of the test. To start a test on a specific interface, issue the `request diagnostics tdr start interface interface-name` command. To stop the TDR test currently in progress on the specified interface, issue the `request diagnostics tdr abort interface interface-name` command. To display the test results for all copper interfaces, enter the `show diagnostics tdr` command. To display the test results for a particular interface, enter the `show diagnostics tdr interface interface-name` command.

**Related Documentation**

- Diagnosing a Faulty Twisted-Pair Cable on ACX Series Routers on page 362

**Diagnosing a Faulty Twisted-Pair Cable on ACX Series Routers**

**Problem**

**Description:** A 10/100BASE-T Ethernet interface has connectivity problems that you suspect might be caused by a faulty cable.

**Solution**

Use the time domain reflectometry (TDR) test to determine whether a twisted-pair Ethernet cable is faulty.

The TDR test:
- Detects and reports faults for each twisted pair in an Ethernet cable. Faults detected include open circuits, short circuits, and impedance mismatches.
- Reports the distance to fault to within 1 meter.
- Detects and reports pair swaps, pair polarity reversals, and excessive pair skew.

The TDR test is supported on the following ACX routers and interfaces:

- On ACX1000 routers, 4 RJ45 (Cu) ports or 8-port Gigabit Ethernet MICs with small form-factor pluggable (SFP) transceivers and RJ45 connectors.
- On ACX1100 routers, 4-port or 8-port Gigabit Ethernet MICs with SFP transceivers and RJ45 connectors.
- On ACX2000 routers, 8-port Gigabit Ethernet MICs with SFP transceivers and RJ45 connectors.
- On ACX2100 and ACX2200 routers, 4-port Gigabit Ethernet MICs with SFP transceivers and RJ45 connectors.
- On ACX4000 routers, 4-port, 6-port, or 8-port Gigabit Ethernet MICs with SFP transceivers and RJ45 connectors.

**NOTE:** We recommend running the TDR test on an interface when there is no traffic on the interface.

TDR diagnostics are applicable for copper ports only and not for optical fiber ports.

To diagnose a cable problem by running the TDR test:

1. Run the *request diagnostics tdr* command.

```
user@host> request diagnostics tdr start interface ge-0/0/10
Interface TDR detail:
Test status                     : Test successfully executed  ge-0/0/10
```

2. View the results of the TDR test with the *show diagnostics tdr* command.

```
user@host> show diagnostics tdr interface ge-0/0/10
Interface TDR detail:
Interface name                  : ge-0/0/10
Test status                     : Passed
Link status                     : Down
MDI pair                        : 1-2
   Cable status                  : Normal
   Distance fault                : 0 Meters
   Polarity swap                 : N/A
   Skew time                     : N/A
MDI pair                        : 3-6
```
Cable status                  : Normal
Distance fault                : 0 Meters
Polarity swap                 : N/A
Skew time                     : N/A
MDI pair                        : 4-5
Cable status                  : Open
Distance fault                : 1 Meters
Polarity swap                 : N/A
Skew time                     : N/A
MDI pair                        : 7-8
Cable status                  : Normal
Distance fault                : 0 Meters
Polarity swap                 : N/A
Skew time                     : N/A
Channel pair                    : 1
Pair swap                     : N/A
Channel pair                    : 2
Pair swap                     : N/A
Downshift                       : N/A

3. Examine the **Cable status** field for the four MDI pairs to determine if the cable has a fault. In the preceding example, the twisted pair on pins 4 and 5 is broken or cut at approximately one meter from the **ge-0/0/10** port connection.

**NOTE:** The **Test Status** field indicates the status of the TDR test, not the cable. The value *Passed* means the test completed—it does not mean that the cable has no faults.

The following is additional information about the TDR test:

- The TDR test can take some seconds to complete. If the test is still running when you execute the `show diagnostics tdr` command, the **Test status** field displays *Started*. For example:

  ```
  user@host> show diagnostics tdr interface ge-0/0/22
  Interface TDR detail:
  Interface name : ge-0/0/22
  Test status    : Started
  ```

- You can terminate a running TDR test before it completes by using the `request diagnostics tdr abort interface interface-name` command. The test terminates with no results, and the results from any previous test are cleared.

- You can display summary information about the last TDR test results for all interfaces on the router that support the TDR test by not specifying an interface name with the `show diagnostics tdr` command. For example:

  ```
  user@host> show diagnostics tdr
  Interface   Test status    Link status  Cable status  Max distance fault
  ```

802.3ad

Syntax

```plaintext
802.3ad {
    primary | backup;
    ae interface-number ;
    lacp {
        port-priority priority-number;
    }
    link-index index-number
    distribution-list distribution-list-number
}
```

Hierarchy Level

```plaintext
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]
```

Release Information

Statement introduced before Junos OS Release 7.4. 
**primary** and **backup** options added in Junos OS Release 8.3.

Description

Specify aggregated Ethernet logical interface number.

Options

- **bundle**—Join an aggregated Ethernet interface.
  ```plaintext
  ae interface-number — Aggregated Ethernet logical interface number. For MX Series routers running Junos release 14.2R3 and later you can configure a maximum of 1000 aggregated interfaces. On MX2010 and MX2020 routers you can configure a maximum of 800 aggregated interfaces.
  
  primary | backup — For link protection configurations, specify the link as primary link or backup link for egress traffic.
  
  lacp — Configure Link Aggregation Control Protocol. Specify the port priority in the range 0 through 65535. Default port-priority is 127.
  ```

- **link-index**—Specify the desired child link index within the aggregated Ethernet Interface. Index number of the logical interface reflects its initialization sequence.

- **distribution-list**—For targeted distribution, specify the distribution list to which the interface belongs.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

- Configuring an Aggregated Ethernet Interface
- Configuring Aggregated Ethernet Link Protection
Syntax  accept (any | dhcp-v4 | dhcp-v6 | inet | inet6 | pppoe);

Hierarchy Level  [edit interfaces interface-name auto-configure stacked-vlan-ranges dynamic-profile profile-name],
[edit interfaces interface-name auto-configure vlan-ranges dynamic-profile profile-name]

Release Information  Statement introduced in Junos OS Release 9.5.
dhcp-v4 option added in Junos OS Release 10.0.
dhcp-v6, inet6 and pppoe options added in Junos OS Release 10.2.
any option added in Junos OS Release 10.4.

Description  Specify the type of VLAN Ethernet packet accepted by an interface that is associated with a VLAN dynamic profile or stacked VLAN dynamic profile.

Options

any—Any packet type. Specifies that any incoming packets trigger the dynamic creation of a VLAN with properties determined by the auto-configure interface configuration stanza and associated profile attributes. This option is used when configuring wholesaling in a Layer 2 network.

dhcp-v4—IPv4 DHCP packet type. Specifies that incoming IPv4 DHCP discover packets trigger the dynamic creation of a VLAN with properties determined by the auto-configure interface configuration stanza and associated profile attributes.

NOTE: The DHCP-specific mac-address and option-82 options are rejected if the accept statement is not set to dhcp-v4.

dhcp-v6—IPv6 DHCP packet type. Specifies that incoming IPv6 DHCP discover packets trigger the dynamic creation of a VLAN with properties determined by the auto-configure interface configuration stanza and associated profile attributes.

inet—IPv4 Ethernet and ARP packet type.

inet6—IPv6 Ethernet packet type.

pppoe—Point-to-Point Protocol over Ethernet packet type.

NOTE: The pppoe VLAN Ethernet packet type option is supported only for MPC/MIC interfaces.
### Required Privilege Level
- *interface*—To view this statement in the configuration.
- *interface-control*—To add this statement to the configuration.

accept-source-mac

Syntax

```
accept-source-mac {
  mac-address mac-address {
    policer {
      input cos-policer-name;
      output cos-policer-name;
    }
  }
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.
Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description

For Gigabit Ethernet intelligent queuing (IQ) interfaces only, accept traffic from and to the specified remote media access control (MAC) address.

The `accept-source-mac` statement is equivalent to the `source-address-filter` statement, which is valid for aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only. To allow the interface to receive packets from specific MAC addresses, include the `accept-source-mac` statement.

On untagged Gigabit Ethernet interfaces, you should not configure the `source-address-filter` statement and the `accept-source-mac` statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the `source-address-filter` statement and the `accept-source-mac` statement with an identical MAC address specified in both filters.

The remaining statements are explained separately. See CLI Explorer.

**NOTE:** The policer statement is not supported on PTX Series Packet Transport Routers.

**NOTE:** On QFX platforms, if you configure source MAC addresses for an interface using the `static-mac` or `persistent-learning` statements and later configure a different MAC address for the same interface using the `accept-source-mac` statement, the MAC addresses that you previously configured for the interface remain in the ethernet-switching table and can still be used to send packets to the interface.

Release Information

Statement introduced before Junos OS Release 7.4.
Support at the [edit interfaces interface-name unit logical-unit-number pppoe-underlying-options] and [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number pppoe-underlying-options] hierarchy levels introduced in Junos OS Release 10.1.
Support at the [edit ... family pppoe] hierarchies introduced in Junos OS Release 11.2.

Description

Configure an alternative access concentrator name in the AC-NAME tag in a PPPoE control packet for use with a dynamic PPPoE subscriber interface. If you do not configure the access concentrator name, the AC-NAME tag contains the system name.

NOTE: The [edit ... family pppoe] hierarchies are supported only on MX Series routers with MPCs.

Options

name—Name of the access concentrator.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Identifying the Access Concentrator
- Configuring the PPPoE Family for an Underlying Interface
- Configuring Dynamic PPPoE Subscriber Interfaces

**access-profile**

**Syntax**

```
access-profile name;
```

**Hierarchy Level**

```
[edit interfaces interface-name ppp-options chap],
[edit interfaces interface-name ppp-options pap],
[edit interfaces interface-name unit logical-unit-number ppp-options chap],
[edit interfaces interface-name unit logical-unit-number ppp-options pap],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options chap],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options pap]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Support for PAP added in Junos OS Release 8.3.
Support for VLAN and stacked VLAN ranges added in Junos OS Release 10.0.

**Description**

For CHAP authentication, the mapping between peer names (or “clients”) and the secrets associated with their respective links. For PAP authentication, the peer’s username and password.

For Asynchronous Transfer Mode 2 (ATM2) IQ interfaces only, you can configure a Challenge Handshake Authentication Protocol (CHAP) access profile on the logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- **atm-ppp-llc**—PPP over AAL5 logical link control (LLC) encapsulation.
- **atm-ppp-vc-mux**—PPP over AAL5 multiplex encapsulation.

**Options**

- `name`—Name of the access profile.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring the PPP Challenge Handshake Authentication Protocol on page 121
- Configuring the PPP Password Authentication Protocol On a Physical Interface on page 124
accounting

Syntax
accounting {
   destination-class-usage;
   source-class-usage {
      direction;
   }
}

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number family inet],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Enable IP packet counters on an interface.
The remaining statements are explained separately. See CLI Explorer.

Required Privilege
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation
- Enabling Source Class and Destination Class Usage on page 241
accounting-profile

**Syntax**

```
accounting-profile name;
```

**Hierarchy Level**

```
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit interfaces interface-range name]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 15.1F6 for PTX Series routers with third-generation FPCs installed.

**Description**

Enable collection of accounting data for the specified physical or logical interface or interface range.

**Options**

* name—Name of the accounting profile.

**Required Privilege**

* interface—to view this statement in the configuration.
* interface-control—to add this statement to the configuration.

**Related Documentation**

* Applying an Accounting Profile to the Physical Interface
* Applying an Accounting Profile to the Logical Interface
acfc

Syntax acfc;

Hierarchy Level [edit interfaces interface-name ppp-options compression],
[edit interfaces interface-name unit logical-unit-number ppp-options compression],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options compression]

Release Information Statement introduced before Junos OS Release 7.4.

Description For interfaces with PPP encapsulation, configure compression of the Data Link Layer address and control fields. The acfc option is not supported with frame-relay-ppp encapsulation.

On M320, M120, and T Series routers, address and control field compression (ACFC) is not supported for any ISO family protocols. Do not include the acfc statement at the [edit interfaces interface-name ppp-options compression] hierarchy level when you include the family iso statement at the [edit interfaces interface-name unit logical-unit-number] hierarchy level.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation • Configuring PPP Address and Control Field Compression on page 133
**Syntax**

acknowledge-retries number;

**Hierarchy Level**

[edit interfaces interface-name mfr-uni-nni-bundle-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For link services and voice services interfaces only, configure the number of retransmission attempts to be made for consecutive hello or remove link messages following the expiration of the acknowledgment timer.

**Options**

- **number**—Number of retransmission attempts to be made following the expiration of the acknowledgment timer.
  - **Range:** 1 through 5
  - **Default:** 2

**Required Privilege**

- **Interface**—To view this statement in the configuration.
- **Interface-control**—To add this statement to the configuration.

**Related Documentation**

- Junos OS Services Interfaces Library for Routing Devices
- action-red-differential-delay on page 404
- hello-timer on page 638
acknowledge-timer

Syntax

acknowledge-timer milliseconds;

Hierarchy Level [edit interfaces interface-name mllfr-uni-nni-bundle-options]

Release Information Statement introduced before Junos OS Release 7.4.

Description For link services and voice services interfaces only, configure the maximum time, in milliseconds, to wait for an add link acknowledgment, hello acknowledgment, or remove link acknowledgment message.

Options milliseconds—Time, in milliseconds, to wait for an add link acknowledgment, hello acknowledgment, or remove link acknowledgment message.

Range: 1 through 10 milliseconds
Default: 4 milliseconds

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation • Junos OS Services Interfaces Library for Routing Devices

• hello-timer on page 638
**action (OAM)**

**Syntax**
```
action {
  link-down;
  send-critical-event;
  syslog;
}
```

**Hierarchy Level**
```
[edit protocols oam ethernet link-fault-management action-profile]
```

**Release Information**
Statement introduced in Junos OS Release 8.5.

**Description**
Define the action or actions to be taken when the OAM fault event occurs.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- *Specifying the Actions to Be Taken for Link-Fault Management Events*

---

**action (Policer)**

**Syntax**
```
action {
  loss-priority high then discard;
}
```

**Hierarchy Level**
```
[edit firewall three-color-policer policer-name]
```

**Release Information**
Statement introduced in Junos OS Release 8.2.

**Description**
This statement discards high loss priority traffic as part of a configuration using tricolor marking on a logical interface.

**Required Privilege Level**
- firewall—To view this statement in the configuration.
- firewall-control—To add this statement to the configuration.

**Related Documentation**
- *Class of Service Feature Guide (Routers and EX9200 Switches)*
- *logical-interface-policer on page 755*
**action-profile (Applying to CFM)**

Syntax

```
action-profile profile-name;
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name mep mep-id remote-mep mep-id]
```

Release Information

Statement introduced in Junos OS Release 8.4.

Description

Identify the action profile to use.

Options

```
profile-name—Name of the action profile to use.
```

Required Privilege

- **Level**
  - interface—To view this statement in the configuration.
  - interface-control—To add this statement to the configuration.

Related Documentation

action-profile (Defining for CFM)

Syntax  
```
action-profile profile-name {
  event {
    ais-trigger-condition {
      adjacency-loss;
      all-defects;
      cross-connect-ccm;
      erroneous-ccm;
      receive-ais;
    }
    interface-status-tlv (down | lower-layer-down);
    port-status-tlv blocked;
    rdi;
  }
  action {
    interface-down;
    log-and-generate-ais {
      interval(1m | 1s);
      level value;
      priority value;
    }
  }
  default-actions {
    interface-down;
  }
}
```

Hierarchy Level  
[edit protocols oam ethernet connectivity-fault-management]

Release Information  
Statement introduced in Junos OS Release 8.4.

Description  
Configure a name and default action for an action profile.

Options  
`profile-name`—Name of the action profile.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level  
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

---

**action-red-differential-delay**

**Syntax**  
`action-red-differential-delay (disable-tx | remove-link);`

**Hierarchy Level**  
[edit interfaces interface-name mfr-uni-nni-bundle-options]

**Release Information**  
Statement introduced before Junos OS Release 7.4.

**Description**  
For link services and voice services interfaces only, configure the action to be taken when the differential delay exceeds the red limit.

**Options**  
- **disable-tx**—Disable transmission on the bundle link.
- **remove-link**—Remove bundle link from service.
  
  Default: disable-tx

**Required Privilege**  
- interface—To view this statement in the configuration.  
- interface-control—To add this statement to the configuration.

**Related Documentation**  
- Junos OS Services Interfaces Library for Routing Devices  
- remote on page 953  
- yellow-differential-delay on page 1149
**activation-delay**

**Syntax**

activation-delay seconds;

**Hierarchy Level**

[edit interfaces dln unit logical-unit-number dialer-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

(J Series Services Routers) For ISDN interfaces, configure the ISDN dialer activation delay. Used only for dialer backup and dialer watch cases.

**Options**

seconds—Interval before the backup interface is activated after the primary interface has gone down.

**Range:** 1 through 4,294,967,295 seconds

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

- Junos OS Interfaces and Routing Configuration Guide
activation-priority

Syntax  
activation-priority priority;

Hierarchy Level  
[edit interfaces interface-name unit logical-unit-number dynamic-call-admission-control],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number  
dynamic-call-admission-control]

Release Information  
Statement introduced in Junos OS Release 8.2.

Description  
(J4350 and J6350 Services Routers supporting voice over IP with the TGM550 media  
gateway module) For Fast Ethernet and Gigabit Ethernet interfaces, ISDN BRI interfaces,  
and serial interfaces with PPP or Frame Relay encapsulation, configure the dynamic call  
admission control (dynamic CAC) activation priority value.

Options  
priority—The activation priority in which the interface is used for providing call bandwidth.  
The interface with the highest activation priority value is used as the primary link for  
providing call bandwidth. If the primary link becomes unavailable, the TGM550  
switches over to the next active interface with the highest activation priority value,  
and so on.  
Range: 0 through 255  
Default: 50

Required Privilege Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

}  
```
**Hierarchy Level**
[edit interfaces interface-name unit logical-unit-number family family],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Configure the interface address.

---

**NOTE:** If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, and the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/8;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/8;
      }
    }
  }
}
```

For more information on configuring the same address on multiple interfaces, see "Configuring the Interface Address" on page 191.

- In Junos OS Release 13.3 and later, when you configure an IPv6 host address and an IPv6 subnet address on an interface, the commit operation fails.
- In releases earlier than Junos OS Release 13.3, when you use the same configuration on an interface, the commit operation succeeds, but only one of the IPv6 addresses that was entered is assigned to the interface. The other address is not applied.
Options  
- **address**—Address of the interface.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

---

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

---

**Required Privilege**

**advertise-interval**

**Syntax**
```adventer-interval milliseconds;```

**Hierarchy Level**
```
[edit interfaces interface-name sonet-options aps]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
Modify the Automatic Protection Switching (APS) interval at which the protect and working routers send packets to their neighbors to advertise that they are operational. A router considers its neighbor to be operational for a period, called the hold time, that is, by default, three times the advertisement interval.

**Options**
- **milliseconds**—Interval between advertisement packets.
  - **Range:** 1 through 65,534 milliseconds
  - **Default:** 1000 milliseconds

**Required Privilege**
- **Level**
  - interface—To view this statement in the configuration.
  - interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring APS Timers
**age**

**Syntax**

```
age (30m | 10m | 1m | 30s | 10s);
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management linktrace]
```

**Release Information**

Statement introduced in Junos OS Release 8.5.

**Description**

Time to wait (in minutes or seconds) for a response. If no response is received, the request and response entry is deleted from the linktrace database.

**Default**

10 minutes

**Required Privilege**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Linktrace Protocol in CFM
agent-specifier

Syntax

agent-specifier {  
  aci circuit-id-string ari remote-id-string {  
    drop;  
    delay seconds;  
    terminate;  
    dynamic-profile profile-name;  
    routing-instance routing-instance-name;  
    static-interface interface-name;  
  }  
}

Hierarchy Level
[edit protocols pppoe service-name-tables table-name service service-name]

Release Information
Statement introduced in Junos OS Release 10.0. drop, delay, terminate, dynamic-profile, routing-instance, and static-interface options introduced in Junos OS Release 10.2.

Description
Specify the action taken by the interface for the specified agent circuit identifier/agent remote identifier (ACI/ARI) pair when the interface receives a PPPoE Active Discovery Initiation (PADI) control packet that includes the vendor-specific tag with ACI/ARI pair information. You can configure an ACI/ARI pair for a named service, empty service, or any service in a PPPoE service name table. A maximum of 8000 ACI/ARI pairs are supported per PPPoE service name table. You can distribute the ACI/ARI pairs in any combination among the named, empty, and any service entries in the service name table.

You can use an asterisk (*) as a wildcard character to match ACI/ARI pairs, the ACI alone, or the ARI alone. The asterisk can be placed only at the beginning, the end, or both the beginning and end of the identifier string. You can also specify an asterisk alone for either the ACI or the ARI. You cannot specify only an asterisk for both the ACI and the ARI. When you specify a single asterisk as the identifier, that identifier is ignored in the PADI packet.

For example, suppose you care about matching only the ACI and do not care what value the ARI has in the PADI packet, or even whether the packet contains an ARI value. In this case you can set the remote-id-string to a single asterisk. Then the interface ignores the ARI received in the packet and the interface takes action based only on matching the specified ACI.

Default
The default action is terminate.

Options
aci circuit-id-string—Identifier for the agent circuit ID that corresponds to the DSLAM interface that initiated the service request. This is a string of up to 63 characters.

ari remote-id-string—Identifier for the subscriber associated with the DSLAM interface that initiated the service request. This is a string of up to 63 characters.
The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

**Required Privilege**
- Interface—To view this statement in the configuration.
- Interface-control—To add this statement to the configuration.

### alias (Interfaces)

**Syntax**

```
alias alias-name;
```

**Hierarchy Level**

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

**Release Information**

Statement introduced in Junos OS Release 13.3.

**Description**

Configure a textual description of a physical interface or the logical unit of an interface to be the alias of an interface name. The alias name can be a single line of text. If the text contains spaces, enclose it in quotation marks. If you configure an alias name, the alias name is displayed instead of the interface name in the output of all `show`, `show interfaces`, and other operational mode commands. In Junos OS Release 12.3R8 and later, display of the alias can be suppressed in favor of the actual interface name by using the `display no-interface-alias` parameter along with the show command.

**Options**

`alias-name`—Text to denote an easily identifiable, meaningful alias name for the interface. If the text includes spaces, enclose the entire text in quotation marks.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Example: Adding an Interface Alias Name on page 108
- Junos OS Network Interfaces Library for Routing Devices
**allow-any-vci**

**Syntax**
`allow-any-vci;`

**Hierarchy Level**
- `[edit interfaces interface-name unit 0]`
- `[edit logical-systems logical-system-name interfaces interface-name unit 0]`

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro routers.

**Description**
Dedicate entire ATM device to ATM cell relay circuit.

**Required Privilege**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**
- *Configuring an ATM Cell-Relay Circuit Overview*
allow-fragmentation

Syntax

allow-fragmentation;

Hierarchy Level

edit interfaces gr-fpc/pic/port unit logical-unit-number tunnel],
[edit logical-systems logical-system-name interfaces gr-fpc/pic/port unit logical-unit-number tunnel]

Release Information

Statement introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 15.1X53-D10 for QFX10000 switches.
Statement introduced in Junos OS Release 19.3 for MPC10E line card.

Description

For a generic routing encapsulation (GRE) tunnel, enable fragmentation of GRE-encapsulated packets whose size exceeds the maximum transmission unit (MTU) value of a link that the packet passes through. The don’t-fragment (DF) bit is not set in the outer IP header of GRE-encapsulated packets.

To enable the reassembly of fragmented GRE-encapsulated packets on GRE tunnel interfaces at the endpoint of the GRE tunnel, include the reassemble-packets statement for the interface.

NOTE: The reassemble-packets statement is not supported on MPC10E line card in Junos OS Release 19.3.

Default

If you do not include the allow-fragmentation statement, fragmentation of GRE-encapsulated packets is disabled.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- reassemble-packets
- Enabling Fragmentation and Reassembly on Packets After GRE-Encapsulation

allow-remote-loopback

Syntax
allow-remote-loopback;

Hierarchy Level  [edit protocols oam link-fault-management interface interface-name negotiation-options]

Release Information  Statement introduced in Junos OS Release 8.4.

Description  Enable the remote loopback on IQ2 and IQ2-E Gigabit Ethernet interfaces, and Ethernet interfaces on the MX Series routers and EX Series switches.

Required Privilege Level
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation  •  Enabling Remote Loopback Support on the Local Interface

annex

Syntax  annex (annex-a | annex-b);

Hierarchy Level  [edit interfaces interface-name shdsl-options],
[edit interfaces interface-name sonet-options aps],
[edit logical-systems logical-system-name interfaces interface-name shdsl-options]

Release Information  Statement introduced in Junos OS Release 7.4.

Description  For M320 and M120 routers only, for Multiplex Section Protection (MSP) switching on SDH interfaces, set annex-b. You must also configure the working protection circuit under the [edit interfaces so-fpc/pic/port sonet-options aps] hierarchy level.

Default  annex-b

Options  annex-a—Use for North American SHDSL network implementations.
annex-b—Use for European SHDSL network implementations.

Required Privilege Level
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.
apply-action-profile

Syntax  apply-action-profile profile-name;

Hierarchy Level  [edit protocols oam ethernet link-fault-management interface]

Release Information  Statement introduced in Junos OS Release 8.5.

Description  Apply the specified action profile to the interface for link-fault management.

Required Privilege Level  interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation  • Applying an Action Profile
**aps**

**Syntax**
```plaintext
aps {
    advertise-interval milliseconds;
    annex-b
    authentication-key key;
    (break-before-make | no-break-before-make);
    fast-aps-switch;
    force;
    hold-time milliseconds;
    lockout;
    neighbor address;
    paired-group group-name;
    preserve-interface;
    protect-circuit group-name;
    request;
    revert-time seconds;
    switching-mode (bidirectional | unidirectional);
    working-circuit group-name;
}
```

**Hierarchy Level**
[edit interfaces interface-name sonet-options]

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
Configure Automatic Protection Switching (APS) on the router.

For DS3 channels on a channelized OC12 interface, configure APS on channel 0 only. If you configure APS on channels 1 through 11, it is ignored.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**arp (Interfaces)**

**Syntax**

```
arp ip-address (mac | multicast-mac) mac-address publish;
```

```
arp {
    aging-timer minutes;
    gratuitous-arp-delay seconds;
    gratuitous-arp-on-ifup;
    interfaces {
        interface-name {
            aging-timer minutes;
        }
    }
    passive-learning;
    purging;
}
```

**Syntax (EX Series)**

```
arp {
    aging-timer minutes;
}
```

**Hierarchy Level**

```
[edit system]
```

```
[edit interfaces interface-name unit logical-unit-number family inet address address],
```

```
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address]
```

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**

For Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, configure Address Resolution Protocol (ARP) table entries by mapping IP addresses to MAC addresses. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.

**NOTE:** By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the family inet statement. By including the arp statement at the [edit interfaces interface-name unit
logical-unit-number family inet policer] hierarchy level, you can apply a specific ARP-packet policer to an interface. This feature is not available on EX Series switches.

When you need to conserve IP addresses, you can configure an Ethernet interface to be unnumbered by including the unnumbered-address statement at the [edit interfaces interface-name unit logical-unit-number family inet] hierarchy level.

NOTE: For EX-Series switches, set only the time interval between ARP updates.
Options

**ip-address**—IP address to map to the MAC address. The IP address specified must be part of the subnet defined in the enclosing **address** statement.

**mac mac-address**—MAC address to map to the IP address. Specify the MAC address as six hexadecimal bytes in one of the following formats: `nnnn.nnnn.nnnn` or `nnn.nnnn.nnnn`. For example, `0000.5e00.5355` or `00:00:5e:00:53:55`.

**multicast-mac mac-address**—Multicast MAC address to map to the IP address. Specify the multicast MAC address as six hexadecimal bytes in one of the following formats: `nnnn.nnnn.nnnn` or `nnn.nnnn.nnnn`. For example, `0000.5e00.5355` or `00:00:5e:00:53:55`.

**publish**—(Optional) Have the router or switch reply to ARP requests for the specified IP address. If you omit this option, the router or switch uses the entry to reach the destination but does not reply to ARP requests.

---

**NOTE:** For unicast MAC addresses only, if you include the **publish** option, the router or switch replies to proxy ARP requests.

---

**aging-timer**—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.

**gratuitous-arp-delay**—(T Series only) Configure a delay for gratuitous ARP requests at the system level. By default, Junos OS sends gratuitous ARP requests immediately after network-related configuration changes are made on an interface (for example, a VLAN ID, MAC address, or IP address change). This might lead to the Packet Forwarding Engine dropping some initial request packets if the configuration updates have not been fully processed. To avoid such request packets being dropped, you can configure a delay in gratuitous ARP requests.

**Values:**

- **seconds**—Configure the ARP request delay in seconds. We recommend configuring a value in the range of 3 through 6 seconds.

**gratuitous-arp-on-ifup**—(ACX Series, SRX Series, T Series only) Add this statement to the [edit system arp] hierarchy to configure Junos OS to automatically issue a gratuitous ARP announcement when an interface is online.

**interfaces**—(T Series only) Specify the ARP aging timer in minutes for a logical interface of family type **inet**.

**Values:**

- **aging-timer minutes**—Time between ARP updates, in minutes.
- **Default:** 20
- **Range:** 1 through 6,00,000
passive-learning—(M Series, MX Series, PTX Series, SRX Series, T Series only) Configure backup VRRP routers or switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests. By default, the backup VRRP router drops these requests; therefore, if the master router fails, the backup router must learn all entries present in the ARP cache of the master router. Configuring passive learning reduces transition delay when the backup router is activated. Learning of ARP mappings (IP-to-MAC address) by backup VRRP routers or switches for hosts sending the requests is disabled unless this statement is configured.

purging—(M Series, MX Series, PTX Series, SRX Series, T Series only) Purge obsolete ARP entries from the cache when an interface or link goes offline.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

asynchronous-notification

Syntax

(asynchronous-notification | no-asynchronous-notification);

Hierarchy Level

[edit interfaces ge-fpc/pic/port gigether-options ]

Release Information

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description

(MX Series routers, T Series routers) For all Gigabit Ethernet interfaces (1-Gigabit, 10-Gigabit, and 100-Gigabit), configure support for notification of link down alarm generation and transfer.

(M120 and M320 routers) For all 10-Gigabit Ethernet PIC interfaces, configure support for notification of link down alarm generation and transfer.

- asynchronous-notification—Support notification of link down alarm generation and transfer.
- no-asynchronous-notification—Prohibit notification of link down alarm generation and transfer.

Default

Support for notification of link down alarm generation and transfer is not enabled.

Required Privilege

Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

atm-encapsulation

Syntax atm-encapsulation (direct | plcp);

Hierarchy Level [edit interfaces at-fpc/pic/port e3-options], [edit interfaces at-fpc/pic/port t3-options]

Release Information Statement introduced before Junos OS Release 7.4.

Description Configure encapsulation for E3 and T3 traffic over ATM interfaces.

Default Physical Layer Convergence Protocol (PLCP) encapsulation is the default for T3 traffic and for E3 traffic using G.751 framing.

Options
direct—Use direct encapsulation. G.832 framing on E3 interfaces requires direct encapsulation.

plcp—Use PLCP encapsulation.

Required Privilege Level

Required Privilege Level interface—to view this statement in the configuration.

interface-control—to add this statement to the configuration.

auto-negotiation

Syntax
(auto-negotiation | no-auto-negotiation) <remote-fault (local-interface-online | local-interface-offline)>;

Hierarchy Level
[edit interfaces interface-name ether-options],
[edit interfaces interface-name gighether-options],
[edit interfaces ge-pim/0/0 switch-options switch-port port-number]

Release Information
Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description
For Gigabit Ethernet interfaces on M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers explicitly enable autonegotiation and remote fault. For EX Series switches, explicitly enable autonegotiation only.

- **auto-negotiation**—Enables autonegotiation. This is the default.
- **no-auto-negotiation**—Disable autonegotiation. When autonegotiation is disabled, you must explicitly configure the link mode and speed.

When you configure Tri-Rate Ethernet copper interfaces to operate at 1 Gbps, autonegotiation must be enabled.

NOTE: On EX Series switches, an interface configuration that disables autonegotiation and manually sets the link speed to 1 Gbps is accepted when you commit the configuration; however, if the interface you are configuring is a Tri-Rate Ethernet copper interface, the configuration is ignored as invalid and autonegotiation is enabled by default.

To correct the invalid configuration and disable autonegotiation:
1. Delete the no-auto-negotiation statement and commit the configuration.
2. Set the link speed to 10 or 100 Mbps, set no-auto-negotiation, and commit the configuration.

On EX Series switches, if the link speed and duplex mode are also configured, the interfaces use the values configured as the desired values in the negotiation. If autonegotiation is disabled, the link speed and link mode must be configured.

NOTE: On T4000 routers, the auto-negotiation command is ignored for interfaces other than Gigabit Ethernet.
NOTE: On ACX Series routers, when you configure fiber interfaces (fiber media mode) to operate at 1 Gbps, autonegotiation is enabled by default to negotiate the speed and duplex settings. You can disable autonegotiation by using the (no-auto-negotiation) statement, and commit the configuration. In the fiber media mode. In copper interfaces (copper media mode), autonegotiation is enabled by default. To disable autonegotiation, you need to explicitly configure the link speed to 10 or 100 Mbps, set no-auto-negotiation, and commit the configuration.

**Default**

Autonegotiation is automatically enabled. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.

**Options**

remote-fault (local-interface-online | local-interface-offline)—(Optional) For M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers only, manually configure remote fault on an interface.

Default: local-interface-online

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

backup-destination

Syntax
backup-destination address;

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number tunnel],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number tunnel]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
For tunnel interfaces, specify the remote address of the backup tunnel.

Options
address—Address of the remote side of the connection.

Required Privilege
Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Junos OS Services Interfaces Library for Routing Devices
- destination (Tunnels) on page 520

backup-interface

Syntax
backup-interface es-fpc/pic/port;

Hierarchy Level
[edit interfaces es-fpc/pic/port es-options]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Configure a backup ES Physical Interface Card (PIC). If the primary ES PIC fails, the backup becomes active, inherits all the tunnels and security associations (SAs), and acts as the new next hop for IP Security (IPsec) traffic.

Options
es-fpc/pic/port—Name of ES interface to serve as the backup.

Required Privilege
Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Junos OS Services Interfaces Library for Routing Devices
backup-options

Syntax
backup-options { interface interface-name; }

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Configure an interface to be used as a backup interface if the primary interface goes down. This is used to support ISDN dial backup operation.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

bandwidth (Interfaces)

Syntax

bandwidth rate;

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Configure the bandwidth value for an interface. This statement is valid for all logical interface types except multilink and aggregated interfaces.

NOTE: We recommend that you be careful when setting this value. Any interface bandwidth value that you configure using the bandwidth statement affects how the interface cost is calculated for a dynamic routing protocol, such as OSPF. By default, the interface cost for a dynamic routing protocol is calculated using the following formula:

\[ \text{cost} = \frac{\text{reference-bandwidth}}{\text{bandwidth}}, \]

where bandwidth is the physical interface speed. However, if you specify a value for bandwidth using the bandwidth statement, that value is used to calculate the interface cost, rather than the actual physical interface bandwidth.

Options

rate—Peak rate, in bits per second (bps) or cells per second (cps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation c; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps.

Range: Not limited.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

bandwidth-limit (Hierarchical Policer)

Syntax

```
bandwidth-limit bps;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall hierarchical-policer aggregate if-exceeding],
[edit dynamic-profiles profile-name firewall hierarchical-policer premium if-exceeding],
[edit firewall hierarchical-policer aggregate if-exceeding],
[edit firewall hierarchical-policer premium if-exceeding]
```

Release Information

Statement introduced in Junos OS Release 9.5. Support at the **[edit dynamic-profiles ... if-exceeding]** hierarchy level introduced in Junos OS Release 11.4.

Description

On M40e, M120, and M320 (with FFPC and SFPC) edge routers; on MPCs hosted on MX Series routers; on T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs; and on T4000 routers with Type 5 FPC and Enhanced Scaling Type 4 FPC, configure the maximum average bandwidth for premium or aggregate traffic in a hierarchical policer.

Options

**bps**—You can specify the number of bits per second either as a decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

Range:

- 32,000 through 50,000,000,000 on M Series routers
- 32,000 through 100,000,000,000 on T Series routers
- 32,000 through 18,446,744,073,709,551,615 on MX Series routers

**NOTE:** When you specify a numeric value beyond the supported bandwidth of the PFE, the router caps the bandwidth at the maximum supported bandwidth of the PFE.

Required Privilege Level

- **firewall**—To view this statement in the configuration.
- **firewall-control**—To add this statement to the configuration.

[edit interfaces interface-name gigether-options ethernet-switch-profile ethernet-policer-profile policer cos-policer-name aggregate],
[edit interfaces interface-name gigether-options ethernet-switch-profile ethernet-policer-profile policer cos-policer-name premium]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Define a policer to apply to nonpremium traffic.

**Options**

**bps**—Bandwidth limit, in bits per second. Specify either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

**Range:** 32 kbps through 32 gigabits per second (Gbps). For IQ2 and IQ2-E interfaces 65,536 bps through 1 Gbps. For 10-Gigabit IQ2 and IQ2-E interfaces 65,536 bps through 10 Gbps.

**Required Privilege Level**

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**Hierarchy Level**  
- `[edit interfaces interface-name unit logical-unit-number dynamic-call-admission-control]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number dynamic-call-admission-control]`

**Release Information**  
Statement introduced in Junos OS Release 8.2.

**Description**  
(J4350 and J6350 Services Routers supporting voice over IP with the TGM550 media gateway module) For Fast Ethernet and Gigabit Ethernet interfaces, ISDN BRI interfaces, and serial interfaces with PPP or Frame Relay encapsulation, configure the bearer bandwidth limit (BBL). BBL is used for dynamic call admission control (dynamic CAC) to provide enhanced control over WAN bandwidth.

**Options**  
`kilobits-per-second`—The bearer bandwidth limit to be reported to a TGM550 media gateway module, in kilobits per second (kbps).

- **Range:** 0 through 9999 kbps
- **Default:** 1 (dynamic CAC is not enabled on the interface)

**Required Privilege Level**  
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

bert-algorithm

**Syntax**

```
bert-algorithm algorithm;
```

**Hierarchy Level**

[edit interfaces ce1-fpc/pic/port],
[edit interfaces ct1-fpc/pic/port],
[edit interfaces interface-name ds0-options],
[edit interfaces interface-name el1-options],
[edit interfaces interface-name e3-options],
[edit interfaces interface-name t1-options],
[edit interfaces interface-name t3-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

**Description**

Configure the pattern to send in the bit stream during a bit error rate test (BERT). Applies to T1, E3, T3, and multichannel DS3 interfaces, the channelized interfaces (DS3, OC12, STM1), and channelized IQ and IQE interfaces (E1, E3 and DS3).

**NOTE:** When configuring CE1 or CT1 interfaces on 10-port Channelized E1/T1 IQE PICs, the bert-algorithm statement must be included at the [edit interfaces ce1-fpc/pic/port] or [edit interfaces ct1-fpc/pic/port] hierarchy level as appropriate.

**Options**

`algorithm`—Pattern to send in the bit stream. There are two categories of test patterns: pseudorandom and repetitive. Both patterns conform to CCITT/ITU O.151, O.152, O.153, and O.161 standards. The algorithm can be one of the following patterns:

- `all-ones-repeating`—Pattern is all ones.
- `all-zeros-repeating`—Pattern is all zeros.
- `alternating-double-ones-zeros`—Pattern is alternating pairs of ones and zeros.
- `alternating-ones-zeros`—Pattern is alternating ones and zeros.
- `pseudo-2e3`—Pattern is $2^3 - 1$.
- `pseudo-2e4`—Pattern is $2^4 - 1$.
- `pseudo-2e5`—Pattern is $2^5 - 1$.
- `pseudo-2e6`—Pattern is $2^6 - 1$.
- `pseudo-2e7`—Pattern is $2^7 - 1$.
- `pseudo-2e9-o153`—Pattern is $2^9 - 1$, as defined in the O153 standard.
- `pseudo-2e10`—Pattern is $2^{10} - 1$. 
• pseudo-2e11-o152—Pattern is $2^{11} - 1$, as defined in the O152 standard.
• pseudo-2e15-o151—Pattern is $2^{15} - 1$, as defined in the O151 standard.
• pseudo-2e17—Pattern is $2^{17} - 1$.
• pseudo-2e18—Pattern is $2^{18} - 1$.
• pseudo-2e20-o151—Pattern is $2^{20} - 1$, as defined in the O151 standard.
• pseudo-2e20-o153—Pattern is $2^{20} - 1$, as defined in the O153 standard.
• pseudo-2e21—Pattern is $2^{21} - 1$.
• pseudo-2e22—Pattern is $2^{22} - 1$.
• pseudo-2e23-o151—Pattern is $2^{23} - 1$, as defined in the O151 standard.
• pseudo-2e25—Pattern is $2^{25} - 1$.
• pseudo-2e28—Pattern is $2^{28} - 1$.
• pseudo-2e29—Pattern is $2^{29} - 1$.
• pseudo-2e31—Pattern is $2^{31} - 1$.
• pseudo-2e32—Pattern is $2^{32} - 1$.
• repeating-1-in-4—One bit in four is set to 1; the others are set to 0.
• repeating-1-in-8—One bit in eight is set to 1; the others are set to 0.
• repeating-3-in-24—Three bits in twenty four are set to 1; the others are set to 0.

Default: pseudo-2e3

[edit interfaces interface-name e3-options],
[edit interfaces interface-name t1-options],
[edit interfaces interface-name t3-options]
```

**Release Information**

**Description**

Configure the bit error rate to use in a BERT procedure. Applies to E1, E3, T1, or T3 interfaces, and to the channelized interfaces (DS3, OC3, OC12, and STM1).

---

**NOTE:** When configuring CE1 or CT1 interfaces on 10-port Channelized E1/T1 IQE PICs, the bert-error-rate statement must be included at the [edit interfaces ce1-fpc/pic/port] or [edit interfaces ct1-fpc/pic/port] hierarchy level as appropriate.

---

**Options**

- **rate**—Bit error rate.
  - **Range:** 0 through 7, which corresponds to $10^{-1}$ (1 error per bit) to $10^{-7}$ (1 error per 10 million bits)
  - **Default:** 0

**Required Privilege Level**

- interface—To view this statement in the configuration.

bert-period

Syntax  
bert-period seconds;

Hierarchy Level  
[edit interfaces ce1-fpc/pic/port],  
[edit interfaces ct1-fpc/pic/port],  
[edit interfaces interface-name ds0-options],  
[edit interfaces interface-name el-options],  
[edit interfaces interface-name e3-options],  
[edit interfaces interface-name t1-options],  
[edit interfaces interface-name t3-options]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

Description  
Configure the duration of a BERT test. Applies to E1, E3, T1, and T3 interfaces, and to E1, E3, T1, and T3 partitions on the channelized interfaces (CE1, CT1, DS3, OC3, OC12, OC48, STM1, STM4, and STM16).

E1 and T1 IQ, IQE, and standard interfaces support an extended BERT period range, up to 86,400 seconds (24 hours).

NOTE: When configuring CE1 or CT1 interfaces on 10-port Channelized E1/T1 IQE PICs, the bert-period statement must be included at the [edit interfaces ce1-fpc/pic/port] or [edit interfaces ct1-fpc/pic/port] hierarchy level as appropriate.

Options  
seconds—Test duration. Range and default values vary by interface type.  
Range:

- PIC-dependent—Normal BERT period: either 1 through 239 seconds or 1 through 240 seconds
- PIC-dependent—Extended BERT period: from 1 through 86,400 seconds

Default:

- Normal BERT period: 10 seconds
- Extended BERT period (on supported E1 interfaces): 10 seconds
- Extended BERT period (on supported T1 interfaces): 240 seconds

Required Privilege Level  
interface—to view this statement in the configuration.  
interface-control—to add this statement to the configuration.

bridge-domain

Syntax

```
bridge-domain name;
    vlan-id [ vlan-identifiers ];
}
```

Hierarchy Level

- [edit protocols oam ethernet connectivity-fault-management maintenance-domain maintenance-domain-name]
- [edit protocols oam ethernet connectivity-fault-management maintenance-domain maintenance-domain-name virtual-switch virtual-switch-name]

Release Information

Statement introduced in Junos OS Release 9.4.

Description

(MX Series routers only) Specify the OAM Ethernet CFM maintenance domain bridge domain.

Options

- **name**—Specify the name of the bridge domain.
- **vlan-identifiers**—Specify one or more VLAN identifiers.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

broadcast

Syntax broadcast address;

Hierarchy Level [edit interfaces interface-name unit logical-unit-number family family address address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the broadcast address on the network or subnet. On a subnet you cannot specify a host address of 0 (0.0.0.0), nor can you specify a broadcast address (255.255.255.255). For example, in the statement set interface ge-0/0/0 unit 0 family inet address 10.1.1.0/24, the subnet address 10.1.1.0 has the host address of 0. Hence, you cannot configure this address. Similarly, for the subnet, you cannot use the broadcast address 10.1.1.255/24.

Default The default broadcast address has a host portion of all ones.

Options address—Broadcast address. The address must have a host portion of either all ones or all zeros. You cannot specify the addresses 0.0.0.0 or 255.255.255.255.

NOTE: The edit logical-systems hierarchy is not available on QFabric systems.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation • Configuring the Interface Address on page 191
**buildout (E3 or T3 over ATM Interfaces)**

Syntax  
buildout feet;

Hierarchy Level  
[edit interfaces at-fpc/pic/port e3-options],  
[edit interfaces at-fpc/pic/port t3-options]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For E3 and T3 traffic over ATM interfaces, set the buildout value.

Options  
**feet**—The buildout value in feet.  
**Range:** 0 through 450 feet (137 meters)  
**Default:** 10 feet (3 meters)

Required Privilege Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation

**buildout (T1 Interfaces)**

**Syntax**

buildout value;

**Hierarchy Level**

[edit interfaces ct1-fpc/pic/port]
[edit interfaces interface-name t1-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

**Description**

For T1 interfaces, set the buildout value.

**NOTE:** When configuring CT1 interfaces on 10-port Channelized E1/T1 IQE PICs and 16-Port Channelized E1/T1 Circuit Emulation MICs, the buildout statement must be included at the hierarchy level.

**Default**

The default buildout value is 0 through 132 feet.

**Options**

You can set the buildout value to one of the following:

- 0-132—0 through 132 feet (0 through 40 meters)
- 133-265—133 through 265 feet (40 through 81 meters)
- 266-398—266 through 398 feet (81 through 121 meters)
- 399-531—399 through 531 feet (121 through 162 meters)
- 532-655—532 through 655 feet (162 through 200 meters)
- **long-7.5db**—For MX Series only, long buildout with 7.5 dB transmit attenuation
- **long-15db**—For MX Series only, long buildout with 15 dB transmit attenuation
- **long-22.5db**—For MX Series only, long buildout with 22.5 dB transmit attenuation

**Required Privilege Level**

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**Related Documentation**

bundle

Syntax

bundle (ml-fpc/pic/port | ls-fpc/pic/port);

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number family family],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Associate the multilink interface with the logical interface it is joining. You can include this statement for the mlfr-end-to-end and mlfr-uni-nni protocol families only.

NOTE:

For M Series routers and T Series routers, the following caveats apply:

- Maximum supported throughput on the bundle interfaces is 45 Mbps.
- Bundling of the logical interfaces under a T3 physical interface into the same or different bundles is not supported.

Options

ml-fpc/pic/port—Name of the multilink interface you are linking.

ls-fpc/pic/port—Name of the link services interface you are linking.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

burst-size-limit (Hierarchical Policer)

Syntax

burst-size-limit bytes;

Hierarchy Level

[edit dynamic-profiles profile-name firewall hierarchical-policer aggregate if-exceeding],
[edit dynamic-profiles profile-name firewall hierarchical-policer premium if-exceeding],
[edit firewall hierarchical-policer aggregate if-exceeding],
[edit firewall hierarchical-policer premium if-exceeding]

Release Information

Statement introduced in Junos OS Release 9.5. Support at the [edit dynamic-profiles ... if exceeding] hierarchy level introduced in Junos OS Release 11.4.

Description

On M40e, M120, and M320 (with FFPC and SFPC) edge routers; on MPCs hosted on MX Series routers; on T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs; and on T4000 routers with Type 5 FPC and Enhanced Scaling Type 4 FPC, configure the burst-size limit for premium or aggregate traffic in a hierarchical policer.

Options

bytes—Burst-size limit in bytes. The minimum recommended value is the maximum transmission unit (MTU) of the IP packets being policed. You can specify the value either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

Range: 1500 through 2,147,450,880 (1500 through 100,000,000,000 on MPCs hosted on MX Series routers)

Required Privilege

firewall—to view this statement in the configuration.
firewall-control—to add this statement to the configuration.

Statement introduced before Junos OS Release 7.4.

**Description**
Set values in some SONET/SDH header bytes.

**Options**

- **c2 value**—Path signal label SONET/SDH overhead byte. SONET/SDH frames use the C2 byte to indicate the contents of the payload inside the frame. SONET/SDH interfaces use the C2 byte to indicate whether the payload is scrambled.
  
  **Range:** 0 through 255
  
  **Default:** 0xCF

- **e1-quiet value**—Default idle byte sent on the orderwire SONET/SDH overhead bytes. The router does not support the orderwire channel, and hence sends this byte continuously.
  
  **Range:** 0 through 255
  
  **Default:** 0x7F

- **f1 value, f2 value, z3 value, z4 value**—SONET/SDH overhead bytes.
  
  **Range:** 0 through 255
  
  **Default:** 0x00

- **s1 value**—Synchronization message SONET overhead byte. This byte is normally controlled as a side effect of the system reference clock configuration and the state of the external clock coming from an interface if the system reference clocks have been configured to use an external reference.
  
  **Range:** 0 through 255
  
  **Default:** 0xCC

**Required Privilege**
- **Level** interface—To view this statement in the configuration.
- **Level** interface-control—To add this statement to the configuration.
calculation-weight

Syntax

```
calculation-weight {
  delay delay-value;
  delay-variation delay-variation-value;
}
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles profile-name]
```

Release Information

Statement introduced in Junos OS Release 11.1.
Statement introduced in Junos OS Release 11.4 for EX Series switches.

Description

Configure the calculation weight for delay and delay variation.

NOTE: This option is applicable only for two-way delay measurement.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

Configure—To enter configuration mode.
Control—To modify any configuration.

### callback

**Syntax**
```
callback;
```

**Hierarchy Level**
```
[edit interfaces dl unit logical-unit-number dialer-options incoming-map],
[edit logical-systems logical-system-name interfaces dl unit logical-unit-number dialer-options incoming-map]
```

**Release Information**
Statement introduced in Junos OS Release 7.5.

**Description**
On J Series Services Routers with interfaces configured for ISDN, configure the dialer to terminate the incoming call and call back the originator after the callback wait period. The default wait time is 5 seconds. To configure the wait time, include the `callback-wait-period` statement at the `[edit interfaces dl unit logical-unit-number dialer-options]` hierarchy level.

**NOTE:** The incoming-map statement is mandatory for the router to accept any incoming ISDN calls.

If the `callback` statement is configured, you cannot use the `caller caller-id` statement at the `[edit interfaces dl unit logical-unit-number dialer-options]` hierarchy level.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Junos OS Interfaces and Routing Configuration Guide
- `callback-wait-period` on page 461
callback-wait-period

**Syntax**

callback-wait-period time;

**Hierarchy Level**

[edit interfaces dl unit logical-unit-number dialer-options],
[edit logical-systems logical-system-name interfaces dl unit logical-unit-number dialer-options]

**Release Information**

Statement introduced in Junos OS Release 7.5.

**Description**

On J Series Services Routers with interfaces configured for ISDN with callback, specify the amount of time the dialer waits before calling back the caller. The default wait time is 5 seconds. The wait time is necessary because, when a call is rejected, the switch waits for up to 4 seconds on point-to-multipoint connections to ensure no other device accepts the call before sending the DISCONNECT message to the originator of the call. However, the default time of 5 seconds may not be sufficient for different switches or may not be needed on point-to-point connections.

To configure callback mode, include the callback statement at the [edit interfaces dl unit logical-unit-number dialer-options] hierarchy level.

If the callback statement is configured, you cannot use the caller caller-id statement at the [edit interfaces dl unit logical-unit-number dialer-options] hierarchy level.

**Options**

- **time**—Time the dialer waits before calling back the caller.

**Required Privilege Level**

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

**Related Documentation**

- Junos OS Interfaces and Routing Configuration Guide
**caller**

**Syntax**  
caller (caller-id | accept-all);

**Hierarchy Level**  
[edit interfaces dln unit logical-unit-number dialer-options incoming-map],  
[edit logical-systems logical-system-name interfaces dln unit logical-unit-number dialer-options incoming-map]

**Release Information**  
Statement introduced in Junos OS Release 7.5.

**Description**  
On J Series Services Routers with interfaces configured for ISDN, specify the dialer to accept a specified caller number or accept all incoming calls.

**Options**  
**caller-id**—Incoming caller number. You can configure multiple caller IDs on a dialer. The caller ID of the incoming call is matched against all caller IDs configured on all dialers. The dialer matching the caller ID is looked at for further processing. Only a precise match is a valid match. For example, the configured caller ID 1-222-333-4444 or 222-333-4444 will match the incoming caller ID 1-222-333-4444.

If the incoming caller ID has fewer digits than the number configured, it is not a valid match. Duplicate caller IDs are not allowed on different dialers; however, for example, the numbers 1-408-532-1091, 408-532-1091, and 532-1091 can still be configured on different dialers.

Only one B-channel can map to one dialer. If one dialer is already mapped, any other call mapping to the same dialer is rejected (except in the case of a multilink dialer). If no dialer caller is configured on a dialer, that dialer will not accept any calls.

**accept-all**—Any incoming call in an associated interface is accepted.

**Required Privilege**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**  
* Junos OS Interfaces and Routing Configuration Guide
calling-number

Syntax

\[
\text{calling-number number;}
\]

Hierarchy Level

[edit interfaces br-pim/0/port isdn-options]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

On J Series Services Routers with ISDN interfaces, configure the calling number to include in outgoing calls.

Options

\[\text{number—Calling number.}\]

Required Privilege

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### cbit-parity

**Syntax**
\[(cbit-parity | no-cbit-parity);\]

**Hierarchy Level**
\[edit interfaces interface-name t3-options\]

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
For T3 interfaces only, enable or disable C-bit parity mode, which controls the type of framing that is present on the transmitted T3 signal. When C-bit parity mode is enabled, the C-bit positions are used for the far-end block error (FEBE), far-end alarm and control (FEAC), terminal data link, path parity, and mode indicator bits, as defined in ANSI T1.107a-1989. For ATM and ATM2 IQ2 and IQ2-E interfaces, M23 framing is used when the `no-cbit-parity` statement is included. For all other interfaces, M13 framing is used when the `no-cbit-parity` statement is included.

**Default**
C-bit parity mode is enabled.

**Required Privilege**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- [Configuring E3 and T3 Parameters on ATM Interfaces](#)
- [Disabling T3 C-Bit Parity Mode](#)
cbr

**Syntax**
cbr rate;

**Hierarchy Level**
[edit interfaces at-fpc/pic/port atm-options vpi vpi-identifier shaping],
[edit interfaces at-fpc/pic/port unit logical-unit-number address address family family multipoint-destination address shaping],
[edit interfaces at-fpc/pic/port unit logical-unit-number shaping],
[edit logical-systems logical-system-name interfaces at-fpc/pic/port unit logical-unit-number address address family family multipoint-destination address shaping],
[edit logical-systems logical-system-name interfaces at-fpc/pic/port unit logical-unit-number shaping]

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
For ATM encapsulation only, define a constant bit rate bandwidth utilization in the traffic-shaping profile.

**Default**
Unspecified bit rate (UBR); that is, bandwidth utilization is unlimited.

**Options**
rate—Peak rate, in bits per second (bps) or cells per second (cps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation c; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps.

For ATM1 and ATM2 OC3 interfaces, the maximum available rate is 100 percent of line-rate, or 135,600,000 bps. For ATM1 OC12 interfaces, the maximum available rate is 50 percent of line-rate, or 271,263,396 bps. For ATM2 IQ interfaces, the maximum available rate is 542,526,792 bps.

**Required Privilege Level**
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

cell-bundle-size

Syntax  

```
cell-bundle-size cells;
```

Hierarchy Level  

[edit interfaces at-fpc/pic/port atm-options],
[edit interfaces at-fpc/pic/port unit logical-unit-number],
[edit logical-systems logical-system-name interfaces at-fpc/pic/port unit logical-unit-number]

Release Information  

Statement introduced before Junos OS Release 7.4.

Description  

For ATM2 IQ interfaces using ATM Layer 2 circuit cell-relay transport mode only, configure the maximum number of ATM cells per frame.

**NOTE:** For MIC-3D-8OC3-2OC12-ATM on MX104 routers, ensure that the configured cell-bundle-size is less than 30 for an ATM interface that is configured with atm-ccc-cell-relay encapsulation. If the configured cell-bundle-size is greater than or equal to 30 and the traffic is passing through the interface at line rate, it might lead to AFEB crash.

Options  

- **cells**—Maximum number of cells.

  Default: 1 cell

  Range: 1 through 176 cells

Required Privilege Level

- interface—to view this statement in the configuration.

- interface-control—to add this statement to the configuration.

Related Documentation  

- Configuring the Layer 2 Circuit Cell-Relay Cell Maximum Overview
chap

Syntax
chap {
    access-profile name;
    challenge-length minimum minimum-length maximum maximum-length;
    default-chap-secret name;
    local-name name;
    passive;
}

Hierarchy Level
[edit interfaces interface-name ppp-options],
[edit interfaces interface-name unit logical-unit-number ppp-options],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Allow each side of a link to challenge its peer, using a “secret” known only to the authenticator and that peer. The secret is not sent over the link.

By default, PPP CHAP is disabled. If CHAP is not explicitly enabled, the interface makes no CHAP challenges and denies all incoming CHAP challenges.

For ATM2 IQ interfaces only, you can configure CHAP on the logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- atm-ppp-llc—PPP over AAL5 LLC encapsulation.
- atm-ppp-vc-mux—PPP over AAL5 multiplex encapsulation.

BEST PRACTICE: On inline service (si) interfaces for L2TP, only the chap statement itself is typically used for subscriber management. We recommend that you leave the subordinate statements at their default values.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

circuit-type

Syntax  
circuit-type;

Hierarchy Level  
[edit interfaces interface-name auto-configure vlan-ranges authentication username-include],
[edit interfaces interface-name auto-configure stacked-vlan-ranges authentication username-include],

Release Information  
Statement introduced in Junos OS Release 10.0.

Description  
Specify that the circuit type is concatenated with the username during the subscriber authentication process.

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  
• Configuring VLAN Interface Username Information for AAA Authentication

cisco-interoperability

Syntax  
cisco-interoperability send-lip-remove-link-for-link-reject;

Hierarchy Level  
[edit interfaces interface-name mlfr-uni-nni-bundle-options]

Release Information  
Statement introduced in Junos OS Release 7.4.

Description  
FRF.16 interoperability settings.

Options  
send-lip-remove-link-for-link-reject—Send Link Integrity Protocol remove link when an add-link rejection message is received.

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  
• Junos OS Services Interfaces Library for Routing Devices
classifier

Syntax

classifier {
  per-unit-scheduler {
    forwarding-class class-name {
      loss-priority (high | low);
    }
  }
}

Hierarchy Level
[edit interfaces interface-name gigether-options ethernet-switch-profile ethernet-policer-profile output-priority-map]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
For Gigabit Ethernet IQ and 10-Gigabit Ethernet interfaces only, define the classifier for the output priority map to be applied to outgoing frames on this interface.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

clear-dont-fragment-bit

**Syntax**
clear-dont-fragment-bit;

**Hierarchy Level**
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
Clear the don't-fragment (DF) bit on all IP version 4 (IPv4) packets entering a generic routing encapsulation (GRE) tunnel. If the encapsulated packet's size exceeds the tunnel's maximum transmission unit (MTU), the packet is fragmented before encapsulation. The statement is supported only on MX Series routers and all M Series routers except the M320 router.

When you configure the `clear-dont-fragment-bit` statement on an interface with the MPLS protocol family enabled, you must specify an MTU value. This MTU value must not be greater than maximum supported value, which is 9192.

**Required Privilege Level**
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**Related Documentation**
- Junos OS Services Interfaces Library for Routing Devices
clock-rate

Syntax  clock-rate rate;

Hierarchy Level  [edit interfaces interface-name serial-options]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  For EIA-530 and V.35 interfaces, configure the interface speed, in meghertz (MHz).

Options  rate—You can specify one of the following rates:

- 2.048 MHz
- 2.341 MHz
- 2.731 MHz
- 3.277 MHz
- 4.096 MHz
- 5.461 MHz
- 8.192 MHz
- 16.384 MHz

Default: 16.384 MHz

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  • Configuring the Serial Clocking Mode on page 322
clocking

Syntax    clocking (external [interface interface-name] | internal);

Hierarchy Level    [edit interfaces interface-name]

Release Information    Statement introduced before Junos OS Release 7.4.
    interface option added in Junos OS Release 8.2.
    Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

Description    For interfaces that can use various clock sources, configure the source of the transmit clock on each interface.

NOTE: On Channelized SONET/SDH PICs, if you set the parent (or the master) controller clock to external, then you must set the child controller clocks to the default value—that is, internal.

For example, on the Channelized STM1 PIC, if the clock on the Channelized STM1 interface (which is the master controller) is set to external, then you must not configure the CE1 interface (which is the child controller) clock to external. Instead you must configure the CE1 interface clock to internal.

Options    external—The clock source is provided by the data communication equipment (DCE).

    interface interface-name—Configure clocking for the drop-and insert feature. When configuring this feature, both ports must use the same clock source: either the router’s internal clock or an external clock on one of the interfaces. If an external clock source is required, one interface must specify clocking external and the other must specify the same clock.

    internal—Use the internal stratum 3 clock as the reference clock.

Default: internal

Required Privilege Level    interface—To view this statement in the configuration.
    interface-control—To add this statement to the configuration.

Related Documentation    • Configuring the Clock Source on page 113
    • Configuring the Clock Source on SONET/SDH Interfaces
    • Clock Sources on Channelized Interfaces
    • Configuring a Channelized T1/E1 Interface to Drop and Insert Time Slots
    • loop-timing on page 759
clocking-mode

**Syntax**
clocking-mode (dce | internal | loop);

**Hierarchy Level**
[edit interfaces interface-name serial-options]

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
For EIA-530 and V.35 interfaces, configure the clock mode. You cannot configure clocking-mode dce on a DTE router using an X.21 serial line protocol (detected automatically when an X.21 cable is plugged into the serial interface).

**Options**
dce—DCE timing (DTE mode only, not valid for X.21).

internal—Internal baud timing.

loop—Loop timing.

Default: loop

**Required Privilege**
interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration

**Related Documentation**
- Configuring the Serial Clocking Mode on page 322
community (Policy Options)

Syntax

```
community name [invert-match; members [community-ids];]
```

Hierarchy Level

[edit dynamic policy-options], [edit logical-systems logical-system-name policy-options], [edit policy-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for configuration in the dynamic database introduced in Junos OS Release 9.5.
Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.
Support for BGP large community introduced in Junos OS Release 17.3 for MX Series, PTX Series, and QFX Series.

Description

Define a community, extended community or large community for use in a routing policy match condition.

Options

- **name**—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters. To include spaces in the name, enclose it in quotation marks (" ").

- **invert-match**—Invert the results of the community expression matching. The community match condition defines a regular expression and if it matches the community attribute of the received prefix, Junos OS returns a TRUE result. If not, Junos OS returns a FALSE result. The `invert-match` statement makes Junos OS behave to the contrary. If there is a match, Junos OS returns a FALSE result. If there is no match, Junos OS returns a TRUE result.

- **members community-ids**—One or more community members. If you specify more than one member, you must enclose all members in brackets.

The format for `community-ids` is:

```
as-number:community-value
```

Starting in Junos OS Release 15.1, you can apply a wildcard member `segmented-nh::.*:0` to apply the BGP policy to all the S-PMSI A-D routes carrying extended community information.

`as-number` is the AS number and can be a value in the range from 0 through 65,535.

`community-value` is the community identifier and can be a number in the range from 0 through 65,535.
You also can specify **community-ids** for communities as one of the following well-known community names, which are defined in RFC 1997, *BGP Communities Attribute*:

- **no-export**—Routes containing this community name are not advertised outside a BGP confederation boundary.

- **no-advertise**—Routes containing this community name are not advertised to other BGP peers.

- **no-export-subconfed**—Routes containing this community name are not advertised to external BGP peers, including peers in other members' ASs inside a BGP confederation.

You can explicitly exclude BGP community information with a static route using the **none** option. Include **none** when configuring an individual route in the **route** portion of the **static** statement to override a **community** option specified in the **defaults** portion of the statement.

The format for extended **community-ids** is the following:

```
type:administrator:assigned-number
```

**type** is the type of extended community and can be either a **bandwidth**, **target**, **origin**, **domain-id**, **src-as**, or **rt-import** community or a 16-bit number that identifies a specific BGP extended community. The **target** community identifies the destination to which the route is going. The **origin** community identifies where the route originated. The **domain-id** community identifies the OSPF domain from which the route originated. The **src-as** community identifies the autonomous system from which the route originated. The **rt-import** community identifies the route to install in the routing table.

**NOTE:** For **src-as**, you can specify only an AS number and not an IP address. For **rt-import**, you can specify only an IP address and not an AS number.

**administrator** is the administrator. It is either an AS number or an IPv4 address prefix, depending on the type of extended community.

**assigned-number** identifies the local provider.

The format for linking a bandwidth with an AS number is:

```
bandswidth:as-number:bandwidth
```

**as-number** specifies the AS number and **bandwidth** specifies the bandwidth in bytes per second.
NOTE: In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, BGP Support for Four-octet AS Number Space, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS. In plain-number format, you can configure a value in the range from 1 through 4,294,967,295. To configure a target or origin extended community that includes a 4-byte AS number in the plain-number format, append the letter “L” to the end of number. For example, a target community with the 4-byte AS number 334,324 and an assigned number of 132 is represented as target:334324L:132.

In Junos OS Release 9.2 and later, you can also use AS-dot notation when defining a 4-byte AS number for the target and origin extended communities. Specify two integers joined by a period: **16-bit high-order value in decimal.16-bit low-order value in decimal**. For example, the 4-byte AS number represented in plain-number format as 65546 is represented in AS-dot notation as 1.10.

As defined in RFC 8092, BGP large community uses 12-byte encoding and the format for BGP large community-ids is:

```
large: global-administrator:assigned-number:assigned-number
```

- **large** indicates BGP large community.
- **global-administrator** is the administrator. It is a 4-byte AS number.
- **assigned-number** is a 4-byte value used to identify the local provider. BGP large community uses two 4-byte assigned number to identify the local provider.

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**compatibility-mode**

**Syntax**

compatibility-mode (adtran | digital-link | kentrox | larscom | verilink) <subrate value>;

**Hierarchy Level**

[edit interfaces interface-name e3-options], [edit interfaces interface-name t3-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Configure the E3 or T3 interface to be compatible with the channel service unit (CSU) at the remote end of the line.

---

**NOTE:** The compatibility-mode statement at the [edit interfaces interface-name e3-options] hierarchy level is not valid for IQE PICs.

---

**Default**

If you omit this option, the full E3 or T3 rate is used.

**Options**

- **adtran**—For T3 IQ interfaces only, configure compatibility with Adtran CSUs.
- **digital-link**—Configure compatibility with Digital Link CSUs. If you include this option on an E3 interface, you must also disable payload scrambling.
- **kentrox**—Configure compatibility with Kentrox CSUs. Kentrox subrate is valid for E3 IQ and T3 IQ interfaces only.
- **larscom**—For T3 and T3 IQ interfaces only, configure compatibility with Larscom CSUs.
- **verilink**—For T3 IQ and T3 IQE interfaces only, configure compatibility with Verilink CSUs.

---

**NOTE:** Verilink configuration is not functional if an IQ interface is paired with an IQE interface.

---

**subrate value**—Subrate of the E3 or T3 line.

**Range:** For Kentrox CSUs on E3 IQ interfaces and T3 IQ interfaces the subrate value must match the value configured on the CSU. Each increment of the subrate value corresponds to a rate increment of about 0.5 Mbps.

**Required Privilege Level**

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

    interface interface-name.unit-number;
  }
}
```

**Hierarchy Level**

```
[edit protocols]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Define the connection between two circuits in a circuit cross-connect (CCC) connection. The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**

`routing`—To view this statement in the configuration.

`routing-control`—To add this statement to the configuration.

connection-protection-tlv

Syntax
connection-protection-tlv;

Hierarchy Level
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name continuity-check]

Description
Includes connection protection OUI TLV in continuity check messages (CCM). The TLV
is responsible for carrying the flag information within CCM PDUs. Though this OUI TLV
will be included in the CCM frames by provider edge devices, the value is updated by the
provider routers in case the traffic to the other end of the network is forwarded by the
facility protection tunnel.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Hierarchy Level   [edit protocols oam ethernet]

Release Information Statement introduced in Junos OS Release 8.4.
Description  For Ethernet interfaces on M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M120, M320, MX Series, and T Series routers, specify connectivity fault management for IEEE 802.1ag Operation, Administration, and Management (OAM) support. In Junos OS Release 9.3 and later, this statement is also supported on aggregated Ethernet interfaces.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege  Level  interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Related Documentation  • IEEE 802.1ag OAM Connectivity Fault Management Overview

container-devices

Syntax  container-devices {
  device-count number;
}

Hierarchy Level  [edit chassis]

Description  Specify the container devices configuration. The number option specifies the number of sequentially numbered container interfaces, from ci0 to ci127 maximum.

Options  number—Number of container devices.
  Range: 1 through 128

Required Privilege  Level  chassis—To view this statement in the configuration.
  chassis-control—To add this statement to the configuration.

Related Documentation  • Displaying APS Using a Container Interface with ATM Encapsulation
  • Configuring Container Interfaces for APS on SONET Links
**container-list**

**Syntax**  
container-list [ container-interface-names ];

**Hierarchy Level**  
[edit interfaces container-options]

**Release Information**  
Statement introduced in Junos OS Release 9.2.

**Description**  
Specify a list of container interfaces; for example: ci0, ci1, and up to ci127.

**Options**  
container-interface-names—Name of each container interface.

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**  
- Displaying APS Using a Container Interface with ATM Encapsulation  
- Configuring Container Interfaces for APS on SONET Links

container-options

Syntax  
container-options  
   container-list  
   container-interface-names  
   container-type  
   container-interface-names  
   member-interface-type  
   member-interface-names  
   member-interface-speed  
   member-interface-names  

Hierarchy Level  [edit interfaces]

Description  Specify the container interface options.

Options  
   interface-name—Name of the SONET or the container interface.
   aps—Specify the member link interface type of the container as APS.
   sonet—Protocol type of the container interface.
   speed—Set interface speed to OC3, OC12, OC48, OC192, OC768, or mixed.

Required Privilege  
   Level  
   interface—To view this statement in the configuration.
   interface-control—To add this statement to the configuration.

Related Documentation

## container-type

**Syntax**

container-type *aps*;

**Hierarchy Level**

[edit interfaces container-options]

**Release Information**

Statement introduced in Junos OS Release 9.2.

**Description**

Specify the container-options interface type.

**Options**

*aps*—Configure the interface type to be Automatic Protection Switching (APS).

**Required Privilege**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

- Displaying APS Using a Container Interface with ATM Encapsulation

**continuity-check**

**Syntax**

```
continuity-check {
    convey-loss-threshold;
    hold-interval minutes;
    interface-status-tlv;
    interval (10m | 10s | 1m | 1s | 100ms | 10ms);
    loss-threshold number;
    port-status-tlv;
}
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name]
```

**Release Information**

Statement introduced in Junos OS Release 8.4.

**Description**

Specify continuity check protocol options.

**Options**

- `hold-interval minutes`—Specify the continuity check hold-interval, in minutes.
- `interface-status-tlv`—Enable interface-status-tlv transmission.
- `interval (10m | 10s | 1m | 1s | 100ms | 10ms)`—Specify the continuity check interval.
- `loss-threshold minutes`—Specify the loss-threshold, in minutes.
- `port-status-tlv`—Enable port-status-tlv transmission.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Continuity Check Protocol Parameters for Fault Detection
control-channel

Syntax
control-channel channel-name {
  vlan vlan-id;
  interface name interface-name
}

Hierarchy Level
[edit protocols protection-group ethernet-ring name (east-interface | west-interface)]

Release Information
Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description
Configure the Ethernet RPS control channel logical interface to carry the RAPS PDU. The related physical interface is the physical ring port.

Options
vlan vlan-id—If the control channel logical interface is a trunk port, then a dedicated vlan vlan-id defines the dedicated VLAN channel to carry the RAPS traffic. Only configure the vlan-id when the control channel logical interface is the trunk port.

interface name interface-name—Interface name of the control channel.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

**control-polarity**

**Syntax**

```
control-polarity (negative | positive);
```

**Hierarchy Level**

```
[edit interfaces interface-name serial-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For X.21 interfaces only, configure the control signal polarity.

**Options**

- `positive`—Positive signal polarity.
- `negative`—Negative signal polarity.

**Default**

`positive`

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring Serial Signal Polarities on page 327
**control-signal**

**Syntax**

control-signal (assert | de-assert | normal);

**Hierarchy Level**

[edit interfaces interface-name serial-options dce-options],
[edit interfaces interface-name serial-options dte-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For X.21 interfaces only, configure the to-DCE signal.

**Options**

*assert*—The to-DCE signal must be asserted.

*de-assert*—The to-DCE signal must be deasserted.

*normal*—Normal request-to-send (RTS) signal handling, as defined by ITU-T Recommendation X.21.

**Default:** normal

**Required Privilege**

**Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring the Serial Signal Handling on page 324
copy-tos-to-outer-ip-header

**Syntax**

```
copy-tos-to-outer-ip-header;
```

**Hierarchy Level**

```
[edit interfaces at fpc/pic/port unit logical-unit-number],
[edit logical-systems logical-system-name interfaces at fpc/pic/port unit logical-unit-number]
```

**Release Information**

Statement introduced in Junos OS Release 8.2.

**Description**

For GRE tunnel interfaces only, enable the inner IP header's TOS bits to be copied to the outer IP packet header.

**Default**

If you omit this statement, the TOS bits in the outer IP header are set to 0.

**Required Privilege**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

---

core-dump

**Syntax**

```
(core-dump | no-core-dump);
```

**Hierarchy Level**

```
[edit interfaces mo-fpc/pic/port multiservice-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For monitoring services interfaces only, a useful tool for isolating the cause of a problem. Core dumping is enabled by default. The directory `/var/tmp` contains core files. The Junos OS saves the current core file (0) and the four previous core files, which are numbered 1 through 4 (from newest to oldest):

- `core-dump`—Enable the core dumping operation.
- `no-core-dump`—Disable the core dumping operation.

**Required Privilege**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring Multiservice Physical Interface Properties on page 154
- *Junos OS Services Interfaces Library for Routing Devices*
**crc-major-alarm-threshold**

**Syntax**

crc-major-alarm-threshold (1e-3 | 5e-4 | 1e-4 | 5e-5 | 1e-5);

**Hierarchy Level**

[edit interfaces interface-name t1-options]

**Release Information**

Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

**Description**

Major alarm error thresholds for T1 CRC errors. When the threshold is exceeded for one second, a defect condition is declared. If the defect condition continues for the monitoring period, an alarm condition is declared.

**Default**

10-second monitoring period for all settings except 1e-5. The 1e-5 value uses a 50-second monitoring period.

**Options**

1e-3—Error rate expressed as the number of errors per number of bits. The value 1e-3 is one crc error in 10^3 bits.

1e-4—Error rate expressed as the number of errors per number of bits. The value 1e-4 is one crc error in 10^4 bits.

1e-5—Error rate expressed as the number of errors per number of bits. The value 1e-5 is one crc error in 10^5 bits.

5e-4—Error rate expressed as the number of errors per number of bits. The value 5e-4 is five crc errors in 10^4 bits.

5e-5—Error rate expressed as the number of errors per number of bits. The value 5e-5 is five crc errors in 10^5 bits.

**Required Privilege Level**

interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

**Related Documentation**

- Configuring T1 CRC Error Major Alarm Thresholds
crc-minor-alarm-threshold

Syntax:  
crc-minor-alarm-threshold (1e-3 | 5e-4 | 1e-4 | 5e-5 | 1e-5 | 5e-6 | 1e-6);

Hierarchy Level:  
[edit interfaces interface-name t1-options]

Release Information:  
Statement introduced in Junos OS Release 8.5.  
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

Description:  
Minor alarm error thresholds for T1 CRC errors. When the threshold is exceeded for one second, a defect condition is declared. If the defect condition continues for the monitoring period, an alarm condition is declared.

Default:  
10-second monitoring period for values 1e-3, 5e-4, 1e-4, and 5e-5. The 1e-5 value uses a 50-second monitoring period. The 5e-6 value uses a 100-second monitoring period. The 1e-6 value uses a 500-second monitoring period.

Options:  
1e-3—Error rate expressed as the number of errors per number of bits. The value 1e-3 is one crc error in 10^3 bits.

1e-4—Error rate expressed as the number of errors per number of bits. The value 1e-4 is one crc error in 10^4 bits.

1e-5—Error rate expressed as the number of errors per number of bits. The value 1e-5 is one crc error in 10^5 bits.

1e-6—Error rate expressed as the number of errors per number of bits. The value 1e-6 is one crc error in 10^6 bits.

5e-4—Error rate expressed as the number of errors per number of bits. The value 5e-4 is five crc errors in 10^4 bits.

5e-5—Error rate expressed as the number of errors per number of bits. The value 5e-5 is five crc errors in 10^5 bits.

5e-6—Error rate expressed as the number of errors per number of bits. The value 5e-6 is five crc errors in 10^6 bits.

Default: 5e-6

Required Privilege Level:  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation:

**cts**

**Syntax**

```plaintext
ccts (ignore | normal | require);
```

**Hierarchy Level**

```plaintext
[edit interfaces interface-name serial-options dce-options],
[edit interfaces interface-name serial-options dte-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For EIA-530 and V.35 interfaces only, configure the from-DCE signal, clear-to-send (CTS).

**Options**

- **ignore**—The from-DCE signal is ignored.
- **normal**—Normal CTS signal handling as defined by the TIA/EIA Standard 530.
- **require**—The from-DCE signal must be asserted.

**Default:** normal

**Required Privilege**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring the Serial Signal Handling on page 324
**cts-polarity**

**Syntax**  
cts-polarity (negative | positive);

**Hierarchy Level**  
[edit interfaces interface-name serial-options]

**Release Information**  
Statement introduced before Junos OS Release 7.4.

**Description**  
Configure CTS signal polarity.

**Options**  
positive—Positive signal polarity.

negative—Negative signal polarity.

Default: positive

**Required Privilege Level**  
interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**  
• Configuring Serial Signal Polarities on page 327
cycle-time

Syntax:  
```
cycle-time cycle-time-value;
```

Hierarchy Level:  
```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles profile-name]
```

Release Information:  
Statement introduced in Junos OS Release 11.1.  
Statement introduced in Junos OS Release 11.4 for EX Series switches.

Description:  
Configure the time (in milliseconds) taken between back-to-back transmissions of SLA frames for a single connection.

Options:  
cycle-time-value—Cycle time value in milliseconds.  
Range:  10 through 3,600,000  
Default:  1000

Required Privilege:  
Configure—To enter configuration mode.  
Control—To modify any configuration.

Related Documentation:  
- Configuring an Iterator Profile  
- Configuring an Iterator Profile on a Switch (CLI Procedure)
damping (Interfaces)

Syntax
damping {
    enable;
    half-life seconds;
    max-suppress seconds;
    reuse number;
    suppress number;
}

Hierarchy Level
[edit interfaces interface--name],
[edit interfaces interface--range]

Release Information
Statement introduced in Junos OS Release 14.1 for PTX Series Packet Transport Routers and T Series Core Routers.

Description
Limit the number of advertisements of the up and down transitions (flapping) on an interface. Each time a transition occurs, the interface state is changed, which generates an advertisement to the upper-level routing protocols. Damping helps reduce the number of these advertisements. Every time an interface goes down, a penalty is added to the interface penalty counter. Penalty added on every interface flap is 1000.

If at some point the accumulated penalty exceeds the suppress level max-suppress, the interface is placed in the suppress state, and further interface state up and down transitions are not reported to the upper-level protocols.

Options
enable—Enable damping on a per-interface basis. If damping is enabled on an interface, it is suppressed during interface flaps that match the configuration settings.

Default: Disabled

half-life seconds—Decay half-life. seconds is the interval after which the accumulated interface penalty counter is reduced by half if the interface remains stable.

Range: 1 through 30
Default: 5

max-suppress seconds—Maximum hold-down time. seconds is the maximum time that an interface can be suppressed no matter how unstable the interface has been.

NOTE: For the half-life, configure a value that is less than the max-suppress value. If you do not, the configuration is rejected.
NOTE: For max-suppress, configure a value that is greater than the half-life. If you do not, the configuration is rejected.

Range: 1 through 20,000
Default: 20

**reuse number**—Reuse threshold. When the accumulated interface penalty counter falls below *number*, the interface is no longer suppressed.

Range: 1 through 20,000
Default: 1000

**suppress number**—Cutoff (suppression) threshold. When the accumulated interface penalty counter exceeds *number*, the interface is suppressed.

Range: 1 through 20,000
Default: 2000

**Required Privilege Level**
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**data-channel**

**Syntax**
```
data-channel {
  vlan number;
}
```

**Hierarchy Level**
```
[edit protocols protection-group ethernet-ring ring-name]
```

**Release Information**
Statement introduced in Junos OS Release 10.2.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description**
For Ethernet ring protection, configure a data channel to define a set of VLAN IDs that belong to a ring instance.

VLANs specified in the data channel use the same topology used by the ERPS PDU in the control channel. Therefore, if a ring interface is blocked in the control channel, all traffic in the data channel is also blocked on that interface.

**Options**
- **vlan number**—Specify (by VLAN ID) one or more VLANs that belong to a ring instance.

**Required Privilege**
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**

# data-tlv-size

## Syntax

data-tlv-size size;

## Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name maintenance-association ma-name mep mep-id remote-mep remote-mep-id sla-iterator-profile profile-name]
```

## Release Information

Statement introduced in Junos OS Release 11.1.

## Description

Configure the size of the data TLV portion of the Y.1731 data frame.

## Options

- **size**—Size of the data TLV portion of the Y.1731 data frame.

**NOTE:** This option is applicable only for two-way delay measurement.

- **Range:** 1 through 1400 bytes
- **Default:** 1

## Required Privilege Level

- **Configure**—To enter configuration mode.
- **Control**—To modify any configuration.

dcd

Syntax  dcd (ignore | normal | require);

Hierarchy Level  [edit interfaces interface-name serial-options dce-options],
                 [edit interfaces interface-name serial-options dte-options]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  For EIA-530 and V.35 interfaces only, configure the from-DCE signal, data-carrier-detect (DCD).

Options  ignore—The from-DCE signal is ignored.
         normal—Normal DCD signal handling as defined by the TIA/EIA Standard 530.
         require—The from-DCE signal must be asserted.
         Default: normal

Required Privilege Level  interface—To view this statement in the configuration.
                          interface-control—To add this statement to the configuration.

Related Documentation  • Configuring the Serial Signal Handling on page 324
dc-d polarity

Syntax  dc-d polarity (negative | positive);

Hierarchy Level  [edit interfaces interface-name serial-options]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  Configure DCD signal polarity.

Options  positive—Positive signal polarity.

negative—Negative signal polarity.

Default: positive

Required Privilege  Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation

[edit protocols oam ethernet connectivity-fault-management action-profile profile-name]
```

**Release Information**

Statement introduced in Junos OS Release 8.4.

**Description**

Define the action to be taken when connectivity to the remote MEP is lost.

**Default**

If no action is configured, no action is taken.

**Options**

**interface-down**—When a remote MEP connectivity failure is detected, bring the interface down.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring a CFM Action Profile to Specify CFM Actions for CFM Events*
default-chap-secret

Syntax  
default-chap-secret name;

Hierarchy Level  
[edit interfaces interface-name ppp-options chap],
[edit interfaces interface-name unit logical-unit-number ppp-options chap],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options chap]

Release Information  
Statement introduced in Junos OS Release 8.0.

Description  
Define the default CHAP secret to be used when no matching CHAP access profile exists.

For ATM2 IQ interfaces only, you can configure a default CHAP secret on the logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

• atm-ppp-llc—PPP over AAL5 LLC encapsulation.
• atm-ppp-vc-mux—PPP over AAL5 multiplex encapsulation.

Default  
If you do not include the default-chap-secret statement in the configuration, and an interface receives a CHAP challenge or response from a peer that is not in the applied access profile, the link is immediately dropped.

Required Privilege Level  
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Related Documentation  
• Configuring a Default CHAP Secret
• access-profile on page 394
**default-pap-password**

**Syntax**
```
default-pap-password password;
```

**Hierarchy Level**
- [edit interfaces interface-name unit logical-unit-number ppp-options pap],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options pap]

**Release Information**
Statement introduced in Junos OS Release 8.3.

**Description**
For PAP authentication, the default PAP password.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring a Default PAP Password
- access-profile on page 394

**delimiter**

**Syntax**
```
delimiter delimiter-character;
```

**Hierarchy Level**
- [edit interfaces interface-name auto-configure vlan-ranges authentication username-include],
- [edit interfaces interface-name auto-configure stacked-vlan-ranges authentication username-include]

**Release Information**
Statement introduced in Junos OS Release 10.0.

**Description**
Specify the character used as the delimiter between the concatenated components of the username. You cannot use the semicolon (;) as a delimiter.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring VLAN Interface Username Information for AAA Authentication
demux-destination (Underlying Interface)

Syntax  
demux-destination family;

Hierarchy Level  
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name routing-instances routing-instance-name interfaces interface-name unit logical-unit-number]

Release Information  
Statement introduced in Junos OS Release 9.0.
Support for aggregated Ethernet added in Junos OS Release 9.4.

Description  
Configure the logical demultiplexing (demux) destination family type on the IP demux underlying interface.

NOTE: The IP demux interface feature currently supports only Fast Ethernet, Gigabit Ethernet, 10-Gigabit Ethernet, or aggregated Ethernet underlying interfaces.

Required Privilege  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

# demux-destination (Demux Interface)

**Syntax**
```
demux-destination {
  destination-prefix;
}
```

**Hierarchy Level**
- [edit interfaces interface-name unit logical-unit-number family family],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family],
- [edit logical-systems logical-system-name routing-instances routing-instance-name interfaces interface-name unit logical-unit-number family family]

**Release Information**
Statement introduced in Junos OS Release 9.0.
Support for aggregated Ethernet added in Junos OS Release 9.4.

**Description**
Configure one or more logical demultiplexing (demux) destination prefixes. The prefixes are matched against the destination address of packets that the underlying interface receives. When a match occurs, the packet is processed as if it was received on the demux interface.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring an IP Demultiplexing Interface on page 296

description (Interfaces)

Syntax

```
description text;
```

Hierarchy Level

```
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Provide a textual description of the interface or the logical unit. Any descriptive text you include is displayed in the output of the `show interfaces` commands, and is also exposed in the `ifAlias` Management Information Base (MIB) object. It has no effect on the operation of the interface on the router or switch.

The textual description can also be included in the extended DHCP relay option 82 Agent Circuit ID suboption.

Options

```
text—Text to describe the interface. If the text includes spaces, enclose the entire text in quotation marks.
```

Required Privilege

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

destination-class-usage

Syntax  destination-class-usage;

Hierarchy Level  [edit interfaces interface-name unit logical-unit-number family inet accounting], [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet accounting]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  Enable packet counters on an interface that count packets that arrive from specific customers and are destined for specific prefixes on the provider core router.

Required Privilege  Interface—To view this statement in the configuration. Interface-control—To add this statement to the configuration.

Related Documentation  •  Enabling Source Class and Destination Class Usage on page 241
  •  accounting on page 395
  •  source-class-usage on page 1006
destination-profile

Syntax  
destination-profile name;

Hierarchy Level  
[edit interfaces interface-name unit logical-unit-number family inet address address],
[edit interfaces interface-name unit logical-unit-number family inet unnumbered-address interface-name destination address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet unnumbered-address interface-name destination address]

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  
For interfaces with PPP encapsulation, assign PPP properties to the remote destination end. You define the profile at the [edit access group-profile name ppp] hierarchy level.

Options  
name—Profile name defined at the [edit access group-profile name ppp] hierarchy level.

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

dial-options

Syntax
dial-options {
  ipsec-interface-id name;
  l2tp-interface-id name;
  (shared | dedicated);
}

Hierarchy Level
[edit interfaces sp-fpc/pic/port unit logical-unit-number],
[edit interfaces si-fpc/pic/port unit logical-unit-number],
[edit logical-systems logical-system-name interfaces sp-fpc/pic/port unit logical-unit-number],
[edit logical-systems logical-system-name interfaces si-fpc/pic/port unit logical-unit-number]

Release Information
Statement introduced before Junos OS Release 7.4.
The [edit ...si-...] hierarchy levels introduced in Junos OS Release 11.4.

Description
Specify the options for configuring logical interfaces for group and user sessions in L2TP or IPsec dynamic endpoint tunneling.

Options
dedicated—(LNS on M Series routers and MX Series routers only) Specify that a logical interface can host only one session at a time.

ipsec-interface-id name—(M Series routers only) Interface identifier for group of dynamic peers. This identifier must be replicated at the [edit access profile name client * ike] hierarchy level.

l2tp-interface-id name—Interface identifier that must be replicated at the [edit access profile name] hierarchy level.

shared—(LNS on M Series routers only) Specify that a logical interface can host multiple (shared) sessions at a time.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

**dial-string**

**Syntax**

dial-string [ dial-string-numbers ];

**Hierarchy Level**

[edit interfaces br-pim/0/port unit logical-unit-number dialer-options],
[edit logical-systems logical-system-name interfaces br-pim/0/port unit logical-unit-number dialer-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

On J Series Services Routers with ISDN interfaces, specify one or more ISDN dial strings used to reach a destination subnetwork.

**Options**

*dial-string-numbers*—One or more strings of numbers to call.

**Required Privilege**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

None

---

**dialer**

**Syntax**

dialer filter-name;

**Hierarchy Level**

[edit interfaces interface-name unit logical-unit-number family family],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Apply a dialer filter to an interface. To create the dialer filter, include the *dialer-filter* statement at the [edit firewall filter family family] hierarchy level.

**Options**

*filter-name*—Dialer filter name.

**Required Privilege**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

direction

Syntax  
direction (up | down);

Hierarchy Level  
[edit protocols oam ethernet connectivity-fault-management maintenance-domain  
domain-name maintenance-association ma-name mep mep-id]

Release Information  
Statement introduced in Junos OS Release 8.4.

Description  
Configure the direction of the MEP.

Options  
up—An UP MEP CCM is transmitted out of every logical interface which is part of the  
same bridging or vpls instance except for the interface configured on this MEP.

NOTE:  The up direction for MEP is not supported on T Series routers.

down—Down MEP CCMs are transmitted only out the interface configured on this MEP.

Required Privilege Level  
interface—to view this statement in the configuration.  
interface-control—to add this statement to the configuration.

disable (Interface)

Syntax

disable;

Hierarchy Level

[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description

Disable a physical or a logical interface, effectively unconfiguring it.

CAUTION:

- Dynamic subscribers and logical interfaces use physical interfaces for connection to the network. The Junos OS allows you to set the interface to disable and commit the change while dynamic subscribers and logical interfaces are still active. This action results in the loss of all subscriber connections on the interface. Use care when disabling interfaces.

- If aggregated SONET links are configured between a T1600 router and a T4000 router, interface traffic is disrupted when you disable the physical interface configured on the T1600 router. If you want to remove the interface, we recommend that you deactivate the interface instead of disabling it.

NOTE:

- When you use the disable statement at the [edit interfaces] hierarchy level, depending on the PIC type, the interface might or might not turn off the laser. Older PIC transceivers do not support turning off the laser, but newer Gigabit Ethernet (GE) PICs with SFP and XFP transceivers and ATM MIC with SFP do support it and the laser will be turned off when the interface is disabled. If the ATM MIC with SFP is part of an APS group, then the laser will not be turned off when you use the disable statement at the [edit interfaces] hierarchy level.

- When you disable or deactivate an interface, then all the references made to the deactivated interface must be removed from the routing instance.

- For abstracted fabric interfaces, the disable command disables AF interface on the local GNF only.
**WARNING:** Do not stare into the laser beam or view it directly with optical instruments even if the interface has been disabled.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Disabling a Physical Interface on page 158
- Disabling a Logical Interface on page 185

### disable (Link Protection)

**Syntax**
disable;

**Hierarchy Level**
[edit interfaces aeX aggregated-ether-options lACP link-protection]

**Release Information**
Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 11.4 for EX Series switches.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

**Description**
Disable LACP link protection on the interface.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring LACP for Aggregated Ethernet Interfaces

### disable-mlppp-inner-ppp-pfc

**Syntax**
```
disable-mlppp-inner-ppp-pfc;
```

**Hierarchy Level**
```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

**Release Information**
Statement introduced in Junos OS Release 8.2.

**Description**
For MLPPP interfaces only, disable compression of the inner PPP header in the MLPPP payload. By default, compression is enabled.

**Required Privilege Level**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**
- *Junos OS Services Interfaces Library for Routing Devices*
dlci

Syntax  
\`dlci dlci-identifier;\`

Hierarchy Level  
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information  
Statement introduced before Junos OS Release 7.4.
Starting with Junos OS Release 18.2R1, the SRX Series devices support frame-relay encapsulation and adds DLCI information to the given frame.

Description  
For Frame Relay and Multilink Frame Relay (MLFR) user-to-network interface (UNI) network-to-network interface (NNI) encapsulation only, and for link services, voice services and point-to-point interfaces only, configure the data-link connection identifier (DLCI) for a permanent virtual circuit (PVC) or an switched virtual circuit (SVC). The DLCI setups a frame-relay PVC to form a L2 point-to-point connection. This is used for peering different LT IFL pairs.

To configure a DLCI for a point-to-multipoint interface, use the `multipoint-destination` statement to specify the DLCI.

Options  
`dlci-identifier`—Data-link connection identifier.
  
Range: 16 through 1022.

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

do-not-fragment

Syntax  do-not-fragment;

Hierarchy Level  [edit interfaces gr-fpc/pic/port unit logical-unit-number tunnel],
                 [edit logical-systems logical-system-name interfaces gr-fpc/pic/port unit logical-unit-number tunnel]

                      Statement introduced in Junos OS Release 15.1X53-D10 for QFX10000 switches.
                      Statement introduced in Junos OS Release 19.3 for MPC10E line card.

Description  For a generic routing encapsulation (GRE) tunnel, disable fragmentation of GRE-encapsulated packets. This sets the do-not-fragment (DF) bit in the outer IP header of the GRE-encapsulated packets so that they do not get fragmented anywhere in the path. When the size of a GRE-encapsulated packet is greater than the MTU of a link that the packet passes through, the GRE-encapsulated packet is dropped.

Default  By default, fragmentation of GRE-encapsulated packets is disabled.

Required Privilege Level  interface—To view this statement in the configuration.
                           interface-control—To add this statement to the configuration.

**domain-name**

**Syntax**

```
domain-name domain-name-string;
```

**Hierarchy Level**

```
[edit interfaces interface-name auto-configure vlan-ranges authentication username-include],
[edit interfaces interface-name auto-configure stacked-vlan-ranges authentication username-include]
```

**Release Information**

Statement introduced in Junos OS Release 10.0.

**Description**

Specify the domain name that is concatenated with the username during the subscriber authentication process.

**Options**

`domain-name-string`—The domain name formatted string.

**Required Privilege Level**

`interface`—To view this statement in the configuration.
`interface-control`—To add this statement to the configuration.

**Related Documentation**

down-count

**Syntax**
```
down-count cells;
```

**Hierarchy Level**
- `[edit interfaces interface-name atm-options vpi vpi-identifier oam-liveness]`
- `[edit interfaces interface-name unit logical-unit-number oam-liveness]`
- `[edit interfaces interface-name unit logical-unit-number family family address address multipoint-destination address oam-liveness]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number oam-liveness]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address multipoint-destination address oam-liveness]`

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
For ATM encapsulation only, configure Operation, Administration, and Maintenance (OAM) F5 loopback cell count thresholds. This feature is not supported on ATM-over-SHDSL interfaces.

For ATM2 IQ PICs only, configure OAM F4 loopback cell count thresholds at the `[edit interfaces interface-name atm-options vpi vpi-identifier]` hierarchy level.

**Options**
- `cells`—Minimum number of consecutive OAM F4 or F5 loopback cells lost before a VC is declared down.
  - **Range:** 1 through 255
  - **Default:** 5 cells

**Required Privilege Level**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

drop (PPPoE Service Name Tables)

Syntax

drop;

Hierarchy Level

[edit protocols pppoe service-name-tables <table-name> service <service-name>],
[edit protocols pppoe service-name-tables <table-name> service <service-name> agent-specifier
aci <circuit-id-string> ari <remote-id-string>]

Release Information

Statement introduced in Junos OS Release 10.0.
Support at [edit protocols pppoe service-name-tables <table-name> service <service-name>
agent-specifier aci <circuit-id-string> ari <remote-id-string>] hierarchy level introduced in Junos
OS Release 10.2.

Description

Direct the router to drop (ignore) a PPPoE Active Discovery Initiation (PADI) control
packet received from a PPPoE client that contains the specified service name tag or
agent circuit identifier/agent remote identifier (ACI/ARI) information. This action
effectively denies the client's request to provide the specified service, or to accept requests
from the subscriber or subscribers represented by the ACI/ARI information.

Required Privilege

Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

**drop-timeout**

**Syntax**

drop-timeout milliseconds;

**Hierarchy Level**

[edit interfaces interface-name mlfr-uni-nni-bundle-options],
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For link services, multilink, and voice services interfaces only, configure the drop timeout period, in milliseconds.

**Options**

milliseconds—Drop timeout period.

- **Range:** 0 through 2000 milliseconds
- **Default:** 0 ms (disabled)

**Required Privilege**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

**dsr**

**Syntax**

```
 dsr (ignore | normal | require);
```

**Hierarchy Level**

```
 [edit interfaces interface-name serial-options dce-options],
 [edit interfaces interface-name serial-options dte-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For EIA-530 and V.35 interfaces only, configure the from-DCE signal, data-set-ready (DSR).

**Options**

- **ignore**—The from-DCE signal is ignored.
- **normal**—Normal DSR signal handling as defined by the TIA/EIA Standard 530.
- **require**—The from-DCE signal must be asserted.

Default: normal

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring the Serial Signal Handling on page 324
**dsr-polarity**

Syntax  
dsr-polarity (negative | positive);

Hierarchy Level  
[edit interfaces interface-name serial-options]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
Configure DSR signal polarity.

Options  
**positive**—Positive signal polarity.

**negative**—Negative signal polarity.

Default: positive

Required Privilege Level  
interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation

dte-options

Syntax

dte-options {
  control-signal (assert | de-assert | normal);
  cts (ignore | normal | require);
  dcd (ignore | normal | require);
  dsr (ignore | normal | require);
  dtr signal-handling-option;
  ignore-all;
  indication (ignore | normal | require);
  rts (assert | de-assert | normal);
  tm (ignore | normal | require);
}

Hierarchy Level  [edit interfaces interface-name serial-options]

Release Information  Statement introduced in Junos OS Release 8.3.
Statement previously known as control-leads.

Description  For M Series and T Series routers, configure the serial interface signal characteristics.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege  Level

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  • Configuring the Serial Signal Handling on page 324
**dtr**

**Syntax**

```
dtr signal-handling-option;
```

**Hierarchy Level**

```
[edit interfaces interface-name serial-options dce-options],
[edit interfaces interface-name serial-options dte-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For EIA-530 and V.35 interfaces only, configure the to-DCE signal, data-transmit-ready (DTR).

**Options**

- `signal-handling-option`—Signal handling for the DTR signal. The signal handling can be one of the following:
  - `assert`—The to-DCE signal must be asserted.
  - `auto-synchronize`—Normal DTR signal with automatic synchronization. This statement has two substatements:
    - `duration milliseconds`—Pulse duration of resynchronization.
      - **Range:** 1 through 1000 milliseconds
      - **Default:** 1000 milliseconds
    - `interval seconds`—Offset interval for resynchronization.
      - **Range:** 1 through 31 seconds
      - **Default:** 15 seconds
  - `de-assert`—The to-DCE signal must be deasserted.
  - `normal`—Normal DTR signal handling as defined by the TIA/EIA Standard 530.
    - **Default:** normal

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring the Serial Signal Handling on page 324
**dtr-circuit**

**Syntax**

dtr-circuit (balanced | unbalanced);

**Hierarchy Level**

[edit interfaces interface-name serial-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For EIA-530 and V.35 interfaces only, configure a DTR circuit.

**Options**

balanced—Balanced DTR signal.

unbalanced—Unbalanced DTR signal.

Default: balanced

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

• Configuring the Serial DTR Circuit on page 327

**dtr-polarity**

**Syntax**

dtr-polarity (negative | positive);

**Hierarchy Level**

[edit interfaces interface-name serial-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Configure DTR signal polarity.

**Options**

positive—Positive signal polarity.

negative—Negative signal polarity.

Default: positive

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

## dynamic-call-admission-control

### Syntax

```text
dynamic-call-admission-control {
  activation-priority priority;
  bearer-bandwidth-limit kilobits-per-second;
}
```

### Hierarchy Level

- `edit interfaces interface-name unit logical-unit-number`
- `edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number`

### Release Information

Statement introduced in Junos OS Release 8.2.

### Description

(J4350 and J6350 Services Routers supporting voice over IP with the TGM550 media gateway module) For Fast Ethernet and Gigabit Ethernet interfaces, ISDN BRI interfaces, and serial interfaces with PPP or Frame Relay encapsulation, configure dynamic call admission control (CAC). Dynamic CAC provides enhanced control over WAN bandwidth. When dynamic CAC is configured on an interface responsible for providing call bandwidth, the TGM550 informs the Media Gateway Controller (MGC) of the bandwidth limit available for voice packets on the interface and requests the MGC to block new calls when the bandwidth is exhausted.

Dynamic CAC must be configured on each Services Router interface responsible for providing call bandwidth.

The remaining statements are explained separately. See CLI Explorer.

### Required Privilege Level

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

### Related Documentation

**dynamic-profile (PPP)**

**Syntax**

dynamic-profile profile-name;

**Hierarchy Level**

[edit interfaces interface-name unit logical-unit-number ppp-options]

**Release Information**

Statement introduced in Junos OS Release 9.5. Support for MLPPP on LSQ interfaces introduced in Junos OS Release 10.2.

**Description**

Specify the dynamic profile that is attached to the interface. On the MX Series routers, this statement is supported on PPPoE interfaces only.

**Required Privilege Level**

interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

**Related Documentation**

- Dynamic Profiles Overview
- Configuring a Basic Dynamic Profile
- Attaching Dynamic Profiles to Static PPP Subscriber Interfaces
- Attaching Dynamic Profiles to MLPPP Bundles
- For hardware requirements, see Hardware Requirements for PPP Subscriber Services on Non-Ethernet Interfaces
**dynamic-profile (PPPoE Service Name Tables)**

**Syntax**

```
dynamic-profile profile-name;
```

**Hierarchy Level**

```
[edit protocols pppoe service-name-tables table-name service service-name],
[edit protocols pppoe service-name-tables table-name service-name service-name agent-specifier aci circuit-id-string ari remote-id-string]
```

**Release Information**

Statement introduced in Junos OS Release 10.2.

**Description**

Specify a dynamic profile to instantiate a dynamic PPPoE interface. You can associate a dynamic profile with a named service entry, empty service entry, or any service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.

The dynamic profile associated with a service entry in a PPPoE service name table overrides the dynamic profile associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.

If you include the `dynamic-profile` statement at the `[edit protocols pppoe service-name-tables table-name service service-name service-name agent-specifier aci circuit-id-string ari remote-id-string]` hierarchy level, you cannot also include the `static-interface` statement at this level. The `dynamic-profile` and `static-interface` statements are mutually exclusive for ACI/ARI pair configurations.

**Options**

- `profile-name`—Name of the dynamic profile that the router uses to instantiate a dynamic PPPoE interface.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring PPPoE Service Name Tables
- Assigning a Dynamic Profile and Routing Instance to a Service Name or ACI/ARI Pair for Dynamic PPPoE Interface Creation
**dynamic-profile (Stacked VLAN)**

**Syntax**

```plaintext
dynamic-profile profile-name {
    accept (any | dhcp-v4 | dhcp-v6 | inet | inet6 | pppoe);
    access-profile vlan-dynamic-profile-name;
    ranges (any | low-tag–high-tag), (any | low-tag–high-tag);
}
```

**Hierarchy Level**

```
[edit interfaces interface-name auto-configure stacked-vlan-ranges]
```

**Release Information**

Statement introduced in Junos OS Release 9.5.

**Description**

Configure a dynamic profile for use when configuring dynamic stacked VLANs.

**Options**

`profile-name`—Name of the dynamic profile that you want to use when configuring dynamic stacked VLANs.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Dynamic Profiles Overview
- Configuring a Basic Dynamic Profile
- Configuring an Interface to Use the Dynamic Profile Configured to Create Stacked VLANs
**dynamic-profile (VLAN)**

**Syntax**

```bash
dynamic-profile profile-name {
    accept (any | dhcp-v4 | dhcp-v6 | inet | inet6 | pppoe);
    accept-out-of-band protocol;
    access-profile vlan-dynamic-profile-name;
    ranges (any | low-tag)–(any | high-tag);
}
```

**Hierarchy Level**

```
[edit interfaces interface-name auto-configure vlan-ranges]
```

**Release Information**

Statement introduced in Junos OS Release 9.5.

**Description**

Configure a dynamic profile for use when configuring dynamic VLANs.

**Options**

- `profile-name`—Name of the dynamic profile that you want to use when configuring dynamic VLANs.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Hierarchy Level   [edit]
Support at the filter, policer, hierarchical-policer, three-color-policer, and policy options hierarchy levels introduced in Junos OS Release 11.4.

Description  Create dynamic profiles for use with DHCP or PPP client access.

Options  profile-name—Name of the dynamic profile; string of up to 80 alphanumeric characters.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege  Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

east-interface

Syntax

east-interface [ 
node-id mac-address; 
control-channel channel-name { 
  vlan number; 
  interface name interface-name 
} 
interface-none 
  ring-protection-link-end; 
]

Hierarchy Level

[edit protocols protection-group ethernet-ring ring-name]

Release Information

Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description

Define one of the two interface ports for Ethernet ring protection, the other being defined by the west-interface statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

EX Series switches do not use the node-id statement—the node ID is automatically configured on the switches using the MAC address.

NOTE: Always configure this port first, before configuring the west-interface statement.

NOTE: The Node ID is not configurable on EX Series switches. The node ID is automatically configured using the MAC address.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

 epsis-policer-overhead

Syntax  

egress-policer-overhead bytes;

Hierarchy Level  

[edit chassis fpc slot-number pic pic-number]

Release Information  

Statement introduced before Junos OS Release 11.1.

Description  

Add the specified number of bytes to the actual length of an Ethernet frame when determining the actions of Layer 2 policers, MAC policers, or queue rate limits applied to output traffic on the line card. You can configure egress policer overhead to account for egress shaping overhead bytes added to output traffic on the line card.

On M Series and T Series routers, this statement is supported on Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs and Enhanced IQ2 (IQ2E) PICs. On MX Series routers, this statement is supported for interfaces configured on Dense Port Concentrators (DPCs).

NOTE: This statement is not supported on Modular Interface Cards (MICs) or Modular Port Concentrators (MPCs) in MX Series routers.

Options  

bytes—Number of bytes added to a packet exiting an interface.  
Range: 0–255 bytes  
Default: 0

Required Privilege Level  

interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers (ether-net, vlan-ccc, and vlan-tcc options only).
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers. Only the `atm-ccc-cell-relay` and `atm-ccc-vc-mux` options are supported on ACX Series routers.
Statement introduced in Junos OS Release 17.3R1 for QFX10000 Series switches (ether-net-ccc and vlan-ccc options only).

Description

Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.

Options

- **atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.
  - **atm-ccc-vc-mux**—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.
  - **atm-cisco-nlpid**—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the `inet` family only.
  - **atm-mlppp-llc**—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.
  - **atm-nlpid**—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the `inet` family only.
  - **atm-ppp-llc**—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.
atm-ppp-vc-mux—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.

atm-snap—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

atm-tcc-snap—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

atm-tcc-vc-mux—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the tcc family only.

atm-vc-mux—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the inet family only.

ether-over-atm-llc—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

ether-vpls-over-atm-llc—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, Multiprotocol Encapsulation over ATM Adaptation Layer 5). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

ether-vpls-over-fr—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, Multiprotocol Interconnect over Frame Relay.

NOTE: The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

ether-vpls-over-ppp—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

ethernet—Use Ethernet II encapsulation (as described in RFC 894, A Standard for the Transmission of IP Datagrams over Ethernet Networks).

ethernet-ccc—Use Ethernet CCC encapsulation on Ethernet interfaces.
ethernet-vpls—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

NOTE: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

ethernet-vpls-fr—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

frame-relay-ccc—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.

frame-relay-ether-type—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

frame-relay-ether-type-tcc—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

frame-relay-ppp—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the ppp family only.

frame-relay-tcc—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the tcc family only.

gre-fragmentation—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet’s size exceeds the tunnel’s maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

multilink-frame-relay-end-to-end—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

multilink-ppp—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

ppp-over-ether—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.
**ppp-over-ether-over-atm-llc**—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

**vlan-bridge**—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0xb100 or a user-defined TPID.

**vlan-ccc**—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-tcc**—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-vpls**—Use Ethernet VLAN encapsulation on VPLS circuits.

**vxlan**—Use VXLAN data plane encapsulation for EVPN.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 11.1 for EX Series switches.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers (flexible-ethernet-services, ethernet-ccc, and ethernet-tcc options only).

Description

For M Series, MX Series, QFX Series, T Series, PTX Series, specify the physical link-layer encapsulation type.

For SRX Series, specify logical link layer encapsulation.

NOTE: Not all encapsulation types are supported on the switches. See the switch CLI.
Default   **ppp**—Use serial PPP encapsulation.
Physical Interface Options and Logical Interface Options

For physical interfaces:

NOTE: Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on EX Series switches.

- **atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.

- **atm-pvc**—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).

- **cisco-hdlc**—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:
  - CCC version (**cisco-hdlc-ccc**)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the **ccc** family only.
  - TCC version (**cisco-hdlc-tcc**)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

- **cisco-hdlc-ccc**—Use Cisco-compatible HDLC framing on CCC circuits.

- **cisco-hdlc-tcc**—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.

- **ethernet-bridge**—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.

- **ethernet-over-atm**—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPU packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.

- **ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.
- **ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

- **ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

- **ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

- **ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

- **extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the ccc family only.

- **extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.

- **extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.

- **extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

- **extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the ccc family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.

- **extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.
• **extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

```
NOTE: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.
```

• **flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet interfaces, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encryption type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

• **flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

• **frame-relay**—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.

• **frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have **frame-relay-ccc** encapsulation. When you use this encapsulation type, you can configure the **ccc** family only.

• **frame-relay-ether-type**—Use Frame Relay ethernet type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

```
NOTE: When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.
```

• **frame-relay-ether-type-tcc**—Use Frame Relay ethernet type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.
• **frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the ccc family only.

• **frame-relay-tcc**—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

• **generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.

• **multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

• **ppp**—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.

• **ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.

• **ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the tcc family only.

• **vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the ccc family only.
• **vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to vlan-vci-ccc.

• **vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:**
- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
- Starting with Junos OS release 13.3, a commit error occurs when you configure vlan-vpls encapsulation on a physical interface and configure family inet on one of the logical units. Previously, it was possible to commit this invalid configuration.

For logical interfaces:

• **frame-relay**—Configure a Frame Relay encapsulation when the physical interface has multiple logical units, and the units are either point to point or multipoint.

• **multilink-frame-relay-uni-nni**—Link services interfaces functioning as FRF.16 bundles can use Multilink Frame Relay UNI NNI encapsulation.

• **ppp**—For normal mode (when the device is using only one ISDN B-channel per call). Point-to-Point Protocol is for communication between two computers using a serial interface.

• **ppp-over-ether**—This encapsulation is used for underlying interfaces of pp0 interfaces.

encoding

Syntax  encoding (nrz | nrzi);

Hierarchy Level  [edit interfaces interface-name serial-options]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  For serial interfaces, set the line encoding format.

Default  The default line encoding is non-return to zero (NRZ).

Options  nrz—Use NRZ line encoding.

nrzi—Use non-return to zero inverted (NRZI) line encoding.

Required Privilege Level  interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation  • Configuring Serial Line Encoding on page 330
**epd-threshold (Logical Interface)**

**Syntax**

```
epd-threshold cells plp1 cells;
```

**Hierarchy Level**

```
[edit interfaces interface-name unit logical-unit-number],
[edit interfaces interface-name unit logical-unit-number address address family family multipoint-destination address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number address address family family multipoint-destination address]
```

**Release Information**

Statement introduced before Junos OS Release 7.4. 
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

For ATM2 IQ interfaces only, define the early packet discard (EPD) threshold on a VC. The EPD threshold is a limit on the number of transmit packets that can be queued. Packets that exceed the limit are discarded. For interfaces configured in trunk mode, you can also configure dual EPD thresholds depending on the packet loss priorities (PLPs).

**Default**

Approximately 1 percent of the available cell buffers. If shaping is enabled, the default EPD threshold is proportional to the shaping rate according to the following formula:

```
default epd-threshold = number of buffers * shaping rate / line rate
```

The minimum EPD threshold value is 48 cells. If the default EPD threshold formula results in an EPD threshold of less than 48 cells, the result will be ignored, and the minimum value of 48 cells will be used.

**Options**

- **cells**—Maximum number of cells.
  
  **Range:** For 1-port and 2-port OC12 interfaces, 48 through 425,984 cells

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

epd-threshold (Physical Interface)

**Syntax**

```
epd-threshold cells plp1 cells;
```

**Hierarchy Level**

```
[edit interfaces at-fpc/pic/port atm-options scheduler-maps map-name forwarding-class class-name]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For ATM2 IQ interfaces only, define the EPD threshold on a VC. The EPD threshold is a limit on the number of transmit packets that can be queued. Packets that exceed the limit are discarded.

**Default**

If you do not include either the `epd-threshold` or the `linear-red-profile` statement in the forwarding class configuration, the Junos OS uses an EPD threshold based on the available bandwidth and other parameters.

**Options**

- **cells**—Maximum number of cells.
  - **Range:** For 1-port and 2-port OC12 interfaces, 48 through 425,984 cells. For 1-port OC48 interfaces, 48 through 425,984 cells. For 2-port OC3, DS3, and E3 interfaces, 48 through 212,992 cells. For 4-port DS3 and E3 interfaces, 48 through 106,496 cells.

  The `plp1` statement is explained separately.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring an ATM Scheduler Map
- `linear-red-profile` on page 733
es-options

**Syntax**

```
es-options {
  backup-interface interface-name;
}
```

**Hierarchy Level**

[edit interfaces es-fpc/pic/port]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

On ES interfaces, configure ES interface-specific interface properties.

The `backup-interface` statement is explained separately.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Description

NOTE: On QFX Series standalone switches, this statement hierarchy is only supported on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet, Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, configure a class of service (CoS)-based policer. Policing applies to the inner VLAN identifiers, not to the outer tag. For Gigabit Ethernet interfaces with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), the premium policer is not supported.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

    mac-learn-enable;
}
```

**Hierarchy Level**
- [edit interfaces interface-name gigether-options],
- [edit interfaces interface-name aggregated-ether-options],
- [edit interfaces interface-name aggregated-ether-options],
- [edit interfaces interface-name ether-options]

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
- Statement introduced in Junos OS Release 13.2 for the QFX Series.
- Statement introduced in Junos OS Release 13.2X50-D15 for the EX Series switches.

**Description**

**NOTE:** On QFX Series standalone switches, the ethernet-policer-profile CLI hierarchy and the mac-learn-enable statement are supported only on the Enhanced Layer 2 Switching CLI.
For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, aggregated Ethernet with Gigabit Ethernet IQ interfaces, the built-in Gigabit Ethernet port on the M7i router); 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, configure VLAN tag and MAC address accounting and filtering properties.

The remaining statements are explained separately. See CLI Explorer.

NOTE: When you gather interfaces into a bridge domain, the no-mac-learn-enable statement at the [edit interfaces interface-name gigether-options ethernet-switch-profile] hierarchy level is not supported. You must use the no-mac-learning statement at the [edit bridge-domains bridge-domain-name bridge-options interface interface-name] hierarchy level to disable MAC learning on an interface in a bridge domain. For information on disabling MAC learning for a bridge domain, see the MX Series Layer 2 Configuration Guide.

Default

If the ethernet-switch-profile statement is not configured, Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router) behave like Gigabit Ethernet interfaces.

Required Privilege Level

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

fast-aps-switch

Syntax

```plaintext
fast-aps-switch;
```

Hierarchy Level

```plaintext
[edit interfaces interface-name sonet-options aps]
```

Release Information

Statement introduced in Junos OS Release 12.1.

Description

(M320 routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only, EX Series switches, and MX series routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only using container interfaces) Reduce the Automatic Protection Switching (APS) switchover time in Layer 2 circuits.

NOTE:

- The fast APS switching feature is supported only within a single chassis on a MX series router using a container interface.
- Configuring this statement reduces the APS switchover time only when the Layer 2 circuit encapsulation type for the interface receiving traffic from a Layer 2 circuit neighbor is SAToP.
- When the `fast-aps-switch` statement is configured in revertive APS mode, you must configure an appropriate value for revert time to achieve reduction in APS switchover time.
- To prevent the logical interfaces in the data path from being shut down, configure appropriate hold-time values on all the interfaces in the data path that support TDM.
- The `fast-aps-switch` statement cannot be configured when the APS annex-b option is configured.
- The interfaces that have the `fast-aps-switch` statement configured cannot be used in virtual private LAN service (VPLS) environments.

Required Privilege Level

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Configure protocol family information for the logical interface.</td>
</tr>
</tbody>
</table>

**NOTE:** Not all subordinate statements are available to every protocol family.
Options  

family—Protocol family:

- any—Protocol-independent family used for Layer 2 packet filtering

NOTE: This option is not supported on T4000 Type 5 FPCs.

- bridge—(M Series and T Series routers only) Configure only when the physical interface is configured with ethernet-bridge type encapsulation or when the logical interface is configured with vlan-bridge type encapsulation. You can optionally configure this protocol family for the logical interface on which you configure VPLS.

- ethernet-switching—(M Series and T Series routers only) Configure only when the physical interface is configured with ethernet-bridge type encapsulation or when the logical interface is configured with vlan-bridge type encapsulation

- ccc—Circuit cross-connect protocol suite. You can configure this protocol family for the logical interface of CCC physical interfaces. When you use this encapsulation type, you can configure the ccc family only.

- inet—Internet Protocol version 4 suite. You must configure this protocol family for the logical interface to support IP protocol traffic, including Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), Internet Control Message Protocol (ICMP), and Internet Protocol Control Protocol (IPCP).

- iso—International Organization for Standardization Open Systems Interconnection (ISO OSI) protocol suite. You must configure this protocol family for the logical interface to support ISO-IS traffic.

- mlfr-end-to-end—Multilink Frame Relay FRF.15. You must configure this protocol or multilink Point-to-Point Protocol (MLPPP) for the logical interface to support multilink bundling.

- mlfr-uni-nni—Multilink Frame Relay FRF.16. You must configure this protocol or mlfr-end-to-end for the logical interface to support link services and voice services bundling.

- multilink-ppp—Multilink Point-to-Point Protocol. You must configure this protocol (or mlfr-end-to-end) for the logical interface to support multilink bundling.

- mpls—Multiprotocol Label Switching (MPLS). You must configure this protocol family for the logical interface to participate in an MPLS path.

- pppoe—Point-to-Point Protocol over Ethernet

- tcc—Translational cross-connect protocol suite. You can configure this protocol family for the logical interface of TCC physical interfaces.
• **tnp**—Trivial Network Protocol. This protocol is used to communicate between the Routing Engine and the router’s packet forwarding components. The Junos OS automatically configures this protocol family on the router’s internal interfaces only, as discussed in “Understanding Internal Ethernet Interfaces” on page 14.

• **vpls**—(M Series and T Series routers only) Virtual private LAN service. You can optionally configure this protocol family for the logical interface on which you configure VPLS. VPLS provides an Ethernet-based point-to-multipoint Layer 2 VPN to connect customer edge (CE) routers across an MPLS backbone. When you configure a VPLS encapsulation type, the family vpls statement is assumed by default.

MX Series routers support dynamic profiles for VPLS pseudowires, VLAN identifier translation, and automatic bridge domain configuration.

For more information about VPLS, see the *Junos OS VPNs Library for Routing Devices*.

The remaining statements are explained separately. See CLI Explorer.

[edit interfaces interface-name sonet-options],
[edit interfaces interface-name t1-options],
[edit interfaces interface-name t3-options]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

**Description**
For E1/E3, SONET/SDH, and T1/T3 interfaces, configure the frame checksum (FCS) on the interface. The checksum must be the same on both ends of the interface.

On a channelized OC12 interface, the SONET/SDH fcs statement is not supported. To configure FCS on each DS3 channel, you must include the t3-options fcs statement in the configuration for each channel. For SONET/SDH, the channelized OC12 interface supports DS3 to STS-1 to OC12. For SDH, the channelized OC12 interface supports NxDS3 to NxVC3 to AU3 to STM.

**NOTE:** When configuring E1 or T1 interfaces on 10-port Channelized E1/T1 I奎 PICs, the fcs statement must be included at the [edit interfaces e1-fpc/pic/port] or [edit interfaces t1-fpc/pic/port] hierarchy level as appropriate.

**Options**
16—Use a 16-bit frame checksum on the interface.
32—Use a 32-bit frame checksum on the interface. Using a 32-bit checksum provides more reliable packet verification, but some older equipment might not support 32-bit checksums.

**Default:** 16

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring the E3 Frame Checksum
- Configuring the SONET/SDH Frame Checksum
feac-loop-respond

Syntax (feac-loop-respond | no-feac-loop-respond);

Hierarchy Level [edit interfaces interface-name t3-options]

Release Information Statement introduced before Junos OS Release 7.4.

Description For T3 interfaces only, configure the router so a remote CSU can place the local router into loopback.

If you configure remote or local loopback with the T3 loopback statement, the router does not respond to FEAC requests from the CSU even if you include the feac-loop-respond statement in the configuration. For the router to respond, you must delete the loopback statement from the configuration.

You must rollback the setting done on the remote CSU prior to deactivating the feac-loop-respond statement. If the remote CSU cannot comply, clear the remote loop through local configuration to achieve the cleanup. For example, configure remote loopback on the interface and then delete the remote loopback.

Default The router does not respond to FEAC requests.

Required Privilege Level interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Statement introduced in Junos OS Release 17.4R1 for MX204 routers

**Description**  
(MX Series Routers with MPC7E, MPC8E, and MPC9E, MX10003 Router with MX10003 MPC, MX204 Router, PTX1000, FPC3-PTX-U2 and FPC3-PTX-U3 on PTX5000) Enable or disable RS-FEC (Reed-Solomon Forward Error Correction) for a 100-Gigabit Ethernet interface. By default, the Junos OS software enables or disables forward error correction based on the plugged-in optics. For instance, Junos OS software enables RS-FEC for 100G SR4 optics and disables RS-FEC for 100G LR4 optics.

This statement allows you to override the default behavior and explicitly enable or disable RS-FEC. For instance, you can extend the reach of 100G LR4 optics when you explicitly enable RS-FEC for the optics. RS-FEC is compliant with IEEE 802.3-2015 Clause 91.

Once you enable or disable RS-FEC using this statement, this behavior applies to any 100-Gigabit Ethernet optical transceiver installed in the port associated with the interface.

**NOTE:** FPC-PTX-P1-A and FPC2-PTX-P1A on PTX5000 routers do not support RS-FEC.

FPC3-SFF-PTX-1H and FP3-SFF-PTX-1T with PE-10-U-QSFP28 PIC and LR4 optics on PTX3000 and PTX5000 routers supports RS-FEC only on port 2. For PE-10-U-QSFP28 with LR4 optics, RS-FEC is the default FEC mode on port 2 and NONE is the default FEC mode on ports 0,1,3 through 9. For PE-10-U-QSFP28 with SR4 optics, RS-FEC is enabled by default on all ports. Do not modify the FEC mode on any port irrespective of the optics installed.

**Default**  
Junos OS software automatically enables or disables RS-FEC based on the type of pluggable optics used.

**Options**  
- **fec91**—Enables RS-FEC. RS-FEC is compliant with IEEE 802.3-2015 Clause 91.
- **none**—Disables RS-FEC.
Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

filter

Syntax

```
filter {
  group filter-group-number;
  input filter-name;
  input-list [ filter-names ];
  output filter-name;
  output-list [ filter-names ];
}
```

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number family family],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

NOTE: On EX Series switches, the group, input-list, output-filter statements are not supported under the [edit interfaces interface-name unit logical-unit-number family family], [edit interfaces interface-name unit logical-unit-number family inet], [edit interfaces interface-name unit logical-unit-number family inet6], and [edit interfaces interface-name unit logical-unit-number family mpls] hierarchies.

Apply a filter to an interface. You can also use filters for encrypted traffic. When you configure filters, you can configure them under the family ethernet-switching, inet, inet6, mpls, or vpls only.

Options

- `group filter-group-number`—Define an interface to be part of a filter group. The default filter group number is 0.
  - Range: 0 through 255
- `input filter-name`—Name of one filter to evaluate when packets are received on the interface.
- `output filter-name`—Name of one filter to evaluate when packets are transmitted on the interface.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Apply a filter to an interface. You can also use filters for encrypted traffic. When you configure filters, you can configure the family `inet`, `inet6`, `mpls`, or `vpls` only.

**NOTE:** Mpls firewall filters applied on output interface are not supported on PTX10003 router due to product limitation.

Options

- **input filter-name**—Name of one filter to evaluate when packets are received on the interface.
- **output filter-name**—Name of one filter to evaluate when packets are transmitted on the interface.

Required Privilege Level

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

flow-control

**Syntax**

(flow-control | no-flow-control);

**Hierarchy Level**

[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options],
[edit interfaces interface-name multiservice-options],
[edit interfaces interface-range name aggregated-ether-options],
[edit interfaces interface-range name ether-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 in EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

**Description**

For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.

**NOTE:** On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

**Default**

Flow control is enabled.

**NOTE:** Flow control is enabled by default only on physical interfaces and it is disabled by default on aggregated Ethernet interfaces.

**Required Privilege Level**

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Flow Control
- Configuring Gigabit Ethernet Interfaces (CLI Procedure)

 flow-control-options

Syntax

```
flow-control-options {
  down-on-flow-control;
  dump-on-flow-control;
  reset-on-flow-control;
  up-on-flow-control;
}
```

Hierarchy Level

```
[edit interfaces mo-fpc/pic/port multiservice-options]
```

Release Information

Statement introduced before Junos OS Release 8.4.

Description

Configure the flow control options for application recovery in case of a prolonged flow control failure.

- **down-on-flow-control**—Bring interface down during prolonged flow control.

- **dump-on-flow-control**—Cause core dump during prolonged flow control.

**NOTE:** Starting with Junos OS Release 15.1, on MX Series routers with MS-MICs and MS-MPCs, instead of an eJunos kernel core file, the multiservices PIC management daemon (mspmand) core file is generated when a prolonged flow control failure occurs and when you configure the setting to generate a core dump during prolonged flow control (by using the dump-on-flow-control option with the flow-control-options statement). The watchdog functionality continues to generate a kernel core file in such scenarios.

- **reset-on-flow-control**—Reset interface during prolonged flow control.

**NOTE:** Starting in Junos OS Release 16.1R7, the reset-on-flow-control option has no effect on the MS-MIC, MS-MPC, MS-DPC, MS-PIC 100, MS-PIC 400, and MS-PIC 500 line cards. This is because starting in Release 16.1R7, Junos OS restarts these line cards to recover them from stuck state due to prolonged flow control.

- **up-on-flow-control**—Cause interface to remain in stuck state until you manually restart the PICs.

**NOTE:** Starting in Junos OS Release 16.1R7, if interfaces on an MS-PIC or MS-DPC are in stuck state because of prolonged flow control, Junos OS restarts the service PICs to recover them from this state. However, if you
want the PICs to remain in stuck state until you manually restart the PICs, configure the up-on-flow-control option. In releases before Release 16.1R7, there is no action taken to recover service PICs from this state unless one of the options for the flow-control-options statement is configured, or service PIC is manually restarted.

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

force

Syntax  force (protect | working);

Hierarchy Level  [edit interfaces interface-name sonet-options aps ]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  Perform a forced switch between the protect and working circuits. This statement is honored only if there are no higher-priority reasons to switch. It can be overridden by a signal failure on the protect circuit, thus causing a switch to the working circuit.

Options  protect—Request the circuit to become the protect circuit.
working—Request the circuit to become the working circuit.

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**frame-error**

**Syntax**  
frame-error count;

**Hierarchy Level**  
[edit protocols oam ethernet link-fault-management action-profile event link-event-rate],  
[edit protocols oam link-fault-management interface interface-name event-thresholds]

**Release Information**  
Statement introduced in Junos OS Release 8.4.

**Description**  
Threshold for sending frame error events or taking the action specified in the action profile.

A frame error is any frame error on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value within the window.

The window or period during which frame errors are counted is 5 seconds or multiples of it (with a maximum value of 1 minute). This window denotes the duration as intervals of 100 milliseconds, encoded as a 16-bit unsigned integer. This window is not configurable in Junos OS. According to the IEEE 802.3ah standard, the default value of the frame-errors window is 1 second. This window has a lower bound of 1 second and an upper bound of 1 minute.

**Options**  
- **count**—Threshold count for frame error events.  
  
  **Range:** 0 through 100

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

### frame-period

**Syntax**  
frame-period count;

**Hierarchy Level**  
[edit protocols oam ethernet link-fault-management action-profile event link-event-rate],  
[edit protocols oam link-fault-management interface interface-name event-thresholds]

**Release Information**  
Statement introduced in Junos OS Release 8.4.

**Description**  
Threshold for sending frame period error events or taking the action specified in the action profile.

A frame error is any frame error on the underlying physical layer. The frame period threshold is reached when the number of frame errors reaches the configured value within the period window. The default period window is the number of minimum-size frames that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.

**Options**  
- **count**—Threshold count for frame period error events.  
  **Range:** 0 through 100

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

frame-period-summary

Syntax

frame-period-summary count;

Hierarchy Level

[edit protocols oam ethernet link-fault-management action-profile event link-event-rate],
[edit protocols oam link-fault-management interface interface-name event-thresholds]

Release Information

Statement introduced in Junos OS Release 8.4.

Description

Threshold for sending frame period summary error events or taking the action specified in the action profile.

An errored frame second is any 1-second period that has at least one errored frame. This event is generated if the number of errored frame seconds is equal to or greater than the specified threshold for that period window. The default window is 60 seconds. The window is not configurable.

Options

count—Threshold count for frame period summary error events.

Range: 0 through 100

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

framing (E1, E3, and T1 Interfaces)

Syntax
framing (g704 | g704-no-crc4 | g.751 | g.832 | unframed | sf | esf);

Hierarchy Level
[edit interfaces ce1-fpc/pic/port],
[edit interfaces ct1-fpc/pic/port],
[edit interfaces at-fpc/pic/port e3-options],
[edit interfaces e1-fpc/pic/port e1-options],
[edit interfaces t1-fpc/pic/port t1-options]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

Description
Configure the framing format.

NOTE: When configuring CE1 or CT1 interfaces on 10-port Channelized E1/T1 IQE PICs, the framing statement must be included at the [edit interfaces ce1-fpc/pic/port] or [edit interfaces ct1-fpc/pic/port] hierarchy level as appropriate.

Default
esf for T1 interfaces; g704 for E1 interfaces. There is no default value for E3 over ATM interfaces.

Options
esf—Extended superframe (ESF) mode for T1 interfaces.
g704—G.704 framing format for E1 interfaces.
g704-no-crc4—G.704 framing with no cyclic redundancy check 4 (CRC4) for E1 interfaces.
g.751—G.751 framing format for E3 over ATM interfaces.
g.832—G.832 framing format for E3 over ATM interfaces.
sf—Superframe (SF) mode for T1 interfaces.
unframed—Unframed mode for E1 interfaces.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

framing (10-Gigabit Ethernet Interfaces)

Syntax

framing (lan-phy | wan-phy);  
precise-bandwidth;

Hierarchy Level

[edit interfaces xe-fpc/pic/port]

[edit interfaces et-fpc/pic/port] (PTX Series Packet Transport Routers and MX Series Routers)

Release Information

Statement introduced in Junos OS Release 8.0.  
Statement introduced in Junos OS Release 12.3R2 for PTX Series Packet Transport Routers.  
The option precise-bandwidth introduced in Junos OS Release 19.3R1 for MX Series Routers.

Description

For routers supporting the 10-Gigabit Ethernet interface, configure the framing format.  
WAN PHY mode is supported on MX240, MX480, MX960, T640, T1600, T4000, and PTX Series Packet Transport Routers routers only.

NOTE:

• The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1.  
Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP).  
Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).

• On PTX Series routers, WAN PHY mode is supported only on the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+.

• When the PHY mode changes, interface traffic is disrupted because of port reinitialization.

• In Junos OS Releases 17.4R2, 17.4R3, and later, on the following MPCs or routers, you cannot configure wan-phy mode at 10-Gbps, 40-Gbps, and 100-Gbps on a per-port basis:

  • MPC7E-10G, MPC7E-MRATE, MX2K-MPC8E, and MX2K-MPC9E
  • MPC10003
  • MX204 router
  • JNP10K-LC2101 MPC

Default

Operates in LAN PHY mode.
Options

lan-phy—10GBASE-R interface framing format that bypasses the WIS sublayer to directly stream block-encoded Ethernet frames on a 10-Gigabit Ethernet serial interface.

wan-phy—10GBASE-W interface framing format that allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and SONET devices.

precise-bandwidth—Enables precise bandwidth for WAN-PHY interface framing format.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

framing (SONET and SDH Interfaces)

Syntax

framing (sdh | sonet);

Hierarchy Level

[edit interfaces so-fpc/pic/port]

Release Information

Statement introduced in Junos OS Release 8.1.

Description

This functionality allows you to mix SONET and SDH modes on interfaces on the same PIC.

• For the 4-port OC48 PIC with SFP installed and the 4-port OC192 PIC in T Series and M Series routers, configure SONET or SDH framing on a per-port basis.

• For 1-port OC192/STM64 MICs with XFP on MX Series routers, configure the SONET or SDH framing on the single port.

Default

Default framing mode is SONET.

Options

sdh—SDH framing.

sonet—SONET framing.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

guard-interval

Syntax  
guard-interval number;

Hierarchy Level  
[edit protocols protection-group ethernet-ring ring-name]

Release Information  
Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description  
When a link goes down, the ring protection link (RPL) activates. When the downed link comes back up, the RPL link receives notification, restores the link, and waits for the restore interval before issuing another block on the same link. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.

Options  
number—Guard timer interval, in milliseconds.
Range: 10 through 2000 ms
Default: 500 ms

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

hardware-assisted-timestamping

Syntax

hardware-assisted-timestamping;

Hierarchy Level

[edit protocols oam ethernet connectivity-fault-management performance-monitoring]

Release Information

Statement introduced in Junos OS Release 9.5.

Description

For Ethernet interfaces on Enhanced and Enhanced Queuing Dense Port Concentrators (DPCs) in MX Series routers only, enable hardware-assisted timestamping support for Ethernet frame delay measurement.

By default, the ETH-DM feature calculates frame delays using software-based timestamping of the ETH-DM PDU frames sent and received by the MEPs in the session. As an option that can increase the accuracy of ETH-DM calculations when the DPC is loaded with heavy traffic in the receive direction, you can enable hardware-assisted timestamping of session frames in the receive direction.

Required Privilege

Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

hierarchical-scheduler (Subscriber Interfaces on MX Series Routers)

Syntax
hierarchical-scheduler {
  implicit-hierarchy;
  maximum-hierarchy-levels number;
}

Hierarchy Level [edit interfaces interface-name]

Release Information
Statement introduced in Junos OS Release 10.1.
  Support on GRE tunnel interfaces configured on physical interfaces on MICs or MPCs in
  MX Series routers added in Junos OS Release 13.3.
  Support for up to four hierarchy levels added in Junos OS Release 16.1.

Description
Configure hierarchical scheduling options on the interface.

The statement is supported on the following interfaces:

- MIC and MPC interfaces in MX Series routers
- GRE tunnel interfaces configured on physical interfaces hosted on MIC or MPC line
  cards in MX Series routers

To enable hierarchical scheduling on MX Series routers, configure the
hierarchical-scheduler statement at each member physical interface level of a particular
aggregated Ethernet interface as well as at that aggregated Ethernet interface level. On
other routing platforms, it is enough if you include this statement at the aggregated
Ethernet interface level.

Options
  implicit-hierarchy—Configure four-level hierarchical scheduling. When you include the
  implicit-hierarchy option, a hierarchical relationship is formed between the CoS
  scheduler nodes at level 1, level 2, level 3, and level 4. The implicit-hierarchy option
  is supported only on MPC/MIC subscriber interfaces and interface sets on MX Series
  routers.

  maximum-hierarchy-levels number—Specify the maximum number of hierarchical
  scheduling levels allowed for node scaling, from 2 through 4 levels. The default
  number of levels is 3. The maximum-hierarchy-levels option is supported on MPC/MIC
  or EQ DPC subscriber interfaces and interface sets on MX Series routers.

  • If you set maximum-hierarchy-levels to 2, interface sets are not allowed. In this case,
    if you configure a level 2 interface set, you generate Packet Forwarding Engine errors.

  • If you do not include the maximum-hierarchy-levels option, keeping the default number
    of hierarchy levels at 3, interface sets can be at either level 2 or level 3, depending on
    whether the member logical interfaces within the interface set have a traffic control
    profile. If any member logical interface has a traffic control profile, then the interface
set is a level 2 CoS scheduler node. If no member logical interface has a traffic control profile, the interface set is at level 3.

---

**CAUTION:** MPC3E, 32x10GE MPC4E, and 2x100GE + 8x10GE MPC4E MPCs support only two levels of scheduling hierarchy. When enabling hierarchical scheduling on these cards, you must explicitly set maximum-hierarchy-levels to 2.

---

**Required Privilege Level**
- view-level—To view this statement in the configuration.
- control-level—To add this statement to the configuration.

hold-time (Physical Interface)

Syntax

hold-time up milliseconds down milliseconds;

Hierarchy Level

[edit interfaces interface-name],
[edit interfaces interface-range interface-range-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 10.4R5 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Statement introduced in Junos OS Release 12.1 for the SRX Series.

Description

Specify the hold-time value to use to damp shorter interface transitions milliseconds. The hold timer enables interface damping by not advertising interface transitions until the hold timer duration has passed. When a hold-down timer is configured and the interface goes from up to down, the down hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still down, then the router begins to advertise the interface as being down. Similarly, when a hold-up timer is configured and an interface goes from down to up, the up hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still up, then the router begins to advertise the interface as being up.

NOTE:

- We recommend that you configure the hold-time value after determining an appropriate value by performing repeated tests in the actual hardware environment. This is because the appropriate value for hold-time depends on the hardware (XFP, SFP, SR, ER, or LR) used in the networking environment.
- The hold-time option is not available for controller interfaces.

NOTE: On MX Series routers with MPC3E and MPC4E, we recommend that you do not configure the hold-down timer to be less than 1 second. On MX Series routers with MPC5EQ-100G10G (MPC5EQ) or MPC6E (MX2K-MPC6E) with 100-Gigabit Ethernet MIC with CFP2 OTN interfaces, we recommend that you do not configure the hold-down timer to be less than 3 seconds.

Default

Interface transitions are not damped.
Options

**down milliseconds**—Hold time to use when an interface transitions from up to down. Junos OS advertises the transition within 100 milliseconds of the time value you specify.

**Range:** 0 through 4,294,967,295

**Default:** 0 (interface transitions are not damped)

**up milliseconds**—Hold time to use when an interface transitions from down to up. Junos OS advertises the transition within 100 milliseconds of the time value you specify.

**Range:** 0 through 4,294,967,295

**Default:** 0 (interface transitions are not damped)

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

hold-time (SONET/SDH Defect Triggers)

Syntax       hold-time up milliseconds down milliseconds;

Hierarchy Level  [edit interfaces interface-name sonet-options trigger defect]

Release Information Statement introduced before Junos OS Release 7.4.

Description  For ATM over SONET/SDH and SONET/SDH interfaces only, apply up and down hold times to SONET/SDH defect triggers. When you apply a down hold time to a defect, the defect must remain present for at least the hold-time period before the interface is marked down. When you apply an up hold time to a defect, the defect must remain absent for at least the hold-time period before the interface is marked up, assuming no other defect is outstanding.

**NOTE:**

- When up or down hold times are applied to SONET defect triggers of a 10-Gigabit Ethernet WAN-PHY interface, only the defects generated in the WAN Interface Sublayer (WIS) are damped. Therefore, if the hold times are applied to SONET defect triggers only, a 10-Gigabit Ethernet WAN-PHY interface might be marked up or down because of the faults that are generated in other layers, such as the Physical Coding Sublayer (PCS) or Physical Medium Attachment Sublayer (PMA), 10 Gigabit Media Independent Interface (XGMII) Extender Sublayer (XGXS), and Media Access Control (MAC). To damp the interface up or down events of a 10-Gigabit Ethernet WAN-PHY interface, you need to apply up or down hold-times for the interface at the [edit interfaces interface-name] hierarchy level.

- On M Series and T Series platforms with Channelized SONET IQ PICs and Channelized SONET IQE PICs, the SONET defect alarm trigger hold-time statement is not supported.

Default  If you do not include this statement, when a defect is detected the interface is marked down immediately, and when the defect becomes absent the interface is marked up immediately.

Options  

- **down milliseconds**—Hold time to wait before the interface is marked down.  
  **Range:** 1 through 65,534 milliseconds  
  **Default:** No hold time

- **up milliseconds**—Hold time to wait before the interface is marked up.
Range: 1 through 65,534 milliseconds
Default: No hold time

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

host (Interfaces)

Syntax
host hostname {
  services severity-level;
  facility-override facility-name;
  log-prefix prefix-value;
  port port-number;
}

Hierarchy Level
[edit interfaces interface-name services-options syslog]

Release Information
Statement introduced before Junos OS Release 7.4.
You can configure multiple system log hosts from Junos OS Release 17.4R1 onwards.

Description
Specify the hostname for the system logging utility.
Starting with Junos OS release 17.4R1, you can configure up to a maximum of four system log servers (combination of local system log hosts and remote system log collectors) for each service set for ms interface under [edit interfaces interface-name services-options] hierarchy.

Options
hostname—Name of the system logging utility host machine. This can be the local Routing Engine or an external server address.

From Junos OS Release 17.4R1, you can configure up to four system log hosts.
The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number],
- [edit logical-systems logical-system-name routing-instances routing-instance-name interfaces interface-name unit logical-unit-number]

**Release Information**  
Statement introduced in Junos OS Release 17.2 on MX Series routers.

**Description**  
(MPC5 and MPC6 cards) Improve datapath performance by allowing only DHCPv4 subscribers that negotiate a 32-bit prefix to come up on the underlying VLAN interface. All DHCP subscribers on the underlying interface must negotiate a 32-bit prefix. Subscribers that negotiate a subnet prefix are not brought up. You can configure this statement for static or dynamic subscribers.

**NOTE:** You must add or remove this statement before subscribers become active. The configuration fails if you attempt to configure the statement while subscribers are active.

**NOTE:** You must also configure demux-source inet for the logical interface. Only inet is supported. A commit error occurs if you specify demux-source inet6 or demux-source [inet inet6].

**Required Privilege**  
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

iccp

Syntax
iccp [ traceoptions; { file <filename> <files number> <match regular-expression> <microsecond-stamp> <size size> <world-readable | no-world-readable>; flag flag; no-remote-trace; } local-ip-address ip address; session-establishment-hold-time value; authentication-key string; peer ip-address [ local-ip-address ip address; session-establishment-hold-time value; authentication-key string; redundancy-group-id-list redundancy-group-id-list; liveness-detection; ] ]

Hierarchy Level
[edit protocols iccp]
[edit logical-systems logical-system-name protocols iccp]

Release Information

Description
Configure Interchassis Control Protocol (ICCP) between the multichassis link aggregation group (MC-LAG) peers. ICCP replicates forwarding information, validates configurations, and propagates the operational state of the MC-LAG members.

Default
If you do not include this statement, no ICCP protocol tracing operations are performed.

Options
traceoptions—Set Interchassis Control Protocol (ICCP) tracing options.

local-ip-address—Specify the source address where the ICCP packet is routed.

session-establishment-hold-time—Specify if the chassis takes over as the master at the ICCP session.

authentication-key—Specify TCP Message Digest 5 (MD5) option for an ICCP TCP session.

peer ip-address—Specify the IP address of the peer that hosts an MC-LAG. You must configure ICCP for both peers that host the MC-LAG.

redundancy-group-id-list—Specify the redundancy groups between two ICCP peers.

liveness-detection—Specify Bidirectional Forwarding Detection (BFD) protocol options.

[edit dynamic-profiles profile-name firewall hierarchical-policer hierarchical-policer-name premium],
[edit firewall hierarchical-policer hierarchical-policer-name aggregate],
[edit firewall hierarchical-policer hierarchical-policer-name premium]

Release Information

Statement introduced in Junos OS Release 15.2 for MX Series routers with MPCs.

Description

For MX Series routers, if-exceeding-pps allows you to configure a packets-per-second (pps)-based trigger for a premium or aggregate component of a hierarchical policer. When applied to the loopback interface (lo0), this kind of trigger can help protect the Routing Engine from DDoS attacks. When applied in other areas, to either transit or control traffic, it is a more fine-grained monitor.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 18.1R1 for SRX1500 devices.
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series.
Description  Configure IGMP snooping to constrain multicast traffic to only the ports that have receivers attached. IGMP snooping enables the device to selectively send out multicast packets on only the ports that need them. Without IGMP snooping, the device floods the packets on every port. The device listens for the exchange of IGMP messages by the device and the end hosts. In this way, the device builds an IGMP snooping table that has a list of all the ports that have requested a particular multicast group. The factory default configuration enables IGMP snooping on all VLANs.

NOTE: IGMP snooping must be disabled on the device before enabling ISSU.

NOTE: Starting with Junos OS Release 18.1R1, QFX5110 switches support IGMP snooping in an EVPN-VXLAN multihoming environment, but in this environment you must enable IGMP snooping on all VLANs associated with any configured VXLANs. You cannot selectively enable IGMP snooping only on those VLANs that might have interested listeners, because all the VXLANs share VXLAN tunnel endpoints (VTEPs) between the same multihoming peers and must have the same settings.

Default  For most devices, IGMP snooping is disabled on the device by default, and you must configure IGMP snooping parameters in this statement hierarchy to enable it on one or more VLANs.

On legacy switches that do not support the Enhanced Layer 2 Software (ELS) configuration style, IGMP snooping is enabled by default on all VLANs, and the vlan statement includes a disable option if you want to disable IGMP snooping selectively on some VLANs or disable it on all VLANs.

Options  The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level  routing—to view this statement in the configuration.

Routing-control—to add this statement to the configuration.

  version (1.0 | 1.1);
}

Hierarchy Level
[edit interfaces (t1-fpc/pic/port:m:n | e1-fpc/pic/port:n | t1|e1-fpc/pic/port)]

Release Information
Statement introduced in Junos OS Release 10.0.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

Description
Specify IMA group options.

Options
differential-delay msec—Maximum differential delay among links in msec.
  Range: 1 through 56
  Default: 25

frame-length (32 | 64 | 128 | 256)—IMA frame length in number of cells.
  Default: 128

frame-synchronization—IMA group frame synchronization selection.
  alpha number—Number of consecutive invalid ICP cells for IFSM.
    Range: 1 through 2
    Default: 2
  beta number—Number of consecutive errored ICP cells for IFSM.
    Range: 1 through 2
    Default: 2
gamma number—Number of consecutive valid ICP cells for IFSM.
Range: 1 through 5
Default: 1

minimum-links number—IMA group minimum active links.
Range: 1 through 8
Default: 1

symmetry (symmetrical-config-and-operation | symmetrical-config-asymmetrical-operation)—IMA group symmetry mode selection.

test-procedure—Specify an IMA link interface test.

  ima-test-start—Start IMA group test.
  ima-test-stop—Stop IMA group test.
  interface name—Interface name of the IMA link to test.

  pattern number—IMA test pattern.
  Range: 1 through 254
  Default: 170

  period seconds—Length of IMA pattern test in seconds.
  Range: 1 through 4,294,967,294.
  Default: 10

transmit-clock (common | independent)—Transmit clock configuration.
  Default: common

version (1.0 | 1.1)—IMA specification version.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

inactivity-timeout

**Syntax**  inactivity-timeout seconds;

**Hierarchy Level**  [edit interfaces interface-name services-options]

**Release Information**  Statement introduced before Junos OS Release 7.4.

**Description**  For adaptive services interfaces, configure the inactivity timeout period for established flows. The timeout configured in the application protocol definition overrides this value.

**Options**  seconds—Timeout period, in seconds.
**Range:**  4 through 86,400 seconds
**Default:**  30 seconds

**Required Privilege Level**  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**Related Documentation**  • Junos OS Services Interfaces Library for Routing Devices
incoming-map

Syntax
incoming-map { caller caller-number | accept-all; }

Hierarchy Level
[edit interfaces dln unit logical-unit-number dialer-options],
[edit logical-systems logical-system-name interfaces dln unit logical-unit-number dialer-options]

Release Information
Statement introduced in Junos OS Release 7.5.

Description
On J Series Services Routers with interfaces configured for ISDN, specify the dialer to accept incoming calls.

The remaining statements are explained separately. See CLI Explorer.

NOTE: The incoming-map statement is mandatory for the router to accept any incoming ISDN calls.

Required Privilege
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

indication

Syntax indication (ignore | normal | require);

Hierarchy Level [edit interfaces interface-name serial-options dce-options],
[edit interfaces interface-name serial-options dte-options]

Release Information Statement introduced before Junos OS Release 7.4.

Description For X.21 interfaces only, configure the from-DCE signal indication.

Options ignore—The from-DCE signal is ignored.
                normal—Normal indication signal handling as defined by ITU-T Recommendation X.21.
                require—The from-DCE signal must be asserted.
                Default: normal

Required Privilege Level interface—To view this statement in the configuration.
                                interface-control—To add this statement to the configuration.

Related Documentation • Configuring the Serial Signal Handling on page 324
indication-polarity

Syntax  
indication-polarity (negative | positive);

Hierarchy Level  
[edit interfaces interface-name serial-options]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For X.21 interfaces only, configure the indication signal polarity.

Options  
positive—Positive signal polarity.

negative—Negative signal polarity.

Default: positive

Required Privilege Level  
interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

• Configuring Serial Signal Polarities on page 327
**ingress-policer-overhead**

**Syntax**

```
ingress-policer-overhead bytes;
```

**Hierarchy Level**

```
[edit chassis fpc slot-number pic pic-number]
```

**Release Information**

Statement introduced before Junos OS Release 11.1.  
Statement introduced in Junos OS Release 15.1X49-D30 for vSRX.

**Description**

Add the configured number of bytes to the length of a packet entering the interface.

Configure a policer overhead to control the rate of traffic received on an interface. Use this feature to help prevent denial-of-service (DoS) attacks or to enforce traffic rates to conform to the service-level agreement (SLA). When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate-limiting action.

Traffic policing combines the configured policy bandwidth limits and the burst size to determine how to meter the incoming traffic. If you configure a policer overhead on an interface, Junos OS adds those bytes to the length of incoming Ethernet frames. This added overhead fills each frame closer to the burst size, allowing you to control the rate of traffic received on an interface.

You can configure the policer overhead to rate-limit queues and Layer 2 and Layer 3 policers, for standalone (SA) and high-availability (HA) deployments. The policer overhead and the shaping overhead can be configured simultaneously on an interface.

---

**NOTE:** vSRX supports policer overhead on Layer 3 policers only.

The policer overhead applies to all interfaces on the PIC. In the following example, Junos OS adds 10 bytes of overhead to all incoming Ethernet frames on ports ge-0/0/0 through ge-0/0/4.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 10
```

---

**NOTE:** vSRX only supports fpc 0 pic 0. When you commit the ingress-policer-overhead statement, the vSRX takes the PIC offline and then back online.
You need to craft the policer overhead size to match your network traffic. A value that is too low will have minimal impact on traffic bursts. A value that is too high will rate-limit too much of your incoming traffic.

In this example, the policer overhead of 255 bytes is configured for ge-0/0/0 through ge-0/0/4. The firewall policer is configured to discard traffic when the burst size is over 1500 bytes. This policer is applied to ge-0/0/0 and ge 0/0/1. Junos OS adds 255 bytes to every Ethernet frame that comes into the configured ports. If, during a burst of traffic, the combined length of incoming frames and the overhead bytes exceeds 1500 bytes, the policer starts to discard further incoming traffic.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 255
set interfaces ge-0/0/0 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/0 unit 0 family inet address 10.9.1.2/24
set interfaces ge-0/0/1 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/1 unit 0 family inet address 10.9.2.2/24
set firewall policer overhead_policer if-exceeding bandwidth-limit 32k
set firewall policer overhead_policer if-exceeding burst-size-limit 1500
set firewall policer overhead_policer then discard
```

**Options**

- **bytes**—Number of bytes added to a frame entering an interface.
- **Range**: 0–255 bytes
- **Default**: 0

```
[edit chassis fpc 0 pic 0]
user@host# set ingress-policer-overhead 10;
```

**Required Privilege Level**

**ingress-rate-limit**

**Syntax**

```
ingress-rate-limit rate;
```

**Hierarchy Level**

```
[edit interfaces interface-name fastether-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Perform port-based rate limiting on ingress traffic arriving on Fast Ethernet 8-port, 12-port, and 48-port PICs.

**Options**

- **rate**—Traffic rate, in megabits per second (Mbps).
- **Range**: 1 through 100 Mbps

**Required Privilege**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**

- Configuring the Ingress Rate Limit
init-command-string

**Syntax**

`init-command-string initialization-command-string;`

**Hierarchy Level**

```
[edit interfaces umd0 modem-options]
```

**Release Information**

Statement introduced in Junos OS Release 8.2.

**Description**

For J Series Services Routers, configure the command string used to initialize the USB modem.

When you connect the USB modem to the USB port on a Services Router, the router applies the modem AT commands configured in the `init-command-string` command to the initialization commands on the modem.

For example, the initialization command string `ATS0=2\n` configures the USB modem to pick up a call after 2 rings.

If you do not include the `init-command-string` statement, the router applies the default initialization string to the modem.

**Options**

`initialization-command-string`—Specify an initialization command string using the following AT command values:

- `%C0`—Disables data compression.
- `&C1`—Disables reset of the modem when it loses the carrier signal.
- `&Q8`—Enables Microcom Networking Protocol (MNP) error control mode.
- `AT`—Attention. Informs the modem that a command follows.
- `E0`—Disables the display on the local terminal of commands issued to the modem from the local terminal.
- `Q0`—Enables the display of result codes.
- `S0=0`—Disables the auto-answer feature, whereby the modem automatically answers calls.
- `S7=45`—Instructs the modem to wait 45 seconds for a telecommunications service provider (carrier) signal before terminating the call.
- `V1`—Displays result codes as words.

**Default:** `AT S7=45 S0=0 V1 X4 &C1 E0 Q0 &Q8 %C0`

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.
initial-route-check

Syntax

```
initial-route-check seconds;
```

Hierarchy Level

```
[edit interfaces dln unit logical-unit-number dialer-options]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

On J Series Services Routers with ISDN interfaces, allows the router to check whether the primary route is up after the initial startup of the router is complete and the timer expires.

Options

- `seconds`—How long to wait to check if the primary interface is up after the router comes up.
  - **Range:** 1 through 300 seconds
  - **Default:** 120 seconds

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

inner-tag-protocol-id

Syntax

inner-tag-protocol-id tpid;

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number input-vlan-map],
[edit interfaces interface-name unit logical-unit-number output-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]

Release Information

Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Configure the IEEE 802.1Q TPID value to rewrite for the inner tag.

All TPIDs you include in input and output VLAN maps must be among those you specify at the [edit interfaces interface-name gigether-options ethernet-switch-profile tag-protocol-id [ tpid ] ] hierarchy level.

On MX Series routers, you can use this statement for Gigabit Ethernet IQ, IQ2 and IQ2-E interfaces, and for aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs.

Default

If the inner-tag-protocol-id statement is not configured, the TPID value is 0x8100.

Required Privilege

Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description

For Gigabit Ethernet IQ and 10-Gigabit Ethernet interfaces only, define the input policer priority map to be applied to incoming frames on this interface.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

- Specifying an Input Priority Map
- output-priority-map on page 862

```
input-three-color

Syntax  

```
input-three-color policer-name;
```

Hierarchy Level  

```
[edit interfaces interface-name unit logical-unit-number layer2-policer]
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number layer2-policer]
```

Release Information  

Statement introduced in Junos OS Release 8.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description  

Apply a single-rate or two-rate three-color policer to the Layer 2 input traffic at the logical interface. The `input-three-color` and `input-policer` statements are mutually exclusive.

Options  

`policer-name`—Name of the single-rate or two-rate three-color policer.

Usage Guidelines  

See `Applying Layer 2 Policers to Gigabit Ethernet Interfaces`.

Required Privilege Level  

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

input-vlan-map (Aggregated Ethernet)

Syntax

```
input-vlan-map {
  (pop | push | swap);
  tag-protocol-id tpid;
  vlan-id number;
}
```

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information

Statement introduced in Junos OS Release 8.2.
Starting in Junos OS Release 17.3R1, input-vlan-map for outer vlan is supported for L2 circuit over aggregated Ethernet interfaces for QFX10000 Series switches.

Description

Define the rewrite profile to be applied to incoming frames on this logical interface. On MX Series routers, this statement only applies to aggregated Ethernet interfaces using Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E interfaces and 100-Gigabit Ethernet Type 5 PIC with CFP.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

**input-vlan-map**

**Syntax**
```plaintext
input-vlan-map {
  (pop | pop-pop | pop-swap | push | push-push | swap | swap-push | swap-swap);
  inner-tag-protocol-id tpid;
  inner-vlan-id number;
  tag-protocol-id tpid;
  vlan-id number;
}
```

**Hierarchy Level**
- [edit interfaces interface-name unit logical-unit-number],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
- Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.
- Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

**Description**
For Gigabit Ethernet IQ, 10-Gigabit Ethernet SFPP interfaces, 100-Gigabit Ethernet Type 5 PIC with CFP only as well as Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces, define the rewrite profile to be applied to incoming frames on this logical interface.

The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** Connectivity fault management (CFM) sessions for all interfaces in which `input-vlan-map` is configured are supported only if the interface also has an explicit configuration for `output-vlan-map` as `output-vlan-map pop;`. See [output-vlan-map](#). This configuration is required for all the interfaces in the topology even when the CFM session is on that interface or on a different interface in the data path of the same topology.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

interface (IEEE 802.1x)

**Syntax**
```plaintext
interface interface-id {
    maximum-requests integer;
    quiet-period seconds;
    reauthentication (disable | interval seconds);
    retries integer;
    server-timeout seconds;
    supplicant (single);
    supplicant-timeout seconds;
    transmit-period seconds;
}
```

**Hierarchy Level**
```plaintext
[edit protocols dot1x authenticator]
```

**Release Information**
Statement introduced in Junos OS Release 9.3.

**Description**
Use this statement to configure the 802.1x Port-Based Network Access Control protocol-specific Ethernet interface options.

**Default**
The default values are provided for the options below on the respective statement pages.

**Options**
- **maximum-requests**—Specify the maximum number of retransmission times for an EAPOL Request packet to the client before it times out the authentication session.
- **quiet-period**—Specify the number of seconds the port remains in the wait state following a failed authentication exchange with the client, before reattempting the authentication.
- **reauthentication**—Includes two options:
  - **disable**—Periodic reauthentication of the client is disabled.
  - **interval**—Specify the periodic reauthentication time interval.
- **retries**—Specify the number of tries after which the port remains in the wait state for quiet-period seconds before reattempting the authentication.
- **server-timeout**—Specify the number of seconds the port waits for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.
- **supplicant (single)**—Specify supplicant single mode. See the usage guidelines to configure other modes.
- **supplicant-timeout**—Specify the number of seconds the port waits for a response when relaying a request from the authentication server to the client before resending the request.
transmit-period—Specify the number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

interface (IEEE 802.1ag OAM Connectivity-Fault Management)

Syntax

interface (interface-name | ((ge- | xe-) (fpc/pic/port | fpc/pic/port.unit-number | fpc/pic/port.unit-number vlan vlan-id)));

Hierarchy Level

[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name mep mep-id]

Release Information

Statement introduced in Junos OS Release 8.4.

Description

For Ethernet interfaces on M320, MX Series, and T Series routers, configure IEEE 802.1ag Operation, Administration, and Management (OAM) support.

For Gigabit Ethernet interfaces and 10-Gigabit Ethernet interfaces on MX Series routers, configure IEEE 802.1ag Connectivity Fault Management (CFM) support on trunk interface ports.

Starting in Junos OS 17.4R1, you can enable support for IEEE 802.1ag CFM on pseudowire service interfaces by configuring maintenance intermediate points (MIPs) on the pseudowire service interfaces.

NOTE: The CFM MIP session is supported only on the pseudowire services interface and not on the pseudowire services tunnel interface.

Options

interface-name—Interface to which the MEP is attached. It could be a physical Ethernet interface, logical Ethernet interface, pseudowire services interfaces, or on a specific VLAN of a trunk port interface (MX Series only).

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

interface (OAM Link-Fault Management)

Syntax

```plaintext
interface interface-name {
    apply-action-profile profile-name;
    link-discovery (active | passive);
    pdu-interval interval;
    pdu-threshold threshold-value;
    remote-loopback;
    event-thresholds {
        frame-error count;
        frame-period count;
        frame-period-summary count;
        symbol-period count;
    }
    negotiation-options {
        allow-remote-loopback;
        no-allow-link-events;
    }
}
```

Hierarchy Level

```plaintext
[edit protocols oam ethernet link-fault-management]
```

Release Information

Statement introduced in Junos OS Release 8.2.

Description

For Ethernet interfaces on M320, MX Series, and T Series routers, configure IEEE 802.3ah Operation, Administration, and Management (OAM) support.

Options

- `interface interface-name`—Interface to be enabled for IEEE 802.3ah link fault management OAM support.

  The remaining statements are described separately.

Required Privilege Level

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

Related Documentation

interface (Port Mirroring)

Syntax

interface interface-name {
    next-hop address;
}

Hierarchy Level
[edit forwarding-options port-mirroring family (inet | inet6) output]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Specify the output interface for sending copies of packets elsewhere to be analyzed.

Options

interface-name—Name of the interface.

The remaining statements are explained separately. See CLI Explorer.

Usage Guidelines
See Configuring Port Mirroring on M, T MX, and PTX Series Routers.

Required Privilege

Level
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

interface-down

Syntax

interface-down;

Hierarchy Level
[edit protocols oam ethernet connectivity-fault-management action-profile profile-name default-actions]

Release Information
Statement introduced in Junos OS Release 8.5.

Description
Bring the interface down when a remote MEP connectivity failure is detected.

Required Privilege

Level
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Related Documentation

**interface-name**

**Syntax**  
interface-name;

**Hierarchy Level**  
[edit interfaces interface-name auto-configure vlan-ranges authentication username-include],  
[edit interfaces interface-name auto-configure stacked-vlan-ranges authentication username-include],

**Release Information**  
Statement introduced in Junos OS Release 10.0.

**Description**  
Append the interface name and VLAN ID or stacked VLAN ID to the username string used for authentication. The appended information takes the following format:

- For single VLAN—<interface-name>:<4-digit-vlan-id>
- For stack VLANs—<interface-name>:<4-digit-svlan-id>-<4-digit-vlan-id>

**Required Privilege Level**  
interface—To view this statement in the configuration.

# interface-range

**Syntax**

```plaintext
interface-range name {
  member-range interface-name-fpc/pic/port to interface-name-fpc/pic/port;
  member interface-name-fpc/pic/port;
  member interface-name-fpc/[low-high]/[*;
  member interface-name-fpc/[pic1,pic2,pic3...picN]/port
/*Common config is added as part of interface-range definition, as follows*/
  mtu 256;
  hold-time up 10;
  ether-options {
    flow-control;
    speed {
      100m;
    }
    802.3ad primary;
  }
}
```

**Hierarchy Level**

```
[edit interfaces]
```

**Release Information**

Statement introduced in Junos OS Release 10.0.

**Description**

Specify a set of identical interfaces as an interface group, to which you can apply a common configuration to the entire set of interfaces. This group can consist of both lexical member ranges of interfaces specified using the `member-range interface-type-fpc/pic/port to xx-fpc/pic/port` option (regex not supported), and of individual or non-sequential members using the `member interface-type-fpc/pic/port` option (with regex support to specify the `fpc/pic/port` values).

**Options**

- **member-range**—Adds interfaces in lexical order. Regex is not supported.

  **Format:** `--member-range <start-range> to <end-range>`

  **Example:**
  ```
  --member-range ge-0/0/0 to ge-4/0/40;
  ```

- **member**—To add individual interfaces or multiple interfaces using regex.

  **Format:** `--member <list of interface names>`

  **Example:**
  ```
  --member ge-0/0/0;
  ```

  ```
  member ge-0/1/1;
  member ge-0/*/*;
  member ge-0/[1-10]/0;
  member ge-1/[1,3,6,10]/12
  ```
**interface-transmit-statistics**

**Syntax**

```
interface-transmit-statistics;
```

**Hierarchy Level**

```
[edit interface interface-name]
```

**Release Information**

Statement introduced in Junos OS Release 11.4R3 for MX Series devices.

**Description**

Configure the interface to report the transmitted load statistics. If this statement is not included in the configuration, the interface statistics show the offered load on the interface, and not the actual transmitted load.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

### interface-shared-with

**Syntax**  
interface-shared-with psdn;

**Hierarchy Level**  
[edit interfaces ge-fpc/pic/slot unit logical-unit-number],  
[edit interfaces so-fpc/pic/slot unit logical-unit-number],  
[edit interfaces xe-fpc/pic/slot unit logical-unit-number]

**Release Information**  
Statement introduced in Junos OS Release 9.3.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**  
Assign a logical interface under a shared physical interface to a Protected System Domain (PSD).

**Options**  
- $n$—PSD identification as a numeric value.  
  **Range:** 1 through 31

**Required Privilege Level**  
- **view-level**—To view this statement in the configuration.  
- **control-level**—To add this statement to the configuration.

**Related Documentation**
**interface-status-tlv**

**Syntax**

```
interface-status-tlv [ down lower-layer-down ];
```

**Hierarchy Level**

```
[edit protocols oam ethernet connectivity-fault-management action-profile profile-name event]
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name continuity-check]
```

**Release Information**

**Description**

Defines an action-profile consisting of various events and the action. Based on values of interface-status-tlv in the received CCM packets, specific action such as interface-down can be taken using action-profile options.

**Options**

- **down**—When the incoming CCM packet contains interface status TLV with value down, the action will be triggered for this action-profile.

- **lower-layer-down**—When the incoming CCM packet contains interface status TLV with value lower-layer-down, the action will be triggered for this action-profile.

**Required Privilege Level**

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

**Related Documentation**

interface-switch

Syntax
interface-switch connection-name {
    interface interface-name.unit-number;
}

Hierarchy Level
[edit logical-systems logical-system-name protocols connections],
[edit protocols connections]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Configure Layer 2 switching cross-connects. The cross-connect is bidirectional, so packets received on the first interface are transmitted out the second interface, and those received on the second interface are transmitted out the first.

For Layer 2 switching cross-connects to work, you must also configure MPLS.

Options
connection-name—Connection name (up to 128 characters in Junos 12.3 and later).
interface interface-name.unit-number—Interface name. Include the logical portion of the name, which corresponds to the logical unit number.

Required Privilege Level
routin—To view this statement in the configuration.
routing-control—To add this statement to the configuration

Related Documentation

interface-type (Interfaces)

Syntax
interface-type (bc | coc1 | ct1 | ct3 | dc | ds | so | t1 | t3);

Hierarchy Level
[edit interfaces interface-range name no-partition],
[edit interfaces interface-range name partition partition-number],
[edit interfaces interface-range name partition partition-number oc-slice oc-slice-range],
[edit interfaces interface-range name partition partition-number timeslot timeslot-range]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
For IQ and IQE interfaces only, configure the sublevel interface type.

Options
bc—Dual—Port Channelized E1 and T1 ISDN PRI interface type. You can specify this
interface type at the [edit interfaces interface-name partition partition-number timeslot
timeslot-range] hierarchy level to create a bearer (B) channel bc-pim/0/port:channel
interface for each time you want to function as an ISDN PRI B-channel.

coc1—Channelized OC1 interface type. You can specify this interface type at the [edit
interfaces interface-name partition partition-number oc-slice oc-slice-range
interface-type coc12-fpc/pic/port] hierarchy level.

coc1—Channelized T1 interface type. You can specify this interface type at the [edit
interfaces interface-name partition partition-number interface-type
tct1-fpc/pic/port<:channel>] hierarchy level.

coc1—Channelized T3 interface type. You can specify this interface type at the [edit
interfaces interface-name partition partition-number oc-slice oc-slice-range
interface-type coc1-fpc/pic/port:channel no-partition] hierarchy level.

dc—Dual-Port Channelized E1 and T1 ISDN PRI interface type. You can specify this interface
type at the [edit interfaces interface-name partition partition-number timeslot
timeslot-range] hierarchy level to create a (D) channel dc-pim/0/port to control the
B-channels.

ds—DS0 interface type. You can specify this interface type at the [edit interfaces
interface-name partition partition-number interface-type (ce1-fpc/pic/port |
tct1-fpc/pic/port<:channel>)] hierarchy level.

so—SONET/SDH interface type. You can specify this interface type at the [edit interfaces
interface-name partition partition-number oc-slice oc-slice-range interface-type
coc12-fpc/pic/port] hierarchy level.

t1—T1 interface type. You can specify this interface type at the [edit interfaces
interface-name partition partition-number oc-slice oc-slice-range interface-type
(coc12-fpc/pic/port | coc1-fpc/pic/port)] hierarchy level.
t3—T3 interface type. You can specify this interface type at the `[edit interfaces
interface-name partition partition-number oc-slice oc-slice-range interface-type
(coc12-fpc/pic/port [ coc1-fpc/pic/port:channel no-partition])]` hierarchy level.

**Required Privilege**

Hierarchy Level  [edit dynamic-profiles profile-name]

Description  Define interfaces for dynamic client profiles.

Options  interface-name—The interface variable ($junos-interface-ifd-name). The interface variable is dynamically replaced with the interface the DHCP client accesses when connecting to the router.

NOTE: Though we do not recommend it, you can also enter the specific name of the interface you want to assign to the dynamic profile.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege  Level  routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

interleave-fragments

Syntax
interleave-fragments;

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
For link services interfaces only, interleave long packets with high-priority packets.

Allows small delay-sensitive packets, such as Voice over IP (VoIP) packets, to interleave with long fragmented packets. This minimizes the latency of delay-sensitive packets.

Required Privilege
Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

### interval

**Syntax**

`interval (100ms | 10m | 10ms | 10s | 1m | 1s);`

**Hierarchy Level**

[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name continuity-check]

**Release Information**

Statement introduced in Junos OS Release 8.4.
Option `10ms` introduced in Junos OS Release 9.1.
Third-party interoperability during a unified in-service software upgrade (ISSU) introduced in Junos OS Release 17.1.

**Description**

Configure the interval between successive transmissions of continuity check messages (CCMs) as part of the connectivity fault detection strategy. When the receiving maintenance association end point (MEP) does not receive a CCM at the configured interval, the `loss-threshold` statement determines how many CCMs can be lost before the sending MEP is marked as down. The `hold-interval` statement then determines the frequency at which the database of MEPs in the maintenance association (MA) is flushed in the absence of updates.

During a unified in-service software upgrade (ISSU), Junos OS connectivity fault management (CFM) works when the peer device is not a Juniper Networks router. Interoperating with the router of another vendor, the Juniper Networks router retains session information and continues to transmit CCM (continuity check message) PDUs during the unified ISSU upgrade. For this feature to work, you must enable Packet Forwarding Engine keepalives with the `hardware-assisted-keepalives` statement, and configure the interval between CCMs to be 1 second with `interval` statement.

---

**NOTE:** For the continuity check message interval to be configured for 10 milliseconds, periodic packet management (PPM) runs on the Routing Engine and Packet Forwarding Engine by default. You can disable PPM only on the Packet Forwarding Engine. To disable PPM on the Packet Forwarding Engine, use the `no-delegate-processing` statement at the `[edit routing-options ppm]` hierarchy level.

---

**NOTE:** A continuity check interval of 10 milliseconds is not supported for CFM sessions over a label-switched interface (LSI).

**Options**

- **100ms**—100 milliseconds.
- **10m**—10 minutes.
10ms—10 milliseconds.
10s—10 seconds.
1m—1 minute.
1s—1 second.
Default: 1m

**Required Privilege**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**inverse-arp**

**Syntax**
inverse-arp;

**Hierarchy Level**
- [edit interfaces interface-name unit logical-unit-number]
- [edit interfaces interface-name unit logical-unit-number family inet address address multipoint-destination destination]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address multipoint-destination destination]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
For ATM encapsulation, enable responses to receive inverse ATM ARP requests. For Frame Relay encapsulation, enable responses to receive inverse Frame Relay ARP requests.

**Default**
Inverse ARP is disabled on all ATM and Frame Relay interfaces.

**Required Privilege**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

invert-data

Syntax
invert-data;

Hierarchy Level
[edit interfaces e1-fpc/pic/port],
[edit interfaces t1-fpc/pic/port],
[edit interfaces interface-name ds0-options],
[edit interfaces interface-name e1-options],
[edit interfaces interface-name t1-options],
[edit interfaces interface-name e3-options]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

Description
Invert the transmission of unused data bits on the DS0, E1, E3, and T1 interface.

NOTE: When configuring E1 or T1 interfaces on 10-port Channelized E1/T1 IQE PICs, the invert-data statement must be included at the [edit interfaces e1-fpc/pic/port] or [edit interfaces t1-fpc/pic/port] hierarchy level as appropriate.

Required Privilege
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

### ipsec-sa

**Syntax**  
```plaintext
ipsec-sa sa-name;
```

**Hierarchy Level**  
- `[edit interfaces es-fpc/pic/port unit logical-unit-number family inet]`,  
- `[edit logical-systems logical-system-name interfaces es-fpc/pic/port unit logical-unit-number family inet]`

**Release Information**  
Statement introduced before Junos OS Release 7.4.

**Description**  
Specify the IP Security (IPsec) security association (SA) name associated with the interface.

**Options**  
- `sa-name`—IPsec security association name.

**Required Privilege Level**  
- `interface`—To view this statement in the configuration.  
- `interface-control`—To add this statement to the configuration.

### isdn-options

**Syntax**

```plaintext
isdn-options {
    bchannel-allocation (ascending | descending);
    calling-number number;
    incoming-called-number number <reject>;
    spid1 spid-string;
    spid2 spid-string;
    static-tei-val value;
    switch-type (att5e | etsi | nil | ntdms100 | ntt);
    t310 seconds;
    tei-option (first-call | power-up);
}
```

**Hierarchy Level**

- [edit interfaces br-pim/0/port]
- [edit interfaces ct1-pim/0/port]
- [edit interfaces cel-pim/0/port]

**Release Information**

Statement introduced before Junos OS Release 7.4. 
`bchannel-allocation` option added in Junos OS Release 8.3.

**Description**

For J Series Services Routers only. Specify the ISDN options for configuring ISDN interfaces for group and user sessions.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

iteration-count

Syntax
iteration-count count-value;

Hierarchy Level
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
  md-name maintenance-association ma-name mep mep-id remote-mep remote-mep-id
  sla-iterator-profile profile-name]

Release Information
Statement introduced in Junos OS Release 11.1.

Description
Configure the number of iterations for which the connection partakes in the iterator for acquiring SLA measurements.

Options
count-value—Number of iterations for which the connection should partake in the iterator for acquiring SLA measurements.

Range: 1 through 65,535
Default: 0 (or infinite iterations)

Required Privilege
Configure—To enter configuration mode.
Control—To modify any configuration.

Related Documentation
• sla-iterator-profile on page 998
• Configuring a Remote MEP with an Iterator Profile
iteration-period

Syntax  iteration-period iteration-period-value;

Hierarchy Level  [edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles profile-name]

Statement introduced in Junos OS Release 11.4 for EX Series switches.

Description  Configure the iteration period, which is the maximum number of cycles per iteration (that is, the number of connections registered to an iterator cannot exceed this value).

Options  iteration-period-value—Maximum number of cycles per iteration.
Range: 1 through 2000
Default: 2000

Required Privilege  Level  Configure—To enter configuration mode.
Control—To modify any configuration.

Related Documentation  • Configuring an Iterator Profile
• Configuring an Iterator Profile on a Switch (CLI Procedure)
keep-address-and-control

Syntax  keep-address-and-control;

Hierarchy Level  [edit interfaces interface-name unit logical-unit-number family ccc],
                 [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family ccc]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  For interfaces with encapsulation type PPP CCC, do not remove the address and control bytes before encapsulating the packet into a tunnel.

Default  If you do not include this statement, address and control bytes are removed before encapsulating the packet into a tunnel.

Required Privilege Level  interface—To view this statement in the configuration.
                           interface-control—To add this statement to the configuration.

Related Documentation  • Disabling the Removal of Address and Control Bytes on page 210
**keepalives**

**Syntax**

```
keepalives <interval seconds> <down-count number> <up-count number>;
```

**Hierarchy Level**

- `[edit interfaces interface-name]`
- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Enable the sending of keepalives on a physical interface configured with PPP, Frame Relay, or Cisco HDLC encapsulation.

For ATM2 IQ interfaces only, you can enable keepalives on a logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- `atm-ppp-llc`—PPP over AAL5 LLC encapsulation.
- `atm-ppp-vc-mux`—PPP over AAL5 multiplex encapsulation.

**Default**

Sending of keepalives is enabled by default. The default keepalive interval is 10 seconds for PPP, Frame Relay, or Cisco HDLC. The default down-count is 3 and the default up-count is 1 for PPP or Cisco HDLC.

**Options**

- **down-count number**—The number of keepalive packets a destination must fail to receive before the network takes down a link.
  
  **Range**: 1 through 255
  
  **Default**: 3

- **interval seconds**—The time in seconds between successive keepalive requests.
  
  **Range**: 1 through 32767 seconds
  
  **Default**: 10 seconds

- **up-count number**—The number of keepalive packets a destination must receive to change a link's status from down to up.
  
  **Range**: 1 through 255
  
  **Default**: 1

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring Keepalives on page 118
- Configuring Frame Relay Keepalives
Applying PPP Attributes to L2TP LNS Subscribers per Inline Service Interface

**key**

**Syntax**
```
key number;
```

**Hierarchy Level**
```
[edit interfaces interface-name unit logical-unit-number tunnel],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number tunnel]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
For Adaptive Services PICs on M Series routers (except the M320 and M120 routers), identify an individual traffic flow within a tunnel, as defined in RFC 2890, *Key and Sequence Number Extensions to GRE*.

**Options**
```
number—Value of the key.
Range: 0 through 4,294,967,295
```

**Required Privilege Level**
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**Related Documentation**
- *Junos OS Services Interfaces Library for Routing Devices*
l2tp-interface-id

Syntax
l2tp-interface-id name;
( dedicated | shared);

Hierarchy Level
[edit interfaces sp-fpc/pic/port unit logical-unit-number interface],
[edit logical-systems logical-system-name interfaces sp-fpc/pic/port unit logical-unit-number interface]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Specify the L2TP options for configuring logical interfaces for group and user sessions.

Options
( dedicated | shared)—Specifies whether a logical interface can host one (dedicated) or multiple (shared) sessions at one time.

name—Interface identifier that must be replicated at the [edit access profile name] hierarchy level.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
• Junos OS Services Interfaces Library for Routing Devices
lACP (Protocols)

Syntax

```
lacp {
  traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
  }
  fast-hello-issu;
  ppm (Ethernet Switching) centralized;
}
```

Hierarchy Level

[edit protocols]

Release Information

Statement introduced in Junos OS Release 9.3.
The `ppm centralized` option introduced in Junos OS Release 9.4.
The `fast-hello-issu` option introduced in Junos OS Release 14.1.

Description

On MX and T Series routers, you can specify periodic packet management (PPM) as centralized. By default, the PPM is distributed.

MX Series routers support Link Aggregation Control Protocol (LACP) with fast hellos during unified ISSU. This support is disabled by default. You must enable the `fast-hello-issu` option on the main router and on the peer routers before starting unified ISSU. Note that the peer router must also be an MX Series router for this functionality to work.

Default

Distributed PPM processing is enabled for all packets that use PPM.

Options

- `ppm`—Set PPM to centralized.
- `fast-hello-issu`—Enable LACP with fast hellos during unified ISSU.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

Related Documentation

- Tracing LACP Operations
- Unified ISSU System Requirements
**lACP (802.3AD)**

**Syntax**
```
lACP {
  port-priority port-priority,
}
```

**Hierarchy Level**
[edit interfaces interface-name fastether-options 802.3ad],
[edit interfaces interface-name gigether-options 802.3ad]

**Release Information**
Statement introduced in Junos OS Release 9.3.

**Description**
Configure the Link Aggregation Control Protocol (LACP) port priority for Ethernet interfaces.

**Options**
- `port-priority`—Priority for being elected as the active port to collect and distribute traffic.
  - A smaller value indicates a higher priority for selection.
  - **Range:** 0 through 65,535
  - **Default:** 127

**Required Privilege Level**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**
- [Configuring LACP for Aggregated Ethernet Interfaces](#)
- [port-priority on page 907](#)
lACP (Aggregated Ethernet)

List of Syntax  
Syntax (NFX Series) on page 723  
Syntax (EX Series) on page 723

Syntax (NFX Series)  
lACP (active | passive) {  
  admin-key key;  
  fast-failover;  
  link-protection {  
    disable;  
    (revertive | non-revertive);  
  }  
  periodic interval  
  system-ID mac-address;  
  system-priority priority;  
  force-up;  
}

Syntax (EX Series)  
lACP {  
  (active | passive);  
  admin-key key;  
  accept-data;  
  fast-failover;  
  link-protection {  
    disable;  
    (revertive | non-revertive);  
  }  
  periodic interval;  
  system-id mac-address;  
  system-priority priority;  
}

Hierarchy Level (EX Series)  
[edit interfaces aeX aggregated-ether-options]  
[edit logical-systems logical-system-name interfaces aeX aggregated-ether-options]

Hierarchy Level (NFX Series)  
[edit interfaces interface-name aggregated-ether-options]

Release Information  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description  
Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces. The remaining statement is explained separately.

For EX Series, when you configure the accept-data statement at the [edit interfaces aeX aggregated-ether-options lACP] hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.
NOTE: When you configure the accept-data statement at the [edit interfaces aeX aggregated-ether-options lacp] hierarchy level, this behavior occurs:

- By default, the accept-data statement is not configured when LACP is enabled.
- You can configure the accept-data statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.
- When LACP is down and a member link receives packets, the router or switch does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the accept-data statement is configured.

NOTE: The force-up statement is not supported on QFX10002 switches.

**Default**
If you do not specify LACP as either active or passive, LACP remains passive.

**Options**
- **active**—Initiate transmission of LACP packets.
- **admin-key number**—Specify an administrative key for the router or switch.

**fast-failover**—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.

- **passive**—Respond to LACP packets.

The remaining statements are explained separately. See CLI Explorer.

**Required Privilege**
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

layer2-policer

Syntax

layer2-policer {
  input-policer policer-name;
  input-three-color policer-name;
  output-policer policer-name;
  output-three-color policer-name;
}

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number],

Release Information

Statement introduced in Junos OS Release 8.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

For 1-Gigabit Ethernet and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces on M Series, MX Series, and T Series routers, and for aggregated Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces on EX Series switches, apply Layer 2 logical interface policers. The following policers are supported:

- Two-color
- Single-rate tricolor marking (srTCM)
- Two-rate tricolor marking (trTCM)

Two-color and tricolor policers are configured at the [edit firewall] hierarchy level.

Options

input-policer policer-name—Two-color input policer to associate with the interface. This statement is mutually exclusive with the input-three-color statement.

input-three-color policer-name—Tricolor input policer to associate with the interface. This statement is mutually exclusive with the input-policer statement.

output-policer policer-name—Two-color output policer to associate with the interface. This statement is mutually exclusive with the output-three-color statement.

output-three-color policer-name—Tricolor output policer to associate with the interface. This statement is mutually exclusive with the output-policer statement.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

**lcp-max-conf-req**

**Syntax**  
```
lcp-max-conf-req number
```

**Hierarchy Level**  
```
[edit interfaces so-fpc/pic/port unit number ppp-options]
```

**Release Information**  

**Description**  
Set the maximum number of LCP Configure-Requests to be sent, after which the router goes to LCP down state.

**Options**  
`number`—From 0 to 65,535, where 0 means send infinite LCP Configure-Requests, and any other value specifies the maximum number LCP Configure-Requests to send and then stop sending.

**Default**  
254

**Required Privilege Level**  
interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**  
- Configuring the LCP Configure-Request Maximum Sent on page 178
- `ppp-options` on page 910
lcp-restart-timer

Syntax  lcp-restart-timer milliseconds;

Hierarchy Level  [edit interfaces interface-name unit logical-unit-number ppp-options],
  [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options]

Description  For interfaces with PPP, PPP TCC, PPP over Ethernet, PPP over ATM, and PPP over Frame Relay encapsulations, configure a restart timer for the Link Control Protocol (LCP) component of a PPP session.

Options  milliseconds—The time, in milliseconds, between successive LCP configuration requests.
  Range:  20 through 10000 milliseconds
  Default:  3 seconds

Required Privilege  interface—To view this statement in the configuration.
  interface-control—To add this statement to the configuration.

Related Documentation  • Configuring the PPP Restart Timers on page 177
level

Syntax  level number;

Hierarchy Level  [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]

Description  A number used in connectivity fault management (CFM) messages to identify the maintenance association. The number is embedded in each of the CFM frames. CFM messages within a given level are processed by maintenance end points (MEPs) at the same level. For example, the operator domain can be level 0, the provider domain can be level 3, and the customer domain can be level 7.

Options  number—A number used to identify the maintenance domain to which the CFM message belongs. 
  Range: 0 through 7

Required Privilege
Level  interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation

**line-encoding**

**Syntax**

```
line-encoding (ami | b8zs);
```

**Hierarchy Level**

```
[edit interfaces ct1-fpc/pic/port],
[edit interfaces interface-name t1-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

**Description**

Set the line encoding format on the T1 interface.

---

**NOTE:** When configuring CT1 interfaces on the 10-port Channelized E1/T1 IQE PIC, the line-encoding statement must be included at the [edit interfaces ct1-fpc/pic/port] hierarchy level.

**Default**

The default line encoding is B8ZS.

**Options**

- `ami`—Use Alternate Mark Inversion (AMI) line encoding.
- `b8zs`—Use bipolar with 8-zeros substitution (B8ZS) line encoding.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- *Configuring T1 Line Encoding*
line-protocol

Syntax

    line-protocol protocol;

Hierarchy Level

    [edit interfaces interface-name serial-options]

Release Information

    Statement introduced before Junos OS Release 7.4.

Description

    For serial interfaces only, configure the line protocol.

Options

    protocol—You can specify the one of the following line protocols:
    • eia530—Line protocol EIA-530
    • v.35—Line protocol V.35
    • x.21—Line protocol X.21

Required Privilege

    interface—To view this statement in the configuration.
    interface-control—To add this statement to the configuration.

Related Documentation

    • Configuring the Serial Line Protocol on page 318
**line-rate**

**Syntax**

```
line-rate line-rate;
```

**Hierarchy Level**

```editor
[edit interfaces interface-name shdsl-options],
[edit logical-systems logical-system-name interfaces interface-name shdsl-options]
```

**Release Information**

Statement introduced in Junos OS Release 7.4.

**Description**

For J Series Services Routers only, configure the SHDSL line rate.

**Options**

`line-rate`—SHDSL line rate, in Kbps. Possible values are:

- **2-wire** (Kbps): 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960, 1024, 1088, 1152, 1216, 1280, 1344, 1408, 1472, 1536, 1600, 1664, 1728, 1792, 1856, 1920, 1984, 2048, 2112, 2176, 2240, 2304, auto

- **4-wire** (Kbps): 384, 512, 640, 768, 896, 1024, 1152, 1280, 1408, 1536, 1664, 1792, 1920, 2048, 2176, 2304, 2432, 2560, 2688, 2816, 2944, 3072, 3200, 3328, 3456, 3584, 3712, 3840, 3968, 4096, 4224, 4352, 4480, 4608

**Default:** For 2-wire mode, **auto**; for 4-wire mode, **4608** Kbps

**Required Privilege**

`interface`—To view this statement in the configuration.

`interface-control`—To add this statement to the configuration.
### linear-red-profile

**Syntax**

 linear-red-profile *profile-name*;

**Hierarchy Level**

[edit interfaces at-fpc/pic/port atm-options scheduler-maps map-name forwarding-class class-name]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For ATM2 IQ interfaces only, assign a linear RED profile to a specified forwarding class. To define the linear RED profiles, include the `linear-red-profiles` statement at the [edit interfaces at-fpc/pic/port atm-options] hierarchy level.

**Default**

If you do not include either the `epd-threshold` or the `linear-red-profile` statement in the forwarding class configuration, the Junos OS uses an EPD threshold based on the available bandwidth and other parameters.

**Options**

`profile-name`—Name of the linear RED profile.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring an ATM Scheduler Map
- linear-red-profiles on page 734
- Applying Scheduler Maps to ATM Interfaces
- `epd-threshold`
linear-red-profiles

Syntax

```
linear-red-profiles profile-name {
  high-plp-threshold percent;
  low-plp-threshold percent;
  queue-depth cells;
}
```

Hierarchy Level

```
[edit interfaces at-fpc/pic/port atm-options]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For ATM2 IQ interfaces only, define CoS virtual circuit drop profiles for RED. When a packet arrives, RED checks the queue fill level. If the fill level corresponds to a nonzero drop probability, the RED algorithm determines whether to drop the arriving packet.

Options

```
profile-name—Name of the drop profile.
```

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

```
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.
```

link-adjacency-loss

Syntax        link-adjacency-loss;

Hierarchy Level [edit protocols oam ethernet link-fault-management action-profile event ]

Release Information Statement introduced in Junos OS Release 8.5.

Description Loss of adjacency with IEEE 802.3ah link-fault management peer event. When included, the loss-of-adjacency event triggers the action specified under the action statement.

Required Privilege Level interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Related Documentation • Monitoring the Loss of Link Adjacency

link-discovery

Syntax        link-discovery (active | passive);

Hierarchy Level [edit protocols oam ethernet link-fault-management interface interface-name ]

Release Information Statement introduced in Junos OS Release 8.2.

Description For Ethernet interfaces on EX Series switches, and M320, M120, MX Series, and T Series routers, specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Management (OAM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs.

Options (active | passive)—Passive or active mode. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. Once the discovery process is initiated, both sides participate in discovery.

Required Privilege Level interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Related Documentation • Configuring Link Discovery
link-down

Syntax     link-down;

Hierarchy Level   [edit protocols oam ethernet link-fault-management ]

Release Information  Statement introduced in Junos OS Release 8.5.

Description  Mark the interface down for transit traffic.

Required Privilege Level
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

      frame-error count;
      frame-period count;
      frame-period-summary count;
      symbol-period count;
    }
    negotiation-options {
      allow-remote-loopback;
      no-allow-link-events;
    }
  }
}
```

Hierarchy Level

[edit protocols oam ethernet]

Release Information

Statement introduced in Junos OS Release 8.2.

Description

For Ethernet interfaces on M320, M120, MX Series, and T Series routers and EX Series switches, specify fault signaling and detection for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately. See CLI Explorer.
link-layer-overhead

Syntax  
link-layer-overhead percent;

Hierarchy Level  
[edit interfaces interface-name m1fr-uni-nni-bundle-options],  
[edit interfaces interface-name unit logical-unit-number],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For AS PIC or MultiServices PIC link services IQ interfaces (lsq) only, configure the percentage of total bundle bandwidth to be set aside for link-layer overhead.

Options  
percent—Percentage of total bundle bandwidth to be set aside for link-layer overhead.  
Range: 0 through 50 percent  
Default: 4 percent

Required Privilege  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation  
• Enabling IEEE 802.3ah OAM Support  
• Junos OS Services Interfaces Library for Routing Devices
link-mode

Syntax  
link-mode mode (automatic | full-duplex | half-duplex);

Hierarchy Level  
[edit interfaces interface-name],
[edit interfaces interface-name ether-options],
[edit interfaces ge-pim/0/0 switch-options switch-port port-number]

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description  
Set the device’s link connection characteristic.

Options  
mode—Link characteristics:

• automatic—Link mode is negotiated. This is the default for EX Series switches.
• full-duplex—Connection is full duplex.
• half-duplex—Connection is half duplex.

Default: Fast Ethernet interfaces can operate in either full-duplex or half-duplex mode. The router’s or switch’s management Ethernet interface, fpx0 or em0, and the built-in Fast Ethernet interfaces on the FIC (M7i router) autonegotiate whether to operate in full-duplex or half-duplex mode. Unless otherwise noted here, all other interfaces operate only in full-duplex mode.

NOTE: On EX Series switches, if no-auto-negotiation is specified in [edit interfaces interface-name ether-options], you can select only full-duplex or half-duplex. If auto-negotiation is specified, you can select any mode.

NOTE:
• Member links of an aggregated Ethernet bundle must not be explicitly configured with a link mode. You must remove any such link-mode configuration before committing the aggregated Ethernet configuration.
• Starting with Junos OS release 17.4R1 and later, the link-mode configuration is not supported for 10-Gigabit Ethernet interfaces.
• Starting in Junos OS release 18.4R1, half-duplex mode is supported on SRX340 and SRX345 devices.
**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

link-protection

Syntax

```plaintext
link-protection {
  disable;
  (revertive | non-revertive);
}
```

Hierarchy Level

- [edit interfaces aex aggregated-ether-options]
- [edit interfaces aex aggregated-ether-options lacp]

Release Information

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.
Support for disable, revertive, and non-revertive statements added in Junos OS Release 9.3.

Description

On the router, for aggregated Ethernet interfaces only, configure link protection. In addition to enabling link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the primary and backup statements at the [edit interfaces ge-fpc/pic/port gigether-options 802.3ad aex] hierarchy level or the [edit interfaces fe-fpc/pic/port fastether-options 802.3ad aex] hierarchy level.

On the switch, you can configure either Junos OS link protection for aggregated Ethernet interfaces or the LACP standards link protection for aggregated Ethernet interfaces.

For Junos OS link protection, specify `link-protection` at the following hierarchy levels:

- [edit interfaces ge-fpc/pic/port ether-options 802.3ad aex]
- [edit interfaces xe-fpc/pic/port ether-options 802.3ad aex] hierarchy level or at the [edit interfaces xe-fpc/pic/port ether-options 802.3ad aex] hierarchy level.

To disable link protection, use the `delete interface ae aggregate-ether-options link-protection` statement at the [edit interfaces aex aggregated-ether-options] hierarchy level or the [edit interfaces aex aggregated-ether-options lacp]] hierarchy level.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

**link-speed (Aggregated Ethernet)**

**Syntax**

```
link-speed speed;
```

**Hierarchy Level (EX Series)**

- [edit interfaces aex aggregated-ether-options],
- [edit interfaces interface-range name aggregated-ether-options],
- [edit interfaces interface-range name aggregated-sonet-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
mixed option added in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers and 15.1F6 and 16.1R2 for PTX3000 routers.

**Description**

For aggregated Ethernet interfaces only, set the required link speed.

**Options**

*speed*—For aggregated Ethernet links, you can specify *speed* in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation *k* (1000), *m* (1,000,000), or *g* (1,000,000,000).

Aggregated Ethernet links on the M120 router can have one of the following speeds:

- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **oc192**—Links are OC192 or STM64c.

Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:

- **10m**—Links are 10 Mbps.
- **100m**—Links are 100 Mbps.
- **1g**—Links are 1 Gbps.
- **10g**—Links are 10 Gbps.

Aggregated Ethernet links on T Series, MX Series, PTX Series routers, and QFX5100, QFX10002, QFX10008, and QFX10016 switches can be configured to operate at one of the following speeds:

- **100g**—Links are 100 Gbps.
- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **40g**—Links are 40 Gbps.
- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

**mixed**—Enables bundling of different Ethernet rate links in the same Aggregated Ethernet interface.

**Required Privilege Level**
- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

**link-speed (Aggregated SONET/SDH)**

**Syntax**
```
link-speed (speed | mixed);
```

**Hierarchy Level**
```
[edit interfaces asx aggregated-sonet-options]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.  
mixed option added in Release 8.0.

**Description**
For aggregated SONET/SDH interfaces only, set the required link speed.

**Options**

- `speed`—Aggregated SONET/SDH links can have one of the following speed values.
  - `oc3`—Links are OC3c or STM1c.
  - `oc12`—Links are OC12c or STM4c.
  - `oc48`—Links are OC48c or STM16c.
  - `oc192`—Links are OC192c or STM64c.
  - `oc768`—Links are OC768c or STM256c.

- `mixed`—For aggregated SONET/SDH links on T Series routers, you can mix interface speeds in SONET/SDH aggregation bundles. Interface speeds from OC3 through OC768 are supported.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.  
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

lmi (Frame Relay)

Syntax

```plaintext
lmi {
    lmi-type (ansi | itu | c-lmi);
    n391dte number;
    n392dce seconds;
    n392dte number;
    n393dce number;
    n393dte number;
    t391dte number;
    t392dce seconds;
}
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Set Frame Relay keepalive parameters.

Options

**n391dte**—DTE full status polling interval.
- **Range:** 1 through 255
- **Default:** 6

**n392dce**—DCE error threshold, in number of errors.
- **Range:** 1 through 10
- **Default:** 3

**n392dte**—DTE error threshold, in number of errors.
- **Range:** 1 through 10
- **Default:** 3

**n393dce**—DCE monitored event-count.
- **Range:** 1 through 10
- **Default:** 4

**n393dte**—DTE monitored event-count.
- **Range:** 1 through 10
- **Default:** 4

**t391dte**—DTE polling timer.
- **Range:** 5 through 30 seconds
- **Default:** 10 seconds

**t392dce**—DCE polling timer.
- **Range:** 5 through 30 seconds
- **Default:** 15 seconds
The remaining statements are explained separately. See CLI Explorer.

lmi (Ethernet OAM)

Syntax

```
lmi {
    status-counter count;
    polling-verification-timer value;
    interface name {
        uni-id uni-name;
        status-counter number;
        polling-verification-timer value;
        evc-map-type (all-to-one-bundling | bundling | service-multiplexing);
        evc evc-name {
            default-evc;
            vlan-list vlan-id-list;
        }
    }
}
```

Hierarchy Level
[edit protocols oam ethernet]

Release Information
Statement introduced in Junos OS Release 9.5.

Description
On routers with ge, xe, or ae interfaces, configure an OAM Ethernet Local Management Interface (E-LMI).

NOTE: On MX Series routers, E-LMI is supported on Gigabit Ethernet (ge), 10-Gigabit Ethernet (xe), and Aggregated Ethernet (ae) interfaces configured on MX Series routers with DPC only.

Options

- **status-counter count**—Status counter (N393), defaults to 4.
- **interface name**—Polling verification timer (T392), defaults to 15 seconds.
- **uni-id uni-name**—(Optional) Defaults to the physical interface name.
- **status-counter number**—(Optional) Defaults to a global value.
- **polling-verification-timer value**—(Optional) Defaults to a global value.
- **evc-map-type (all-to-one-bundling | bundling | service-multiplexing)**—Specify the Ethernet virtual connection (EVC) map type.
- **evc evc-name**—Specify the name of the EVC.
- **default-evc**—Set the specified EVC as the default EVC.
- **vlan-list vlan-id-list**—Specify a group of VLANs to assign to the EVC.
### lmi-type

**Syntax**

```
lmi-type (ansi | itu | c-lmi);
```

**Hierarchy Level**

```
[edit interfaces interface-name lmi],
[edit interfaces interface-name mlfr-uni-nni-bundle-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Set Frame Relay Local Management Interface (LMI) type.

---

**NOTE:** Consortium LMI is supported on all MPCs and I-chip based FPCs.

**Options**

- **ansi**—Use ANSI T1.617 Annex D LMIs.
- **itu**—Use ITU Q933 Annex A LMIs.
- **c-lmi**—Use Consortium LMI.

**Default:** ansi

---

**Required Privilege Level**

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

load-interval

Syntax

load-interval seconds;

Hierarchy Level

[edit interfaces dl unit logical-unit-number dialer-options],
[edit logical-systems logical-system-name interfaces dl unit logical-unit-number dialer-options]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

On J Series Services Routers with ISDN logical interfaces, specify the interval used to calculate the average load on the network. By default, the average interface load is calculated every 60 seconds.

Options

seconds—Number of seconds at which the average load calculation is triggered.

Range: 20 through 180, in 10-second intervals

Default: 60 seconds

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation

**load-threshold**

**Syntax**

load-threshold *percent*;

**Hierarchy Level**

[edit interfaces dln *unit logical-unit-number* dialer-options],
[edit logical-systems *logical-system-name* interfaces dln *unit logical-unit-number* dialer-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

On J Series Services Routers with ISDN logical interfaces, specify the bandwidth threshold percentage used for adding interfaces. Another link is added to the multilink bundle when the load reaches the threshold value you set. Specify a percentage between 0 and 100.

**Options**

*percent*—Bandwidth threshold percentage used for adding interfaces. When set to 0, all available channels are dialed.

- **Range**: 0 through 100 seconds
- **Default**: 100 seconds

**Required Privilege Level**

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

- [edit dynamic-profiles profile-name interfaces pp0 unit "$junos-interface-unit" ppp-options]
- [edit dynamic-profiles profile-name interfaces "$junos-interface-ifd-name" unit "$junos-interface-unit" ppp-options]

**Release Information**

**Description**
Specify the name of the interface used for CHAP or PAP authentication. Dynamic interfaces are supported only for CHAP authentication.

For ATM2 IQ interfaces only, you can configure a CHAP local name on the logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- **atm-ppp-llc**—PPP over AAL5 LLC encapsulation.
- **atm-ppp-vc-mux**—PPP over AAL5 multiplex encapsulation.

**Options**

- **name**—Name of the interface used as an identifier in CHAP challenge and response packets or PAP request and response packets.

**Default:** When you do not include the `local-name` statement in the configuration, the interface sends the router’s system hostname in CHAP challenge and response packets or PAP request and response packets.

**Range:** For CHAP authentication, a string of 1 through 32 characters. For PAP authentication, a string of 1 through 8 characters.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

### local-password

**Syntax**

```bash
local-password password;
```

**Hierarchy Level**

-[edit interfaces interface-name ppp-options pap],
-[edit interfaces interface-name unit logical-unit-number ppp-options pap],
-[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options pap]

**Release Information**

Statement introduced in Junos OS Release 8.3.

**Description**

Configure the host password for sending PAP requests.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring the Local Password
- Configuring the PPP Password Authentication Protocol On a Physical Interface on page 124

### lockout

**Syntax**

```bash
lockout;
```

**Hierarchy Level**

-[edit interfaces interface-name sonet-options aps]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Configure a lockout of protection, forcing the use of the working circuit and locking out the protect circuit regardless of anything else.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

logical-interface-fpc-redundancy (Aggregated Ethernet Subscriber Interfaces)

Syntax

logical-interface-fpc-redundancy;

Hierarchy Level

[edit interfaces ae number aggregated-ether-options]

Release Information

Statement introduced in Junos OS Release 11.2.
Statement introduced in Junos OS Release 13.2R2 for EX Series switches.

Description

Provide module redundancy for demux subscribers on aggregated Ethernet bundles configured with targeted distribution. Backup links for a subscriber are chosen on a different EQ DPC or MPC from the primary link, based on the link with the fewest number of subscribers among the links on different modules. If all links are on a single module when this is configured, backup links are not provisioned.

By default, link redundancy is provided for the aggregated Ethernet bundle.

Required Privilege

Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

**logical-interface-policer**

**Syntax**

`logical-interface-policer;`

**Hierarchy Level**

- `[edit dynamic-profiles profile-name firewall policer policer-name]`
- `[edit dynamic-profiles profile-name firewall three-color-policer name]`
- `[edit firewall atm-policer atm-policer-name]`
- `[edit firewall policer policer-name]`
- `[edit firewall policer policer-template-name]`
- `[edit firewall three-color-policer policer-name]`
- `[edit logical-systems logical-system-name firewall policer policer-name]`
- `[edit logical-systems logical-system-name firewall three-color-policer name]`

**Release Information**

Statement introduced before Junos OS Release 7.4.

Support at the `[edit firewall three-color-policer policer-name]` hierarchy level introduced in Junos OS Release 8.2.

Logical systems support introduced in Junos OS Release 9.3.

Support at the `[edit dynamic-profiles ... policer policer-name]` and `[edit dynamic-profiles ... three-color-policer name]` hierarchy levels introduced in Junos OS Release 11.4.

Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Support for PTX series routers with third-generation FPCs added in Junos OS Release 18.3R1.

**Description**

Configure a logical interface policer. For PTX series routers running Junos OS Release 18.3R1 or later, you can use this command to configure separate firewall filters for different family address types (IPv4 and IPv6) that share the same interface, and configure the same policer as an action for the filter.

To configure the aggregate policer, configure the firewall policer you want to use as `logical-interface-policer`. And at the `firewall family family-name filter filter-name` hierarchy level where you will reference the policer, make the policer an `interface-specific` firewall filter action.

The sample configuration shows the relationship.

```plaintext
firewall {
    policer Shared_Policer {
        logical-interface-policer;
        if-exceeding {
            bandwidth-limit 100m;
            burst-size-limit 500k;
        }
        then {
            discard;
        }
    }
}
```
family inet {
  filter filter_name{
    interface-specific;
    term term_name {
      then {
        policer Shared_Policer;
        count cinet;
      }
    }
  }
}

NOTE: Starting in Junos OS Release 12.2R2, on T Series Core Routers only, you can configure an MPLS LSP policer for a specific LSP to be shared across different protocol family types. You must include the logical-interface-policer statement to do so.

Required Privilege Level
- firewall—To view this statement in the configuration.
- firewall-control—To add this statement to the configuration.

### logical-systems

**Syntax**

```
logical-systems {
  logical-system-name {
    ...logical-system-configuration...
  }
}
```

**Hierarchy Level**

[edit]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement name changed from `logical-routers` in Junos OS Release 9.3.

**Description**

Configure a logical system.

**Options**

- `logical-system-name`—Name of the logical system.

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**Related Documentation**

- *Logical Systems Feature Guide for Routers and Switches*
### long-buildout

**Syntax**  
(long-buildout | no-long-buildout);

**Hierarchy Level**  
[edit interfaces interface-name t3-options]

**Release Information**  
Statement introduced before Junos OS Release 7.4.

**Description**  
Configure the T3 line buildout. A T3 interface has two settings for the T3 line buildout: a short setting, which is less than 255 feet (68 meters), and a long setting, which is greater than 255 feet and shorter than 450 feet (137 meters).

This statement applies to copper-cable-based T3 interfaces only. You cannot configure a line buildout for a DS3 channel on a channelized OC12 interface, which runs over fiber-optic cable.

**Default**  
A T3 interface uses the short line buildout setting (**no-long-buildout**) for wires shorter than 255 feet (68 meters).

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**  
- Configuring the T3 Line Buildout
loop-timing

Syntax  (loop-timing | no-loop-timing);

Hierarchy Level  [edit interfaces ct3-fpc/pic/port t3-options],
                 [edit interfaces e1-fpc/pic/port:0 sonet-options],
                 [edit interfaces stm1-fpc/pic/port sonet-options]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  For channelized IQ interfaces and non-IQ channelized STMI interfaces only, configure
              the SONET/SDH or DS3-level clocking source.

NOTE: On M Series, MX Series, and T Series routers, under E1 channels, loop
timing can be configured only at channel 0. When you configure on channel
0, it is applicable on all channels as internal by default.

Options  loop-timing—Configure loop timing (external) clocking.
         no-loop-timing—Configure line timing (internal) clocking.
Default: no-loop-timing

Required Privilege Level  interface—To view this statement in the configuration.
                          interface-control—To add this statement to the configuration.

Related Documentation  • Configuring Channelized IQ and IQE SONET/SDH Loop Timing

**loopback (ADSL, DS0, E1/E3, SONET/SDH, SHDSL, and T1/T3)**

**Syntax**

```
loopback (local | payload | remote);
```

**Hierarchy Level**

```
[edit interfaces ce1-fpc/pic/port],
[edit interfaces ct1-fpc/pic/port],
[edit interfaces t1-fpc/pic/port],
[edit interfaces interface-name ds0-options],
[edit interfaces interface-name dsl-options],
[edit interfaces interface-name e1-options],
[edit interfaces interface-name e3-options],
[edit interfaces interface-name shdsl-options],
[edit interfaces interface-name sonet-options],
[edit interfaces interface-name t1-options],
[edit interfaces interface-name t3-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

**Description**

Configure a loopback connection. To turn off the loopback capability, remove the `loopback` statement from the configuration.

**NOTE:** When configuring CE1 or CT1 interfaces on 10-port Channelized E1/T1 IQE PICs, the loopback statement must be included with the local or remote option at the `[edit interfaces ce1-fpc/pic/port]` or `[edit interfaces ct1-fpc/pic/port]` hierarchy level as appropriate.

When configuring T1 interfaces on 10-port Channelized E1/T1 IQE PICs, the loopback statement must be included with the payload option at the `[edit interfaces t1-fpc/pic/port]` hierarchy level.

**NOTE:** When configuring CE1 or CT1 interfaces on the 16-port Channelized E1/T1 MIC (MIC-3D-16CHE1-T1-CE), you must include the loopback statement at the `[edit interfaces ce1-fpc/pic/port]` hierarchy level, or `[edit interfaces ct1-fpc/pic/port]`.

To configure loopback on channelized IQ and IQE PICs, SONET/SDH level, use the `sonet-options loopback` statement local and remote options at the controller interface (coc48, cstm16, coc12, cstm4, coc3, cstm1). It is ignored for path-level interfaces `so-fpc/pic/port` or `so-fpc/pic/port:channel`. 
Options  

local—Loop packets, including both data and timing information, back on the local router’s PIC. NxDS0 IQ interfaces do not support local loopback.

payload—For channelized T3, T1, and NxDS0 IQ interfaces only, loop back data only (without clocking information) on the remote router’s PIC. With payload loopback, overhead is recalculated. Neither ATM-over-asymmetrical digital subscriber line (ADSL) interfaces nor ATM-over-SHDSL interfaces support payload loopback.

remote—Loop packets, including both data and timing information, back on the remote router’s interface card. NxDS0 IQ interfaces do not support remote loopback.

Required Privilege 

interface—to view this statement in the configuration.

interface-control—to add this statement to the configuration.

loopback (Aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet)

Syntax
(loopback | no-loopback);

Hierarchy Level
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options],
[edit interfaces interface-range name ether-options]

For QFX Series and EX Series:
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name ether-options],

For SRX Series Devices and vSRX:
[edit interfaces interface-name redundant-ether-options]

Release Information
Statement introduced before Junos OS Release 7.4 for MX Series.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Statement modified in Junos OS Release 9.2 for the SRX Series.

Description
For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces, enable or disable loopback mode.

NOTE:
- By default, local aggregated Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces connect to a remote system.
- IPv6 Neighbor Discovery Protocol (NDP) addresses are not supported on Gigabit Ethernet interfaces when loopback mode is enabled on the interface. That is, if the loopback statement is configured at the [edit interfaces ge-fpc/pic/port gigether-options] hierarchy level, an NDP address cannot be configured at the [edit interfaces ge-fpc/pic/port unit logical-unit-number family inet6 address] hierarchy level.

Default
By default, loopback is disabled.
Required Privilege Level: interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

**loopback (Serial)**

**Syntax**

```plaintext
loopback mode;
```

**Hierarchy Level**

```
[edit interfaces interface-name serial-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Configure a loopback connection.

**Default**

If you do not include this statement, there is no loopback connection.

**Options**

`mode`—You can specify the one of the following loopback modes:

- **dce-local**—For EIA-530 interfaces only, loop packets back on the local DCE.
- **dce-remote**—For EIA-530 interfaces only, loop packets back on the remote DCE.
- **local**—Loop packets back on the local router's PIC.
- **remote**—Loop packets back on the line interface unit (LIU).

**Required Privilege Level**

interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

**Related Documentation**

loopback-clear-timer

Syntax

```
loopback-clear-timer seconds;
```

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number ppp-options],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options]

Release Information

Statement introduced in Junos OS Release 8.5.

Description

For interfaces with PPP, PPP TCC, PPP over Ethernet, PPP over ATM, and PPP over Frame Relay encapsulations, configure a loop detection clear timer for the Link Control Protocol (LCP) component of a PPP session.

Options

seconds—The time in seconds to wait before the loop detection flag is cleared if it is not cleared by the protocol.

Range: 1 through 60 seconds

Default: 9 seconds

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

loss-priority

Syntax  
loss-priority (high | low);

Hierarchy Level  
[edit interfaces interface-name gigether-options ethernet-switch-profile ethernet-policer-profile output-priority-map classifier premium forwarding-class class-name]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
Specify the packet loss priority value.

Options  
high—Packet has high loss priority.

low—Packet has low loss priority.

Required Privilege  
interface—to view this statement in the configuration.

interface-control—to add this statement to the configuration.

Related Documentation  
• Specifying an Output Priority Map
loss-threshold

Syntax  loss-threshold number;

Hierarchy Level  [edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name continuity-check]

Release Information  Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport
Routers.

Description  Specify the number of continuity check messages lost before marking the remote MEP
as down. The value can be from 3 to 256 protocol data units (PDUs). The default value
is 3 PDUs.

Options  number—The number of continuity check messages that can be lost before the remote
MEP is considered down.

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

lowest-priority-defect

### Syntax

```
lowest-priority-defect (all-defects | err-xcon | mac-rem-err-xcon | no-defect | rem-err-xcon | xcon)
```

### Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name mep mep-id]
```

### Release Information

Statement introduced in Junos OS Release 10.0.

### Description

Specify the lowest priority defect that is allowed to generate a Fault Alarm whenever CFM detects a defect. This configuration is done at the MEP level.

### Options

Specify one of the following lowest priority defect options:

- **all-defects**—Allows all defects.
- **err-xcon**—Allows only erroneous CCM and cross-connect CCM defects.
- **mac-rem-err-xcon**—Allows only MAC, not receiving CCM, erroneous CCM, and cross-connect defects.
- **no-defect**—Allows no defects.
- **rem-err-xcon**—Allows only not receiving CCM, erroneous CCM, and cross-connect CCM defects.
- **xcon**—Allows only cross-connect CCM defects.

### Required Privilege Level

mac-learn-enable

Syntax

mac-learn-enable;

Hierarchy Level

[edit interfaces interface-name gigether-options ethernet-switch-profile]
[edit interfaces aex aggregated-ether-options ethernet-switch-profile]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, for 100-Gigabit Ethernet Type 5 PIC with CFP, and for MPC3E, MPC4E, MPC5E, MPC5EQ, and MPC6E MPCs, configure dynamic learning of the source and destination MAC addresses. By default, the interface is not allowed to dynamically learn source and destination MAC addresses.

To disable dynamic learning of the source and destination MAC addresses after it has been configured, you must delete mac-learn-enable from the configuration.

MPCs support MAC address accounting for an individual interface or an aggregated Ethernet interface member link only after the interface has received traffic from the MAC source. If traffic is only exiting an interface, the MAC address is not learned and MAC address accounting does not occur.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

• Configuring MAC Address Filtering
• Configuring MAC Address Accounting
mac-validate

Syntax
mac-validate (loose | strict);

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number family family]

Release Information
Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description
Enable IP and MAC address validation for static Ethernet and IP demux interfaces.

Options
loose—Forwards incoming packets when both the IP source address and the MAC source address match one of the trusted address tuples. Drops packets when the IP source address matches one of the trusted tuples, but the MAC address does not match the MAC address of the tuple. Continues to forward incoming packets when the source address of the incoming packet does not match any of the trusted IP addresses.

strict—Forwards incoming packets when both the IP source address and the MAC source address match one of the trusted address tuples. Drops packets when the MAC address does not match the tuple’s MAC source address, or when IP source address of the incoming packet does not match any of the trusted IP addresses.

Required Privilege
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
Support for multiple down MEP introduced in Junos OS Release 15.1R1 for MX Series Routers.

Description

Configure the name of the maintenance domain in IEEE-compliant format.
NOTE: For MX Series Routers, you can configure multiple down MEPs for a single instance of maintenance domain identifier and maintenance association name to monitor services provided on Virtual Private LAN Service (VPLS), bridge, circuit cross-connect (CCC), and IPv4 domains.

Options  
**domain-name**—Name of the maintenance domain.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege**

**Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Creating a Maintenance Domain
- Configuring a MEP to Generate and Respond to CFM Protocol Messages

### master-only

**Syntax**

master-only;

**Hierarchy Level**

- [edit groups rex interfaces (fxp0 | em0) unit logical-unit-number family family address],
- [edit groups rex logical-systems logical-system-name interfaces fxp0 unit logical-unit-number family family address],
- [edit interfaces (fxp0 | em0) unit logical-unit-number family family address],
- [edit logical-systems logical-system-name interfaces fxp0 unit logical-unit-number family family address]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Configure the IP address to be used when the Routing Engine is the current master.

**Required Privilege**

**Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring a Consistent Management IP Address
- CLI User Guide
maximum-contexts

Syntax  maximum-contexts number <force>;

Hierarchy Level  [edit interfaces interface-name unit logical-unit-number compression rtp],
     [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number compression rtp]

Release Information  Statement introduced in Junos OS Release 7.5.

Description  Specify the maximum number of RTP contexts to accept during negotiation.

Options  number—Maximum number of contexts.

          force—(Optional) Requires the PIC to use the value specified for maximum RTP contexts,
                  regardless of the negotiated value. This option allows the software to interoperate
                  with Junos OS Releases that base the RTP context value on link speed.

Required Privilege  interface—To view this statement in the configuration.

                  interface-control—To add this statement to the configuration.

Related Documentation  •  Junos OS Services Interfaces Library for Routing Devices
**maximum-requests**

**Syntax**

```
maximum-requests times;
```

**Hierarchy Level**

```
[edit protocols dot1x authenticator interface interface-id]
```

**Release Information**

Statement introduced in Junos OS Release 9.3.

**Description**

Specify the maximum number of retransmission times of an EAPOL Request packet to the client before it times out the authentication session.

**Options**

- `times`—Specify the maximum number of retransmission times.
  
  **Range:** 1 through 10 times
  
  **Default:** 2 times

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

**maximum-vcs**

**Syntax**

```
maximum-vcs maximum-vcs;
```

**Hierarchy Level**

```
[edit interfaces at-fpc/pic/port atm-options vpi vpi-identifier]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For ATM1 interfaces, configure the maximum number of virtual circuits (VCs) allowed on a virtual path (VP). When configuring ATM1 interfaces on the router, you must include this statement.

For a configured virtual path identifier (VPI), valid virtual channel identifier (VCI) numbers are from 0 through \((\text{maximum-vcs} \text{ value} - 1)\). VCI numbers 0 through 31 are reserved by the ATM Forum. It is recommended that you use a VCI number higher than 31 when connecting to an ATM switch.

**Options**

- **maximum-vcs**—Maximum number of VCs on the VP.
  - **Range:** 1 through 4090

**Required Privilege Level**

- interface—To view this statement in the configuration.
  - interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring the Maximum Number of ATM1 VCs on a VP

mc-ae

Syntax

```perl
mc-ae {
  chassis-id chassis-id;
  events {
    iccp-peer-down;
    force-icl-down;
    prefer-status-control-active;
  }
  init-delay-time seconds;
  mc-ae-id mc-ae-id;
  mode (active-active | active-standby);
  redundancy-group group-id;
  revert-time revert-time;
  status-control (active | standby);
  switchover-mode (non-revertive | revertive);
}
```

Hierarchy Level

- [edit interfaces aeX aggregated-ether-options],
- [edit logical-systems logical-system-name interfaces aeX aggregated-ether-options]

Release Information

Statement introduced in Junos OS Release 9.6 for MX Series routers.
- `events` statement introduced in Junos OS Release 11.4R4 for MX Series routers.
- Statement introduced in Junos OS Release 12.2 for the QFX Series. Only the `chassis-id`, `mc-ae-id`, `mode active-active`, and `status-control (active | standby)` options are supported on QFX Series devices.
- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
- `prefer-status-control-active` statement introduced in Junos OS Release 13.2R1 for EX Series switches.
- `init-delay-time seconds` statement introduced in Junos OS Release 13.2R3 for EX Series switches.
- `switchover-mode` and `revert-time` statements introduced in Junos OS Release 13.3.
- Support for logical systems introduced in Junos OS Release 14.1.

Description

Enable multichassis link aggregation groups (MC-LAG), which enables one device to form a logical LAG interface with two or more other devices.

Options

- **chassis-id**—Specify the chassis ID for Link Aggregation Control Protocol (LACP) to calculate the port number of MC-LAG physical member links.
  - **Values:** 0 or 1

- **events**—Specify an action if a specific MC-LAG event occurs.
  - `iccp-peer-down`—Specify an action if the ICCP peer of this node goes down.
  - `force-icl-down`—If the node's ICCP peer goes down, bring down the interchassis-link logical interface.
prefer-status-control-active—Specify that the node configured as status-control active become the active node if the peer of this node goes down.

When ICCP goes down, you can use this keyword to make a mc-lag PE to become the active PE. For example, if you want mc-lag PE1 to be Active on ICCP down, then configure this keyword in PE1. It is not recommended to configure this keyword in both the mc-lag PEs.

NOTE: The prefer-status-control-active statement can be configured with the status-control standby configuration to prevent the LACP MC-LAG system ID from reverting to the default LACP system ID on ICCP failure. Use this configuration only if you can ensure that ICCP will not go down unless the router or switch is down. You must also configure the hold-time down value (at the [edit interfaces interface-name] hierarchy level) for the interchassis link with the status-control standby configuration to be higher than the ICCP BFD timeout. This configuration prevents data traffic loss by ensuring that when the router or switch with the status-control active configuration goes down, the router or switch with the status-control standby configuration does not go into standby mode.

To make the prefer-status-control-active configuration work with the status-control standby configuration when an interchassis-link logical interface is configured on aggregate Ethernet interface, you must configure the lacp periodic interval statement at the [edit interface interface-name aggregated-ether-options] hierarchy level as slow or configure the detection-time threshold statement at the [edit protocols iccp peer liveness-detection] hierarchy level as less than 3 seconds.

init-delay-time seconds—To minimize traffic loss, specify the number of seconds in which to delay bringing the multichassis aggregated Ethernet interface back to the up state when you reboot an MC-LAG peer.

NOTE: On QFX and EX Series switches, the default session establishment hold time is 300 seconds. However, the session establishment time must be at least 100 seconds higher than the init delay time. You can optionally update the session establishment time to be 340 seconds and the init delay time to be 240 seconds.
**mc-ae-id mc-ae-id**—Specify the identification number of the MC-LAG device. The two MC-LAG network devices that manage a given MC-LAG must have the same identification number.

**Range:** 1 through 65,535

**mode (active-active | active-standby)**—Specify whether the MC-LAG is in active-active or active-standby mode.

**NOTE:** You can configure IPv4 (inet) and IPv6 (inet6) addresses on mc-ae interfaces when the active-standby mode is configured.

**redundancy-group group-id**—Specify the redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate multiple chassis that perform similar redundancy functions.

**Range:** 1 through 4,294,967,294

**revert-time**—Wait interval (in minutes) before the switchover to the preferred node is performed when the switchover-mode is configured as revertive.

**Range:** 1 through 10

**status-control (active | standby)**—Specify whether the chassis becomes active or remains in standby mode when an interchassis link failure occurs.

**switchover-mode (non-revertive | revertive)**—Specify whether Junos OS should trigger a link switchover to the preferred node when the active node is available.

**NOTE:** For revertive mode to automatically switch over to the preferred node, the status-control statement should be configured as active.

**Required Privilege**

member-interface-type

Syntax  
```  
member-interface-type sonet [
  member-interface-speed [ speed ];
]  
```

Hierarchy Level  
[edit interfaces container-options]

Release Information  
Statement introduced in Junos OS Release 9.2.

Description  
Specify container-interface member-interface type as sonet and speed options.

Options  
- **sonet**—Protocol type of the container interface, specify sonet.
- **speed**—Set interface speed to OC3, OC12, OC48, OC192, OC768, or mixed.

Required Privilege Level  
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

For aggregated Ethernet, SONET/SDH, multilink, link services, and voice services interfaces only, set the minimum number of links that must be up for the bundle to be labeled up.

**Options**

*number*—Number of links.

**Range:** On M120, M320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, the valid range for minimum-links number is 1 through 64. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX8200 switches, the range of valid values for minimum-links number is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX4600, QFX Series and Q Fabric Systems, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up.

mip-half-function

Syntax

mip-half-function (none | default | explicit);

Hierarchy Level

[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name],
[edit protocols oam ethernet connectivity-fault-management maintenance-association ma-name]

Release Information

Description

Specify the OAM Ethernet CFM maintenance domain MIP half functions.

NOTE: Whenever a MIP is configured and a bridge domain is mapped to multiple maintenance domains or maintenance associations, it is essential that the mip-half-function value for all maintenance domains and maintenance associations are the same.

Options

none—Specify to not use the mip-half-function.

default—Specify to use the default mip-half-function.

explicit—Specify an explicit mip-half-function.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

# mode (Dynamic Profiles)

**Syntax**

```plaintext
mode loose;
```

**Hierarchy Level**

```plaintext
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number family (inet) rpf-check]
```

**Release Information**

**Description**

Check whether the packet has a source address with a corresponding prefix in the routing table. If a corresponding prefix is not found, unicast reverse path forwarding (RPF) loose mode does not accept the packet. Unlike strict mode, loose mode does not check whether the interface expects to receive a packet with a specific source address prefix.

**Default**

If you do not include this statement, unicast RPF is in strict mode.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
- Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
- Support at the `[set interfaces interface-name unit logical-unit-number family ccc]` hierarchy level introduced in Junos OS Release 12.3R3 for MX Series routers.
- Statement introduced in Junos OS 17.3R1 Release for MX Series Routers.

**Description**

Specify the maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

To route jumbo data packets on an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI) on EX Series switches, you must configure the jumbo MTU size on the member physical interfaces of the VLAN that you have associated with the IRB interface or RVI, as well as on the IRB interface or RVI itself (the interface named irb or vlan, respectively).
CAUTION: For EX Series switches, setting or deleting the jumbo MTU size on an IRB interface or RVI while the switch is transmitting packets might cause packets to be dropped.

NOTE: The MTU for an IRB interface is calculated by removing the Ethernet header overhead \( [6(DMAC)+6(SMAC)+2(EtherType)] \). Because, the MTU is the lower value of the MTU configured on the IRB interface and the MTU configured on the IRB's associated bridge domain IFDs or IFLs, the IRB MTU is calculated as follows:

- In case of Layer 2 IFL configured with the flexible-vlan-tagging statement, the IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
- In case of Layer 2 IFL configured with the vlan-tagging statement, the IRB MTU is calculated by including a single VLAN 4 bytes overhead.
NOTE:

- If a packet whose size is larger than the configured MTU size is received on the receiving interface, the packet is eventually dropped. The value considered for MRU (maximum receive unit) size is also the same as the MTU size configured on that interface.

- Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. You cannot configure an MTU for management Ethernet interfaces (fxp0, em0, or me0) or for loopback, multilink, and multicast tunnel devices.

- On ACX Series routers, you can configure the protocol MTU by including the mtu statement at the [edit interfaces interface-name unit logical-unit-number family inet] or [edit interfaces interface-name unit logical-unit-number family inet6] hierarchy level.
  - If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
  - If you are configuring the protocol MTU for both inet and inet6 families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for inet and inet6 families that are configured on the same logical interface.

- Starting in Release 14.2, MTU for IRB interfaces is calculated by removing the Ethernet header overhead (6(DMAC)+6(SMAC)+2(EtherType)), and the MTU is a minimum of the two values:
  - Configured MTU
  - Associated bridge domain's physical or logical interface MTU
    - For Layer 2 logical interfaces configured with flexible-vlan-tagging, IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
    - For Layer 2 logical interfaces configured with vlan-tagging, IRB MTU is calculated by including single VLAN 4 bytes overhead.

NOTE: Changing the Layer 2 logical interface option from vlan-tagging to flexible-vlan-tagging or vice versa adjusts the logical interface MTU by 4 bytes with the existing MTU size. As a result, the Layer 2 logical interface is deleted and re-added, and the IRB MTU is re-computed appropriately.
For more information about configuring MTU for specific interfaces and router or switch combinations, see "Configuring the Media MTU" on page 99.

**Options**

**bytes**—MTU size.

**Range:** 256 through 9192 bytes, 256 through 9216 (EX Series switch interfaces), 256 through 9500 bytes (Junos OS 12.1X48R2 for PTX Series routers), 256 through 9500 bytes (Junos OS 16.1R1 for MX Series routers)

---

**NOTE:** Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E

**Default:** 1500 bytes (INET, INET6, and ISO families), 1448 bytes (MPLS), 1514 bytes (EX Series switch interfaces)

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

multi-chassis-protection

Syntax
multi-chassis-protection {
  peer a.b.c.d {
    interface interface-name;
  }
}

Hierarchy Level [edit interfaces interface-name]

Description For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, you can use this statement under the physical interface level to reduce the configuration at the logical interface level if the following assumption exists:

If there are n + 1 logical interfaces under ae0, from ae0.0 through ae0.n, there will be n + 1 logical interfaces under ge-0/0/0 as well, from ge-0/0/0.0 through ge-0/0/0.n, and each ge-0/0/0 logical interface will be a protection link for the ae0 logical interface.

NOTE: A bridge domain cannot have MC-AE logical interfaces which belong to different redundancy groups.

If the Inter-Chassis Control Protocol (ICCP) connection is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer.

The remaining statements are explained separately. See CLI Explorer.

Options
interface interface-name—Specify the interface: interface interface-name-fpc/pic/port

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

multicast-dlci

Syntax

multicast-dlci dlci-identifier;

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For point-to-multipoint Frame Relay, link services, and voice services interfaces only, enable multicast support on the interface. You can configure multicast support on the interface if the Frame Relay switch performs multicast replication.

Options

dlci-identifier—DLCI identifier, a number from 16 through 1022 that defines the Frame Relay DLCI over which the switch expects to receive multicast packets for replication.

Required Privilege

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

**multicast-only**

Syntax: `multicast-only;`

Hierarchy Level: `[edit interfaces interface-name unit logical-unit-number family inet],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet]`

Release Information: Statement introduced before Junos OS Release 7.4.

Description: Configure the unit and family so that it can transmit and receive multicast traffic only.
You can configure this property on the IP family only.

Required Privilege Level:
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

multicast-vci

Syntax: multicast-vci vpi-identifier.vci-identifier;

Hierarchy Level: [edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information: Statement introduced before Junos OS Release 7.4.

Description: For ATM encapsulation only, and for point-to-multipoint ATM logical interfaces only, enable the support of multicast on the interface. You can configure multicast support on the interface if the ATM switch performs multicast replication.

Options:
- vci-identifier—ATM virtual circuit identifier.
  Range: 0 through 16,384
- vpi-identifier—ATM virtual path identifier.
  Range: 0 through 255
  Default: 0

Required Privilege Level:
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**multilink-max-classes**

**Syntax**
```
multilink-max-classes number;
```

**Hierarchy Level**
```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
For Adaptive Services (AS) PIC link services IQ interfaces (lsq) only, configure the number of multilink classes to be negotiated when a link joins the bundle.

**Options**
- `number`—The number of multilink classes to be negotiated when a link joins the bundle.
  - **Range:** 1 through 8
  - **Default:** None

**Required Privilege Level**
- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

**Related Documentation**

multipoint-destination

Syntax multipoint-destination address dlci dlci-identifier;
multipoint-destination address {
  epd-threshold cells;
  inverse-arp;
  oam-liveness {
    down-count cells;
    up-count cells;
  }
  oam-period (disable | seconds);
  shaping {
    (cbr rate | rtvbr peak rate sustained rate burst length | vbr peak rate sustained rate burst length);
    queue-length number;
  }
  vci vpi-identifier.vci-identifier;
}

Hierarchy Level [edit interfaces interface-name unit logical-unit-number family family address address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]

Release Information Statement introduced before Junos OS Release 7.4.

Description For point-to-multipoint Frame Relay or ATM interfaces only, enable the support of multicast on the interface. You can configure multicast support on the interface if the Frame Relay or ATM switch performs multicast replication.

Options address—Address of the remote side of the point-to-multipoint connection.

dlci-identifier—For Frame Relay interfaces, the data-link connection identifier.
Range: 0 through 0xFFFFFF (24 bits)

vci-identifier—For ATM interfaces, the virtual circuit identifier.
Range: 0 through 16,384

vpi-identifier—For ATM interfaces, the virtual path identifier.
Range: 0 through 255
Default: 0

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

name-format

Syntax

```latex
name-format (character-string | none | dns | mac+2oct);
```

Hierarchy Level

```latex
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]
```

Release Information

Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

Description

Specify the format of the maintenance domain name.

Options

- **character-string**—The name is an ASCII character string.
- **none**—The maintenance domain name is not used.
- **dns**—The name is in domain name service (DNS) format. For example: www.juniper.net.
- **mac+2oct**—Name is the MAC address plus a two-octet maintenance association identifier. For example: 08:00:22:33:44:55.100.

Default: character-string

Required Privilege Level

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

native-vlan-id

Syntax
native-vlan-id vlan-id;

Hierarchy Level (QFX Series and EX4600)
For platforms without ELS:
[edit interfaces (QFX Series) interface-name unit 0 family ethernet-switching]
For platforms with ELS:
[edit interfaces (QFX Series) interface-name]

Hierarchy Level (ACX Series, EX Series, SRX Series, M Series, MX Series, and T Series)
[edit interfaces ge-fpc/pic/port],
[edit interfaces interface-name]

Hierarchy Level (SRX Series)
[edit interfaces interface-name]

Release Information
Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 9.5 for SRX Series.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

Description
Configure the VLAN identifier to associate with untagged packets received on the physical interface of a trunk mode interface for the following:

- QFX Series and EX4600
- M Series routers with Gigabit Ethernet IQ PICs with SFP and Gigabit Ethernet IQ2 PICs with SFP configured for 802.1Q flexible VLAN tagging
- MX Series routers with Gigabit Ethernet DPCs and MICs, Tri-Rate Ethernet DPCs and MICs, and 10-Gigabit Ethernet DPCs and MICs and MPCs configured for 802.1Q flexible VLAN tagging
- T4000 routers with 100-Gigabit Ethernet Type 5 PIC with CFP
- EX Series switches with Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces

The logical interface on which untagged packets are received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface, otherwise the untagged packets are dropped. To configure the logical interface, include the `vlan-id`
statement (matching the `native-vlan-id` statement on the physical interface) at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level.

When the `native-vlan-id` statement is included with the `flexible-vlan-tagging` statement, untagged packets are accepted on the same mixed VLAN-tagged port and on the interfaces that are configured for Q-in-Q tunneling.

When the `native-vlan-id` statement is combined with the `interface-mode` statement, untagged packets are accepted and forwarded within the bridge domain or VLAN that is configured with the matching VLAN ID.

To configure the logical interface, include the `vlan-id` statement (matching the `native-vlan-id` statement on the physical interface) at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level.

---

**NOTE:** Starting in Junos OS Release 17.1R1, you can send untagged traffic without a native VLAN ID to the remote end of the network. To do this, remove the native VLAN ID from the untagged traffic configuration by setting the `no-native-vlan-insert` statement. If you do not configure this statement, the native VLAN ID is added to the untagged traffic.

---

**Default**

By default, the untagged packets are dropped. That is, if you do not configure the `native-vlan-id` option, the untagged packets are dropped.

**Options**

- `vlan-id`—Numeric identifier of the VLAN.
  - **Range:** 1 through 4094

- `number`—VLAN ID number.
  - **Range:** (ACX Series routers, SRX Series devices and EX Series switches) 0 through 4094

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

ncp-max-conf-req

Syntax  ncp-max-conf-req number

Hierarchy Level  [edit interfaces so-fpc/pic/port unit number ppp-options]

Description  Set the maximum number of NCP Configure-Requests to be sent, after which the router goes to NCP down state.

Options  

number—Ranges from 0 to 65535, where 0 means send infinite NCP Configure-Requests and any other value specifies the maximum number NCP Configure-Requests to send and then stop sending.

Default—254

Range: 0 through 65,535

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation

- Configuring the NCP Configure-Request Maximum Sent on page 179

ncp-restart-timer

Syntax
ncp-restart-timer milliseconds;

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number ppp-options],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options]

Release Information
Statement introduced in Junos OS Release 8.1.

Description
For interfaces with PPP and PPP TCC encapsulations and on multilink PPP bundle interfaces, configure a restart timer for the Network Control Protocol (NCP) component of a PPP session.

Options
milliseconds—The time in milliseconds between successive NCP configuration requests.
Range: 500 through 10,000 milliseconds
Default: 3 seconds

Required Privilege
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
• Configuring the PPP Restart Timers on page 177
**nd6-stale-time**

**Syntax**

```
nd6-stale-time seconds;
```

**Hierarchy Level**

```
[edit interfaces interface-name unit logical-unit-number family inet6]
```

**Release Information**

**Description**

Set the stale timer for IPv6 neighbor reachability confirmation. Reachability of the IPv6 neighbors is confirmed only after the stale timer has expired. For example, by setting the stale timer to 180 seconds, users can specify that IPv6 neighbor reachability be confirmed every 180 seconds.

**NOTE:** When the Routing Engine sends a control packet to an IPv6 neighbor, the stale timer is the maximum interval in which neighbor reachability is confirmed. In such cases, IPv6 neighbor reachability is confirmed before the stale timer expires.

**Default**

Default is 20 minutes (1200 seconds)

**Options**

`seconds`—Duration in seconds.

**Range:** 1 to 18000

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

neighbor (Automatic Protection Switching for SONET/SDH)

Syntax
neighbor address;

Hierarchy Level
[edit interfaces interface-name sonet-options aps]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
If you are configuring one router to be the working router and a second to be the protect router, configure the address of the remote interface. You configure this on one or both of the interfaces.

The address you specify for the neighbor must never be routed through the interface on which APS is configured, or instability will result. We strongly recommend that you directly connect the working and protect routers and that you configure the interface address of this shared network as the neighbor address.

Options
address—Neighbor’s address.

Required Privilege
Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**asynchronous-notification**

**Syntax**

(asynchronous-notification | no-asynchronous-notification);

**Hierarchy Level**

[edit interfaces ge-fpc/pic/port gigether-options ]

**Release Information**

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

**Description**

(MX Series routers, T Series routers) For all Gigabit Ethernet interfaces (1-Gigabit, 10-Gigabit, and 100-Gigabit), configure support for notification of link down alarm generation and transfer.

(M120 and M320 routers) For all 10-Gigabit Ethernet PIC interfaces, configure support for notification of link down alarm generation and transfer.

- **asynchronous-notification**—Support notification of link down alarm generation and transfer.
- **no-asynchronous-notification**—Prohibit notification of link down alarm generation and transfer.

**Default**

Support for notification of link down alarm generation and transfer is not enabled.

**Required Privilege Level**

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**Related Documentation**

- Gigabit Ethernet Notification of Link Down Alarm Overview
- Configuring Gigabit Ethernet Notification of Link Down Alarm
no-auto-mdix

Syntax  no-auto-mdix;

Hierarchy Level  [edit interface ge-fpc/port/pic gigether-options]

Release Information  Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description  Disable the Auto MDI/MDIX feature.

MX Series routers with Gigabit Ethernet interfaces automatically detect MDI and MDIX port connections. Use this statement to override the default setting. Remove this statement to return to the default setting.

Default  Auto MDI/MDIX is enabled by default.

Options  There are no options for this statement.

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  • Ethernet Interfaces Overview
• gigether-options on page 632.
auto-negotiation

Syntax    (auto-negotiation | no-auto-negotiation) <remote-fault (local-interface-online | local-interface-offline)>;

Hierarchy Level    [edit interfaces interface-name ether-options],
                    [edit interfaces interface-name gigether-options],
                    [edit interfaces ge-pim/0/0 switch-options switch-port port-number]

Release Information    Statement introduced in Junos OS Release 7.6.
                        Statement introduced in Junos OS Release 9.0 for EX Series switches.
                        Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description    For Gigabit Ethernet interfaces on M Series, MX Series, T Series, TX Matrix routers, and
                ACX Series routers explicitly enable autonegotiation and remote fault. For EX Series
                switches, explicitly enable autonegotiation only.

                • auto-negotiation—Enables autonegotiation. This is the default.
                • no-auto-negotiation—Disable autonegotiation. When autonegotiation is disabled, you
                  must explicitly configure the link mode and speed.

                When you configure Tri-Rate Ethernet copper interfaces to operate at 1 Gbps,
                autonegotiation must be enabled.

                NOTE: On EX Series switches, an interface configuration that disables
                autonegotiation and manually sets the link speed to 1 Gbps is accepted when
                you commit the configuration; however, if the interface you are configuring
                is a Tri-Rate Ethernet copper interface, the configuration is ignored as invalid
                and autonegotiation is enabled by default.

                To correct the invalid configuration and disable autonegotiation:

                1. Delete the no-auto-negotiation statement and commit the configuration.

                2. Set the link speed to 10 or 100 Mbps, set no-auto-negotiation, and commit
                   the configuration.

                On EX Series switches, if the link speed and duplex mode are also configured, the
                interfaces use the values configured as the desired values in the negotiation. If
                autonegotiation is disabled, the link speed and link mode must be configured.

                NOTE: On T4000 routers, the auto-negotiation command is ignored for
                interfaces other than Gigabit Ethernet.
NOTE: On ACX Series routers, when you configure fiber interfaces (fiber media mode) to operate at 1 Gbps, autonegotiation is enabled by default to negotiate the speed and duplex settings. You can disable autonegotiation by using the (no-auto-negotiation) statement, and commit the configuration. In the fiber media mode. In copper interfaces (copper media mode), autonegotiation is enabled by default. To disable autonegotiation, you need to explicitly configure the link speed to 10 or 100 Mbps, set no-auto-negotiation, and commit the configuration.

Default  Autonegotiation is automatically enabled. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.

Options  remote-fault (local-interface-online | local-interface-offline)—(Optional) For M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers only, manually configure remote fault on an interface.

Default: local-interface-online

Required Privilege Level  interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation  • Gigabit Ethernet Autonegotiation Overview
  • Configuring Gigabit Ethernet Interfaces (CLI Procedure)
  • Configuring Gigabit Ethernet Interfaces for EX Series Switches with ELS support
cbit-parity

Syntax  (cbit-parity | no-cbit-parity);

Hierarchy Level  [edit interfaces interface-name t3-options]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  For T3 interfaces only, enable or disable C-bit parity mode, which controls the type of framing that is present on the transmitted T3 signal. When C-bit parity mode is enabled, the C-bit positions are used for the far-end block error (FEBE), far-end alarm and control (FEAC), terminal data link, path parity, and mode indicator bits, as defined in ANSI T1.107a-1989. For ATM and ATM2 IQ2 and IQ2-E interfaces, M23 framing is used when the no-cbit-parity statement is included. For all other interfaces, M13 framing is used when the no-cbit-parity statement is included.

Default  C-bit parity mode is enabled.

Required Privilege  Level  interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Related Documentation  • Configuring E3 and T3 Parameters on ATM Interfaces
                      • Disabling T3 C-Bit Parity Mode
core-dump

Syntax  (core-dump | no-core-dump);

Hierarchy Level  [edit interfaces mo-fpc/pic/port multiservice-options]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  For monitoring services interfaces only, a useful tool for isolating the cause of a problem. Core dumping is enabled by default. The directory /var/tmp contains core files. The Junos OS saves the current core file (0) and the four previous core files, which are numbered 1 through 4 (from newest to oldest):

- core-dump—Enable the core dumping operation.
- no-core-dump—Disable the core dumping operation.

Required Privilege Level  interface—To view this statement in the configuration.

Interface-control—To add this statement to the configuration.

Related Documentation  • Configuring Multiservice Physical Interface Properties on page 154
  • Junos OS Services Interfaces Library for Routing Devices
**feac-loop-respond**

**Syntax**  
(feac-loop-respond | no-feac-loop-respond);

**Hierarchy Level**  
[edit interfaces interface-name t3-options]

**Release Information**  
Statement introduced before Junos OS Release 7.4.

**Description**  
For T3 interfaces only, configure the router so a remote CSU can place the local router into loopback.

If you configure remote or local loopback with the T3 loopback statement, the router does not respond to FEAC requests from the CSU even if you include the feac-loop-respond statement in the configuration. For the router to respond, you must delete the loopback statement from the configuration.

You must rollback the setting done on the remote CSU prior to deactivating the feac-loop-respond statement. If the remote CSU cannot comply, clear the remote loop through local configuration to achieve the cleanup. For example, configure remote loopback on the interface and then delete the remote loopback.

**Default**  
The router does not respond to FEAC requests.

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**  
- Configuring the T3 FEAC Response

flow-control

Syntax  
(flow-control | no-flow-control);

Hierarchy Level  
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options],
[edit interfaces interface-name multiservice-options],
[edit interfaces interface-range name aggregated-ether-options],
[edit interfaces interface-range name ether-options]

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 in EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description  
For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.

NOTE: On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

Default  
Flow control is enabled.

NOTE: Flow control is enabled by default only on physical interfaces and it is disabled by default on aggregated Ethernet interfaces.

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  
- Configuring Flow Control
- Configuring Gigabit Ethernet Interfaces (CLI Procedure)
- Configuring Gigabit Ethernet Interfaces for EX Series Switches with ELS support
gratuitous-arp-reply

Syntax  (gratuitous-arp-reply | no-gratuitous-arp-reply);

Hierarchy Level  [edit interfaces interface-name]
                  [edit interfaces interface-range interface-range-name]

Release Information  Statement introduced before Junos OS Release 7.4.
                       Statement introduced in Junos OS Release 9.0 in EX Series switches.
                       Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description  For Ethernet interfaces, enable updating of the Address Resolution Protocol (ARP) cache for gratuitous ARPs.

Default  Updating of the ARP cache is disabled on all Ethernet interfaces.

Required Privilege Level  interface—To view this statement in the configuration.
                           interface-control—To add this statement to the configuration.

Related Documentation  • Configuring Gratuitous ARP
                       • no-gratuitous-arp-request on page 831
no-gratuitous-arp-request

**Syntax**  
no-gratuitous-arp-request;

**Hierarchy Level**  
[edit interfaces interface-name]

**Release Information**  
Statement introduced in Junos OS Release 9.6 for EX Series switches.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

**Description**  
For Ethernet interfaces and pseudowire logical interfaces, do not respond to gratuitous ARP requests.

**Default**  
Gratuitous ARP responses are enabled on all Ethernet interfaces.

**Required Privilege**  
interface—to view this statement in the configuration.  
interface-control—to add this statement to the configuration.

**Related Documentation**  
• Configuring Gratuitous ARP
no-keepalives

Syntax  no-keepalives;

Hierarchy Level  [edit interfaces interface-name],
                 [edit interfaces interface-name unit logical-unit-number],
                 [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  Disable the sending of keepalives on a physical interface configured with PPP, Frame Relay, or Cisco HDLC encapsulation. The default keepalive interval is 10 seconds.

For ATM2 IQ interfaces only, you can disable keepalives on a logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- `atm-ppp-llc`—PPP over AAL5 LLC encapsulation.
- `atm-ppp-vc-mux`—PPP over AAL5 multiplex encapsulation.

Required Privilege Level  interface—To view this statement in the configuration.
                          interface-control—To add this statement to the configuration.

Related Documentation  • Configuring Keepalives on page 118
                       • Disabling the Sending of PPPoE Keepalive Messages
                       • Configuring Frame Relay Keepalives
long-buildout

**Syntax**

(long-buildout | no-long-buildout);

**Hierarchy Level**

[edit interfaces interface-name t3-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Configure the T3 line buildout. A T3 interface has two settings for the T3 line buildout: a short setting, which is less than 255 feet (68 meters), and a long setting, which is greater than 255 feet and shorter than 450 feet (137 meters).

This statement applies to copper-cable-based T3 interfaces only. You cannot configure a line buildout for a DS3 channel on a channelized OC12 interface, which runs over fiber-optic cable.

**Default**

A T3 interface uses the short line buildout setting (no-long-buildout) for wires shorter than 255 feet (68 meters).

**Required Privilege Level**

interface—to view this statement in the configuration.

interface-control—to add this statement to the configuration.

**Related Documentation**

- Configuring the T3 Line Buildout
loopback (Aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet)

Syntax  
(loopback | no-loopback);

Hierarchy Level  
[edit interfaces interface-name aggregated-ether-options],  
[edit interfaces interface-name ether-options],  
[edit interfaces interface-name fastether-options],  
[edit interfaces interface-name gigether-options],  
[edit interfaces interface-range name ether-options]

For QFX Series and EX Series:

[edit interfaces interface-name aggregated-ether-options],  
[edit interfaces interface-name ether-options],

For SRX Series Devices and vSRX:

[edit interfaces interface-name redundant-ether-options]

Release Information  
Statement introduced before Junos OS Release 7.4 for MX Series.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
Statement modified in Junos OS Release 9.2 for the SRX Series.

Description  
For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces, enable or disable loopback mode.

NOTE:

- By default, local aggregated Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces connect to a remote system.
- IPv6 Neighbor Discovery Protocol (NDP) addresses are not supported on Gigabit Ethernet interfaces when loopback mode is enabled on the interface. That is, if the loopback statement is configured at the [edit interfaces ge-fpc/pic/port gigether-options] hierarchy level, an NDP address cannot be configured at the [edit interfaces ge-fpc/pic/port unit logical-unit-number family inet6 address] hierarchy level.

Default  
By default, loopback is disabled.
mac-learn-enable

Syntax  
mac-learn-enable;

Hierarchy Level  
[edit interfaces interface-name gigether-options ethernet-switch-profile]  
[edit interfaces aex aggregated-ether-options ethernet-switch-profile]

Release Information  
Statement introduced before Junos OS Release 7.4.  

Description  
For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, for 100-Gigabit Ethernet Type 5 PIC with CFP, and for MPC3E, MPC4E, MPC5E, MPC5EQ, and MPC6E MPCs, configure dynamic learning of the source and destination MAC addresses. By default, the interface is not allowed to dynamically learn source and destination MAC addresses.

To disable dynamic learning of the source and destination MAC addresses after it has been configured, you must delete mac-learn-enable from the configuration.

MPCs support MAC address accounting for an individual interface or an aggregated Ethernet interface member link only after the interface has received traffic from the MAC source. If traffic is only exiting an interface, the MAC address is not learned and MAC address accounting does not occur.

Required Privilege Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation  
• Configuring MAC Address Filtering  
• Configuring MAC Address Accounting
no-partition

Syntax  
no-partition interface-type (e1 | (cau4 | so) | (ct3 | t3) | so | t3);

Hierarchy Level  
[edit interfaces cel-fpc/pic/port],
[edit interfaces coc1-fpc/pic/port:channel],
[edit interfaces coc12-fpc/pic/port],
[edit interfaces cstm1-fpc/pic/port],
[edit interfaces ct3-fpc/pic/port]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For Channelized E1 IQ PICs only, configure the channelized E1 interface as an unpartitioned, clear channel.

For Channelized OC12 PIC only, convert the channelized OC12 IQ interface into a channelized T3 interface or a T3 interface. You perform this configuration task for C-bit parity and M13-mapped configurations.

For Channelized OC12 IQ PICs only, configure the channelized OC12 interface as an unpartitioned, clear channel.

For Channelized STM1 PIC only, convert the channelized STM1 IQ interface into a channelized Administrative Unit 4 (AU-4) interface or a SONET/SDH STM1 interface.

For Channelized DS3 PIC only, configure the channelized T3 interface as an unpartitioned, clear channel.

Default  
If you do not include either this statement or the partition statement, the Channelized IQ PIC is not partitioned, and no data channels are configured.

Options  
The option used must correspond to the physical interface type:

e1—E1 interface type.

coc12 so—Channelized OC12 interface type, in SONET mode.

cau4—Channelized AU-4 interface type.

cstm1—SONET/SDH STM1 interface type, in SDH mode.

ct3—Channelized T3 interface type.

t3—T3 interface type.

Required Privilege Level  
interface—to view this statement in the configuration.

interface-control—to add this statement to the configuration.

payload-scrambler

Syntax (payload-scrambler | no-payload-scrambler);

Hierarchy Level [edit interfaces interface-name e3-options], [edit interfaces interface-name sonet-options], [edit interfaces interface-name t3-options]

Release Information Statement introduced before Junos OS Release 7.4.

Description Enable or disable HDLC scrambling on an E3, a SONET/SDH, or a T3 interface. This type of scrambling provides better link stability. Both sides of a connection must either use or not use scrambling.

If you commit a T3 interface configuration that has HDLC payload scrambling enabled, the interface must also be configured to be compatible with the channel service unit (CSU) at the remote end of the line.

Disable payload scrambling on an E3 interface if Digital Link compatibility mode is used.

On a channelized OC12 interface, the sonet payload-scrambler statement is ignored. To configure scrambling on the DS3 channels on the interface, you can include the t3-options payload-scrambler statement in the configuration for each DS3 channel.

NOTE: The payload-scrambler statement at the [edit interfaces interface-name e3-options] hierarchy level is not valid for IQE PICs.

Default Payload scrambling is disabled on all E3 and T3 interfaces; it is enabled by default on E3/T3 over ATM interfaces and on SONET/SDH interfaces.

Required Privilege Level interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

## no-pre-classifier

### Syntax

```plaintext
no-pre-classifier;
```

### Hierarchy Level

```
[edit chassis fpc n pic n]
```

### Release Information

Statement introduced in Junos OS Release 10.4.

### Description

Specify disabling the control queue for all ports on the 10-Gigabit Ethernet LAN/WAN PIC. Deleting this configuration re-enables the control queue feature on all ports of the 10-Gigabit Ethernet LAN/WAN PIC.

### NOTE:

For the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PD-5-10XGE-SFPP), the control queue has a rate limiter to limit the control traffic to 2 Mbps (fixed, not user-configurable) per port. If the transit control traffic crosses this limit, then it can cause drops on locally terminating control traffic, causing flap of protocols such as BGP and OSPF. To avoid the control traffic being dropped, configure the `no-pre-classifier` statement to disable the control queue.

### Default

The `no-pre-classifier` statement is not configured and the control queue is operational.

### Required Privilege Level

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

### Related Documentation

- [10-port 10-Gigabit Ethernet LAN/WAN PIC Overview](#)
- [Disabling Control Queue Disable on a 10-port 10-Gigabit Ethernet LAN/WAN PIC](#)
no-redirects

Syntax  no-redirects;

Hierarchy Level  [edit interfaces interface-name unit logical-unit-number family family]

Release Information  Statement introduced before Junos OS Release 7.4.
  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Do not send protocol redirect messages on the interface.
  To disable the sending of protocol redirect messages for the entire router or switch,
  include the no-redirects statement at the [edit system] hierarchy level.

Default  Interfaces send protocol redirect messages.

Required Privilege Level  interface—To view this statement in the configuration.
  interface-control—To add this statement to the configuration.

Related Documentation  • Disabling the Transmission of Redirect Messages on an Interface on page 210
  • Junos OS Administration Library
source-filtering

Syntax  (source-filtering | no-source-filtering):

Hierarchy Level  [edit interfaces interface-name aggregated-ether-options],
                [edit interfaces interface-name fastether-options],
                [edit interfaces interface-name gigether-options]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.

Description  For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and Gigabit Ethernet IQ interfaces only, enable the filtering of MAC source addresses, which blocks all incoming packets to that interface. To allow the interface to receive packets from specific MAC addresses, include the source-address-filter statement.

If the remote Ethernet card is changed, the interface is no longer able to receive packets from the new card because it has a different MAC address.

Default  Source address filtering is disabled.

Required Privilege  Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  • Configuring MAC Address Filtering for Ethernet Interfaces

| Release Information | Statement introduced in Junos OS Release 8.2.  
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers. |
| Description      | For Ethernet interfaces on M320, M120, MX Series, and T Series routers and PTX Series Packet Transport Routers, provide IEEE 802.3ah Operation, Administration, and Maintenance (OAM) support.  
The remaining statements are explained separately. See CLI Explorer. |
| Required Privilege Level | interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration. |
| Related Documentation | • IEEE 802.3ah OAM Link-Fault Management Overview |
**oam-liveness**

**Syntax**

```plaintext
doam-liveness {
down-count cells;
up-count cells;
}
```

**Hierarchy Level**

- `edit interfaces interface-name atm-options vpi vpi-identifier`,
- `edit interfaces interface-name unit logical-unit-number`,
- `edit interfaces interface-name unit logical-unit-number family family address address` multipoint-destination `address`,
- `edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number`,
- `edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address multipoint-destination address`

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

For ATM encapsulation only, configure Operation, Administration, and Maintenance (OAM) F5 loopback cell count thresholds. Not supported on ATM-over-SHDSL interfaces.

For ATM2 IQ PICs only, configure OAM F4 loopback cell count thresholds at the `edit interfaces interface-name atm-options vpi vpi-identifier` hierarchy level.

**Options**

- **down-count cells**—Minimum number of consecutive OAM F4 or F5 loopback cells lost before a VC is declared down.
  - **Range:** 1 through 255
  - **Default:** 5 cells

- **up-count cells**—Minimum number of consecutive OAM F4 or F5 loopback cells received before a VC is declared up.
  - **Range:** 1 through 255
  - **Default:** 5 cells

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring the ATM OAM F5 Loopback Cell Threshold
# oam-period

**Syntax**

```plaintext
oam-period (disable | seconds);
```

**Hierarchy Level**

- `edit interfaces interface-name atm-options vpi vpi-identifier`.
- `edit interfaces interface-name unit logical-unit-number`.
- `edit interfaces interface-name unit logical-unit-number family family address address multipoint-destination address`.
- `edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number`.
- `edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address multipoint-destination address`.

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

For ATM encapsulation only, configure the OAM F5 loopback cell period. Not supported on ATM-over-SHDSL interfaces.

For ATM2 IQ PICs only, configure the OAM F4 loopback cell period at the `edit interfaces interface-name atm-options vpi vpi-identifier` hierarchy level.

**Default**

If you omit this statement, OAM F5 loopback cells are not initiated, but the interface still responds if it receives OAM F5 loopback cells.

**Options**

- `disable`—Disable the OAM loopback cell transmit feature.
- `seconds`—OAM loopback cell period.
  
  **Range**: 1 through 900 seconds

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- *Defining the ATM OAM F5 Loopback Cell Period*
**oc-slice**

**Syntax**  
`oc-slice oc-slice-range;`

**Hierarchy Level**  
[edit interfaces interface-name partition partition-number]

**Release Information**  
Statement introduced before Junos OS Release 7.4.

**Description**  
For channelized OC12 IQ interfaces only, configure the range of SONET/SDH slices.

**Default**  
If you do not include either this statement or the **no-partition** statement, the Channelized OC12 IQ PICs not partitioned, and no data channels are configured.

**Options**  
`oc-slice-range`—Range of SONET/SDH slices. OC3 interfaces must occupy three consecutive OC slices per interface, in the form 1–3, 4–6, 7–9, or 10–12. The T3, T1, and DS0 interface types each occupy one OC slice per interface.

**Range:**  
For OC3 interfaces, 1–3, 4–6, 7–9, or 10–12; for SONET/SDH and T3 interfaces, 1–12

The remaining statement is explained separately. See CLI Explorer.

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**  
- Channelized OC12/STM4 IQ and IQE Interfaces Overview
open-timeout

Syntax  open-timeout seconds;

Hierarchy Level  [edit interfaces interface-name services-options]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  Configure timeout period for Transmission Control Protocol (TCP) session establishment.

Options  seconds—Timeout period in seconds.
  Range: 4 through 224 seconds
  Default: 5 seconds

Required Privilege Level  interface—To view this statement in the configuration.
  interface-control—To add this statement to the configuration.

Related Documentation  • Junos OS Services Interfaces Library for Routing Devices
operating-mode

Syntax  
operating-mode mode;

Hierarchy Level  
[edit interfaces at-fpc/pic/port dsl-options]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For J Series Services Routers only, modify the operating mode of the digital subscriber line for an ATM interface.

Options  

mode—Operating mode for ATM-over-ADSL interfaces. The mode can be one of the following:

- adsl2plus—Set the ADSL line to train in the ITU G.992.5 mode.
- ansi-dmt—Set the ADSL line to train in the ANSI T1.413 Issue 2 mode.
- auto—Set the ADSL line to autonegotiate the setting to match the setting of the DSL access multiplexer (DSLAM) located at the central office. The ADSL line trains in the ANSI T1.413 Issue 2 (ansi-dmt) or ITU G.992.1 (itu-dmt) mode.
- etsi—Set the ADSL line to train in the ETSI TS 101 388 V1.3.1 mode.
- itu-annexb-ur2—Set the ADSL line to train in the ITU G.992.1 UR-2 mode.
- itu-annexb-non-ur2—Set the ADSL line to train in the ITU G.992.1 non-UR-2 mode.
- itu-dmt—Set the ADSL line to train in the ITU G.992.1 mode.
- itu-dmt-bis—Set the ADSL line to train in the ITU G.992.3 mode.

Default: auto

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

## optics-options

**Syntax**

```plaintext
options-options {
  alarm low-light-alarm {
    (link-down | syslog);
  }
  tca tca-identifier (enable-tca | no-enable-tca) (threshold number | threshold-24hrs number); tx-power dbm;
  warning low-light-warning {
    (link-down | syslog);
  }
  wavelength nm;
  loopback;
}
```

**Hierarchy Level**

```
[edit interfaces interface-name]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
- **alarm** option and **warning** options introduced in Junos OS Release 10.0.
- Statement introduced in Junos OS Release 12.1 for EX Series switches.
- Statement and **tx-power** option introduced in Junos OS Release 13.2 for PTX Series routers.
- **tca** option introduced in Junos OS Release 14.2 for PTX Series routers.
- Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.
- Statement introduced in Junos OS Release 18.3R1 for ACX6360 routers.
- **loopback** option introduced in Junos OS Release 19.2R1 for QSFP-100GE-DWDM2 transceiver on MX10003, MX10008, MX10016, and MX204 routers.

**Description**

For 10-Gigabit Ethernet or 100-Gigabit Ethernet dense wavelength-division multiplexing (DWDM) interfaces only, configure full C-band International Telecommunication Union (ITU)-Grid tunable optics.

On the PTX Series routers, when an interface is configured in 8QAM mode, you must configure both the optics from a AC400 module with the same optics-options for the links to come up.

**Options**

- **loopback**—Displays the electrical loopback status of QSFP-100GE-DWDM2 transceiver on MX10003, MX10008, MX10016, and MX204 routers.

  The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.
option-82

Syntax

```
option-82 <circuit-id> <remote-id>;
```

Hierarchy Level

```
[edit interfaces interface-name auto-configure vlan-ranges authentication username-include],
[edit interfaces interface-name auto-configure stacked-vlan-ranges authentication username-include]
```

Release Information

Statement introduced in Junos OS Release 10.0.
Options `circuit-id` and `remote-id` introduced in Junos OS Release 11.4.

Description

Specify that the option 82 information from the client PDU is concatenated with the username during the subscriber authentication process.

For autosense VLANs, you can additionally specify Option 82 suboption information that is concatenated with the username. You can specify either both or neither of the Agent Circuit ID (suboption 1) and Agent Remote ID (suboption 1). If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If you specify that neither suboption is supplied, the raw payload of Option 82 from the PDU is concatenated to the username.

NOTE: The option 82 value used in creating the username is based on the option 82 value that is encoded in the incoming DHCP discover packet. The use of suboptions is supported for DHCPv4 only.

Options

- **none**—Use the raw payload of Option 82 from the PDU.
- **circuit-id**—(Optional) Use the Agent Circuit ID suboption (suboption 1).
- **remote-id**—(Optional) Use the Agent Remote ID suboption (suboption 2).

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

- Configuring VLAN Interface Username Information for AAA Authentication
- Using DHCP Option 82 Suboptions in Authentication Usernames for Autosense VLANs
otn-options

Syntax

```
otn-options {
  bytes (otn-options) transmit-payload-type value;
  fec (efec | gfec | gfec-sdfec | none);
  (is-ma | no-is-ma);
  (laser-enable | no-laser-enable);
  (line-loopback | no-line-loopback);
  (local-loopback | no-local-loopback);
  (odu-ttim-action-enable | no-odu-ttim-action-enable);
  (otu-ttim-action-enable | no-otu-ttim-action-enable);
  odu-delay-management {

tca option introduced in Junos OS Release 14.2 for PTX Series routers.

bytes, line-loopback, local-loopback, preemptive-fast-reroute, tca, trigger, prbs, and tti statements introduced in 18.3R1 for ACX6360 routers.
output

Syntax

```
output {
    service-set service-set-name <service-filter filter-name>;
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family inet service],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family inet service]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Define one or more output service sets and filters to be applied to traffic.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

output-list

Syntax

```
output-list [ filter-names ];
```

Hierarchy Level

- [edit interfaces interface-name unit logical-unit-number family family filter],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family filter]

Release Information

Statement introduced in Junos OS Release 7.6.

Description

Apply a group of filters to evaluate when packets are transmitted on an interface.

Options

**[ filter-names ]**—Name of a filter to evaluate when packets are transmitted on the interface. Up to 16 filters can be included in a filter input list.

Required Privilege

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

Related Documentation

output-policer

Syntax  output-policer policer-name;

Hierarchy Level  [edit interfaces interface-name unit logical-unit-number layer2-policer],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number layer2-policer]

Release Information  Statement introduced in Junos OS Release 8.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description  Apply a single-rate two-color policer to the Layer 2 output traffic at the logical interface. The output-policer and output-three-color statements are mutually exclusive.

Options  policer-name—Name of the single-rate two-color policer that you define at the [edit firewall] hierarchy level.

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

### output-priority-map

**Syntax**

```plaintext
classifier {
  premium {
    forwarding-class class-name {
      loss-priority (high | low);
    }
  }
}
```

**Hierarchy Level**

- [edit interfaces interface-name gigether-options ethernet-switch-profile ethernet-policer-profile]
- [edit interfaces interface-name ether-options ethernet-switch-profile ethernet-policer-profile]

**Release Information**

Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description**

For Gigabit Ethernet IQ and 10-Gigabit Ethernet interfaces only, define the output policer priority map to be applied to outgoing frames on this interface.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**

- [Specifying an Output Priority Map](#)
- input-priority-map on page 682
### output-three-color

**Syntax**

```
output-three-color policer-name;
```

**Hierarchy Level**

```
[edit interfaces interface-name unit logical-unit-number layer2-policer]
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number layer2-policer]
```

**Release Information**

Statement introduced in Junos OS Release 8.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Apply a single-rate or two-rate three-color policer to the Layer 2 output traffic at the logical interface. The `output-three-color` and `output-policer` statements are mutually exclusive.

**Options**

- **policer-name**—Name of the single-rate or two-rate three-color policer.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

output-vlan-map (Aggregated Ethernet)

**Syntax**

```output-vlan-map {
  (pop | push | swap);
  tag-protocol-id tpid;
  vlan-id number;
}
```

**Hierarchy Level**

- [edit interfaces interface-name unit logical-unit-number],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**

Statement introduced in Junos OS Release 8.2.
Starting in Junos OS Release 17.3R1, input-vlan-map for outer vlan is supported for L2 circuit over aggregated Ethernet interfaces for QFX10000 Series switches.

**Description**

Define the rewrite profile to be applied to outgoing frames on this logical interface. On MX Series routers, this statement only applies to aggregated Ethernet interfaces using Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E interfaces and 100-Gigabit Ethernet Type 5 PIC with CFP.

The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- input-vlan-map (Aggregated Ethernet) on page 684
**output-vlan-map**

Syntax

```plaintext
output-vlan-map {
   (pop | pop-pop | pop-swap | push | push-push | swap | swap-push | swap-swap);
   inner-tag-protocol-id tpid;
   inner-vlan-id number;
   tag-protocol-id tpid;
   vlan-id number;
}
```

Hierarchy Level

```plaintext
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Release Information

Statement introduced before Junos OS Release 7.4.

- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

For EX Series switches, defines the rewrite operation to be applied to outgoing frames.

For MX Series routers and NFX Series devices' Gigabit Ethernet IQ and 10-Port 10-Gigabit Ethernet SFPP interfaces only, defines the rewrite operation to be applied to outgoing frames on this logical interface.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- **Level**
  - interface—To view this statement in the configuration.
  - interface-control—To add this statement to the configuration.

Related Documentation

- Stacking and Rewriting Gigabit Ethernet VLAN Tags
- input-vlan-map on page 685
overflow (Receive Bucket)

Syntax  
overflow (discard | tag);

Hierarchy Level  
[edit interfaces interface-name receive-bucket]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
Specify how to handle packets that exceed the threshold for the receive leaky bucket.

Options  
tag—Tag, count, and process received packets that exceed the threshold.

discard—Discard received packets that exceed the threshold. No counting is done.

Required Privilege  

Level  
interface—To view this statement in the configuration.

transmit-control—To add this statement to the configuration.

Related Documentation  
• Configuring Receive and Transmit Leaky Bucket Properties to Reduce Network Congestion on page 140

overflow (Transmit Bucket)

Syntax  
overflow discard;

Hierarchy Level  
[edit interfaces interface-name transmit-bucket]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
Discard packets that exceed the threshold for the transmit leaky bucket.

Required Privilege  

Level  
interface—To view this statement in the configuration.

transmit-control—To add this statement to the configuration.

Related Documentation  
• Configuring Receive and Transmit Leaky Bucket Properties to Reduce Network Congestion on page 140
override

Syntax:  
```
override tag vlan-tag dynamic-profile profile name;
```

Hierarchy Level:  
```
[edit interfaces interface-name auto-configure vlan-ranges],
[edit interfaces interface-name auto-configure stacked-vlan-ranges]
```

Release Information:  
Statement introduced in Junos OS Release 11.2.

Description:  
Override dynamic profile assignment to individual VLANs that are already part of a previously defined VLAN range and dynamic profile.

Options:  
- `vlan-tag`—VLAN tag that you want to override.
- `profile-name`—Name of the dynamic profile that you want to use when overriding the specified VLAN tag.

Required Privilege Level:  
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**pado-advertise**

**Syntax**

```
pado-advertise;
```

**Hierarchy Level**

```
[edit protocols pppoe]
```

**Release Information**

Statement introduced in Junos OS Release 10.2.

**Description**

Enable named services configured in PPPoE service name tables to be advertised in PPPoE Active Discovery Offer (PADO) control packets. By default, advertisement of named services in PADO packets is disabled.

**NOTE:** If you enable advertisement of named services in PADO packets, make sure the number and length of all advertised service entries does not exceed the maximum transmission unit (MTU) size of the PPPoE underlying interface.

**Required Privilege**

- **Level**
  - interface—To view this statement in the configuration.
  - interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring PPPoE Service Name Tables
- Enabling Advertisement of Named Services in PADO Control Packets
paired-group

**Syntax**  
paired-group *group-name*;

**Hierarchy Level**  
[edit interfaces *interface-name* sonet-options *aps*]

**Release Information**  
Statement introduced before Junos OS Release 7.4.

**Description**  
Configure load sharing between two working protect circuit pairs.

**Options**  
*group-name*—Circuit’s group name, as configured with the *protect-circuit* or *working-circuit* statement.

**Required Privilege**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**  
- Configuring APS Load Sharing  
- working-circuit on page 1148
pap

Syntax

```pap
{access-profile name;
default-pap-password password;
local-name name;
local-password password;
passive; }
```

Hierarchy Level

- [edit interfaces interface-name ppp-options],
- [edit interfaces interface-name unit logical-unit-number ppp-options],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options]

Release Information

Statement introduced in Junos OS Release 8.3.

Description

Configure the Password Authentication Protocol (PAP). Use PAP authentication as a means to provide a simple method for the peer to establish its identity using a two-way handshake. This is done only upon initial link establishment.

After the link is established, an ID and password pair is repeatedly sent by the peer to the authenticator until authentication is acknowledged or the connection is terminated.

**BEST PRACTICE:** On inline service (si) interfaces for L2TP, only the `pap` statement itself is typically used for subscriber management. We recommend that you leave the subordinate statements at their default values.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

**partition**

**Syntax**

```
partition partition-number oc-slice oc-slice-range interface-type type timeslots
time-slot-range;
```

**Hierarchy Level**

[edit interfaces interface-name]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

The partition number is correlated with the channel number. Partition and channel numbering on IQ interfaces begins with :1, not :0.

**Default**

If you omit this statement, the channelized PIC or PIM is not partitioned, and no data channels are configured.

**Options**

- **partition-number**—Sublevel interface partition index.
  - Range:
    - 1 through 4 for an OC3 interface on a channelized OC12 IQ interface.
    - 1 through 12 for a T3 interface on a channelized OC12 IQ interface.
    - 1 through 4 for a T3 interface on a channelized T3 IQ interface.
    - 1 through 28 for a T1 IQ interface on a channelized OC12 IQ or channelized T3 IQ interface.
    - 1 through 10 for an E1 interface on a channelized E1 IQ interface.
    - 1 through 30 on a channelized E1 interface.
    - 1 through 23 on a channelized T1 interface.
    - 1 through 24 for NxDS0 interfaces on either channelized OC12 IQ or channelized DS3 IQ interfaces.
    - 0 through 31 (with 0 reserved for framing) for NxDS0 interfaces on channelized E1 IQ interfaces.

The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

**Related Documentation**

## passive (CHAP)

**Syntax**
```
passive;
```

**Hierarchy Level**
```
[edit interfaces interface-name ppp-options chap],
[edit interfaces interface-name unit logical-unit-number ppp-options chap],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options chap]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
Do not challenge the peer, but respond if challenged. If you omit this statement from the configuration, the interface always challenges its peer.

For ATM2 IQ interfaces only, you can configure CHAP on the logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- **atm-ppp-llc**—PPP over AAL5 LLC encapsulation.
- **atm-ppp-vc-mux**—PPP over AAL5 multiplex encapsulation.

**Required Privilege Level**
- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

**Related Documentation**
- *Configuring Passive Mode*
passive (PAP)

Syntax

```
passive;
```

Hierarchy Level

```
[edit interfaces interface-name ppp-options pap],
[edit interfaces interface-name unit logical-unit-number ppp-options pap],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-options pap]
```

Release Information

Statement introduced in Junos OS Release 8.3.

Description

Initiate an authentication request when the PAP option is received from a peer. If you omit this statement from the configuration, the interface requires the peer to initiate an authentication request.

Required Privilege

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Passive Mode
- Junos OS Administration Library
passive-monitor-mode

Syntax

```
passive-monitor-mode;
```

Hierarchy Level

```
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Monitor packet flows from another router. If you include this statement in the configuration, the interface does not send keepalives or alarms, and does not participate actively on the network.

This statement is supported on ATM, Ethernet, and SONET/SDH interfaces. For more information, see ATM Interfaces Feature Guide for Routing Devices.

For ATM and Ethernet interfaces, you can include this statement on the physical interface only.

For SONET/SDH interfaces, you can include this statement on the logical interface only.

Required Privilege Level

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

password (Interfaces)

Syntax  

password password-string;

Hierarchy Level  

[edit interfaces interface-name auto-configure vlan-ranges authentication],  
[edit interfaces interface-name auto-configure stacked-vlan-ranges authentication]

Release Information  

Statement introduced in Junos OS Release 10.0.

Description  

Configure the password that is sent to the external AAA authentication server for subscriber VLAN or stacked VLAN interface authentication.

Options  

password-string—Authentication password.

Required Privilege  

Level  

interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation  

• Configuring an Authentication Password for VLAN or Stacked VLAN Ranges

path-database-size

Syntax  

path-database-size path-database-size;

Hierarchy Level  

[edit protocols oam ethernet connectivity-fault-management linktrace]

Release Information  

Statement introduced in Junos OS Release 8.5.

Description  

Number of linktrace reply entries to be stored per linktrace request.

Options  

path-database-size—Database size.  
Range: 1 through 255  
Default: 64

Required Privilege  

Level  

interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation  

• Configuring Linktrace Protocol in CFM
**path-trace**

**Syntax**  
`path-trace trace-string;`

**Hierarchy Level**  
`[edit interfaces interface-name sonet-options]`

**Release Information**  
Statement introduced before Junos OS Release 7.4.

**Description**  
For SONET/SDH interfaces and 10-Gigabit Ethernet interfaces in WAN PHY mode, configure a path trace identifier, which is a text string that identifies the circuit.

On SONET/SDH OC48 interfaces that are configured for channelized (multiplexed) mode (by including the `no-concatenate` statement at the `[edit chassis fpc slot-number pic pic-number]` hierarchy level), the `bytes e1-quiet` and `bytes f1` options have no effect. The `bytes f2`, `bytes z3`, `bytes z4`, and `path-trace` options work correctly on channel 0 and work in the transmit direction only on channels 1, 2, and 3.

For DS3 channels on a channelized OC12 interface, you can configure a unique path trace for each of the 12 channels. Each path trace can be up to 16 bytes. For channels on a channelized OC12 IQ interface, each path trace can be up to 64 bytes.

**Options**  
`trace-string`—Text string that identifies the circuit. If the string contains spaces, enclose it in quotation marks. A common convention is to use the circuit identifier as the path trace identifier. If you do not configure an identifier, the Junos OS uses the system and interface names to construct the default `trace-string`. For all nonchannelized SONET/SDH interfaces, the default `trace-string` is `system-name interface-name`. For channelized SONET/SDH interfaces and 10–Gigabit Ethernet WAN-PHY interfaces, the default `trace-string` is `interface-name`.

**Required Privilege Level**  
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**  
- Configuring the SONET/SDH Path Trace Identifier for a Circuit
- `sonet-options` on page 1002
payload-scrambler

Syntax (payload-scrambler | no-payload-scrambler);

Hierarchy Level [edit interfaces interface-name e3-options],
[edit interfaces interface-name sonet-options],
[edit interfaces interface-name t3-options]

Release Information Statement introduced before Junos OS Release 7.4.

Description Enable or disable HDLC scrambling on an E3, a SONET/SDH, or a T3 interface. This type of scrambling provides better link stability. Both sides of a connection must either use or not use scrambling.

If you commit a T3 interface configuration that has HDLC payload scrambling enabled, the interface must also be configured to be compatible with the channel service unit (CSU) at the remote end of the line.

Disable payload scrambling on an E3 interface if Digital Link compatibility mode is used.

On a channelized OC12 interface, the sonet payload-scrambler statement is ignored. To configure scrambling on the DS3 channels on the interface, you can include the t3-options payload-scrambler statement in the configuration for each DS3 channel.

NOTE: The payload-scrambler statement at the [edit interfaces interface-name e3-options] hierarchy level is not valid for IQE PICs.

Default Payload scrambling is disabled on all E3 and T3 interfaces; it is enabled by default on E3/T3 over ATM interfaces and on SONET/SDH interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation • Configuring E3 and T3 Parameters on ATM Interfaces
• Configuring E3 HDLC Payload Scrambling
• Configuring SONET/SDH HDLC Payload Scrambling for Link Stability
• Configuring T3 HDLC Payload Scrambling
• Examples: Configuring T3 Interfaces
• compatibility-mode on page 477
payload-size

Syntax  payload-size bytes ;

Hierarchy Level  [edit interfaces interface-name satop-options]

Release Information  Statement introduced in Junos OS Release 9.3.

Description  Specify the satop-options payload size in integer number of bytes.

Required Privilege Level  

interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation

•  satop-options on page 977
**pdu-interval**

**Syntax**  
pdu-interval interval;

**Hierarchy Level**  
[edit protocols oam ethernet link-fault-management interface interface-name]

**Release Information**  
Statement introduced in Junos OS Release 8.2 for MX, M, T, ACX, Series routers, SRX Series firewalls, and EX Series Switches.  
Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description**  
For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, specify the periodic OAM PDU sending interval for fault detection. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

**Options**  
*interval*—Periodic OAM PDU sending interval.  
**Range:** For MX, M, T, ACX, Series routers, SRX Series firewalls and EX Series switches – 100 through 1000 milliseconds  
**Default:** For EX Series switches – 1000 milliseconds

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.  
routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**  
- Configuring the OAM PDU Interval  
- Example: Configuring Ethernet OAM Link Fault Management  
- Configuring Ethernet OAM Link Fault Management
pdu-threshold

Syntax  pdu-threshold threshold-value;

Hierarchy Level  [edit protocols oam ethernet link-fault-management interface interface-name]

Statement introduced in Junos OS Release 9.4 for EX Series switches and NFX Series devices.

Description  Configure how many protocol data units (PDUs) are missed before declaring the peer lost in Ethernet OAM link fault management (LFM) for all interfaces or for specific interfaces.

For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, specify the number of OAM PDUs to miss before an error is logged. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

Options  threshold-value—The number of PDUs missed before declaring the peer lost.
Range:  3 through 10 PDUs
Default:  3 PDUs

Required Privilege Level  interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Related Documentation  • Configuring the OAM PDU Threshold
• Configuring Ethernet OAM Link Fault Management
peer

Syntax
peer a.b.c.d [ 
    interface interface-name;
] 

Hierarchy Level
[edit interfaces interface-name multi-chassis-protection]

Release Information
Statement introduced in Junos OS Release 11.1.

Description
For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, use the multi-chassis-protection statement under the physical interface level to reduce the configuration at the logical interface level. If the interchassis control protocol connection (ICCP) is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer active-active node specified by the peer statement. You must also specify the peer’s physical interface.

Options
  a.b.c.d—Specify the IP address of the peer.

  interface interface-name—Specify the peer’s physical interface: interface
    interface-name-fpc/pic/port

Required Privilege
Level
  interface—To view this statement in the configuration.
  interface-control—To add this statement to the configuration.

Related Documentation
  • Configuring Multichassis Link Aggregation on MX Series Routers

### peer-unit

**Syntax**

peer-unit unit-number;

**Hierarchy Level**

[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Configure a peer relationship between two logical systems.

**Options**

- **unit-number**—Peering logical system unit number.

**Required Privilege**

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

**Related Documentation**

- [Junos OS Services Interfaces Library for Routing Devices](#)
per-unit-scheduler

Syntax  
per-unit-scheduler;

Hierarchy Level  
[edit interfaces interface-name]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 13.2 on 16x10GE MPC and MPC3E line cards.  
Statement introduced in Junos OS Release 13.3 on MPC4E line cards.  
Statement introduced in Junos OS Release 15.1 on MPC6E line cards.

Description  
For Channelized OC3 IQ, Channelized OC12 IQ, Channelized ST1 IQ, Channelized T3 IQ,  
Channelized E1 IQ, E3 IQ, link services IQ interfaces (lsq-), Gigabit Ethernet IQ, Gigabit  
Ethernet IQ2 and IQ2-E, and 10-, 40-, and 100-Gigabit Ethernet interfaces (including the  
16x10GE MPC), enable the association of scheduler maps with logical interfaces.

CAUTION:  Turning on per-unit scheduling causes the interface to reinitialize,  
which means all logical interfaces (units) on the interface are deleted and recreated.

NOTE:  To enable per-unit scheduling on MX80 and MX104 routers, configure  
the per-unit-scheduler statement at each member physical interface level of  
a particular aggregated Ethernet interface as well as at that aggregated  
Ethernet interface level. On other routing platforms, it is enough if you include  
this statement at the aggregated Ethernet interface level.

NOTE:  Per-unit scheduling is not supported on T1 interfaces configured on  
the Channelized OC12 IQ PIC.

NOTE:  On Gigabit Ethernet IQ2 and IQ2-E PICs without the per-unit-scheduler  
statement, the entire PIC supports 4071 VLANs and the user can configure  
all the VLANs on the same port.  
On Gigabit Ethernet IQ2 and IQ2-E PICs with the per-unit-scheduler statement,  
the entire PIC supports 1024 – 2 * number of ports (1024 minus two times  
the number of ports), because each port is allocated two default schedulers.
When including the **per-unit-scheduler** statement, you must also include the **vlan-tagging** statement or the **flexible-vlan-tagging** statement (to apply scheduling to VLANs) or the **encapsulation frame-relay** statement (to apply scheduling to DLCIs) at the [edit interfaces interface-name] hierarchy level.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

plp1

Syntax  
plp1 cells;

Hierarchy Level  
[edit interfaces interface-name unit logical-unit-number],  
[edit interfaces interface-name unit logical-unit-number address address family family multipoint-destination address],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number address address family family multipoint-destination address]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for QFX Series switches.

Description  
For ATM2 IQ interfaces only, define the EPD threshold on a VC. The EPD threshold is a limit on the number of transmit packets that can be queued. Packets that exceed the limit are discarded. This threshold applies to packets that have a PLP of 1.

Default  
EPD threshold is unregulated.

Options  
- **cells**—Maximum number of cells.  
  Range:  
  - For 1-port and 2-port OC12 interfaces, 1 through 425,984 cells  
  - For 1-port OC48 interfaces, 1 through 425,984 cells  
  - For 2-port OC3, DS3, and E3 interfaces, 1 through 212,992 cells  
  - For 4-port DS3 and E3 interfaces, 1 through 106,496 cells

Required Privilege Level  
- interface—To view this statement in the configuration.

Statement introduced before Junos OS Release 7.4.

Description
Apply a policer to an interface.

Options

arp policer-template-name—For inet family only, name of one policer to evaluate when ARP packets are received on the interface.

input policer-template-name—Name of one policer to evaluate when packets are received on the interface.

output policer-template-name—Name of one policer to evaluate when packets are transmitted on the interface.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

policer (MAC)

Syntax

```
policer {
   input cos-policer-name;
   output cos-policer-name;
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number accept-source-mac mac-address mac-address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number accept-source-mac mac-address mac-address]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, configure MAC policing.

NOTE:

On MX Series routers with Gigabit Ethernet or Fast Ethernet PICs, the following considerations apply:

- Interface counters do not count the 7-byte preamble and 1-byte frame delimiter in Ethernet frames.
- In MAC statistics, the frame size includes MAC header and CRC before any VLAN rewrite/imposition rules are applied.
- In traffic statistics, the frame size encompasses the L2 header without CRC after any VLAN rewrite/imposition rule.

Options

**input cos-policer-name**—Name of one policer to specify the premium bandwidth and aggregate bandwidth.

**output cos-policer-name**—Name of one policer to specify the premium bandwidth and aggregate bandwidth.

Required Privilege Level

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

- **resolution-map** statement introduced in Junos OS Release 19.2R1-S1 on MX and PTX Series routers.

**Description**

Define a routing policy, including subroutine policies.

A **term** is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

Each term contains a set of match conditions and a set of actions:

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of **accept** or **reject** is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either **accept** or **reject**) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the **[edit policy-options]** hierarchy level by **policy-statement policy-name** in alphabetical order, enter the **show policy-options** configuration command.

The statements are explained separately.
Options  

**actions**—(Optional) One or more actions to take if the conditions match. The actions are described in Configuring Flow Control Actions.

**family family-name**—(Optional) Specify an address family protocol. Specify **inet** for IPv4. Specify **inet6** for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify **iso**. For IPv4 multicast VPN traffic, specify **inet-mvpn**. For IPv6 multicast VPN traffic, specify **inet6-mvpn**. For multicast-distribution-tree (MDT) IPv4 traffic, specify **inet-mdt**. For BGP route target VPN traffic, specify **route-target**. For traffic engineering, specify **traffic-engineering**.

**NOTE:** When family is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the family statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

**from**—(Optional) Match a route based on its source address.

**as-path-unique-count count (equal | orhigher | orlower)**—(Optional) Specify a number from 0 through 1024 to filter routes based on the number of unique autonomous systems (ASs) in the AS path. Specify the match condition for the unique AS path count.

**aggregate-bandwidth**—(Optional) Enable BGP to advertise aggregate outbound link bandwidth for load balancing.

**dynamic-tunnel-attributes dynamic-tunnel-attributes**—(Optional) Choose a set of defined dynamic tunnel attributes for forwarding traffic over V4oV6 tunnels.

**match-conditions**—(Optional in from statement; required in to statement) One or more conditions to use to make a match. The qualifiers are described in Routing Policy Match Conditions.

**multipath-resolve multipath-resolve**—(Optional) Enable the use of all paths for resolution over the specified prefix.

**limit-bandwidth limit-bandwidth**—(Optional) Specify the limit for advertised aggregate outbound link bandwidth for load balancing.

**Range:** 0 through 4,294,967,295 bytes

**no-entropy-label-capability**—(Optional) Disable the entropy label capability advertisement at egress or transit routes specified in the policy.

**priority (high | medium | low)**—(Optional) Configure the priority for an IS-IS route to change the default order in which the routes are installed in the routing table, in the event of a network topology change.
**policy subroutine-policy-name**—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form `.*-internal.*`, as this form is reserved. For information about how to configure subroutines, see *Understanding Policy Subroutines in Routing Policy Match Conditions*.

**policy-name**—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

**prefix-list prefix-list-name**—Name of a list of IPv4 or IPv6 prefixes.

**prefix-list-filter prefix-list-name**—Name of a prefix list to evaluate using qualifiers; `match-type` is the type of match, and `actions` is the action to take if the prefixes match.

**protocol protocol-name**—Name of the protocol used to control traffic engineering database import at the originating point.

Starting in Junos OS Release 19.1R1, you can specify options to match label IS-IS and label OSPF routes using the `lisis` and `l ospf` options, respectively. The `isis` options matches all IS-IS routes, excluding labelled IS-IS routes. The `ospf` option matches all OSPF routes, including OSPFv2, OSPFv3 and labelled OSPF routes.

**resolution-map**—(Optional) Set resolution map modes. A given resolution-map can be shared across multiple policy-statements.

**route-filter destination-prefix match-type <actions>**—(Optional) List of routes on which to perform an immediate match; `destination-prefix` is the IPv4 or IPv6 route prefix to match, `match-type` is the type of match (see *Configuring Route Lists*), and `actions` is the action to take if the `destination-prefix` matches.

**source-address-filter source-prefix match-type <actions>**—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. `source-prefix` is the IPv4 or IPv6 route prefix to match, `match-type` is the type of match (see *Configuring Route Lists*), and `actions` is the action to take if the `source-prefix` matches.

**tag value**—(Optional) A numeric value that identifies a route. You can tag certain routes to prioritize them over other routes. In the event of a network topology change, Junos OS updates these routes in the routing table before updating other routes with lower priority. You can also tag some routes to identify and reject them based on your requirement.

**term term-name**—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the `term` statement when defining match conditions and actions.
to—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

then—(Optional) Actions to take on matching routes. The actions are described in Configuring Flow Control Actions and Configuring Actions That Manipulate Route Characteristics.

Required Privilege
Level
routing—To view this statement in the configuration.
routeing-control—To add this statement to the configuration.

pool

Syntax
pool pool-name <priority priority>;

Hierarchy Level
[edit interfaces br-pim/0/port dialer-options],
[edit interfaces umdo dialer-options],
[edit interfaces dl unit logical-unit-number dialer-options],
[edit logical-systems logical-system-name interfaces dl unit logical-unit-number dialer-options]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
On J Series Services Routers, for logical and physical ISDN interfaces, specify the dial pool. The dial pool allows logical (dialer) and physical (br-pim/0/port) interfaces to be bound together dynamically on a per-call basis. On a dialer interface, pool directs the dialer interface which dial pool to use. On br-pim/0/port interface, pool defines the pool to which the interface belongs.

Options
pool-name—Pool identifier.

priority priority—(Physical br-pim/0/port interfaces only) Specify a priority value of 0 (lowest) to 255 (highest) for the interface within the pool.

Required Privilege
Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

[edit interfaces interface-name sonet-options mpls],
[edit interfaces interface-name fastether-options mpls],
[edit interfaces interface-name gigether-options mpls]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description

For passive monitoring on ATM, SONET/SDH, Fast Ethernet, and Gigabit Ethernet interfaces only, removes up to two MPLS labels from incoming IP packets. For passive monitoring on T Series devices, removes up to five MPLS labels from incoming IP packets.

This statement has no effect on IP packets with more than two MPLS labels, or IP packets with more than five MPLS labels on T Series devices. Packets with MPLS labels cannot be processed by the Monitoring Services PIC; if packets with MPLS labels are forwarded to the Monitoring Services PIC, they are discarded.

The remaining statement is explained separately. See CLI Explorer.

Default

If you omit this statement, the MPLS labels are not removed, and the packet is not processed by the Monitoring Services PIC.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Description

On interfaces with PPP encapsulation, configure PPP-specific interface properties.

For ATM2 IQ interfaces only, you can configure CHAP on the logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- atm-ppp-llc—PPP over AAL5 LLC encapsulation.
- atm-ppp-vc-mux—PPP over AAL5 multiplex encapsulation.
**BEST PRACTICE:** On inline service (si) interfaces for L2TP, only the chap and pap statements are typically used for subscriber management. We recommend that you leave the other statements subordinate to ppp-options—including those subordinate to chap and pap—at their default values.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

**Required Privilege Level**
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**

**pppoe-options**

**Syntax**

```
pppoe-options {
  access-concentrator name;
  auto-reconnect seconds;
  (client | server);
  service-name name;
  underlying-interface Interface-name;
  ppp-max-payload ppp-max-payload
}
```

**Hierarchy Level**

```
[edit interfaces pp0 unit logical-unit-number],
[edit logical-systems logical-system-name interfaces pp0 unit logical-unit-number]
[set interface ppp interface unit logical-unit-number ppp-max-payload ppp-max-payload],
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
client Statement introduced in Junos OS Release 8.5.
server Statement introduced in Junos OS Release 8.5.
**ppp-max-payload** Statement introduced in Junos OS Release 15.1X49-D100.

**Description**

Configure PPP over Ethernet-specific interface properties.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

The maximum payload allowed on an Ethernet frame is 1500 bytes. For a PPPoE interface, the PPPoE header uses 6 bytes and the PPP protocol ID uses 2 bytes. This restricts the maximum MTU size on a PPPoE interface to 1492 bytes, which can cause frequent fragmentation and reassembly of larger PPP packets received over the PPPoE interface. To prevent frequent fragmentation and reassembly for PPP packets over Ethernet, you can configure the maximum transmission unit (MTU) and MRU sizes for PPP subscribers.

For PPPoE subscribers, the PPP MRU or PPP MTU size can be greater than 1492 bytes if the PPP-Max-Payload tag is received in the PPPoE Active Discovery Request (PADR) packets.

The PPP-Max-Payload option allows you to override the default behavior of the PPPoE client by providing a maximum size that the PPP payload can support in both sending and receiving directions. The PPPoE server might allow the negotiation of an MRU larger than 1492 octets and the ability to use an MTU larger than 1500 octets.

It is important to set an appropriate value for the MTU size of the physical interface before setting ppp-max-payload. The value of mtu must be greater than the value of ppp-max-payload.

To enable Jumbo frames refer Understanding Jumbo Frames Support for Ethernet Interfaces.

Statement introduced in Junos OS Release 9.0.

Description

For unnumbered Ethernet interfaces configured with a loopback interface as the donor interface, specify one of the loopback interface's secondary addresses as the preferred source address for the unnumbered Ethernet interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network.

Configuration of a preferred source address for unnumbered Ethernet interfaces is supported for the IPv4 and IPv6 address families.

Options

address—Secondary IP address of the donor loopback interface.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring a Preferred Source Address for Unnumbered Ethernet or Demux Interfaces on page 202
- address on page 407

preferred-source-address

**Syntax**

preferred-source-address address;

**Hierarchy Level**

[edit dynamic-profiles interfaces interface-name unit logical-unit-number family family unnumbered-address interface-name],
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family family],

**Release Information**

Statement introduced in Junos OS Release 9.2.
Support for the $junos-preferred-source-address and $junos-preferred-source-ipv6-address predefined variables introduced in Junos OS Release 9.6.

**Description**

For unnumbered Ethernet interfaces configured with a loopback interface as the donor interface, specify one of the loopback interface's secondary addresses as the preferred source address for the unnumbered Ethernet interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. To configure the preferred source address dynamically, instead of using this statement, you must include the $junos-preferred-source-address predefined variable for IPv4 (family inet) addresses or the $junos-preferred-source-ipv6-address predefined variable for IPv6 (family inet6) addresses.

Configuration of a preferred source address for unnumbered Ethernet interfaces is supported for IPv4 and IPv6 address families.

---

### NOTE:

When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the $junos-routing-instance predefined variable, you must not configure a preferred source address, whether with the $junos-preferred-source-address predefined variable, the $junos-preferred-source-ipv6-address predefined variable, or the preferred-source-address statement. Configuring the preferred source address in this circumstance causes a commit failure.

---

**Options**

- **address**—Secondary IP address of the donor loopback interface. Alternatively, use the $junos-preferred-source-address or the $junos-preferred-source-ipv6-address predefined variable to dynamically apply a preferred source address to the unnumbered Ethernet interface.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

premium (Hierarchical Policer)

Syntax

```
premium {
  if-exceeding {
    bandwidth-limit bandwidth;
    burst-size-limit burst;
  }
  then {
    discard;
  }
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall hierarchical-policer],
[edit firewall hierarchical-policer]
```

Release Information

Statement introduced in Junos OS Release 9.5.
Support at the [edit dynamic-profiles ... hierarchical-policer name] hierarchy level introduced in Junos OS Release 11.4.

Description

On M40e, M120, and M320 edge routers with FPC input as FFPC and FPC output as SFPC, and on MX Series, T320, T640, and T1600 edge routers with Enhanced Intelligent Queuing (IQE) PICs, T4000 routers with Type 5 FPC and Enhanced Scaling Type 4 FPC, specify a premium level for a hierarchical policer.

Options

Options are described separately.

Required Privilege

- firewall—To view this statement in the configuration.
- firewall-control—To add this statement to the configuration.

**preserve-interface**

**Syntax**  
`preserve-interface;`

**Hierarchy Level**  
[edit interfaces interface-name sonet-options aps]

**Release Information**  
Statement introduced in Junos OS Release 7.6.

**Description**  
Provide link PIC replication, providing MLPPP link redundancy at the port level. This feature is supported with SONET APS and the following link PICs:

- Channelized OC3 IQ PIC
- Channelized OC12 IQ PIC
- Channelized STM1 IQ PIC

Link PIC replication provides the ability to add two sets of links, one from the active SONET PIC and the other from the standby SONET PIC, to the same bundle. If the active SONET PIC fails, links from the standby PIC are used without triggering link renegotiation. All the negotiated state is replicated from the active links to the standby links to prevent link renegotiation.

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**  
- Configuring Link PIC Redundancy
- Junos OS Services Interfaces Library for Routing Devices
primary (Address on Interface)

Syntax primary;

Hierarchy Level [edit interfaces interface-name unit logical-unit-number family family address address], [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]

Description Configure this address to be the primary address of the protocol on the interface. If the logical unit has more than one address, the primary address is used by default as the source address when packet transfer originates from the interface and the destination address does not indicate the subnet.

NOTE: The edit logical-systems hierarchy is not available on QFabric systems.

Default For unicast traffic, the primary address is the lowest non-127 (in other words, non-loopback) preferred address on the unit.

Required Privilege Level interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Related Documentation • Configuring the Interface Address on page 191
primary (Interface for Router)

Syntax

primary;

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number family family ]
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family ]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Configure the primary interface for a device. By default, the multicast-capable interface with the lowest-index address is chosen as the primary interface. If there is no such interface, the point-to-point interface with the lowest-index address is chosen. Otherwise, any interface with an address can be picked. In practice, this means that, on the device, the fxp0 or em0 interface is picked by default. To configure a different interface to be the primary interface, you include this statement.

The primary interface for the router has the following characteristics:

- It is the interface through which the packets go out when you type a command such as ping 255.255.255.255—that is, a command that does not include an interface name (there is no interface type-0/0/0.0 qualifier) and where the destination address does not imply any particular outgoing interface.

- It is the interface on which multicast applications running locally on the router, such as Session Announcement Protocol (SAP), perform group joins by default.

- It is the interface from which the default local address is derived for packets sourced out of an unnumbered interface if there are no non-127 addresses configured on the loopback interface, lo0.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Default, Primary, and Preferred Addresses and Interfaces on page 193
primary (AS PIC or Multiservices PIC Interfaces)

Syntax: primary interface-name;

Hierarchy Level: [edit interfaces (rsp0 | rsp1) redundancy-options]

Release Information: Statement introduced before Junos OS Release 7.4.

Description: Specify the primary AS PIC or MultiServices PIC interface.

Options: 
- **interface-name**—The identifier for the AS PIC interface or MultiServices PIC interface, which must be of the form sp-fpc/pic/port.

Required Privilege Level:
- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

Related Documentation:
- Junos OS Services Interfaces Library for Routing Devices
priority (OAM Connectivity-Fault Management)

Syntax

priority number;

Hierarchy Level

[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name maintenance-association ma-name mep mep-id]

For EX Series Switches:

[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name mep mep-id]

Release Information

Statement introduced in Junos OS Release 8.4.

Description

IEEE 802.1p priority bits used by the continuity check messages.

Options

number—Configure the IEEE 802.1p priority bits to be used in the VLAN header of the CFM packets.

Range: 0 through 7

Required Privilege

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

priority (Schedulers)

Syntax
priority (high | low);

Hierarchy Level
[edit interfaces at-fpc/pic/port atm-options scheduler-maps map-name forwarding-class class-name]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
For ATM2 IQ interfaces only, assign queuing priority to a forwarding class.

Options
- low—Forwarding class has low priority.
- high—Forwarding class has high priority.

Required Privilege
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

promiscuous-mode

Syntax

promiscuous-mode {
    vpi vpi-identifier;
}

Hierarchy Level
[edit interfaces interface-name atm-options]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

Description
For ATM interfaces with atm-ccc-cell-relay encapsulation, map all incoming cells from either an interface port or a VP to a single label-switched path (LSP) without restricting the VCI number. Promiscuous mode allows you to map traffic from all 65,535 VCIs to a single LSP, or from all 256 VPIs to a single LSP.

NOTE: In ACX Series routers, the statement supports only Inverse Multiplexing for ATM (IMA).

Options
vpi-identifier—Open this VPI in promiscuous mode.

Range: 0 through 255

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

protocols

**Syntax**
protocols [inet isompls];

**Hierarchy Level**
[edit interfaces interface-name unit logical-unit-number family tcc]

**Release Information**
Statement introduced in Junos OS Release 8.3.

**Description**
For Layer 2.5 VPNs on T Series, MX Series, M120, and M320 routers support, configure IS-IS (ISO traffic) or MPLS traffic to traverse a TCC interface. By default, IPv4 (inet) traffic runs on T Series, MX, Series, M120, and M320 routers and over TCC interfaces. You must configure the same traffic type on both ends of the Layer 2.5 VPN.

NOTE: Some platform and FPC combinations cannot pass TCC encapsulated ISO traffic. See Platforms/FPCs That Cannot Forward TCC Encapsulated ISO Traffic for details.

**Required Privilege**
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

proxy

Syntax
proxy inet-address address;

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number family tcc],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family tcc]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the IP address for which the TCC router is proxying. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only. Ethernet TCC is not supported on the T640 router.

Options
inet-address—Configure the IP address of the neighbor to the TCC router.

Required Privilege
level

Level
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

**proxy-arp**

**Syntax**  
proxy-arp (restricted | unrestricted);

**Hierarchy Level**  
[edit interfaces interface-name unit logical-unit-number],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.6 for EX Series switches.  
**restricted** added in Junos OS Release 10.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.

**Description**  
For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request’s target address.

---

**NOTE:** You must configure the IP address and the inet family for the interface when you enable proxy ARP.

---

**Default**  
Proxy ARP is not enabled. The router or switch responds to an ARP request only if the destination IP address is its own.

**Options**  
- **none**—The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.
- **restricted**—(Optional) The router or switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are in the same subnet. The router or switch must also have a route to the target IP address.
- **unrestricted**—(Optional) The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.

**Default:** unrestricted

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

push

Syntax
push;

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number input-vlan-map],
[edit interfaces interface-name unit logical-unit-number output-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

Description
NOTE: On EX4300 switches, push is not supported at the [edit interfaces interface-name unit logical-unit-number output-vlan-map] hierarchy level.

Specify the VLAN rewrite operation to add a new VLAN tag to the top of the VLAN stack. An outer VLAN tag is pushed in front of the existing VLAN tag.

You can use this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces; 10-Gigabit Ethernet LAN/WAN PIC; aggregated Ethernet interfaces using Gigabit Ethernet IQ interfaces; 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.

If you include the push statement in the configuration, you must also include the pop statement at the [edit interfaces interface-name unit logical-unit-number output-vlan-map] hierarchy level.

Required Privilege
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

[edit interfaces interface-name services-options session-limit]

Release Information  
Statement introduced in Junos OS Release 9.6. Support added in Junos OS Release 19.3R1 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-MX-SPC3 services card.

Description  
Specify the maximum number of new sessions allowed per second on services cards.

Options  
rate new-sessions-per-second—Specify the maximum number of new sessions allowed per second.
   Range: 0, which indicates no limit, and 500 or greater.

Required Privilege Level  
interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Related Documentation  
• How to Configure Services Interfaces for Next Gen Services

rdi

Syntax  
rdi;

Hierarchy Level  
[edit protocols oam ethernet connectivity-fault-management action-profile tlv-action event]

Release Information  
Statement introduced in Junos OS Release 10.1.

Description  
Define a new event rdi. The remote defect indication (rdi) event is triggered whenever CCM packets are received from a remote location with the rdi bit set.
This event is cleared and action is reverted when none of the remote MEPs send the CCM packets with the RDI bit.

Required Privilege Level  
interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Related Documentation

**reassemble-packets**

**Syntax**
```
reassemble-packets;
```

**Hierarchy Level**

```
[edit interfaces gr-fpc/pic/port unit logical-unit-number],
[edit logical-systems logical-system-name interfaces gr-fpc/pic/port unit logical-unit-number]
```

**Release Information**

Statement introduced in Junos OS Release 9.2.

**Description**
Enable reassembly of fragmented tunnel packets on generic routing encapsulation (GRE) tunnel interfaces.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- Junos OS Services Interfaces Library for Routing Devices

reauthentication

Syntax  
reauthentication (disable | interval seconds);

Hierarchy Level  
[edit protocols dot1x authenticator interface interface-id]

Release Information  
Statement introduced in Junos OS Release 9.3.

Description  
Set or disable the periodic reauthentication of the client.

Options  
• disable—Disable the periodic reauthentication of the client.
  • interval seconds—Specify the periodic reauthentication time interval.

  Range: 1 through 65,535 seconds
  Default: 3600 seconds

Required Privilege  
level interface—to view this statement in the configuration.
  level interface-control—to add this statement to the configuration.

receive-bucket

Syntax

receive-bucket {
  overflow (discard | tag);
  rate percentage;
  threshold bytes;
}

Hierarchy Level
[edit interfaces interface-name]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Set parameters for the receive leaky bucket, which specifies what percentage of the interface’s total capacity can be used to receive packets.

For each DS3 channel on a channelized OC12 interface, you can configure a unique receive bucket.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

receive-options-packets

Syntax
receive-options-packets;

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number family inet],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
For a Monitoring Services PIC and an ATM or SONET/SDH PIC installed in an M160, M40e, or T Series router, guarantee conformity with cflowd records structure. This statement is required when you enable passive monitoring.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

red-differential-delay

Syntax  
red-differential-delay milliseconds;

Hierarchy Level  
[edit interfaces interface-name mlfr-uni-nni-bundle-options]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For link services and voice services interfaces only, configure the red differential delay among bundle links to give warning when a link has a differential delay that exceeds the configured threshold.

Options  
milliseconds—Red differential delay threshold.
Range: 1 through 2000 milliseconds
Default: 10 milliseconds

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  
- action-red-differential-delay on page 404

redial-delay

Syntax  redial-delay time;

Hierarchy Level  [edit interfaces dln unit logical-unit-number dialer-options],
                   [edit logical-systems logical-system-name interfaces dln unit logical-unit-number
dialer-options]

Release Information  Statement introduced in Junos OS Release 7.5.

Description  On J Series Services Routers with interfaces configured for ISDN with dialout, specify the
delay (in seconds) between two successive calls made by the dialer. To configure callback
mode, include the callback statement at the [edit interfaces dln unit logical-unit-number
dialer-options] hierarchy level.

If the callback statement is configured, you cannot use the caller caller-id statement at
the [edit interfaces dln unit logical-unit-number dialer-options] hierarchy level.

Options  time—Delay (in seconds) between two successive calls.
  Range:  2 through 255 seconds
  Default:  3 seconds

Required Privilege  interface—To view this statement in the configuration.
Level  interface-control—To add this statement to the configuration.

## redundancy-options

**Syntax**

```plaintext
redundancy-options {
  primary interface-name;
  secondary interface-name;
  hot-standby;
}
```

**Hierarchy Level**

- `[edit interfaces (rsp0 | rsp1)]`,
- `[edit interfaces rlsqnumber]`
- `[edit interfaces rspnumber]`
- `[edit interfaces rmsnumber]`

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Specify the primary and secondary (backup) AS PIC interfaces or MultiServices PIC interfaces.

**Options**

- **primary interface-name**—The identifier for the primary LSQ AS, rsp, or rms interface.
- **secondary interface-name**—The identifier for the secondary (backup) LSQ AS, rsp, or rms interface.
- **hot-standby**—For one-to-one AS, rsp, or rms redundancy configurations, specify that the failure detection and recovery must take place in less than 5 seconds.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

- *Junos OS Services Interfaces Library for Routing Devices*
remote

Syntax  
remote {
    (inet-address address | mac-address address);
}

Hierarchy Level  
[edit interfaces interface-name unit logical-unit-number family tcc],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family tcc]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the location of the remote router. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only.

Options  
mac-address—Configure the MAC address of the remote site.

inet-address—Configure the IP address of the remote site.

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

remote-loopback

Syntax  
remote-loopback;

Hierarchy Level  
[edit protocols oam link-fault-management interface interface-name]

Release Information  
Statement introduced in Junos OS Release 8.2.

Description  
For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, set the remote DTE into loopback mode. Remove the statement from the configuration to take the remote DTE out of loopback mode. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  
• Setting a Remote Interface into Loopback Mode
remote-loopback-respond

Syntax  
remote-loopback-respond;

Hierarchy Level  
[edit interfaces ct1-fpc/pic/port],  
[edit interfaces interface-name t1-options]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

Description  
For T1 interfaces only, configure the router to respond to remote loopback requests. Remote loopback requests can be from the facilities data link or inband.

NOTE:  When configuring CT1 interfaces on the 10-port Channelized E1/T1 IQE PIC, the remote-loopback-respond statement must be included at the [edit interfaces ct1-fpc/pic/port] hierarchy level.

Default  
The router does not respond to remote loop requests.

Required Privilege  
Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation

remote-mep

Syntax

```
remote-mep mep-id {
    action-profile profile-name;
    sla-iterator-profile profile-name {
        data-tlv-size size;
        iteration-count count-value;
        priority priority-value;
    }
    detect-loc;
}
```

Hierarchy Level

```diff
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
    md-name maintenance-association ma-name mep mep-id]
```

Release Information

Statement introduced in Junos OS Release 8.4.

Description

Configure the numeric identifier of the remote maintenance association end point (MEP) within the maintenance association.

Options

- **mep-id**—Numeric identifier of the MEP.

  **Range:** 1 through 8191

  The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- **Configure**—To enter configuration mode.
- **Control**—To modify any configuration.

Related Documentation

- Configuring a MEP to Generate and Respond to CFM Protocol Messages
- `detect-loc`
**remove-when-no-subscribers**

**Syntax**
remove-when-no-subscribers;

**Hierarchy Level**
[edit interfaces interface-name auto-configure]

**Release Information**
Statement introduced in Junos OS Release 11.4.

**Description**
Remove subscriber VLANs automatically when no client sessions (for example, DHCP or PPPoE) exist on the VLAN.

**Required Privilege**
- routing—To view this statement in the configuration.
- routing–control—To add this statement to the configuration.

**Related Documentation**
- Automatically Removing VLANs with No Subscribers

**request**

**Syntax**
request (protect | working);

**Hierarchy Level**
[edit interfaces interface-name sonet-options aps]

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
Perform a manual switch between the protect and working circuits. This statement is honored only if there are no higher-priority reasons to switch.

**Options**
- **protect**—Request that the circuit become the protect circuit.
- **working**—Request that the circuit become the working circuit.

**Required Privilege**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring Switching Between the Working and Protect Circuits
- force on page 620
required-depth

Syntax

```
required-depth number;
```

Hierarchy Level

```
[edit interfaces interface-name atm-options mpls pop-all-labels],
[edit interfaces interface-name sonet-options mpls pop-all-labels],
[edit interfaces interface-name fastether-options mpls pop-all-labels],
[edit interfaces interface-name gigether-options mpls pop-all-labels]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description

For passive monitoring on ATM and SONET/SDH interfaces only, specify the number of MPLS labels an incoming packet must have for the `pop-all-labels` statement to take effect.

If you include the `required-depth 1` statement, the `pop-all-labels` statement takes effect for incoming packets with one label only. If you include the `required-depth 2` statement, the `pop-all-labels` statement takes effect for incoming packets with two labels only.

Options

```
number—Number of MPLS labels on incoming IP packets.
Range: 1 or 2 labels
Default: If you omit this statement, the `pop-all-labels` statement takes effect for incoming packets with one or two labels. The default is equivalent to including the `required-depth [1 2]` statement.
```

Required Privilege Level

```
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.
```

Related Documentation

**restore-interval**

**Syntax**  
```restore-interval number;```  

**Hierarchy Level**  
```[edit protocols protection-group ethernet-ring ring-name]```  

**Release Information**  
Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  

**Description**  
Configures the number of minutes that the node does not process any Ethernet ring protection (ERP) protocol data units (PDUs). This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.

**Options**  
- `number`—Specify the restore interval.  
  **Range:** 1 through 12 minutes

**Required Privilege Level**  
- interface—To view this statement in the configuration.  
- interface-control—To add this statement to the configuration.

**Related Documentation**

retries

Syntax    retries integer;

Hierarchy Level    [edit protocols dot1x authenticator interface interface-id]

Release Information    Statement introduced in Junos OS Release 9.3.

Description    Set a limit on the number of failed authentication attempts between a port and a client. When the limit is exceeded, the port waits to reattempt authentication for the number of seconds set by the quiet-period statement configured at the same hierarchy level.

Options    integer—Specify the number of retries.

       Range: 1 through 10
       Default: 3 retries

Required Privilege Level

       interface—To view this statement in the configuration.
       interface-control—To add this statement to the configuration.

revert-time (Interfaces)

Syntax  revert-time seconds;

Hierarchy Level  [edit interfaces interface-name sonet-options aps]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  Configure APS revertive mode.

Default  APS operates in nonrevertive mode.

Options  seconds—Amount of time to wait after the working circuit has again become functional before making the working circuit active again.

Range: 1 through 65,535 seconds
Default: None (APS operates in nonrevertive mode)

Required Privilege

Level  interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation  • Configuring Revertive Mode
**revertive**

**Syntax**  
revertive;

**Hierarchy Level**  
[edit interfaces aeX aggregated-ether-options lACP link-protection]

**Release Information**  
Statement introduced in Junos OS Release 9.3.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.  
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

**Description**  
Enable the ability to switch to a better priority link (if one is available).

---

**NOTE:** By default, LACP link protection is revertive. However, you can use this statement to define a specific aggregated Ethernet interface as revertive to override a global non-revertive statement specified at the [edit chassis] hierarchy level.

**Required Privilege Level**  
- interface—To view this statement in the configuration.  
- interface-control—To add this statement to the configuration.

**Related Documentation**  
- [non-revertive (Chassis)]  
- [Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches]
rfc-2615

Syntax  rfc-2615;

Hierarchy Level  [edit interfaces interface-name sonet-options]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  Include this statement to enable features described in RFC 2615, PPP over SONET/SDH.

Default  Settings required by RFC 1619, PPP over SONET/SDH.

Required Privilege Level  interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation  • Configuring PPP Support on SONET/SDH Interfaces

ring-protection-link-end

Syntax  ring-protection-link-end;

Hierarchy Level  [edit protocols protection-group ethernet-ring ring-name (east-interface | west-interface)]

Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description  Specify that the port is one side of a ring protection link (RPL) by setting the RPL end flag.

Required Privilege Level  interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation  • Ethernet Ring Protection Switching Overview  
  • Example: Configuring Ethernet Ring Protection Switching on EX Series Switches  
  • Example: Configuring Ethernet Ring Protection Switching on QFX Series and EX Series 
    Switches Supporting ELS

**ring-protection-link-owner**

**Syntax**

```plaintext
ring-protection-link-owner;
```

**Hierarchy Level**

```
[edit protocols protection-group ethernet-ring ring-name]
```

**Release Information**

- Statement introduced in Junos OS Release 9.4.
- Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description**

Specify the ring protection link (RPL) owner flag in the Ethernet protection ring. Include this statement only once for each ring (only one node can function as the RPL owner).

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Ethernet Ring Protection Switching Overview
- Example: Configuring Ethernet Ring Protection Switching on EX Series Switches
- Example: Configuring Ethernet Ring Protection Switching on QFX Series and EX Series Switches Supporting ELS
**routing-instance**

**Syntax**
```
routing-instance {
    destination routing-instance-name;
}
```

**Hierarchy Level**
- [edit interfaces interface-name unit logical-unit-number tunnel],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number tunnel]

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
To configure interfaces and logical-systems, specify the destination routing instance that points to the routing table containing the tunnel destination address.

**Default**
The default Internet routing table is inet.0.

**Required Privilege Level**
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**Related Documentation**
- Junos OS Services Interfaces Library for Routing Devices
**Routing-Instance (PPPoE Service Name Tables)**

**Syntax**
```
routing-instance routing-instance-name;
```

**Hierarchy Level**
```
[edit protocols pppoe service-name-tables table-name service service-name],
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier
aci circuit-id-string ari remote-id-string]
```

**Release Information**
Statement introduced in Junos OS Release 10.2.

**Description**
Use in conjunction with the `dynamic-profile` statement at the same hierarchy levels to specify the routing instance in which to instantiate a dynamic PPPoE interface. You can associate a routing instance with a named service entry, empty service entry, or any service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.

The routing instance associated with a service entry in a PPPoE service name table overrides the routing instance associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.

If you include the `routing-instance` statement at the [edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string] hierarchy level, you cannot also include the `static-interface` statement at this level. The `routing-instance` and `static-interface` statements are mutually exclusive for ACI/ARI pair configurations.

**Options**
- `routing-instance-name`—Name of the routing instance in which the router instantiates the dynamic PPPoE interface.

**Required Privilege Level**
- Interface—To view this statement in the configuration.
- Interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring PPPoE Service Name Tables
- Assigning a Dynamic Profile and Routing Instance to a Service Name or ACI/ARI Pair for Dynamic PPPoE Interface Creation
rpf-check (Dynamic Profiles)

Syntax

```
rpf-check {
   fail-filter filter-name;
   mode loose;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number family]
```

Release Information

Description

Reduce forwarding of IP packets that might be spoofing and address by checking whether traffic is arriving on an expected path that the sender would use to reach the destination. You can include this statement with the `inet` protocol family only. When the traffic passes the check, it is forwarded to the destination address; otherwise it is discarded. When you configure `rpf-check` alone, then unicast RPF is in strict mode, meaning that the check passes only when the packet’s source address is in the FIB and the interface matches the routes RPF.

Starting in Junos OS Release 19.1, the `show interfaces statistics logical-interface-name detail` command displays unicast RPF statistics for dynamic logical interfaces when either `rpf-check` or `rpf-check mode loose` is enabled on the interface. No additional statistics are displayed when `rpf-check fail-filter filter-name` is configured on the interface. The `clear interfaces statistics logical-interface-name` command clears RPF statistics.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

Related Documentation

- Unicast RPF in Dynamic Profiles for Subscriber Interfaces

### rpf-check

#### List of Syntax

**Syntax (MX Series, SRX Series, M Series, T Series, PTX Series)** on page 968

**Syntax (EX Series and QFX Series)** on page 968

```plaintext
rpf-check {
    fail-filter filter-name;
    mode loose;
}
```

**Syntax (EX Series and QFX Series)**

```plaintext
rpf-check;
```

#### Hierarchy Level (MX Series, SRX Series, M Series, T Series, PTX Series)

- [edit interfaces interface-name unit logical-unit-number family inet]
- [edit interfaces interface-name unit logical-unit-number family inet6]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet6]

#### Hierarchy Level (EX Series and QFX Series)

- [edit interfaces interface-name unit logical-unit-number family inet]
- [edit interfaces interface-name unit logical-unit-number family inet6]

#### Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Support for interface ps0 (pseudowire subscriber logical interface device) added in Junos OS Release 15.1.

#### Description

Enable a reverse-path forwarding (RPF) check on unicast traffic.

On EX3200 and EX4200 switches, enable a reverse-path forwarding (RPF) check on unicast traffic (except ECMP packets) on all ingress interfaces.

On EX4300 switches, enable a reverse-path forwarding (RPF) check on unicast traffic, including ECMP packets, on all ingress interfaces.

On EX8200 and EX6200 switches, enable an RPF check on unicast traffic, including ECMP packets, on the selected ingress interfaces.

On QFX Series switches, enable an RPF check on unicast traffic on the selected ingress interfaces. ECMP packets are checked by QFX5000 Series switches only.

The mode statement is explained separately.

#### Default

Unicast RPF is disabled on all interfaces.
Options  fail-filter—A filter to evaluate when packets are received on the interface. If the RPF check fails, this optional filter is evaluated. If the fail filter is not configured, the default action is to silently discard the packet.

Required Privilege Level
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

rts

Syntax  
rts (assert | de-assert | normal);

Hierarchy Level  
[edit interfaces interface-name serial-options dce-options],
[edit interfaces interface-name serial-options dte-options]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For EIA-530 and V.35 interfaces only, configure the to-DCE signal, request to send (RTS).

Options  
assert—The to-DCE signal must be asserted.

de-assert—The to-DCE signal must be deasserted.

normal—Normal RTS signal handling, as defined by the TIA/EIA Standard 530.
Default: normal

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

rts-polarity

Syntax

rts-polarity (negative | positive);

Hierarchy Level

[edit interfaces interface-name serial-options]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Configure RTS signal polarity.

Options

negative—Negative signal polarity.
positive—Positive signal polarity.

Default: positive

Required Privilege

Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

rtvbr

Syntax  

rtvbr peak rate sustained rate burst length;

Hierarchy Level  

[edit interfaces interface-name atm-options vpi vpi-identifier shaping ],  
[edit interfaces interface-name unit logical-unit-number address address family family multipoint-destination address shaping ],  
[edit interfaces interface-name unit logical-unit-number shaping ],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number shaping ],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number address address family family multipoint-destination address shaping ]

Release Information  

Statement introduced before Junos OS Release 7.4.

Description  

For ATM2 IQ PICs only, define the real-time variable bandwidth utilization in the traffic-shaping profile.

When you configure the real-time bandwidth utilization, you must specify all three options (burst, peak, and sustained). You can specify the rate in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000). You can also specify the rate in cells per second by entering a decimal number followed by the abbreviation c; values expressed in cells per second are converted to bits per second using the formula 1 cps = 384 bps.

Default  

If the rtvbr statement is not included, bandwidth utilization is unlimited.

Options  

burst length—Burst length, in cells. If you set the length to 1, the peak traffic rate is used.  

Range: 1 through 4000 cells

peak rate—Peak rate, in bits per second or cells per second.  

Range: For ATM2 IQ OC3 and OC12 interfaces, 33 Kbps through 542,526,792 bps. For ATM2 IQ OC48 interfaces, 33 Kbps through 2,170,107,168 bps. For ATM2 IQ DS3 and E3 interfaces, 33 Kbps through the maximum rate, which depends on the ATM encapsulation and framing you configure.

sustained rate—Sustained rate, in bps or cps.  

Range: For ATM2 IQ OC3 and OC12 interfaces, 33 Kbps through 542,526,792 bps. For ATM2 IQ OC48 interfaces, 33 Kbps through 2,170,107,168 bps. For ATM2 IQ DS3 and E3 interfaces, from 33 Kbps through the maximum rate, which depends on the ATM encapsulation and framing you configure.

Required Privilege Level  

interface—to view this statement in the configuration.  

interface-control—to add this statement to the configuration.

sa-multicast (100-Gigabit Ethernet)

Syntax

```
sa-multicast;
```

Hierarchy Level

```
[edit chassis fpc slot pic slot forwarding-mode]
```

Release Information

Statement introduced in Junos OS Release 10.4.

Description

Configure the 100-Gigabit Ethernet PIC or MIC to interoperate with other Juniper Networks 100-Gigabit Ethernet PICs.

NOTE: The default packet steering mode for PD-1CE-CFP-FPC4 is SA multicast bit mode. No SA multicast configuration is required to enable this mode.

sa-multicast supports interoperability between the following PICs and MICs:

- 100-Gigabit Ethernet Type 5 PIC with CFP (PF-1CGE-CFP) and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4).
- 100-Gigabit Ethernet MICs and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4).

Required Privilege

Level

```
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.
```

sampling (Interfaces)

Syntax    sampling direction;

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number family inet],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet]

Release Information Statement introduced before Junos OS Release 7.4.

Description Configure the direction of traffic to be sampled.

Options direction can be one of the following:

input—Configure at least one expected ingress point.

output—Configure at least one expected egress point.

input output—On a single interface, configure at least one expected ingress point and one expected egress point.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

satop-options

Syntax

satop-options {
  excessive-packet-loss-rate {
    apply-groups group-name
    apply-groups-except group-name
    groups group-name
    sample-period milliseconds
    threshold percentile
  }
  idle-pattern pattern
  jitter-buffer-auto-adjust
  jitter-buffer-latency milliseconds
  jitter-buffer-packets packets
  payload-size bytes;
}

Hierarchy Level
[edit interfaces interface-name]

Release Information
Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

Description
Set Structure-Agnostic TDM over Packet (SAtOP) protocol options.

On ACX Series routers, the following statements are not supported:

  apply-groups group-name
  apply-groups-except group-name
  groups group-name
  jitter-buffer-auto-adjust

Options
excessive-packet-loss-rate options—Set packet loss options.

- apply-groups group-name—Groups from which to inherit configuration data.
- apply-groups-except group-name—Don’t inherit configuration data from these groups.
- groups group-name—Specify groups.
- sample-period milliseconds—Number of milliseconds over which excessive packet loss rate is calculated.
- threshold percentile—Percentile designating the threshold of excessive packet loss rate (from 1 to 100).
- idle-pattern pattern—An 8–bit hexadecimal pattern to replace TDM data in a lost packet (from 0 to 255).
- jitter-buffer-auto-adjust—Automatically adjust the jitter buffer.
NOTE: This option is not applicable on MX Series routers.

jitter-buffer-latency milliseconds—Number of milliseconds delay in jitter buffer (from 1 to 1000 milliseconds).

jitter-buffer-packets packets—Number of packets in jitter buffer (from 1 to 64).

payload-size bytes—Payload size in integer number of bytes.

shared-interface

Syntax shared-interface;

Hierarchy Level [edit interfaces ge-fpc/pic/slot],
[edit interfaces so-fpc/pic/slot],
[edit interfaces xe-fpc/pic/slot]

Release Information Statement introduced in Junos OS Release 9.3.

Description Configure a physical interface to be a shared interface. Logical interfaces configured under the shared physical interface can be assigned to different Protected System Domains (PSDs).

Options This statement has no options.

Required Privilege Level view-level—To view this statement in the configuration.
control-level—To add this statement to the configuration.

Related Documentation • interface-shared-with on page 697
scheduler-maps (For ATM2 IQ Interfaces)

Syntax

```
scheduler-maps map-name {
    forwarding-class (class-name | assured-forwarding | best-effort | expedited-forwarding | network-control):
    vc-cos-mode (alternate | strict);
}
```

Hierarchy Level

```
[edit at-fpc/pic/port interface-name atm-options]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For ATM2 IQ interfaces only, define CoS parameters assigned to forwarding classes.

Options

`map-name`—Name of the scheduler map.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**schedulers**

**Syntax**

`schedulers number;`

**Hierarchy Level**

`[edit interfaces interface-name]`

**Release Information**

Statement introduced in Junos OS Release 8.2.

**Description**

Specify the number of schedulers for Ethernet IQ2 and IQ2-E PIC port interfaces.

**Default**

If you omit this statement, the 1024 schedulers are distributed equally over all ports in multiples of 4.

**Options**

`number`—Number of schedulers to configure on the port.

**Range:** 1 through 1024

**Required Privilege Level**

`interface`—To view this statement in the configuration.

`interface-control`—To add this statement to the configuration.

service (PPPoE)

Syntax

```
service service-name {
    drop;
    delay seconds;
    terminate;
    dynamic-profile profile-name;
    routing-instance routing-instance-name;
    max-sessions number;
    agent-specifier {
        aci circuit-id-string ari remote-id-string {
            drop;
            delay seconds;
            terminate;
            dynamic-profile profile-name;
            routing-instance routing-instance-name;
            static-interface interface-name;
        }
    }
}
```

Hierarchy Level

[edit protocols pppoe service-name-tables table-name]

Release Information

Statement introduced in Junos OS Release 10.0.

any, dynamic-profile, routing-instance, max-sessions, and static-interface options introduced in Junos OS Release 10.2.

Description

Specify the action taken by the interface on receipt of a PPPoE Active Discovery Initiation (PADI) control packet for the specified named service, empty service, or any service in a PPPoE service name table. You can also specify the dynamic profile and routing instance that the router uses to instantiate a dynamic PPPoE interface, and the maximum number of active PPPoE sessions that the router can establish with the specified service.

Default

The default action is terminate.

Options

- **service-name**—Service entry in the PPPoE service name table:
  - **service-name**—Named service entry of up to 32 characters; for example, premiumService. You can configure a maximum of 512 named service entries across all PPPoE service name tables on the router.
  - **empty**—Service entry of zero length that represents an unspecified service. Each PPPoE service name table includes one empty service entry by default.
  - **any**—Default service for non-empty service entries that do not match the named or empty service entries configured in the PPPoE service name table. Each PPPoE service name table includes one any service entry by default.
The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

### service-domain

**Syntax**
service-domain (inside | outside);

**Hierarchy Level**
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**
Statement introduced before Junos OS Release 7.4.

**Description**
For adaptive services interfaces, specify a service interface domain. If you specify this interface using the next-hop-service statement at the [edit services service-set service-set-name] hierarchy level, the interface domain must match that used with the inside-service-interface and outside-service-interface statements.

**Options**
- inside—Interface used within the network.
- outside—Interface used outside the network.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Junos OS Services Interfaces Library for Routing Devices
service-filter (Interfaces)

Syntax

```
service-filter filter-name;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family inet service (input | output) service-set service-set-name],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet service (input | output) service-set service-set-name]
```

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Define the filter to be applied to traffic before it is accepted for service processing. Configuration of a service filter is optional; if you include the `service-set` statement without a `service-filter` definition, Junos OS assumes the match condition is true and selects the service set for processing automatically.

Options

`filter-name`—Identifies the filter to be applied in service processing. You can include special characters, such as a forward slash (/), colon (:), or a period (.).

Required Privilege

- **Interface**—To view this statement in the configuration.
- **Interface-control**—To add this statement to the configuration.

- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family pppoe],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number pppoe-underlying-options]

Release Information

Statement introduced in Junos OS Release 10.0.
Support at the [edit ... family pppoe] hierarchies introduced in Junos OS Release 11.2.

Description

Specify the PPPoE service name table assigned to a PPPoE underlying interface. This underlying interface is configured with either the `encapsulation ppp-over-ether` statement or the `family pppoe` statement; the two statements are mutually exclusive.

NOTE: The [edit ... family pppoe] hierarchies are supported only on MX Series routers with MPCs.

Options

- `table-name`—Name of the PPPoE service name table, a string of up to 32 alphanumeric characters.

Required Privilege

- Interface—To view this statement in the configuration.
- Interface-control—To add this statement to the configuration.

Hierarchy Level [edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name]

Release Information Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

Description Specify the name format of the maintenance association name.

Options character-string—The name is an ASCII character string.
   vlan—The primary VLAN identifier.
   2octet—A number in the range 0 through 65,535.
   rfc-2685-vpn-id—A VPN identifier that complies with RFC 2685.
Default: character-string

NOTE: The PTX Series Packet Transport Routers support the vlan and 2octet options only.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation • Creating a Maintenance Association

```

Release Information

Statement introduced in Junos OS Release 11.1.

Description

Configure a remote MEP with an iterator profile and specify the options.

Y.1731 performance monitoring (PM) over Aggregated Ethernet Interfaces is not supported on EX4300 switches.

Options

```
profile-name—Name of the iterator profile configured for a remote MEP. For more information about configuring a remote MEP with an iterator profile, see Configuring a Remote MEP with an Iterator Profile.
```

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

Configure—To enter configuration mode.
Control—To modify any configuration.

**snr-margin**

**Syntax**
```
snr-margin {
    snext margin;
}
```

**Hierarchy Level**
- [edit interfaces interface-name shdsl-options],
- [edit logical-systems logical-system-name interfaces interface-name shdsl-options]

**Release Information**
Statement introduced in Junos OS Release 7.4.

**Description**
For J Series Services Routers only, configure the SHDSL signal-to-noise ratio (SNR) margin. The SNR margin is the difference between the desired SNR and the actual SNR. Configuring the SNR creates a more stable SHDSL connection by making the line train at a SNR margin higher than the threshold. If any external noise below the threshold is applied to the line, the line remains stable.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Hierarchy Level
[edit interfaces interface-name]

Release Information
Statement introduced before Junos OS Release 7.4.
**Description** Configure SONET/SDH-specific interface properties.

On SONET/SDH OC48 interfaces that you configure for channelized (multiplexed) mode (by including the `no-concatenate` statement at the `[edit chassis fpc slot-number pic pic-number]` hierarchy level), the `bytes el-quiet` and `bytes f1` options have no effect. The `bytes f2, bytes z3, bytes z4`, and `path-trace` options work correctly on channel 0 and work in the transmit direction only on channels 1, 2, and 3.

On a channelized OC12 interface, the `bytes el-quiet, bytes f1, bytes f2, bytes z3, and bytes z4` options are not supported. The `fcs` and `payload-scrambler` statements are also not supported; you must configure these for each DS3 channel using the `t3-options fcs` and `t3-options payload-scrambler` statements. The `aps` and `loopback` statements are supported only on channel 0 and are ignored if included in the configurations for channels 1 through 11. You can configure loopbacks for each DS3 channel with the `t3-options loopback` statement. The `path-trace` statement can be included in the configuration for each DS3 channel, thereby configuring a unique path trace for each channel.

To configure loopback on channelized IQ and IQE PICs, SONET/SDH level, use the `loopback` statement `local` and `remote` options at the controller interface (`coc48, cstm16, coc12, cstm4, coc3, and cstm1`). It is ignored for path-level interfaces `so-fpc/pic/port` or `so-fpc/pic/port:channel`.

If you are running Intermediate System-to-Intermediate System (IS-IS) over SONET/SDH interfaces, use PPP if you are running Cisco IOS Release 12.0 or later. If you need to run HDLC, configure an ISO family MTU of 4469 on the router.

The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**

[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number tunnel address]

Release Information

Statement introduced before Junos OS Release 7.4. 
Statement introduced in Junos OS Release 12.1 for EX Series switches. 
Statement introduced in Junos OS Release 13.2 for the QFX Series. 
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Specify the source address of the tunnel.

Default

If you do not specify a source address, the tunnel uses the unit’s primary address as the source address of the tunnel.

Options

source-address—Address of the local side of the tunnel. This is the address that is placed in the outer IP header’s source field.

Required Privilege Level

interface—To view this statement in the configuration. 
interface-control—To add this statement to the configuration.

**source-address-filter**

**Syntax**

```
source-address-filter {
    mac-address;
}
```

**Hierarchy Level**

```
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.

**Description**

For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), specify the MAC addresses from which the interface can receive packets. For this statement to have any effect, you must include the source-filtering statement in the configuration to enable source address filtering.

**Options**

- **mac-address**—MAC address filter. You can specify the MAC address as `nn:nn:nn:nn:nn:nn` or `nnnn.nnnn.nnnn`, where `n` is a decimal digit. To specify more than one address, include multiple `mac-address` options in the source-address-filter statement.

If you enable the VRRP on a Fast Ethernet or Gigabit Ethernet interface, as described in VRRP and VRRP for IPv6 Overview, and if you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the source-address-filter statement. MAC addresses ranging from `00:00:5e:00:01:00` through `00:00:5e:01:00` are reserved for VRRP, as defined in RFC 3768, Virtual Router Redundancy Protocol. When you configure the VRRP group, the group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

On untagged Gigabit Ethernet interfaces, you should not configure the source-address-filter statement and the accept-source-mac statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the source-address-filter statement and the accept-source-mac statement with an identical MAC address specified in both filters.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet accounting],
- [edit routing-instances routing-instance-name vrf-table-label]

**Release Information**

**Description**

Enable packet counters on an interface that count packets that arrive from specific prefixes on the provider core router and are destined for specific prefixes on the customer edge router.

**Options**

`direction` can be one of the following:

- `input`—Configure at least one expected ingress point.
- `output`—Configure at least one expected egress point.
- `input output`—On a single interface, configure at least one expected ingress point and one expected egress point.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

source-filtering

**Syntax**

(source-filtering | no-source-filtering);

**Hierarchy Level**

[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.

**Description**

For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and Gigabit Ethernet IQ interfaces only, enable the filtering of MAC source addresses, which blocks all incoming packets to that interface. To allow the interface to receive packets from specific MAC addresses, include the `source-address-filter` statement.

If the remote Ethernet card is changed, the interface is no longer able to receive packets from the new card because it has a different MAC address.

**Default**

Source address filtering is disabled.

**Required Privilege Level**

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Speed option 2.5Gbps introduced in Junos OS Release 18.1R2 for EX2300 switch.
Speed option 10Gbps and 5Gbps introduced in Junos OS Release 18.2R1 for EX4300 switch.
Speed option 1-Gbps is introduced in Junos OS Release 19.1R1 on the 4-port 1-Gigabit Ethernet/10-Gigabit Ethernet uplink module on EX4300-48MP switches.
Speed options 100-Mbps, 1-Gbps, and auto is introduced in Junos OS Releases 18.4R1S2, 18.4R2, and 19.2R1 and later for ACX5448 Universal Metro Routers.
Speed option 10Gbps, 40Gbps, and 100Gbps introduced in Junos OS Evolved Release 19.1R1 for PTX10003-80C, PTX10003-160C routers.
Configure the interface speed. This statement applies to the management Ethernet interface (fxp0 or em0), Fast Ethernet 12-port and 48-port PICs, the built-in Fast Ethernet port on the FIC (M7 router), Combo Line Rate DPCs and Tri-Rate Ethernet Copper interfaces on MX Series routers, and Gigabit Ethernet interfaces on EX Series switches.

When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled. When you configure 100BASE-FX SFP, you must set the port speed at 100 Mbps.

NOTE: On MX Series routers with Tri-rate Enhanced DPC (DPCE-R-40GE-TX), when you configure the interface speed using the auto-10m-100m option, the speed is negotiated to the highest value possible (100 Mbps), if the same value is configured on both sides of the link. However, when you view the interface speed of the DPC, using the show interfaces command, the value of the speed is not accurately displayed. For instance, if you configure the speed of the Tri-rate enhanced DPC, as 100Mbps on both sides of the link, the interface speed of the DPC is negotiated to 100 Mbps. However, the interface speed of the DPC displays 1 bps. This is an issue with the show interfaces command only. The actual interface speed is 100 Mbps.

On 10-Gigabit Ethernet SFP interfaces, autonegotiation is enabled by default and auto-detects the speed to be either 1 Gbps or 10 Gbps. On QFX5100-48S, QFX5100-96S, and QFX5100-24Q devices using 10-Gigabit Ethernet SFP interfaces, the speed is set to 10 Gbps by default and cannot be configured to operate in a different speed. On QFX5100-48S and QFX5100-96S devices using 1-Gigabit Ethernet SFP interfaces, the speed is set to 1 Gbps by default and cannot be configured to operate in a different speed.

NOTE: In Junos OS Release 14.1X53-D35 on QFX5100-48T-6Q devices using 10-Gigabit Ethernet Copper interfaces, autonegotiation is disabled by default on the copper ports, and the interfaces operate at a speed of 100M. You can, however, enable auto-negotiation by issuing the set interface name ether-options auto-negotiation command on the interface for which you want to change the interface speed. With autonegotiation enabled, the interface auto-detects the speed in which to operate.

NOTE: Only 10 Gbps and 40 Gbps interfaces are supported on OCX Series switches.

NOTE: When displaying interface information with show interfaces commands, you might see speed values for 1 Gbps interfaces displayed as 1000mbps.
(For EX2300 only) Starting in Junos OS Release 18.1R2, the multi-rate speed is supported on EX2300-48MP and EX2300-24MP switches. The speed configuration statement is supported on both multi-rate gigabit ethernet interface (mge) and gigabit ethernet (ge) interface. The mge interface is a rate-selectable (multirate) Gigabit Ethernet interface that can support speeds of 10-Gbps, 5-Gbps, and 2.5-Gbps over CAT5e/CAT6/CAT6a cables. In the EX2300, the mge interface supports 100-Mbps, 1-Gbps, and 2.5-Gbps speeds, which can be configured by using the speed configuration statement. Note that 10Mbpss speed is supported only on ge interfaces of EX2300 switch.

On EX2300-24MP and EX2300-48MP switches, if both Energy Efficient Ethernet (EEE) and 100-Mbps speed are configured on a rate-selectable (ormultirate) Gigabit Ethernet (mge) port, the port operates only at 100-Mbps speed but EEE is not enabled on that port. EEE is supported only on mge interfaces that operate at 1-Gbps and 2.5-Gbps speeds.

(For EX4300-48MP only) Starting with Junos OS Release 19.1R1, the 4-port 1-Gigabit Ethernet/10-Gigabit Ethernet uplink module (EX-UM-4SFPP-MR) on EX4300-48MP switches supports 1-Gbps speed. You do not need to explicitly configure 1-Gbps speed on the uplink module as it automatically identifies the installed 1-gigabit SFP transceivers and creates the interface accordingly.

---

**NOTE:** On EX4300-48MP, the status LED of 1-Gigabit Ethernet uplink module port is solid green (instead of blinking green) because of a device limitation. However, there is no impact on device functionality.

---

(For ACX5448 only) 100-Mbps speed is supported from interfaces xe-0/0/24 to xe-0/0/47 only.

**Default (EX Series)** If the auto-negotiation statement at the [edit interfaces interface-name ether-options] hierarchy level is enabled, the auto-negotiation option is enabled by default.
Options

You can specify the speed as either 10m (10 Mbps), 100m (100 Mbps), and on MX Series routers, 1g (1 Gbps). You can also specify the auto option on MX Series routers.

For Gigabit Ethernet interfaces on EX Series switches, you can specify one of the following options:

speed (MX Series DPC)

Syntax

speed (auto | 1Gbps | 100Mbps | 10Mbps);

Hierarchy Level

[edit interfaces ge-fpc/pic/port]

Release Information

Statement introduced in Junos OS Release 9.5.

Description

On MX Series routers with Combo Line Rate DPCs and Tri-Rate Copper SFPs you can set autonegotiation of speed. To specify the autonegotiation speed, use the speed (auto | 1Gbps | 100Mbps | 10Mbps) statement under the [edit interface ge-/fpc/pic/port] hierarchy level. The auto option will attempt to automatically match the rate of the connected interface. To set port speed negotiation to a specific rate, set the port speed to 1Gbps, 100Mbps, or 10Mbps.

NOTE: If the negotiated speed and the interface speed do not match, the link will not be brought up. Half duplex mode is not supported.

Options

You can specify the speed as either auto (autonegotiate), 10Mbps (10 Mbps), 100Mbps (100 Mbps), or 1Gbps (1 Gbps).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation

speed (SONET/SDH)

Syntax  speed (oc3 | oc12 | oc48);

Hierarchy Level  [edit interfaces so-fpc/pic/port],
                 [edit interfaces so-fpc/pic/port:channel]

Release Information  Statement introduced in Junos OS Release 8.3.

Description  Configure the interface speed. This statement applies to SONET/SDH interfaces on
             next-generation SONET/SDH Type 1 and Type 2 PICs with SFP. Available speeds depend
             on whether the PIC is in concatenated mode or nonconcatenated mode. Include the
             channel in the interface name when configuring nonconcatenated interfaces.

Options  oc3 | oc12 | oc48—Speed when the PIC is in concatenated mode. For example, you can
         configure each port of a 4-port OC12 PIC to have a speed of oc3.

         You can configure port 0 of a 4-port OC12 PIC to have a speed of oc12.

         oc3 | oc12—Speed when the PIC is in nonconcatenated mode.

Required Privilege Level  interface—To view this statement in the configuration.
                          interface-control—To add this statement to the configuration.

### spid1

**Syntax**

`spid1 spid1-string;`

**Hierarchy Level**

`[edit interfaces br-pim/0/port isdn-options]`

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Configure the Service Profile Identifier (SPID).

**Options**

`spid1-string`—Numeric SPID.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Junos OS Interfaces and Routing Configuration Guide

### spid2

**Syntax**

`spid2 spid2-string;`

**Hierarchy Level**

`[edit interfaces br-pim/0/port isdn-options]`

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

Configure an additional SPID.

**Options**

`spid2-string`—Numeric SPID.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**
stacked-vlan-ranges

Syntax

stacked-vlan-ranges {

      mac-address;
      option-18
      option-37
      option-62;
      radius-realm radius-realm-string;
      user-prefix user-prefix-string;
      vlan-tags;
    }
  }
  dynamic-profile profile-name {
    accept (any | dhcp-v4 | inet);
    access-profile vlan-dynamic-profile-name;
    ranges (any | low-tag–high-tag),(any | low-tag–high-tag);
  }
  override;
}

Hierarchy Level

[edit interfaces interface-name auto-configure]

Release Information

Statement introduced in Junos OS Release 9.5.

Description

Configure multiple VLANs. Each VLAN is assigned a VLAN ID number from the range.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

routing—To view this statement in the configuration.

routing–control—To add this statement to the configuration.

Related Documentation

stacked-vlan-tagging

Syntax

stacked-vlan-tagging;

Hierarchy Level

[edit interfaces interface-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description

For Gigabit Ethernet IQ interfaces, Gigabit Ethernet, 10-Gigabit Ethernet LAN/WAN PIC, and 100-Gigabit Ethernet Type 5 PIC with CFP, enable stacked VLAN tagging for all logical interfaces on the physical interface.

For pseudowire subscriber interfaces, enable stacked VLAN tagging for logical interfaces on the pseudowire service.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**start-end-flag**

**Syntax**  
start-end-flag (filler | shared);

**Hierarchy Level**  
[edit interfaces e1-fpc/pic/port],  
[edit interfaces t1-fpc/pic/port],  
[edit interfaces interface-name ds0-options],  
[edit interfaces interface-name e1-options],  
[edit interfaces interface-name e3-options],  
[edit interfaces interface-name t1-options],  
[edit interfaces interface-name t3-options]

**Release Information**  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.

**Description**  
For DS0, E1, E3, T1, and T3 interfaces, configure the interface to share the transmission of start and end flags.

**NOTE:** When configuring E1 or T1 interfaces on the 10-port Channelized E1/T1 IQE PIC, the start-end-flag statement must be included at the [edit interfaces e1-fpc/pic/port] or [edit interfaces t1-fpc/pic/port] hierarchy level as appropriate.

**Options**  
filler—Wait two idle cycles between the start and end flags.  
shared—Share the transmission of the start and end flags. This is the default.

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**  
• Configuring E1 Start and End Flags  
• Configuring the E3 Start and End Flags  
• Configuring T1 Start and End Flags

### static-interface

**Syntax**

static-interface interface-name;

**Hierarchy Level**

[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string]

**Release Information**

Statement introduced in Junos OS Release 10.2.

**Description**

Reserve the specified static PPPoE interface for use only by the PPPoE client with matching agent circuit identifier (ACI) and agent remote identifier (ARI) information. You can specify only one static interface per ACI/ARI pair configured for a named service entry, empty service entry, or any service entry in the PPPoE service name table.

The static interface associated with an ACI/ARI pair takes precedence over the general pool of static interfaces associated with the PPPoE underlying interface.

If you include the static-interface statement in the configuration, you cannot also include either the dynamic-profile statement or the routing-instance statement. The dynamic-profile, routing-instance, and static-interface statements are mutually exclusive for ACI/ARI pair configurations.

**Options**

interface-name—Name of the static PPPoE interface reserved for use by the PPPoE client with matching ACI/ARI information. Specify the interface in the format pp0.logical, where logical is a logical unit number from 0 through 16385 for static interfaces.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring PPPoE Service Name Tables
- Reserving a Static PPPoE Interface for Exclusive Use by a PPPoE Client
**static-tei-val**

**Syntax**

static-tei-val value;

**Hierarchy Level**

[edit interfaces br-pim/0/port isdn-options]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For J Series Services Routers only. Statically configure the Terminal Endpoint Identifier (TEI) value. The TEI value represents any ISDN-capable device attached to an ISDN network that is the terminal endpoint. TEIs are used to distinguish between several different devices using the same ISDN links.

**Options**

value—Value between 0 through 63.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

- Junos OS Interfaces and Routing Configuration Guide
## supplicant

**Syntax**  
`supplicant single;`

**Hierarchy Level**  
`[edit protocols dot1x authenticator interface interface-id]`

**Release Information**  
Statement introduced in Junos OS Release 9.3.

**Description**  
Specify the supplicant mode. Only single mode is supported.

This option will authenticate only the first client that connects to a port. All other clients that connect later (802.1x compliant or non-compliant) will be allowed free access on that port without any further authentication. If the first authenticated client logs out, all other users are locked out until a client authenticates again.

**Options**  
- `single`—Sets single mode.

**Required Privilege Level**  
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**  
- *IEEE 802.1x Port-Based Network Access Control Overview*

### supplicant-timeout

**Syntax**  
supplicant-timeout seconds;

**Hierarchy Level**  
[edit protocols dot1x authenticator interface interface-id]

**Release Information**  
Statement introduced in Junos OS Release 9.3.

**Description**  
Specify the number of seconds the port waits for a response when relaying a request from the authentication server to the client before resending the request.

**Options**  
- **seconds**—Specify the number of seconds the port waits for the supplicant timeout.  
  - **Range:** 1 through 60 seconds  
  - **Default:** 30 seconds

**Required Privilege Level**  
- interface—To view this statement in the configuration.  
- interface-control—To add this statement to the configuration.

swap

Syntax  swap;

Hierarchy Level  [edit interfaces interface-name unit logical-unit-number input-vlan-map],  
[edit interfaces interface-name unit logical-unit-number output-vlan-map],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]

Release Information  Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.  
Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

Description  Specify the VLAN rewrite operation to replace a VLAN tag. The outer VLAN tag of the frame is overwritten with the user-specified VLAN tag information.  

On MX Series routers, you can enter this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, aggregated Ethernet using Gigabit Ethernet IQ interfaces, and 100-Gigabit Ethernet Type 5 PIC with CFP. On EX Series switches, you can enter this statement on Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.

Required Privilege  
Level  interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

swap-push

Syntax

```
swap-push;
```

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number input-vlan-map],
[edit interfaces interface-name unit logical-unit-number output-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]

Release Information

Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Specify the VLAN rewrite operation to replace the outer VLAN tag of the frame with a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame.

You can use this statement on Gigabit Ethernet IQ, IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, and for aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs on MX Series routers, and 100-Gigabit Ethernet Type 5 PIC with CFP.

Required Privilege

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**switch-options**

Syntax

```plaintext
switch-options {
  switch-port port-number {
    (auto-negotiation | no-auto-negotiation);
    speed (10m | 100m | 1g);
    link-mode (full-duplex | half-duplex);
  }
}
```

Hierarchy Level

[edit interfaces ge-pim/0/0]

Release Information

Statement introduced in Junos OS Release 8.4.

Description

Configuration of the physical port characteristics is done under the single physical interface.

Required Privilege Level

interface—to view this statement in the configuration.

interface-control—to add this statement to the configuration.
switch-port

Syntax

switch-port port-number {
    (auto-negotiation | no-auto-negotiation);
    speed (10m | 100m | 1g);
    link-mode (full-duplex | half-duplex);
}

Hierarchy Level
[edit interfaces ge-pim/0/0 switch-options]

Release Information
Statement introduced in Junos OS Release 8.4.

Description
Configuration of the physical port characteristics, done under the single physical interface.

Default
Autonegotiation is enabled by default. If the link speed and duplex are also configured, the interfaces use the values configured as the desired values in the negotiation.

Options

port-number—Ports are numbered 0 through 5 on the 6-port Gigabit Ethernet uPIM, 0 through 7 on the 8-port Gigabit Ethernet uPIM, and 0 through 15 on the 16-port Gigabit Ethernet uPIM.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege

interface—to view this statement in the configuration.

Level
interface-control—to add this statement to the configuration.
**switch-type**

**Syntax**

```
switch-type (att5e | etsi | nil | ntdms-100)
```

**Hierarchy Level**

```
[edit interfaces br-pim/0/port isdn-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For J Series Services Routers only. Configure the ISDN variant supported.

**Options**

- `att5e`—AT&T switch variant.
- `etsi`—European Telecommunications Standards Institute switch variant.
- `nil`—National ISDN 1 switch variant.
- `ntdms-100`—Northern Telecom DMS-100.
- `ntt`—NTT Group switch for Japan.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.

switching-mode

Syntax

switching-mode (bidirectional | unidirectional);

Hierarchy Level

[edit interfaces interface-name sonet-options aps]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For unchannelized OC3, OC12, and OC48 SONET/SDH interfaces on T Series routers only, configure the interface to interoperate with SONET/SDH line-terminating equipment (LTE) that is provisioned for unidirectional linear APS in 1+1 architecture.

Default

If the `switching-mode` statement is not configured, the mode is bidirectional, and the interface does not interoperate with a unidirectional SONET/SDH LTE.

Options

bidirectional—Support bidirectional mode only.

unidirectional—Interoperate with a SONET/SDH LTE provisioned for unidirectional mode.

Required Privilege Level

interface—to view this statement in the configuration.

interface-control—to add this statement to the configuration.

Related Documentation

• Configuring Switching Mode
symbol-period

Syntax  symbol-period count;

Hierarchy Level  [edit protocols oam ethernet link-fault-management action-profile event, link-event-rate],
                 [edit protocols oam link-fault-management interface interface-name event-thresholds]

Release Information  Statement introduced in Junos OS Release 8.4.

Description  Configure the threshold for sending symbol period events or taking the action specified in the action profile.

A symbol error is any symbol code error on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period window. The default period window is the number of symbols that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.

Options  count—Threshold count for symbol period events.
          Range: 0 through 100

Required Privilege Level  interface—To view this statement in the configuration.
                           interface-control—To add this statement to the configuration.

Related Documentation  • Configuring Threshold Values for Local Fault Events on an Interface

system-priority

Syntax

system-priority priority;

Hierarchy Level

[edit interfaces aeX aggregated-ether-options lacp]

Release Information

Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 11.4 for EX Series switches.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

Description

Define LACP system priority at the aggregated Ethernet interface level. This system priority value takes precedence over a system priority value configured at the global [edit chassis] hierarchy level.

The device with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 127), the device MAC address determines which switch is in control.

Options

priority—Priority for the aggregated Ethernet system. A smaller value indicates a higher priority.

Range: 0 through 65535

Default: 127

Required Privilege

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.
t1-options

Syntax  

```
t1-options {
  bert-algorithm algorithm;
  bert-error-rate rate;
  bert-period seconds;
  buildout value;

  loopback (local | payload | remote);
  start-end-flag value;
}
```

Hierarchy Level  [edit interfaces interface-name]

Release Information Statement introduced before Junos OS Release 7.4.

Description Configure T3-specific physical interface properties, including the properties of DS3 channels on a channelized OC12 interface. The long-buildout statement is not supported for DS3 channels on a channelized OC12 interface.

On T3 interfaces, the default encapsulation is PPP.

For ATM1 interfaces, you can configure a subset of E3 options statements.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

Related Documentation

- T3 Interfaces Overview
**tag-protocol-id (TPIDs Expected to Be Sent or Received)**

**Syntax**
tag-protocol-id [tpids];

**Hierarchy Level**
[edit interfaces interface-name gigether-options ethernet-switch-profile],
[edit interfaces interface-name aggregated-ether-options ethernet-switch-profile],
[edit interfaces interface-name aggregated-ether-options ethernet-switch-profile],
[edit interfaces interface-name ether-options ethernet-switch-profile]

**Release Information**
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.  
Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.  
Statement introduced in Junos OS Release 14.1X53-D15 for the QFX Series.

**Description**
For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, aggregated Ethernet with Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, and the built-in Gigabit Ethernet port on the M7i router), define the TPIDs expected to be sent or received on a particular VLAN. For each Gigabit Ethernet port, you can configure up to eight TPIDs using the `tag-protocol-id` statement; but only the first four TPIDs are supported on IQ2 and IQ2-E interfaces.

For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers only the default TPID value (0x8100) is supported.

For Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, define the TPIDs expected to be sent or received on a particular VLAN. The default TPID value is 0x8100. Other supported values are 0x88a8, 0x9100, and 0x9200.

**Options**
**tpids**—TPIDs to be accepted on the VLAN. Specify TPIDs in hexadecimal.

**Required Privilege Level**
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**Related Documentation**

tag-protocol-id (TPID to Rewrite)

Syntax

```
tag-protocol-id tpid;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number input-vlan-map],
[edit interfaces interface-name unit logical-unit-number output-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]
```

Release Information

Description

For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces only, configure the outer TPID value. All TPIDs you include in input and output VLAN maps must be among those you specify at the `edit interfaces interface-name gigether-options ethernet-switch-profile tag-protocol-id [tpids]` hierarchy level.

For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers the default TPID value (0x8100) is supported.

Default

If the `tag-protocol-id` statement is not configured, the TPID value is 0x8100.

Required Privilege

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

[edit interfaces interface-range interface-range-name unit logical-unit-number family inet]
```

Release Information

Statement introduced in Junos OS Release 9.4 for EX Series switches.
Statement introduced in Junos OS Release 10.2.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Specify the IP packets destined for a Layer 3 broadcast address to be forwarded to both an egress interface and the Routing Engine, or to an egress interface only. The packets are broadcast only if the egress interface is a LAN interface.

The remaining statements are explained separately. See CLI Explorer.

Default

When this statement is not included, broadcast packets are sent to the Routing Engine only.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

targeted-distribution (Static Interfaces over Aggregated Ethernet)

Syntax  targeted-distribution;

Hierarchy Level  [edit interfaces demux0 unit logical-unit-number],
                  [edit interfaces pp0 unit logical-unit-number]

Release Information  Statement introduced in Junos OS Release 11.2.
                        Statement introduced in Junos OS Release 13.2R2 for EX Series switches.

Description  Configure egress data for a logical interface to be sent across a single member link in an
              aggregated Ethernet bundle. A backup link is provisioned and CoS scheduling resources
              are switched to the backup link in the event that the primary assigned link goes down.
              The aggregated Ethernet interface must be configured without link protection.

Required Privilege  Level  interface—To view this statement in the configuration.
                    interface-control—To add this statement to the configuration.

## tei-option

**Syntax**

tei-option (first-call | power-up);

**Hierarchy Level**

[edit interfaces br-pim/0/portisdn-options ]

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For ISDN interfaces, configure when the Terminal Endpoint Identifier (TEI) negotiates with the ISDN provider.

**Options**

- **first-call**—Activation does not occur until the call setup is sent.
- **power-up**—Activation occurs when the Services Router is powered on.

**Default:** power-up

**Required Privilege**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

### terminate (PPPoE Service Name Tables)

**Syntax**

```
terminate;
```

**Hierarchy Level**

```
[edit protocols pppoe service-name-tables table-name service service-name],
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string]
```

**Release Information**

**Description**

Direct the router to immediately respond to a PPPoE Active Discovery Initiation (PADI) control packet received from a PPPoE client by sending the client a PPPoE Active Discovery Offer (PADO) packet. The PADO packet contains the name of the access concentrator (router) that can service the client request. The `terminate` action is the default action for a named service entry, `empty` service entry, `any` service entry, or agent circuit identifier/agent remote identifier (ACI/ARI) pair in a PPPoE service name table.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

Class of Service Feature Guide (Routers and EX9200 Switches) |
threshold

Syntax    threshold bytes;

Hierarchy Level    [edit interfaces interface-name]

Release Information    Statement introduced before Junos OS Release 7.4.

Description    Specify the bucket threshold, which controls the burstiness of the leaky bucket mechanism. The larger the value, the more bursty the traffic, which means that over a very short amount of time, the interface can receive or transmit close to line rate, but the average over a longer time is at the configured bucket rate.

Options    bytes—Maximum size, in bytes, for traffic bursts. For ease of entry, you can enter number either as a complete decimal number or as a decimal number followed by the abbreviation k (1000). For example, the entry threshold 2k corresponds to a threshold of 2000 bytes.

Range: 0 through 65,535 bytes

Required Privilege    interface—to view this statement in the configuration.

Level    interface-control—to add this statement to the configuration.

Related Documentation    • Configuring Receive and Transmit Leaky Bucket Properties to Reduce Network Congestion on page 140
timeslots

Syntax  
timeslots time-slot-range;

Hierarchy Level  
[edit interfaces e1-fpc/pic/port],
[edit interfaces t1-fpc/pic/port],
[edit interfaces interface-name e1-options],
[edit interfaces interface-name partition partition-number],
[edit interfaces interface-name t1-options]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For E1 and T1 interfaces, allocate the specific time slots by number.

NOTE: When configuring E1 or T1 interfaces on the 10-port Channelized E1/T1 IQ EPIC, the timeslots statement must be included at the [edit interfaces e1-fpc/pic/port] or [edit interfaces t1-fpc/pic/port] hierarchy level as appropriate.

Options  
time-slot-range—Actual time slot numbers allocated:

Range: Ranges vary by interface type and configuration option as follows:

- 1 through 24 for T1 interfaces (0 is reserved)
- 1 through 31 for 4-port E1 PICs (0 is reserved)
- 1 through 31 for Nx DS0 interfaces (0 is reserved)
- 2 through 32 for 10-port Channelized E1 and 10-port Channelized E1 IQ PICs (1 is reserved)
- 2 through 32 for the setting under e1-options with IQE PICs (1 is reserved) (when creating fractional E1)
- 1 through 31 for the setting under partition with IQE PICs (0 is reserved) (when creating Nx DS0)

NOTE: When creating fractional E1 interfaces only, if you connect a 4-port E1 PIC interface to a device that uses time slot numbering from 2 through 32, you must subtract 1 from the configured number of time slots.

Required Privilege Level  
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

**tm**

**Syntax**

```
tm (ignore | normal | require);
```

**Hierarchy Level**

```
[edit interfaces interface-name serial-options dce-options],
[edit interfaces interface-name serial-options dte-options]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For EIA-530 interfaces only, configure the from-DCE signal, test-mode (TM).

**Options**

- **ignore**—The from-DCE signal is ignored.
- **normal**—Normal TM signal handling as defined by the TIA/EIA Standard 530.
- **require**—The from-DCE signal must be asserted.

**Default:** normal

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

### Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in JUNOS Release 10.2 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

### Description
Define tracing operations for individual interfaces.

To specify more than one tracing operation, include multiple `flag` statements.

The interfaces `traceoptions` statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system `syslog` file in the directory `/var/log/dcd`.

On EX Series, QFX Series, and NFX Series platforms, configure tracing options the link fault management.

On ACX Series, SRX Series, MX Series, M Series, and T Series platforms define tracing operations for the interface process (dcd).

### Default
If you do not include this statement, no interface-specific tracing operations are performed.
Options  Table 28 on page 1056 lists options for traceoption command for the following platforms:
Table 28: Options for traceoptions

[edit interfaces]
Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in JUNOS Release 10.2 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description
Define tracing operations for individual interfaces.

To specify more than one tracing operation, include multiple flag statements.

The interfaces traceoptions statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system syslog file in the directory /var/log/dcd.

On EX Series, QFX Series, and NFX Series platforms, configure tracing options the link fault management.

On ACX Series, SRX Series, MX Series, M Series, and T Series platforms define tracing operations for the interface process (dcd).

Default
If you do not include this statement, no interface-specific tracing operations are performed.
Options   Table 28 on page 1056 lists options for traceoption command for the following platforms:

### traceoptions (LACP)

**Syntax**

```plaintext
traceoptions {
  file <filename> <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

**Hierarchy Level**

[edit protocols lacp]

**Release Information**

Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

**Description**

Define tracing operations for the LACP protocol.

**Default**

If you do not include this statement, no LACP protocol tracing operations are performed.

**Options**

- **filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, interface process tracing output is placed in the file `lacpd`.

- **files number**—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

  **Range:** 2 through 1000

  **Default:** 3 files

- **flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

  - **all**—All LACP tracing operations
  - **configuration**—Configuration code
  - **packet**—Packets sent and received
  - **process**—LACP process events
  - **protocol**—LACP protocol state machine
  - **routing-socket**—Routing socket events
  - **startup**—Process startup events

  **no-world-readable**—(Optional) Prevent any user from reading the log file.
**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option:

**Syntax:** `xk` to specify kilobytes, `xm` to specify megabytes, or `xg` to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your router

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

---

**Required Privilege**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

traceoptions (PPP Process)

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression> <size size> <world-readable | no-world-readable>;
    flag flag;
    level severity-level;
    no-remote-trace;
}
```

Hierarchy Level<br>[edit protocols ppp]

Release Information<br>Statement introduced in Junos OS Release 7.5.

Description<br>Define tracing operations for the PPP process.

To specify more than one tracing operation, include multiple flag statements.

You cannot specify a separate trace tile. Tracing information is placed in the system syslog file in the directory /var/log/pppd.

Default<br>If you do not include this statement, no PPPD-specific tracing operations are performed.

Options

- **filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. By default, commit script process tracing output is placed in the file ppd. If you include the file statement, you must specify a filename. To retain the default, you can specify eventd as the filename.

- **files number**—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

   If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.

   **Range:** 2 through 1000

   **Default:** 3 files

- **disable**—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.

- **flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. The following are the PPPD-specific tracing options.

   - **access**—Access code
• **address-pool**—Address pool code
• **alt**—All areas of code
• **auth**—Authentication code
• **chap**—Challenge Handshake Authentication Protocol (CHAP) code
• **config**—Configuration code
• **ifdb**—Interface database code
• **lcp**—LCP state machine code
• **memory**—Memory management code
• **message**—Message processing code
• **mlppp**—Trace MLPPP code
• **ncp**—NCP state machine code
• **pap**—Password Authentication Protocol (PAP) code
• **ppp**—PPP protocol processing code
• **radius**—RADIUS processing code
• **rtsock**—Routing socket code
• **session**—Session management code
• **signal**—Signal handling code
• **timer**—Timer code
• **ui**—User interface code

**match regex**—(Optional) Refine the output to include only those lines that match the given regular expression.

**size** **size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and filename.

**Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**non-world-readable**—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. Specify `non-world-readable` to reset the default.
Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

traceoptions (PPPoE)

Syntax

```
traceoptions {
    file <filename> <files number> <match regular-expression> <size maximum-file-size>
    <world-readable | no-world-readable>;
    filter {
        aci regular-expression;
        ari regular-expression;
        service-name regular-expression;
        underlying-interface interface-name;
    }
    flag flag;
    level (all | error | info | notice | verbose | warning);
    no-remote-trace;
}
```

Hierarchy Level

[edit protocols pppoe]

Release Information

Option filter introduced in Junos OS Release 12.3

Description

Define tracing operations for PPPoE processes.

Options

- **file filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

- **files number**—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

  Range: 2 through 1000

  Default: 3 files

- **disable**—Disable this trace flag.

- **filter**—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.

  - **aci regular-expression**—Regular expression to match the agent circuit identifier provided by PPPoE client.

  - **ari regular-expression**—Regular expression to match the agent remote identifier provided by PPPoE client.

  - **service-name regular-expression**—Regular expression to match the service name provided by PPPoE client.

  - **underlying-interface interface-name**—Interface name that the PPPoE client is using.

 **BEST PRACTICE:** Due to the complexity of agent circuit identifiers and agent remote identifiers, we recommend that you do not try an exact match when filtering on these options. For service names, searching on the exact name is appropriate, but you can also use a regular expression with that option.
• **ari regular-expression**—Regular expression to match the agent remote identifier provided by PPPoE client.

• **service regular-expression**—Regular expression to match the name of PPPoE service.

• **underlying-interface interface-name**—Name of a PPPoE underlying interface. You cannot use a regular expression for this filter option.

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **config**—Trace configuration events.
- **events**—Trace events.
- **gres**—Trace GRES events.
- **init**—Trace initialization events.
- **interface-db**—Trace interface database operations.
- **memory**—Trace memory processing events.
- **protocol**—Trace protocol events.
- **rtsock**—Trace routing socket events.
- **session-db**—Trace connection events and flow.
- **signal**—Trace signal operations.
- **state**—Trace state handling events.
- **timer**—Trace timer processing.
- **ui**—Trace user interface processing.

**level**—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

Default: *error*

**match regular-expression**—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.
size maximum-file-size—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the files option.

Syntax: size <size> to specify KB, size <size> to specify MB, or size <size> to specify GB

Range: 10240 through 1073741824

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level
- trace—to view this statement in the configuration.
- trace-control—to add this statement to the configuration.

translate-discard-eligible

Syntax (translate-discard-eligible | no-translate-discard-eligible);

Hierarchy Level
- [edit interfaces <interface-name> unit <logical-unit-number> family ccc],
- [edit logical-systems <logical-system-name> interfaces <interface-name> unit <logical-unit-number> family ccc]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
For interfaces with encapsulation type Frame Relay CCC, enable or disable translation of Frame Relay discard eligible (DE) control bits.

Default
DE bit translation is disabled.

Required Privilege Level
- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

Related Documentation
- Configuring Frame Relay Control Bit Translation
translate-fecn-and-becn

Syntax  (translate-fecn-and-becn | no-translate-fecn-and-becn);

Hierarchy Level [edit interfaces interface-name unit logical-unit-number family ccc],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family ccc]

Release Information Statement introduced before Junos OS Release 7.4.

Description For interfaces with encapsulation type Frame Relay CCC, enable or disable translation of Frame Relay forward explicit congestion notification (FECN) control bits and Frame Relay backward explicit congestion notification (BECN) control bits.

Default FECN and BECN bit translation is disabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation • Configuring Frame Relay Control Bit Translation

translate-plp-control-word-de

Syntax translate-plp-control-word-de

Hierarchy Level [edit interfaces interface-name unit logical-unit-number family ccc]

Description For the interfaces with encapsulation type Frame Relay CCC, classify and rewrite the control word discard eligibility (DE) bit based on the packet loss priority (PLP).

Default PLP bit translation is disabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation • Configuring Frame Relay Control Bit Translation
• frame-relay-de
transmit-bucket

Syntax
transmit-bucket {
  overflow discard;
  rate percentage;
  threshold bytes;
}

Hierarchy Level
[edit interfaces interface-name]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Set parameters for the transmit leaky bucket, which specifies what percentage of the interface’s total capacity can be used to transmit packets.

For each DS3 channel in a channelized OC12 interface, you can configure a unique transmit bucket.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

• Configuring Receive and Transmit Leaky Bucket Properties to Reduce Network Congestion on page 140
• receive-bucket on page 948
transmit-clock

Syntax  transmit-clock invert;

Hierarchy Level  [edit interfaces interface-name serial-options]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  Configure the transmit clock signal.

Options  invert—Shift the clock phase 180 degrees.

Required Privilege  level

Level  interface—to view this statement in the configuration.
        interface-control—to add this statement to the configuration.

Related Documentation  • Configuring the Serial Clocking Mode on page 322
transmit-period

Syntax:  transmit-period seconds;

Hierarchy Level:  [edit protocols dot1x authenticator interface interface-id]

Release Information:  Statement introduced in Junos OS Release 9.3.

Description:  Set the number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.

Options:

  seconds—The number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.

  Range: 1 through 65,535 seconds

  Default: 30 seconds

Required Privilege Level:

  interface—To view this statement in the configuration.

  interface-control—To add this statement to the configuration.

transmit-weight (ATM2 IQ CoS Forwarding Class)

Syntax	transmit-weight (cells number | percent number);

Hierarchy Level	[edit interfaces interface-name atm-options scheduler-maps map-name forwarding-class
class-name]

Release Information	Statement introduced before Junos OS Release 7.4.

Description	For ATM2 IQ interfaces only, assign a transmission weight to a forwarding class.

Default	95 percent for queue 0, 5 percent for queue 3.

Options
tp  per  cent  percent—Transmission weight of the forwarding class as a percentage of the
total bandwidth.
Range: 5 through 100

cells number—Transmission weight of the forwarding class as a number of cells.
Range: 0 through 32,000

Required Privilege Level	interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
• ATM2 IQ VC Tunnel CoS Components Overview
transmit-weight (ATM2 IQ Virtual Circuit)

Syntax  
transmit-weight number;

Hierarchy Level  
[edit interfaces interface-name unit logical-unit-number],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For ATM2 IQ PICs only, configure the transmission weight.

Each VC is serviced in weighted round robin (WRR) mode. When VCs have data to send, they send the number of cells equal to their weight before passing control to the next active VC. This allows proportional bandwidth sharing between multiple VCs within a rate-shaped VP tunnel. VP tunnels are not supported on multipoint interfaces.

Options  
number—Number of cells a VC sends before passing control to the next active VC within a VP tunnel.

Range: 1 through 32,767

Required Privilege Level  
interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Related Documentation

**Release Information**

Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.  
Support at the `[edit dynamic-profiles profile-name interfaces interface-name]` hierarchy level introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

**Description**

Enable or disable the sending of Simple Network Management Protocol (SNMP) notifications when the state of the connection changes.  

(Enhanced subscriber management for MX Series routers) To enable SNMP notifications, you must first configure the `interface-mib` statement at the `[edit dynamic-profiles profile-name interfaces interface-name]` hierarchy level. If `interface-mib` is not configured, the `traps` statement has no effect.

**BEST PRACTICE:** To achieve maximum performance when enhanced subscriber management is enabled, we recommend that you not enable SNMP notifications on all dynamic subscriber interfaces.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.  
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- [Enabling or Disabling SNMP Notifications on Physical Interfaces on page 155](#)
- [Enabling or Disabling SNMP Notifications on Logical Interfaces on page 185](#)
trigger

**Syntax**

```
trigger {
    defect ignore;
    defect hold-time up milliseconds down milliseconds;
}
```

**Hierarchy Level**

```
[edit interfaces interface-name sonet-options]
```  

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For ATM over SONET/SDH, SONET/SDH interfaces, and 10-Gigabit Ethernet interfaces in WAN PHY mode, configure SONET/SDH defect triggers to be ignored.

**Default**

If you do not include this statement, all SONET/SDH defect triggers are honored.

**Options**

**defect**—Defect to ignore or hold. It can be one of the following:

- ais-l—Line alarm indication signal
- ais-p—Path alarm indication signal
- ber-sd—Bit error rate signal degrade
- ber-sf—Bit error rate signal fault
- locd (ATM only)—Loss of cell delineation
- lof—Loss of frame
- lol—PHY loss of light
- lop-p—Path loss of pointer
- los—Loss of signal
- pll—PHY phase-locked loop out of lock
- plm-p—Path payload (signal) label mismatch
- rfi-l—Line remote failure indication
- rfi-p—Path remote failure indication
- uneq-p—Path unequipped

The remaining statements are explained separately. See CLI Explorer.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.
trigger-link-failure

Syntax

```
[trigger-link-failure interface-name];
```

Hierarchy Level

```
[edit interfaces lsq-fpc/pic/port lsq-failure-options]
```

Release Information

Statement introduced in Junos OS Release 7.4.

Description

List of SONET interfaces connected to the LSQ interface that can implement Automatic Protection Switching (APS) if the LSQ PIC fails.

Options

- `interface-name`—Name of SONET interface.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

- Junos OS Services Interfaces Library for Routing Devices
- Configuring SONET/SDH Defect Triggers
trunk-bandwidth

Syntax  
trunk-bandwidth rate;

Hierarchy Level  
[edit interfaces interface-name unit logical-unit-number],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information  
Statement introduced before Junos OS Release 7.4.

Description  
For ATM2 IQ interfaces configured to use Layer 2 circuit trunk mode, configure a scheduler so that unused bandwidth from any inactive trunk is proportionally shared among the active trunks.

During congestion, each trunk receives a proportional share of the leftover bandwidth, thus minimizing the latency on each trunk.

Options  
rate—Peak rate, in bits per second (bps) or cells per second (cps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation c; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps.

Range: 1,000,000 through 542,526,792 bps

Required Privilege  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation  
- Configuring Layer 2 Circuit Trunk Mode Scheduling Overview
trunk-id

**Syntax**

```
trunk-id number;
```

**Hierarchy Level**

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For ATM2 IQ interfaces with ATM CCC cell-relay encapsulation, configure the trunk identification number.

When you associate a trunk ID number with a logical interface, you are in effect specifying the interfaces that are allowed to send ATM traffic over an LSP.

**Options**

- `number`—A valid trunk identifier.
  
  **Range:** For UNI mode, 0 through 7. For NNI mode, 0 through 31.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- [Configuring Layer 2 Circuit Transport Mode](#)
ttl

Syntax  ttl value;

Hierarchy Level  [edit interfaces interface-name unit number tunnel]

Release Information  Statement introduced before Junos OS Release 7.4

Description  Set the time-to-live value bit in the header of the outer IP packet.

Options  value—Time-to-live value.
  Range: 0 through 255
  Default: 64

Required Privilege
  Level  interface—to view this statement in the configuration.
         interface-control—to add this statement to the configuration.

Related Documentation
  • Junos OS Services Interfaces Library for Routing Devices
tunnel

Syntax

tunnel {
  backup-destination address;
  destination address;
  key number;
  routing-instance {
    destination routing-instance-name;
  }
  source source-address;
  ttl number;
}

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
Configure a tunnel. You can use the tunnel for unicast and multicast traffic or just for multicast traffic. You can also use tunnels for encrypted traffic or VPNs.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

• Junos OS VPNs Library for Routing Devices
underlying-interface

Syntax

underlying-interface interface-name;

Hierarchy Level

[edit interfaces pp0 unit logical-unit-number pppoe-options],
[edit interfaces demux0 unit logical-unit-number demux-options],
[edit logical-systems logical-system-name interfaces demux0 unit logical-unit-number demux-options],
[edit logical-systems logical-system-name interfaces pp0 unit logical-unit-number pppoe-options],
[edit logical-systems logical-system-name routing-instances routing-instance-name interfaces demux0 unit logical-unit-number demux-options],
[edit logical-systems logical-system-name routing-instances routing-instance-name interfaces pp0 unit logical-unit-number pppoe-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Support for aggregated Ethernet added in Junos OS Release 9.4.

Description

Configure the interface on which PPP over Ethernet is running.

For demux interfaces, configure the underlying interface on which the demultiplexing (demux) interface is running.

Options

interface-name—Name of the interface on which PPP over Ethernet or demux is running.

For example, at-0/0/1.0 (ATM VC), fe-1/0/1.0 (Fast Ethernet interface), ge-2/0/0.0 (Gigabit Ethernet interface), ae1.0 (for IP demux on an aggregated Ethernet interface), or ae1 (for VLAN demux on an aggregated Ethernet interface).

NOTE: Demux interfaces are currently supported on Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet interfaces, or aggregated Ethernet devices.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

### unframed

**Syntax**

`(unframed | no-unframed);`

**Hierarchy Level**

`[edit interfaces interface-name e3-options]`

**Release Information**

Statement introduced before Junos OS Release 7.4.

**Description**

For E3 IQ interfaces only, enable or disable unframed mode. In unframed mode, the E3 IQ interface do not detect yellow (`ylw`) or loss-of-frame (`lof`) alarms.

**Default**

Unframed mode is disabled.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring E3 IQ and IQE Unframed Mode
**unidirectional**

Syntax  
unidirectional;

Hierarchy Level  
[edit interfaces interface-name],  
[edit logical-systems logical-system-name interfaces interface-name]

Release Information  
Statement introduced in Junos OS Release 8.5.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description  
Create two new, unidirectional (transmit-only and receive-only) physical interfaces subordinate to the original parent interface. Unidirectional links are currently supported only on 10-Gigabit Ethernet interfaces on the following hardware:

- 4-port 10-Gigabit Ethernet DPC on the MX960 router
- 10–Gigabit Ethernet IQ2 PIC and 10–Gigabit Ethernet IQ2E PIC on the T Series router

Default  
Disabled.

Required Privilege Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Hierarchy Level  [edit dynamic-profiles profile-name interfaces interface-name]

Description  Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.
Options

logical-unit-number—The specific unit number of the interface you want to assign to the dynamic profile, or one of the following predefined variables:

- $junos-underlying-interface-unit—For static VLANs, the unit number variable. The static unit number variable is dynamically replaced with the client unit number when the client session begins. The client unit number is specified by the DHCP when it accesses the subscriber network.

- $junos-interface-unit—The unit number variable on a dynamic underlying VLAN interface for which you want to enable the creation of dynamic VLAN subscriber interfaces based on the ACI.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options**

- **logical-unit-number**—Number of the logical unit.
  - **Range:** 0 through 1,073,741,823 for demux, PPPoE, and pseudowire static interfaces. 0 through 16,385 for all other static interface types.

- **etree-ac-role (leaf | root)**—To configure an interface as either leaf or root.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.
unnumbered-address (Demux)

Syntax

unnumbered-address interface-name <preferred-source-address address>;

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number family inet],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet]

Release Information

Statement introduced in Junos OS Release 8.2.
preferred-source-address option introduced in Junos OS Release 9.0.
IP demultiplexing interfaces supported in Junos OS Release 9.2.

Description

For IP demultiplexing interfaces, enable the local address to be derived from the specified interface. Configuring an unnumbered interface enables IP processing on the interface without assigning an explicit IP address to the interface.

Options

interface-name—Name of the interface from which the local address is derived. The specified interface must have a logical unit number and a configured IP address, and must not be an unnumbered interface.

The preferred-source-address statement is explained separately.

Required Privilege

Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

unnumbered-address (Dynamic Profiles)

Syntax

unnumbered-address interface-name <preferred-source-address address>;

Hierarchy Level

[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number family family],
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family family]

Release Information

Description

For Ethernet interfaces, enable the local address to be derived from the specified interface. Configuring unnumbered Ethernet interfaces enables IP processing on the interface without assigning an explicit IP address to the interface. To configure unnumbered address dynamically, include the $junos-loopback-interface-address predefined variable.

You can configure unnumbered address support on Ethernet interfaces for IPv4 and IPv6 address families.

Options

interface-name—Name of the interface from which the local address is derived. The specified interface must have a logical unit number, a configured IP address, and must not be an unnumbered interface. This value can be a specific interface name or the $junos-loopback-interface predefined variable.

When defining the unnumbered-address statement using a static interface, keep the following in mind:

- If you choose to include the routing-instance statement at the [edit dynamic-profiles] hierarchy level, that statement must be configured with a dynamic value by using the $junos-routing-instance predefined variable. In addition, whatever static unnumbered interface you specify must belong to that routing instance; otherwise, the profile instantiation fails.
- If you choose to not include the routing-instance statement at the [edit dynamic-profiles] hierarchy level, the unnumbered-address statement uses the default routing instance. The use of the default routing instance requires that the unnumbered interface be configured statically and that it reside in the default routing instance.

NOTE: When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the $junos-routing-instance predefined variable, you must not configure a preferred source address, whether with the $junos-preferred-source-address predefined variable, the
preferred-source-address statement. Configuring the preferred source address in this circumstance causes a commit failure.

When defining the unnumbered-address statement using the $junos-loopback-interface predefined variable, keep the following in mind:

- To use the $junos-loopback-interface predefined variable, the dynamic profile must also contain the routing-instance statement configured with the $junos-routing-instance predefined variable at the [edit dynamic-profiles] hierarchy level.
- The applied loopback interface is based on the dynamically obtained routing instance of the subscriber.

address—(Optional) Secondary IP address of the donor interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. This value can be a static IP address, the $junos-preferred-source-address predefined variable for the inet family, or the $junos-preferred-source-ipv6-address predefined variable for the inet6 family.

When defining the preferred-source-address value using a static IP address, keep the following in mind:

- The unnumbered interface must be statically configured.
- The IP address specified as the preferred-source-address must be configured in the specified unnumbered interface.

When defining the preferred-source-address value using the $junos-preferred-source-address or the $junos-preferred-source-ipv6-address predefined variables, keep the following in mind:

- You must configure the unnumbered-address statement using the $junos-loopback-interface predefined variable.
- You must configure the routing-instance statement using the $junos-routing-instance predefined variable at the [edit dynamic-profiles] hierarchy level.
- The preferred source address chosen is based on the dynamically applied loopback address which is in turn derived from the dynamically obtained routing instance of the subscriber. The configured loopback address with the closest network match to the user IP address is selected as the preferred source address.

Required Privilege
Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

username-include (Interfaces)

**Syntax**

```plaintext
username-include {
    circuit-id;
    circuit-type;
    delimiter delimiter-character;
    domain-name domain-name-string;
    interface-name;
    mac-address;
    option-18;
    option-37;
    option-82 <circuit-id> <remote-id>;
    radius-realm radius-realm-string;
    remote-id;
    user-prefix user-prefix-string;
    vlan-tags;
}
```

**Hierarchy Level**

- [edit interfaces interface-name auto-configure vlan-ranges authentication],
- [edit interfaces interface-name auto-configure stacked-vlan-ranges authentication]

**Release Information**

Statement introduced in Junos OS Release 10.0.
`vlan-tags` option added in Junos OS Release 18.3R1 on MX Series routers.

**Description**

Configure the username that the router passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router accesses the local authentication service only and does not use external authentication services, such as RADIUS.

The username takes the format `user-prefix mac-address circuit-type circuit-id remote-id option–82 interface-name domain-name radius-realm`. By default, each component is separated by a period (.), but you can specify a different delimiter with the `delimiter` statement.

**Options**

- `vlan-tags`—Include the subscriber session VLAN tags in the username for interactions with an external authority. Both single-tagged and double-tagged VLANs are supported: The tags are added in the format `outer-vlan-tag-inner-vlan-tag`. The outer tag is always included; the inner tag is included for double-tagged VLANs.

You can use this option instead of the `interface-name` option when the outer VLAN tag is unique across the system and you do not need the underlying physical interface name to be part of the format.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

vbr

Syntax  vbr peak rate sustained rate burst length;

Hierarchy Level  [edit interfaces interface-name atm-options vpi vpi-identifier shaping],
[edit interfaces interface-name unit logical-unit-number address address family family multipoint-destination address shaping ],
[edit interfaces interface-name unit logical-unit-number shaping ],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number address address family family multipoint-destination address shaping ],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number shaping ]

Release Information  Statement introduced before Junos OS Release 7.4.

Description  For ATM encapsulation only, define the variable bandwidth utilization in the traffic-shaping profile.

When you configure the variable bandwidth utilization, you must specify all three options (burst, peak, and sustained). You can specify the rate in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000). You can also specify the rate in cells per second by entering a decimal number followed by the abbreviation c; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps.

Default  If the vbr statement is not specified, bandwidth utilization is unlimited.

Options  burst length—Burst length, in cells. If you set the length to 1, the peak traffic rate is used.
Range: 1 through 4000 cells

peak rate—Peak rate, in bits per second or cells per second.
Range: For ATM1 interfaces, 33 Kbps through 135.6 Mbps (ATM OC3); 33 Kbps through 276 Mbps (ATM OC12). For ATM2 IQ OC3 and OC12 interfaces, 33 Kbps through 542,526,792 bps. For ATM2 IQ OC48 interfaces, 33 Kbps through 2,170,107,168 bps. For ATM2 IQ DS3 and E3 interfaces, from 33 Kbps through the maximum rate, which depends on the ATM encapsulation and framing you configure.

sustained rate—Sustained rate, in bits per second or cells per second.
Range: For ATM1 interfaces, 33 Kbps through 135.6 Mbps (ATM OC3); 33 Kbps through 276 Mbps (ATM OC12). For ATM2 IQ OC3 and OC12 interfaces, 33 Kbps through 542,526,792 bps. For ATM2 IQ OC48 interfaces, 33 Kbps through 2,170,107,168 bps. For ATM2 IQ DS3 and E3 interfaces, from 33 Kbps through the maximum rate, which depends on the ATM encapsulation and framing you configure.
vc-cos-mode

Syntax
vc-cos-mode (alternate | strict);

Hierarchy Level
[edit interfaces interface-name atm-options scheduler-maps map-name]

Release Information
Statement introduced before Junos OS Release 7.4.

Description
For ATM2 IQ interfaces only, specify packet-scheduling priority value for ATM2 IQ VC tunnels.

Options
- alternate—VC CoS queue has high priority. The scheduling of the queues alternates between the high-priority queue and the remaining queues, so every other scheduled packet is from the high-priority queue.

- strict—VC CoS queue has strictly high priority. A queue with strict high priority is always scheduled before the remaining queues. The remaining queues are scheduled in round-robin fashion.

Default: alternate
vci

Syntax  vci vpi-identifier.vci-identifier;

Hierarchy Level  [edit interfaces at-fpc/pic/port unit logical-unit-number],
                 [edit interfaces at-fpc/pic/port unit logical-unit-number family family address address multipoint-destination address],

                 [edit logical-systems logical-system-name interfaces at-fpc/pic/port unit logical-unit-number family family address address multipoint-destination address]

Release Information  Statement introduced before Junos OS Release 7.4.
                      Statement introduced in Junos OS Release 11.1 for the QFX Series.
                      Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro routers.

Description  For ATM point-to-point logical interfaces only, configure the virtual circuit identifier (VCI) and virtual path identifier (VPI).

To configure a VPI for a point-to-multipoint interface, specify the VPI in the multipoint-destination statement.

VCIs 0 through 31 are reserved for specific ATM values designated by the ATM Forum.

Options  vci-identifier—ATM virtual circuit identifier. Unless you configure the interface to use promiscuous mode, this value cannot exceed the highest-numbered VC configured for the interface with the maximum-vcs option of the vpi statement.

Range: 0 through 4089 or 0 through 65,535 with promiscuous mode, with VCIs 0 through 31 reserved.

vpi-identifier—ATM virtual path identifier.

Range: 0 through 255

Default: 0

Required Privilege Level  interface—To view this statement in the configuration.
                          interface-control—To add this statement to the configuration.

[edit interfaces ge-fpc/pic/port],
[edit interfaces interface-name]

**Hierarchy Level (SRX Series)**

[edit interfaces interface-name]

**Release Information**

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 9.5 for SRX Series.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

**Description**

Configure the VLAN identifier to associate with untagged packets received on the physical interface of a trunk mode interface for the following:

- QFX Series and EX4600
- M Series routers with Gigabit Ethernet IQ PICs with SFP and Gigabit Ethernet IQ2 PICs with SFP configured for 802.1Q flexible VLAN tagging
- MX Series routers with Gigabit Ethernet DPCs and MICs, Tri-Rate Ethernet DPCs and MICs, and 10-Gigabit Ethernet DPCs and MICs and MPCs configured for 802.1Q flexible VLAN tagging
- T4000 routers with 100-Gigabit Ethernet Type 5 PIC with CFP
- EX Series switches with Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces

The logical interface on which untagged packets are received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface, otherwise the untagged packets are dropped. To configure the logical interface, include the `vlan-id`
statement (matching the `native-vlan-id` statement on the physical interface) at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level.

When the `native-vlan-id` statement is included with the `flexible-vlan-tagging` statement, untagged packets are accepted on the same mixed VLAN-tagged port and on the interfaces that are configured for Q-in-Q tunneling.

When the `native-vlan-id` statement is combined with the `interface-mode` statement, untagged packets are accepted and forwarded within the bridge domain or VLAN that is configured with the matching VLAN ID.

To configure the logical interface, include the `vlan-id` statement (matching the `native-vlan-id` statement on the physical interface) at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level.

---

**NOTE:** Starting in Junos OS Release 17.1R1, you can send untagged traffic without a native VLAN ID to the remote end of the network. To do this, remove the native VLAN ID from the untagged traffic configuration by setting the `no-native-vlan-insert` statement. If you do not configure this statement, the native VLAN ID is added to the untagged traffic.

---

**Default**

By default, the untagged packets are dropped. That is, if you do not configure the `native-vlan-id` option, the untagged packets are dropped.

**Options**

- `vlan-id`—Numeric identifier of the VLAN.
  - **Range:** 1 through 4094
- `number`—VLAN ID number.
  - **Range:** (ACX Series routers, SRX Series devices and EX Series switches) 0 through 4094.

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**vlan-id-list (Ethernet VLAN Circuit)**

**Syntax**

```
vlan-id-list [vlan-id vlan-id–vlan-id];
```

**Hierarchy Level**

[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**

Statement introduced in Junos OS Release 9.5.

**Description**

Binds a single-tag logical interface to a list of VLAN IDs. Configures a logical interface to receive and forward any tag frame whose VLAN ID tag matches the list of VLAN IDs you specify.

**NOTE:**
When you create a circuit cross-connect (CCC) using VLAN-bundled single-tag logical interfaces on Layer 2 VPN routing instances, the circuit automatically uses ethernet encapsulation. For Layer 2 VPN, you need to include the encapsulation-type statement and specify the value ethernet at either of the following hierarchy levels:

- [edit routing-instances routing-instance-name protocols l2vpn]
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn]

For more information about the encapsulation-type configuration statement and the Layer 2 encapsulation types ethernet and ethernet-vlan, see the Junos OS VPNs Library for Routing Devices.

**Options**

```
[vlan-id vlan-id–vlan-id]—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

Range: 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.
```

**NOTE:** Configuring vlan-id-list with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:
[edit interfaces interface-name]
    vlan-tagging;
    unit number {
        vlan-id-range 1-4094;
    }

[edit interfaces interface-name]
    unit 0;

**vlan-id-list (Interface in Bridge Domain)**

**Syntax**

```
vlan-id-list [ number number-number ];
```

**Hierarchy Level**

```
[edit interfaces interface-name unit logical-unit-number family bridge],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family bridge]
```

**Release Information**

Statement introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 15.1.

**Description**

Configure a logical interface to forward packets and learn MAC addresses within each bridge domain configured with a VLAN ID that matches a VLAN ID specified in the list. VLAN IDs can be entered individually using a space to separate each ID, entered as an inclusive list separating the starting VLAN ID and ending VLAN ID with a hyphen, or a combination of both.

**Options**

- `number number`—Individual VLAN IDs separated by a space.
- `number-number`—Starting VLAN ID and ending VLAN ID in an inclusive range.
  
  **Range:** 1 through 4095

**Required Privilege Level**

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

**Related Documentation**

- Configuring a Logical Interface for Trunk Mode
- Configuring the VLAN ID List for a Trunk Interface
- Tunnel Services Overview
- Tunnel Interface Configuration on MX Series Routers Overview
**vlan-id-range**

**Syntax**  
`vlan-id-range vlan-id–vlan-id`

**Hierarchy Level**  
[edit interfaces interface-name unit logical-unit-number],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**  
Statement introduced in Junos OS Release 8.4.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**  
Bind a range of VLAN IDs to a logical interface.

**Options**  
`number`—The first number is the lowest VLAN ID in the range the second number is the highest VLAN ID in the range.

**Range:** 1 through 4094

---

**NOTE:** Configuring `vlan-id-range` with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
  vlan-tagging;
  unit number {
    vlan-id-range 1-4094;
  }

[edit interfaces interface-name]
  unit 0;
```

VLAN ID 0 is reserved for tagging the priority of frames.

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

]  

Hierarchy Level  [edit interfaces interface-name auto-configure]

Release Information  Statement introduced in Junos OS Release 9.5.

Description  Configure multiple VLANs. Each VLAN is assigned a VLAN ID number from the range.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege
Level  routing—To view this statement in the configuration.
      routing–control—To add this statement to the configuration.

Related Documentation  • Configuring an Interface to Use the Dynamic Profile Configured to Create Single-Tag VLANs
                      • Configuring Interfaces to Support Both Single and Stacked VLANs
**Syntax**

```
vlan-rewrite translate (200 500 | 201 501)
```

**Hierarchy Level**

```
[edit interfaces interface-name unit number family bridge interface-mode trunk]
[edit interfaces interface-name unit number family ethernet-switching interface-mode trunk]
```

**Release Information**

Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Translates an incoming VLAN to a bridge-domain VLAN, corresponding counter translation at egress. Supports translation of VLAN 200 to VLAN 500 and VLAN 201 to VLAN 501. Other valid VLANs pass through without translation.

**Options**

- `translate 200 500`—Translates incoming packets with VLAN 200 to 500.
- `translate 201 501`—Translates incoming packets with VLAN 201 to 501.

**vlan-rule (100-Gigabit Ethernet Type 4 PIC with CFP)**

**Syntax**

`vlan-rule (high-low | odd-even);`

**Hierarchy Level**

```
[edit chassis fpc slot pic slot forwarding-mode vlan-steering]
```

**Release Information**

Statement introduced in Junos OS Release 10.4.

**Description**

Configure the interoperability mode of the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4) when interoperating with 100 gigabit Ethernet interfaces from other vendors.

If no VLAN rule is configured, all tagged packets are distributed to PFE0.

**Options**

- **high-low**—VLAN IDs 1 through 2047 are distributed to PFE0 and VLAN IDs 2048 through 4096 are distributed to PFE1.
- **odd-even**—Odd number VLAN IDs are distributed to PFE1 and even number VLAN IDs are distributed to PFE0.

**Required Privilege Level**

vlan-tagging

**Syntax**

```
vlan-tagging;
```

**Syntax (QFX Series, NFX Series, and EX4600)**

```
vlan-tagging;
```

**Syntax (SRX Series Interfaces)**

```
vlan-tagging native-vlan-id vlan-id;
```

**Hierarchy Level**

```
[edit interfaces interface-name],
[edit logical-systems logical-system-name interfaces interface-name]
```

**QFX Series, NFX Series, and EX4600 Interfaces**

```
[edit interfaces (QFX Series) interface-name ]
[edit interfaces (QFX Series) interface-range interface-range-name ]
```

**SRX Series Interfaces**

```
[edit interfaces interface ]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 13.2 for PTX Series Routers.
Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series.

**Description**

For Fast Ethernet and Gigabit Ethernet interfaces, aggregated Ethernet interfaces configured for VPLS, and pseudowire subscriber interfaces, enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface.

**NOTE:** For QFX Series configure VLAN identifier for untagged packets received on the physical interface of a trunk mode interface. Enable VLAN tagging. The platform receives and forwards single-tag frames with 802.1Q VLAN tags.

On EX Series switches except for EX4300 and EX9200 switches, the `vlan-tagging` and `family ethernet-switching` statements cannot be configured on the same interface. Interfaces on EX2200, EX3200, EX3300, EX4200, and EX4500 switches are set to `family ethernet-switching` by the default factory configuration. EX6200 and EX8200 switch interfaces do not have a default family setting.
VLAN tagging is disabled by default.

Options

**native-vlan-id**—(SRX Series) Configures a VLAN identifier for untagged packets. Enter a number from 0 through 4094.

---

**NOTE:** The native-vlan-id can be configured only when either flexible-vlan-tagging mode or interface-mode trunk is configured.

---

**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

### vlan-tags (Dual-Tagged Logical Interface)

**Syntax**

```plaintext
vlan-tags inner-list [vlan-id vlan-id–vlan-id] outer <tpid.>vlan-id;
```

**Hierarchy Level**

```plaintext
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

**Release Information**

Statement introduced in Junos OS Release 9.5.

**Description**

(MX Series routers only) Binds a dual-tag logical interface to a list of VLAN IDs. Configures the logical interface to receive and forward any dual-tag frame whose inner VLAN ID tag matches the list of VLAN IDs you specify.

---

**NOTE:**

To create a circuit cross-connect (CCC) using VLAN-bundled dual-tag logical interfaces on Layer 2 VPN routing instances, you must include the encapsulation-type statement and specify the value ethernet-vlan at the one of the following hierarchy levels:

- [edit routing-instances routing-instance-name protocols l2vpn]
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn]

For more information about the encapsulation-type configuration statement and the Layer 2 encapsulation types ethernet and ethernet-vlan, see the Junos OS VPNs Library for Routing Devices.

---

**Options**

- **inner-list [vlan-id vlan-id vlan-id–vlan-id]**—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.
  - **Range:** 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

- **outer <tpid.>vlan-id**—An optional Tag Protocol ID (TPID) and a valid VLAN ID.
  - **Range:** For TPID, specify a hexadecimal value in the format Oxnnnn.
  - **Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

**NOTE:** Configuring inner-list with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1 through 4094), the inner VLAN ID is unnecessary.
4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-tags outer vid inner-list 1-4094;
}
```

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id vid;
}
```

**Required Privilege**

**Level**

interface—to view this statement in the configuration.

interface-control—to add this statement to the configuration.

vlan-tags (Stacked VLAN Tags)

Syntax

```
_vlan-tags inner tpid vlan-id inner-list value inner-range vid1—vid2 outer tpid vlan-id;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

Description

Bind TPIDs and 802.1Q VLAN tag IDs to a logical interface. TPID fields are used to identify the frame as an IEEE 802.1Q-tagged frame.

Options

- **inner tpid vlan-id**—A TPID and a valid VLAN identifier. TPID is a 16-bit field set to a value of 0x8100 in order to identify the frame as an IEEE 802.1Q-tagged frame.
  - **Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

- **inner-list value**—List or a set of VLAN identifiers.

  **NOTE:** This is supported on MX Series routers with Trio-based FPCs.

- **inner-range tpid vid1—vid2**—Specify a TPID and a range of VLAN IDs where vid1 is the start of the range and vid2 is the end of the range.

  **NOTE:** On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the inner-range tpid vid1—vid2 option with the vlan-tags statement for ISP-facing interfaces.

- **Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

- **outer tpid vlan-id**—A TPID and a valid VLAN identifier.

  **Range:** For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

  **NOTE:** Configuring inner-range with the entire vlan-id range consumes system resources and is not a best practice. The inner-range must be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated...
with a logical interface. If you specify the entire range (1 through 4094), it has the same result as not specifying a range; however, it consumes Packet Forwarding Engine resources such as VLAN lookup table entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
stacked-vlan-tagging;
unit number {
    vlan-tags outer vid inner-range 1-4094;
}

[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id vid;
}
```

wavelength

Syntax  wavelength nm;

Hierarchy Level  [edit interfaces interface-name optics-options]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series routers.

Description  For 10-Gigabit or 100-Gigabit Ethernet DWDM interfaces only, configure full C-band ITU-Grid tunable optics.

Options  nm—Wavelength value. It can be one of the following:

- 1528.38—1528.38 nanometers (nm), corresponds to a 50-GHz grid
- 1528.77—1528.77 nm, corresponds to 50-GHz and 100-GHz grids
- 1529.16—1529.16 nm, corresponds to a 50-GHz grid
- 1529.55—1529.55 nm, corresponds to 50-GHz and 100-GHz grids
- 1529.94—1529.94 nm, corresponds to a 50-GHz grid
- 1530.33—1530.33 nm, corresponds to 50-GHz and 100-GHz grids
- 1530.72—1530.72 nm, corresponds to a 50-GHz grid
- 1531.12—1531.12 nm, corresponds to 50-GHz and 100-GHz grids
- 1531.51—1531.51 nm, corresponds to a 50-GHz grid
- 1531.90—1531.90 nm, corresponds to 50-GHz and 100-GHz grids
- 1532.29—1532.29 nm, corresponds to a 50-GHz grid
- 1532.68—1532.68 nm, corresponds to 50-GHz and 100-GHz grids
- 1533.07—1533.07 nm, corresponds to a 50-GHz grid
- 1533.47—1533.47 nm, corresponds to 50-GHz and 100-GHz grids
- 1533.86—1533.86 nm, corresponds to a 50-GHz grid
- 1534.25—1534.25 nm, corresponds to 50-GHz and 100-GHz grids

NOTE: All values are displayed. However, if you configure a value that is not supported by the device, an error message is displayed and the device is not tuned to the specified wavelength.
- 1534.64—1534.64 nm, corresponds to a 50-GHz grid
- 1535.04—1535.04 nm, corresponds to 50-GHz and 100-GHz grids
- 1535.43—1535.43 nm, corresponds to a 50-GHz grid
- 1535.82—1535.82 nm, corresponds to 50-GHz and 100-GHz grids
- 1536.22—1536.22 nm, corresponds to a 50-GHz grid
- 1536.61—1536.61 nm, corresponds to 50-GHz and 100-GHz grids
- 1537.00—1537.00 nm, corresponds to a 50-GHz grid
- 1537.40—1537.40 nm, corresponds to 50-GHz and 100-GHz grids
- 1537.79—1537.79 nm, corresponds to a 50-GHz grid
- 1538.19—1538.19 nm, corresponds to 50-GHz and 100-GHz grids
- 1538.58—1538.58 nm, corresponds to a 50-GHz grid
- 1538.98—1538.98 nm, corresponds to 50-GHz and 100-GHz grids
- 1539.37—1539.37 nm, corresponds to a 50-GHz grid
- 1539.77—1539.77 nm, corresponds to 50-GHz and 100-GHz grids
- 1540.16—1540.16 nm, corresponds to a 50-GHz grid
- 1540.56—1540.56 nm, corresponds to 50-GHz and 100-GHz grids
- 1540.95—1540.95 nm, corresponds to a 50-GHz grid
- 1541.35—1541.35 nm, corresponds to 50-GHz and 100-GHz grids
- 1541.75—1541.75 nm, corresponds to a 50-GHz grid
- 1542.14—1542.14 nm, corresponds to 50-GHz and 100-GHz grids
- 1542.54—1542.54 nm, corresponds to a 50-GHz grid
- 1542.94—1542.94 nm, corresponds to 50-GHz and 100-GHz grids
- 1543.33—1543.33 nm, corresponds to a 50-GHz grid
- 1543.73—1543.73 nm, corresponds to 50-GHz and 100-GHz grids
- 1544.13—1544.13 nm, corresponds to a 50-GHz grid
- 1544.53—1544.53 nm, corresponds to 50-GHz and 100-GHz grids
- 1544.92—1544.92 nm, corresponds to a 50-GHz grid
- 1545.32—1545.32 nm, corresponds to 50-GHz and 100-GHz grids
- 1545.72—1545.72 nm, corresponds to a 50-GHz grid
- 1546.12—1546.12 nm, corresponds to 50-GHz and 100-GHz grids
- 1546.52—1546.52 nm, corresponds to a 50-GHz grid
- 1546.92—1546.92 nm, corresponds to 50-GHz and 100-GHz grids
- 1547.32—1547.32 nm, corresponds to a 50-GHz grid
• 1547.72—1547.72 nm, corresponds to 50-GHz and 100-GHz grids
• 1548.11—1548.11 nm, corresponds to a 50-GHz grid
• 1548.51—1548.51 nm, corresponds to 50-GHz and 100-GHz grids
• 1548.91—1548.91 nm, corresponds to a 50-GHz grid
• 1549.32—1549.32 nm, corresponds to 50-GHz and 100-GHz grids
• 1549.72—1549.72 nm, corresponds to a 50-GHz grid
• 1550.12—1550.12 nm, corresponds to 50-GHz and 100-GHz grids
• 1550.52—1550.52 nm, corresponds to a 50-GHz grid
• 1551.12—1551.12 nm, corresponds to 50-GHz and 100-GHz grids
• 1551.52—1551.52 nm, corresponds to a 50-GHz grid
• 1552.93—1552.93 nm, corresponds to a 50-GHz grid
• 1553.33—1553.33 nm, corresponds to 50-GHz and 100-GHz grids
• 1553.73—1553.73 nm, corresponds to a 50-GHz grid
• 1554.13—1554.13 nm, corresponds to 50-GHz and 100-GHz grids
• 1554.54—1554.54 nm, corresponds to a 50-GHz grid
• 1554.94—1554.94 nm, corresponds to 50-GHz and 100-GHz grids
• 1555.34—1555.34 nm, corresponds to a 50-GHz grid
• 1555.75—1555.75 nm, corresponds to 50-GHz and 100-GHz grids
• 1556.15—1556.15 nm, corresponds to a 50-GHz grid
• 1556.55—1556.55 nm, corresponds to 50-GHz and 100-GHz grids
• 1556.95—1556.95 nm, corresponds to a 50-GHz grid
• 1557.36—1557.36 nm, corresponds to 50-GHz and 100-GHz grids
• 1557.77—1557.77 nm, corresponds to a 50-GHz grid
• 1558.17—1558.17 nm, corresponds to 50-GHz and 100-GHz grids
• 1558.58—1558.58 nm, corresponds to a 50-GHz grid
• 1558.98—1558.98 nm, corresponds to 50-GHz and 100-GHz grids
• 1559.39—1559.39 nm, corresponds to a 50-GHz grid
• 1559.79—1559.79 nm, corresponds to 50-GHz and 100-GHz grids
• 1560.20—1560.20 nm, corresponds to a 50-GHz grid
• 1560.61—1560.61 nm, corresponds to 50-GHz and 100-GHz grids
• 1561.01—1561.01 nm, corresponds to a 50-GHz grid
• 1561.42—1561.42 nm, corresponds to 50-GHz and 100-GHz grids
• 1561.83—1561.83 nm, corresponds to a 50-GHz grid
• 1562.23—1562.23 nm, corresponds to 50-GHz and 100-GHz grids
• 1562.64—1562.64 nm, corresponds to a 50-GHz grid
• 1563.05—1563.05 nm, corresponds to 50-GHz and 100-GHz grids
• 1563.45—1563.45 nm, corresponds to a 50-GHz grid
• 1563.86—1563.86 nm, corresponds to 50-GHz and 100-GHz grids
• 1564.27—1564.27 nm, corresponds to a 50-GHz grid
• 1564.68—1564.68 nm, corresponds to 50-GHz and 100-GHz grids
• 1565.09—1565.09 nm, corresponds to a 50-GHz grid
• 1565.50—1565.50 nm, corresponds to 50-GHz and 100-GHz grids
• 1565.90—1565.90 nm, corresponds to a 50-GHz grid
• 1566.31—1566.31 nm, corresponds to 50-GHz and 100-GHz grids
• 1566.72—1566.72 nm, corresponds to a 50-GHz grid
• 1567.13—1567.13 nm, corresponds to 50-GHz and 100-GHz grids
• 1567.54—1567.54 nm, corresponds to a 50-GHz grid
• 1567.95—1567.95 nm, corresponds to 50-GHz and 100-GHz grids
• 1568.36—1568.36 nm, corresponds to a 50-GHz grid
• 1568.77—1568.77 nm, corresponds to 50-GHz and 100-GHz grids

Default: 1550.12—1550.12 nm, corresponds to 50-GHz and 100-GHz grids

Required Privilege Level

}
```

Hierarchy Level
[edit protocols protection-group ethernet-ring ring-name]

Release Information
Statement introduced in Junos OS Release 9.5.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  

Description
Define one of the two interface ports for Ethernet ring protection, the other being defined by the east-interface statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

NOTE: Always configure this port second, after configuring the east-interface statement.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

Common Output Fields Description

This chapter explains the content of the output fields, which appear in the output of most show interfaces commands.

Damping Field

For the physical interface, the Damping field shows the setting of the following damping parameters:

• **half-life**—Decay half-life. The number of seconds after which the accumulated interface penalty counter is reduced by half if the interface remains stable.

• **max-suppress**—Maximum hold-down time. The maximum number of seconds that an interface can be suppressed irrespective of how unstable the interface has been.

• **reuse**—Reuse threshold. When the accumulated interface penalty counter falls below this number, the interface is no longer suppressed.

• **suppress**—Cutoff (suppression) threshold. When the accumulated interface penalty counter exceeds this number, the interface is suppressed.

• **state**—Interface damping state. If damping is enabled on an interface, it is suppressed during interface flaps that match the configured damping parameters.

Destination Class Field

For the logical interface, the Destination class field provides the names of destination class usage (DCU) counters per family and per class for a particular interface. The counters display packets and bytes arriving from designated user-selected prefixes. For example:

<table>
<thead>
<tr>
<th>Destination class</th>
<th>Packets (packet-per-second)</th>
<th>Bytes (bits-per-second)</th>
</tr>
</thead>
<tbody>
<tr>
<td>gold</td>
<td>1928095 (889)</td>
<td>161959980 (597762)</td>
</tr>
<tr>
<td>bronze</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>silver</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
Enabled Field

For the physical interface, the Enabled field provides information about the state of the interface, displaying one or more of the following values:

- **Administratively down, Physical link is Down**—The interface is turned off, and the physical link is inoperable and cannot pass packets even when it is enabled. To change the interface state to Enabled, use the following command:

  ```bash
  user@host# set interfaces interface enable
  ```

  Manually verify the connections to bring the physical link up.

- **Administratively down, Physical link is Up**—The interface is turned off, but the physical link is operational and can pass packets when it is enabled. To change the interface state to Enabled, use the following command:

  ```bash
  user@host# set interfaces interface enable
  ```

- **Enabled, Physical link is Down**—The interface is turned on, but the physical link is inoperable and cannot pass packets. Manually verify the connections to bring the physical link up.

- **Enabled, Physical link is Up**—The interface is turned on, and the physical link is operational and can pass packets.

Filters Field

For the logical interface, the Filters field provides the name of the firewall filters to be evaluated when packets are received or transmitted on the interface. The format is Filters: Input: filter-name and Filters: Output: filter-name. For example:

```plaintext
Filters: Input: sample-all
Filters: Output: cp-ftp
```

Flags Fields

The following sections provide information about flags that are specific to interfaces:

- Addresses, Flags Field on page 1154
- Device Flags Field on page 1154
- Family Flags Field on page 1155
- Interface Flags Field on page 1156
- Link Flags Field on page 1156
- Logical Interface Flags Field on page 1157
Addresses, Flags Field

The **Addresses, Flags** field provides information about the addresses configured for the protocol family on the logical interface and displays one or more of the following values:

- **Dest-route-down**—The routing process detected that the link was not operational and changed the interface routes to nonforwarding status.
- **Is-Default**—The default address of the router used as the source address by SNMP, ping, traceroute, and other network utilities.
- **Is-Preferred**—The default local address for packets originating from the local router and sent to destinations on the subnet.
- **Is-Primary**—The default local address for broadcast and multicast packets originated locally and sent out the interface.
- **Preferred**—This address is a candidate to become the preferred address.
- **Primary**—This address is a candidate to become the primary address.
- **Trunk**—Interface is a trunk.
- **Trunk, Inter-Switch-Link**—Interface is a trunk, and InterSwitch Link protocol (ISL) is configured on the trunk port of the primary VLAN in order to connect the routers composing the PVLAN to each other.

Device Flags Field

The **Device flags** field provides information about the physical device and displays one or more of the following values:

- **ASIC Error**—Device is down because of ASIC wedging and due to which PFE is disabled.
- **Down**—Device has been administratively disabled.
- **Hear-Own-Xmit**—Device receives its own transmissions.
- **Link-Layer-Down**—The link-layer protocol has failed to connect with the remote endpoint.
- **Loopback**—Device is in physical loopback.
- **Loop-Detected**—The link layer has received frames that it sent, thereby detecting a physical loopback.
- **No-Carrier**—On media that support carrier recognition, no carrier is currently detected.
- **No-Multicast**—Device does not support multicast traffic.
- **Present**—Device is physically present and recognized.
- **Promiscuous**—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media.
- **Quench**—Transmission on the device is quenched because the output buffer is overflowing.
• **Recv-All-Multicasts**—Device is in multicast promiscuous mode and therefore provides no multicast filtering.

• **Running**—Device is active and enabled.

**Family Flags Field**

The **Family flags** field provides information about the protocol family on the logical interface and displays one or more of the following values:

• **DCU**—Destination class usage is enabled.

• **Dest-route-down**—The software detected that the link is down and has stopped forwarding the link's interface routes.

• **Down**—Protocol is inactive.

• **Is-Primary**—Interface is the primary one for the protocol.

• **Mac-Validate-Loose**—Interface is enabled with loose MAC address validation.

• **Mac-Validate-Strict**—Interface is enabled with strict MAC address validation.

• **Maximum labels**—Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.

• **MTU-Protocol-Adjusted**—The effective MTU is not the configured value in the software.

• **No-Redirects**—Protocol redirects are disabled.

• **Primary**—Interface can be considered for selection as the primary family address.

• **Protocol-Down**—Protocol failed to negotiate correctly.

• **SCU-in**—Interface is configured for source class usage input.

• **SCU-out**—Interface is configured for source class usage output.

• **send-bcast-packet-to-re**—Interface is configured to forward IPv4 broadcast packets to the Routing Engine.

• **targeted-broadcast**—Interface is configured to forward IPv4 broadcast packets to the LAN interface and the Routing Engine.

• **Unnumbered**—Protocol family is configured for unnumbered Ethernet. An unnumbered Ethernet interface borrows an IPv4 address from another interface, which is referred to as the donor interface.

• **Up**—Protocol is configured and operational.

• **uRPF**—Unicast Reverse Path Forwarding is enabled.
Interface Flags Field

The interface flags field provides information about the physical interface and displays one or more of the following values:

- **Admin-Test**—Interface is in test mode and some sanity checking, such as loop detection, is disabled.
- **Disabled**—Interface is administratively disabled.
- **Down**—A hardware failure has occurred.
- **Hardware-Down**—Interface is nonfunctional or incorrectly connected.
- **Link-Layer-Down**—Interface keepalives have indicated that the link is incomplete.
- **No-Multicast**—Interface does not support multicast traffic.
- **No-receive No-transmit**—Passive monitor mode is configured on the interface.
- **OAM-On-SVLAN**—(MX Series routers with MPC/MIC interfaces only) Interface is configured to propagate the Ethernet OAM state of a static, single-tagged service VLAN (S-VLAN) on a Gigabit Ethernet, 10-Gigabit Ethernet, or aggregated Ethernet interface to a dynamic or static double-tagged customer VLAN (C-VLAN) that has the same S-VLAN (outer) tag as the S-VLAN.
- **Point-To-Point**—Interface is point-to-point.
- **Pop all MPLS labels from packets of depth**—MPLS labels are removed as packets arrive on an interface that has the pop-all-labels statement configured. The depth value can be one of the following:
  - 1—Takes effect for incoming packets with one label only.
  - 2—Takes effect for incoming packets with two labels only.
  - [12]—Takes effect for incoming packets with either one or two labels.
- **Promiscuous**—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses.
- **Recv-All-Multicasts**—Interface is in multicast promiscuous mode and provides no multicast filtering.
- **SNMP-Traps**—SNMP trap notifications are enabled.
- **Up**—Interface is enabled and operational.

Link Flags Field

The link flags field provides information about the physical link and displays one or more of the following values:

- **ACFC**—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option.
- **Give-Up**—Link protocol does not continue connection attempts after repeated failures.
• **Loose-LCP**—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational.

• **Loose-LMI**—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational.

• **Loose-NCP**—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational.

• **No-Keepalives**—Link protocol keepalives are disabled.

• **PFC**—Protocol field compression is configured. The PPP session negotiates the PFC option.

**Logical Interface Flags Field**

The *Logical interface flags* field provides information about the logical interface and displays one or more of the following values:

• **ACFC Encapsulation**—Address control field Compression (ACFC) encapsulation is enabled (negotiated successfully with a peer).

• **Device-down**—Device has been administratively disabled.

• **Disabled**—Interface is administratively disabled.

• **Down**—A hardware failure has occurred.

• **Clear-DF-Bit**—GRE tunnel or IPsec tunnel is configured to clear the Don’t Fragment (DF) bit.

• **Hardware-Down**—Interface protocol initialization failed to complete successfully.

• **PFC**—Protocol field compression is enabled for the PPP session.

• **Point-To-Point**—Interface is point-to-point.

• **SNMP-Traps**—SNMP trap notifications are enabled.

• **Up**—Interface is enabled and operational.

**Label-Switched Interface Traffic Statistics Field**

When you use the *vrf-table-label* statement to configure a VRF routing table, a label-switched interface (LSI) logical interface label is created and mapped to the VRF routing table.

Any routes present in a VRF routing table and configured with the *vrf-table-label* statement are advertised with the LSI logical interface label allocated for the VRF routing table. When packets for this VPN arrive on a core-facing interface, they are treated as if the enclosed IP packet arrived on the LSI interface and are then forwarded and filtered based on the correct table. For more information on the *vrf-table-label* statement, including a list of supported interfaces, see the *Junos VPNs Configuration Guide*.

If you configure the *family mpls* statement at the [edit interfaces interface-name unit logical-unit-number] hierarchy level and you also configure the *vrf-table-label* statement at the [edit routing-instances routing-instance-name] hierarchy level, the output for the
**show interface interface-name extensive** command includes the following output fields about the LSI traffic statistics:

- **Input bytes**—Number of bytes entering the LSI and the current throughput rate in bits per second (bps).
- **Input packets**—Number of packets entering the LSI and the current throughput rate in packets per second (pps).

---

**NOTE:** If LSI interfaces are used with VPLS when no-tunnel-services is configured or L3VPN when vrf-table-label configuration is applied inside the routing-instance, the **Input packets** field associated with the core-facing interfaces may not display the correct value. Only the Input counter is affected because the LSI is used to receive traffic from the remote PEs. Traffic that arrives on an LSI interface might not be counted at both the Traffic Statistics and the Label-switched interface (LSI) traffic statistics levels.

This note applies to the following platforms:

- M Series routers with -E3 FPC model numbers or configured with an Enhanced CFEB (CFEB-E), and M120 routers
- MX Series routers with DPC or ADPC only

The following example shows the LSI traffic statistics that you might see as part of the output of the **show interface interface-name extensive** command:

```
Label-switched interface (LSI) traffic statistics:
Input bytes:  0  0 bps
Input packets: 0 0 pps
```

### Policer Field

For the logical interface, the **Policer** field provides the policers that are to be evaluated when packets are received or transmitted on the interface. The format is **Policer: Input: type-fpc/pic/port-in-policer, Output: type-fpc/pic/port-out-policer.** For example:

```
```

### Protocol Field

For the logical interface, the **Protocol** field indicates the protocol family or families that are configured on the interface, displaying one or more of the following values:

- **aenet**—Aggregated Ethernet. Displays on Fast Ethernet interfaces that are part of an aggregated Ethernet bundle.
- **ccc**—Circuit cross-connect (CCC). Configured on the logical interface of CCC physical interfaces.
- **inet**—IP version 4 (IPv4). Configured on the logical interface for IPv4 protocol traffic, including Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), Internet Control Message Protocol (ICMP), and Internet Protocol Control Protocol (IPCP).

- **inet6**—IP version 6 (IPv6). Configured on the logical interface for IPv6 protocol traffic, including Routing Information Protocol for IPv6 (RIPng), Intermediate System-to-Intermediate System (IS-IS), and BGP.

- **iso**—International Organization for Standardization (ISO). Configured on the logical interface for IS-IS traffic.

- **mlfr-uni-nni**—Multilink Frame Relay (MLFR) FRF.16 user-to-network network-to-network (UNI NNI). Configured on the logical interface for link services bundling.

- **mlfr-end-to-end**—Multilink Frame Relay end-to-end. Configured on the logical interface for multilink bundling.

- **mlppp**—Multilink Point-to-Point Protocol (MLPPP). Configured on the logical interface for multilink bundling.

- **mpls**—Multiprotocol Label Switching (MPLS). Configured on the logical interface for participation in an MPLS path.

- **pppoe**—Point-to-Point Protocol over Ethernet (PPPoE). Configured on Ethernet interfaces enabled to support multiple protocol families.

- **tcc**—Translational cross-connect (TCC). Configured on the logical interface of TCC physical interfaces.

- **tnp**—Trivial Network Protocol (TNP). Used to communicate between the Routing Engine and the router’s packet forwarding components. The Junos OS automatically configures this protocol family on the router’s internal interfaces only.

- **vpls**—Virtual private LAN service (VPLS). Configured on the logical interface on which you configure VPLS.

### RPF Failures Field

For the logical interface, the **RPF Failures** field provides information about the amount of incoming traffic (in packets and bytes) that failed a unicast reverse path forwarding (RPF) check on a particular interface. The format is **RPF Failures: Packets: xx, Bytes: yy**.

For example:

```
RPF Failures: Packets: 0, Bytes: 0
```

### Source Class Field

For the logical interface, the **Source class** field provides the names of source class usage (SCU) counters per family and per class for a particular interface. The counters display packets and bytes arriving from designated user-selected prefixes. For example:

<table>
<thead>
<tr>
<th>Source class</th>
<th>Packets (packet-per-second)</th>
<th>Bytes (bits-per-second)</th>
</tr>
</thead>
</table>
Improvements to Interface Transmit Statistics Reporting

The offered load on an interface can be defined as the amount of data the interface is capable of transmitting during a given time period. The actual traffic that goes out of the interface is the transmitted load. However, when outgoing interfaces are oversubscribed, there could be traffic drops in the schedulers attached to the outgoing interfaces. Hence, the offered load is not always the same as the actual transmitted load because the offered load calculation does not take into account possible packet drop or traffic loss.

On MX Series routers, the logical interface-level statistics show the offered load, which is often different from the actual transmitted load. To address this limitation, Junos OS introduces a new configuration option in Release 11.4 R3 and later. The new configuration option, `interface-transmit-statistics`, at the `[edit interface interface-name]` hierarchy level, enables you to configure Junos OS to accurately capture and report the transmitted load on interfaces.

When the `interface-transmit-statistics` statement is included at the `[edit interface interface-name]` hierarchy level, the following operational mode commands report the actual transmitted load:

- `show interface interface-name <detail | extensive>`
- `monitor interface interface-name`
- `show snmp mib get objectID.ifIndex`

The `show interface interface-name` command also shows whether the `interface-transmit-statistics` configuration is enabled or disabled on the interface.

```
Release Information

Command introduced before Junos OS Release 7.4 for Gigabit interfaces.
Command introduced in Junos OS Release 8.0 for 10 Gigabit interfaces.
Command modified in Junos OS Release 9.5 for SRX Series devices.
Command introduced in Junos OS Release 18.1 for Gigabit interfaces.
Command modified in Junos OS Release 19.3R1 for MX Series Routers.

Starting in Junos OS Release 19.3R1, Output fields **ifindex** and **speed** is modified in the **show interfaces interface name extensive** command, on all MX Series routers.

- The default behavior of WAN-PHY interface remains the same. The new **precise-bandwidth** option reflects the new speed (9.294Gbps) configured on the supported line cards.
- The WAN-PHY framing mode is supported only on MPC5E and MPC6E line cards.

Command modified in Junos OS Release 19.3R1 for vSRX and vSRX 3.0 platforms to support 1G, 10G, 40G, and 100G Gigabit Ethernet interfaces, for performing CoS operations and to provide better bandwidth for processing traffic during congestion using variant speeds.

Description

Display status information about the specified Gigabit Ethernet interface.

(M320, M120, MX Series, and T Series routers only) Display status information about the specified 10-Gigabit Ethernet interface.

Display the IPv6 interface traffic statistics about the specified Gigabit Ethernet interface for MX series routers. The input and output bytes (bps) and packets (pps) rates are not displayed for IFD and local traffic.

Display status information and statistics about interfaces on SRX Series, vSRX, and vSRX 3.0 platforms running Junos OS.

**NOTE:** On SRX Series appliances, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

Starting in Junos OS Release 18.4R1, Output fields **Next-hop** and **vpls-status** is displayed in the **show interfaces interface name detail** command, only for Layer 2 protocols on MX480 routers.

Options

For Gigabit interfaces:

**ge-fpc/pic/port**—Display standard information about the specified Gigabit Ethernet interface.

Starting in Junos OS Release 19.3R1, on vSRX and vSRX 3.0, this interface can be configured with different speed rates of 1G, 10G, 40G, and 100G. This speed is applied for performing CoS operations and to provide better bandwidth for processing traffic during congestion.
NOTE: Interfaces with different speeds are named uniformly with `ge-0/0/x` for backward compatibility. Use the `show interfaces` command to view the interface speeds.

brief | detail | extensive | terse—(Optional) Display the specified level of output.
descriptions—(Optional) Display interface description strings.
media—(Optional) Display media-specific information about network interfaces.
snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.
statistics—(Optional) Display static interface statistics.

For 10 Gigabit interfaces:

`xe-fpc/pic/port`—Display standard information about the specified 10-Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.
descriptions—(Optional) Display interface description strings.
media—(Optional) Display media-specific information about network interfaces.
snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.
statistics—(Optional) Display static interface statistics.

For SRX interfaces:

- interface-name—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
  - at-pim/0/port—ATM-over-ADSL or ATM-over-SHDSL interface.
  - cel-pim/0/ port—Channelized E1 interface.
  - cl-0/0/8—3G wireless modem interface for SRX320 devices.
  - ct1-pim/0/port—Channelized T1 interface.
  - dl0—Dialer Interface for initiating ISDN and USB modem connections.
  - e1-pim/0/port—E1 interface.
  - e3-pim/0/port—E3 interface.
  - fe-pim/0/port—Fast Ethernet interface.
  - ge-pim/0/port—Gigabit Ethernet interface.
Starting in Junos OS Release 19.3R1, on vSRX and vSRX 3.0, this interface supports different speed of 1G, 10G, 40G, and 100G. You can configure CoS on these interfaces. This speed is applied for performing CoS operations and to provide better bandwidth for processing traffic during congestion.

- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
  - **at-pim/0/port**—ATM-over-ADSL or ATM-over-SHDSL interface.
  - **cel-pim/0/port**—Channelized E1 interface.
  - **cl0/0/8**—3G wireless modem interface for SRX320 devices.
  - **ct1-pim/0/port**—Channelized T1 interface.
  - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
  - **e1-pim/0/port**—E1 interface.
  - **e3-pim/0/port**—E3 interface.
  - **fe-pim/0/port**—Fast Ethernet interface.
  - **ge-pim/0/port**—Gigabit Ethernet interface.

Additional Information

In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.

Output Fields  
Table 30 on page 1166 describes the output fields for the show interfaces (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see Table 31 on page 1195.

<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input errors</strong></td>
<td>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Framing errors</strong>—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Runts</strong>—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Policed discards</strong>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L3 incompletes</strong>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code> statement.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 channel errors</strong>—Number of times the software did not find a valid logical interface for an incoming frame.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 mismatch timeouts</strong>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO errors</strong>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
</tbody>
</table>
### Table 30: show interfaces (Gigabit Ethernet) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td><strong>Carrier transitions</strong>—Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <strong>Drops</strong> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Collisions</strong>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number must always be 0. If it is nonzero, there is a software bug.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Aged packets</strong>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>FIFO errors</strong>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>HS link CRC errors</strong>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>MTU errors</strong>—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td><strong>Egress queues</strong></td>
<td>Total number of egress queues supported on the specified interface.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>

**NOTE:** In DPCs that are not of the enhanced type, such as DPC 40x1GE R, DPCE 20x1GE + 2x10GE R, or DPCE 40x1GE R, you might notice a discrepancy in the output of the `show interfaces` command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs.
### Table 30: show interfaces (Gigabit Ethernet) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Queue counters (Egress)</strong></td>
<td>CoS queue number and its associated user-configured forwarding class name. Queued packets—Number of queued packets. Transmitted packets—Number of transmitted packets. Dropped packets—Number of packets dropped by the ASIC’s RED mechanism.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>Ingress queues</strong></td>
<td>Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.</td>
<td>extensive</td>
</tr>
<tr>
<td><strong>Queue counters (Ingress)</strong></td>
<td>CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. Queued packets—Number of queued packets. Transmitted packets—Number of transmitted packets. Dropped packets—Number of packets dropped by the ASIC’s RED mechanism.</td>
<td>extensive</td>
</tr>
<tr>
<td><strong>Active alarms and Active defects</strong></td>
<td>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link. None—There are no active defects or alarms. Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td><strong>Interface transmit statistics</strong></td>
<td>(On MX Series devices) Status of the interface-transmit-statistics configuration: Enabled or Disabled. Enabled—When the interface-transmit-statistics statement is included in the configuration. If this is configured, the interface statistics show the actual transmitted load on the interface. Disabled—When the interface-transmit-statistics statement is not included in the configuration. If this is not configured, the interface statistics show the offered load on the interface.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>OTN FEC statistics</strong></td>
<td>The forward error correction (FEC) counters provide the following statistics: Corrected Errors—Count of corrected errors in the last second. Corrected Error Ratio—Corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>
### Table 30: show interfaces (Gigabit Ethernet) Output Fields (continued)

<table>
<thead>

<tr>
<td>PCS statistics</td>
<td>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>• Bit errors—Number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Errored blocks—Number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.</td>
<td></td>
</tr>
<tr>
<td>Link Degrade</td>
<td>Shows the link degrade status of the physical link and the estimated bit error rates (BERs). This field is available only for the PICs supporting the physical link monitoring feature.</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>• Link Monitoring—Indicates if physical link degrade monitoring is enabled on the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Enable—Indicates that link downgrade monitoring has been enabled (using the link-degrade-monitor statement) on the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Disable—Indicates that link degrade monitoring has not been enabled on the interface. If link degrade monitoring has not been enabled, the output does not show any related information, such as BER values and thresholds.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Link Degrade Set Threshold—The BER threshold value at which the link is considered degraded and a corrective action is triggered.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Link Degrade Clear Threshold—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Estimated BER—The estimated bit error rate.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Link-degrade event—Shows link degrade event information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Seconds—Time (in seconds) elapsed after a link degrade event occurred.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Count—The number of link degrade events recorded.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• State—Shows the link degrade status (example: Defect Active).</td>
<td></td>

<tbody>
<tr>
<td>MAC statistics</td>
<td><strong>Receive and Transmit</strong> statistics reported by the PIC's MAC subsystem, including the following:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Total octets and total packets</strong>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <code>show interfaces</code> command.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Unicast packets, Broadcast packets, and Multicast packets</strong>—Number of unicast, broadcast, and multicast packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>CRC/Align errors</strong>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO error</strong>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC control frames</strong>—Number of MAC control frames.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC pause frames</strong>—Number of MAC control frames with pause operational code.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Oversized frames</strong>—There are two possible conditions regarding the number of oversized frames:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Packet length exceeds interface MTU, or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Packet length exceeds MRU</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Jabber frames</strong>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Fragment frames</strong>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>VLAN tagged frames</strong>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the VLAN tagged frames field displays 0 when the <code>show interfaces</code> command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Code violations</strong>—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”</td>
<td></td>
</tr>
</tbody>
</table>

Table 30: show interfaces (Gigabit Ethernet) Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter statistics</td>
<td><strong>Receive</strong> and <strong>Transmit</strong> statistics reported by the PIC’s MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet’s source and destination MAC addresses to determine whether the packet may enter the system or be rejected.</td>
<td></td>
</tr>
</tbody>
</table>

  - **Input packet count**—Number of packets received from the MAC hardware that the filter processed.
  - **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.
  - **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting).
  - **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field must increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.
  - **Output packet count**—Number of packets that the filter has given to the MAC hardware.
  - **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.
  - **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field must not increment.
  - **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.

<table>

<tr>
<td>• Flow control—Types of flow control supported by the local device. For Gigabit Ethernet interfaces, advertised capabilities are Symmetric/Asymmetric (local device supports PAUSE on receive and transmit or only PAUSE on receive) and None (local device does not support flow control). Depending on the result of the negotiation with the link partner, local resolution flow control type will display Symmetric (local device supports PAUSE on receive and transmit), Asymmetric (local device supports PAUSE on receive), and None (local device does not support flow control).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Received path trace, Transmitted path trace**

(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.

**Packet Forwarding Engine configuration**

Information about the configuration of the Packet Forwarding Engine:

• Destination slot—FPC slot number.

</tbody>
</table>
### Remote-fault

(Gigabit Ethernet interfaces) Remote fault status:

- **Online**—Autonegotiation is manually configured as online.
- **Offline**—Autonegotiation is manually configured as offline.

### Device flags

Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1152.

### Interface flags

Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1152.

### Link flags

Information about the link. Possible values are described in the “Links Flags” section under “Common Output Fields Description” on page 1152.

### Wavelength

(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).

### Frequency

(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).

### CoS queues

Number of CoS queues configured.

### Schedulers

(Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.

### Hold-times

Current interface hold-time up and hold-time down, in milliseconds.

### Current address

Configured MAC address.

### Hardware address

Hardware MAC address.

### Last flapped

Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago). For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).

### Input Rate

Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.

### Output Rate

Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.

### Statistics last cleared

Time when the statistics for the interface were last set to zero.

### Egress account overhead

Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.

### Ingress account overhead

Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.
<table>
<thead>

<tr>
<td>• Drops</td>
<td>Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
</tr>
<tr>
<td>• Framing errors</td>
<td>Number of packets received with an invalid frame checksum (FCS).</td>
</tr>
<tr>
<td>• Runts</td>
<td>Number of frames received that are smaller than the runt threshold.</td>
</tr>
<tr>
<td>• Policed discards</td>
<td>Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
</tr>
<tr>
<td>• L3 incompletes</td>
<td>Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code> statement.</td>
</tr>
<tr>
<td>• L2 channel errors</td>
<td>Number of times the software did not find a valid logical interface for an incoming frame.</td>
</tr>
<tr>
<td>• L2 mismatch timeouts</td>
<td>Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
</tr>
<tr>
<td>• FIFO errors</td>
<td>Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
</tr>
<tr>
<td>• Resource errors</td>
<td>Sum of transmit drops.</td>
</tr>
</tbody>
</table>
Output errors

Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:

- **Carrier transitions**—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.
- **Errors**—Sum of the outgoing frame aborts and FCS errors.
- **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.
- **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.
- **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.
- **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.
- **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.
- **MTU errors**—Number of packets whose size exceeded the MTU of the interface.
- **Resource errors**—Sum of transmit drops.

Egress queues

Total number of egress queues supported on the specified interface.

NOTE: In DPCs that are not of the enhanced type, such as DPC 40x1GE R, DPCE 20x1GE + 2x10GE R, or DPCE 40x1GE R, you might notice a discrepancy in the output of the `show interfaces` command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs.

Queue counters (Egress)

CoS queue number and its associated user-configured forwarding class name.

- **Queued packets**—Number of queued packets.
- **Transmitted packets**—Number of transmitted packets.
- **Dropped packets**—Number of packets dropped by the ASIC’s RED mechanism.

Ingress queues

Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.
<table>
<thead>

</tbody>
</table>

| Active alarms and Active defects | Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link. |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------|----------|
| • None                            | There are no active defects or alarms.                                                                            |          |
| • Link                            | Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. |          |

| OTN alarms | Active OTN alarms identified on the interface. | detail extensive |
| OTN defects | OTN defects received on the interface. | detail extensive |

<table>
<thead>

</table>
**OTN OC**

OTN OC defects triggered on the interface.

- **LOS**—OC Loss of Signal defect.
- **LOF**—OC Loss of Frame defect.
- **LOM**—OC Loss of Multiframe defect.
- **Wavelength Lock**—OC Wavelength Lock defect.

**OTN OTU**

OTN OTU defects detected on the interface

- **AIS**—OTN AIS alarm.
- **BDI**—OTN OTU BDI alarm.
- **IAE**—OTN OTU IAE alarm.
- **TTIM**—OTN OTU TTIM alarm.
- **SF**—OTN ODU bit error rate fault alarm.
- **SD**—OTN ODU bit error rate defect alarm.
- **TCA-ES**—OTN ODU ES threshold alarm.
- **TCA-SES**—OTN ODU SES threshold alarm.
- **TCA-UAS**—OTN ODU UAS threshold alarm.
- **TCA-BBE**—OTN ODU BBE threshold alarm.
- **BIP**—OTN ODU BIP threshold alarm.
- **BBE**—OTN OTU BBE threshold alarm.
- **ES**—OTN OTU ES threshold alarm.
- **SES**—OTN OTU SES threshold alarm.
- **UAS**—OTN OTU UAS threshold alarm.

**Received DAPI**

Destination Access Port Interface (DAPI) from which the packets were received.

**Received SAPI**

Source Access Port Interface (SAPI) from which the packets were received.

**Transmitted DAPI**

Destination Access Port Interface (DAPI) to which the packets were transmitted.

**Transmitted SAPI**

Source Access Port Interface (SAPI) to which the packets were transmitted.

**PCS statistics**

(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.

- **Bit errors**—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.
- **Errored blocks**—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.
### MAC statistics

**Receive and Transmit** statistics reported by the PIC’s MAC subsystem, including the following:

- **Total octets and total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.
- **Unicast packets, Broadcast packets, and Multicast packets**—Number of unicast, broadcast, and multicast packets.
- **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
- **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.
- **MAC control frames**—Number of MAC control frames.
- **MAC pause frames**—Number of MAC control frames with pause operational code.
- **Oversized frames**—Number of frames that exceed 1518 octets.
- **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.
- **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.
- **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.
- **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”

### OTN Received

| Overhead Bytes | APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08 | extensive |

### OTN Transmitted

| Overhead Bytes | APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08 | extensive |
Filter statistics

Receive and Transmit statistics reported by the PIC’s MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet’s source and destination MAC addresses to determine whether the packet should enter the system or be rejected.

- **Input packet count**—Number of packets received from the MAC hardware that the filter processed.
- **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.
- **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).
- **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.
- **Output packet count**—Number of packets that the filter has given to the MAC hardware.
- **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.
- **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.
- **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.

<table>
<thead>
<tr>
<th>PMA PHY</th>
<th>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Extensive</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Seconds</strong>—Number of seconds the defect has been active.</td>

<td><strong>State</strong>—State of the error. Any state other than <strong>OK</strong> indicates a problem.</td>
</tr>
</tbody>
</table>
### WIS section

(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:

- **Seconds**—Number of seconds the defect has been active.
- **Count**—Number of times that the defect has gone from inactive to active.
- **State**—State of the error. Any state other than **OK** indicates a problem.

Subfields are:

- **BIP-B1**—Bit interleaved parity for SONET section overhead
- **SEF**—Severely errored framing
- **LOL**—Loss of light
- **LOF**—Loss of frame
- **ES-S**—Errored seconds (section)
- **SES-S**—Severely errored seconds (section)
- **SEFS-S**—Severely errored framing seconds (section)

### WIS line

(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information.

- **Seconds**—Number of seconds the defect has been active.
- **Count**—Number of times that the defect has gone from inactive to active.
- **State**—State of the error. State other than **OK** indicates a problem.

Subfields are:

- **BIP-B2**—Bit interleaved parity for SONET line overhead
- **REI-L**—Remote error indication (near-end line)
- **RDI-L**—Remote defect indication (near-end line)
- **AIS-L**—Alarm indication signal (near-end line)
- **BERR-SF**—Bit error rate fault (signal failure)
- **BERR-SD**—Bit error rate defect (signal degradation)
- **ES-L**—Errored seconds (near-end line)
- **SES-L**—Severely errored seconds (near-end line)
- **UAS-L**—Unavailable seconds (near-end line)
- **ES-LFE**—Errored seconds (far-end line)
- **SES-LFE**—Severely errored seconds (far-end line)
- **UAS-LFE**—Unavailable seconds (far-end line)
active alarms and defects, plus counts of specific SONET errors with detailed information.

- **Seconds**—Number of seconds the defect has been active.
- **Count**—Number of times that the defect has gone from inactive to active.
- **State**—State of the error. Any state other than **OK** indicates a problem.

Subfields are:

- **BIP-B3**—Bit interleaved parity for SONET section overhead
- **REI-P**—Remote error indication
- **LOP-P**—Loss of pointer (path)
- **AIS-P**—Path alarm indication signal
- **RDI-P**—Path remote defect indication
- **UNEQ-P**—Path unequipped
- **PLM-P**—Path payload label mismatch
- **ES-P**—Errored seconds (near-end STS path)
- **SES-P**—Severely errored seconds (near-end STS path)
- **UAS-P**—Unavailable seconds (near-end STS path)
- **SES-PFE**—Severely errored seconds (far-end STS path)
- **UAS-PFE**—Unavailable seconds (far-end STS path)

### Autonegotiation information

Information about link autonegotiation.

- **Negotiation status:**
  - **Incomplete**—Ethernet interface has the speed or link mode configured.
  - **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
  - **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.

- **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.

- **Link partner:**
  - **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
  - **Flow control**—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is **None**. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
  - **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error, **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.

- **Local resolution**—Information from the link partner:
  - **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
  - **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.

</tbody>
</table>

| **IPv6 transit statistics** | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. | extensive |

| **Local statistics** | Number and rate of bytes and packets destined to the routing device. | extensive |
**Transit statistics**  Number and rate of bytes and packets transiting the switch.

**NOTE:** For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the *Output bytes* and *Output packets* interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.

| **Generation** | Unique number for use by Juniper Networks technical support only. | detail extensive |
| **Route Table** | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0. | detail extensive none |

| **Destination** | IP address of the remote side of the connection. | detail extensive none |
| **Local** | IP address of the logical interface. | detail extensive none |
| **Broadcast** | Broadcast address of the logical interface. | detail extensive none |
| **Generation** | Unique number for use by Juniper Networks technical support only. | detail extensive |
For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. The following table describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). The ge-0/3/0 interface is the inbound physical interface, and the ge-0/0/0 interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit .50 (VLAN 50).

Table 32: show interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input errors</strong></td>
<td>Input errors on the interface.</td>
<td>Extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager ASIC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Framing errors</strong>—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Runts</strong>—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Policed discards</strong>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L3 incompleteds</strong>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incompelt errors can be ignored by configuring the <code>ignore-l3-incompletes</code> .</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 channel errors</strong>—Number of times the software did not find a valid logical interface for an incoming frame.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 mismatch timeouts</strong>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO errors</strong>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td><strong>Output errors</strong></td>
<td>Output errors on the interface.</td>
<td>Extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Carrier transitions</strong>—Number of times the interface has gone from down to up.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Collisions</strong>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation; therefore, for Gigabit Ethernet PICs, this number must always remain 0. If it is nonzero, there is a software bug.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Aged packets</strong>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO errors</strong>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>HS link CRC errors</strong>—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MTU errors</strong>—Number of packets whose size exceeded the MTU of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
</tbody>
</table>

<td>Number of MAC control frames.</td>
<td></td>
</tr>
<tr>
<td>- MAC pause frames</td>
<td>Number of MAC control frames with pause operational code.</td>
<td></td>
</tr>
<tr>
<td>- Oversized frames</td>
<td>There are two possible conditions regarding the number of oversized frames:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Packet length exceeds 1518 octets, or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Packet length exceeds MRU</td>
<td></td>
</tr>
<tr>
<td>- Jabber frames</td>
<td>Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</td>
<td></td>
</tr>
<tr>
<td>- Fragment frames</td>
<td>Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</td>
<td></td>
</tr>
<tr>
<td>- VLAN tagged frames</td>
<td>Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</td>
<td></td>
</tr>
<tr>
<td>- Code violations</td>
<td>Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”</td>
<td></td>
</tr>
</tbody>
</table>
### Table 32: show interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter statistics</td>
<td><strong>Receive</strong> and <strong>Transmit</strong> statistics reported by the PIC’s MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet’s source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Input packet count</strong>—Number of packets received from the MAC hardware that the filter processed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input packet rejects</strong>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input DA rejects</strong>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Input SA rejects</strong>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet count</strong>—Number of packets that the filter has given to the MAC hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet pad count</strong>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Output packet error count</strong>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>CAM destination filters, CAM source filters</strong>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</td>
<td></td>
</tr>
<tr>
<td>Autonegotiation information</td>
<td>Information about link autonegotiation.</td>
<td>extensive</td>

</tr>
</tbody>
</table>

**NOTE:** For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the *Output bytes* and *Output packets* interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.

| Security                | Security zones that interface belongs to.                                        | extensive       |
| Flow Input statistics   | Statistics on packets received by flow module.                                    | extensive       |
| Flow Output statistics  | Statistics on packets sent by flow module.                                        | extensive       |
| Flow error statistics   | Statistics on errors in the flow module.                                          | extensive       |
| (Packets dropped due to)|                                                                                   |                 |

   Input rate : 0 bps (0 pps)
   Output rate : 0 bps (0 pps)
   Active alarms : None
   Active defects : None

Logical interface ge-2/2/2.0 (Index 82) (SNMP ifIndex 219)
   Flags: Up SNMP-Traps 0x4004000 Encapsulation: ENET2
   Input packets : 10232
   Output packets: 10294
```
The document contains information about network interfaces and their configurations. It includes details such as protocol information, MTU settings, link status, and interface statistics. Here's a summary of the information presented:

**Protocols and MTUs**
- **inet**: MTU 1500, Flags: Sendbcast-pkt-to-re
- **inet6**: MTU 1500, Max nh cache: 4, New hold nh limit: 100000, Curr nh cnt: 4, Curr new hold cnt: 0
- **multiservice**: MTU: Unlimited, Flags: Is-Primary

**Interface Status**
- **et-3/0/0**: Physical interface is Down, Enabled, Physical link is Down
- **ge-2/1/2**: Physical interface is Up, Enabled

**Statistics**
- **PCS statistics**:
  - Bit errors: 0
  - Errored blocks: 0
- **Link Degradation**:
  - Link Monitoring: Enable
  - Link Degradation Set Threshold: 1E-7
  - Link Degradation Clear Threshold: 1E-12
  - Estimated BER: 1E-7
  - Link-degrade event: 782 seconds

**Configuration**
- **show interfaces**
- **show interfaceset-3/0/0**
- **show interfaces ge-2/1/2 extensive | match "output|interface"**

The document provides a detailed view of network interface settings and their statuses, which is crucial for understanding network performance and diagnostics.
user@host> show interfaces ge-5/2/0.0 statistics detail

NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface
egress statistics displayed in the `show interfaces` command output might not accurately
reflect the traffic on the wire when output shaping is applied. Traffic management output
shaping might drop packets after they are tallied by the interface counters. For detailed
information, see the description of the logical interface Transit statistics fields in
Table 30 on page 1166.

show interfaces (Gigabit Ethernet Unnumbered Interface)

user@host> show interfaces ge-3/2/0
Physical interface: ge-3/2/0, Enabled, Physical link is Up
  Interface index: 148, SNMP ifIndex: 50
  Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online
  Device flags: Present Running
  Interface flags: SNMP-Traps Internal: 0x4000
  Link flags: None
  CoS queues: 8 supported, 4 maximum usable queues
  Current address: 00:00:5e:00:53:f8, Hardware address: 00:00:5e:00:53:f8
  Last flapped: 2006-10-27 04:42:23 PDT (08:01:52 ago)
  Input rate: 0 bps (0 pps)
  Output rate: 624 bps (1 pps)
  Active alarms: None
  Active defects: None

Logical interface ge-3/2/0.0 (Index 67) (SNMP ifIndex 85)
  Flags: SNMP-Traps Encapsulation: ENET2
  Input packets: 0
  Output packets: 6
  Protocol inet, MTU: 1500
  Flags: Unnumbered
  Donor interface: lo0.0 (Index 64)
  Preferred source address: 203.0.113.22

show interfaces (ACI Interface Set Configured)

user@host> show interfaces ge-1/0/0.4001
Logical interface ge-1/0/0.4001 (Index 340) (SNMP ifIndex 548)
  Flags: SNMP-Traps Encapsulation: PPP-over-
  Ethernet
  ACI VLAN:
  Dynamic Profile: aci-vlan-set-profile
  PPPoE:
show interfaces (ALI Interface Set)

user@host> show interfaces ge-1/0/0.10

Logical interface ge-1/0/0.10 (Index 346) (SNMP ifIndex 554) (Generation 155)
Flags: Up SNMP-Traps 0x4000 VLAN-Tag [ 0x8100.10 ] Encapsulation: ENET2

Dynamic Profile: ali-set-profile
Circuit-id Remote-id Accept-no-ids

PPPoE:
Dynamic Profile: ali-vlan-pppoe-profile,
Service Name Table: None,
Max Sessions: 32000, Max Sessions VSA Ignore: Off,
Duplicate Protection: On, Short Cycle Protection: Off,
Direct Connect: Off,
AC Name: nbc
Input packets : 9
Output packets: 8
Protocol multiservice, MTU: Unlimited

**show security zones (SRX devices)**

```
user@host> show security zones

Functional zone: management
   Description: This is the management zone.
   Policy configurable: No
   Interfaces bound: 1
   Interfaces:
      ge-0/0/0.0

Security zone: Host
   Description: This is the host zone.
   Send reset for non-SYN session TCP packets: Off
   Policy configurable: Yes
   Interfaces bound: 1
   Interfaces:
      fxp0.0

Security zone: abc
   Description: This is the abc zone.
   Send reset for non-SYN session TCP packets: Off
   Policy configurable: Yes
   Interfaces bound: 1
   Interfaces:
      ge-0/0/1.0

Security zone: def
   Description: This is the def zone.
   Send reset for non-SYN session TCP packets: Off
   Policy configurable: Yes
   Interfaces bound: 1
   Interfaces:
      ge-0/0/2.0
```
**show interfaces (ATM)**

**Syntax**

```
show interfaces atm/fpc/pic/port
<br|de|ext|te>
<des>
<me>
<snmp-index snmp-index>
<st>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**

(M Series and T Series routers only) Display status information about the specified ATM interface.

**Options**

- `at-fpc/pic/port`—Display standard information about the specified ATM interface.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about network interfaces.
- `snmp-index snmp-index`—(Optional) Display the SNMP index of the interface.

**Required Privilege Level**

`view`

**List of Sample Output**

- show interfaces (ATM, IMA Group) on page 1259
- show interfaces extensive (ATM IMA Group) on page 1260
- show interfaces (ATM1, SONET Mode) on page 1261
- show interfaces brief (ATM1, SONET Mode) on page 1262
- show interfaces detail (ATM1, SONET Mode) on page 1262
- show interfaces extensive (ATM1, SONET Mode) on page 1263
- show interfaces (ATM2, SDH Mode) on page 1266
- show interfaces brief (ATM2, SDH Mode) on page 1266
- show interfaces detail (ATM2, SDH Mode) on page 1267
- show interfaces extensive (ATM2, SDH Mode) on page 1269
- show interfaces (ATM2, SONET Mode) on page 1271
- show interfaces brief (ATM2, SONET Mode) on page 1273
- show interfaces detail (ATM2, SONET Mode) on page 1273
- show interfaces extensive (ATM2, SONET Mode) on page 1276

**Output Fields**

Table 33 on page 1245 lists the output fields for the `show interfaces` (ATM) command. Output fields are listed in the approximate order in which they appear.
### Table 33: ATM show interfaces Output Fields

<table>
<thead>
<tr>

<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the incoming frame aborts and frame check sequence (FCS)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the input queue of the I/O Manager</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ASIC. If the interface is saturated, this number increments once for every</td>
<td></td>
</tr>
<tr>
<td></td>
<td>packet that is dropped by the ASIC’s random early detection (RED) mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Invalid VCs</strong>—Number of cells that arrived for a nonexistent VC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Framing errors</strong>—Sum of AAL5 packets that have FCS errors, reassembly</td>
<td></td>
</tr>
<tr>
<td></td>
<td>timeout errors, and length errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Policed discards</strong>—Number of frames that the incoming packet match code</td>
<td></td>
</tr>
<tr>
<td></td>
<td>discarded because they were not recognized or not of interest. Usually, this</td>
<td></td>
</tr>
<tr>
<td></td>
<td>field reports protocols that the Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L3 incompletes</strong>—Number of incoming packets discarded because they failed</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with</td>
<td></td>
</tr>
<tr>
<td></td>
<td>less than 20 bytes of available IP header is discarded.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 channel errors</strong>—Number of times the software did not find a valid logical</td>
<td></td>
</tr>
<tr>
<td></td>
<td>interface for an incoming frame.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>L2 mismatch timeouts</strong>—Number of malformed or short packets that caused the</td>
<td></td>
</tr>
<tr>
<td></td>
<td>incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Resource errors</strong>—Sum of transmit drops.</td>
<td></td>
</tr>
</tbody>
</table>

| **Output errors** | Output errors on the interface. The following paragraphs explain the counters     | extensive       |
|                   | whose meaning might not be obvious:                                               |                 |
|                   | • **Carrier transitions**—Number of times the interface has gone from down to up. |                 |
|                   |   This number does not normally increment quickly, increasing only when the       |                 |
|                   |   cable is unplugged, the far-end system is powered down and up, or another       |                 |
|                   |   problem occurs. If the number of carrier transitions increments quickly,        |                 |
|                   |   increasing only when the cable is unplugged, the far-end system is powered     |                 |
|                   |   down and then up, or another problem occurs. If it increments quickly (perhaps   |                 |
|                   |   once every 10 seconds), the cable, the far-end system, or the PIC or PIM is     |                 |
|                   |   malfunctioning.                                                                  |                 |
|                   | • **Errors**—Sum of the outgoing frame aborts and FCS errors.                     |                 |
|                   | • **Drops**—Number of packets dropped by the output queue of the I/O Manager      |                 |
|                   |   ASIC. If the interface is saturated, this number increments once for every      |                 |
|                   |   packet that is dropped by the ASIC’s RED mechanism.                             |                 |
|                   | • **Aged packets**—Number of packets that remained so long in shared packet      |                 |
|                   |   SDRAM that the system automatically purged them. The value in this field        |                 |
|                   |   should never increment. If it does, it is most likely a software bug or possibly|                 |
|                   |   malfunctioning hardware.                                                        |                 |
|                   | • **MTU errors**—Number of packets larger than the MTU threshold.                 |                 |

### Table 33: ATM show interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATM Statistics</td>
<td>ATM statistics for the interface:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Uncorrectable HCS errors—Number of cells dropped because the cell delineation failed. These errors most likely indicate that a SONET/SDH layer problem has occurred.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Correctable HCS errors—Number of correctable HCS errors that occurred. The cell delineation process can recover from these errors and locate the ATM cell boundary, although the framing process is not quite stable. The ATM cell is not dropped. This counter increases when the cell delineation process changes its state from present to sync (for example, when a cable is plugged into the interface).</td>
<td></td>
</tr>
</tbody>
</table>

The following error statistics are from the framer:

- **Tx cell FIFO overruns**—Number of overruns in the transmit FIFO.
- **Rx cell FIFO overruns**—Number of overruns in the receive FIFO.
- **Rx cell FIFO underruns**—Number of underruns in the receive FIFO.
- **Input cell count**—Number of ATM cells received by the interface (not including idle cells).
- **Output cell count**—Number of ATM cells transmitted by the interface (including idle cells).
- **Output idle cell count**—Number of idle cells sent by the port. When ATM has nothing to send, it sends idle cells to fill the timeslot.
- **Output VC queue drops**—Number of packets dropped by a port on the PIC. Packets are dropped because of queue limits on the VC.

The following error statistics are from the SAR:

- **Input no buffers**—Number of AAL5 packets dropped because no channel blocks or buffers were available to handle them.
- **Input length errors**—Number of AAL5 packets dropped because their length was incorrect. Usually, these errors occur because a cell has been corrupted or lost, or because the length field was corrupted. They can also mean the AAL5 length field was zero.
- **Input timeouts**—Number of AAL5 packets dropped because of a reassembly timeout.
- **Input invalid VCs**—Number of AAL5 packets dropped because the header was unrecognized (because the VC was not correct or not configured).
- **Input bad CRCs**—Number of AAL5 packets dropped because of frame check sequence errors.
- **Input OAM cell no buffers**—Number of received OAM cells or raw cells dropped because no buffers were available to handle them.
- **L2 circuit out-of-sequence packets**—(Layer 2 AAL5 mode) Number of AAL5 packets that are out of sequential order.
- **Denied packets count**—The number of packets dropped due to VLAN priority deny packets or due to an error forwarding configuration that might cause a negative frame length, that is, the stripping size is larger than the packet size.
