YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Table of Contents

	About the Documentation	lvii
	Documentation and Release Notes	lvii
	Supported Platforms	lvii
	Using the Examples in This Manual	lvii
	Merging a Full Example	lviii
	Merging a Snippet	lviii
	Documentation Conventions	lix
	Documentation Feedback	lx
	Requesting Technical Support	lxi
	Self-Help Online Tools and Resources	lxi
	Opening a Case with JTAC	lxii

Administration	446
Operational Commands: CLI Interface	446
set cli complete-on-space	447
set cli directory	448
set cli idle-timeout	449
set cli prompt	450
set cli restart-on-upgrade	451
set cli screen-length	452
set cli screen-width	453
set cli terminal	454

set cli timestamp	455
show cli	456
show cli authorization	458
show cli directory	462
show cli history	463
start shell	464
Operational Commands: Software Installation	465
request system license add	466
request system license delete	467
request system license save	468
request system reboot	469
request system snapshot	474
request system software add	481
request system software delete	489
request system software rollback	492
request system software validate	496
request system zeroize	499
show system boot-messages	504
show system license	511
show system snapshot	514
Operational Commands: System Monitoring	516
show chassis alarms	517
show chassis environment	528
show chassis environment cb	578
show chassis environment fpc	595
show chassis environment pem	620
show chassis environment routing-engine	628
show chassis fan	633
show chassis hardware	644
show chassis location	750
show chassis pic	754
show chassis routing-engine	767
show chassis temperature-thresholds	787
show log	804
show system alarms	807
show system processes	808
show system statistics	835
show system uptime	870
Chapter 5 System Services	875
Overview	875
DHCP Local Server	875
Extended DHCP Local Server Overview	876
DHCPv6 Local Server Overview	880
DHCP Local Server Handling of Client Information Request Messages	881
DHCP Duplicate Client Differentiation Using Client Subinterface Overview	882
Group-Specific DHCP Local Server Options	883

Understanding Dynamic Reconfiguration of Extended DHCP Local Server Clients	883
DHCP Snooping Support	887
DHCP Auto Logout Overview	888
Address-Assignment Pools Overview	890
Use of DHCP Option 50 and DHCPv6 IA_NA Option to Request a Specific IP Address	891
Multiple Address Assignment for DHCPv6 Clients	891
Centrally Configured Opaque DHCP Options	893
Graceful Routing Engine Switchover	897
Port Number Requirements for DHCP Firewall Filters	898
DHCP Relay Agent	899
Extended DHCP Relay Agent Overview	900
DHCP Relay Proxy Overview	903
DHCPv6 Relay Agent Overview	905
DHCP Duplicate Client Differentiation Using Client Subinterface Overview	906
Group-Specific DHCP Relay Options	906
DHCP Snooping Support	907
DHCP Auto Logout Overview	908
Graceful Routing Engine Switchover	910
Port Number Requirements for DHCP Firewall Filters	911
Configuration	911
DHCP Local Server Examples	912
Example: Minimum Extended DHCP Local Server Configuration	912
Example: Extended DHCP Local Server Configuration with Optional Pool Matching	912
Example: Configuring Group Liveness Detection for DHCP Local Server Clients	913
DHCP Relay Agent Examples	916
Example: Minimum DHCP Relay Agent Configuration	916
Example: Configuring DHCP Relay Agent Selective Traffic Processing Based on DHCP Option Strings	917
Example: Configuring DHCP Snooping Support for DHCP Relay Agent	921
Configuration Tasks for DHCP Local Server	923
Using External AAA Authentication Services with DHCP	923
Guidelines for Configuring Support for DHCP Duplicate Clients	925
Configuring DHCP Duplicate Client Support	925
Grouping Interfaces with Common DHCP Configurations	926
Guidelines for Configuring Interface Ranges	927
Overriding Default DHCP Local Server Configuration Settings	928
Specifying the Maximum Number of DHCP Clients Per Interface	929
Disabling ARP Table Population	930
Automatically Logging Out DHCP Clients	932
Enabling Processing of Client Information Requests	933
Specifying the Delegated Address Pool for IPv6 Prefix Assignment	934
Enabling DHCPv6 Rapid Commit Support	935
Deleting DHCP Local Server and DHCP Relay Override Settings	935

Configuring Extended DHCP Local Server Dynamic Client Reconfiguration	936
Configuring Dynamic Reconfiguration Attempts for DHCP Clients	937
Configuring Deletion of the Client When Dynamic Reconfiguration Fails	938
Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect	938
Configuring a Token for DHCP Local Server Authentication	939
Preventing Binding of Clients That Do Not Support Reconfigure Messages	939
Requesting DHCP Local Server to Initiate Reconfiguration of Client Bindings	940
Configuring Detection of DHCP Local Server Client Connectivity	941
Attaching Dynamic Profiles to DHCP Subscriber Interfaces or DHCP Client Interfaces	942
Configuring DHCP Snooped Packets Forwarding Support for DHCP Local Server	944
Configuring Passwords for Usernames	945
Creating Unique Usernames for DHCP Clients	946
Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use	949
Configuration Tasks for DHCP Relay Agent	950
Using External AAA Authentication Services with DHCP	951
Configuring DHCP Duplicate Client Support	952
Grouping Interfaces with Common DHCP Configurations	953
Guidelines for Configuring Interface Ranges	954
Overriding the Default DHCP Relay Configuration Settings	955
Overwriting giaddr Information	957
Replacing the DHCP Relay Request and Release Packet Source Address	957
Overriding Option 82 Information	957
Using Layer 2 Unicast Transmission for DHCP Packets	958
Trusting Option 82 Information	958
Disabling ARP Table Population	959
Specifying the Maximum Number of DHCP Clients Per Interface	960
Automatically Logging Out DHCP Clients	961
DHCP Relay Agent Option 82 Value for Auto Logout	962
Configuring DHCP Snooping for DHCP Relay Agent	963
Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent	964
Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent	969
Sending Release Messages When Clients Are Deleted	971
Disabling Automatic Binding of Stray DHCP Requests	972
Enabling and Disabling Insertion of Option 82 Information	973
Configuring Server Groups	976
Configuring Active Server Groups	977

Enabling DHCP Relay Proxy Mode	977
Attaching Dynamic Profiles to DHCP Subscriber Interfaces or DHCP Client Interfaces	978
Inserting DHCPv6 Interface-ID Option (Option 18) In DHCPv6 Packets	979
DHCP Liveness Detection Overview	980
Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity	981
Disabling DHCP Relay	983
DHCP Local Server Configuration Statements	983
[edit system] Hierarchy Level	983
attempts (DHCP Local Server)	999
authentication (DHCP Local Server)	1000
bfd	1001

Features

Class of Service	1263
Class of Service Overview and Examples	1263
Overview	1263
CoS Overview	1263
CoS Input and Output Configuration	1272

Packet Flow Through the CoS Process	1273
Configuration	1275
Configuration Statements	1275
Class of Service on Ethernet Interfaces	1311
Overview	1311
Class of Service for Ethernet	1311
Configuration	1312
Configuration Task	1312
Class of Service for MPLS	1317
Overview	1317
CoS for MPLS	1317
Configuration	1318
Configuration Task	1318
Classifying Packets by Behavior Aggregate	1319
Overview	1319
Behavior Aggregate Classifier	1320
BA Classifier Default Values	1324
Configuration	1330
Configuration Tasks for Classifiers	1330
Configuration Tasks for BA Classifiers	1338
Configuration Task for DSCP IPv6 Classifiers	1341
Configuration Tasks for MPLS EXP Classifiers	1341
Configuration Task for IEEE 802.1ad Classifiers	1346
Configuration Statements	1347
Defining Code-Point Aliases	1371
Overview	1371
Code-Point Alias	1372
Configuration	1375
Configuration Task	1375
Configuration Statements	1376
Classifying Packets Based on Various Packet Header Fields	1386
Overview	1386
Overview	1386
Configuration	1390
Configuration Tasks	1390
Examples	1393
Configuration Statements	1402
Tricolor Marking Policers	1440
Overview	1440
Tricolor Marking Policers	1440
Configuration	1447
Configuration Tasks for Tricolor Marking Policers	1447
Configuration Tasks for Packet Loss Priority	1460
Configuration Statements for Tricolor Marking Policers	1463

Forwarding Classes	1525
Overview	1525
Forwarding Classes	1525
Configuration	1530
Configuration Tasks	1530
Configuration Statements	1542
Forwarding Policy Options	1556
Overview	1556
Forwarding Policy	1557
Configuration	1557
Configuration Tasks	1557
Examples	1561
Configuration Statements	1565
Schedulers	1573
Overview	1573
Schedulers	1573
Configuration	1578
Configuration Tasks for Schedulers	1578
Configuration Tasks for Scheduler Maps	1613
Configuration Statements for Schedulers	1624
Queue-Level Bandwidth Sharing	1666
Overview	1666
Bandwidth Sharing	1666
Configuration	1667
Configuration Task	1667
Example	1668
RED Drop Profiles	1673
Overview	1674
RED Drop Profiles	1674
Configuration	1677
Configuration Tasks	1677
Examples	1679
Configuration Statements	1681
Rewriting Packet Header Information	1689
Overview	1689
Rewriting Packet Header Information	1689
Configuration	1692
Configuration Tasks for Applying Rewrite Rules	1692
Configuration Tasks for Rewriting Packet Header Information	1702
Example	1713
Configuration Statements	1714
Routing Engine Protocol Queue Assignments	1745
Overview	1745
Routing Engine Protocol Queue Assignments	1745
Configuration	1748
Configuration Statements	1748

	CoS for Tunnels	1765
	Overview	1765
	CoS for Tunnels	1765
	Configuration	1766
	Configuration Task	1766
	Examples	1767
	Configuration Statements	1770
Chapter 7	Device Security	1803
	Overview	1803
	Rate Limiting	1803
	Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages	1803
	Configuring the Junos OS ICMPv6 Rate Limit for ICMPv6 Routing Engine Messages	1803
	Configuration	1804
	Configuration Statements	1804
	[edit system] Hierarchy Level	1804
	icmpv4-rate-limit	1818
	icmpv6-rate-limit	1819
Chapter 8	Ethernet Switching	1821
	Overview	1821
	Bridging	1821
	Layer 2 VLANs Overview	1821
	Layer 2 Learning and Forwarding Overview	1822
	Layer 2 Learning and Forwarding for VLANs Overview	1822
	Layer 2 Learning and Forwarding for VLANs Acting as a Switch for a Layer 2 Trunk Port	1823
	Guidelines for Configuring VLAN Identifiers for VLANs and VPLS Routing Instances	1823
	MVRP	1824
	Understanding Multiple VLAN Registration Protocol (MVRP)	1824
	Proxy ARP	1826
	Restricted and Unrestricted Proxy ARP Overview	1827
	Configuration	1829
	Configuration Tasks	1829
	Configuring a VLAN	1829
	Configuring VLAN Identifiers for VLANs and VPLS Routing Instances	1830
	Configuring Integrated Routing and Bridging for VLANs	1835
	Configuring a Set of VLANs to Act as a Switch for a Layer 2 Trunk Port	1836
	Disabling MAC Learning for a VLAN or Logical Interface	1837
	Disabling MAC Learning for a Set of VLANs	1838
	Enabling MAC Accounting	1838

About the Documentation

- Documentation and Release Notes on page lvii
- Supported Platforms on page lvii
- Using the Examples in This Manual on page lvii
- Documentation Conventions on page lix
- Documentation Feedback on page lx
- Requesting Technical Support on page lxi

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

Supported Platforms

For the features described in this document, the following platforms are supported:

- EX Series

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

Documentation Conventions

Table 1 on page [lix](#) defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.

Table 2 on page [lix](#) defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> show chassis alarms No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> Introduces or emphasizes important new terms. Identifies guide names. Identifies RFC and Internet draft titles. 	<ul style="list-style-type: none"> A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS CLI User Guide</i> RFC 1997, <i>BGP Communities Attribute</i>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level. The console port is labeled CONSOLE.
< > (angle brackets)	Enclose optional keywords or variables.	stub <default-metric metric>;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (string1 string2 string3)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Enclose a variable for which you can substitute one or more values.	community name members [<i>community-ids</i>]
Indentation and braces ({ })	Identify a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> In the Logical Interfaces box, select All Interfaces. To cancel the configuration, click Cancel.
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can send your comments to techpubs-comments@juniper.net, or fill out the documentation feedback form at

<https://www.juniper.net/cgi-bin/docbugreport/> . If you are using e-mail, be sure to include the following information with your comments:

- Document or topic name
- URL or page number
- Software release version (if applicable)

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes: <http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://www.juniper.net/alerts/>
- Join and participate in the Juniper Networks Community Forum: <http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

CHAPTER 1

Software Overview

- [EX Series Switch Software Features Overview on page 63](#)

EX Series Switch Software Features Overview

This topic lists the Juniper Networks EX Series Ethernet Switches software features, the Juniper Networks Junos operating system (Junos OS) release in which they were introduced, and the first Junos OS release for each switch.

NOTE: For Virtual Chassis features, see *EX Series Virtual Chassis Software Features Overview*.

NOTE: In all tables in this topic, “N.S.” = “Not supported”, and “—” = “Not applicable”.

Table 6: Class-of-Service (CoS) Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Class of service (CoS)—Class-based queuing with prioritization, Layer 2 and Layer 3 classification, rewrite, and queuing; strict priority queuing on egress	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	See Table 6-3 for a list of EX9200 CoS features
CoS—DSCP, IEEE 802.1p, and IP precedence packet rewrites on RVIs or IRB interfaces	N.S.	9.5R1	11.3R1	N.S.	10.2R1	12.2R1	11.3R2	9.4R1	
CoS—Interface-specific classifiers on RVIs or IRB interfaces	N.S.	9.4R1	11.3R1	13.2X50 - D10	11.3R1	12.2R1	N.S.	10.2R1	
CoS—Multidestination	—	—	—	—	—	—	N.S.	9.5R1	
CoS—Per-interface classification	N.S.	9.3R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.2R1	
CoS support on link aggregation groups (LAGs)	10.1R1	9.2R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	9.4R1	
CoS support on RVIs or IRB interfaces	10.3R1	9.4R1	11.3R1	13.2X50 - D10 (classifiers only; rewrites N.S.)	10.4R1	12.2R1	N.S.	9.4R1	
DSCP setting on ingress interface	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R1	
Flexible CoS-outer 802.1p marking	N.S.	9.6R1	12.3R1	N.S.	12.1R1	12.2R1	N.S.	N.S.	
Interface-specific CoS rewrite rules	10.3R1	9.4R1	N.S.		11.2R1	12.2R1	N.S.	10.2R1	

Table 6: Class-of-Service (CoS) Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
				13.2X50 - D10 (for Layer 3 interfaces; IRB interfaces and Layer 3 sub-interfaces N.S.)					
Junos EZQoS for CoS	10.1R1	9.3R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Port shaping and queue shaping	10.1R1	9.3R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.1R1	
Re-marking of bridged packets	11.2R1	9.4R1	N.S.	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.2R1	
Shaped-deficit weighted round-robin (SDWRR)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Single-rate two-color marking	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	

Table 7: Class-of-Service (CoS) Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Assigning forwarding class and DSCP value for Routing Engine generated traffic	12.3R2
BA classification for VPLS based on IEEE 802.1p bits	12.3R2
Classification—Associate packets with CoS servicing levels. Types of classification: <ul style="list-style-type: none"> • Behavior aggregate (BA)—Operates on packets as they enter the switch • Multifield classification—Examines multiple fields in packets. • Fixed classification—Associate a forwarding class with a packet regardless of packet contents. 	12.3R2
Classification and DSCP marking of distributed protocol handler traffic	12.3R2
Classification of control-plane traffic	12.3R2
CoS classification and rewrite for IRB and Layer 2 interfaces and for other Layer 3 interfaces. Port-level queuing, scheduling, and shaping are supported.	12.3R2

Table 7: Class-of-Service (CoS) Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Egress GRE classification based on DSCP	12.3R2
IEEE 802.1p inheritance push and swap from transparent tags configuration	12.3R2
Elevated packet drops during oversubscription	12.3R2
Layer 2 policers for the ingress and egress interfaces. Policer types: <ul style="list-style-type: none"> • Single-rate two-color • Single-rate three-color (color-blind and color-aware) • Two-rate three-color (color-blind and color-aware) 	12.3R2
Independent values for DSCP and EXP bits	12.3R2
Apply CoS schedulers on ingress interfaces	12.3R2
Ingress DSCP bits for multicast traffic over Layer 3 VPNs	12.3R2
Layer 2 traffic policing	12.3R2
Policer support for aggregated Ethernet bundles (link aggregation groups, or LAGs)	12.3R2
Queuing support for logical tunnel interfaces	12.3R2
Rate-limit and excess rate or excess priority option	12.3R2
Re-marking of MVPN GRE encapsulation DCSP at ASBR	12.3R2
Scheduling	12.3R2
Set IPv6 DSCP and MPLS EXP independently	12.3R2
Set IPv6 DiffServ code point (DSCP) and MPLS EXP independently	12.3R2
Support for Layer 2 policers at the VLAN level	12.3R2
Support for applying a transmit rate limit to logical interfaces on Type 1, 2, or 3 Multiservices PICs	12.3R2
Support for configuring ToS rewrite rules so that DCSP bits of GRE packets are consistent with service providers' CoS policy	12.3R2
Support for copying the TOS bits to the outer IP header on GRE tunnel traffic sent by the Routing Engine	12.3R2
Support for setting the forwarding class and DSCP value for traffic generated by the Routing Engine	12.3R2
Unified command to display all CoS statistics	12.3R2

Table 8: Converged Networks (LAN and SAN) Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
NOTE: The EX4500 switch models that support Fibre Channel over Ethernet features must be Converged Enhanced Ethernet (CEE) capable. The CEE-capable EX4500 switch models have a “-C” in the hardware model number. See <i>EX4500 Switch Models</i> .									
Data Center Bridging Capability Exchange protocol (DCBX)	N.S.	N.S.	N.S.	N.S.	11.3R1	12.2R1	N.S.	N.S.	N.S.
DCBX application protocol TLV exchange	N.S.	N.S.	N.S.	N.S.	12.1R1	12.2R1	N.S.	N.S.	N.S.
FIP snooping	N.S.	N.S.	N.S.	N.S.	10.4R1	12.2R1	N.S.	N.S.	N.S.
Priority-based flow control (PFC)	N.S.	N.S.	N.S.	N.S.	10.4R1	12.2R1	N.S.	N.S.	N.S.

Table 9: Device Security Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Automatic recovery for port error disable conditions	10.1R1	9.6R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.0R1	N.S.
Storm control (broadcast and unicast)	10.1R1	9.1R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	N.S.
Storm control (multicast)	10.3R2	10.3R2	N.S.	13.2X50 - D10	10.3R2	12.2R1	11.3R2	10.3R2	N.S.
Unknown Layer 2 unicast forwarding	10.1R1	9.3R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.0R1	12.3R2

Table 10: High Availability and Resiliency Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
NOTE: For complete lists of Virtual Chassis features, see EX Series Virtual Chassis Software Features Overview .									See Table 3 for a list of EX9200 HA features.
Graceful protocol restart for BGP	–	9.0R2	N.S.	13.2X50 - D10	–	–	11.3R2	9.4R1	
Graceful protocol restart for IS-IS	–	9.3R2	N.S.	13.2X50 - D10	–	–	11.3R2	9.4R1	
Graceful protocol restart for OSPF	–	9.0R2	N.S.	13.2X50 - D10	–	–	11.3R2	9.4R1	
Graceful protocol restart for RSVP and LDP	N.S.	N.S.	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	12.3R1	
GRES for ARP entries, forwarding database, and Layer 3 protocols	–	9.2R1 (Virtual Chassis only)	11.3R1	13.2X50 - D10	11.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	11.3R2	9.4R1	
GRES for IGMP snooping	–	11.3R1 (Virtual Chassis only)	12.1R1 (Virtual Chassis only)	13.2X50 - D10	11.4R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	11.3R1	
GRES for LACP	N.S.	11.3R1	N.S.	13.2X50 - D10	11.3R1	12.2R1	N.S.	11.3R1	
GRES for Layer 2 and Layer 3 VPN LSPs	N.S.	N.S.	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	12.3R1	
GRES for port security (DHCP snooping, DAI, and IP source guard)	–	9.2R1 (Virtual Chassis only)	N.S.	13.2X50 - D10	–	–	11.3R2	9.6R1	
LACP support for dual-homing applications in data centers	10.1R1	10.0R1	N.S.	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.0R1	
Link Aggregation Control Protocol (LACP)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Link aggregation groups (LAGs)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	

Table 10: High Availability and Resiliency Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Nonstop active routing (NSR) for BGP, IS-IS, IGMP with BFD, and RIP	—	11.1R1 (Virtual Chassis only)	12.1R1 (Virtual Chassis only)	N.S.	11.3R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	11.3R2	11.1R1	
Nonstop active routing (NSR) for IPv6 IS-IS, RIPng, and OSPFv3 with BFD	—	12.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	12.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	11.2R1	
Nonstop active routing (NSR) for OSPFv2	—	11.1R1	12.1R1 (Virtual Chassis only)	N.S.	11.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	11.3R2	10.4R1	
Nonstop active routing (NSR) for Protocol Independent Multicast (PIM)	N.S.	12.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	12.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	11.4R2	
Nonstop active routing (NSR) for RSVP and LDP	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R1	
Nonstop bridging (NSB) for LAGs and LACP	—	11.4R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	11.4R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	12.1R1	11.3R1	
Nonstop bridging (NSB) for LLDP and LLDP-MED	—	11.3R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	N.S.	N.S.	N.S.	11.3R1	
Nonstop bridging (NSB) for spanning-tree protocols	—	11.3R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	12.1R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	12.1R1	11.3R1	
Nonstop software upgrade (NSSU)	—	12.1R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	12.1R1 (Virtual Chassis only)	12.1R1 (Virtual Chassis only)	12.2R1	10.4R1	
Power budget management	—	—	N.S.	13.2X50 - D10	—	—	11.3R2	10.2R1	
	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	11.4R1	

Table 10: High Availability and Resiliency Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Virtual Router—Network Time Protocol (NTP), system logging, Simple Network Management Protocol (SNMP), RADIUS, and TACACS support in a virtual router									
Virtual Router Redundancy Protocol (VRRP)	12.3R1	9.0R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Virtual Router Redundancy Protocol (VRRP)—Support for multiple VRRP owners per physical interface	12.3R1	12.3R1	12.3R1	N.S.	12.3R1	12.3R1	N.S.	12.3R1	
Virtual Router Redundancy Protocol (VRRP) for IPv6 (except authentication type and authentication key)	N.S.	10.2R1	12.3R1	13.2X50 - D10	11.2R1	12.2R1	12.1R1	10.1R1	

Table 11: High Availability and Resiliency Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Graceful Routing Engine switchover (GRES)	12.3R2
Nonstop active routing (NSR) support for Protocol Independent Multicast (PIM) for IPv4 and IPv6	12.3R2
Nonstop active routing (NSR) support for VPLS and for LDP-based VPLS	12.3R2
Nonstop active routing (NSR) support for LDP OAM features	12.3R2
Nonstop active routing (NSR) support for Layer 2 VPNs	12.3R2
Unified ISSU (requires EX9200-40T or EX9200-40F line cards)	12.3R3

Table 11: High Availability and Resiliency Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Virtual Router Redundancy Protocol version 3 (VRRPv3)	12.3R2

Table 12: Interfaces Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Digital optical monitoring (DOM)	N.S.	10.0R1	11.3R1	13.2X50 - D10	N.S.	N.S.	N.S.	10.0R1	See Table 12-1 for a list of EX9200 interfaces features.
Interface ranges	10.1R1	10.0R1	11.3R1	13.2X50 - D10	10.2R	12.2R1	11.3R2	10.1R1	
IPv4 over generic routing encapsulation (GRE) tunnels—encapsulation support	N.S.	12.1R1	N.S.	N.S.	N.S.	N.S.	N.S.	12.1R1	
IPv4 over generic routing encapsulation (GRE) tunnels—de-encapsulation support	N.S.	12.1R1	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R1	
IPv6 over generic routing encapsulation (GRE) tunnels using IPv4 transport—encapsulation support	N.S.	12.1R1	N.S.	N.S.	N.S.	N.S.	N.S.	12.1R1	
IPv6 over generic routing encapsulation (GRE) tunnels using IPv4 transport—de-encapsulation support	N.S.	12.1R1	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R1	
IP directed broadcast	11.3R1	9.4R1	12.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Time domain reflectometry (TDR)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	N.S.	N.S.	11.3R2	9.4R1	
Unicast reverse-path forwarding (RPF)	N.S.	9.3R2	12.3R1	13.2X50 - D10	11.2R1	12.2R1	11.3R2	10.1R1	
	N.S.	9.2R1	N.S.	13.2X50 - D10	11.2R1	12.2R1	11.3R2	9.4R1	

Table 12: Interfaces Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
VLAN-tagged Layer 3 subinterfaces									

Table 13: Interfaces Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
ICMP redirect	12.3R2
Clear MAC address information	12.3R2
IPv6 subnet support on loopback interfaces	12.3R2
IPv6 support for unnumbered Ethernet interfaces	12.3R2
Multichassis link aggregation (MC-LAG)	12.3R2
Nonstop active routing (NSR) support for Bidirectional Forwarding Detection (BFD)	12.3R2
Protection against distributed denial-of-service (DDOS) attacks	12.3R2
Software support for IPv4 to IPv6 transition	12.3R2
Static mapping for port forwarding	12.3R2
Support for active monitoring on logical systems	12.3R2
Support for VRF in Routing Engine-based sampling	12.3R2
Support for integrated routing and bridging (IRB) MAC synchronization in MC-LAG for aggregated Ethernet	12.3R2
Targeted broadcast for virtual routing and forwarding (VRF) instances	12.3R2
Trunk interface enhancements: <ul style="list-style-type: none"> Configure a single logical trunk interface to support a list of VLANs or to accept packets with no VLAN tag. Configure multiple logical trunk interfaces on a single physical interface. 	12.3R2
Unicast reverse-path forwarding (RPF) loose mode, with ability to discard packets with source addresses pointing to the discard interface	12.3R2
Unnumbered Ethernet—Configure IPv4 processing on interfaces without assigning explicit IP addresses to the interfaces.	12.3R2
VLAN rewrite operations on incoming and outgoing frames	12.3R2

Table 14: IP Address Management Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
DHCP server and relay with option 82 for Layer 2 VLANs	10.1R1	9.3R2	11.3R1	N.S.	10.2R1	12.2R1	11.3R2	9.4R1	See Table 14-1 for a list of EX9200 IP address management features.
DHCP server and relay with option 82 for Layer 3 interfaces	10.1R1	9.0R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
DNS for IPv6	N.S.	9.3R2	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	N.S.	
Local DHCP server	10.1R1	9.3R2	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	9.4R1	
Virtual router aware DHCP (VR-aware DHCP)	N.S.	12.3R1	N.S.	13.2X50 - D10	12.3R1	12.3R1	N.S.	12.3R1	
Virtual router aware DHCPv6 (VR-aware DHCPv6)	N.S.	N.S.	N.S.	13.2X50 - D10	12.3R1	12.3R1	12.3R1	N.S.	
Static addresses	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	9.4R1	

Table 15: IP Address Management Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
DHCP server and relay	12.3R2
DHCPv6 local server	12.3R2
DHCPv6 support	12.3R2
Distinguishing DHCP duplicate clients by subinterface	12.3R2
Dynamic reconfiguration of extended DHCP and DHCPv6 local server clients	12.3R2
Dynamic IPv6 filters	12.3R2
Expression support for dynamic profiles	12.3R2
Extended DHCP relay proxy	12.3R2

Table 15: IP Address Management Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Optional disabling of automatic ARP table population	12.3R2
IPv6 address assignment pools	12.3R2
Overriding DHCP settings on specific interfaces	12.3R2
Per-interface DHCP tracing operations	12.3R2
S-VLAN-based shaping for dynamic profiles	12.3R2
Sending a DHCP relay and relay proxy release message	12.3R2
Specifying the DHCP source address used for IP packets	12.3R2
Support for MAC address validation	12.3R2
Support for address pool threshold traps	12.3R2
Address assignment pools	12.3R2
Per-interface DHCP lease limits	12.3R2

Table 16: IPv6 Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
NOTE: A separate software license is required for IPv6. See Understanding Software Licenses for EX Series Switches .									
Application identification (APPID) for IPv6 packets	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R2
BFD for IPv6	N.S.	12.3R1	N.S.	13.2X50 - D10	12.3R1	12.3R1	N.S.	12.3R1	12.3R2 (also for static routes)
BGP for IPv6	N.S.	9.4R1	12.3R1	13.2X50 - D10	11.1R1	12.2R1	12.1R1	10.1R1	12.3R2
IPv6 CoS (multifield classification and rewrite)	N.S.	10.2R1	12.3R1	13.2X50 - D10	12.1R1	12.2R1	12.1R1	10.4R1	12.3R2

Table 16: IPv6 Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
IPv6 management	10.3R1	9.3R2 (using loopback addresses only)	11.3R1	13.2X50 - D10	10.4R1	12.2R1	N.S.	10.1R1	12.3R2
IPv6 multicast protocols (PIM, MLDv1/v2)	N.S.	10.1R1	12.3R1	13.2X50 - D10	11.2R1	12.2R1	12.1R1	10.2R1	12.3R2

NOTE: Compliance with RFC 4291

EX Series switches drop the following types of illegal IPv6 packets:

- Packets that have a link-local source or destination address. Because link-local addresses are intended to be used for addressing only on a single link, EX Series switches do not forward any packets with such addresses to other links.
- Packets with the IPv6 unspecified source address 0:0:0:0:0:0:0:0.
- Packets that are to be sent outside a node but have the IPv6 loopback address 0:0:0:0:0:0:0:1 as the source address. When IPv6 packets are received on an interface, EX Series switches drop packets that have the loopback address as the destination address.

EX Series switches do not support Subnet-Router Anycast address.

Table 17: Layer 2 Network Protocols Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
802.1Q VLAN tagging	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	See Table 82 for a list of EX9200 Layer 2 networking protocols features.
Edge virtual bridging (EVB) support with virtual Ethernet port aggregator (VEPA)	N.S.	N.S.	N.S.	N.S.	12.1R1	12.2R1	N.S.	12.1R1	
Ethernet ring protection switching (ERPS, G.8032/Y.1344)	12.1R1	12.1R1	12.3R1	13.2X50 - D10	12.3R1	12.3R1	N.S.	12.3R1	
Layer 2 protocol tunneling (L2PT)	11.1R1	10.0R1	12.3R1	N.S.	11.2R1	12.2R1	12.1R1	N.S.	
Link Layer Discovery Protocol (LLDP)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Link Layer Discovery Protocol—Media Endpoint Discovery (LLDP-MED) with voice over IP (VoIP) integration	10.1R1	9.0R2	11.3R1	13.2X50 - D10	N.S.	N.S.	N.S.	N.S.	
MAC-based VLANs	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Multiple VLAN Registration Protocol (MVRP, IEEE 802.1ak)	11.3R1	10.0R1	12.3R1	13.2X50 - D10	11.2R1	12.2R1	12.1R1	10.0R1	
Private VLANs (PVLANS)	11.1R1	9.3R2	12.1R1	N.S.	11.2R1	12.2R1	11.3R2	10.1R1	
Private VLANs (PVLANS) support across switches	11.1R1	10.4R1	12.1R1	N.S.	11.2R1	12.2R1	11.3R2	11.2R1	
Proxy ARP—Restricted	10.1R1	10.0R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.0R1	

Table 17: Layer 2 Network Protocols Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Proxy ARP—Unrestricted	10.1R1	9.6R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	10.0R1	
Proxy ARP per VLAN	10.1R1	10.1R1	N.S.	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.1R1	
Q-in-Q tunneling	11.1R1	9.3R2	11.4R1	N.S.	11.2R1	12.2R1	12.1R1	11.1R1	
Q-in-Q VLAN extended support for multiple S-VLANs per access interface, firewall-filter-based VLAN assignment, and RVIs or IRB interfaces	N.S.	9.6R1	12.3R1	N.S.	11.2R1	12.2R1	12.1R1	11.1R1	
Redundant trunk groups	10.1R1	9.0R2	11.3R1	13.2X50 - D10	11.2R1	12.2R1	11.3R2	9.4R1	
Routed VLAN interfaces (RVIs)—Also known as integrated routing and bridging (IRB) interfaces	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
VLAN ID translation	11.1R1	10.0R1	N.S.	N.S.	11.2R1	12.2R1	N.S.	11.1R1	
VLAN ranges	10.1R1	9.2R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	

Table 18: Layer 2 Networking Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
VLANs and virtual switching	12.3R2
DHCP support for integrated routing and bridging (IRB)	12.3R2
MC-LAG support for IGMP snooping in IRB	12.3R2
Hash-key load-balancing support for Layer 3 and Layer 4 fields	12.3R2

Table 18: Layer 2 Networking Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
IP multicast over Layer 2 trunk port support	12.3R2
Integrated routing and bridging (IRB)	12.3R2
Layer 2 Ethernet OAM: <ul style="list-style-type: none"> Distributed periodic packet management process (ppmd) for improved scaling Graceful Routing Engine switchover (GRES) Remote defect indication (RDI) Configuration of action profiles 	12.3R2
Layer 2 address learning in logical systems	12.3R2
Layer 2 forwarding support for bridging and VPLS	12.3R2
Layer 2 policer statistics MIB	12.3R2
Firewall filter match conditions for Layer 2 bridging and VPLS	12.3R2
Next-hop groups using either IP addresses or Layer 2 addresses for the next hop	12.3R2
Unicast reverse-path forwarding (RPF) loose mode, with ability to discard packets with source addresses pointing to the discard interface	12.3R2
Spanning-tree protocols support for Layer 2 bridging and VPLS	12.3R2
VLAN rewrite operations on incoming and outgoing frames	12.3R2
STP root guard (root protection)	12.3R2
Support for Layer 2 and Layer 2.5 features: <ul style="list-style-type: none"> Extensive set of Layer 2 label-manipulation capabilities, Q-in-Q support MC-LAG active / standby and MC-LAG active / active xSTP protocol support Integrated Routing and Bridging (IRB) interface support IGMP snooping for multichassis link aggregation group (MC-LAG) interfaces Configurable label block sizes for VPLS Connectivity fault management process flooding to interfaces based on mesh groups Layer 2 address learning in logical systems Virtual switch support, providing virtual Layer 2 switch instances with separate Layer 2 learning domains, isolated 4K VLAN ID spaces, and STP instances Ethernet Ring Protocol (ERP) for multiple ring instances on the same physical ring Transit and bypass static label-switched paths (LSPs) Layer 2 Gigabit Ethernet logical interface policing Static LSP statistics Multiple VLAN Registration Protocol (MVRP)—IEEE 802.1ak-2007 	12.3R2

Table 18: Layer 2 Networking Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
VPLS root protection topology change-action control	12.3R2
VLAN ranges	12.3R2
Q-in-Q VLAN extended support for multiple S-VLANs per access interface, firewall-filter-based VLAN assignment, and RVIs or IRB interfaces	12.3R2
Q-in-Q tunneling	12.3R2
Proxy ARP—Unrestricted and restricted	12.3R2
MAC-based VLANs	12.3R2
Link Layer Discovery Protocol (LLDP)	12.3R2
Layer 2 protocol tunneling (L2PT)	12.3R2

Table 19: Layer 3 Protocols Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Bidirectional Forwarding Detection (BFD)	11.3R1	9.0R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	9.4R1	See Table 18 for a list of EX9200 Layer 3 protocols features.
Border Gateway Protocol (BGP)	N.S.	9.0R2	12.1R1	13.2X50 - D10	11.1R1	12.2R1	11.3R2	9.4R1	
Multiprotocol Border Gateway Protocol (MBGP)	N.S.	9.3R1	12.3R1	13.2X50 - D10	11.2R1	12.2R1	12.1R1	9.4R1	

A separate software license is required for BGP and MBGP. See [Understanding Software Licenses for EX Series Switches](#).

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
OSPFv2	11.1R1	9.0R2	11.4R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
OSPFv3 IPsec support	N.S.	10.3R1	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	N.S.	
Routing Information Protocol version 1 (RIPv1) and RIPv2	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Static routes	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Virtual routing and forwarding (VRF) with IPv4—Virtual routing instances	12.3R1	9.2R1	12.3R1	13.2X50 - D10	11.1R1	12.2R1	11.3R2	9.6R1	
VRF with IPv4—Virtual routing instances for PIM and IGMP	N.S.	10.0R1	N.S.	13.2X50 - D10	11.1R1	12.2R1	11.3R2	10.0R1	
VRF with IPv4—Virtual routing instances for IGMP snooping	N.S.	11.4R1	N.S.	13.2X50 - D10	12.1R1	12.2R1	N.S.	11.3R1	
VRF with IPv6—Virtual routing instances for multicast traffic	N.S.	10.1R1	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	10.1R1	
VRF with IPv6—Virtual routing instances for unicast traffic	N.S.	10.1R1	12.3R1	13.2X50 - D10	N.S.	N.S.	N.S.	10.1R1	

Table 20: Layer 3 Protocols Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Accumulated IGP attribute for BGP	12.3R2
Advertisement of the best external BGP path to internal peers	12.3R2

Table 20: Layer 3 Protocols Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Alias support for local autonomous system numbers for BGP	12.3R2
BFD liveness detection	12.3R2
BFD protocol support for OSPFv3	12.3R2
BGP remote next-hop support for single-hop EBGP peers	12.3R2
BGP support for 4-byte autonomous system numbers	12.3R2
BGP support for MDT-SAFI updates without a route target	12.3R2
Behavior change for BGP-independent autonomous system (AS) domains	12.3R2
Bidirectional Forwarding Detection (BFD) hold-down timer	12.3R2
Distributed periodic packet management support for aggregate interfaces	12.3R2
Egress filtering PIMv4/v6 join messages	12.3R2
For internal BGP (IBGP), advertise multiple paths to a destination	12.3R2
Frequent BGP keepalive messages and short BGP hold time	12.3R2
Hitless authentication key rollover for IS-IS	12.3R2
Hub-and-spoke support for multiprotocol BGP-based multicast VPNs with PIM-SSM GRE S-PMSI transport	12.3R2
IPv4 subnet support on loopback interfaces	12.3R2
IS-IS hold-down timer for subsequent SPF calculations	12.3R2
Keepalive support for GRE interfaces	12.3R2
Multitopology routing (MTR)	12.3R2
Nonstop active routing (NSR) support for the Routing Information Protocol (RIP) and RIP next generation (RIPng)	12.3R2
Nonstop active routing (NSR) support	12.3R2
OSPF graceful restart enhancement	12.3R2
OSPF hold-down timer for subsequent SPF calculations	12.3R2
Only the system log notes failure to add routes	12.3R2

Table 20: Layer 3 Protocols Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Origin validation for BGP	12.3R2
PIM join suppression support	12.3R2
Priority assignment for prefixes in OSPF import policies	12.3R2
Reduction in flooding of self-originated OSPF LSAs	12.3R2
Support for BFD over multihop static routes	12.3R2
Support for BFD on logical switches	12.3R2
Support for IPSec authentication for OSPFv2	12.3R2
Support for OSPF database protection for OSPF and OSPFv3	12.3R2
Support for OSPF export and import policies for network-summary LSAs	12.3R2
Support for alternate loop-free routes for IS-IS and OSPF	12.3R2
Support for clearing the VPN tag	12.3R2
Support for disabling the attribute set messages on independent AS domains for BGP loop detection	12.3R2
Support for disabling traps for passive OSPFv2 interfaces	12.3R2
Support for display of flood next-hop branch overflow condition	12.3R2
Support for dropping and ignoring path attributes during BGP neighbor updates	12.3R2
Support for the algorithm that determines the single best path to skip the step that evaluates an AS path	12.3R2
Support for limiting the number of prefixes accepted from a BGP peer	12.3R2
Support for multiarea adjacency in OSPFv2	12.3R2
Support for multiple address families in OSPFv3	12.3R2
Support for route leaking when the switch is in overload mode	12.3R2
Support for route-filter-based BGP outbound route filtering	12.3R2
Support for the BGP Monitoring Protocol	12.3R2
Support to hold down BGP peering sessions after a nonstop active routing (NSR) switchover Timer to delay MED updates for routes advertised by BGP groups or peers configured with the metric-out igp statement Virtual Router Redundancy Protocol (VRRP)	12.3R2

Table 20: Layer 3 Protocols Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Timer to delay MED updates for routes advertised by BGP groups or peers configured with the metric-out igp statement	12.3R2
Virtual Router Redundancy Protocol (VRRP)	12.3R2

Table 22: MPLS Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Layer 3 subinterfaces as MPLS core interfaces					12.2R1 See Note at end of table.	12.2R1 See Note at end of table.			
Routed VLAN interfaces (RVIs) as MPLS core interfaces	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.1R1	
Path maximum transmission unit (MTU) and unicast reverse-path forwarding (RPF) checks for VPNs	N.S.	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.1R1	
Resource Reservation Protocol—traffic engineering (RSVP-TE)	N.S.	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.1R1	
Standby secondary path protection	N.S.	12.1R1	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.1R1	
Static label-switched paths (LSPs)	N.S.	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.	12.1R1	

NOTE: Layer 3 subinterfaces as MPLS core interfaces—For EX4500 and EX4550 switches to support Layer 3 subinterfaces as MPLS core interfaces, the peer switch that the Layer 3 subinterfaces connect to, must be an EX8200 switch.

IP over MPLS—The EX4500 and EX4550 switches do not support IP over MPLS (single MPLS label in the packet) when the switch is positioned as a non-penultimate-hop popping (non-PHP) switch.

Table 23: MPLS Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
---------	------------------

A separate software license is required for MPLS. See [Understanding Software Licenses for EX Series Switches](#).

Table 23: MPLS Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Bypass static LSPs	12.3R2
LDP LSP action based on a BFD failure event	12.3R2
LDP downstream on demand	12.3R2
LDP, BGP, and VPLS interworking	12.3R2
P2MP LSP traceroute	12.3R2
Static LSP: <ul style="list-style-type: none"> • Revert timer • Statistics • Traceoptions • At the ingress switch • At the transit switch 	12.3R2
Statistics for P2MP LSPs	12.3R2

Table 24: Multicast Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
IGMP (Internet Group Management Protocol) version 1 (IGMPv1) and IGMPv2	11.1R1	9.0R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	See Table 24-5 for a list of EX9200 multicast features
IGMP filtering	11.3R1	9.5R1	12.3R1	13.2X50 - D10	11.3R1	11.3R1	11.3R1	9.5R1	
IGMP snooping with RVIs or IRB interfaces	10.1R1	9.2R1	12.1R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	9.4R1	
IGMPv3	11.1R1	9.3R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.6R1	
IGMPv1 and IGMPv2 snooping	10.1R1	9.1R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
IGMPv3 snooping	10.1R1	9.6R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.6R1	
Multicast Listener Discovery version 1 and 2 (MLDv1 and MLDv2)	N.S.	10.1R1	N.S.	13.2X50 - D10	11.2R1	12.2R1	12.1R1	10.2R1	
Multicast Listener Discovery version 1 (MLDv1) snooping (MLDv1 snooping)	12.1R1	12.1R1	12.1R1	N.S.	12.1R1	12.2R1	12.1R1	12.1R1	
Multicast Listener Discovery version 2 (MLDv2) snooping (MLDv2 snooping)	12.1R1	12.1R1	12.1R1	N.S.	12.1R1	12.2R1	12.1R1	12.1R1	
Multicast Source Discovery Protocol (MSDP)	N.S.	9.4R1	12.3R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	9.4R1	
See the Junos OS Multicast Protocols Configuration Guide .									
Multicast VLAN registration (MVR)	11.3R1	9.6R1	12.1R1	N.S.	N.S.	N.S.	N.S.	N.S.	
	11.1R1	9.2R1	12.1R1		11.2R1	12.2R1	11.3R2	9.4R1	

Table 24: Multicast Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Protocol Independent Multicast dense mode (PIM DM)				13.2X50 - D10					
See the Junos OS Multicast Protocols Configuration Guide .									
Protocol Independent Multicast sparse mode (PIM SM)	11.1R1	9.0R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
See the Junos OS Multicast Protocols Configuration Guide .									
Protocol Independent Multicast source-specific multicast (PIM SSM)	11.1R1	9.3R1	12.1R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
See the Junos OS Multicast Protocols Configuration Guide .									
Single-source multicast	N.S.	9.0R2	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	9.4R1	

Table 25: Multicast Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
BFD for PIM—IPv6	12.3R2
BFD support for ECMP LSPs signaled using LDP	12.3R2
Bidirectional PIM (RFC 5015)	12.3R2
Control of PIM resources for multicast VPNs	12.3R2
Disable PIM for IPv6 only	12.3R2
Dynamic reuse of data multicast distribution tree (MDT) group addresses	12.3R2
Flexible configuration for IGMP or MLD static-join	12.3R2
IGMPv3 and MLDv2 full support	12.3R2

Table 25: Multicast Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
IGMP and MLD enhancements— <ul style="list-style-type: none"> • immediate-leave (IGMP and MLD) • promiscuous-mode (IGMP only) 	12.3R2
IGMP and PIM support for unnumbered interfaces	12.3R2
IGMP join and leave recording for system or for specific interfaces	12.3R2
IGMP and MLD source or group access lists and MLD join and leave recording	12.3R2
IGMP and MLD support for dynamic interfaces	12.3R2
Independently configurable loopback addresses for VRF VPNs	12.3R2
Internet multicast using ingress replication provider tunnels	12.3R2
Software support for configuring accept any-source multicast (ASM) join messages (*;G) for group addresses	12.3R2
Software support for configuring a provider network to operate in source-specific multicast (SSM) mode	12.3R2
LDP signaling for point-to-multipoint LSPs in next-generation MBGP multicast VPNs	12.3R2
Load-balancing PIM join messages on multicast VPNs	12.3R2
Multicast flow maps	12.3R2
Nonstop active routing (NSR) PIM for Draft-Rosen VPNs	12.3R2
PIM automatic make-before-break (MBB) join load balancing	12.3R2
PIM join load balancing	12.3R2
Source-specific multicast (SSM)-map definition for different groups to different sources	12.3R2
Support for filtering unwanted PIM neighbors	12.3R2
Support for multicast output interface (OIF) mapping	12.3R2
Translation of PIM join/prune messages to IGMP or MLD report/leave messages	12.3R2
Turn off spanning-tree interface state in multicast snooping	12.3R2

Table 26: Network Management and Monitoring Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
802.1ag Ethernet OAM connectivity fault management (CFM)	11.2R1	10.2R1	12.3R1	13.2X50 - D10	12.2R1	12.2R1	N.S.	11.4R1	See Table 26-99 for a list of EX9200 network management and monitoring features.
Ethernet frame delay measurement (ETH-DM, Y.1731)	N.S.	11.4R1 (EX4200 only)	N.S.	13.2X50 - D10	11.4R1	12.2R1	N.S.	11.4R1	
Ethernet OAM link fault management (LFM—also known as Ethernet in the First Mile, EFM)	11.1R1	9.4R1	12.2R1	13.2X50 - D10	12.2R1	12.2R1	N.S.	10.0R1	
Port mirroring	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Port mirroring enhancements <ul style="list-style-type: none"> • Layer 3 interface support • Multiple VLAN support 	N.S.	9.5R1	N.S.	—	N.S.	N.S.	N.S.	9.5R1	
Port mirroring enhancements <ul style="list-style-type: none"> • For remote port mirroring, ingress and egress options on VLAN member interfaces on the intermediate (transit) switch to avoid flooding mirrored traffic to those interfaces 	N.S.	10.0R1	N.S.	—	N.S.	N.S.	N.S.	N.S.	
	N.S.	N.S.	N.S.	13.2X50 - D10	11.2R1	12.2R1	N.S.	N.S.	

Table 26: Network Management and Monitoring Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Port mirroring support for multiple analyzers per session									
Real-time performance monitoring (RPM)	10.1R1	9.3R2	12.2R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	10.1R1	
Real-time performance monitoring (RPM)—hardware timestamps with RVIs or IRB interfaces	N.S.	10.3R1	12.2R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	10.3R1	
Real-time performance monitoring (RPM)—client and server on same interface	10.3R1	10.3R1	12.2R1	13.2X50 - D10	11.1R1	12.2R1	N.S.	10.3R1	
Routing Engine Software Development Kit (SDK)	N.S.	12.2R1	12.2R1 (EX4200 only)	N.S.	12.2R1	12.2R1	N.S.	12.2R1	
RMON	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
sFlow monitoring technology	11.1R1	9.3R2	12.1R1	13.2X50 - D10	11.2R1	12.2R1	12.1R1	10.0R1	
sFlow monitoring technology—Persistent IP addresses for agent IDs and use in datagrams	11.1R1	10.2R1	N.S.	13.2X50 - D10	N.S.	N.S.	12.1R1	10.2R1	
Simple Network Management Protocol version 1 (SNMPv1), SNMPv2, and SNMPv3	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
	11.1R1	11.1R1	12.1R2		11.1R1	12.2R1	N.S.	12.1R1	

Table 26: Network Management and Monitoring Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Uplink failure detection				13.2X50 - D10					

Table 27: Network Management and Monitoring Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Junos OS XML API and scripting—NETCONF Java toolkit for rapid development of Java applications to manage devices running Junos OS	12.3R2
Junos OS XML API and scripting—NETCONF Perl client installation—Supports loading prerequisites from Comprehensive Perl Archive Network (CPAN) global repository	12.3R2
Junos OS XML API and scripting—NETCONF tracing operations	12.3R2
Junos OS XML API and scripting: <ul style="list-style-type: none"> • Dedicated directory for user script library • Global variable provided to Junos OS automation scripts • References to a correlating event in a policy action • Trigger a policy based on the event count • Unique filenames for uploaded files • Upload files created by event scripts • XML schemata for Junos OS XML operational tag elements • jcs:open() extension function support for routing instances 	12.3R2
Configuration options to filter out interfaces from SNMP Get and GetNext operations	12.3R2
Enhanced SNMP support for logical switches and routing instances	12.3R2
Generating SNMP traps when MAC address table is full	12.3R2
Junos OS MIB support for VPLS	12.3R2
MIB support for VRF route entries	12.3R2
Proxy SNMP agent	12.3R2
SNMP MIB support for OSPFv3	12.3R2
SNMP poll and trap support for DHCP leases	12.3R2
SNMP support for the DHCP bindings table	12.3R2
SNMP support for the authd daemon and for radius-acc-server-mib and radius-auth-server-mib	12.3R2

Table 27: Network Management and Monitoring Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
SNMP support for spanning-tree protocols	12.3R2
Support for Internet draft draft-ietf-bfd-mib-02.txt—MIB for BFD liveness detection	12.3R2
Support for MIB objects in accounting profiles	12.3R2
Support for an enterprise-specific event MIB (mib-jnx-event.txt)	12.3R2
Support for sending traps over routing instances	12.3R2
Support for adding lists of clients to the SNMP community	12.3R2
Support for the enterprise-specific Packet Forwarding Engine MIB (mib-jnx-pfe.txt)	12.3R2
Support for the pimNeighborLoss trap	12.3R2
Support for trap spoofing	12.3R2
IEEE 802.3ah link fault management (LFM) for Ethernet OAM (also known as Ethernet in the First Mile, or EFM)	12.3R2
Port mirroring of Layer 2 VLAN and VPLS traffic	12.3R2
Fast update filters for dynamic profiles	12.3R2
Flow aggregation to multiple collectors	12.3R2
IPv6 flow aggregation templates	12.3R2
Inline flow monitoring	12.3R2

Table 28: Port Security Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Automatic recovery for port error disable conditions	10.1R1	9.6R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.0R1	N.S.
DHCP option 82	10.1R1	9.3R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	9.4R1	12.3R2
DHCP snooping	10.1R1	9.0R2	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.

Table 28: Port Security Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Dynamic ARP inspection (DAI)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.
IP source guard	10.1R1	9.2R1	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.
Layer 3 virtual private network (VPN) for IPv4 (RFC 2547 and 4364)	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R2
Layer 3 virtual private network (VPN) for IPv6 through IPv4 MPLS	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R2
MAC limiting	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	12.3R2
MAC address limit per port	10.1R1	9.0R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.3R1	12.3R2
MAC limiting per port and per VLAN (VLAN membership MAC limit)	12.3R1	12.3R1	12.3R1	13.2X50 - D10	12.3R1	12.3R1	12.3R1	12.3R1	12.3R2
MAC move limiting	10.1R1	9.0R2	11.3R1	13.2X50 - D10	N.S.	N.S.	11.3R2	N.S.	N.S.
Persistent MAC learning (sticky MAC)	11.4R1	11.4R1	12.3R1	13.2X50 - D10	11.4R1	12.2R1	11.4R1	11.4R1	N.S.
Persistent storage for DHCP snooping	10.1R1	9.4R1	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.
Self-signed digital certificates for enabling SSL services	11.1R1	11.1R1	N.S.	13.2X50 - D10	11.1R1	12.2R1	12.1R1	11.1R1	N.S.
Static ARP support	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	12.3R2

Table 29: Power over Ethernet (PoE) Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Link Layer Discovery Protocol (LLDP) with granular Power over Ethernet (PoE) management	12.2R1	12.2R1 (EX4200-24PX and EX4200-48PX models only)	12.2R1	13.2X50 - D10	N.S.	N.S.	12.2R1	12.2R1	N.S.
NOTE: EX4200 switches must be running PoE controller software firmware version 4.04 or later to support the Link Layer Discovery Protocol (LLDP) with granular Power over Ethernet (PoE) management feature. See show chassis firmware detail and request system firmware upgrade poe to check or upgrade this firmware.									N.S.
Power over Ethernet (PoE)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	—	—	11.3R2	11.2R1	N.S.
Power over Ethernet Plus (PoE+)	10.3R1	11.2R1 (EX4200-24PX and EX4200-48PX models only)	11.3R1	13.2X50 - D10	—	—	11.3R2	11.2R1	N.S.
Power over Ethernet (PoE) power management mode	10.1R1	9.3R2	11.3R1	13.2X50 - D10	—	—	11.3R2	11.2R1	N.S.

Table 30: Routing Policy and Packet Filtering Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Dynamic allocation of TCAM memory to firewall filters	10.1R1	10.0R1	11.3R1	–	10.2R1	12.2R1	N.S.	10.3R1	See Table 30 for a list of EX9200 routing policy and firewall filter features.
Firewall filters and rate limiting	10.1R1	9.0R2	11.3R1	13.2X50 – D10	10.2R1	12.2R1	11.3R2	9.4R1	
For a list of supported firewall filter match conditions and actions, see <i>Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches</i> .									
Firewall filters on LAGs	10.1R1	9.0R2	11.3R1	13.2X50 – D10	10.2R1	12.2R1	N.S.	10.0R1	
Firewall filters on the loopback interface	10.1R1	9.2R1	11.3R1	13.2X50 – D10	11.1R1	12.2R1	12.1R1	9.6R1	
For a list of supported firewall filter match conditions and actions on a loopback interface, see <i>Support for Match Conditions and Actions for Loopback Firewall Filters on Switches</i> .									
Firewall filters on the management interface	11.3R1	10.4R1	N.S.	13.2X50 – D10	10.4R1	12.2R1	12.1R1	10.4R1	
Firewall filters on the virtual management interface	–	10.4R1 (EX4200 Virtual Chassis only)	N.S.	13.2X50 – D10	–	–	–	–	
Firewall filters with IPv6	11.3R1	10.1R1	12.3R1	13.2X50 – D10	12.1R1	12.2R1	12.1R1	10.3R1	
Policing	10.1R1	9.0R2	11.3R1	13.2X50 – D10	10.2R1	12.2R1	11.3R2	9.4R1	
Tricolor marking policers	11.2R1	11.2R1	11.4R8	N.S.	12.1R1	12.2R1	11.3R1	N.S.	

Table 31: Routing Policy and Firewall Filters on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Access and access-internal routes	12.3R2
Extension of numeric-range match conditions in firewall filters	12.3R2
Aggregate policer support for different family address types configured on the same interface	12.3R2

Table 31: Routing Policy and Firewall Filters on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Authentication for BFD (MD5/SHA1)	12.3R2
BGP multipath link-bandwidth attribute	12.3R2
DHCP state persistence for DHCP relay agent	12.3R2
Dynamic configuration support for routing policies	12.3R2
Extended DHCP relay agent	12.3R2
Filter-based forwarding to a specific outgoing interface or destination IP address	12.3R2
Firewall filters within logical systems	12.3R2
IEEE 802.1p priority match conditions for Layer 2 VPN firewall filters	12.3R2
Filter-based forwarding to a specific outgoing interface or destination IP address	12.3R2
Layer 2 Gigabit Ethernet logical interface extended policing support	12.3R2
Layer 2 support for firewall filter match conditions	12.3R2
Load balancing of VPLS traffic	12.3R2
Option 60 support for extended DHCP relay agents	12.3R2
Policers on physical interfaces	12.3R2
Firewall filters feature support	12.3R2
Support for policers that limit traffic on logical interfaces in ingress or egress directions	12.3R2
Support for policers that rate-limit based on a percentage of physical port speed on an interface	12.3R2
Support for the discard action for tricolor marking policers applied to firewall filters	12.3R2
Support for the prefix-list match condition for firewall filters for the VPLS protocol family	12.3R2
Support for enhanced policer statistics	12.3R2
Support for MAC address validation	12.3R2
Tricolor marking policers	12.3R2

Table 32: Spanning-Tree Protocols Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
BPDU protection for spanning-tree protocols	10.1R1	9.1R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	See Table 33 for a list of EX9200 spanning-tree protocols features.
BPDU filter	12.2R1	12.2R1	12.2R1	13.2X50 - D10	12.2R1	12.2R1	12.2R1	12.2R1	
Distributed periodic packet management (PPM) for Spanning Tree Protocols	N.S.	12.3R1	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R1	
Loop protection for spanning-tree protocols	10.1R1	9.1R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Root protection for spanning-tree protocols	10.1R1	9.1R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1

EX9208 Switch Hardware Overview

Juniper Networks EX9208 Ethernet Switches provide high performance, scalable connectivity, and carrier-class reliability for high-density environments such as campus-aggregation and data-center networks. The EX9208 switch has a capacity of up to 4.8 terabits per second (Tbps) or up to 240 gigabit per second (Gbps) per slot full duplex. The EX9208 switch is a modular system that provides high availability and redundancy for all major hardware components, including Routing Engine modules (RE modules), Switch Fabric modules (SF modules), fan tray (redundant fans), and power supplies.

A fully populated EX9208 switch provides a maximum port density of 240 1-Gigabit Ethernet ports, 160 10-Gigabit Ethernet ports, or 24 40-Gigabit Ethernet ports in a redundant configuration.

You can manage EX9208 switches by using the same interfaces that you use for managing other devices running the Juniper Networks Junos operating system (Junos OS)—the command-line interface (CLI) and the Network and Security Manager (NSM).

Software

The Juniper Networks EX Series Ethernet Switches run Junos OS, which provides Layer 2 and Layer 3 switching, routing, and security services. The same Junos OS code base that runs on EX Series switches also runs on all Juniper Networks J Series, M Series, MX Series, and T Series routers and SRX Series Services Gateways.

Chassis Physical Specifications

The EX9208 switch is eight rack units (8 U) in size. Five EX9208 switches can fit in a standard 48 U rack. Each EX9208 switch is designed to optimize rack space and cabling. See [Figure 1 on page 116](#), [Figure 2 on page 116](#), and [Figure 3 on page 117](#).

Figure 1: Front View of an EX9208 Switch

Figure 2: Rear View of an AC-Powered EX9208 Switch

Figure 3: Rear View of a DC-Powered EX9208 Switch

Host Subsystem

Switching and routing functionality, system management, and system control functions of an EX9208 switch are performed by the host subsystem. The host subsystem consists of a Routing Engine functioning together with a Switch Fabric.

You can install either one or two host subsystems in the slots labeled **0** and **1** in the front panel of the chassis. A base configuration EX9208 switch has one host subsystem. A redundant configuration EX9208 switch has a second host subsystem. See *EX9208 Switch Configurations*.

Line Cards

The EX9208 switch has six horizontal line card slots and supports line rate for each line card. The line cards in EX9208 switches combine a Packet Forwarding Engine and Ethernet interfaces in a single assembly. Line cards are field-replaceable units (FRUs) that can be installed in the line card slots labeled **0** through **5** on the front of the switch chassis. All line cards are hot-removable and hot-insertable.

Four line cards are available for EX9208 switches:

Table 38: Line Cards Available for EX9208 Switches

Model	Description	Additional Information
EX9200-32XS	32-port SFP+ line card	<i>EX9200-32XS Line Card</i>
EX9200-40T	40-port 10/100/1000BASE-T RJ-45 line card	<i>EX9200-40T Line Card</i>

Table 38: Line Cards Available for EX9208 Switches (*continued*)

Model	Description	Additional Information
EX9200-40F	40-port 100FX/1000BASE-X SFP line card	<i>EX9200-40F Line Card</i>
EX9200-4QS	4-port 40-Gigabit Ethernet QSFP+ line card	<i>EX9200-4QS Line Card</i>

Cooling System

The cooling system in an EX9208 switch is a field-replaceable unit (FRU). It consists of a hot-removable and hot-insertable fan tray. The fan tray contains six fans. The fan tray installs vertically on the right back of the chassis and provides side-to-side chassis cooling. See *Cooling System and Airflow in an EX9208 Switch*.

Power Supplies

Power supplies for the EX9208 switch are fully redundant, load-sharing, and hot-removable and hot-insertable FRUs. Each EX9208 switch chassis can hold up to four AC or DC power supplies.

[Table 39 on page 118](#) shows the details of the power supplies available for EX9208 switches.

Table 39: Power Supplies Supported on EX9208 Switches

Power Supply	Input Voltage	Output Power
2520 W AC	Low-voltage line (100–120 VAC)	1167 W
	High-voltage line (220–240 VAC)	2050 W
2400 W DC	–40 VDC through –70 VDC	2400 W to 2600 W

An AC base configuration EX9208 switch ships with three low-line (110–120 VAC) AC power supplies or two high-line (220–240 VAC) AC power supplies. A redundant AC configuration EX9208 switch ships with four low-line (110–120 VAC) or four high-line (220–240 VAC) AC power supplies. See *AC Power Supply in an EX9208 Switch*.

A redundant DC configuration EX9208 switch ships with four DC power supplies. See *DC Power Supply in an EX9208 Switch*.

CAUTION: Mixing different types of power supplies (AC and DC) in the same chassis is not supported.

- [Junos OS Login Classes Overview on page 128](#)
- [Access Privilege User Permission Flags Overview on page 128](#)
- [Specifying Access Privileges for Junos OS Configuration Mode Hierarchies on page 130](#)

Understanding Junos OS Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with them. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more *permission flags*.

For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

The following sections provide additional information about permissions:

- [Junos OS Login Class Permission Flags on page 123](#)
- [Allowing or Denying Individual Commands for Junos OS Login Classes on page 127](#)

Junos OS Login Class Permission Flags

The **permissions** statement specifies one or more of the permission flags listed in [Table 40 on page 124](#). Permission flags are not cumulative, so for each class you must list all the permission flags needed, including **view** to display information and **configure**

to enter configuration mode. Two forms of permissions control for individual parts of the configuration are:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

Table 40 on page 124 lists the Junos® operating system (Junos OS) login class permission flags that you can configure by including the **permissions** statement at the **[edit system login class class-name]** hierarchy level.

Table 40: Login Class Permission Flags

Permission Flag	Description
access	Can view the access configuration in configuration mode and with the show configuration operational mode command.
access-control	Can view and configure access information at the [edit access] hierarchy level.
admin	Can view user account information in configuration mode and with the show configuration operational mode command.
admin-control	Can view user accounts and configure them at the [edit system login] hierarchy level.
all-control	Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels.
clear	Can clear (delete) information learned from the network that is stored in various network databases by using the clear commands.
configure	Can enter configuration mode by using the configure command.
control	Can perform all control-level operations—all operations configured with the -control permission flags.
field	Can view field debug commands. Reserved for debugging support.
firewall	Can view the firewall filter configuration in configuration mode.
firewall-control	Can view and configure firewall filter information at the [edit firewall] hierarchy level.
floppy	Can read from and write to the removable media.
flow-tap	Can view the flow-tap configuration in configuration mode.

Table 40: Login Class Permission Flags (*continued*)

Permission Flag	Description
flow-tap-control	Can view the flow-tap configuration in configuration mode and can configure flow-tap configuration information at the [edit services flow-tap] hierarchy level.
flow-tap-operation	Can make flow-tap requests to the router or switch. For example, a Dynamic Tasking Control Protocol (DTCP) client must authenticate itself to the Junos OS as an administrative user. That account must have flow-tap-operation permission. NOTE: The flow-tap-operation option is not included in the all-control permissions flag.
idp-profiler-operation	Can view profiler data.
interface	Can view the interface configuration in configuration mode and with the show configuration operational mode command.
interface-control	Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the following hierarchy levels: <ul style="list-style-type: none"> • [edit chassis] • [edit class-of-service] • [edit groups] • [edit forwarding-options] • [edit interfaces]
maintenance	Can perform system maintenance, including starting a local shell on the router or switch and becoming the superuser in the shell by using the su root command, and can halt and reboot the router or switch by using the request system commands.
network	Can access the network by using the ping , ssh , telnet , and traceroute commands.
pgcp-session-mirroring	Can view the pgcp session mirroring configuration.
pgcp-session-mirroring-control	Can modify the pgcp session mirroring configuration.
reset	Can restart software processes by using the restart command and can configure whether software processes are enabled or disabled at the [edit system processes] hierarchy level.
rollback	Can use the rollback command to return to a previously committed configuration other than the most recently committed one.
routing	Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.

Table 40: Login Class Permission Flags (*continued*)

Permission Flag	Description
routing-control	Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the [edit routing-options] hierarchy level, routing protocols at the [edit protocols] hierarchy level, and routing policy at the [edit policy-options] hierarchy level.
secret	Can view passwords and other authentication keys in the configuration.
secret-control	Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.
security	Can view security configuration in configuration mode and with the show configuration operational mode command.
security-control	Can view and configure security information at the [edit security] hierarchy level.
shell	Can start a local shell on the router or switch by using the start shell command.
snmp	Can view Simple Network Management Protocol (SNMP) configuration information in configuration and operational modes.
snmp-control	Can view SNMP configuration information and can modify SNMP configuration at the [edit snmp] hierarchy level.
system	Can view system-level information in configuration and operational modes.
system-control	Can view system-level configuration information and configure it at the [edit system] hierarchy level.
trace	Can view trace file settings and configure trace file properties.
trace-control	Can modify trace file settings and configure trace file properties.
view	Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.
view-configuration	Can view all of the configuration excluding secrets, system scripts, and event options. NOTE: Only users with the maintenance permission can view commit script, op script, or event script configuration.

Allowing or Denying Individual Commands for Junos OS Login Classes

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

- The **all** login class permission bits take precedence over extended regular expressions when a user with **rollback** permission issues the **rollback** command.
- Expressions used to allow and deny commands for users on RADIUS and TACACS+ servers have been simplified. Instead of a single, long expression with multiple commands (**allow-commands=cmd1 cmd2 ... cmdn**), you can specify each command as a separate expression. This new syntax is valid for **allow-configuration** and **deny-configuration**, **allow-commands** and **deny-commands**, and all user permission bits.
- Users cannot issue the **load override** command when specifying an extended regular expression. Users can only issue the **merge**, **replace**, and **patch** configuration commands.
- If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by the **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.
- Regular expressions for **allow-commands** and **deny-commands** can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **deny-commands**.

Related Documentation

Junos OS Login Classes Overview

All users who can log in to the router or switch must be in a login class. With login classes, you define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify
- How long a login session can be idle before it times out and the user is logged out

You can define any number of login classes and then apply one login class to an individual user account.

The Junos OS contains a few predefined login classes, which are listed in [Table 41 on page 128](#). The predefined login classes cannot be modified.

Table 41: Predefined System Login Classes

Login Class	Permission Flag Set
operator	clear, network, reset, trace, and view
read-only	view
superuser or super-user	all
unauthorized	None

NOTE:

- You cannot modify a predefined login class name. If you issue the **set** command on a predefined class name, the Junos OS appends **-local** to the login class name. The following message also appears:

warning: '<class-name>' is a predefined class name; changing to '<class-name>-local'

- You cannot issue the **rename** or **copy** command on a predefined login class. Doing so results in the following error message:

error: target '<class-name>' is a predefined class

Access Privilege User Permission Flags Overview

Permission flags are used to grant a user access to operational mode commands and configuration hierarchy levels and statements. By specifying a specific permission flag

on the user's login class at the **[edit system login class]** hierarchy level, you grant the user access to the corresponding commands and configuration hierarchy levels and statements. To grant access to all commands and configuration statements, use the **all** permissions flag.

For permission flags that grant access to configuration hierarchy levels and statements, the flags grant read-only privilege to that configuration. For example, the **interface** permissions flag grants read-only access to the **[edit interfaces]** hierarchy level. The **-control** form of the flag grants read-write access to that configuration. Using the preceding example, **interface-control** grants read-write access to the **[edit interfaces]** hierarchy level.

The permission flags listed in "Related Documentation" grant a specific set of access privileges. Each permission flag is listed with the operational mode commands and configuration hierarchy levels and statements for which that flag grants access.

NOTE: Each command listed represents that command and all subcommands with that command as a prefix. Each configuration statement listed represents the top of the configuration hierarchy to which that flag grants access.

Specifying Access Privileges for Junos OS Configuration Mode Hierarchies

The **allow/deny-configuration** and **allow/deny-configuration-regexps** statements let you explicitly allow or deny users access privileges to portions of the configuration hierarchy. Each of these statements is added to named login classes and configured with one or more regular expressions to be allowed or denied. Each login class is assigned to specific users or user IDs.

The search and match methods differ in the two forms of these statements. You must select which form to use within a login class—you cannot configure **allow-configuration** and **allow-configuration-regexps** together in the same login class. You must select just one. If you have existing configurations using the **allow/deny-configuration** form of the statements, using the same configuration options with the **allow/deny-configuration-regexps** form of the statements might not produce the same results.

- **Allow/deny-configuration** statements perform slower matching, with more flexibility, especially in wildcard matching. However, it can take a very long time to evaluate all of the possible statements if a great number of full path regular expressions or wildcard

expressions are configured, possibly impacting performance. These statements were introduced before Junos OS Release 7.4.

- **Allow/deny-configuration-regexps** statements perform faster matching, with less flexibility. You configure a set of strings in which each string is a regular expression, with spaces between the terms of the string. This provides very fast matching. However, it is more tedious to use wildcard expressions in this form of the statement, because you must set up wildcards for each token (term) of the space-delimited string you want to match. These statements were introduced in Junos OS Release 11.2.

Configuring Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with it. Users can execute only those commands and configure and view only those statements for which they have access privileges.

To configure access privilege levels, include the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
permissions [ permissions ];
```

Related Documentation

- *permissions*

Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class class-name]** hierarchy level:

```
[edit system login class class-name]
  allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class class-name]** hierarchy level:

```
[edit system login class class-name]
  deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

NOTE: Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command **set protocols** does not match anything, whereas **protocols** matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system**

software add", the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

allow-commands = "(monitor.*)"|(ping.*)"|(show.*)"|(exit)". Instead, you must specify the expression using the following syntax: **allow-commands = "(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands = "^ (monitor | ping | show | exit)"**

Specifying Access Privileges for Junos OS Configuration Mode Hierarchies

The **allow/deny-configuration** and **allow/deny-configuration-regexps** statements let you explicitly allow or deny users access privileges to portions of the configuration hierarchy. Each of these statements is added to named login classes and configured with one or more regular expressions to be allowed or denied. Each login class is assigned to specific users or user IDs.

The search and match methods differ in the two forms of these statements. You must select which form to use within a login class—you cannot configure **allow-configuration** and **allow-configuration-regexps** together in the same login class. You must select just one. If you have existing configurations using the **allow/deny-configuration** form of the statements, using the same configuration options with the **allow/deny-configuration-regexps** form of the statements might not produce the same results.

- **Allow/deny-configuration** statements perform slower matching, with more flexibility, especially in wildcard matching. However, it can take a very long time to evaluate all of the possible statements if a great number of full path regular expressions or wildcard expressions are configured, possibly impacting performance. These statements were introduced before Junos OS Release 7.4.
- **Allow/deny-configuration-regexps** statements perform faster matching, with less flexibility. You configure a set of strings in which each string is a regular expression, with spaces between the terms of the string. This provides very fast matching. However, it is more tedious to use wildcard expressions in this form of the statement, because you must set up wildcards for each token (term) of the space-delimited string you want to match. These statements were introduced in Junos OS Release 11.2.

Example: Configuring Access Privilege Levels

Create two access privilege classes on the router or switch, one for configuring and viewing user accounts only and the second for configuring and viewing SNMP parameters only:

```
[edit]
system {
  login {
    class user-accounts {
      permissions [ configure admin admin-control ];
    }
    class network-mgmt {
      permissions [ configure snmp snmp-control ];
    }
  }
}
```

- [Configuring Access Privilege Levels on page 131](#)

Example: Configuring Access Privileges for Operational Mode Commands

The following example shows how to configure access privileges for different login classes for individual operational mode commands:

```
[edit]
```

```

system {
  # This login class has operator privileges and the additional ability
  # to reboot the router.
  login {
    # This login class has operator privileges and the additional ability to reboot the
    # router or switch.
    class operator-and-boot {
      permissions [ clear network reset trace view ];
      allow-commands "request system reboot";
    }
    # This login class has operator privileges but can't use any commands beginning
    # with "set".
    # This login class has operator privileges
    # but cannot use any commands beginning with "set"
    class operator-no-set {
      permissions [ clear network reset trace view ];
      deny-commands "^set";
    }
    # This login class has operator privileges and can install software but not view
    # BGP information, and can issue the show route command, without specifying
    # commands or arguments under it.
    class operator-and-install-but-no-bgp {
      permissions [ clear network reset trace view ];
      allow-commands "(request system software add)|(show route$)";
      deny-commands "show bgp";
    }
  }
}

```

Documentation**

- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 132](#)

Example: Specifying Access Privileges Using allow/deny-configuration-regexps Statements

This example shows how to set up configuration access privileges using the **allow-configuration-regexps** and **deny-configuration-regexps** statements.

- [Requirements on page 135](#)
- [Overview on page 136](#)
- [Configuration on page 136](#)
- [Examples on page 136](#)

Requirements

This example uses the following hardware and software components:

- One Juniper Networks J Series, M Series, MX Series, or T Series device
- Junos OS Release 11.2 or later
 - There must be at least one user assigned to a login class.
 - There can be more than one login class, each with varying permission configurations, and more than one user on the device.

Overview

The **allow-configuration-regexps** and **deny-configuration-regexps** statements let you explicitly allow or deny users assigned to named user classes access privileges to portions of the configuration hierarchy, giving the system administrator precision control over who can change specific configurations in the system.

NOTE: The statements **allow-configuration-regexps** and **deny-configuration-regexps** perform similar functions as the statements **allow-configuration** and **deny-configuration**, except you can configure sets of strings in which the strings include spaces when using the first set of statements. You cannot use the two kinds of statements together.

Configuration

To set up configuration access privileges:

1. To explicitly allow one or more individual configuration mode hierarchies that would otherwise be denied, include the **allow-configuration-regexps** statement at the **[edit system login class class-name]** hierarchy level, configured with the regular expressions to be allowed.

```
[edit system login class class-name]
user@host# set allow-configuration-regexps "regular expression 1" "regular expression
2" "regular expression 3" "regular expression 4" ...
```

2. To explicitly deny one or more individual configuration hierarchies that would otherwise be allowed, include the **deny-configuration-regexps** statement at the **[edit system login class class-name]** hierarchy level, configured with the regular expressions to be denied.

```
[edit system login class class-name]
user@host# set deny-configuration-regexps "regular expression 1" "regular-expression
2" "regular expression 3" "regular expression 4"...
```

3. Assign the login class to one or more users.

```
[edit system login]
user@host# set user username class class-name
```

4. Commit your changes.

Users assigned this login class have the permissions you have set for the class.

Examples

Using Allow or Deny Configurations with Regular Expressions

Purpose This section provides examples of access privilege configurations to give you ideas for creating configurations appropriate for your system. You can use combinations of privilege statements for configuration access and for operational mode commands to give precise control over classes of access privileges.

Allow Configuration Changes The following example login class lets the user make changes at the **[edit system services]** hierarchy level and issue configuration mode commands (such as **commit**), in addition to the permissions specified by the **configure** permissions flag, which allows the user to enter configuration mode using the **configure** command.

```
[edit system login class class-name]
user@host# set permissions configure view view-configuration
user@host# set allow-configuration-regexps "system services"
```

Deny Configuration Changes The following example login class lets the user perform all operations allowed by the **all** permissions flag. However, it denies modifying the configuration at the **[edit system services]** hierarchy level.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set deny-configuration-regexps "system services"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot configure telnet parameters:

```
[edit system login class class-name]
user@host# set deny-configuration "system services telnet"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot issue login class commands within any login class whose name begins with "m":

```
[edit system login class class-name]
user@host# set deny-configuration "system login class m.*"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot edit the configuration or issue commands (such as **commit**) at the **[edit system login class]** or the **[edit system services]** hierarchy levels:

```
[edit system login class class-name]
user@host# set deny-configuration "system login class" "system services"
```

Allow and Deny Configuration Changes The following example login class lets the user perform all operations allowed by the **all** permissions flag, and explicitly grants configuration access to **[system "interfaces .* unit .* family inet address .*" protocols]**. However, the user is denied configuration access to the SNMP hierarchy level.

NOTE: You can use the ***** wildcard character when denoting regular expressions. However, it must be used as a portion of a regular expression. You cannot use **[*]** or **[.*]** alone.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set allow-configuration-regexps system "interfaces .* unit .* family inet
address .*" protocols
user@host# set deny-configuration-regexps snmp
```

Allow and Deny Multiple Configuration Changes

The following example login class lets the user perform all operations allowed by the **all** permissions flag, and explicitly grants configuration access to multiple hierarchy levels for interfaces. It denies configuration access to the **[edit system]** and **[edit protocols]** hierarchy levels.

NOTE: You can configure as many regular expressions as needed to be allowed or denied. Regular expressions to be denied take precedence over configurations to be allowed.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set allow-configuration-regexps "interfaces .* description .*" "interfaces .*
unit .* description .*" "interfaces .* unit .* family inet address .*" "interfaces .* disable"
user@host# set deny-configuration-regexps "system" "protocols"
```

Allow Configuration Changes and Deny Operations Commands

You can combine allow and deny configuration statements with allow and deny operational commands statements to fine-tune access privileges. The following example login class uses a combination of the **deny-commands** operational permissions statement and the **allow-configuration-regexps** configuration permissions statement to let the user configure and commit changes to the OSPF and BGP protocols. However, this class of user cannot issue the **show system statistics** or the **show bgp summary** commands.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set deny-commands "(show system statistics)|(show bgp summary)"
user@host# set allow-configuration-regexps "protocols ospf|bgp"
```

The following shows permissions set for individual configuration mode hierarchies:

```
[edit]
system {
  login { # This login class has operator privileges and the additional ability to edit
    # configuration at the system services hierarchy level.
    class only-system-services {
      permissions [ configure ];
      allow-configuration "system services";
    }
    # services commands.
    class all-except-system-services { # This login class has operator privileges but
      # cannot edit any system services configuration.
      permissions [ all ];
      deny-configuration "system services";
    }
  }
}
```

Verification To verify that you have set the access privileges correctly:

1. Configure a login class and commit the changes.
2. Assign the login class to a *username*.
3. Log in as the *username* assigned with the new login class.
4. Attempt to perform the configurations that have been allowed or denied.
 - You should be able to perform configuration changes to hierarchy levels and regular expressions that have been allowed.
 - You should not be able to perform configuration changes to hierarchy levels and regular expressions that have been denied.
 - Denied expressions should take precedence over allowed expressions.
 - Any allowed or denied expressions should take precedence over any permissions granted with the **permissions** statement.

interface-control

Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the **[edit chassis]**, **[edit**

`class-of-service`], `[edit groups]`, `[edit forwarding-options]`, and `[edit interfaces]` hierarchy levels.

Commands No associated CLI commands.

maintenance

Can perform system maintenance, including starting a local shell on the router and becoming the superuser in the shell, and can halt and reboot the router.

Commands

- `clear system reboot`
 - `<clear-reboot>`
- `clear-system-services-reverse-information`
- `file archive`
 - `<file-archive>`

routing-control

Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the **[edit routing-options]** hierarchy level, routing protocols at the **[edit protocols]** hierarchy level, and routing policy at the **[edit policy-options]** hierarchy level.

Commands No associated CLI commands.

Configuration Hierarchy Levels	<ul style="list-style-type: none"> [edit bridge-domains] [edit bridge-domains domain multicast-snooping-options] [edit bridge-domains domain multicast-snooping-options traceoptions] [edit dynamic-profiles protocols igmp traceoptions] [edit dynamic-profiles protocols mld traceoptions] [edit dynamic-profiles protocols router-advertisement traceoptions] [edit dynamic-profiles routing-instances] [edit dynamic-profiles routing-instances instance bridge-domains] [edit dynamic-profiles routing-instances instance bridge-domains domain multicast-snooping-options] [edit dynamic-profiles routing-instances instance bridge-domains domain multicast-snooping-options traceoptions] [edit dynamic-profiles routing-instances instance multicast-snooping-options] [edit dynamic-profiles routing-instances instance multicast-snooping-options traceoptions] [edit dynamic-profiles routing-instances instance pbb-options] [edit dynamic-profiles routing-instances instance protocols] [edit dynamic-profiles routing-instances instance protocols bgp group neighbor traceoptions] [edit dynamic-profiles routing-instances instance protocols bgp group traceoptions] [edit dynamic-profiles routing-instances instance protocols bgp traceoptions] [edit dynamic-profiles routing-instances instance protocols esis traceoptions] [edit dynamic-profiles routing-instances instance protocols isis traceoptions] [edit dynamic-profiles routing-instances instance protocols l2vpn traceoptions] [edit dynamic-profiles routing-instances instance protocols ldp traceoptions] [edit dynamic-profiles routing-instances instance protocols msdp group peer traceoptions] [edit dynamic-profiles routing-instances instance protocols msdp group traceoptions] [edit dynamic-profiles routing-instances instance protocols msdp peer traceoptions] [edit dynamic-profiles routing-instances instance protocols msdp traceoptions] [edit dynamic-profiles routing-instances instance protocols mvpn traceoptions] [edit dynamic-profiles routing-instances instance protocols ospf traceoptions] [edit dynamic-profiles routing-instances instance protocols pim traceoptions] [edit dynamic-profiles routing-instances instance protocols rip traceoptions] [edit dynamic-profiles routing-instances instance protocols ripng traceoptions] [edit dynamic-profiles routing-instances instance protocols router-discovery traceoptions] [edit dynamic-profiles routing-instances instance protocols vpls traceoptions] [edit dynamic-profiles routing-instances instance routing-options] [edit dynamic-profiles routing-instances instance routing-options multicast traceoptions] [edit dynamic-profiles routing-instances instance routing-options traceoptions] [edit dynamic-profiles routing-instances instance service-groups] [edit dynamic-profiles routing-instances instance switch-options] [edit dynamic-profiles routing-options multicast traceoptions] [edit jnx-example] [edit fabric protocols]

snmp

Can view Simple Network Management Protocol (SNMP) configuration.

Commands No associated CLI commands.

Configuration Hierarchy Levels [edit snmp]

Overview

- [Installation Overview on page 295](#)
- [Licenses Overview on page 296](#)

Installation Overview

- [Junos OS Package Names on page 295](#)

Junos OS Package Names

You upgrade the Juniper Networks Junos operating system (Junos OS) on a Juniper Networks EX Series Ethernet Switch by copying a software package to your switch or another system on your local network, then install the new software package on the switch.

A software package name is in the following format:

package-name-m.nZx.y-domestic-signed.tgz

where:

- ***package-name*** is the name of the package—for example, ***jinstall-ex-4200***.
- ***m.n*** is the software release, with ***m*** representing the major release number and ***n*** representing the minor release number—for example, ***9.5***.
- ***Z*** indicates the type of software release, where ***R*** indicates released software and ***B*** indicates beta-level software.
- ***x.y*** represents the version of the major software release (***x***) and an internal tracking number (***y***)—for example, ***1.6***.
- ***domestic-signed*** is appended to all EX Series package names. For most Junos packages, ***domestic*** is used for the United States and Canada and ***export*** for worldwide distribution. However, for EX Series software, ***domestic*** is used for worldwide distribution as well.

A sample EX Series software package name is:

`jinstall-ex-4200-9.5R1.6-domestic-signed.tgz`

Licenses Overview

- [Understanding Software Licenses for EX Series Switches on page 296](#)

Understanding Software Licenses for EX Series Switches

To enable and use some of the Juniper Networks operating system (Junos OS) features, you must purchase, install, and manage separate software licenses. If the switch has the appropriate software license, you can configure and use these features.

The Junos OS feature license (that is, the purchased authorization code) is universal. However, to conform to Junos OS feature licensing requirements, you must install a unique license key (a combination of the authorization code and the switch's serial number) on each switch.

For a Virtual Chassis deployment, two license keys are recommended for redundancy—one for the device in the master role and the other for the device in the backup role:

- In an EX8200 Virtual Chassis, the devices in the master and backup roles are always XRE200 External Routing Engines.
- In all other Virtual Chassis, the devices in the master and backup roles are switches.

You do not need additional license keys for Virtual Chassis member switches that are in the linecard role or for the redundant Routing Engine (RE) modules or the redundant Switch Fabric and Routing Engine (SRE) modules in an EX8200 member switch.

This topic describes:

- [Purchasing a Software Feature License on page 297](#)
- [Features Requiring a License on EX2200 Switches on page 297](#)
- [Features Requiring a License on EX3300 Switches on page 298](#)
- [Features Requiring a License on EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 Switches on page 299](#)
- [License Warning Messages on page 300](#)

Purchasing a Software Feature License

The following sections list features that require separate licenses. To purchase a software license, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the `show chassis hardware` command.

NOTE: You are required to provide a 12-digit serial number when purchasing a license for an XRE200 External Routing Engine in an EX8200 Virtual Chassis.

The serial number listed on the XRE200 External Routing Engine serial ID label is 16 digits long. Use the last 12 digits of the 16-digit serial number to purchase the license.

You can use the `show chassis hardware` command output to display the 12-digit serial number of the XRE200 External Routing Engine to use when you purchase the license.

Features Requiring a License on EX2200 Switches

For Juniper Networks EX2200 Ethernet Switches, the following features can be added to basic Junos OS by installing an enhanced feature license (EFL):

- Bidirectional Forwarding Detection (BFD)
- Connectivity fault management (IEEE 802.1ag)
- IGMP (Internet Group Management Protocol) version 1 (IGMPv1), IGMPv2, and IGMPv3
- OSPFv1/v2 (with four active interfaces)
- Protocol Independent Multicast (PIM) dense mode, PIM source-specific mode, PIM sparse mode
- Q-in-Q tunneling (IEEE 802.1ad)
- Real-time performance monitoring (RPM)
- Virtual Router
- Virtual Router Redundancy Protocol (VRRP)

Table 42 on page 297 lists the EFLs that you can purchase for EX2200 switch models. If you have the license, you can run all of the above-mentioned enhanced software features on your EX2200 switch.

Table 42: Junos OS EFL Part Number on EX2200 Switches

Switch Model	EFL Part Number
EX2200-C-12P-2G EX2200-C-12T-2G	EX-12-EFL

Table 42: Junos OS EFL Part Number on EX2200 Switches (*continued*)

Switch Model	EFL Part Number
EX2200-24T-4G EX2200-24P-4G EX2200-24T-DC-4G	EX-24-EFL
EX2200-48T-4G EX2200-48P-4G	EX-48-EFL

Features Requiring a License on EX3300 Switches

Two types of licenses are available on Juniper Networks EX3300 Ethernet Switches: enhanced feature licenses (EFLs) and advanced feature licenses (AFLs).

To use the following features on the EX3300 switches, you must install an EFL:

- Bidirectional Forwarding Detection (BFD)
- IGMP (Internet Group Management Protocol) version 1 (IGMPv1), IGMPv2, and IGMPv3
- IPv6 routing protocols: Multicast Listener Discovery version 1 and 2 (MLD v1/v2), OSPFv3, PIM multicast, VRRPv6, virtual router support for unicast and filter-based forwarding (FBF)
- OSPFv1/v2
- Protocol Independent Multicast (PIM) dense mode, PIM source-specific mode, PIM sparse mode
- Q-in-Q tunneling (IEEE 802.1ad)
- Virtual Router
- Virtual Router Redundancy Protocol (VRRP)

[Table 43 on page 298](#) lists the EFLs that you can purchase for EX3300 switch models. If you have the license, you can run all of the above-mentioned enhanced software features on your EX3300 switch.

Table 43: Junos OS EFL Part Number on EX3300 Switches

Switch Model	EFL Part Number
EX3300-24T EX3300-24P EX3300-24T-DC	EX-24-EFL
EX3300-48T EX3300-48T-BF EX3300-48P	EX-48-EFL

To use the following feature on EX3300 switches, you must install an AFL:

- BGP/MBGP

- IPv6 routing protocols: IPv6 BGP and IPv6 for MBGP
- Virtual routing and forwarding (VRF) BGP

[Table 44 on page 299](#) lists the AFLs that you can purchase for EX3300 switch models. For EX3300 switches, you must purchase and install a corresponding EFL along with the AFL in order to enable the advanced license features. If you have both these licenses, you can run all of the above-mentioned advanced software features on your EX3300 switch.

Table 44: Junos OS AFL Part Number on EX3300 Switches

Switch Model	AFL Part Number
EX3300-24T EX3300-24P EX3300-24T-DC	EX-24-AFL
EX3300-48T EX3300-48T-BF EX3300-48P	EX-48-AFL

Features Requiring a License on EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 Switches

To use the following features on Juniper Networks EX3200, EX4200, EX4500, EX4550, EX8200, and EX9200 Ethernet Switches, you must install an advanced feature license (AFL):

- Border Gateway Protocol (BGP) and multiprotocol BGP (MBGP)
- Intermediate System-to-Intermediate System (IS-IS)
- IPv6 routing protocols: IS-IS for IPv6, IPv6 BGP, IPv6 for MBGP
- Logical systems (available only on EX9200 switches)
- MPLS with RSVP-based label-switched paths (LSPs) and MPLS-based circuit cross-connects (CCCs) (Not supported on EX9200 switches)

To use the following features on Juniper Networks EX6200 Ethernet Switches, you must install an advanced feature license (AFL):

- Border Gateway Protocol (BGP)
- Intermediate System-to-Intermediate System (IS-IS)
- IPv6 routing protocols: IS-IS for IPv6, IPv6 BGP

[Table 45 on page 300](#) lists the AFLs that you can purchase for EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 switches. If you have the license, you can run all of the above-mentioned advanced software features on your EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, or EX9200 switch.

Table 45: Junos OS AFL Part Number on EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 Switches

Switch Model	AFL Part Number
EX3200-24P EX3200-24T EX4200-24F EX4200-24P EX4200-24PX EX4200-24T	EX-24-AFL
EX3200-48P EX3200-48T EX4200-48F EX4200-48P EX4200-48PX EX4200-48T	EX-48-AFL
EX4500-40F-BF EX4500-40F-BF-C EX4500-40F-FB EX4500-40F-FB-C	EX-48-AFL
EX4550	EX4550-AFL
EX6210	EX6210-AFL
EX8208	EX8208-AFL
EX8216	EX8216-AFL
EX-XRE200	EX-XRE200-AFL
EX9204	EX9204-AFL
EX9208	EX9208-AFL
EX9214	EX9214-AFL

License Warning Messages

For using features that require a license, you must install and configure a license key. To obtain a license key, use the contact information provided in your certificate.

If you have not purchased the AFL or EFL and installed the license key, you receive warnings when you try to commit the configuration:

```
[edit protocols]
  'bgp'
    warning: requires 'bgp' license
error: commit failed: (statements constraint check failed)
```

The system generates system log (**syslog**) alarm messages notifying you that the feature requires a license—for example:

```
Sep 3 05:59:11 craftd[806]: Minor alarm set, BGP Routing Protocol usage
requires a license
Sep 3 05:59:11 alarmd[805]: Alarm set: License color=YELLOW, class=CHASSIS,
reason=BGP Routing Protocol usage requires a license
Sep 3 05:59:11 alarmd[805]: LICENSE_EXPIRED: License for feature bgp(47) expired
```

Output of the **show system alarms** command displays the active alarms:

```
user@switch> show system alarms
1 alarm currently active
Alarm time           Class  Description
2009-09-03 06:00:11 UTC  Minor  BGP Routing Protocol usage requires a license
```

Downloading Software Packages from Juniper Networks

You can download Junos OS packages from the Juniper Networks website to upgrade software on your EX Series switch.

Before you begin to download software upgrades, ensure that you have a Juniper Networks Web account and a valid support contract. To obtain an account, complete the registration form at the Juniper Networks website: <https://www.juniper.net/registration/Register.jsp>.

To download software upgrades from Juniper Networks:

1. Using a Web browser, follow the links to the download URL on the Juniper Networks webpage. For EX Series, there are not separate software packages for Canada the U.S. and other locations. Therefore, select **Canada and U.S. Version** regardless of your location:
 - <https://www.juniper.net/support/downloads/junos.html>
2. Log in to the Juniper Networks authentication system using the username (generally your e-mail address) and password supplied by Juniper Networks representatives.

3. Using the J-Web interface or the CLI, select the appropriate software package for your application. See [“Junos OS Package Names” on page 295](#).
4. Download the software to a local host or to an internal software distribution site.

[\[edit firewall\] Hierarchy Level](#)

Several statements in the **[edit firewall]** hierarchy are valid at numerous locations within the hierarchy. To make the complete hierarchy easier to read, the repeated statements are listed in the following sections, which are referenced at the appropriate locations in “[Complete \[edit firewall\] Hierarchy](#)” on page 325.

- [Common Firewall Actions on page 320](#)
- [Common IP Firewall Actions on page 321](#)
- [Common IPv4 Firewall Actions on page 321](#)
- [Common IP Firewall Match Conditions on page 322](#)
- [Common IPv4 Firewall Match Conditions on page 323](#)
- [Common Layer 2 Firewall Match Conditions on page 323](#)
- [Complete \[edit firewall\] Hierarchy on page 325](#)

Common Firewall Actions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit firewall\] Hierarchy](#)” on page 325 instead of the statements being repeated.

- **[edit firewall family (*any* | *ccc* | *ethernet-switching* | *inet* | *inet6* | *mpls* | *vpls*) filter *filter-name* term *term-name* then]**
- **[edit firewall filter *filter-name* term *term-name* then]**

The common firewall actions are as follows:

```
count counter-name;
forwarding-class class-name;
loss-priority (high | low | medium-high | medium-low);
```

```

next term;
policer policer-name;
three-color-policer policer-name {
    (single-rate single-rate-policer-name | two-rate two-rate-policer-name);
}

```

Common IP Firewall Actions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in [“Complete \[edit firewall\] Hierarchy” on page 325](#) instead of the statements being repeated.

- **[edit firewall family inet filter *filter-name* term *term-name* then]**
- **[edit firewall family inet6 filter *filter-name* term *term-name* then]**
- **[edit firewall filter *filter-name* term *term-name* then]**

The common IP firewall actions are as follows:

```

log;
logical-system logical-system-name <routing-instance routing-instance-name>
    <topology topology-name>;
port-mirror;
port-mirror-instance instance-name;
routing-instance routing-instance-name <topology topology-name>;
sample;
service-filter-hit;
syslog;
topology topology-name;

```

Common IPv4 Firewall Actions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in [“Complete \[edit firewall\] Hierarchy” on page 325](#) instead of the statements being repeated.

- **[edit firewall family inet filter *filter-name* term *term-name* then]**
- **[edit firewall filter *filter-name* term *term-name* then]**

The common IP version 4 (IPv4) firewall actions are as follows:

```

(accept | discard <accounting collector-name> | reject <administratively-prohibited |
    bad-host-tos | bad-network-tos | fragmentation-needed | host-prohibited |
    host-unknown | host-unreachable | network-prohibited | network-unknown |
    network-unreachable | port-unreachable | precedence-cutoff | precedence-violation |
    protocol-unreachable | source-host-isolated | source-route-failed | tcp-reset>);
ipsec-sa sa-name;
load-balance sa-name;
next-hop-group group-name;
prefix-action action-name;

```

Common IP Firewall Match Conditions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit firewall\] Hierarchy](#)” on page 325 instead of the statements being repeated.

- [edit firewall family inet dialer-filter *filter-name* term *term-name* from] (with the exceptions noted at this level in “[Complete \[edit firewall\] Hierarchy](#)” on page 325)
- [edit firewall family inet filter *filter-name* term *term-name* from]
- [edit firewall family inet6 dialer-filter *filter-name* term *term-name* from] (with the exceptions noted at this level in “[Complete \[edit firewall\] Hierarchy](#)” on page 325)
- [edit firewall family inet6 filter *filter-name* term *term-name* from]
- [edit firewall filter *filter-name* term *term-name* from]

The common IP firewall match conditions are as follows:

```
address {
  ip-prefix</prefix-length> <except>;
}
destination-address {
  ip-prefix</prefix-length> <except>;
}
destination-class [ class-names ] | destination-class-except [ class-names ];
(destination-port [ port-names ] | destination-port-except [ port-names ]);
destination-prefix-list {
  list-name <except>;
}
(forwarding-class [ class-names ] | forwarding-class-except [ class-names ]);
icmp-code [ codes ] | icmp-code-except [ codes ];
icmp-type [ types ] | icmp-type-except [ types ];
interface interface-name;
(interface-group [ group-names ] | interface-group-except [ group-names ]);
interface-set set-name;
(loss-priority [ priorities ] | loss-priority-except [ priorities ]);
(packet-length [ values ] | packet-length-except [ values ]);
(port [ port-names ] | port-except [ port-names ]);
prefix-list {
  list-name <except>;
}
service-filter-hit;
source-address {
  ip-prefix</prefix-length> <except>;
}
(source-class [ class-names ] | source-class-except [ class-names ]);
(source-port [ port-names ] | source-port-except [ port-names ]);
source-prefix-list {
  list-name <except>;
}
tcp-established;
tcp-flags flag;
tcp-initial;
```

Common IPv4 Firewall Match Conditions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit firewall\] Hierarchy](#)” on page 325 instead of the statements being repeated.

- **[edit firewall family inet dialer-filter *filter-name* term *term-name* from]** (with the exceptions noted at this level in “[Complete \[edit firewall\] Hierarchy](#)” on page 325)
- **[edit firewall family inet filter *filter-name* term *term-name* from]**
- **[edit firewall filter *filter-name* term *term-name* from]**

The common IPv4 firewall match conditions are as follows:

```
(ah-spi [ values ] | ah-spi-except [ values ]);
(dscp [ code-point-values ] | dscp-except [ code-point-values ]);
(esp-spi [ values ] | esp-spi-except [ values ]);
first-fragment;
fragment-flags flag;
(fragment-offset [ offsets ] | fragment-offset-except [ offsets ]);
(ip-options [ option-names ] | ip-options-except [ option-names ]);
is-fragment;
precedence-names ] | precedence-except [ precedence-names ]);
(protocol [ protocol-names ] | protocol-except [ protocol-names ]);
(ttl [ tll-values ] | ttl-except [ tll-values ]);
```

Common Layer 2 Firewall Match Conditions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit firewall\] Hierarchy](#)” on page 325 instead of the statements being repeated.

- **[edit firewall family ethernet-switching filter *filter-name* term *term-name* from]**
- **[edit firewall family vpls filter *filter-name* term *term-name* from]**

The common Layer 2 firewall match conditions are as follows:

```
destination-mac-address {
    mac-address <except>;
}
(destination-port [ port-names ] | destination-port-except [ port-names ]);
(dscp [ code-point-values ] | dscp-except [ code-point-values ]);
(ether-type [ protocol-types ] | ether-type-except [ protocol-types ]);
(forwarding-class [ class-names ] | forwarding-class-except [ class-names ]);
(icmp-code [ codes ] | icmp-code-except [ codes ]);
(icmp-type [ types ] | icmp-type-except [ types ]);
(interface-group [ group-names ] | interface-group-except [ group-names ]);
ip-address {
    ip-prefix</prefix-length> <except>;
}
ip-destination-address {
    ip-prefix</prefix-length> <except>;
}
(ip-precedence [ precedence-names ] | ip-precedence-except [ precedence-names ]);
```

```
(ip-protocol [ protocol-names ] | ip-protocol-except [ protocol-names ]);
ip-source-address ip-prefix </prefix-length>;
(learn-vlan-1p-priority [ priorities ] | learn-vlan-1p-priority [ priorities ]);
(learn-vlan-id [ vlan-ids ] | learn-vlan-id-except [ vlan-ids ]);
(loss-priority [ priorities ] | loss-priority-except [ priorities ]);
(port [ port-names ] | port-except [ port-names ]);
source-mac-address {
    mac-address <except>;
}
(source-port [ port-names ] | source-port-except [ port-names ]);
tcp-flags flag;
(traffic-type [ broadcast known-unicast multicast unknown-unicast ] |
    traffic-type-except [ broadcast known-unicast multicast unknown-unicast ]);
(user-vlan-1p-priority [ priorities ] | user-vlan-1p-priority [ priorities ]);
(user-vlan-id [ vlan-ids ] | user-vlan-id-except [ vlan-ids ]);
(vlan-ether-type [ protocol-types ] | vlan-ether-type-except [ protocol-types ]);
```

[\[edit logical-systems\] Hierarchy Level](#)

As indicated in the following hierarchy, you can include at this hierarchy level several of the hierarchies that can be included at the **[edit]** hierarchy level. However, some statements in a subhierarchy are not valid for logical systems. To learn which statements can be included under **[edit logical-systems *logical-system-name*]** on your device, issue the **set ?** command at the hierarchy level of interest.

```

logical-systems {
  logical-system-name {
    access {
      address-assignment {
        ... same statements as in the address-assignment subhierarchy in [edit access]
        Hierarchy Level ...
      }
    }
    access-profile profile-name;
    bridge-domains {
      ... (MX Series only) same statements as in [edit bridge-domains] Hierarchy Level ...
    }
    bridge-domains {
      ... (MX Series only) same statements as in [edit bridge-domains] Hierarchy Level ...
    }
    firewall {
      ... same statements as in several subhierarchies in [edit firewall] Hierarchy Level ...
    }
    forwarding-options {
      ... same statements as in [edit forwarding-options dhcp-relay] Hierarchy Level ...
    }
    interfaces {
      interface-name {

[\[edit policy-options\] Hierarchy Level](#)

Several statements in the **[edit policy-options]** hierarchy are valid at numerous locations within the hierarchy. To make the complete hierarchy easier to read, the repeated

statements are listed in the following sections, which are referenced at the appropriate locations in [“Complete \[edit policy-options\] Hierarchy” on page 363](#).

- [Common Policy Terms on page 361](#)
- [Common Policy Match Conditions on page 362](#)
- [Common Ingress Policy Match Conditions on page 363](#)
- [Complete \[edit policy-options\] Hierarchy on page 363](#)

Common Policy Terms

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in [“Common Ingress Policy Match Conditions” on page 363](#) and [“Complete \[edit policy-options\] Hierarchy” on page 363](#) instead of the statements being repeated.

- [edit policy-options policy-statement *policy-name* from prefix-list-filter *prefix-list-name* (exact | longer | orlonger)]
- [edit policy-options policy-statement *policy-name* from route-filter *ip-prefix*</*prefix-length*> (exact | longer | orlonger | through *ip-prefix*</*prefix-length*> | upto /*prefix-length*)]
- [edit policy-options policy-statement *policy-name* from source-address-filter *ip-prefix*</*prefix-length*> (exact | longer | orlonger | through *ip-prefix*</*prefix-length*> | upto /*prefix-length*)]
- [edit policy-options policy-statement *policy-name* term *term-name* from prefix-list-filter *prefix-list-name* (exact | longer | orlonger)]
- [edit policy-options policy-statement *policy-name* term *term-name* from route-filter *ip-prefix*</*prefix-length*> (exact | longer | orlonger | through *ip-prefix*</*prefix-length*> | upto /*prefix-length*)]
- [edit policy-options policy-statement *policy-name* term *term-name* from source-address-filter *ip-prefix*</*prefix-length*> (exact | longer | orlonger | through *ip-prefix*</*prefix-length*> | upto /*prefix-length*)]
- [edit policy-options policy-statement *policy-name* then]
- [edit policy-options policy-statement *policy-name* term *term-name* then]

The common policy terms are as follows:

```
(accept | reject);
aigp-originate distance;
as-path-expand (as-number | last-as) <count number>;
as-path-prepend as-number;
class class-name;
color (preference | add number | subtract number);

trace;

```

Common Policy Match Conditions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in [“Complete \[edit policy-options\] Hierarchy” on page 363](#) instead of the statements being repeated.

- [edit policy-options policy-statement *policy-name* from]
- [edit policy-options policy-statement *policy-name* term *term-name* from]
- [edit policy-options policy-statement *policy-name* term *term-name* to]
- [edit policy-options policy-statement *policy-name* to]

The common policy match conditions are as follows:

```

area area-id;
as-path [ regular-expression-names ];
as-path-group [ as-path-group-names ];
color preference;
color2 preference;
community [ community-names ];
external {
    type (1 | 2);
}
family family-name;

```

```

Common Ingress Policy Match Conditions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in [“Complete \[edit policy-options\] Hierarchy” on page 363](#) instead of the statements being repeated at each level.

- [edit policy-options policy-statement *policy-name* from]
- [edit policy-options policy-statement *policy-name* term *term-name* from]

The common ingress policy match conditions are as follows:

```

aggregate-contributor;
condition [ conditions ];
multicast-scope (scope-value | global | link-local | node-local | organization-local |
  site-local) <orhigher | orlower>;
next-hop-type merged;
prefix-list prefix-list-name;
prefix-list-filter prefix-list-name (exact | longer | orlonger) {
  ... statements in Common Policy Terms on page 361 ...;
}
route-filter ip-prefix</prefix-length> (exact | longer | orlonger |
  through ip-prefix</prefix-length> | upto /prefix-length) {
  ... statements in Common Policy Terms on page 361 ...;
}
route-type (external | internal);
rtf-prefix-list name route-targets
source-address-filter ip-prefix</prefix-length> (exact | longer | orlonger |
  through ip-prefix</prefix-length> | upto /prefix-length) {
  ... statements in Common Policy Terms on page 361 ...;
}
state (active | inactive);

```

Complete [edit policy-options] Hierarchy

The statement hierarchy in this section can also be included at the [edit logical-systems *logical-system-name*] hierarchy level.

```
policy-options {
  as-path name regular-expression;
  as-path-group group-name {
    as-path name regular-expression;
  }
  community name {
    invert-match;
    members [ community-ids ];
  }
  condition condition-name {
    if-route-exists address table table-name;
    route-active-on (node0 | node1);
  }
  damping name {
    disable;
    half-life minutes;
    max-suppress minutes;
    reuse number;
    suppress number;
  }
  policy-statement policy-name {

bfd

Syntax	<pre> bfd { traceoptions { file <i>filename</i> <files <i>number</i>> <match <i>regular-expression</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i> <<i>flag-modifier</i>> <disable>; } } </pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols],</p> <p>[edit protocols],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols]</p>
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Configure trace options for Bidirectional Forwarding Protocol (BFD) traffic.
Default	If you do not include this statement, no BFD tracing operations are performed.
Options	<p>disable—(Optional) Disable the BFD tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the /var/log directory. We recommend that you place global routing protocol tracing output in the routing-log file.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p>Range: 2 through 1000 files</p> <p>Default: 2 files</p> <p>flag <i>flag</i>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. These are the BFD protocol tracing options:</p> <ul style="list-style-type: none"> • adjacency—Trace adjacency messages. • all—Trace all options for BFD. • error—Trace all errors. • event—Trace all events. • issu—Trace in-service software upgrade (ISSU) packet activity.

- **nsr-packet**—Trace non-stop-routing (NSR) packet activity.
- **nsr-synchronization**—Trace NSR synchronization events.
- **packet**—Trace all packets.
- **pipe**—Trace pipe messages.
- **pipe-detail**—Trace pipe messages in detail.
- **ppm-packet**—Trace packet activity by periodic packet management (PPM).
- **state**—Trace state transitions.
- **timer**—Trace timer processing.

match *regular-expression*—(Optional) Regular expression for lines to be logged.

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the trace file again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level	routing and trace—To view this statement in the configuration.
	routing-control and trace-control—To add this statement to the configuration.

[\[edit protocols bgp\] Hierarchy Level](#)

Several statements in the **[edit protocols mpls]** hierarchy are valid at numerous locations within it. To make the complete hierarchy easier to read, the repeated statements are listed in “[Common BGP Family Options](#)” on page 369 and that section is referenced at the appropriate locations in “[Complete \[edit protocols bgp\] Hierarchy](#)” on page 369.

- [Common BGP Family Options on page 369](#)
- [Complete \[edit protocols bgp\] Hierarchy on page 369](#)

Common BGP Family Options

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit protocols bgp\] Hierarchy](#)” on page 369 instead of the statements being repeated.

- [edit protocols bgp family inet (any | flow | labeled-unicast | multicast | unicast)]
- [edit protocols bgp family inet6 (any | labeled-unicast | multicast | unicast)]
- [edit protocols bgp family (inet-mdt | inet-mvpn | inet6-mvpn | l2vpn) signaling]
- [edit protocols bgp family inet-vpn (any | flow | multicast | unicast)]
- [edit protocols bgp family inet6-vpn (any | multicast | unicast)]
- [edit protocols bgp family iso-vpn unicast]

The common BGP family options are as follows:

```
accepted-prefix-limit {
    maximum number;
    teardown <percentage> <idle-timeout (forever | minutes)>;
}
damping;
loops number;
prefix-limit {
    maximum number;
    teardown <percentage> <idle-timeout (forever | minutes)>;
}
rib-group group-name;
topology name {
    community {
        target identifier;
    }
}
```

Complete [edit protocols bgp] Hierarchy

The statement hierarchy listed in this section can also be included at the [edit logical-systems *logical-system-name*] hierarchy level.

```

```

Hierarchy Level [edit logical-systems *logical-system-name* protocols],
[edit protocols]

Release Information Statement introduced before Junos OS Release 7.4.

Description Enable MLD on the routing device. MLD must be enabled for the routing device to receive multicast packets.

Default MLD is disabled on the routing device. MLD is automatically enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP).

Options The statements are explained separately.

Required Privilege routing—To view this statement in the configuration.
Level routing-control—To add this statement to the configuration.

Layer 2 Routing Instances Configuration Hierarchy

Use the **vpls** routing instance type for point-to-multipoint LAN implementations between a set of sites in a VPN.

To configure routing instances for Layer 2 networks, include the following statements:

```

routing-instances {
    routing-instance-name {
        access {
            address-assignment {
                ... same statements as in the address-assignment subhierarchy in [edit access]
                Hierarchy Level ...
            }
            address-protection;
            description text;
            egress-protection {
                context-identifier context-id;
            }
            forwarding-options {
                ...forwarding-options...
            }
            instance-role role;
            instance-type type;
            interface interface-name;
            l2-domain-id-for-l3 id;
            l2vpn-id community;
            layer3-domain-identifier identifier;
            multicast-snooping-options {
                ... same statements as in [edit multicast-snooping-options] Hierarchy Level EXCEPT
                FOR ...
                traceoptions {...} # NOT valid at this level
            }
            no-irb-layer-2-copy;
            no-local-switching;

    }
  }
}
}
}

```

With the exception of the **instance-type virtual-switch** statement (which configures a virtual-switch routing instance), you can include the statements at the following hierarchy levels:

- **[edit]**
- **[edit logical-systems *logical-system-name*]**

The **instance-type virtual-switch** statement is not supported at the **[edit logical-systems *logical-system-name*]** hierarchy level.

[edit routing-options] Hierarchy Level

Several statements in the **[edit routing-options]** hierarchy are valid at numerous locations within the hierarchy. To make the complete hierarchy easier to read, the repeated statements are listed in “[Common Routing Options](#)” on page 412 and that section is

referenced at the appropriate locations in “[Complete \[edit routing-options\] Hierarchy](#)” on page 413.

- [Common Routing Options](#) on page 412
- [Complete \[edit routing-options\] Hierarchy](#) on page 413

Common Routing Options

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit routing-options\] Hierarchy](#)” on page 413 instead of the statements being repeated.

- [\[edit routing-options aggregate defaults\]](#)
- [\[edit routing-options aggregate route *ip-prefix* </prefix-length>\]](#)
- [\[edit routing-options generate defaults\]](#)
- [\[edit routing-options generate route *ip-prefix* </prefix-length>\]](#)
- [\[edit routing-options static defaults\]](#)
- [\[edit routing-options static route *ip-prefix* </prefix-length>\]](#)

The common routing options are as follows:

```
(active | passive);
as-path {
    aggregator as-number address;
    atomic-aggregate;
    origin (egp | igp | incomplete);
    path path-identifier;
}
color metric <type metric-type>;
color2 metric <type metric-type>;
community [ community-id no-advertise no-export no-export-subconfed ];
metric metric <type metric-type>;
metric2 metric <type metric-type>;
metric3 metric <type metric-type>;
metric4 metric <type metric-type>;
passive;
preference preference-value <type metric-type>;
preference2 preference-value <type metric-type>;
tag metric <type metric-type>;
tag2 metric <type metric-type>;
```

Complete [edit routing-options] Hierarchy

The statement hierarchy in this section can also be included at the [edit logical-systems *logical-system-name*] hierarchy level.

```

Operational Commands: CLI Interface

set cli complete-on-space

Syntax	set cli complete-on-space (off on)
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the command-line interface (CLI) to complete a partial command entry when you type a space or a tab. This is the default behavior of the CLI.
Options	off —Turn off command completion. on —Allow either a space or a tab to be used for command completion.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>CLI User Interface Overview</i> • show cli on page 456
List of Sample Output	set cli complete-on-space on page 447
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli complete-on-space

In the following example, pressing the Spacebar changes the partial command entry from **com** to **complete-on-space**. The example shows how adding the keyword **off** at the end of the command disables command completion.

```
user@host> set cli com<Space>
user@host>set cli complete-on-space off
Disabling complete-on-space
```

set cli directory

Syntax	set cli directory <i>directory</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the current working directory.
Options	<i>directory</i> —Pathname of the working directory.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• <i>CLI User Interface Overview</i>• show cli directory on page 462
List of Sample Output	set cli directory on page 448
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli directory

```
user@host> set cli directory /var/home/regress
Current directory: /var/home/regress
```

set cli idle-timeout

Syntax	set cli idle-timeout < <i>minutes</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the maximum time that an individual session can be idle before the user is logged off the router or switch.
Options	<i>minutes</i> —(Optional) Maximum idle time. The range of values, in minutes, is 0 through 100,000. If you do not issue this command, and the user's login class does not specify this value, the user is never forced off the system after extended idle times. Setting the value to 0 disables the timeout.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>CLI User Interface Overview</i> • show cli on page 456
List of Sample Output	set cli idle-timeout on page 449
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli idle-timeout

```
user@host> set cli idle-timeout 60
Idle timeout set to 60 minutes
```

set cli prompt

Syntax	set cli prompt <i>string</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the prompt so that it is displayed within the CLI.
Options	<i>string</i> —CLI prompt string. To include spaces in the prompt, enclose the string in quotation marks. By default, the string is <i>username@hostname</i> .
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• CLI User Interface Overview• show cli on page 456
List of Sample Output	set cli prompt on page 450
Output Fields	When you enter this command, the new CLI prompt is displayed.

Sample Output

set cli prompt

```
user@host> set cli prompt lab1-router>  
lab1-router>
```

set cli restart-on-upgrade

Syntax	set cli restart-on-upgrade string (off on)
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	For an individual session, set the CLI to prompt you to restart the router or switch after upgrading the software.
Options	off —Disables the prompt. on —Enables the prompt.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• <i>CLI User Interface Overview</i>• show cli on page 456
List of Sample Output	set cli restart-on-upgrade on page 451
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli restart-on-upgrade

```
user@host> set cli restart-on-upgrade on
Enabling restart-on-upgrade
```

set cli screen-length

Syntax	<code>set cli screen-length <i>length</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set terminal screen length.
Options	<i>length</i> —Number of lines of text that the terminal screen displays (0 through 10,000). The default is 24.
Additional Information	The point at which the ---(more)--- prompt appears on the screen is a function of this setting and the settings for the <code>set cli screen-width</code> and <code>set cli terminal</code> commands.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• <i>CLI User Interface Overview</i>• set cli screen-width on page 453• set cli terminal on page 454• show cli on page 456
List of Sample Output	set cli screen-length on page 452
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli screen-length

```
user@host> set cli screen-length 75
Screen length set to 75
```

set cli screen-width

Syntax	<code>set cli screen-width <i>width</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the terminal screen width.
Options	<i>width</i> —Number of characters (0 through 1024) in a line. The default is 80.
Additional Information	The point at which the ---(more)--- prompt appears on the screen is a function of this setting and the settings for the <code>set cli screen-length</code> and <code>set cli terminal</code> commands.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>CLI User Interface Overview</i> • set cli screen-length on page 452 • set cli terminal on page 454 • show cli on page 456
List of Sample Output	set cli screen-width on page 453
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli screen-width

```
user@host> set cli screen-width
Screen width set to 132
```

set cli terminal

Syntax	set cli terminal <i>terminal-type</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the terminal type.
Options	<i>terminal-type</i> —Type of terminal that is connected to the Ethernet management port: <ul style="list-style-type: none">• ansi—ANSI-compatible terminal (80 characters by 24 lines)• small-xterm—Small xterm window (80 characters by 24 lines)• vt100—VT100-compatible terminal (80 characters by 24 lines)• xterm—Large xterm window (80 characters by 65 lines)
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• <i>CLI User Interface Overview</i>• set cli screen-length on page 452• set cli screen-width on page 453• show cli on page 456
List of Sample Output	set cli terminal on page 454
Output Fields	This command provides no output.

Sample Output

set cli terminal

```
user@host> set cli terminal xterm
```

set cli timestamp

Syntax	set cli timestamp (format <i>timestamp-format</i> disable)
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set a timestamp for CLI output.
Options	<p>format <i>timestamp-format</i>—Set the date and time format for the timestamp. The timestamp format you specify can include the following placeholders in any order:</p> <ul style="list-style-type: none"> • %m—Two-digit month • %d—Two-digit date • %T—Six-digit hour, minute, and seconds <p>disable—Remove the timestamp from the CLI.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>CLI User Interface Overview</i> • show cli on page 456
List of Sample Output	set cli timestamp on page 455
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli timestamp

```
user@host> set cli timestamp format '%m-%d-%T'
'04-21-17:39:13'
CLI timestamp set to: '%m-%d-%T'
```

show cli

Syntax	show cli
Syntax (QFX Series)	show cli <authorization> <directory> <history <i>count</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display configured CLI settings.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show cli on page 457
Output Fields	Table 46 on page 456 lists the output fields for the show cli command. Output fields are listed in the approximate order in which they appear.

Table 46: show cli Output Fields

Field Name	Field Description
CLI complete-on-space	Capability to complete a partial command entry when you type a space or a tab: on or off .
CLI idle-timeout	Maximum time that an individual session can be idle before the user is logged out from the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is disabled .
CLI restart-on-upgrade	CLI is set to prompt you to restart the router or switch after upgrading the software: on or off .
CLI screen-length	Number of lines of text that the terminal screen displays.
CLI screen-width	Number of characters in a line on the terminal screen.
CLI terminal	Terminal type.
CLI is operating in	Mode: enhanced .
CLI timestamp	Date and time format for the timestamp. If the timestamp is not set, the state is disabled .
CLI working directory	Pathname of the working directory.

Sample Output

show cli

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
CLI terminal is 'vt100'
CLI is operating in enhanced mode
CLI timestamp disabled
CLI working directory is '/var/home/regress'
```

show cli authorization

Syntax	show cli authorization
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the permissions for the current user.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show cli authorization on page 460
Output Fields	Table 47 on page 458 lists the output fields for the show cli authorization command. In the table, all possible permissions are displayed and output fields are listed in alphabetical order.

Table 47: show cli authorization Output Fields

Field Name	Field Description
access	Can view access configuration information.
access-control	Can modify access configuration.
admin	Can view user account information.
admin-control	Can modify user account information.
clear	Can clear learned network information.
configure	Can enter configuration mode.
control	Can modify any configuration.
edit	Can edit configuration files.
field	Reserved for field (debugging) support.
firewall	Can view firewall configuration information.
firewall-control	Can modify firewall configuration information.
floppy	Can read from and write to removable media.
flow-tap	Can view flow-tap configuration information.

Table 47: show cli authorization Output Fields (*continued*)

Field Name	Field Description
flow-tap-control	Can configure flow-tap configuration information.
idp-profiler-operation	Can configure Profiler data.
interface	Can view interface configuration information.
interface-control	Can modify interface configuration information.
maintenance	Can perform system maintenance.
network	Can access the network by entering the ping , ssh , telnet , and traceroute commands.
pgcp-session-mirroring	Can view Packet Gateway Control Protocol session mirroring configuration.
pgcp-session-mirroring-control	Can modify Packet Gateway Control Protocol session mirroring configuration all-control.
reset	Can reset or restart interfaces and system processes.
rollback	Can roll back to previous configurations.
routing	Can view routing configuration information.
routing-control	Can modify routing configuration information.
secret	Can view passwords and authentication keys in the configuration.
secret-control	Can modify passwords and authentication keys in the configuration.
security	Can view security configuration information.
security-control	Can modify security configuration information.
shell	Can start a local shell.
snmp	Can view SNMP configuration information.
snmp-control	Can modify SNMP configuration information.
system	Can view system configuration information.
system-control	Can modify system configuration information.
trace	Can view trace file settings information.

Table 47: show cli authorization Output Fields (*continued*)

Field Name	Field Description
trace-control	Can modify trace file settings information.
view	Can view current values and statistics.
view-configuration	Can view all configuration information (not including secrets).

Sample Output

show cli authorization

```

user@host> show cli authorization
Current user: 'remote' login: 'user' class ''
Permissions:
  admin      -- Can view user accounts
  admin-control-- Can modify user accounts
  clear      -- Can clear learned network information
  configure  -- Can enter configuration mode
  control    -- Can modify any configuration
  edit       -- Can edit full files
  field      -- Special for field (debug) support
  floppy     -- Can read and write from the floppy
  interface  -- Can view interface configuration
  interface-control-- Can modify interface configuration
  network    -- Can access the network
  reset      -- Can reset/restart interfaces and daemons
  routing    -- Can view routing configuration
  routing-control-- Can modify routing configuration
  shell      -- Can start a local shell
  snmp       -- Can view SNMP configuration
  snmp-control-- Can modify SNMP configuration
  system     -- Can view system configuration
  system-control-- Can modify system configuration
  trace      -- Can view trace file settings
  trace-control-- Can modify trace file settings
  view       -- Can view current values and statistics
  maintenance -- Can become the super-user
  firewall   -- Can view firewall configuration
  firewall-control-- Can modify firewall configuration
  secret     -- Can view secret configuration
  secret-control-- Can modify secret configuration
  rollback   -- Can rollback to previous configurations
  security   -- Can view security configuration
  security-control-- Can modify security configuration
  access     -- Can view access configuration
  access-control-- Can modify access configuration
  view-configuration-- Can view all configuration (not including secrets)
  flow-tap   -- Can view flow-tap configuration
  flow-tap-control-- Can configure flow-tap service
Individual command authorization:
  Allow regular expression: none
  Deny regular expression: none
  Allow configuration regular expression: none
  Deny configuration regular expression: none

```

show cli directory

Syntax	show cli directory
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the current working directory.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show cli directory on page 462
Output Fields	Table 48 on page 462 lists the output fields for the show cli directory command. Output fields are listed in the approximate order in which they appear.

Table 48: show cli directory Output Fields

Field Name	Field Description
Current directory	Pathname of the current working directory.

Sample Output

show cli directory

```
user@host> show cli directory
Current directory: /var/home/regress
```

show cli history

Syntax	<code>show cli history</code> <code><count></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display a list of previous CLI commands.
Options	none —Display all previous CLI commands. count —(Optional) Maximum number of commands to display.
Required Privilege Level	view
List of Sample Output	show cli history on page 463
Output Fields	Table 49 on page 463 lists the output fields for the show cli history command. Output fields are listed in the approximate order in which they appear.

Table 49: show cli history Output Fields

Field Name	Field Description
<i>timestamp</i>	Time at which the command was entered.
<i>command-syntax</i>	Command that was entered.

Sample Output

show cli history

```
user@host> show cli history
11:14:14 -- show arp
11:22:10 -- show cli authorization
11:27:12 -- show cli history
```

start shell

Syntax	<code>start shell (csh sh)</code> <code><user username></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type exit from the shell.
<div> NOTE:<ul style="list-style-type: none">To issue this command, the user must have the required login access privileges configured by including the permissions statement at the [edit system login class class-name] hierarchy level.UNIX wheel group membership or permissions are no longer required to issue this command.</div>	
Options	csh —Create a UNIX C shell. sh —Create a UNIX Bourne shell. user username —(Optional) Start the shell as another user.
Additional Information	When you are in the shell, the shell prompt has the following format: <code>username@hostname%</code> An example of the prompt is: <code>root@host%</code>
Required Privilege Level	shell and maintenance
List of Sample Output	start shell csh on page 464
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

start shell csh

```
user@host> start shell csh
%
exit
```

```
%  
username@hostname% start shell sh  
%  
exit  
user@host>
```

Operational Commands: Software Installation

request system license add

Syntax	<code>request system license add (<i>filename</i> terminal)</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Add a license key.
Options	<i>filename</i> —License key from a file or URL. Specify the filename or the URL where the key is located. <i>terminal</i> —License key from the terminal.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• <i>Adding New Licenses (CLI Procedure)</i>
List of Sample Output	request system license add on page 466
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system license add

```
user@host> request system license add terminal
```

request system license delete

Syntax	<code>request system license delete <i>license-id</i></code>
Syntax (QFX Series)	<code>request system license delete <i>license-identifier</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Delete a license key. You can delete only one license at a time.
Options	<i>license-id</i> —License ID that uniquely identifies a license key. <i>license-identification</i> —(QFX Series) License ID that uniquely identifies a license key.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • Deleting a License (CLI Procedure)
List of Sample Output	request system license delete on page 467
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system license delete

```
user@host> request system license delete G03000002223
```

request system license save

Syntax	<code>request system license save (<i>filename</i> terminal)</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Save installed license keys to a file or URL.
Options	<i>filename</i> —License key from a file or URL. Specify the filename or the URL where the key is located. <i>terminal</i> —License key from the terminal.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• <i>Saving License Keys</i>
List of Sample Output	request system license save on page 468
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system license save

```
user@host> request system license save ftp://user@host/license.conf
```

request system reboot

Syntax	request system reboot <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> > <media (compact-flash disk removable-compact-flash usb)> <message " <i>text</i> "> <other-routing-engine>
Syntax (EX Series Switches)	request system reboot <all-members> <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> > <local> <media (external internal)> <member <i>member-id</i> > <message " <i>text</i> "> <other-routing-engine> <slice <i>slice</i> >
Syntax (TX Matrix Router)	request system reboot <all-chassis all-lcc lcc <i>number</i> scc> <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> > <media (compact-flash disk)> <message " <i>text</i> "> <other-routing-engine>
Syntax (TX Matrix Plus Router)	request system reboot <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> > <media (compact-flash disk)> <message " <i>text</i> "> <other-routing-engine> <partition (1 2 alternate)>
Syntax (MX Series Router)	request system reboot <all-members> <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> > <local> <media (external internal)> <member <i>member-id</i> > <message " <i>text</i> "> <other-routing-engine>
Release Information	Command introduced before Junos OS Release 7.4.

Option **other-routing-engine** introduced in Junos OS Release 8.0.

Command introduced in Junos OS Release 9.0 for EX Series switches.

Option **sfc** introduced for the TX Matrix Plus router in Junos OS Release 9.6.

Option **both-routing-engines** introduced in Junos OS Release 12.1.

Description Reboot the software.

Options **none**—Reboot the software immediately.

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.

all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.

all-members—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on all members of the Virtual Chassis configuration.

at time—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **now**—Stop or reboot the software immediately. This is the default.
- **+minutes**—Number of minutes from now to reboot the software.
- **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software, specified in 24-hour time.

both-routing-engines—(Optional) Reboot both Routing Engines at the same time.

in minutes—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, the number of a specified line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively. Replace **number** with a value from 0 through 3.

local—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

media (external | internal)—(EX Series switches and MX Series routers only) (Optional) Reboot the boot media:

- **external**—Reboot the external mass storage device.

- **internal**—Reboot the internal flash device.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

message "*text*"—(Optional) Message to display to all system users before stopping or rebooting the software.

other-routing-engine—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

partition—(TX Matrix Plus routers only) (Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition.

scc—(TX Matrix routers only) (Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted.

sfc *number*—(TX Matrix Plus routers only) (Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace *number* with 0.

slice *slice*—(EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information Reboot requests are recorded in the system log files, which you can view with the **show log** command (see [show log](#)). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see [show system processes](#)).

On a TX Matrix or TX Matrix Plus router, if you issue the **request system reboot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

NOTE: Before issuing the `request system reboot` command on a TX Matrix Plus router with no options or the `all-chassis`, `all-lcc`, `lcc number`, or `sfc` options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the `request system reboot` command.

NOTE: To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

Required Privilege Level maintenance

List of Sample Output

- [request system reboot on page 472](#)
- [request system reboot \(at 2300\) on page 472](#)
- [request system reboot \(in 2 Hours\) on page 473](#)
- [request system reboot \(Immediately\) on page 473](#)
- [request system reboot \(at 1:20 AM\) on page 473](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

`request system reboot`

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

`request system reboot (at 2300)`

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

request system reboot (Immediately)

```
user@host> request system reboot at now
```

request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

request system snapshot

Syntax	request system snapshot <partition>

Syntax (J Series Routers)	request system snapshot <as-primary> <config-size <i>size</i> > <data-size <i>size</i> > <factory> <media type> <partition> <root-size <i>size</i> > <swap-size <i>size</i> >
Syntax (MX Series Routers)	request system snapshot <all-members> <local> <member <i>member-id</i> > <partition>
Syntax (TX Matrix Routers)	request system snapshot <all-chassis all-lcc lcc <i>number</i> scc> <partition>
Syntax (TX Matrix Plus Routers)	request system snapshot <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <partition>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 10.0 for EX Series switches.
Description	<ul style="list-style-type: none">On the router, back up the currently running and active file system partitions to standby partitions that are not running. Specifically, the root file system (/) is backed up to /altroot, and /config is backed up to /altconfig. The root and /config file systems are on the router's flash drive, and the /altroot and /altconfig file systems are on the router's hard drive.On the switch, take a snapshot of the files currently used to run the switch—the complete contents of the root (/) , /altroot, /config, /var, and /var-tmp directories, which include the running Junos OS, the active configuration, and log files.

CAUTION: After you run the `request system snapshot` command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

Options The specific options available depend upon the router or switch:

none—Back up the currently running software as follows:

- On the router, back up the currently running and active file system partitions to standby partitions that are not running. Specifically, the root file system (/) is backed up to `/altroot`, and `/config` is backed up to `/altconfig`. The root and `/config` file systems are on the router's flash drive, and the `/altroot` and `/altconfig` file systems are on the router's hard drive.
- On the switch, take a snapshot of the files currently used to run the switch and copy them to the media that the switch did not boot from. If the switch is booted from internal media, the snapshot is copied to external (USB) media. If the switch is booted from external (USB) media, the snapshot is copied to internal media.
- If the snapshot destination is external media but a USB flash drive is not connected, an error message is displayed.
- If the automatic snapshot procedure is already in progress, the command returns the following error: **Snapshot already in progress. Cannot start manual snapshot.** For additional information about the automatic snapshot feature, see *Understanding Resilient Dual-Root Partitions on Switches*.

all-chassis | all-lcc | lcc *number* —(TX Matrix and TX Matrix Plus router only) (Optional)

- **all-chassis**—On a TX Matrix router, archive data and executable areas for all Routing Engines in the chassis. On a TX Matrix Plus router, archive data and executable areas for all Routing Engines in the chassis.
- **all-lcc**—On a TX Matrix router, archive data and executable areas for all T640 routers (or line-card chassis) connected to a TX Matrix router. On a TX Matrix Plus router, archive data and executable areas for all T1600 routers (or line-card chassis) connected to a TX Matrix Plus router.
- **lcc *number***—On a TX Matrix router, archive data and executable areas for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, archive data and executable areas for a specific T1600 router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace *number* with a value from 0 through 3.

all-members | local | member *member-id*—(EX Series Virtual Chassis and MX Series routers only) (Optional) Specify where to place the snapshot (archive data and executable areas) in a Virtual Chassis:

- **all-members**—Create a snapshot (archive data and executable areas) for all members of the Virtual Chassis.

- **local**—Create a snapshot (archive data and executable areas) on the member of the Virtual Chassis that you are currently logged into.
- **member *member-id***—Create a snapshot (archive data and executable areas) for the specified member of the Virtual Chassis.

as-primary—(J Series routers only) (Optional) Create a snapshot that can be used to replace the medium in the primary compact flash drive. This option can be used on the removable compact flash only. The option copies the default files that were loaded on the primary compact flash drive when it was shipped from the factory, plus the rescue configuration if one has been set. This option is useful if you have multiple routers and want to use the same software and configuration on each router. After a boot device is created as a primary compact flash drive, it can operate in only a primary compact flash drive slot. This option causes the boot medium to be partitioned.

config-size *size*—(J Series routers only) (Optional) Specify the size of the config partition, in megabytes. The default value is **10** percent of physical memory on the boot partition. The config partition is mounted on **/config**, and the configuration files are stored in this partition. This option causes the boot medium to be partitioned.

data-size *size*—(J Series routers only) (Optional) Specify the size of the data partition, in megabytes. The default value is **0** MB. The data partition is mounted on **/data**. This space is not used by the router, and can be used for extra storage. This option causes the boot medium to be partitioned.

factory—(J Series routers only) (Optional) Copy only default files that were loaded on the primary compact flash drive when it was shipped from the factory, plus the rescue configuration if one has been set. After the boot medium is created with the factory option, it can operate in only the primary compact flash drive.

media *type*—(J Series routers and EX Series switches only)(Optional) Specify the boot device the software is copied to:

- **compact-flash**—Copy software to the primary compact flash drive.
- **external**—(EX Series switches only) Copy software to an external mass storage device, such as a USB flash drive. If a USB drive is not connected, the switch displays an error message.
- **internal**—(EX Series switches only) Copy software to an internal flash drive.
- **removable-compact-flash**—Copy software to the removable compact flash drive.
- **usb**—(ACX Series, M320, T640, MX960, and J Series routers only) Copy software to the device connected to the USB port.

partition—(Optional) Repartition the flash drive before a snapshot occurs. If the partition table on the flash drive is corrupted, the **request system snapshot** command fails and reports errors. The partition option is supported only for restoring the software image from the hard drive to the flash drive.

(Routers only) You cannot issue the **request system snapshot** command when you enable flash disk mirroring. We recommend that you disable flash disk mirroring when you upgrade or downgrade the software. For more information, see the *Junos OS System Basics Configuration Guide*.

(EX Series switches only) If the snapshot destination is the media that the switch did not boot from, you must use the **partition** option.

re0 | re1 | routing-engine routing-engine-id—(EX6200 and EX8200 switches only) Specify where to place the snapshot in a redundant Routing Engine configuration.

- **re0**—Create a snapshot on Routing Engine 0.
- **re1**—Create a snapshot on Routing Engine 1.
- **routing-engine routing-engine-id**—Create a snapshot on the specified Routing Engine.

root-size size—(J Series routers only) (Optional) Specify the size of the root partition, in megabytes. The default value is one-third of the physical memory minus the config, data, and swap partitions. The root partition is mounted on / and does not include configuration files. This option causes the boot medium to be partitioned.

slice alternate—(EX Series switches only) (Optional) Take a snapshot of the active root partition and copy it onto the alternate slice on the boot media.

scc—(TX Matrix routers only) (Optional) Archive data and executable areas for a TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Archive data and executable areas for a TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

swap-size size—(J Series router only) (Optional) Specify the size of the swap partition, in megabytes. The default value is one-third of the physical memory on a boot medium larger than 128 MB, or 0 MB on a smaller boot device. The swap partition is used for swap files and software failure memory snapshots. Software failure memory snapshots are saved to the boot medium only if it is specified as the dump device in the system dump-device configuration hierarchy. This option causes the boot medium to be partitioned.

- Additional Information**
- (Routers only) Before upgrading the software on the router, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.
 - (Routers only) You cannot issue the **request system snapshot** command when you enable flash disk mirroring. We recommend that you disable flash disk mirroring when you upgrade or downgrade the software. For more information, see the *Junos OS System Basics Configuration Guide*

	<ul style="list-style-type: none"> (TX Matrix and TX Matrix Plus routers only) On a routing matrix, if you issue the request system snapshot command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are backed up. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are backed up.

NOTE: On EX Series switches, the **set [*package-name package-name*]** option allows you to install only two software packages on a mixed EX4200 and EX4500 Virtual Chassis, whereas, on M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways, the **set [*package-name package-name*]** option allows you to install multiple software packages and software add-on packages at the same time.

upgrade-with-config and **upgrade-with-config-format** *format* options added in Junos OS Release 12.3 for M Series routers, MX Series routers, T Series routers, EX Series Ethernet switches, and QFX Series devices.

Description

NOTE: We recommend that you always download the software image to `/var/tmp` only. On EX Series and QFX Series switches, you must use the `/var/tmp` directory. Other directories are not supported.

Install a software package or bundle on the router or switch.

Options

package-name—Location from which the software package or bundle is to be installed.

For example:

- **/var/tmp/package-name**—For a software package or bundle that is being installed from a local directory on the router or switch.
- **protocol://hostname/pathname/package-name**—For a software package or bundle that is to be downloaded and installed from a remote location. Replace **protocol** with one of the following:
 - **ftp**—File Transfer Protocol.
Use **ftp://hostname/pathname/package-name**. To specify authentication credentials, use **ftp://<username>:<password>@hostname/pathname/package-name**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
 - **http**—Hypertext Transfer Protocol.
Use **http://hostname/pathname/package-name**. To specify authentication credentials, use **http://<username>:<password>@hostname/pathname/package-name**. If a password is required and you omit it, you are prompted for it.
 - **scp**—Secure copy (available only for Canada and U.S. version).
Use **scp://hostname/pathname/package-name**. To specify authentication credentials, use **scp://<username>:<password>@hostname/pathname/package-name**.

NOTE:

- The *pathname* in the protocol is the relative path to the user's home directory on the remote system and not the root directory.
- Do not use the `scp` protocol in the `request system software add` command to download and install a software package or bundle from a remote location. The previous statement does not apply to the QFabric switch. The software upgrade is handled by the MGD process which does not support `scp`.
Use the `file copy` command to copy the software package or bundle from the remote location to the `/var/tmp` directory on the hard disk:
`file copy scp://source/package-name /var/tmp`
Then install the software package or bundle using the `request system software add` command:
`request system software add /var/tmp/package-name`
- On a J Series Services Router, when you install the software from a remote location, the package is removed at the earliest opportunity in order to make room for the installation to be completed. If you copy the software to a local directory on the router and then install the new package, use the `unlink` option to achieve the same effect and allow the installation to be completed.

best-effort-load—(Optional) Activate a partial load and treat parsing errors as warnings instead of errors.

component all—(QFabric systems only) (Optional) Install software package on all of the QFabric components.

delay-restart—(Optional) Install a software package or bundle, but do not restart software processes.

force—(Optional) Force the addition of the software package or bundle (ignore warnings).

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) In a routing matrix based on the TX Matrix router, install a software package or bundle on a T640 router (or line-card chassis) that is connected to the TX Matrix router. In a routing matrix based on the TX Matrix Plus router, install a software package or bundle on a T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace *number* with a value from 0 through 3.

member member-id—(MX Series routers only) (Optional) Install a software package on the specified Virtual Chassis member. Replace *member-id* with a value of 0 or 1.

partition—(QFX3500 switches only) (Optional) Format and repartition the media before installation.

scc—(TX Matrix routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix Plus router (or switch-fabric chassis). Replace *number* with **0**.

no-copy—(Optional) Install a software package or bundle, but do not save copies of the package or bundle files.

no-validate—(Optional) When loading a software package or bundle with a different release, suppress the default behavior of the **validate** option.

re0 | re1—(Optional) On routers or switches that support dual or redundant Routing Engines, load a software package or bundle on the Routing Engine in slot 0 (**re0**) or the Routing Engine in slot 1 (**re1**).

reboot—(Optional) After adding the software package or bundle, reboot the system. On a QFabric switch, the software installation is not complete until you reboot the component for which you have installed the software.

set [package-name package-name]—(Mixed EX4200 and EX4500 Virtual Chassis only) (Optional) Install two software packages—a package for an EX4200 switch and the same release of the package for an EX4500 switch—to upgrade all member switches in a mixed EX4200 and EX4500 Virtual Chassis.

set [package-name package-name]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages and software add-on packages at the same time.

unlink—(Optional) On J Series Services Routers, this option ensures that the software package is removed at the earliest opportunity in order to make room for the installation to be completed. On M Series, T Series, and MX Series routers, use the **unlink** option to remove the software package from this directory after a successful upgrade is completed.

upgrade-with-config—(Optional) Install one or more configuration files.

upgrade-with-config-format format—(Optional) Specify the configuration file format, **text** or **xml**. The default format is **text**.

NOTE: The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the **.failed** suffix.

validate—(Optional) Validate the software package or bundle against the current configuration as a prerequisite to adding the software package or bundle. This is the default behavior when the software package or bundle being added is a different release.

Additional Information

NOTE: The **request system snapshot** command is currently not supported on the QFabric system. Also, you cannot add or install multiple packages on a QFabric system.

Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router or switch and are satisfied that the new package or bundle is successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.

After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

If you are upgrading more than one package at the same time, delete the operating system package, **jkernl**, last. Add the operating system package, **jkernl**, first and the routing software package, **jroute**, last. If you are upgrading all packages at once, delete and add them in the following order:

```
user@host> request system software add /var/tmp/jbase
user@host> request system software add /var/tmp/jkernl
user@host> request system software add /var/tmp/jpfe
user@host> request system software add /var/tmp/jdocs
user@host> request system software add /var/tmp/jroute
user@host> request system software add /var/tmp/jcrypto
```

By default, when you issue the **request system software add package-name** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, when you issue the **request system software add package-name** command on a TX Matrix Plus master Routing Engine, all the T1600 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix Plus backup Routing Engine, all the T1600 backup Routing Engines that are connected to it are upgraded to the same version of software.

```
user@switch> request system software add /pbdata/packages/jinstall-qfabric-12.2X50-D1.3.rpm  
component all  
...
```

request system software delete

Syntax	request system software delete <i>software-package</i> <force> <reboot> <set [<i>package-name package-name</i>]>
Syntax (TX Matrix Router)	request system software delete <i>software-package</i> <force> <lcc <i>number</i> scc> <reboot> <set [<i>package-name package-name</i>]>
Syntax (TX Matrix Plus Router)	request system software delete <i>software-package</i> <force> <lcc <i>number</i> sfc <i>number</i> > <reboot> <set [<i>package-name package-name</i>]>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option set [<i>package-name package-name</i>] added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Services Gateways.</p> <p>Option reboot introduced in Junos OS Release 12.3.</p>
Description	Remove a software package or bundle from the router or switch.
<div style="display: flex; align-items: center;">  <div style="margin-left: 10px;"> <p>CAUTION: Before removing a software package or bundle, make sure that you have already placed the new software package or bundle that you intend to load onto the router or switch.</p> </div> </div>	
Options	<p><i>software-package</i>—Software package or bundle name. You can delete any or all of the following software bundles or packages:</p> <ul style="list-style-type: none"> • jbase—(Optional) Junos base software suite • jcrypto—(Optional, in domestic version only) Junos security software • jdocs—(Optional) Junos online documentation file • jkernel—(Optional) Junos kernel software suite • jpfe—(Optional) Junos Packet Forwarding Engine support • jroute—(Optional) Junos routing software suite • junos—(Optional) Junos base software

NOTE: On EX Series switches, some of the package names are different than those listed. To see the list of packages that you can delete on an EX Series switch, enter the command **show system software**.

force—(Optional) Ignore warnings and force removal of the software.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, remove an extension or upgrade package from a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, remove an extension or upgrade package from a specific T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

reboot—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software delete** command.

scc—(TX Matrix routers only) (Optional) Remove an extension or upgrade package from the TX Matrix router (or switch-card chassis).

set [*package-name package-name*]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

sfc *number*—(TX Matrix Plus routers only) (Optional) Remove an extension or upgrade package from the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

Additional Information Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

request system software rollback

Syntax	request system software rollback
Syntax (EX Series Switches)	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
Syntax (TX Matrix Router)	request system software rollback <lcc <i>number</i> scc> <reboot>
Syntax (TX Matrix Plus Router)	request system software rollback <lcc <i>number</i> sfc <i>number</i> > <reboot>
Syntax (MX Series Router)	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command behavior changed in Junos OS Release 12.1.</p> <p>Option reboot introduced in Junos OS Release 12.3.</p>
Description	<p>For all versions of Junos OS up to and including Junos OS 11.4, revert to the software that was loaded at the last successful request system software add command.</p> <p>As of Junos OS 12.1 and greater, revert to the last known good state before the most recent request system software (add delete) command. For example, using rollback in Junos OS 12.1 after using request system software add restores the system to a known good state prior to using the add command. Similarly, using rollback in Junos OS 12.1 after using request system software delete restores the system to a known good state prior to using the delete command.</p> <p>A software rollback fails if any required package (or a jbundle package containing the required package) cannot be found in /var/sw/pkg.</p> <p><i>Additional Information</i></p> <ul style="list-style-type: none">On M Series and T Series routers, if request system software add <jinstall> reboot was used for the previous installation, then request system software rollback has no effect. In this case, use jinstall to reinstall the required package.

- On M Series and T Series routers, if **request system software add <sdk1>** was used for the previous installation, then **request system software rollback** removes the last installed SDK package (**sdk1** in this example).
- On SRX Series devices with dual root systems, when **request system software rollback** is run, the system switches to the alternate root. Each root can have a different version of Junos OS. Rollback takes each root back to the previously installed image.

Options **all-members**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on all members of the Virtual Chassis configuration.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, attempt to roll back to the previous set of packages on a T640 router (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, attempt to roll back to the previous set of packages on a T1600 router (or line-card chassis) connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

local—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the local Virtual Chassis member.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace **member-id** with a value from 0 through 9. For an MX Series Virtual Chassis, replace **member-id** with a value of 0 or 1.

none—For all versions of Junos OS up to and including Junos OS 11.4, revert to the set of software as of the last successful **request system software add**. As of Junos OS 12.1 and greater, revert to the last known good state before the most recent **request system software (add | delete)** command.

reboot—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software rollback** command.

scc—(TX Matrix routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with 0.

request system software validate

Syntax	request system software validate <i>package-name</i> <set [<i>package-name package-name</i>]> <upgrade-with-config> <upgrade-with-config-format <i>format</i> >
Syntax (TX Matrix Router)	request system software validate <i>package-name</i> <lcc <i>number</i> scc> <set [<i>package-name package-name</i>]> <upgrade-with-config> <upgrade-with-config-format <i>format</i> >
Syntax (TX Matrix Plus Router)	request system software validate <i>package-name</i> <lcc <i>number</i> sfc <i>number</i> > <set [<i>package-name package-name</i>]> <upgrade-with-config> <upgrade-with-config-format <i>format</i> >
Syntax (MX Series Router)	request system software validate <i>package-name</i> <member <i>member-id</i> > <set [<i>package-name package-name</i>]> <upgrade-with-config> <upgrade-with-config-format <i>format</i> >
Release Information	Command introduced before Junos OS Release 7.4. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. set [<i>package-name package-name</i>] option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways. upgrade-with-config and upgrade-with-config-format <i>format</i> options added in Junos OS Release 12.3 for M Series routers, MX Series routers, and T Series routers.
Description	Validate candidate software against the current configuration of the router.
Options	<p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, validate the software bundle or package on a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, validate the software bundle or package on a specific T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace <i>number</i> with a value from 0 through 3.</p> <p>member <i>member-id</i>—(MX Series routers only) (Optional) Validate the software bundle or package on the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace <i>member-id</i> with a value of 0 or 1.</p> <p><i>package-name</i>—Name of the software bundle or package to test.</p> <p>scc—(TX Matrix routers only) (Optional) Validate the software bundle or package for the TX Matrix router (or switch-card chassis).</p>

set [*package-name package-name*]**—**(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

sfc number**—**(TX Matrix Plus routers only) (Optional) Validate the software bundle or package for the TX Matrix Plus router (or switch-fabric chassis).

upgrade-with-config**—**(Optional) Install one or more configuration files.

upgrade-with-config-format *format***—**(Optional) Specify the configuration file format, **text** or **xml**. The default format is **text**.

NOTE: The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the **.failed** suffix.

Additional Information By default, when you issue the **request system software validate** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are validated. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, if you issue the **request system software validate** command on a TX Matrix Plus master Routing Engine, all the T1600 master Routing Engines that are connected to it are validated. If you issue the same command on a TX Matrix Plus backup Routing Engine, all the T1600 backup Routing Engines that are connected to it are upgraded to the same version of software.

request system zeroize

Syntax	request system zeroize <media>
Release Information	<p>Command introduced before Junos OS Release 9.0.</p> <p>Command introduced in Junos OS Release 11.2 for EX Series switches.</p> <p>Option media added in Junos OS Release 11.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.2 for MX Series devices.</p> <p>Command introduced in Junos OS Release 12.3 for the QFX Series.</p>
Description	<div>  <p>NOTE: The media option is not available on the QFX Series.</p> </div> <p>Remove all configuration information on the Routing Engines and reset all key values. If the device has dual Routing Engines, the command is broadcast to all Routing Engines on the device. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories. The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.</p> <p>This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as root and start the Junos OS command-line interface (CLI) by typing cli at the prompt.</p> <p>To completely erase user-created data so that it is unrecoverable, use the media option.</p>
Options	<p>media—(Optional) In addition to removing all configuration and log files, the media option causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and the like. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the request system zeroize media operation can take considerably more time than the request system zeroize operation. However, the critical security parameters are all removed at the beginning of the process.</p>

show system boot-messages

Syntax	show system boot-messages
Syntax (EX Series Switches)	show system boot-messages <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system boot-messages <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system boot-messages <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system boot-messages <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system boot-messages infrastructure <i>name</i> interconnect-device <i>name</i> node-group <i>name</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display initial messages generated by the system kernel upon startup. These messages are the contents of <code>/var/run/dmesg.boot</code> .
Options	none —Display all boot time messages. all-chassis —(TX Matrix and TX Matrix Plus routers only) (Optional) Display boot time messages for all of the chassis. all-lcc —(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for all T640 routers (or line-card chassis) connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for all T1600 routers (or line-card chassis) connected to a TX Matrix Plus router. all-members —(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration. infrastructure <i>name</i> —(QFabric systems only) (Optional) Display boot time messages on the fabric control Routing Engine or fabric manager Routing engines. interconnect-device <i>name</i> —(QFabric systems only) (Optional) Display boot time messages on the Interconnect device. lcc <i>number</i> —(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for a specific T640 router connected to a TX Matrix

router. On a TX Matrix Plus router, display boot time messages for a specific T1600 router connected to a TX Matrix Plus router. Replace *number* with a value from 0 through 3.

local—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display boot time messages on the Node group.

scc—(TX Matrix routers only) (Optional) Display boot time messages for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display boot time messages for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

Additional Information By default, when you issue the **show system boot-messages** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) master Routing Engines or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) backup Routing Engines or T1600 (routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

show system license

Syntax	show system license <installed keys usage>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display licenses and information about how they are used.
Options	<p>none—Display all license information.</p> <p>installed—(Optional) Display installed licenses only.</p> <p>keys—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.</p> <p>usage—(Optional) Display the state of licensed features.</p>
Required Privilege Level	maintenance
List of Sample Output	show system license on page 512 show system license installed on page 512 show system license keys on page 513 show system license usage on page 513 show system license (QFX Series) on page 513
Output Fields	Table 50 on page 511 lists the output fields for the show system license command. Output fields are listed in the approximate order in which they appear.

Table 50: show system license Output Fields

Field Name	Field Description
Feature name	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.
Licenses used	<p>Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.</p> <p>NOTE: In Junos OS Release 10.1 and later, the Licenses used column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (scale-subscriber), L2TP (scale-l2tp), Mobile IP (scale-mobile-ip), and so on.</p>

Table 50: show system license Output Fields (*continued*)

Field Name	Field Description
Licenses installed	<p>Information about the installed license key:</p> <ul style="list-style-type: none"> License identifier—Identifier associated with a license key. State—State of the license key: valid or invalid. An invalid state indicates that the key was entered incorrectly or is not valid for the specific device. License version—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key. Valid for device—Device that can use a license key. Group defined—Group membership of a device. Features—Feature associated with a license, such as data link switching (DLSw).
Licenses needed	Number of licenses required for features being used but not yet properly licensed.
Expiry	Amount of time left within the grace period before a license is required for a feature being used.

show system snapshot

Syntax	show system snapshot
Syntax (EX Series Switches)	show system snapshot <all-members local member <i>member-id</i> > <media (external internal)>
Release Information	Command introduced in Junos OS Release 7.6. Command introduced in Junos OS Release 10.0 for EX Series switches.
Description	<p>Display information about the backup software:</p> <ul style="list-style-type: none"> On the routers, display information about the backup software, which is located in the /altroot, and /altconfig file systems or on the alternate media. On the switches, display information about the backup of the root file system (/) and directories /altroot, /config, /var, and /var/tmp, which are located either on an external USB flash drive or in internal flash memory.
	<div>  <p>NOTE: To back up software, use the request system snapshot command.</p> </div>
Options	<p>none—Display information about the backup software.</p> <p>all-members local member <i>member-id</i>—(EX Series switch Virtual Chassis only) (Optional) Display the snapshot in a Virtual Chassis:</p> <ul style="list-style-type: none"> all-members—Display the snapshot for all members of the Virtual Chassis. local—Display the snapshot on the member of the Virtual Chassis that you are currently logged into. member <i>member-id</i>—Display the snapshot for the specified member of the Virtual Chassis. <p>media (external internal)—(EX Series switch only) (Optional) Display the destination media location for the snapshot. The external option specifies the snapshot on an external mass storage device, such as a USB flash drive. The internal option specifies the snapshot on an internal memory source, such as internal flash memory. If no additional options are specified, the command displays the snapshot stored in both slices.</p>

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option for the TX Matrix Plus router introduced in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	Display information about the conditions that have been configured to trigger alarms.
Options	none —Display information about the conditions that have been configured to trigger alarms.

all-members—(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.

lcc *number* — (TX Matrix and TX Matrix Plus routers only) (Optional) On the TX Matrix router, show information about a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On the TX Matrix Plus router, show information about a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

local—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.

scc—(TX Matrix router only) (Optional) Show information about the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Show information about the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

Additional Information You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (**Plane/FPC/PFE**) for link errors in the chassis.

In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby sonic clock generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257
```

Apr 12 08:04:19 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code: 559

To understand what CM_ALARM error codes mean, you need to first identify the structure of the CM_ALARM code. A CM_ALARM code has the following structure:

Bits:	Error type:
1-31	Major (1)
0	Minor (0)

As per the above table, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code: 559

First, you have to convert 559 to binary; that is **100010111**. The LSB in this case is 1, which means that this is a major alarm. After removing the LSB, you are left with **10001011**, which is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

Chip Type: L Chip	Code
CMALARM_LCHIP_LOUT_DESRD_PARITY_ERR	1
CMALARM_LCHIP_LOUT_DESRD_UNINIT_ERR	2
CMALARM_LCHIP_LOUT_DESRD_ILLEGALLINK_ERR	3
CMALARM_LCHIP_LOUT_DESRD_ILLEGALSIZERR	4
CMALARM_LCHIP_LOUT_HDRF_TOERR_ERR	5
CMALARM_LCHIP_LOUT_HDRF_PARITY_ERR	6
CMALARM_LCHIP_LOUT_HDRF_UCERR_ERR	7
CMALARM_LCHIP_LOUT_NLIF_CRCDROP_ERR	8
CMALARM_LCHIP_LOUT_NLIF_CRCERR_ERR	9
CMALARM_LCHIP_UCODE_TIMEOUT_ERR	10
CMALARM_LCHIP_LIN_SRCTL_ACCT_DROP_ERR	11
CMALARM_LCHIP_LIN_SRCTL_ACCT_ADDR_SIZE_ERR	12

CMALARM_LCHIP_SRAM_PARITY_ERR	13
CMALARM_LCHIP_UCODE_OVFLW_ERR	14
CMALARM_LCHIP_LOUT_HDRF_MTU_ERR	15
<hr/>	
Chip Type: M Chip	Code
CMALARM_MCHIP_ECC_UNCORRECT_ERR	128
<hr/>	
Chip Type: N Chip	Code
CMALARM_NCHIP_RDDMA_JBUS_TIMEOUT_ERR	256
CMALARM_NCHIP_RDDMA_FIFO_OVFLW_ERR	257
CMALARM_NCHIP_RDDMA_FIFO_UNFLW_ERR	258
CMALARM_NCHIP_RDDMA_SIZE_ERR	259
CMALARM_NCHIP_RDDMA_JBUS_CRC_ERR	260
CMALARM_NCHIP_WRDMA_PKTR_ERR	261
CMALARM_NCHIP_WRDMA_PKT_CRC_ERR	262
CMALARM_NCHIP_WRDMA_JBUS_TIMEOUT_ERR	263
CMALARM_NCHIP_WRDMA_FIFO_OVFLW_ERR	264
CMALARM_NCHIP_WRDMA_FIFO_UNFLW_ERR	265
CMALARM_NCHIP_WRDMA_PKT_LEN_ERR	266
CMALARM_NCHIP_WRDMA_JBUS_CRC_ERR	267
CMALARM_NCHIP_PKTR_DMA_AGE_ERR	268
CMALARM_NCHIP_PKTR_ICELLSIG_ERR	269
CMALARM_NCHIP_PKTR_FTTL_ERR	270
CMALARM_NCHIP_RODR_OFFSET_OVFLW_ERR	271
CMALARM_NCHIP_PKTR_TMO_CELL_ERR	272
CMALARM_NCHIP_PKTR_TMO_OUTRANGE_ERR	273
CMALARM_NCHIP_PKTR_MD_REQUEST_Q_OVFLW_ERR	274

CMALARM_NCHIP_PKTR_DMA_BUFFER_OVFLW_ERR	275
CMALARM_NCHIP_PKTR_GRT_OVFLW_ERR	276
CMALARM_NCHIP_FRQ_ERR	277
CMALARM_NCHIP_RODR_IN_Q_OVFLW_ERR	278
CMALARM_NCHIP_DBUF_CRC_ERR	279
<hr/>	
Chip Type: R Chip	Code
CMALARM_RCHIP_SRAM_PARITY_ERR	512
<hr/>	
Chip Type: R Chip	Code
CMALARM_ICHIP_WO_DESRD_ID_ERR	601
CMALARM_ICHIP_WO_DESRD_DATA_ERR	602
CMALARM_ICHIP_WO_DESRD_OFLOW_ERR	603
CMALARM_ICHIP_WO_HDRF_UCERR_ERR	604
CMALARM_ICHIP_WO_HDRF_MTUERR_ERR	605
CMALARM_ICHIP_WO_HDRF_PARITY_ERR	606
CMALARM_ICHIP_WO_HDRF_TOERR_ERR	607
CMALARM_ICHIP_WO_IP_CRC_ERR	608
CMALARM_ICHIP_WO_IP_INTER_ERR	609
CMALARM_ICHIP_WI_WAN_TIMEOUT_ERR	625
CMALARM_ICHIP_WI_FAB_TIMEOUT_ERR	626
CMALARM_ICHIP_RLDRAM_BIST_ERR	630
CMALARM_ICHIP_SDRAM_BIST_ERR	631
CMALARM_ICHIP_RLDRAM_PARITY_ERR	632
CMALARM_ICHIP_SDRAM_UNCORRECT_ERR	633
CMALARM_ICHIP_SDRAM_CORRECT_ERR	634
CMALARM_ICHIP_FUSE_DONE_ERR	635

According to the table above, the **279** error code corresponds to **CMALARM_NCHIP_DBUF_CRC_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice-versa, you may use the following shortcut:

For major alarms, the **Actual Error Code = (Error Code - 1)/2**, where **Error Code** is the code that you get in the log message. For example, if you get the following log:

Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257

Actual Error Code = $(257-1)/2 = 128$. Similarly, for minor alarms, Actual Error Code = $(\text{Error Code})/2$

show chassis alarms (Alarms on a T4000 Router After the enhanced-mode Statement is Enabled)

On T4000 routers, when you include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router are online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation of the alarms.

Description	<p>Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.</p> <p>In addition on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.</p>

Options **none**—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached T1600 routers.

all-members—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.

adc **adc-slot-number**—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace **adc-slot-number** with a value from 0 through 19. For MX2010 routers, replace **adc-slot-number** with a value from 0 through 9.

cb **cb-slot-number**—(ACX Series Universal Access Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, PTX Series Packet Transport Switches, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace **cb-slot** with 0 or 1. For the EX Series switches, see *EX Series Switches Hardware and CLI Terminology Mapping* for information on CB slot numbering.

cb interconnect-device name—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.

ccg **ccg-slot-number**—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace **cb-slot** with a value of 0 or 1.

fpc **fpc-slot**—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, PTX Series Packet Transport Switches, QFX Series, QFX3500 switches, QFabric systems, and T Series routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 routers, replace **fpc-slot** with a value from 0 through 9. For MX2020 routers, replace **fpc-slot** with a value from 0 through 19. For information about FPC numbering, see [show chassis environment fpc](#). On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see *EX Series Switches Hardware and CLI Terminology Mapping* for information on FPC numbering.

fpm—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, PTX Series, Packet Transport Switches, and T Series routers only) (Optional) Display chassis environmental information for the craft interface (FPM).

interconnect-device name—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

monitored—(MX2020 routers and PTX Series Packet Transport Switches only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display chassis environmental information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display chassis environmental information for a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

local—(MX Series routers and EX Series switches) (Optional) Display chassis environmental information for the local Virtual Chassis member.

member *member-id*—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace ***member-id*** with a value of 0 or 1. For EX Series switches, see *member* for member ID values.

node-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

pdu *pdu-slot-number*—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

pem—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

pem *pem-slot-number*—(ACX Series Universal Access Routers, M120, M320, and M40e routers, MX Series routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see [show chassis environment pem](#).

psm *psm-slot-number*—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace ***psm-slot-number*** with a value from 0 through 17. For MX2010 routers, replace ***psm-slot-number*** with a value from 0 through 8.

psu *psu-slot-number*—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply. See *EX Series Switches Hardware and CLI Terminology Mapping* for detailed information.

routing-engine—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

routing-engine *re-slot-number*—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see [show chassis environment routing-engine](#).

scg—(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

scc—(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (or switch-card chassis).

sfb *sfb-slot-number*—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. Replace ***sfb-slot-number*** with a value from 0 through 7.

sfc *number*—(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

sib *sib-slot-number*—(M320 routers, PTX Series Packet Transport Switches, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see *show chassis environment sib*.

Output Fields [Table 53 on page 534](#) lists the output fields for the **show chassis environment** command. Output fields are listed in the approximate order in which they appear.

Table 53: show chassis environment Output Fields

Field Name	Field Description
Class	<p>Information about the category or class of chassis component:</p> <ul style="list-style-type: none"> • Power: Power information: <ul style="list-style-type: none"> • (M5, M10, M20, and M40 routers and EX Series switches only) Power supply status: OK, Testing, (during initial power-on), Failed, or Absent. • (M7i, M10i, M40e, M120, M160, M320, and T Series routers and EX Series switches only) Power Entry Modules status: OK, Testing, (during initial power-on), Check, Failed, or Absent. • (PTX Series only) Power information is reported in PDU or PSM combinations. The status is: OK, Testing, (during initial power-on), Check, Failed, or Absent. • Temp: Temperature of air flowing through the chassis in degrees Celsius (C) and Fahrenheit (F). <ul style="list-style-type: none"> • On PTX Series Packet Transport Switches and MX2010 and MX2020 Routers, multiple cooling zones are supported. FRU temperatures in each zone are coordinated with the fan speed of fan trays in those zones. • EX2200 switches have a side-to-rear cooling system. The Local Intake temperature is measured by the sensor on the right side of the chassis, and the Remote Intake temperature is measured by the sensor on the left side of the chassis. • Pic: On ACX4000 Routers, multiple temperature channels on a MIC. The status is: OK and the Measurement is in degrees Celsius (C) and Fahrenheit (F). • Fan: Fan status: OK, Testing (during initial power-on), Failed, or Absent. On PTX Series Packet Transport Switches and MX2010 and MX2020 Routers, multiple fan trays are supported. Fan status is reported in Fan Tray or Fan combinations. Measurement indicates actual fan RPM (PTX and MX2010 and MX2020 Routers only). • Misc: Information about other components of the chassis. <ul style="list-style-type: none"> • On some routers, this field indicates the status of one or more additional components. • On the M40e, M160, and M320 router, Misc includes CIP (Connector Interface Panel). OK indicates that the CIP is present. Absent indicates that the CIP is not present. • On T Series routers, Misc includes CIP and SPMB (Switch Processor Mezzanine Board). OK indicates that the CIP or SPMB is present. Absent indicates that the CIP or SPMB is not present. • On PTX Series Packet Transport Switches, Misc includes the SPMB (Switch Processor Mezzanine Board). The SPMB is located on the control boards. OK indicates that the control board is present. Absent indicates that the control board is not present.
Item	(MX2010 and MX2020 Routers) Information about the chassis component: Routing Engines, Controls Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).

Table 53: show chassis environment Output Fields (*continued*)

Field Name	Field Description
Status	<p>(MX2010 and MX2020 Routers) Status of the specified chassis component. For example, if the Class is Fan, the fan status can be:</p> <ul style="list-style-type: none"> • OK: The fans are operational. • Testing: The fans are being tested during initial power-on. • Failed: The fans have failed or the fans are not spinning. • Absent: The fan tray is not installed. <p>If the Class is Power, the power supply status can be:</p> <ul style="list-style-type: none"> • OK: The power component is operational. • Testing: The power component is being tested during initial power-on. • Check: There is insufficient power---that is, fewer than the minimum required feeds are connected. • Failed: The inputs leads have failed. • Absent: The power component is not installed.
Measurement	<p>(MX2010 and MX2020 Routers) Dependant on the Class. For example, if the Class is Temp, indicates the temperature in degree Celsius and degrees Fahrenheit. If the Class is Fan, indicates actual fan RPM.</p>

Description	(M120, M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Switches only) Display environmental information about the Control Boards (CBs). For information about the meaning of “CBs” on the switches, see <i>EX Series Switches Hardware and CLI Terminology Mapping</i> .
Options	none —Display environmental information about all CBs. For a TX Matrix router, display environmental information about all CBs on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all CBs on the TX Matrix Plus router and its attached T1600 routers.

all-members—(MX Series routers only) (Optional) Display environmental information about the CBs on all the members of the Virtual Chassis configuration.

interconnect-device—(QFabric systems only) Display environmental information about the CBs on the Interconnect device.

lcc-number—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, display environmental information about the CBs in a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. For a TX Matrix Plus router, display environmental information about the CBs in a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

local—(MX Series routers only) (Optional) Display environmental information about the CBs on the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Display environmental information about the CBs on the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display environmental information about the CBs in the TX Matrix router (or switch-card chassis).

sfc-number—(TX Matrix Plus router only) (Optional) Display environmental information about the CBs in the TX Matrix Plus router (or switch-fabric chassis).

slot—(Optional) Display environmental information about the specified CB. On routers and PTX Series Packet Transport Switches, replace **slot** with 0 or 1. On EX Series switches replace **slot** with 0, 1, or 2. On QFX Series switches, replace **slot** with 0 or 1.

Output Fields [Table 54 on page 580](#) lists the output fields for the **show chassis environment cb** command. Output fields are listed in the approximate order in which they appear.

Table 54: show chassis environment cb Output Fields

Field Name	Field Description
State	<p>Status of the CB. If two CBs are installed and online, one is functioning as the master, and the other is the standby.</p> <ul style="list-style-type: none"> • Online—CB is online and running. • Offline—CB is powered down. <p>NOTE: On the EX8208 switch, the installation can include three CBs. See <i>EX Series Switches Hardware and CLI Terminology Mapping</i>.</p>
Temperature	<p>Temperature in Celsius (C) and Fahrenheit (F) of the air flowing past the CB.</p> <ul style="list-style-type: none"> • Temperature Intake—Measures the temperature of the air intake to cool the power supplies. • Temperature Exhaust—Measures the temperature of the hot air exhaust. <p>NOTE: On the MX2010 and MX2020 routers, the intake temperature measures the temperature of the air intake to cool the Control Board (CB). The MX2010 and MX2020 routers include intake and exhaust temperatures for multiple zones (Intake A, Intake B, Intake C, Exhaust A, Exhaust B, and TCBC).</p>
Power	<p>Power required and measured on the CB. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.</p>
BUS Revision	<p>Revision level of the generic bus device. (Not on switches.)</p>
FPGA Revision	<p>Revision level of the field-programmable gate array (FPGA). (Not on switches.)</p>
PMBus device (on MX240, MX480, and MX960 routers with Enhanced MX SCB)	<p>Enhanced SCB on MX 240, MX480, and MX960 routers allows the system to save power by supplying only the amount of voltage that is required. Configurable PMBus devices are used to provide the voltage for each individual device. There is one PMBus device for each XF ASIC so that the output can be customized to each device. The following PMBus device information is displayed for routers with Enhanced MX SCB:</p> <ul style="list-style-type: none"> • Expected voltage • Measured voltage • Measured current • Calculated power

Syntax (QFX Series)	show chassis environment fpc <fpc-slot> interconnect-device <i>name</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.1 for T4000 Core Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	(M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series switches only) Display environmental information about Flexible PIC Concentrators (FPCs).
Options	<p>none—Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached T1600 routers.</p> <p>all-members—(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.</p> <p>interconnect-device <i>name</i>—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.</p> <p>fcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display environmental information about the FPC in a T640 router (or line-card</p>

chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display environmental information about the FPC in a T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

local—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

slot or fpc-slot—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Similarly, on a TX Matrix Plus router, if you specify the number of the T1600 router by using only the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis environment fpc 1 lcc 1
```

```
user@host> show chassis environment fpc 9
```

- M120 router—Replace **slot** with a value from 0 through 5.
- MX240 router—Replace **slot** with a value from 0 through 2.
- MX480 router—Replace **slot** with a value from 0 through 5.
- MX960 router—Replace **slot** with a value from 0 through 11.
- MX2010 router—Replace **slot** with a value from 0 through 9.
- MX2020 router—Replace **slot** with a value from 0 through 19.
- Other routers—Replace **slot** with a value from 0 through 7.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—Replace **slot** with 0.
 - EX4200 switches in a Virtual Chassis configuration—Replace **slot** with a value from 0 through 9 (switch's member ID).
 - EX6210 switches—Replace **slot** with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Rotating Engine (SRE) module), or 6 through 9 (line card only).
 - EX8208 switches—Replace **slot** with a value from 0 through 7 (line card).
 - EX8216 switches—Replace **slot** with a value from 0 through 15 (line card).
- QFX3500 switches —Replace **fpc-slot** with 0 through 15.
- PTX5000 Packet Transport Switch—Replace **fpc-slot** with 0 through 7.

Output Fields	<p>Table 55 on page 598 lists the output fields for the show chassis environment fpc command. Output fields are listed in the approximate order in which they appear.</p>

Table 55: show chassis environment fpc Output Fields

Field Name	Field Description
State	<p>Status of the FPC:</p> <ul style="list-style-type: none"> • Unknown—FPC is not detected by the router. • Empty—No FPC is present. • Present—FPC is detected by the chassis daemon but is either not supported by the current version of the Junos OS, or the FPC is coming up but not yet online. • Ready—FPC is in intermediate or transition state. • Announce online—Intermediate state during which the FPC is coming up but not yet online, and the chassis manager acknowledges the chassisd FPC online initiative. • Online—FPC is online and running. • Offline—FPC is powered down. • Diagnostics—FPC is set to operate in diagnostics mode.
Temperature	(M40e and M160 routers and QFX Series only) Temperature of the air flowing past the FPC.
PMB Temperature	(PTX Series only) Temperature of the air flowing past the PMB (bottom of the FPC).
Temperature Intake	(M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing into the chassis.
Temperature Top	(T Series routers only) Temperature of the air flowing past the top of the FPC.
Temperature Exhaust	<p>(M120 and M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing out of the chassis.</p> <p>The PTX Series Packet Transport Switches, and the MX2010 and MX2020 routers include exhaust temperatures for multiple zones (Exhaust A and Exhaust B).</p>
Temperature Bottom	(T Series routers only) Temperature of the air flowing past the bottom of the FPC.
TL <i>n</i> Temperature	(PTX Series only) Temperature of the air flowing past the specified TL area of the packet forwarding engine (PFE) on the FPC.
TQ <i>n</i> Temperature	(PTX Series only) Temperature of the air flowing past the specified TQ area of the packet forwarding engine (PFE) on the FPC.
Temperature MMBO	(T640 router only) Temperature of the air flowing past the type 3 FPC.
Temperature MMB1	(M320 and T Series routers only) Temperature of the air flowing past the type 1, type 2, and type 3 FPC.
Power	Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
CMB Revision or BUS revision	Revision level of the chassis management bus device (M Series router) or bus (T Series routers).

show chassis environment pem

Syntax	show chassis environment pem <slot>
Syntax (ACX4000 Router)	show chassis environment pem
Syntax (TX Matrix Routers)	show chassis environment pem <lcc number scc> <slot>
Syntax (TX Matrix Plus Routers)	show chassis environment pem <lcc number sfc number> <slot>
Syntax (MX Series Router)	show chassis environment pem <slot> <all-members> <local> <member member-id>
Syntax (QFX Series)	show chassis environment pem <slot (interconnect-device name slot) (node-device name)>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS 11.3 for the QFX Series. Command introduced in Junos OS 12.3R2 for EX Series switches.
Description	Display Power Entry Module (PEM) environmental status information.

NOTE: The new high-capacity (4100W) enhanced DC PEM on MX960 routers includes a new design that can condition the input voltage. This results in the output voltage differing from the input voltage. The earlier generation of DC PEMs coupled the input power directly to the output, thereby making it safe to assume that the output voltage was equal to the input voltage.

- Options** **none**—Display environmental information about both PEMs. For the TX Matrix router, display environmental information about the PEMs, the TX Matrix router, and its attached T640 routers. For the TX Matrix Plus router, display environmental information about the PEMs, the TX Matrix Plus router, and its attached T1600 routers.
- all-members**—(MX Series routers only) (Optional) Display environmental information about the PEMs in all the member routers of the Virtual Chassis configuration.
- interconnect-device name**—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display environmental information about the PEM in a specified T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display environmental information about the PEM in a specified T1600 router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace ***number*** with a value from **0** through **3**.

local—(MX Series routers only) (Optional) Display environmental information about the PEM in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information about the PEM in the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Node device.

scc—(TX Matrix routers only) (Optional) Display environmental information about the PEM in the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display environmental information about the PEM in the TX Matrix Plus router (or switch-fabric chassis).

slot —(Optional) Display environmental information about an individual PEM. Replace ***slot*** with **0** or **1**.

Output Fields Table 56 on page 622 lists the output fields for the **show chassis environment pem** command. Output fields are listed in the approximate order in which they appear.

Table 56: show chassis environment pem Output Fields

Field Name	Field Description
PEM slot status	Number of the PEM slot.
State	Status of the PEM.
Temperature	Temperature of the air flowing past the PEM.
AC Input	Status of the AC input for the specified component
AC Output	Status of the AC output for the specified component.
DC input	Status of the DC input for the specified component.
DC output	Status of the DC output for the specified component.
Load	(Not available on M40e or M160 routers) Information about the load on supply, in percentage of rated current being used.
Voltage	(M120, M160, M320, T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about voltage supplied to the PEM.
Current	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM current.
Power	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM power.
SCG/CB/SIB	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) SONET Clock Generator/Control Board/Switch Interface Board.
FAN	(T640, T1600, and T4000 routers with six-input DC power supply only) Information about the DC output to the fan.

Syntax (MX2020 3D Universal Edge Routers)	show chassis environment routing-engine <slot>
Syntax (QFX Series)	show chassis environment routing-engine interconnect-device <i>name</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.1 for the T4000 Core Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	Display Routing Engine environmental status information.
Options	none —Display environmental information about all Routing Engines. For a TX Matrix router, display environmental information about all Routing Engines on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all Routing Engines on the TX Matrix Plus router and its attached T1600 routers. all-members —(MX Series routers only) (Optional) Display environmental information about the Routing Engines in all member routers in the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display environmental information about the Routing Engines for the Interconnect device.

lcc *number*—(TX Matrix and TX Matrix routers only) (Optional) On a TX Matrix router, display environmental information about the Routing Engine in a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display environmental information about the Routing Engine in a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

local—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the specified member in the Virtual Chassis configuration. Replace ***member-id*** with the value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix Plus router (or switch-fabric chassis).

slot—(Optional) Display environmental information about an individual Routing Engine. On M10i, M20, M40e, M120, M160, M320, MX Series, MX2020 routers, and T Series routers, replace **slot** with 0 or 1. On M5, M7i, M10, and M40 routers and on the J Series router, replace **slot** with 0. On EX3200 and EX4200 standalone switches, replace **slot** with 0. On EX4200 switches in a Virtual Chassis configuration and on EX8208 and EX8216 switches, replace **slot** with 0 or 1. On the QFX3500 switch, there is only one Routing Engine, so you do not need to specify the slot number. On PTX Series Packet Transport Switches, replace **slot** with 0 or 1.

Output Fields Table 57 on page 630 lists the output fields for the **show chassis environment routing-engine** command. Output fields are listed in the approximate order in which they appear.

Table 57: show chassis environment routing-engine Output Fields

Field Name	Field Description
Routing engine slot status	Number of the Routing Engine slot: 0 or 1.
State	Status of the Routing Engine: <ul style="list-style-type: none"> • Online Master—Routing Engine is online, operating as Master. • Online Standby—Routing Engine is online, operating as Standby. • Offline—Routing Engine is offline.
Temperature	Temperature of the air flowing past the Routing Engine.
CPU Temperature	(PTX Series and T4000 Core Routers only) Temperature of the air flowing past the Routing Engine CPU.

Sample Output

show chassis environment routing-engine (Nonredundant)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                Online Master
  Temperature          27 degrees C / 80 degrees
```

show chassis environment routing-engine (Redundant)

```
user@host> show chassis environment routing-engine
Route Engine 0 status:
  State:                Online Master
  Temperature:          26 degrees C / 78 degrees F
Route Engine 1 status:
  State:                Online Standby
  Temperature:          26 degrees C / 78 degrees F
```

show chassis environment routing-engine (MX2010 Router)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                Online Master
  Temperature          37 degrees C / 98 degrees F
  CPU Temperature      37 degrees C / 98 degrees F
Routing Engine 1 status:
  State                Online Standby
  Temperature          35 degrees C / 95 degrees F
  CPU Temperature      34 degrees C / 93 degrees F
```

show chassis environment routing-engine (MX2020 Router)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                Online Master
  Temperature          35 degrees C / 95 degrees F
  CPU Temperature      34 degrees C / 93 degrees F
```

```

Routing Engine 1 status:
  State           Online Standby
  Temperature     44 degrees C / 111 degrees F
  CPU Temperature 43 degrees C / 109 degrees F

```

show chassis environment routing-engine (TX Matrix Plus Router)

```

user@host> show chassis environment routing-engine

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>models option introduced in Junos OS Release 8.2.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	<p>Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.</p> <p>In the EX Series switch command output, FPC refers to the following:</p> <ul style="list-style-type: none"> On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC number is always 0. On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC number equals the member ID, from 0 through 9. On EX8208 and EX8216 switches—Refers to a line card; FPC number equals the slot number for the line card. <p>On a QFX3500 standalone switch, both the FPC and FPC number are always 0.</p> <p>On Type 5 FPC on T4000 routers, there are no top temperature sensor or bottom temperature sensor parameters. Instead, fan intake temperature sensor and fan exhaust temperature sensors parameters are displayed.</p>
Options	<p>none—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached T1600 routers.</p> <p>clei-models—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).</p> <p>detail—(Optional) Include RAM and disk information in output.</p> <p>extensive—(Optional) Display ID EEPROM information.</p> <p>all-members—(MX Series routers and EX Series switches only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.</p> <p>interconnect-device name—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.</p>

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from **0** through **3**.

local—(MX Series routers and EX Series switches only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

member *member-id*—(MX Series routers and EX Series switches only) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of **0** or **1**.

models—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

node-device *name*—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

scc—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with **0**.

Additional Information The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines:

Table 59: Routing Engines Displaying DIMM Information

Routing Engines	Routers
RE-S-1800x2 and RE-S-1800x4	MX240, MX480, and MX960 routers
RE-A-1800x2	M120 and M320 routers

Output Fields [Table 60 on page 649](#) lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 60: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
Item	<p>Chassis component:</p> <ul style="list-style-type: none"> (EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches. See <i>EX Series Switches Hardware and CLI Terminology Mapping</i>. (MX Series routers and EX Series switches)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two “pseudo” FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). (M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller. (M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB. (QFX Series)—Information about the chassis, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). (PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal). (MX2010 and MX2020 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays. 	All levels
Version	Revision level of the chassis component.	All levels
Part number	Part number of the chassis component.	All levels
Serial number	Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.	All levels
Assb ID or Assembly ID	(extensive keyword only) Identification number that describes the FRU hardware.	extensive

Table 60: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
Assembly Version	(extensive keyword only) Version number of the FRU hardware.	extensive
Assembly Flags	(extensive keyword only) Flags.	extensive
FRU model number	(clei-models , extensive , and models keyword only) Model number of the FRU hardware component.	none specified
CLEI code	(clei-models and extensive keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
EEPROM Version	ID EEPROM version used by the hardware component: 0x00 (version 0), 0x01 (version 1), or 0x02 (version 2).	extensive
Description	<p>Brief description of the hardware item:</p> <ul style="list-style-type: none"> • Type of power supply. • Type of PIC. If the PIC type is not supported on the current software release, the output states Hardware Not Supported. • Type of FPC: FPC Type 1, FPC Type 2, FPC Type 3, FPC Type 4, or FPC TypeOC192. <p>On EX Series switches, a brief description of the FPC.</p> <p>On the J Series routers, the FPC type corresponds to the Physical Interface Module (PIM). The following list shows the PIM abbreviation in the output and the corresponding PIM name.</p> <ul style="list-style-type: none"> • 2x FE—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM • 4x FE—4-port Fast Ethernet ePIM • 1x GE Copper—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port) • 1x GE SFP—SFP Gigabit Ethernet ePIM (one fiber port) • 4x GE Base PIC—Four built-in Gigabit Ethernet ports on a J4350 or J6350 chassis (fixed PIM) • 2x Serial—Dual-port serial PIM • 2x T1—Dual-port T1 PIM • 2x E1—Dual-port E1 PIM • 2x CTIE1—Dual-port channelized T1/E1 PIM • 1x T3—T3 PIM (one port) • 1x E3—E3 PIM (one port) • 4x BRI S/T—4-port ISDN BRI S/T PIM • 4x BRI U—4-port ISDN BRI U PIM • 1x ADSL Annex A—ADSL 2/2+ Annex A PIM (one port, for POTS) • 1x ADSL Annex B—ADSL 2/2+ Annex B PIM (one port, for ISDN) • 1x TGM550—TGM550 Telephony Gateway Module (Avaya VoIP gateway module with one console port, two analog LINE ports, and two analog TRUNK ports) 	All levels

Table 60: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
	<ul style="list-style-type: none"> • 1x DS1 TIM510—TIM510 E1/T1 Telephony Interface Module (Avaya VoIP media module with one E1 or T1 trunk termination port and ISDN PRI backup) • 4x FXS, 4x FX0, TIM514—TIM514 Analog Telephony Interface Module (Avaya VoIP media module with four analog LINE ports and four analog TRUNK ports) • 4x BRI TIM521—TIM521 BRI Telephony Interface Module (Avaya VoIP media module with four ISDN BRI ports) • Crypto Accelerator Module—For enhanced performance of cryptographic algorithms used in IP Security (IPsec) services • MPC M 16x 10GE—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on EX Series switches.) • For hosts, the Routing Engine type. • For small form-factor pluggable transceiver (SFP) modules, the type of fiber: LX, SX, LH, or T. • LCD description for EX Series switches (except EX2200 switches). • MPC2—1-port MPC2 that supports two separate slots for MICs. • MPC3E—1-port MPC3E that supports two separate slots for MICs (MIC-3D-1X100GE-CFP and MIC-3D-20GE-SFP) on MX960, MX480, and MX240 routers. The MPC3E maps one MIC to one PIC (1 MIC, 1 PIC), which differs from the mapping of legacy MPCs. • 100GBASE-LR4, pluggable CFP optics • Supports the Enhanced MX Switch Control Board with fabric redundancy and existing SCBs without fabric redundancy. • Interoperates with existing MX Series line cards, including Flexible Port Concentrators (FPC), Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs). • MPC4E—Fixed configuration MPC4E that is available in two flavors: MPC4E-3D-32XGE-SFP and MPC4E-3D-2CGE-8XGE) on MX2020, MX960, MX480, and MX240 routers. • LCD description for MX Series routers and EX Series switches

show chassis location

Syntax	show chassis location
Syntax (TX Matrix Router)	show chassis location <fpc interface (by-name <i>name</i> by-slot fpc <i>number</i> lcc <i>number</i>) lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show chassis location <fpc interface (by-name <i>name</i> by-slot fpc <i>number</i> lcc <i>number</i>) lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show chassis location <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show chassis location <interconnect-device <i>name</i> > <node-device <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the physical location of the chassis. This command can only be used on the master Routing Engine.
Options	<p>none—Display all information about the physical location of the chassis. On a TX Matrix router, display all information about the physical location of the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display all information about the physical location of the TX Matrix Plus router and its attached T1600 routers.</p> <p>all-members—(MX Series routers only) (Optional) Display the physical location of the chassis for all the member routers in the Virtual Chassis configuration.</p> <p>fpc—(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of all Flexible PIC Concentrators (FPCs).</p> <p>interconnect-device <i>name</i>—(QFabric systems only) (Optional) Display the physical location of the Interconnect device.</p> <p>interface by-name <i>name</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of a specified interface name. On a TX Matrix router, this option displays the FPC number and T640 router (or line-card chassis) number associated with the specified interface. On a TX Matrix Plus router, this option displays the FPC number and T1600 router (or line-card chassis) number associated with the specified interface.</p> <p>interface by-slot fpc <i>number</i> lcc <i>number</i>—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the global FPC number of an interface by</p>

specifying its local FPC number and T640 router (or line-card chassis) number. On a TX Matrix Plus router, display the global FPC number of an interface by specifying its local FPC number and T1600 router (or line-card chassis) number.

- The global FPC number is the FPC slot number when all the FPC slots in the routing matrix are considered: **0** through **31**. The local FPC number is the FPC slot number on a particular T640 router.
- For **fpc**, replace **number** with a value from **0** through **7**.
- For **lcc**, replace **number** with a value from **0** through **3**.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the physical location of a specified T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the physical location of a specified T1600 router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace **number** with a value from **0** through **3**.

local—(MX Series routers only) (Optional) Display the physical location of the chassis for the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Display the physical location of the chassis for the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of **0** or **1**.

node-device name—(QFabric systems only) (Optional) Display the physical location of the Node device.

scc—(TX Matrix routers only) (Optional) Display the physical location of the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display the physical location of the TX Matrix Plus router (or switch-fabric chassis).

Output Fields [Table 61 on page 751](#) lists the output fields for the **show chassis location** command. Output fields are listed in the approximate order in which they appear.

Table 61: show chassis location Output Fields

Field Name	Field Description
country-code	Country code information.

Table 61: show chassis location Output Fields (*continued*)

Field Name	Field Description
postal-code	Postal code information.
Building	Building information.
Floor	Floor information.
Global FPC	Global FPC number. The FPC slot number, when all FPC slots in the routing matrix are considered. The range of values is 0 through 31 .
LCC	Line-card chassis number. On a TX Matrix router, the number of a particular T640 router connected to the TX Matrix router. On a TX Matrix Plus router, the number of a particular T1600 router connected to the TX Matrix Plus router.
Local FPC	Local FPC number. On a TX Matrix router, the FPC slot number on a particular T640 router. On a TX Matrix Plus router, the FPC slot number on a particular T1600 router.

Syntax (ACX Series Universal Access Routers)	show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.
Options	<p>fpc-slot <i>slot-number</i>—Display information about the PIC in this particular FPC slot:</p> <ul style="list-style-type: none"> On a TX Matrix router, if you specify the number of the T640 router by using the lcc <i>number</i> option (the recommended method), replace <i>slot-number</i> with a value from 0 through 7. Otherwise, replace <i>slot-number</i> with a value from 0 through 31. <p>Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the lcc <i>number</i> option (the recommended method), replace <i>slot-number</i> with a value from 0 through 7. Otherwise, replace <i>slot-number</i> with a value from 0 through 31. For example, the following commands have the same result:</p> <pre> user@host> show chassis pic fpc-slot 1 lcc 1 pic-slot 1 user@host> show chassis pic fpc-slot 9 pic-slot 1 </pre> <ul style="list-style-type: none"> M120 routers only—Replace <i>slot-number</i> with a value from 0 through 5. MX80 routers only—Replace <i>slot-number</i> with a value from 0 through 1. MX240 routers only—Replace <i>slot-number</i> with a value from 0 through 2.

- MX480 routers only—Replace **slot-number** with a value from 0 through 5.
- MX960 routers only—Replace **slot-number** with a value from 0 through 11.
- MX2020 routers only—Replace **slot-number** with a value from 0 through 19.
- Other routers—Replace **slot-number** with a value from 0 through 7.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—Replace **slot-number** with 0.
 - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9 (switch's member ID).
 - EX8208 switches—Replace **slot-number** with a value from 0 through 7 (line card).
 - EX8216 switches—Replace **slot-number** with a value from 0 through 15 (line card).
- QFX Series:
 - QFX3500 switches—Replace **slot-number** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
 - QFabric systems—Replace **slot-number** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

all-members—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

interconnect-device name—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

local—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

member member-id—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

node-device name—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

pic-slot slot-number—Display information about the PIC in this particular PIC slot. For routers, replace **slot-number** with a value from 0 through 3. For EX3200 and EX4200

switches, replace *slot-number* with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace *slot-number* with 0. For the QFX3500 standalone switch and the QFabric system, replace *slot-number* with 0 or 1.

Output Fields Table 62 on page 757 lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

Table 62: show chassis pic Output Fields

Field Name	Field Description
Type	<p>PIC type.</p> <p>NOTE: On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as MIC-3D-1STM64-XFP and with the SONET framing mode, the type is displayed as MIC-3D-1OC192-XFP. By default, the 1-port OC192/STM64 MICs displays the type as MIC-3D-1OC192-XFP.</p>
ASIC type	Type of ASIC on the PIC.
State	<p>Status of the PIC. State is displayed only when a PIC is in the slot.</p> <ul style="list-style-type: none"> • Online— PIC is online and running. • Offline—PIC is powered down.
PIC version	PIC hardware version.
Uptime	How long the PIC has been online.
Package	(Multiservices PICs only) Services package supported: Layer-2 or Layer-3 .
Port Number	Port number for the PIC.
Cable Type	Type of cable connected to the port: LH , LX , or SX .
PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> • Port—Port number • Cable type—Type of optical transceiver installed. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction • Xcvr Firmware—Transceiver firmware version.

Table 62: show chassis pic Output Fields (*continued*)

Field Name	Field Description
PIC Port Information (MX960 Router Bidirectional Optics)	Port-level information for the PIC. <ul style="list-style-type: none"> • Port—Port number • Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. <ul style="list-style-type: none"> • BX10-10-km bidirectional optics. • BX40-40-km bidirectional optics. • SFP-LX-40-km SFP optics. • Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.
PIC Port Information (Next-Generation SONET/SDH SFP)	Port-level information for the next-generation SONET/SDH SFP PIC. <ul style="list-style-type: none"> • Port—Port number. • Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. • Fiber type—Type of fiber: SM (single-mode) or MM (multimode). • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.
Multirate Mode	Rate-selectability status for the MIC: Enabled or Disabled .
Channelization	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release in 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	Display the status of the Routing Engine.

Options	<p>none—Display information about one or more Routing Engines. On a TX Matrix router, display information about all Routing Engines on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about all Routing Engines on the TX Matrix Plus router and its attached T1600 routers.</p> <p>all-members—(MX Series routers only) (Optional) Display Routing Engine information for all members of the Virtual Chassis configuration.</p> <p>bios—(Optional) Display the (BIOS) firmware version.</p> <p>interconnect-device <i>number</i>—(QFabric systems only) (Optional) Display Routing Engine information for a specified Interconnect device.</p> <p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Routing Engine information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display Routing Engine information for a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace <i>number</i> with a value from 0 through 3.</p> <p>local—(MX Series routers only) (Optional) Display Routing Engine information for the local Virtual Chassis member.</p> <p>member <i>member-id</i>—(MX Series routers only) (Optional) Display Routing Engine information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace <i>member-id</i> with a value of 0 or 1.</p> <p>node-device <i>number</i>—(QFabric systems only) (Optional) Display Routing Engine information for a specified Node device.</p> <p>scc—(TX Matrix routers only) (Optional) Display Routing Engine information for the TX Matrix router (or switch-card chassis).</p> <p>sfc <i>number</i>—(TX Matrix Plus routers only) (Optional) Display Routing Engine information for the TX Matrix Plus router (or switch-fabric chassis). Replace <i>number</i> with 0.</p> <p>slot—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace <i>slot</i> with 0 or 1. For QFX3500 switches, there is only one Routing Engine, so you do not need to specify the slot number.</p>

Output Fields [Table 63 on page 769](#) lists the output fields for the **show chassis routing-engine** command. Output fields are listed in the approximate order in which they appear.

Table 63: show chassis routing-engine Output Fields

Field Name	Field Description
Slot	(Systems with single and multiple Routing Engines) Slot number.
Current state	(Systems with multiple Routing Engines) Current state of the Routing Engine: Master , Backup , or Disabled .
Election priority	(Systems with multiple Routing Engines) Election priority for the Routing Engine: Master or Backup .
Temperature	Temperature of the air flowing past the Routing Engine.
CPU Temperature	Temperature of the CPU.
DRAM	Total DRAM available to the Routing Engine's processor.
Memory utilization	Percentage of Routing Engine memory being used.

Table 63: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
CPU utilization	Information about the Routing Engine's CPU utilization: <ul style="list-style-type: none">• User—Percentage of CPU time being used by user processes.• Background—Percentage of CPU time being used by background processes.• Kernel—Percentage of CPU time being used by kernel processes.• Interrupt—Percentage of CPU time being used by interrupts.• Idle—Percentage of CPU time that is idle.
Model	Routing Engine model number.
Serial ID	(Systems with multiple Routing Engines) Identification number of the Routing Engine in this slot.
Start time	Time at which the Routing Engine started running.
Uptime	How long the Routing Engine has been running.
Routing Engine BIOS Version	BIOS version being run by the Routing Engine.

Table 63: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
Last reboot reason	<p>Reason for last reboot, including:</p> <ul style="list-style-type: none"> • power cycle/failure—Halt of the Routing Engine using the halt command, powering down using the power button on the chassis or any other method (such as removal of the control board or Routing Engine), and then powering back the Routing Engine. A halt of the operating system also occurs if you enter the request system halt command. You can enter this command to halt the system operations on the chassis or specific Routing Engines. To restart the software, press any key on the keyboard. • watchdog—Reboot due to a hardware watchdog. A watchdog is a hardware monitoring process that examines the health and performance of the router to enable the device to recover from failures. A watchdog checks for problems at certain intervals, and reboots the routing engine if a problem is encountered. • reset-button reset—(Not available on the J Series router or EX Series switch) Reboot due to pressing of the reset button on the Routing Engine. • power-button hard power off—Reboot due to pressing of the power button on the chassis. A powering down of the software also occurs if you enter the request system power-off command. You can enter this command to power down the chassis or specific Routing Engines; you can then restart the software. • misc hardware reason—Reboot due to miscellaneous hardware reasons. • thermal shutdown—Reboot due to the router or switch reaching a critical temperature at which point it is unsafe to continue operations. • hard disk failure—Reboot due to a hard disk or solid-state drive (SSD) failure. • reset from debugger—Reboot due to reset from the debugger. • chassis control reset—Restart the chassis process that manages PICs, FPCs, and other hardware components. The chassis control module that runs the Routing Engine performs management and monitoring functions, and it provides a single access point for operational and maintenance functions. A reset of the chassis management process occurs when you enter the restart chassis-control command. • bios auto recovery reset—Reboot due to a BIOS auto-recovery reset. • could not be determined—Reboot due to an undetermined reason. • Router rebooted after a normal shutdown—Reboot due to a normal shutdown. This reason is displayed if the Routing Engine is powered down by pushing and holding the online/offline button on the Routing Engine faceplate for 30 seconds, and then powered back. A reboot of the software also occurs if you enter the request system reboot command. You can enter this command to reboot the chassis or specific Routing Engines.
Load averages	Routing Engine load averages for the last 1, 5, and 15 minutes.

Sample Output

show chassis routing-engine (M5 Router)

```

user@host> show chassis routing-engine
Routing Engine status:
  Temperature                25 degrees C / 77 degrees F
  DRAM                       768 MB
  Memory utilization         21 percent
  CPU utilization:
    User                      0 percent
    Background                0 percent
    Kernel                    0 percent
    Interrupt                  0 percent

```

Idle	100 percent
Model	RE-2.0
Serial ID	31000007349bf701
Start time	2003-12-04 09:42:17 PST
Uptime	26 days, 1 hour, 12 minutes, 27 seconds
Last reboot reason	Router rebooted after a normal shutdown
Load averages:	1 minute 5 minute 15 minute
	0.00 0.01 0.00

show chassis routing-engine (M10 Router)

```
user@host> show chassis routing-engine
Routing Engine status:
  Temperature      25 degrees C / 77 degrees F
  DRAM             768 MB
  Memory utilization 21 percent
  CPU utilization:
    User           0 percent
    Background     0 percent
    Kernel         0 percent
    Interrupt      0 percent

Description	Display chassis temperature threshold settings, in degrees Celsius.
Options	<p>none—Display the temperature threshold details.</p> <p>all-members—(MX Series routers only) (Optional) Display the chassis temperature threshold settings of all member routers in the Virtual Chassis configuration.</p> <p>interconnect-device <i>name</i>—(QFabric systems only) (Optional) Display the chassis temperature threshold settings of the Interconnect device.</p> <p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the temperature threshold details of a specified T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the temperature threshold details of a specified T1600 router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace <i>number</i> with a value from 0 through 3.</p> <p>local—(MX Series routers only) (Optional) Display the chassis temperature threshold settings of the local Virtual Chassis member.</p>

member *member-id*—(MX Series routers only) (Optional) Display the chassis temperature threshold settings of the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display the chassis temperature threshold settings of the Node device.

scc—(TX Matrix routers only) (Optional) Display the temperature threshold details of the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display the temperature threshold details of the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

Output Fields [Table 64 on page 788](#) lists the output fields for the **show chassis temperature-thresholds** command. Output fields are listed in the approximate order in which they appear.

Table 64: show chassis temperature-thresholds Output Fields

Field name	Field Description
Item	Chassis component. If per FRU per slot thresholds are configured, the components about which information is displayed include the chassis, the Routing Engines, FPCs, and FEBs. If per FRU per slot thresholds are not configured, the components about which information is displayed include the chassis and the Routing Engines.

Table 64: show chassis temperature-thresholds Output Fields (*continued*)

Field name	Field Description
Fan speed	<p>NOTE: On the QFX3500 switch and QFX3600 switch, there are four fan speeds: low, medium-low, medium-high, and high. The fan speed changes at the threshold when going from a low speed to a higher speed. When the fan speed changes from a higher speed to a lower speed, the temperature changes two degrees below the threshold.</p> <p>Temperature threshold settings, in degrees Celsius, for the fans to operate at normal and high speeds.</p> <ul style="list-style-type: none"> • Normal—The fans operate at normal speed if the component is at or below this temperature and all the fans are present and functioning normally. • High—The fans operate at high speed if the component has exceeded this temperature or a fan has failed or is missing. <p>NOTE: For MX480 Routers, there are three fan speeds: Low, Medium, and High.</p> <p>An alarm is not triggered until the temperature exceeds the threshold settings for a yellow alarm or a red alarm.</p>
Yellow alarm	<p>Temperature threshold settings, in degrees Celsius, that trigger a yellow alarm.</p> <ul style="list-style-type: none"> • Normal—The temperature that must be exceeded on the component to trigger a yellow alarm when the fans are running at full speed. • Bad fan—The temperature that must be exceeded on the component to trigger a yellow alarm when one or more fans have failed or are missing.
Red alarm	<p>Temperature threshold settings, in degrees Celsius, that trigger a red alarm.</p> <ul style="list-style-type: none"> • Normal—The temperature that must be exceeded on the component to trigger a red alarm when the fans are running at full speed. • Bad fan—The temperature that must be exceeded on the component to trigger a red alarm when one or more fans have failed or are missing.
Fire Shutdown	<p>(T4000 routers and PTX Series Packet Transport Switches only)—Temperature threshold settings, in degrees Celsius, for the network device to shut down.</p>

show log

Syntax	show log <filename user <username>>
Syntax (QFabric System)	show log <filename>
Syntax (TX Matrix Routers)	show log <all-lcc lcc <i>number</i> scc> <filename user <username>>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	List log files, display log file contents, or display information about users who have logged in to the router or switch.
Options	<p>none—List all log files.</p> <p><all-lcc lcc <i>number</i> scc>—(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).</p> <p>filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.</p> <p>user <username>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include <i>username</i>, display logging information about the specified user.</p>
Required Privilege Level	trace
List of Sample Output	show log on page 804 show log filename on page 805 show log filename (QFabric System) on page 805 show log user on page 806

show system alarms

Syntax	show system alarms
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display active system alarms.
Options	This command has no options.
Additional Information	System alarms are preset. They include a configuration alarm that appears when no rescue configuration alarm is set and a license alarm that appears when a software feature is configured and no valid license is configured for the feature. For more information about system alarms, see the <i>Junos OS System Basics Configuration Guide</i> . In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.
Required Privilege Level	admin

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>

Description	Display information about software processes that are running on the router or switch and that have controlling terminals.
Options	<p>none—Display standard information about system processes.</p> <p>brief detail extensive summary—(Optional) Display the specified level of detail.</p> <p>adaptive-services—(Optional) Display the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.</p> <p>alarm-control—(Optional) Display the process to configure the system alarm.</p> <p>all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) Display standard system process information about all the T640 routers (in a routing matrix based on the TX Matrix router) or all the T1600 routers (in a routing matrix based on the TX Matrix Plus router) in the chassis.</p> <p>all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) Display standard system process information for all T640 routers (or line-card chassis) connected to the TX Matrix router. Display standard system process information for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> <p>all-members—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for all members of the Virtual Chassis configuration.</p> <p>ancpd-service—Display the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.</p> <p>application-identification—Display the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.</p> <p>audit-process—(Optional) Display the RADIUS accounting process.</p> <p>auto-configuration—Display the Interface Auto-Configuration process.</p> <p>bootp—Display the process that enables a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent. DHCP relaying is disabled.</p> <p>captive-portal-content-delivery—Display the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.</p> <p>ce-l2tp-service—(Optional) (M10, M10i, M7i, and MX Series routers only) Display the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.</p>

cfm—Display Ethernet Operations, Administration, and Maintenance (OAM) connectivity fault management (CFM) process, which can be used to monitor the physical link between two switches.

chassis-control—(Optional) Display the chassis management process.

class-of-service—(Optional) Display the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

clksyncd-service—Display the external clock synchronization process, which uses synchronous Ethernet (SyncE).

craft-control—Display the process for the I/O of the craft interface.

database-replication—(EX Series switches and MX Series routers only) (Optional) Display the database replication process.

datapath-trace-service—Display the packet path tracing process.

dhcp-service—(EX Series switches and MX Series routers only) (Optional) Display the Dynamic Host Configuration Protocol process, which enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.

diameter-service—(Optional) Display the diameter process.

disk-monitoring—(Optional) Display the disk monitoring process, which checks the health of the hard disk drive on the Routing Engine.

dynamic-flow-capture—(Optional) Display the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

ecc-error-logging—(Optional) Display the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

ethernet-connectivity-fault-management—Display the process that provides IEEE 802.1ag OAM connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

ethernet-link-fault-management—(EX Series switches and MX Series routers only) (Optional) Display the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

event-processing—(Optional) Display the event process (eventd).

firewall—(Optional) Display the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

general-authentication-service—(EX Series switches and MX Series routers only) (Optional) Display the general authentication process.

health (*pid* ***process-identifier*** | ***process-name*** ***process-name***)—(Optional) Display process health information, either by process id (PID) or by process name.

iccp-service—Display the Inter-Chassis Communication Protocol (ICCP) process.

idp-policy—Display the intrusion detection and prevention (IDP) protocol process.

ilmi—Display the Integrated Local Management Interface (ILMI) protocol process, which provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

inet-process—Display the IP multicast family process.

init—Display the process that initializes the USB modem.

interface-control—(Optional) Display the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

kernel-replication—(Optional) Display the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

l2-learning—(Optional) Display the Layer 2 address flooding and learning process.

l2cpd-service—Display the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

lACP—(Optional) Display the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display standard system process information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display standard system process information for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

local—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the local Virtual Chassis member.

local-policy-decision-function—Display the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

logical-system-mux—Display the logical router multiplexer process (lrmuxd), which manages the multiple instances of the routing protocols process (rpd) on a machine running logical routers.

mac-validation—Display the MAC validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

mib-process—(Optional) Display the MIB II process, which provides the router's MIB II agent.

mobile-ip—(Optional) Display the Mobile IP process, which configures Junos OS Mobile IP features.

moundd-service—(EX Series switches and MX Series routers only) (Optional) Display the service for NFS mounts requests.

mpls-traceroute—(Optional) Display the MPLS Periodic Traceroute process.

mspd—(Optional) Display the Multiservice process.

multicast-snooping—(EX Series switches and MX Series routers only) (Optional) Display the multicast snooping process, which makes Layer 2 devices such as VLAN switches aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

named-service—(Optional) Display the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

neighbor-liveness—Display the process, which specifies the maximum length of time that the router waits for its neighbor to re-establish an LDP session.

nfsd-service—(Optional) Display the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

ntp—Display the Network Time Protocol (NTP) process, which provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network.

packet-triggered-subscribers—Display the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

peer-selection-service—(Optional) Display the Peer Selection Service process.

periodic-packet-services—Display the Periodic packet management process, which is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

pfe—Display the Packet Forwarding Engine management process.

pgcp-service—(Optional) Display the pgcpd service process running on the Routing Engine.

pgm—Display the Pragmatic General Multicast (PGM) protocol process, which enables a reliable transport layer for multicast applications.

pic-services-logging—(Optional) Display the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

ppp—(Optional) Display the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

ppp-service—Display the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

pppoe—(Optional) Display the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

process-monitor—Display the process health monitor process (pmond).

providers—(Optional) Display provider processes.

redundancy-interface-process—(Optional) Display the ASP redundancy process.

remote-operations—(Optional) Display the remote operations process, which provides the ping and traceroute MIBs.

resource-cleanup—Display the resource cleanup process.

resource-limits (brief | detail) *process-name*—(Optional) Display process resource limits.

routing—(Optional) Display the routing protocol process.

sampling—(Optional) Display the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

sbc-configuration-process—Display the session border controller (SBC) process of the border signaling gateway (BSG).

scc—(TX Matrix routers only) (Optional) Display standard system process information for the TX Matrix router (or switch-card chassis).

sdk-service—Display the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

secure-neighbor-discovery—(EX Series switches and MX Series routers only) (Optional) Display the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

send—(Optional) Display the Secure Neighbor Discovery Protocol (SEND) process, which provides support for protecting Neighbor Discovery Protocol (NDP) messages.

service-deployment—(Optional) Display the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system process information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

snmp—Display the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

sonet-aps—Display the SONET Automatic Protection Switching (APS) process, which monitors any SONET interface that participates in APS.

static-subscribers—(Optional) Display the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

tunnel-oamd—(Optional) Display the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

vrrp—(EX Series switches and MX Series routers only) (Optional) Display the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

watchdog—Display the watchdog timer process, which enables the watchdog timer when Junos OS encounters a problem.

wide—(Optional) Display process information that might be wider than 80 columns.

Additional Information By default, when you issue the **show system processes** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

Output Fields [Table 65 on page 815](#) describes the output fields for the **show system processes** command. Output fields are listed in the approximate order in which they appear.

Table 65: show system processes Output Fields

Field Name	Field Description	Level of Output
last pid	Last process identifier assigned to the process.	brief extensive summary
load averages	Three load averages followed by the current time.	brief extensive summary
processes	Number of existing processes and the number of processes in each state (sleeping , running , starting , zombies , and stopped).	brief extensive summary
Mem	Information about physical and virtual memory allocation.	brief extensive summary
Swap	Information about physical and virtual memory allocation.	brief extensive summary
PID	Process identifier.	detail extensive summary
TT	Control terminal name.	none detail

Table 65: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
STAT	<p>Symbolic process state. The state is given by a sequence of letters. The first letter indicates the run state of the process:</p> <ul style="list-style-type: none"> • D—In disk or other short-term, uninterruptible wait • I—Idle (sleeping longer than about 20 seconds) • R—Runnable • S—Sleeping for less than 20 seconds • T—Stopped • Z—Dead (zombie) • + —The process is in the foreground process group of its control terminal. • <—The process has raised CPU scheduling priority. • >—The process has specified a soft limit on memory requirements and is currently exceeding that limit; such a process is not swapped. • A—The process requested random page replacement. • E—The process is trying to exit. • L—The process has pages locked in core. • N—The process has reduced CPU scheduling priority. • S—The process requested first-in, first-out (FIFO) page replacement. • s—The process is a session leader. • V—The process is temporarily suspended. • W—The process is swapped out. • X—The process is being traced or debugged. 	none detail
UID	User identifier.	detail
USERNAME	Process owner.	extensive summary
PPID	Parent process identifier.	detail
CPU	<p>(D)—Short-term CPU usage.</p> <p>(E and S)—Raw (unweighted) CPU usage. The value of this field is used to sort the processes in the output.</p>	detail extensive summary
RSS	Resident set size.	detail
WCHAN	Symbolic name of the wait channel.	detail
STARTED	Local time when the process started running.	detail
PRI	Current priority of the process. A lower number indicates a higher priority.	detail extensive summary
NI or NICE	UNIX "niceness" value. A lower number indicates a higher priority.	detail extensive summary
SIZE	Total size of the process (text, data, and stack), in kilobytes.	extensive summary

Table 65: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
RES	Current amount of resident memory, in kilobytes.	extensive summary
STATE	Current state of the process (for example, sleep , wait , run , idle , zombie , or stop).	extensive summary
TIME	(S)—Number of system and user CPU seconds that the process has used. (None, D, and E)—Total amount of time that the command has been running.	detail extensive summary
WCPU	Weighted CPU usage.	extensive summary
COMMAND	Command that is currently running.	detail extensive summary

show system statistics

Syntax	show system statistics
Syntax (EX Series Switches)	show system statistics <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system statistics <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system statistics
Release Information	Command introduced before JUNOS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display system-wide protocol-related statistics.
Options	none —Display system statistics for all the following protocols: <ul style="list-style-type: none"> • arp—Address Resolution Protocol • bridge—IEEE 802.1 Bridging • clns—Connectionless Network Service • esis—End System-to-Intermediate System • ethoamcfm—Ethernet OAM protocol for connectivity fault management • ethoamlfm—Ethernet OAM protocol for link fault management • icmp—Internet Control Message Protocol • icmp6—Internet Control Message Protocol version 6 • igmp—Internet Group Management Protocol • ip—Internet Protocol version 4 • ip6—Internet Protocol version 6 • mpls—Multiprotocol Label Switching • rdp—Reliable Datagram Protocol

- **tcp**—Transmission Control Protocol
- **tnp**—Trivial Network Protocol
- **ttp**—TNP Tunneling Protocol
- **tudp**—Trivial User Datagram Protocol
- **udp**—User Datagram Protocol
- **vpls**—Virtual Private LAN Service

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for all the routers in the chassis.

all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router

all-members—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for all members of the Virtual Chassis configuration.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for a specific T1600 router that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

local—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the local Virtual Chassis member.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace **member-id** with a value from 0 through 9. For an MX Series Virtual Chassis, replace **member-id** with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Display system statistics for a protocol for the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with 0.

Additional Information By default, when you issue the **show system statistics** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

Required Privilege Level view

List of Sample Output [show system statistics on page 837](#)
[show system statistics \(EX Series Switches\) on page 844](#)
[show system statistics \(TX Matrix Router\) on page 853](#)
[show system statistics \(QFX Series\) on page 860](#)

Sample Output

show system statistics

```
user@host> show system statistics
ip:
    3682087 total packets received
    0 bad header checksums
    0 with size smaller than minimum
    0 with data size < data length
    0 with header length < data size
    0 with data length < header length
    0 with incorrect version number
    0 packets destined to dead next hop
    0 fragments received
    0 fragments dropped (dup or out of space)
    0 fragments dropped (queue overflow)
    0 fragments dropped after timeout
    0 fragments dropped due to over limit
    0 packets reassembled ok
    3664774 packets for this host
    17316 packets for unknown/unsupported protocol
    0 packets forwarded
    0 packets not forwardable
    0 redirects sent
    6528 packets sent from this host
    0 packets sent with fabricated ip header
    0 output packets dropped due to no bufs
    0 output packets discarded due to no route
    0 output datagrams fragmented
    0 fragments created
    0 datagrams that can't be fragmented
    0 packets with bad options
    1123 packets with options handled without error
    0 strict source and record route options
    0 loose source and record route options
    0 record route options
    0 timestamp options
    0 timestamp and address options
    0 timestamp and prespecified address options
    0 option packets dropped due to rate limit
    1123 router alert options
    0 multicast packets dropped (no iflist)
    0 packets dropped (src and int don't match)
icmp:
    0 drops due to rate limit
    0 calls to icmp_error
    0 errors not generated because old message was icmp
Output histogram:
    echo reply: 75
    0 messages with bad code fields
    0 messages less than the minimum length
    0 messages with bad checksum
```

```
0 messages with bad source address
0 messages with bad length
0 echo drops with broadcast or multicast destination address
0 timestamp drops with broadcast or multicast destination address
Input histogram:
    echo: 75
    router advertisement: 130
75 message responses generated
tcp:
3844 packets sent
    3618 data packets (1055596 bytes)
    0 data packets (0 bytes) retransmitted
    0 resends initiated by MTU discovery
    205 ack-only packets (148 packets delayed)
    0 URG only packets
    0 window probe packets
    0 window update packets
    1079 control packets
5815 packets received
    3377 acks (for 1055657 bytes)
    24 duplicate acks
    0 acks for unsent data
    2655 packets (15004 bytes) received in-sequence
    1 completely duplicate packet (0 bytes)
    0 old duplicate packets
    0 packets with some dup. data (0 bytes duped)
    0 out-of-order packets (0 bytes)
    0 packets (0 bytes) of data after window
    0 window probes
    7 window update packets
    0 packets received after close
    0 discarded for bad checksums
    0 discarded for bad header offset fields
    0 discarded because packet too short
1 connection request
32 connection accepts
0 bad connection attempts
0 listen queue overflows
33 connections established (including accepts)
30 connections closed (including 0 drops)
    27 connections updated cached RTT on close
    27 connections updated cached RTT variance on close
    0 connections updated cached ssthresh on close
0 embryonic connections dropped
3374 segments updated rtt (of 3220 attempts)
0 retransmit timeouts
    0 connections dropped by rexmit timeout
0 persist timeouts
    0 connections dropped by persist timeout
344 keepalive timeouts
    0 keepalive probes sent
    0 connections dropped by keepalive
1096 correct ACK header predictions
1314 correct data packet header predictions
32 syncache entries added
    0 retransmitted
    0 dupsyn
    0 dropped
    32 completed
    0 bucket overflow
    0 cache overflow
```

```

        0 reset
        0 stale
        0 aborted
        0 badack
        0 unreach
        0 zone failures
    0 cookies sent
    0 cookies received
    0 ACKs sent in response to in-window but not exact RSTs
    0 ACKs sent in response to in-window SYNs on established connections
    0 rcv packets dropped by TCP due to bad address
    0 out-of-sequence segment drops due to insufficient memory
    1058 RST packets
    0 ICMP packets ignored by TCP
    0 send packets dropped by TCP due to auth errors
    0 rcv packets dropped by TCP due to auth errors
udp:
    3658884 datagrams received
    0 with incomplete header
    0 with bad data length field
    0 with bad checksum
    3657342 dropped due to no socket
    3657342 broadcast/multicast datagrams dropped due to no socket
    0 dropped due to full socket buffers
    0 not for hashed pcb
    4291311496 delivered
    1551 datagrams output
ipsec:
    0 inbound packets processed successfully
    0 inbound packets violated process security policy
    0 inbound packets with no SA available
    0 invalid inbound packets
    0 inbound packets failed due to insufficient memory
    0 inbound packets failed getting SPI
    0 inbound packets failed on AH replay check
    0 inbound packets failed on ESP replay check
    0 inbound AH packets considered authentic
    0 inbound AH packets failed on authentication
    0 inbound ESP packets considered authentic
    0 inbound ESP packets failed on authentication
    0 outbound packets processed successfully
    0 outbound packets violated process security policy
    0 outbound packets with no SA available
    0 invalid outbound packets
    0 outbound packets failed due to insufficient memory
    0 outbound packets with no route
igmp:
    17186 messages received
    0 messages received with too few bytes
    0 messages received with bad checksum
    0 membership queries received
    0 membership queries received with invalid field(s)
    0 membership reports received
    0 membership reports received with invalid field(s)
    0 membership reports received for groups to which we belong
    0 membership reports sent
arp:
    44181302 datagrams received
    2 ARP requests received
    2028 ARP replies received
    3156 resolution requests received

```

```
0 unrestricted proxy requests
0 received proxy requests
0 proxy requests not proxied
0 with bogus interface
787 with incorrect length
712 for non-IP protocol
0 with unsupported op code
0 with bad protocol address length
0 with bad hardware address length
0 with multicast source address
7611 with multicast target address
0 with my own hardware address
14241699 for an address not on the interface
0 with a broadcast source address
0 with source address duplicate to mine
29929250 which were not for me
0 packets discarded waiting for resolution
6 packets sent after waiting for resolution
17812 ARP requests sent
2 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry

ip6:
0 total packets received
0 with size smaller than minimum
0 with data size < data length
0 with bad options
0 with incorrect version number
0 fragments received
0 fragments dropped (dup or out of space)
0 fragments dropped after timeout
0 fragments that exceeded limit
0 packets reassembled ok
0 packets for this host
0 packets forwarded
0 packets not forwardable
0 redirects sent
0 packets sent from this host
0 packets sent with fabricated ip header
0 output packets dropped due to no bufs, etc.
0 output packets discarded due to no route
0 output datagrams fragmented
0 fragments created
0 datagrams that can't be fragmented
0 packets that violated scope rules
0 multicast packets which we don't join
Mbuf statistics:
0 packets whose headers are not continuous
0 tunneling packets that can't find gif
0 packets discarded due to too many headers
0 failures of source address selection
0 forward cache hit
0 forward cache miss
0 packets destined to dead next hop
0 option packets dropped due to rate limit
0 packets dropped (src and int don't match)
0 packets dropped due to bad protocol

icmp6:
0 calls to icmp_error
0 errors not generated because old message was icmp error or so
```

```

0 errors not generated because rate limitation
0 messages with bad code fields
0 messages < minimum length
0 bad checksums
0 messages with bad length
Histogram of error messages to be generated:
    0 no route
    0 administratively prohibited
    0 beyond scope
    0 address unreachable
    0 port unreachable
    0 packet too big
    0 time exceed transit
    0 time exceed reassembly
    0 erroneous header field
    0 unrecognized next header
    0 unrecognized option
    0 redirect
    0 unknown
0 message responses generated
0 messages with too many ND options
ipsec6:
0 inbound packets processed successfully
0 inbound packets violated process security policy
0 inbound packets with no SA available
0 invalid inbound packets
0 inbound packets failed due to insufficient memory
0 inbound packets failed getting SPI
0 inbound packets failed on AH replay check
0 inbound packets failed on ESP replay check
0 inbound AH packets considered authentic
0 inbound AH packets failed on authentication
0 inbound ESP packets considered authentic

show system uptime

Syntax	show system uptime
Syntax (EX Series Switches)	show system uptime <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system uptime <director-group <i>name</i> > <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
Syntax (TX Matrix Router)	show system uptime <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system uptime <detail> <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system uptime <all-members> <invoke-on> <local> <member <i>member-id</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.
Options	none —Show time since the system rebooted and processes started. all-chassis —(TX Matrix and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis. all-lcc —(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router. all-members —(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.

director-group *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

infrastructure *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

invoke-on—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

local—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

scc—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

Additional Information By default, when you issue the **show system uptime** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

Output Fields [Table 66 on page 872](#) describes the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

Table 66: show system uptime Output Fields

Field Name	Field Description
Current time	Current system time in UTC.
System booted	Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.
Protocols started	Date and time when the routing protocols were last started and how long they have been running.
Last configured	Date and time when a configuration was last committed. Also shows the name of the user who issued the last commit command.
time and up	Current time, in the local time zone, and how long the router or switch has been operational.
users	Number of users logged in to the router or switch.
load averages	Load averages for the last 1 minute, 5 minutes, and 15 minutes.

Extended DHCP Local Server Overview

You can enable the router or switch to function as an extended DHCP local server and configure the extended DHCP local server options on the router (or switch). The extended DHCP local server provides an IP address and other configuration information in response to a client request. The DHCP local server supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or DHCP client authentication. You can configure dynamic profile and authentication support on a global basis or for a specific group of interfaces.

The extended DHCP local server enhances traditional DHCP server operation by utilizing centralized address-assignment pools. The address-assignment pools are managed independently of the DHCP local server and can be shared by different client applications.

You can also configure the extended DHCP local server to support IPv6 clients. Both DHCP local server and DHCPv6 local server support the specific address request feature, which enables you to assign a particular address to a client. See [“DHCPv6 Local Server Overview” on page 880](#) for information about the DHCPv6 local server feature.

NOTE: You cannot configure the extended DHCP local server and extended DHCP relay on the same interface.

To configure the extended DHCP local server on the router (or switch), you include the **dhcp-local-server** statement at the **[edit system services]** hierarchy level. See the *[edit system services dhcp-local-server] Hierarchy Level* for the complete DHCP local server syntax.

This overview covers:

- [Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools on page 876](#)
- [Providing DHCP Client Configuration Information on page 877](#)
- [Minimal Configuration for Clients on page 878](#)
- [DHCP Local Server and Address-Assignment Pools on page 878](#)
- [DHCP Liveness Detection on page 879](#)

Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools

The pattern of interaction between the DHCP local server, the DHCP client, and address-assignment pools is the same regardless of whether the software installation is on a router or a switch. Technically, the codes operates in the same manner, regardless of the hardware platform. However, there are some difference in the details of usage.

- On routers—In a typical carrier edge network configuration, the DHCP client is on the subscriber's computer, and the DHCP local server is configured on the router.

- On switches—In a typical network configuration, the DHCP client is on an access device, such as a personal computer, and the DHCP local server is configured on the switch.

The following steps provide a high-level description of the interaction among the DHCP local server, DHCP client, and address-assignment pools:

1. The DHCP client sends a discover packet to one or more DHCP local servers in the network to obtain configuration parameters and an IP address for the subscriber (or DHCP client).
2. Each DHCP local server that receives the discover packet then searches its address-assignment pool for the client address and configuration options. Each local server creates an entry in its internal client table to keep track of the client state, then sends a DHCP offer packet to the client.
3. On receipt of the offer packet, the DHCP client selects the DHCP local server from which to obtain configuration information and sends a request packet indicating the DHCP local server selected to grant the address and configuration information.
4. The selected DHCP local server sends an acknowledgement packet to the client that contains the client address lease and configuration parameters. The server also installs the host route and ARP entry, and then monitors the lease state.

Providing DHCP Client Configuration Information

When the extended DHCP application receives a response from an external authentication server, the response might include information in addition to the IP address and subnet mask. The extended DHCP application uses the information from the authentication grant for the response the DHCP application sends to the DHCP client. The DHCP application can either send the information in its original form or the application might merge the information with local configuration specifications. For example, if the authentication grant includes an address pool name and a local configuration specifies DHCP attributes for that pool, the extended DHCP application merges the authentication results and the attributes in the reply that the server sends to the client.

A local configuration is optional — a client can be fully configured by the external authentication service. However, if the external authentication service does not provide client configuration, you must configure the local address-assignment pool to provide the configuration for the client. When a local configuration specifies options, the extended DHCP application adds the local configuration options to the offer PDU the server sends to the client. If the two sets of options overlap, the options in the authentication response from the external service take precedence.

When you use RADIUS to provide the authentication, the additional information might be in the form of RADIUS attributes and Juniper Networks VSAs. [Table 67 on page 878](#) lists the information that RADIUS might include in the authentication grant. See *RADIUS Attributes and Juniper Networks VSAs Supported by the AAA Service Framework* for a complete list of RADIUS attributes and Juniper Networks VSAs that the extended DHCP applications supports for subscriber access management or DHCP management.

Table 67: Information in Authentication Grant

Attribute Number	Attribute Name	Description
RADIUS attribute 8	Framed-IP-Address	Client IP address
RADIUS attribute 9	Framed-IP-Netmask	Subnet mask for client IP address (DHCP option 1)
Juniper Networks VSA 26-4	Primary-DNS	Primary domain server (DHCP option 6)
Juniper Networks VSA 26-5	Secondary-DNS	Secondary domain server (DHCP option 6)
Juniper Networks VSA 26-6	Primary-WINS	Primary WINS server (DHCP option 44)
Juniper Networks VSA 26-7	Secondary-WINS	Secondary WINS server (DHCP option 44)
RADIUS attribute 27	Session-Timeout	Lease time
RADIUS attribute 88	Framed-Pool	Address assignment pool name
Juniper Networks VSA 26-109	DHCP-Guided-Relay-Server	DHCP relay server

Minimal Configuration for Clients

The extended DHCP local server provides a minimal configuration to the DHCP client if the client does not have DHCP option 55 configured. The server provides the subnet mask of the address-assignment pool that is selected for the client. In addition to the subnet mask, the server provides the following values to the client if the information is configured in the selected address-assignment pool:

- **router**—A router (or switch) located on the client's subnet. This statement is the equivalent of DHCP option 3.
- **domain name**—The name of the domain in which the client searches for a DHCP server host. This is the default domain name that is appended to hostnames that are not fully qualified. This is equivalent to DHCP option 15.
- **domain name server**—A Domain Name System (DNS) name server that is available to the client to resolve hostname-to-client mappings. This is equivalent to DHCP option 6.

DHCP Local Server and Address-Assignment Pools

In the traditional DHCP server operation, the client address pool and client configuration information reside on the DHCP server. With the extended DHCP local server, the client address and configuration information reside in centralized address-assignment pools, which are managed independently of the DHCP local server and which can be shared by different client applications.

The extended DHCP local server also supports advanced pool matching and the use of named address ranges. You can also configure the local server to use DHCP option 82 information in the client PDU to determine which named address range to use for a particular client. The client configuration information, which is configured in the address-assignment pool, includes user-defined options, such as boot server, grace period, and lease time.

Configuring the DHCP environment that includes the extended DHCP local server requires two independent configuration operations, which you can complete in any order. In one operation, you configure the extended DHCP local server on the router and specify how the DHCP local server determines which address-assignment pool to use. In the other operation, you configure the address-assignment pools used by the DHCP local server. The address-assignment pools contain the IP addresses, named address ranges, and configuration information for DHCP clients. See *Configuring Address-Assignment Pools* for details about creating and using address-assignment pools.

NOTE: The extended DHCP local server and the address-assignment pools used by the server must be configured in the same logical system and routing instance.

DHCP Liveness Detection

Liveness detection for DHCP subscriber IP (or DHCP client IP) sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients are expected to respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented. You can configure

NOTE: DHCP liveness detection either globally or per DHCP group.

DHCPv6 Local Server Overview

The DHCPv6 local server enhances the extended DHCP local server by providing support for IPv6. When a DHCPv6 client logs in, the DHCPv6 local server uses the AAA service framework to interact with the RADIUS server. The RADIUS server, which is configured independently of DHCP, authenticates the client and supplies the IPv6 prefix and client configuration parameters.

You can configure DHCPv6 local server to communicate the following attributes to the AAA service framework and RADIUS at login time:

- Client username
- Client password

NOTE: The client username, which uniquely identifies a subscriber or a DHCP client, must be present in the configuration in order for DHCPv6 local server to use RADIUS authentication.

Based on the attributes that the DHCPv6 local server provides, RADIUS returns the information listed in [Table 68 on page 880](#) to configure the client:

Table 68: RADIUS Attributes and VSAs for DHCPv6 Local Server

Attribute Number	Attribute Name	Description
27	Session-Timeout	Lease time, in seconds. If not supplied, the lease does not expire
123	Delegated-IPv6-Prefix	Prefix that is delegated to the client
26-143	Max-Clients-Per-Interface	Maximum number of clients allowed per interface

The DHCPv6 local server is compatible with the extended DHCP local server and the extended DHCP relay agent, and can be enabled on the same interface as either the extended DHCP local server or DHCP relay agent.

The DHCPv6 local server provides many of the same features as the extended DHCP local server, including:

- Configuration for a specific interface or for a group of interfaces
- Site-specific usernames and passwords
- Numbered Ethernet interfaces
- Statically configured CoS and filters
- AAA directed login
- Use of the IA_NA option to assign a specific address to a client

To configure the extended DHCPv6 local server on the router (or switch), you include the **dhcpv6** statement at the **[edit system services dhcp-local-server]** hierarchy level. See the *[edit system services dhcp-local-server] Hierarchy Level* for the complete DHCP local server syntax, including the DHCPv6 syntax.

You can also include the **dhcpv6** statement at the following hierarchy levels:

- **[edit logical-systems *logical-system-name* system services dhcp-local-server]**
- **[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system services dhcp-local-server]**
- **[edit routing-instances *routing-instance-name* system services dhcp-local-server]**

DHCP Local Server Handling of Client Information Request Messages

DHCP clients that already have externally provided addresses may solicit further configuration information from a DHCP server by sending a DHCP information request that indicates what information is desired. By default, DHCP local server and DHCPv6 local server ignore any DHCP information requests that they receive. You can override this default behavior to enable processing of these messages. Include the **process-inform**

statement at the **[edit system services dhcp-local-server overrides]** or **[edit system services dhcp-local-server dhcpv6 overrides]** hierarchy level.

By default, DHCP relay and DHCP relay proxy automatically forward DHCP information request messages without modification if the messages are received on an interface configured for a DHCP server group. DHCP relay and relay proxy drop information request messages received on any other interfaces. You cannot disable this default DHCP relay and relay proxy behavior.

The information requested by these clients has typically been configured with the **dhcp-attributes** statement for an address pool defined by the **address-assignment pool pool-name** statement at the **[edit access]** hierarchy level.

When you enable processing of DHCP information requests, you can optionally specify the name of the pool from which the local server retrieves the requested configuration information for the client. If you do not specify a local pool, then the local server requests that AAA selects and returns only the name of the relevant pool.

DHCP local server responds to the client with a DHCP acknowledgment message that includes the requested information—if it is available. DHCPv6 local server responds in the same manner but uses a DHCP reply message. No subscriber management or DHCP-management is applied as a result of the DHCP information request message.

NOTE: PPP interfaces are not supported on EX Series switches.

When DHCPv6 is configured over PPP interfaces, the PPP RADIUS authentication data can be used to select the pool from which the response information is taken. Additionally other RADIUS attributes can also be inserted into the DHCPv6 reply message. If an overlap exists between RADIUS attributes and local pool attributes, the RADIUS values are used instead of the local configuration data. If no RADIUS information is received from the underlying PPP interface, then the behavior is the same as described previously for non-PPP interfaces.

DHCP Duplicate Client Differentiation Using Client Subinterface Overview

In some network environments, client IDs and MAC addresses might not be unique, resulting in duplicate clients. For example, two network adapters might be manufactured with the same hardware address, resulting in a duplicate MAC address among the DHCP clients attached to the router (or switch). A duplicate DHCP client occurs when a client attempts to get a lease, and that client has the same client ID or the same MAC address as an existing DHCP client.

When DHCP server receives a request from a new client that has a duplicate ID or MAC address, DHCP server terminates the address lease for the existing client and returns the address to its original address pool. DHCP server then assigns a new address and lease to the new client.

By default, both DHCP local server and DHCP relay use the subnet information to differentiate between duplicate clients. However, in some cases, this level of differentiation is not adequate. For example, when multiple subinterfaces share the same underlying loopback interface with the same preferred source address, the interfaces appear to be on the same subnet. In this situation, the default configuration prevents duplicate clients.

You can provide greater differentiation between duplicate clients by configuring DHCP to consider the client subinterface when duplicate clients occur. In this optional configuration, DHCP uniquely identifies:

- The subnet on which the client resides
- The subinterface on which the client resides
- The client within the subnet

Group-Specific DHCP Local Server Options

You can include the following statements at the **[edit system services dhcp-local-server group group-name]** hierarchy level to set group-specific DHCP local server configuration options, and at the **[edit system services dhcp-local-server]** hierarchy level to set global DHCP local server configuration options. Statements configured at the **[edit system services dhcp-local-server group group-name]** hierarchy level apply only to the named group of interfaces, and override any global DHCP local server settings configured with the same statements at the **[edit system services dhcp-local-server]** hierarchy level.

DHCPv6 local server supports the same set of statements with the exception of the **dynamic-profile** statement.

- **authentication**—Configure the parameters the router sends to the external AAA server.
- **dynamic-profile**—Specify the dynamic profile that is attached to a group of interfaces.
- **interface**—Specify one or more interfaces, or a range of interfaces, that are within the specified group.
- **overrides**—Override the default configuration settings for the extended DHCP local server. For information, see “[Overriding Default DHCP Local Server Configuration Settings](#)” on page 928.

**Related
Documentation**

- [Grouping Interfaces with Common DHCP Configurations on page 926](#)

Understanding Dynamic Reconfiguration of Extended DHCP Local Server Clients

Dynamic reconfiguration of clients enables the extended DHCP local server to initiate a client update without waiting for the client to initiate a request.

Default Client/Server Interaction

Typically the DHCP client initiates all of the basic DHCP client/server interactions. The DHCP server sends information to a client only in response to a request from that client. This behavior does not enable a client to be quickly updated with its network address and configuration in the event of server changes:

NOTE: Technically, the DHCP client/server interactions are the same on routers and switches. However, the primary usage of this technology on the routers is for subscriber management. The switches are not used for subscriber management. Therefore, this topic provides two sample scenarios. The actions are the same, but the implementation details are different.

- On routers—Suppose a service provider restructures its addressing scheme or changes the server IP addresses that it provided to clients. Without dynamic reconfiguration, the service provider typically clears the DHCP server binding table, but cannot inform the DHCP clients that their bindings have been cleared. Consequently, the DHCP client operates as though its IP address is still valid, but it is now unable to communicate over the access network, resulting in an outage. The DHCP local server needs to wait for the client to send a message to renew its lease or rebind to the server. In response, the server sends a NAK message to the client to force it to begin the DHCP connection process again. Alternatively, the provider can wait for customers to make a service call about the network failures and then instruct them to power cycle their customer premises equipment to reinitiate the connection. Neither of these actions is timely or convenient for customers.
- On switches—Suppose you restructure the addressing scheme or change the server IP addresses that the DHCP server provides to clients. Without dynamic reconfiguration, the network typically clears the DHCP server binding table, but cannot inform the DHCP clients that their bindings have been cleared. Consequently, the DHCP client operates as though its IP address is still valid, but it is now unable to communicate over the access network, resulting in an outage. The DHCP local server needs to wait for the client to send a message to renew its lease or rebind to the server. In response, the server sends a NAK message to the client to force it to begin the DHCP connection process again. Alternatively, you can wait for users to notify you of the network failures and then instruct them to power cycle their equipment to reinitiate the connection. Neither of these actions is timely or convenient for users.

Dynamic Client/Server Interaction for DHCPv4

Dynamic reconfiguration for DHCPv4 is available through a partial implementation of RFC 3203, *DHCP Reconfigure Extension* for DHCPv4. It enables the DHCPv4 local server to send a message to the client to force reconfiguration.

The server sends a `forcerenew` message to a DHCPv4 client, initiating a message exchange. In response, DHCPv4 clients that support the `forcerenew` message then send a lease renewal message to the server. The server rejects the lease renewal request and sends a NAK to the client, causing the client to reinitiate the DHCP connection. A successful reconnection results in the reconfiguration of the DHCP client. Only the

exchange of `forcerenew`, `renew`, and `NAK` messages is supported from RFC 3202. DHCP relay and DHCP relay proxy do not participate in the client reconfiguration or react to `forcerenew` messages other than to forward them to the client.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a `forcerenew` message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber services or DHCP-managed services, such as forwarding and statistics, continue to work. Client statistics are not maintained in the interval between a successful reconfiguration and the subsequent client binding. When the server responds to the client renewal request with a `NAK`, the client entry is removed from the binding table and final statistics are reported. New statistics are collected when the client sends a `discover` message to establish a new session.

Dynamic Client/Server Interaction for DHCPv6

Dynamic reconfiguration for DHCPv6 is available through a partial implementation of RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*. It enables the DHCPv6 local server to send a message to the client to force reconfiguration.

DHCPv6 servers send `reconfigure` messages to DHCPv6 clients, initiating a message exchange. In response, DHCPv6 clients that support the `reconfigure` message transition to the renewing state and send a `renew` message to the server. The server returns a reply message with a lifetime of zero (0). The client transitions to the init state and sends a `solicit` message. The server sends an `advertise` message to indicate that it is available for service. The client sends a request for configuration parameters, which the server then includes in its reply. DHCP relay and DHCP relay proxy do not participate in the client reconfiguration or react to `reconfigure` messages other than to forward them to the client.

When a DHCPv6 server is triggered to initiate reconfiguration on a bound DHCPv6 client, the client transitions to the `reconfigure` state. All subscriber services, such as forwarding and statistics, continue to work. The server then sends the `reconfigure` message to the client. If the DHCPv6 client is already in the `reconfigure` state, the DHCPv6 server ignores the reconfiguration trigger. For clients in any state other than bound or `reconfigure`, the server clears the binding state of the client, as if the `clear dhcpv6 server binding` command had been issued.

Dynamic Configuration Options

You can enable dynamic reconfiguration for all DHCP clients or only the DHCP clients serviced by a specified group of interfaces, and you can modify the behavior accordingly.

- To enable dynamic reconfiguration with default reconfiguration values for all DHCP clients, include the `reconfigure` statement at the `[edit system services dhcp-local-server]` hierarchy level for DHCPv4 clients, and at the `[edit system services dhcp-local-server dhcpv6]` hierarchy level for DHCPv6 clients.
- Alternatively, to enable dynamic reconfiguration for only the DHCP clients serviced by a specified group of interfaces, include the `reconfigure` statement at the `[edit system services dhcp-local-server group group-name]` hierarchy level for DHCPv4 clients, and at the `[edit system services dhcp-local-server dhcpv6 group group-name]` hierarchy level for DHCPv6 clients.

You can optionally modify the behavior of the reconfiguration process by including the appropriate statements at the **[edit system services dhcp-local-server reconfigure]** hierarchy level for all DHCPv4 clients, and at the **[edit system services dhcp-local-server dhcpv6 reconfigure]** hierarchy level for all DHCPv6 clients. To override this global configuration for only the DHCP clients serviced by a specified group of interfaces, you can include the statements with different values at the **[edit system services dhcp-local-server group group-name reconfigure]** hierarchy level for DHCPv4 clients, and at the **[edit system services dhcp-local-server dhcpv6 group group-name reconfigure]** hierarchy level for DHCPv6 clients.

Include the **attempts** statement to specify how many times the local server sends the **forcerenew** or **reconfigure** message to initiate client reconfiguration. Include the **timeout** statement to set the interval between the first and second attempts. The interval between each subsequent attempt doubles the previous value. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on.

By default, the DHCP client's original configuration is restored if all of the reconfiguration attempts fail. Include the **clear-on-abort** statement to delete the client instead.

You can configure an authentication token by including the **token** statement. The DHCP local server then includes this token inside the authentication option when it sends **forcerenew** or **reconfigure** messages. If the service provider has previously configured the DHCP client with this token, then the client can compare that token against the newly received token, and reject the message if the tokens do not match. This functionality corresponds to RFC 3118, *Authentication for DHCP Messages*, section 4.

In the event of a RADIUS-initiated disconnect (RID), the client is deleted by default. You can configure the client to be reconfigured instead of deleted by including the **radius-disconnect** statement. The client is deleted if all attempts to reconfigure the client fail.

For the DHCPv6 server only, you can include the **strict** statement. By default, the server accepts solicit messages from clients that do not support server-initiated reconfiguration. Including this statement causes the server to discard solicit messages from nonsupporting clients; consequently the server does not bind these clients.

You can force the local server to initiate the reconfiguration process for clients by issuing the **request dhcp server reconfigure** command for DHCPv4 clients, and the **request dhcpv6 server reconfigure** command for DHCPv6 clients. Command options determine whether reconfiguration is then attempted for all clients or specified clients.

Events that take place while a reconfiguration is in process take precedence over the reconfiguration. [Table 69 on page 887](#) lists the actions taken in response to several different events.

Table 69: Action Taken for Events That Occur During a Reconfiguration

Event	Action
Server receives a discover (DHCPv4) or solicit (DHCPv6) message from the client.	Server drops packet and deletes client.
Server receives a request, renew, rebind, or init-reboot message from the client.	DHCPv4—Server sends NAK message and deletes client. DHCPv6—Server drops packet and deletes client. Server replies to renew message with lease time of zero (0).
Server receives a release or decline message from the client.	Server deletes client.
The client lease times out.	Server deletes client.
The clear dhcp server binding command is issued.	Server deletes client.
The request dhcp server reconfigure (DHCPv4) or request dhcpv6 server reconfigure (DHCPv6) command is issued.	Command is ignored.
GRES or DHCP restart occurs.	Reconfiguration process is halted.

DHCP Snooping Support

DHCP snooping provides DHCP security on the router by filtering incoming messages. When DHCP snooping is enabled, the router differentiates between trusted and untrusted interfaces, and forwards messages from trusted sources while rejecting the untrusted messages.

In Junos OS, DHCP snooping is enabled in a routing instance when you configure either the **dhcp-relay** statement at the **[edit forwarding-options]** hierarchy level, or the **dhcp-local-server** statement at the **[edit system services]** hierarchy level in that routing instance. However, depending on the Junos OS release, the router processes the snooped packets differently, as described in the following list:

- In Junos OS Release 10.0 and earlier, the router processes snooped packets normally.
- In Junos OS Release 10.1 and later, the router discards snooped packets by default. To enable normal processing of snooped packets in Junos OS Release 10.1 and later, you must explicitly configure the **allow-snooped-clients** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level.

You can configure DHCP snooping support for the following:

- DHCPv4 relay agent—Override the router's (or switch's) default snooping configuration and specify that DHCP snooping is enabled or disabled globally, for a named group of interfaces, or for a specific interface within a named group.

In a separate procedure, you can set a global configuration to specify whether the DHCPv4 relay agent forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces. The router also uses the global DHCP relay agent snooping configuration to determine whether to forward or drop snooped BOOTREPLY packets.

- DHCPv6 relay agent—As you can with snooping support for the DHCPv4 relay agent, you can override the default DHCPv6 relay agent snooping configuration on the router to explicitly enable or disable snooping support globally, for a named group of interfaces, or for a specific interface with a named group of interfaces.

In multi-relay topologies where more than one DHCPv6 relay agent is between the DHCPv6 client and the DHCPv6 server, snooping enables intervening DHCPv6 relay agents between the client and the server to correctly receive and process the unicast traffic from the client and forward it to the server. The DHCPv6 relay agent snoops incoming unicast DHCPv6 packets by setting up a filter with UDP port 547 (the DHCPv6 UDP server port) on a per-forwarding table basis. The DHCPv6 relay agent then processes the packets intercepted by the filter and forwards the packets to the DHCPv6 server.

Unlike the DHCPv4 relay agent, the DHCPv6 relay agent does not support global configuration of forwarding support for DHCPv6 snooped packets.

- DHCP local server—Configure whether DHCP local server forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces.

DHCP Auto Logout Overview

This topic provides an introduction to the optional DHCP auto logout feature and includes the following sections:

- [Auto Logout Overview on page 888](#)
- [How DHCP Identifies and Releases Clients on page 889](#)
- [Option 60 and Option 82 Requirements on page 890](#)

Auto Logout Overview

Auto logout is an optional configuration for DHCP local server and DHCP relay agent that improves the efficiency of DHCP IP address assignment. Auto logout enables IP addresses to be immediately released and returned to the address pool when the addresses are no

longer used by DHCP clients. DHCP can then assign the addresses to other clients. Without auto logout, an IP address is blocked for the entire lease period, and DHCP must wait until the address lease time expires before reusing the address.

Auto logout is particularly useful when DHCP uses long lease times for IP address assignments and to help avoid allocating duplicate IP addresses for a single client.

For example (on the routers), you might have an environment that includes set-top boxes (STB) that are often upgraded or replaced. Each time a STB is changed, the new STB repeats the DHCP discover process to obtain client configuration information and an IP address. DHCP views the new STB as a completely new client and assigns a new IP address—the previous IP address assigned to the client (the old STB) remains blocked and unavailable until the lease expires. If auto logout is configured in this situation, DHCP recognizes that the new STB is actually the same client and then immediately releases the original IP address. DHCP relay agent acts as a proxy client for auto logout and sends a DHCP release message to the DHCP server.

How DHCP Identifies and Releases Clients

The auto logout feature requires that DHCP explicitly identify clients. By default, DHCP local server and DHCP relay agent identify clients based on MAC address or Client Identifier. However, in some cases this type of identification might not be sufficient. For example, in the previous STB example, each STB has a different MAC address, so DHCP incorrectly assumes that an upgraded or replacement STB is a new client.

In order to explicitly identify clients, auto logout uses a secondary identification method when the primary identification method is unsuccessful—the primary method is considered unsuccessful if the MAC address or Client Identifier does not match that of an existing client. The secondary identification method is based on the DHCP option 60 and option 82 information in DHCP discover messages.

Both the primary and secondary identification methods use subnet information to differentiate between clients. The primary identification method differentiates between two clients with the same MAC address (or same Client Identifier) if the clients are on different subnets. Similarly, the secondary identification method considers two clients as different if they have the same option 60 and option 82 information, but different subnets.

DHCP local server and DHCP relay agent perform the following operations when auto logout is enabled and the secondary identification method identifies a duplicate client (that is, the discover packet is from an existing client).

- DHCP local server immediately releases the existing address.
- DHCP relay agent immediately releases the existing client and then sends a DHCP release packet to the DHCP server. Sending the release packet ensures that DHCP relay and the DHCP server are synchronized.

If the DHCP relay receives a DISCOVER message from an existing client, the DHCP relay forwards the DISCOVER message to the DHCP server. The DHCP relay preserves the binding if the client's existing IP address is returned by the DHCP server. This behavior is not applicable if the proxy-mode override or client-discover-match functionality are enabled.

NOTE: If the DHCP relay agent is in snoop mode, DHCP relay releases the client but does not send a release packet to the DHCP server if the discover packet is for a passive client (a client added as a result of snooped packets) or if the discover packet is a snooped packet.

Option 60 and Option 82 Requirements

DHCP local server requires that the received discover packet include both DHCP option 60 and option 82. If either option is missing, DHCP local server cannot perform the secondary identification method and auto logout is not used.

DHCP relay agent requires that the received discover packet contain DHCP option 60. DHCP relay determines the option 82 value based on the guidelines provided in [“DHCP Relay Agent Option 82 Value for Auto Logout” on page 962](#).

Address-Assignment Pools Overview

The address-assignment pool feature supports subscriber management and DHCP management functionality by enabling you to create IPv4 and IPv6 address pools that different client applications can share. For example, multiple client applications, such as DHCP, can use an address-assignment pool to provide addresses for their particular clients. Client applications can acquire addresses for either authenticated or unauthenticated clients.

Address-assignment pools support both dynamic and static address assignment. In dynamic address assignment, a client is automatically assigned an address from the address-assignment pool. In static address assignment, which is supported for IPv4 pools only, you reserve an address that is then always used by a particular client. Addresses that are reserved for static assignment are removed from the dynamic address pool and cannot be assigned to other clients.

You can configure named address ranges within an address-assignment pool. A named range is a subset of the overall address range. A client application can use named ranges to manage address assignment based on client-specific criteria. For example, for IPv4 address-assignment pools, you might create a named range that is based on a specific DHCP option 82 value. Then, when a DHCP client request matches the specified option 82 value, an address from the specified range is assigned to the client.

You can link address-assignment pools together to provide backup pools for address assignment. When the primary pool is fully allocated, the router or switch automatically switches to the linked, or secondary, pool and begins allocating addresses from that pool.

You can also explicitly identify that an address-assignment pool is used for ND/RA.

Use of DHCP Option 50 and DHCPv6 IA_NA Option to Request a Specific IP Address

Subscriber management or DHCP management enables you to specify that DHCP local server assign a particular address to a client. For example, if a client is disconnected, you might use this capability to assign the same address that the client was using prior to being disconnected. If the requested address is available, DHCP assigns it to the client. If the address is unavailable, the DHCP local server offers another address, based on the address allocation process.

Both DHCP local server and DHCPv6 local server support the specific address request feature. DHCP local server uses DHCP option 50 in DHCP DISCOVER messages to request a particular address, while DHCPv6 local server uses the IA_NA option (Identity Association for Non-Temporary Addresses) in DHCPv6 SOLICIT messages.

NOTE: Subscriber management (DHCP management) supports only one address for each of the DHCPv6 IA_NA or IA_PD address types. If the DHCPv6 client requests more than one address for a given type, the DHCPv6 local server uses only the first address and ignores the other addresses.

Multiple Address Assignment for DHCPv6 Clients

Subscriber management (on the routers) or DHCP management (on the switches) enables you to assign multiple addresses to a single DHCPv6 client. Multiple address support is enabled by default, and is activated when the DHCPv6 local server receives a DHCPv6 Solicit message from a subscriber (or DHCP client) that contains multiple addresses.

For example, if you are implementing this feature on the routers, you might use the multiple address assignment feature in a networking environment in which a customer premises equipment (CPE) device requires a host address and a delegated prefix. In such an environment, you can configure subscriber management to assign both a DHCPv6 IA_NA (Identity Association for Non-Temporary Addresses) and an IA_PD (Identity Association for Prefix Delegation) address to the client (the CPE device).

- [Multiple Address Assignment Using Local Address Pools or RADIUS on page 892](#)
- [Junos OS Predefined Variable for Multiple DHCPv6 Address Assignment on page 892](#)

Multiple Address Assignment Using Local Address Pools or RADIUS

You can use either local address pools or RADIUS when assigning multiple addresses to a DHCP client. When at least one address is successfully allocated, the router or switch creates a subscriber (or DHCP client) entry and binds the entry to the assigned address. If both addresses are successfully allocated, the router (or switch) creates a single subscriber (or DHCP client) entry and binds both addresses to that entry.

You can also configure a delegated address pool, which explicitly specifies the address pool that subscriber management (or DHCP management) uses to assign IPv6 prefixes for subscribers (or DHCP clients).

Junos OS Predefined Variable for Multiple DHCPv6 Address Assignment

NOTE: EX Series switches do not support demux.

(On the routers only) Subscriber management provides a predefined variable that you can use to dynamically configure DHCPv6 multiple address assignment. You apply the Junos OS predefined variable, **\$junos-subscriber-ipv6-multi-address**, as a demux source address in a dynamic profile. When the dynamic profile is attached to a subscriber, the variable is expanded to include both the host and prefix addresses. You use this variable instead of the **\$junos-subscriber-ipv6-address** variable, which supports a single IPv6 address.

You include the **\$junos-subscriber-ipv6-multi-address** variable at the **[edit dynamic-profile profile-name interfaces interface-name unit logical-unit-number family inet6 demux-source]** hierarchy level.

Centrally Configured Opaque DHCP Options

Subscriber management (on the routers) or DHCP management (on the switches) enables you to centrally configure DHCP options on a RADIUS server and then distribute the options on a per-subscriber or per DHCP-client basis. This method results in RADIUS-sourced DHCP options—the DHCP options originate at the RADIUS server and are sent to the subscriber (or DHCP client). This differs from the traditional client-sourced method (also called DHCP-sourced) of configuring DHCP options, in which the options originate at the client and are sent to the RADIUS server. The subscriber management (DHCP management) RADIUS-sourced DHCP options are also considered to be *opaque*, because DHCP local server performs minimal processing and error checking for the DHCP options string before passing the options to the subscriber (DHCP client).

Subscriber management (or DHCP management) uses Juniper Networks VSA 26-55 (DHCP-Options) to distribute the RADIUS-sourced DHCP options. The RADIUS server includes VSA 26-55 in the Access-Accept message that the server returns during subscriber authentication or DHCP client authentication. The RADIUS server sends the Access-Accept message to the RADIUS client, and then on to DHCP local server for return to the DHCP subscriber. The RADIUS server can include multiple instances of VSA 26-55 in a single Access-Accept message. The RADIUS client concatenates the multiple instances and uses the result as a single instance.

There is no CLI configuration required to enable subscriber management (DHCP management) to use the centrally configured DHCP options—the procedure is triggered by the presence of VSA 26-55 in the RADIUS Access-Accept message.

When building the offer packet for the DHCP client, DHCP local server uses the following sequence:

1. Processes any RADIUS-configured parameters that are passed as separate RADIUS attributes; for example, RADIUS attribute 27 (Session Timeout).
2. Processes any client-sourced parameters; for example, RADIUS attributes 53 (DHCP Message Type) and 54 (Server Identifier).
3. Appends (without performing any processing) the opaque DHCP options string contained in the VSA 26-55 received from the RADIUS server.

In addition to supporting central configuration of DHCP options directly on the RADIUS server (RADIUS-sourced options), subscriber management (DHCP management) also supports the traditional client-sourced options configuration, in which the router's (switch's) DHCP component sends the options to the RADIUS server. The client-sourced DHCP options method is supported for both DHCP local server and DHCP relay agent; however, the RADIUS-sourced central configuration method is supported on DHCP local server only. Both the RADIUS-sourced and client-sourced methods support DHCPv4 and DHCPv6 subscribers (clients).

NOTE: You can use the RADIUS-sourced and client-sourced methods simultaneously on DHCP local server. However, you must ensure that the central configuration method does not include options that override client-sourced DHCP options, because this can create unpredictable results.

- [Data Flow for RADIUS-Sourced DHCP Options on page 895](#)
- [Multiple VSA 26-55 Instances Configuration on page 896](#)
- [DHCP Options That Cannot Be Centrally Configured on page 896](#)

Data Flow for RADIUS-Sourced DHCP Options

Figure 4 on page 895 shows the procedure subscriber management (DHCP management) uses when configuring DHCP options for subscribers (DHCP clients).

Figure 4: DHCP Options Data Flow

The following general sequence describes the data flow when subscriber management (DHCP management) uses RADIUS-sourced DHCP options and VSA 26-55 to configure a DHCP subscriber (client):

1. The subscriber (DHCP client) sends a DHCP discover message (or DHCPv6 solicit message) to the DHCP local server. The message includes client-sourced DHCP options.
2. The DHCP local server initiates authentication with the Junos OS RADIUS client.
3. The RADIUS client sends an Access-Request message on behalf of the subscriber (DHCP client) to the external RADIUS server. The message includes the subscriber's (DHCP client's) client-sourced DHCP options.
4. The external RADIUS server responds by sending an Access-Accept message to the RADIUS client. The Access-Accept message includes the RADIUS-sourced opaque DHCP options in VSA 26-55.
5. The RADIUS client sends the DHCP options string to DHCP local server. If there are multiple VSA 26-55 instances, the RADIUS client first assembles them into a single options string.
6. DHCP local server processes all options into the DHCP offer (or DHCPv6 reply) message, except for the RADIUS-sourced VSA 26-55 DHCP options. After processing all other options, DHCP local server then appends the unmodified VSA 26-55 DHCP options to the message and sends the message to the subscriber (DHCP client).

7. The subscriber (DHCP client) is configured with the DHCP options.
8. The following operations occur after the subscriber (DHCP client) receives the DHCP options:
 - Accounting—The RADIUS client sends Acct-Start and Interim-Accounting requests to the RADIUS server, including the RADIUS-sourced DHCP options in VSA 26-55. By default, the DHCP options are included in accounting requests.
 - Renewal—When the subscriber (DHCP client) renews, the cached DHCP options value is returned in the DHCP renew (or DHCPv6 ACK) message. The originally assigned DHCP options cannot be modified during a renew cycle.
 - Logout—When the subscriber (DHCP client) logs out, the RADIUS client sends an Acct-Stop message to the RADIUS server, including the RADIUS-sourced VSA 26-55.

Multiple VSA 26-55 Instances Configuration

VSA 26-55 supports a maximum size of 247 bytes. If your RADIUS-sourced DHCP options field is greater than 247 bytes, you must break the field up and manually configure multiple instances of VSA 26-55 for the RADIUS server to return. When using multiple instances for an options field, you must place the instances in the packet in the order in which the fragments are to be reassembled by the RADIUS client. The fragments can be of any size of 247 bytes or less.

BEST PRACTICE: For ease of configuration and management of your DHCP options, you might want to have one DHCP option per VSA 26-55 instance, regardless of the size of the option field.

When the RADIUS client returns a reassembled opaque options field in an accounting request to the RADIUS server, the client uses 247-byte fragments. If you had originally created instances of fewer than 247 bytes, the returned fragments might not be the same as you originally configured on the RADIUS server.

NOTE: If you are configuring Steel-Belted Radius (SBR) to support multiple VSA 26-55 instances, ensure that you specify VSA 26-55 with the RO flags in the Subscriber Management RADIUS dictionary file. The R value indicates a multivalued reply attribute and the O value indicates an ordered attribute.

DHCP Options That Cannot Be Centrally Configured

Table 70 on page 896 shows the DHCP options that you must not centrally configure on the RADIUS server.

Table 70: Unsupported Opaque DHCP Options

DHCP Option	Option Name	Comments
Option 0	Pad Option	Not supported.

Table 70: Unsupported Opaque DHCP Options (*continued*)

DHCP Option	Option Name	Comments
Option 51	IP Address Lease Time	Value is provided by RADIUS attribute 27 (Session-Timeout).
Option 52	Option Overload	Not supported.
Option 53	DHCP Message Type	Value is provided by DHCP local server.
Option 54	Server Identifier	Value is provided by DHCP local server.
Option 55	Parameter Request List	Value is provided by DHCP local server.
Option 255	End	Value is provided by DHCP local server.
–	DHCP magic cookie	Not supported.

Graceful Routing Engine Switchover

For EX Series switches, only extended DHCP local server maintains the state of active DHCP client leases. The DHCP local server supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication. You can configure dynamic profile and authentication support on a global basis or for a specific group of interfaces. The extended DHCP local server also supports the use of Junos address-assignment pools or external authorities, such as RADIUS, to provide the client address and configuration information.

For MX Series routers, the extended DHCP local server and the DHCP relay agent applications both maintain the state of active DHCP client leases in the session database. The extended DHCP application can recover this state if the DHCP process fails or is manually restarted, thus preventing the loss of active DHCP clients in either of these circumstances. However, the state of active DHCP client leases is lost if a power failure occurs or if the kernel stops operating (for example, when the router is reloaded) on a single Routing Engine.

You can enable graceful switchover support on both EX Series switches and MX Series routers. To enable graceful switchover support for the extended DHCP local server or extended DHCP relay agent on a switch, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level. To enable graceful Routing Engine switchover support on MX Series routers, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level. You cannot disable graceful Routing Engine

switchover support for the extended DHCP application when the router is configured to support graceful Routing Engine switchover.

For more information about using graceful Routing Engine switchover, see the *Junos OS High Availability Configuration Guide*.

Port Number Requirements for DHCP Firewall Filters

When you configure a firewall filter to perform some action on DHCP packets at the Routing Engine, such as protecting the Routing Engine by allowing only proper DHCP packets, you must specify both port 67 (bootps) and port 68 (bootpc) for both the source and destination. The firewall filter acts at both the line cards and the Routing Engine.

This requirement applies to both DHCP local server and DHCP relay, but it applies only when DHCP is provided by the `jdhcpd` process. MX Series routers, M120 routers, and M320 routers use `jdhcpd`. For DHCP relay, that means the configuration is required only at the `[edit forwarding-options dhcp-relay]` hierarchy level and not at the `[edit forwarding-options helpers bootp]` hierarchy level.

DHCP packets received on the line cards are encapsulated by `jdhcpd` with a new UDP header where their source and destination addresses are set to port 68 before being forwarded to the Routing Engine.

For DHCP relay and DHCP proxy, packets sent to the DHCP server from the router have both the source and destination UDP ports set to 67. The DHCP server responds using the same ports. However, when the line card receives these DHCP response packets, it changes both port numbers from 67 to 68 before passing the packets to the Routing Engine. Consequently the filter needs to accept port 67 for packets relayed from the client to the server, and port 68 for packets relayed from the server to the client.

Failure to include both port 67 and port 68 as described here results in most DHCP packets not being accepted.

For complete information about configuring firewall filters in general, see *Junos OS Firewall Filters and Traffic Policers Configuration Guide*.

Extended DHCP Relay Agent Overview

You can configure extended DHCP relay options on the router or on the switch and enable the router (or switch) to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.

DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or DHCP client authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.

NOTE: The PTX Series Packet Transport Switches do not support authentication for DHCP relay agents.

On the routers, you can use DHCP relay in carrier edge applications such as video/IPTV to obtain configuration parameters, including an IP address, for your subscribers. For more information about how to use the DHCP relay agent in a video/IPTV application, see the *Junos OS Feature Guides*.

On the switches, you can use DHCP relay to obtain configuration parameters including an IP address for DHCP clients.

NOTE: The extended DHCP relay agent options configured with the `dhcp-relay` statement are incompatible with the DHCP/BOOTP relay agent options configured with the `bootp` statement. As a result, you cannot enable both the extended DHCP relay agent and the DHCP/BOOTP relay agent on the router at the same time.

For information about the DHCP/BOOTP relay agent, see the *Routing Policy Configuration Guide*.

You can also configure the extended DHCP relay agent to support IPv6 clients. See “[DHCPv6 Relay Agent Overview](#)” on [page 905](#) for information about the DHCPv6 relay agent feature.

To configure the extended DHCP relay agent on the router (or switch), include the `dhcp-relay` statement at the `[edit forwarding-options]` hierarchy level. See the *[edit forwarding-options dhcp-relay] Hierarchy Level* for the complete DHCP relay agent syntax.

You can also include the `dhcp-relay` statement at the following hierarchy levels:

- `[edit logical-systems logical-system-name forwarding-options]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options]`
- `[edit routing-instances routing-instance-name forwarding-options]`

This overview covers:

- [DHCP Liveness Detection on page 902](#)

Interaction Among the DHCP Relay Agent, DHCP Client, and DHCP Servers

The pattern of interaction among the DHCP Relay agent, DHCP client, and DHCP servers is the same regardless of whether the software installation is on a router or a switch. However, there are some difference in the details of usage.

On routers—In a typical carrier edge network configuration, the DHCP client is on the subscriber's computer, and the DHCP relay agent is configured on the router between the DHCP client and one or more DHCP servers.

On switches—In a typical network configuration, the DHCP client is on an access device such as a personal computer and the DHCP relay agent is configured on the switch between the DHCP client and one or more DHCP servers.

The following steps describe, at a high level, how the DHCP client, DHCP relay agent, and DHCP server interact in a configuration that includes two DHCP servers.

1. The DHCP client sends a discover packet to find a DHCP server in the network from which to obtain configuration parameters for the subscriber (or DHCP client), including an IP address.
2. The DHCP relay agent receives the discover packet and forwards copies to each of the two DHCP servers. The DHCP relay agent then creates an entry in its internal client table to keep track of the client's state.
3. In response to receiving the discover packet, each DHCP server sends an offer packet to the client. The DHCP relay agent receives the offer packets and forwards them to the DHCP client.
4. On receipt of the offer packets, the DHCP client selects the DHCP server from which to obtain configuration information. Typically, the client selects the server that offers the longest lease time on the IP address.
5. The DHCP client sends a request packet that specifies the DHCP server from which to obtain configuration information.
6. The DHCP relay agent receives the request packet and forwards copies to each of the two DHCP servers.
7. The DHCP server requested by the client sends an acknowledgement (ACK) packet that contains the client's configuration parameters.
8. The DHCP relay agent receives the ACK packet and forwards it to the client.
9. The DHCP client receives the ACK packet and stores the configuration information.
10. If configured to do so, the DHCP relay agent installs a host route and Address Resolution Protocol (ARP) entry for this client.
11. After establishing the initial lease on the IP address, the DHCP client and the DHCP server use unicast transmission to negotiate lease renewal or release. The DHCP relay

agent “snoops” on all of the packets unicast between the client and the server that pass through the router (or switch) to determine when the lease for this client has expired or been released. This process is referred to as *lease shadowing* or *passive snooping*.

DHCP Liveness Detection

Liveness detection for DHCP subscriber or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients are expected to respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

NOTE: DHCP liveness detection either globally or per DHCP group.

DHCP Relay Proxy Overview

DHCP relay proxy mode is an enhancement to extended DHCP relay. DHCP relay proxy supports all DHCP relay features while providing additional features and benefits.

Normally, extended DHCP relay operates as a helper application for DHCP operations. Except for the ability to add DHCP relay agent options and the gateway address (giaddr) to DHCP packets, DHCP relay is transparent to DHCP clients and DHCP servers, and simply forwards messages between DHCP clients and servers.

When you configure DHCP relay to operate in proxy mode, the relay is no longer transparent. In proxy mode, DHCP relay conceals DHCP server details from DHCP clients, which interact with a DHCP relay in proxy mode as though it is the DHCP server. For DHCP servers there is no change, because proxy mode has no effect on how the DHCP server interacts with the DHCP relay.

DHCP relay proxy provides the following benefits:

- DHCP server isolation and DoS protection—DHCP clients are unable to detect the DHCP servers, learn DHCP server addresses, or determine the number of servers that are providing DHCP support. Server isolation also provides denial-of-service (DoS) protection for the DHCP servers.
- Multiple lease offer selection—DHCP relay proxy receives lease offers from multiple DHCP servers and selects a single offer to send to the DHCP client, thereby reducing traffic in the network. Currently, the DHCP relay proxy selects the first offer received.
- Support for both numbered and unnumbered Ethernet interfaces—For DHCP clients connected through Ethernet interfaces, when the DHCP client obtains an address, the DHCP relay proxy adds an access internal host route specifying that interface as the outbound interface. The route is automatically removed when the lease time expires or when the client releases the address.
- Logical system support—DHCP relay proxy can be configured in a logical system, whereas a non-proxy mode DHCP relay cannot.

NOTE: Extended DHCP relay proxy is not supported for the J Series Services Routers DHCP server. Also, you cannot configure both DHCP relay proxy and extended DHCP local server on the same interface.

Interaction Among DHCP Relay Proxy, DHCP Client, and DHCP Servers

The DHCP relay agent is configured on the router (or switch), which operates between the DHCP client and one or more DHCP servers.

The following steps provide a high-level description of how DHCP relay proxy interacts with DHCP clients and DHCP servers.

1. The DHCP client sends a discover packet to locate a DHCP server in the network from which to obtain configuration parameters for the subscriber.
2. The DHCP relay proxy receives the discover packet from the DHCP client and forwards copies of the packet to each supporting DHCP server. The DHCP relay proxy then creates a client table entry to keep track of the client state.
3. In response to the discover packet, each DHCP server sends an offer packet to the client, which the DHCP relay proxy receives. The DHCP relay proxy does the following:
 - a. Selects the first offer received as the offer to sent to the client
 - b. Replaces the DHCP server address with the address of the DHCP relay proxy
 - c. Forwards the offer to the DHCP client.
4. The DHCP client receives the offer from the DHCP relay proxy.
5. The DHCP client sends a request packet that indicates the DHCP server from which to obtain configuration information—the request packet specifies the address of the DHCP relay proxy.
6. The DHCP relay proxy receives the request packet and forwards copies, which include the address of selected server, to all supporting DHCP servers.
7. The DHCP server requested by the client sends an acknowledgement (ACK) packet that contains the client configuration parameters.
8. The DHCP relay proxy receives the ACK packet, replaces the DHCP server address with its own address, and forwards the packet to the client.
9. The DHCP client receives the ACK packet and stores the configuration information.
10. If configured to do so, the DHCP relay proxy installs a host route and Address Resolution Protocol (ARP) entry for the DHCP client.
11. After the initial DHCP lease is established, the DHCP relay proxy receives all lease renewals and lease releases from the DHCP client and forwards them to the DHCP server.

DHCPv6 Relay Agent Overview

The DHCPv6 relay agent enhances the extended DHCP relay agent by providing support in an IPv6 network. The DHCPv6 relay agent passes messages between the DHCPv6 client and the DHCPv6 server, similar to the way DHCP relay agent supports an IPv4 network.

When a DHCPv6 client logs in, the DHCPv6 relay agent uses the AAA service framework to interact with the RADIUS server to provide authentication and accounting. The RADIUS server, which is configured independently of DHCP, authenticates the client and supplies the IPv6 prefix and client configuration parameters, such as session timeout and the maximum number of clients allowed per interface.

NOTE: The PTX Series Packet Transport Switches do not support authentication for DHCPv6 relay agents.

The DHCPv6 relay agent is compatible with the extended DHCP local server and the extended DHCP relay agent, and can be enabled on the same interface as either the extended DHCP local server or DHCP relay agent.

To configure the DHCPv6 relay agent on the router (or switch), you include the **dhcpv6** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level.

You can also include the **dhcpv6** statement at the following hierarchy levels:

- **[edit logical-systems *logical-system-name* forwarding-options dhcp-relay]**
- **[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* forwarding-options dhcp-relay]**
- **[edit routing-instances *routing-instance-name* forwarding-options dhcp-relay]**

DHCP Duplicate Client Differentiation Using Client Subinterface Overview

In some network environments, client IDs and MAC addresses might not be unique, resulting in duplicate clients. For example, two network adapters might be manufactured with the same hardware address, resulting in a duplicate MAC address among the DHCP clients attached to the router (or switch). A duplicate DHCP client occurs when a client attempts to get a lease, and that client has the same client ID or the same MAC address as an existing DHCP client.

When DHCP server receives a request from a new client that has a duplicate ID or MAC address, DHCP server terminates the address lease for the existing client and returns the address to its original address pool. DHCP server then assigns a new address and lease to the new client.

By default, both DHCP local server and DHCP relay use the subnet information to differentiate between duplicate clients. However, in some cases, this level of differentiation is not adequate. For example, when multiple subinterfaces share the same underlying loopback interface with the same preferred source address, the interfaces appear to be on the same subnet. In this situation, the default configuration prevents duplicate clients.

You can provide greater differentiation between duplicate clients by configuring DHCP to consider the client subinterface when duplicate clients occur. In this optional configuration, DHCP uniquely identifies:

- The subnet on which the client resides
- The subinterface on which the client resides
- The client within the subnet

Group-Specific DHCP Relay Options

You can include the following statements at the **[edit forwarding-options dhcp-relay group group-name]** hierarchy level to set group-specific DHCP relay agent configuration options. Group-specific statements apply only to the named group of interfaces, and override any global DHCP relay agent settings for the same statement.

Include the statements at the **[edit forwarding-options dhcp-relay dhcpv6 group group-name]** hierarchy level to configure group-specific options for DHCPv6 relay agent.

- **active-server-group**—Configure an active server group to apply a common DHCP relay agent configuration to a named group of DHCP server addresses. For information, see [“Configuring Active Server Groups” on page 977](#).
- **authentication**—Configure the parameters the router (or switch) sends to the external AAA server.
- **dynamic-profile**—Specify the dynamic profile that is attached to a group of interfaces.

- **interface**—Specify one or more interfaces, or a range of interfaces, that are within the specified group.
- **liveness-detection**—Configure bidirectional failure detection timers and authentication criteria for static routes. For more information, see [“DHCP Liveness Detection Overview” on page 980](#).
- **overrides**—Override the default configuration settings for the extended DHCP relay agent. For information, see [“Overriding the Default DHCP Relay Configuration Settings” on page 955](#).
- **relay-agent-interface-id**—(DHCPv6 only) Insert the DHCPv6 Relay Agent Interface-ID option (option 18) in DHCPv6 packets destined for the DHCPv6 server.
- **relay-option**—Configure selective processing, which uses DHCP options in client packets to identify and filter client traffic, and to specify the action DHCP relay agent takes with the traffic. For more information, see *Using DHCP Option Information to Selectively Process DHCP Client Traffic*.
- **relay-option-82**—(DHCPv4 only) Enable or disable the insertion of option 82 information in packets destined for a DHCP server. For information, see [“Enabling and Disabling Insertion of Option 82 Information” on page 973](#).
- **service-profile**—Specify the default subscriber service, (or default profile) which is activated when the subscriber (or DHCP client) logs in and no other service is activated by a RADIUS server or a provisioning server. For more information, see *Default Subscriber Service Overview*.

DHCP Snooping Support

DHCP snooping provides DHCP security on the router by filtering incoming messages. When DHCP snooping is enabled, the router differentiates between trusted and untrusted interfaces, and forwards messages from trusted sources while rejecting the untrusted messages.

In Junos OS, DHCP snooping is enabled in a routing instance when you configure either the **dhcp-relay** statement at the **[edit forwarding-options]** hierarchy level, or the **dhcp-local-server** statement at the **[edit system services]** hierarchy level in that routing instance. However, depending on the Junos OS release, the router processes the snooped packets differently, as described in the following list:

- In Junos OS Release 10.0 and earlier, the router processes snooped packets normally.
- In Junos OS Release 10.1 and later, the router discards snooped packets by default. To enable normal processing of snooped packets in Junos OS Release 10.1 and later, you must explicitly configure the **allow-snooped-clients** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level.

You can configure DHCP snooping support for the following:

- DHCPv4 relay agent—Override the router's (or switch's) default snooping configuration and specify that DHCP snooping is enabled or disabled globally, for a named group of interfaces, or for a specific interface within a named group.

In a separate procedure, you can set a global configuration to specify whether the DHCPv4 relay agent forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces. The router also uses the global DHCP relay agent snooping configuration to determine whether to forward or drop snooped BOOTREPLY packets.

- DHCPv6 relay agent—As you can with snooping support for the DHCPv4 relay agent, you can override the default DHCPv6 relay agent snooping configuration on the router to explicitly enable or disable snooping support globally, for a named group of interfaces, or for a specific interface with a named group of interfaces.

In multi-relay topologies where more than one DHCPv6 relay agent is between the DHCPv6 client and the DHCPv6 server, snooping enables intervening DHCPv6 relay agents between the client and the server to correctly receive and process the unicast traffic from the client and forward it to the server. The DHCPv6 relay agent snoops incoming unicast DHCPv6 packets by setting up a filter with UDP port 547 (the DHCPv6 UDP server port) on a per-forwarding table basis. The DHCPv6 relay agent then processes the packets intercepted by the filter and forwards the packets to the DHCPv6 server.

Unlike the DHCPv4 relay agent, the DHCPv6 relay agent does not support global configuration of forwarding support for DHCPv6 snooped packets.

- DHCP local server—Configure whether DHCP local server forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces.

DHCP Auto Logout Overview

This topic provides an introduction to the optional DHCP auto logout feature and includes the following sections:

- [Auto Logout Overview on page 908](#)
- [How DHCP Identifies and Releases Clients on page 909](#)
- [Option 60 and Option 82 Requirements on page 910](#)

Auto Logout Overview

Auto logout is an optional configuration for DHCP local server and DHCP relay agent that improves the efficiency of DHCP IP address assignment. Auto logout enables IP addresses to be immediately released and returned to the address pool when the addresses are no

longer used by DHCP clients. DHCP can then assign the addresses to other clients. Without auto logout, an IP address is blocked for the entire lease period, and DHCP must wait until the address lease time expires before reusing the address.

Auto logout is particularly useful when DHCP uses long lease times for IP address assignments and to help avoid allocating duplicate IP addresses for a single client.

For example (on the routers), you might have an environment that includes set-top boxes (STB) that are often upgraded or replaced. Each time a STB is changed, the new STB repeats the DHCP discover process to obtain client configuration information and an IP address. DHCP views the new STB as a completely new client and assigns a new IP address—the previous IP address assigned to the client (the old STB) remains blocked and unavailable until the lease expires. If auto logout is configured in this situation, DHCP recognizes that the new STB is actually the same client and then immediately releases the original IP address. DHCP relay agent acts as a proxy client for auto logout and sends a DHCP release message to the DHCP server.

How DHCP Identifies and Releases Clients

The auto logout feature requires that DHCP explicitly identify clients. By default, DHCP local server and DHCP relay agent identify clients based on MAC address or Client Identifier. However, in some cases this type of identification might not be sufficient. For example, in the previous STB example, each STB has a different MAC address, so DHCP incorrectly assumes that an upgraded or replacement STB is a new client.

In order to explicitly identify clients, auto logout uses a secondary identification method when the primary identification method is unsuccessful—the primary method is considered unsuccessful if the MAC address or Client Identifier does not match that of an existing client. The secondary identification method is based on the DHCP option 60 and option 82 information in DHCP discover messages.

Both the primary and secondary identification methods use subnet information to differentiate between clients. The primary identification method differentiates between two clients with the same MAC address (or same Client Identifier) if the clients are on different subnets. Similarly, the secondary identification method considers two clients as different if they have the same option 60 and option 82 information, but different subnets.

DHCP local server and DHCP relay agent perform the following operations when auto logout is enabled and the secondary identification method identifies a duplicate client (that is, the discover packet is from an existing client).

- DHCP local server immediately releases the existing address.
- DHCP relay agent immediately releases the existing client and then sends a DHCP release packet to the DHCP server. Sending the release packet ensures that DHCP relay and the DHCP server are synchronized.

If the DHCP relay receives a DISCOVER message from an existing client, the DHCP relay forwards the DISCOVER message to the DHCP server. The DHCP relay preserves the binding if the client's existing IP address is returned by the DHCP server. This behavior is not applicable if the proxy-mode override or client-discover-match functionality are enabled.

NOTE: If the DHCP relay agent is in snoop mode, DHCP relay releases the client but does not send a release packet to the DHCP server if the discover packet is for a passive client (a client added as a result of snooped packets) or if the discover packet is a snooped packet.

Option 60 and Option 82 Requirements

DHCP local server requires that the received discover packet include both DHCP option 60 and option 82. If either option is missing, DHCP local server cannot perform the secondary identification method and auto logout is not used.

DHCP relay agent requires that the received discover packet contain DHCP option 60. DHCP relay determines the option 82 value based on the guidelines provided in [“DHCP Relay Agent Option 82 Value for Auto Logout” on page 962](#).

Graceful Routing Engine Switchover

For EX Series switches, only extended DHCP local server maintains the state of active DHCP client leases. The DHCP local server supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication. You can configure dynamic profile and authentication support on a global basis or for a specific group of interfaces. The extended DHCP local server also supports the use of Junos address-assignment pools or external authorities, such as RADIUS, to provide the client address and configuration information.

For MX Series routers, the extended DHCP local server and the DHCP relay agent applications both maintain the state of active DHCP client leases in the session database. The extended DHCP application can recover this state if the DHCP process fails or is manually restarted, thus preventing the loss of active DHCP clients in either of these circumstances. However, the state of active DHCP client leases is lost if a power failure occurs or if the kernel stops operating (for example, when the router is reloaded) on a single Routing Engine.

You can enable graceful switchover support on both EX Series switches and MX Series routers. To enable graceful switchover support for the extended DHCP local server or extended DHCP relay agent on a switch, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level. To enable graceful Routing Engine switchover support on MX Series routers, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level. You cannot disable graceful Routing Engine switchover support for the extended DHCP application when the router is configured to support graceful Routing Engine switchover.

For more information about using graceful Routing Engine switchover, see the *Junos OS High Availability Configuration Guide*.

Port Number Requirements for DHCP Firewall Filters

When you configure a firewall filter to perform some action on DHCP packets at the Routing Engine, such as protecting the Routing Engine by allowing only proper DHCP packets, you must specify both port 67 (bootps) and port 68 (bootpc) for both the source and destination. The firewall filter acts at both the line cards and the Routing Engine.

This requirement applies to both DHCP local server and DHCP relay, but it applies only when DHCP is provided by the `jdhcpd` process. MX Series routers, M120 routers, and M320 routers use `jdhcpd`. For DHCP relay, that means the configuration is required only at the `[edit forwarding-options dhcp-relay]` hierarchy level and not at the `[edit forwarding-options helpers bootp]` hierarchy level.

DHCP packets received on the line cards are encapsulated by `jdhcpd` with a new UDP header where their source and destination addresses are set to port 68 before being forwarded to the Routing Engine.

For DHCP relay and DHCP proxy, packets sent to the DHCP server from the router have both the source and destination UDP ports set to 67. The DHCP server responds using the same ports. However, when the line card receives these DHCP response packets, it changes both port numbers from 67 to 68 before passing the packets to the Routing Engine. Consequently the filter needs to accept port 67 for packets relayed from the client to the server, and port 68 for packets relayed from the server to the client.

Failure to include both port 67 and port 68 as described here results in most DHCP packets not being accepted.

For complete information about configuring firewall filters in general, see *Junos OS Firewall Filters and Traffic Policers Configuration Guide*.

- [Example: Extended DHCP Local Server Configuration with Optional Pool Matching on page 912](#)
- [Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 913](#)

Example: Minimum Extended DHCP Local Server Configuration

This example shows the minimum configuration you need to use for the extended DHCP local server on the router or switch:

```
[edit system services]
dhcp-local-server {
  group group_one {
    interface fe-0/0/2.0;
  }
}
```

NOTE: The interface type in this topic is just an example. The **fe-** interface type is not supported by EX Series switches.

This example creates the server group named **group_one**, and specifies that the DHCP local server is enabled on interface **fe-0/0/2.0** within the group. The DHCP local server uses the default pool match configuration of **ip-address-first**.

Related Documentation

- [Extended DHCP Local Server Overview on page 876](#)

Example: Extended DHCP Local Server Configuration with Optional Pool Matching

This example shows an extended DHCP local server configuration that includes optional IPv4 address-assignment pool matching and interface groups. For pool matching, this configuration specifies that the DHCP local server first check the response from an external authentication authority (for example, RADIUS) and use the Framed-IPv6-Pool attribute to determine the address-assignment pool to use for the client address. If no external authority match is found, the DHCP local server then uses **ip-address-first** matching together with the option 82 information to match the named address range for client IPv4 address assignment. The option 82 matching must also be included in the address-assignment pool configuration.

```
[edit system services]
dhcp-local-server {
  group group_one {
    interface fe-0/0/2.0;
    interface fe-0/0/2.1;
  }
}
```

```

}
group group_two {
  interface fe-0/0/3.0;
  interface fe-0/0/3.1;
}
pool-match-order {
  external-authority
  ip-address-first;
  option-82;
}
}

```

NOTE: The interface type in this topic is just an example. The fe- interface type is not supported by EX Series switches.

Example: Configuring Group Liveness Detection for DHCP Local Server Clients

This example shows how to configure group liveness detection for DHCP local server subscribers or DHCP clients using Bidirectional Forwarding Detection (BFD) as the liveness detection method.

- [Requirements on page 913](#)
- [Overview on page 913](#)
- [Configuration on page 914](#)

Requirements

- Juniper Networks MX Series routers
- Juniper Networks EX Series switches
- Junos OS Release 12.1R1 or later
- Junos OS Release 12.3R2 or later for EX Series switches
- Configure DHCP local server. See [“Extended DHCP Local Server Overview” on page 876](#).

Overview

In this example, you configure group liveness detection for DHCP local server subscribers (clients) by completing the following operations:

1. Enable liveness detection for DHCP local server subscriber (or DHCP client) groups.
2. Specify BFD as the liveness detection method for all dynamically created DHCP local server subscribers (clients).
3. Configure BFD-specific statements to define how the protocol behaves.
4. Configure the action the router (switch) takes when a liveness detection failure occurs.

NOTE: This example explains how to configure liveness detection for a DHCPv4 network. Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the `liveness-detection` statement, and any subsequent configuration statements, at the `[edit system services dhcp-local-server dhcpv6]` or `[edit system services dhcp-local-server dhcpv6 group group-name]` hierarchy level.

Configuration

Step-by-Step Procedure

To configure group liveness detection for DHCP local server:

1. Specify that you want to configure liveness detection.

```
[edit system services dhcp-local-server ]
user@host# edit liveness-detection
```
2. Specify that you want to configure liveness detection for a specific DHCP local server group.

```
[edit system services dhcp-local-server liveness-detection]
user@host# edit group local_group_1
```
3. Specify that you want to configure the liveness detection method.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection]
user@host# edit method
```
4. Specify BFD as the liveness detection method that you want DHCP to use.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method]
user@host# edit bfd
```
5. Configure the detection time threshold (in milliseconds) at which a trap is produced.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
user@host# set detection-time threshold 30000
```
6. Configure the time (in milliseconds) for which BFD holds a session up notification.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
user@host# set holddown-interval 50
```
7. Configure the BFD minimum transmit and receive interval (in milliseconds).

NOTE: You do not need to configure the BFD minimum transmit and receive interval if you configure the `minimum-interval` for the BFD `transmit-interval` statement and the `minimum-receive-interval`.

```
[edit system services dhcp-local-servergroup local_group_1 liveness-detection method
bfd]
user@host# set minimum-interval 45000
```

8. Configure the minimum receive interval (in milliseconds).

NOTE: You do not need to configure the BFD minimum receive interval if you configure the BFD minimum transmit and receive interval.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
user@host# set minimum-receive-interval 60000
```

9. Configure a multiplier value for the detection time.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
user@host# set multiplier 100
```

10. Disable the ability for BFD interval timers to change or adapt to network situations.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
user@host# set no-adaptation
```

11. Configure the BFD session mode.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
user@host# set session-mode automatic
```

12. Configure the threshold and minimum interval for the BFD transmit interval.

NOTE: You do not need to configure the transmit interval values if you have already configured the minimum transmit and receive interval for BFD.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
user@host# set transmit-interval threshold 60000 minimum-interval 45000
```

13. Configure the BFD protocol version you want to detect.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
user@host# set version automatic
```

14. Configure the action the router (switch) takes when a liveness detection failure occurs. In this example, the failure action is to clear the client session only when a liveness detection failure occurs and the local interface is detected as being up.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection]
user@host# edit failure-action action
```

Results From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct it.

```
[edit]
regress@montag# show system
services {
  dhcp-local-server {
    group local_group_1 {
      liveness-detection {
        failure-action clear-binding-if-interface-up;
        method {
          bfd {
            version automatic;
            minimum-interval 45000;
            minimum-receive-interval 60000;
            multiplier 100;
            no-adaptation;
            transmit-interval {
              minimum-interval 45000;
              threshold 60000;
            }
            detection-time {
              threshold 30000;
            }
            session-mode automatic;
            holddown-interval 50;
          }
        }
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

- [Example: Configuring DHCP Snooping Support for DHCP Relay Agent on page 921](#)

Example: Minimum DHCP Relay Agent Configuration

This example shows the minimum configuration you need to use the extended DHCP relay agent on the router or switch:

```
[edit forwarding-options]
dhcp-relay {
  server-group {
    test 10.0.2.1;
  }
}
```

```

active-server-group test;
group all {
    interface fe-0/0/2.0;
}
}

```

NOTE: The interface type in this topic is just an example. The `fe-` interface type is not supported by EX Series switches.

This example creates a server group and an active server group named **test** with IP address 10.0.2.1. The DHCP relay agent configuration is applied to a group named **all**. Within this group, the DHCP relay agent is enabled on interface `fe-0/0/2.0`.

Related Documentation

- [Extended DHCP Relay Agent Overview on page 900](#)

Example: Configuring DHCP Relay Agent Selective Traffic Processing Based on DHCP Option Strings

This example shows how to configure DHCP relay agent to use DHCP option strings to selectively identify, filter, and process client traffic.

- [Requirements on page 917](#)
- [Overview on page 917](#)
- [Configuration on page 918](#)
- [Verification on page 920](#)

Requirements

This example uses the following hardware and software components:

- MX Series 3D Universal Edge Routers or EX Series Switches
- Junos OS Release 12.3 or later or Junos OS Release 12.3R2 for EX Series switches

Before you configure DHCP relay agent selective processing support, be sure you:

- Configure DHCP relay agent.

See [“Extended DHCP Relay Agent Overview” on page 900](#).

- (Optional) Configure a named DHCP local server group if you want to forward client traffic to a server group.

See [“Grouping Interfaces with Common DHCP Configurations” on page 926](#).

Overview

In this example, you configure DHCP relay agent to use DHCP option strings in client packets to selectively identify, filter, and process client traffic. To configure selective processing, you perform the following procedures:

1. Identify the client traffic—Specify the DHCP option that DHCP relay agent uses to identify the client traffic you want to process. The option you specify matches the option in the client traffic.
2. Configure a default action—Specify the default processing action, which DHCP relay uses for identified client traffic that does not satisfy any configured match criteria.
3. Create match filters and associate an action with each filter—Specify match criteria that filter the client traffic. The criteria can be an exact match or a partial match with the option string in the client traffic. Associate a processing action with each match criterion.

Configuration

To configure DHCP relay agent selective processing based on DHCP option information, perform these tasks:

- [Configuring DHCP Relay Agent To Selectively Process Client Traffic Based on DHCP Option Strings on page 918](#)
- [Results on page 919](#)

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the command into the CLI at the **[edit]** hierarchy level.

```
set forwarding-options dhcp-relay relay-option option-number 60
set forwarding-options dhcp-relay relay-option equals ascii video-gold forward-only
set forwarding-options dhcp-relay relay-option equals ascii video-bronze local-server-group
  servergroup-15
set forwarding-options dhcp-relay relay-option starts-with hexadecimal ffff
  local-server-group servergroup-east
set forwarding-options dhcp-relay relay-option default-action drop
```

Configuring DHCP Relay Agent To Selectively Process Client Traffic Based on DHCP Option Strings

Step-by-Step Procedure

To configure DHCP relay selective processing:

1. Specify that you want to configure DHCP relay agent support.

```
[edit forwarding-options]
user@host# edit dhcp-relay
```
2. Specify the DHCP option that DHCP relay agent uses to identify incoming client traffic.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option option-number 60
```
3. Configure a default action, which DHCP relay agent uses when the incoming client traffic does not satisfy any configured match criteria.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option default-action drop
```

4. Configure an exact match condition and associated action that DHCP relay uses to process the identified client traffic.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option equals ascii video-gold forward-only
```

5. Configure a second exact match condition and associated action that DHCP relay uses to process client traffic.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option equals ascii video-bronze local-server-group
servergroup-15
```

6. Configure a partial match criteria and associated action that DHCP relay uses to process client traffic.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option starts-with hexadecimal ffff local-server-group
servergroup-east
```

Results

From configuration mode, confirm the results of your configuration by issuing the **show** statement at the **[edit forwarding-options]** hierarchy level. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit forwarding-options]
user@host# show
dhcp-relay {
  relay-option {
    option-number 60;
    equals {
      ascii video-gold {
        forward-only;
      }
    }
    equals {
      ascii video-bronze {
        local-server-group servergroup-15;
      }
    }
    default-action {
      drop;
    }
    starts-with {
      hexadecimal ffff {
        local-server-group servergroup-east;
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

To verify the status of DHCP relay agent selective traffic processing, perform this task:

- [Verifying the Status of DHCP Relay Agent Selective Traffic Processing on page 920](#)

Verifying the Status of DHCP Relay Agent Selective Traffic Processing

Purpose Verify the DHCP relay agent selective traffic processing status.

Action Display statistics for DHCP relay agent.

```
user@host> show dhcp relay statistics
Packets dropped:
  Total                30
  Bad hardware address  1
  Bad opcode            1
  Bad options           3
  Invalid server address 5
  No available addresses 1
  No interface match    2
  No routing instance match 9
  No valid local address 4
  Packet too short      2
  Read error            1
  Send error            1
  Option 60             1
  Option 82             2

Messages received:
  BOOTREQUEST          116
  DHCPDECLINE           0
  DHCPDISCOVER          11
  DHCPINFORM            0
  DHCPRELEASE           0
  DHCPREQUEST          105

Messages sent:
  BOOTREPLY             0
  DHCPOFFER             2
  DHCPACK                1
  DHCPNAK                0
  DHCPFORCERENEW         0

Packets forwarded:
  Total                4
  BOOTREQUEST           2
  BOOTREPLY             2
```

Meaning The **Packets forwarded** field in the **show dhcp relay statistics** command output displays the number of client packets that have been forwarded as a result of the selective traffic processing configuration. In this example, the output indicates the total number of packets that DHCP relay agent has forwarded, as well as a breakdown for the number of **BOOTREQUEST** and **BOOTREPLY** packets forwarded.

Example: Configuring DHCP Snooping Support for DHCP Relay Agent

This example shows how to configure DHCP snooping support for DHCP relay agent.

- [Requirements on page 921](#)
- [Overview on page 921](#)
- [Configuration on page 921](#)

Requirements

- Configure DHCP relay agent. See “[Extended DHCP Relay Agent Overview](#)” on page 900.

Overview

In this example, you configure DHCP snooping support for DHCP relay agent by completing the following operations:

- Override the default DHCP snooping configuration and enable DHCP snooping support for the interfaces in group **frankfurt**.
- Configure DHCP relay agent to forward snooped packets to only configured interfaces.

NOTE: By default, DHCP snooping is enabled globally in Junos OS Release 10.0 and earlier and disabled globally in Junos OS Release 10.1 and later.

Configuration

Step-by-Step Procedure

To configure DHCP relay support for DHCP snooping:

1. Specify that you want to configure DHCP relay agent.

```
[edit]
user@host# edit forwarding-options dhcp-relay
```
2. Specify the named group of interfaces on which DHCP snooping is supported.

```
[edit forwarding-options dhcp-relay]
user@host# edit group frankfurt
```
3. Specify the interfaces that you want to include in the group. DHCP relay agent considers these as the configured interfaces when determining whether to forward or drop traffic.

```
[edit forwarding-options dhcp-relay group frankfurt]
user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9
```

4. Specify that you want to override the default configuration for the group.

```
[edit forwarding-options dhcp-relay group frankfurt]
user@host# edit overrides
```

5. Enable DHCP snooping support for the group.

```
[edit forwarding-options dhcp-relay group frankfurt overrides]
user@host# set allow-snooped-clients
```

6. Return to the `[edit forwarding-options dhcp-relay]` hierarchy level to configure the forwarding action and specify that DHCP relay agent forward snooped packets on only configured interfaces:

```
[edit forwarding-options dhcp-relay group frankfurt overrides]
user@host# up 2
```

7. Enable DHCP snooped packet forwarding for DHCP relay agent.

```
[edit forwarding-options dhcp-relay]
user@host# edit forward-snooped-clients
```

8. Specify that snooped packets are forwarded on only configured interfaces (the interfaces in group `frankfurt`).

```
[edit forwarding-options dhcp-relay forward-snooped-clients]
user@host# set configured-interfaces
```

Results From configuration mode, confirm your configuration by entering the **show forwarding-options** command. If the output does not display the intended configuration, repeat the instructions in this example to correct it. The following output also shows a range of configured interfaces in group `frankfurt`.

```
[edit]
regress@montag# show forwarding-options
dhcp-relay {
  forward-snooped-clients configured-interfaces;
  group frankfurt {
    overrides {
      allow-snooped-clients;
    }
    interface fe-1/0/1.3 {
      upto fe-1/0/1.9;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Using External AAA Authentication Services with DHCP

The extended DHCP local server, including DHCPv6 local server, and the extended DHCP relay agent, including DHCPv6 relay agent, support the use of external AAA authentication services, such as RADIUS, to authenticate DHCP clients. When the extended DHCP local server or relay agent receives a discover PDU from a client, the extended DHCP application contacts the AAA server to authenticate the DHCP client. The extended DHCP application

can obtain client addresses and DHCP configuration options from the external AAA authentication server.

NOTE: This section uses the term *extended DHCP application* to refer to both the extended DHCP local server and the extended DHCP relay agent.

The external authentication feature also supports AAA directed logout. If the external AAA service supports a user logout directive, the extended DHCP application honors the logout and responds as though it were requested by a CLI management command. All of the client state information and allocated resources are deleted at logout. The extended DHCP application supports directed logout using the list of configured authentication servers you specify with the **authentication-server** statement at the **[edit access profile profile-name]** hierarchy level.

You can configure either global authentication support or group-specific support.

You must configure the **username-include** statement to enable the use of authentication. The **password** statement is not required and does not cause DHCP to use authentication if the **username-include** statement is not included.

To configure DHCP local server and DHCP relay agent authentication support:

1. Specify that you want to configure authentication options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit authentication
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit authentication
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit authentication
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit authentication
```

2. (Optional) Configure a password that authenticates the username to the external authentication service.

See [“Configuring Passwords for Usernames” on page 945](#).

3. (Optional) Configure optional features to create a unique username.

See [“Creating Unique Usernames for DHCP Clients” on page 946](#).

Guidelines for Configuring Support for DHCP Duplicate Clients

This topic describes the guidelines for configuring DHCP to include the client subinterface in order to distinguish between duplicate clients (clients with the same MAC address or client ID) in a subscriber access or in a DHCP-managed environment.

When configuring DHCP duplicate client support, consider the following guidelines:

- The optional DHCP duplicate client support feature is used for DHCPv4 clients. For DHCPv6, client identification is independent of MAC address.
- For DHCP relay agent configuration:
 - DHCP relay must be configured to insert option 82, regardless of whether or not the incoming packet has option 82.
 - Option 82 must include the Agent Circuit ID suboption (suboption 1).
 - Option 82 must be the interface name, not the interface description.
 - DHCP server must echo option 82 in the server's reply. This is required because of the following:
 - The giaddr inserted by DHCP relay is the same for duplicate clients on different subinterfaces. The DHCP local server uses option 82 when allocating the IP address.
 - DHCP relay uses the echoed option 82 to learn the client subinterface and to construct the client key.
- For the Layer 3 wholesale model:
 - The wholesaler and retailer logical system/routing instances must have the same **duplicate-clients-on-interface** statement configuration.
 - For DHCP relay, the wholesaler and the retailer routing contexts must both be configured with the Agent Circuit ID suboption (suboption 1) in option 82.

Related Documentation

- [DHCP Duplicate Client Differentiation Using Client Subinterface Overview on page 882](#)
- [Configuring DHCP Duplicate Client Support on page 925](#)

Configuring DHCP Duplicate Client Support

You can optionally configure DHCP local server and DHCP relay to include a client subinterface when distinguishing between two clients that have the same MAC address or client ID. The configuration is a global setting for each logical system/routing instance.

To configure DHCP local server to include the client subinterface:

1. Specify that you want to configure DHCP local server.

```
[edit system services]
user@host# edit dhcp-local-server
```

2. Configure the optional duplicate client support.

```
[edit system services dhcp-local-server]
user@host# set duplicate-clients-on-interface
```

To configure DHCP relay agent to include the client subinterface:

1. Specify that you want to configure DHCP relay agent.

```
[edit forwarding-options]
user@host# edit dhcp-relay
```

2. Configure the optional duplicate client support.

```
[edit system services dhcp-relay]
user@host# set duplicate-clients-on-interface
```

**Related
Documentation**

- [DHCP Duplicate Client Differentiation Using Client Subinterface Overview on page 882](#)
- [Guidelines for Configuring Support for DHCP Duplicate Clients on page 925](#)

Grouping Interfaces with Common DHCP Configurations

You use the group feature to group together a set of interfaces and then apply a common DHCP configuration to the named interface group. The extended DHCP local server, DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent all support interface groups.

The following steps create a DHCP local server group; the steps are similar for the DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent.

To configure a DHCP local server interface group:

1. Specify that you want to configure DHCP local server.

```
[edit system services]
user@host# edit dhcp-local-server
```

2. Create the group and assign a name.

```
[edit system services dhcp-local-server]
user@host# edit group boston
```

3. Specify the names of one or more interfaces on which the extended DHCP application is enabled. You can repeat the `interface interface-name` statement to specify multiple interfaces within the group, but you cannot use the same interface in more than one group.

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.1
user@host# set interface fe-1/0/1.2
```

4. (Optional) You can use the `upto` option to specify a range of interfaces for a group.

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9
```

5. (Optional) You can use the **exclude** option to exclude a specific interface or a specified range of interfaces from the group. For example:

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.1 upto fe-1/0/1.102
user@host# set interface fe-1/0/1.6 exclude
user@host# set interface fe-1/0/1.70 upto fe-1/0/1.80 exclude
```

- [Group-Specific DHCP Relay Options on page 906](#)
- [Guidelines for Configuring Interface Ranges on page 927](#)

Guidelines for Configuring Interface Ranges

This topic describes guidelines to consider when configuring interface ranges for named interface groups for DHCP local server and DHCP relay. The guidelines refer to the following configuration statement:

```
user@host# set interface interface-name upto upto-interface-name
```

- The start subunit, **interface *interface-name***, serves as the key for the stanza. The remaining configuration settings are considered attributes.
- If the subunit is not included, an implicit **.0** subunit is enforced. The implicit subunit is applied to all interfaces when autoconfiguration is enabled. For example, **interface ge-2/2/2** is treated as **interface ge-2/2/2.0**.
- Ranged entries contain the **upto** option, and the configuration applies to all interfaces within the specified range. The start of a ranged entry must be less than the end of the range. Discrete entries apply to a single interface, except in the case of autoconfiguration, in which a **0** (zero) subunit acts as a wildcard.
- Interface stanzas defined within the same router or switch context are dependent and can constrain each other—both DHCP local server and DHCP relay are considered. Interface stanzas defined across different router (switch) contexts are independent and do not constrain one another.
- Each interface stanza, whether discrete or ranged, has a unique start subunit across a given router context. For example, the following configuration is not allowed within the same group because **ge-1/0/0.10** is the start subunit for both.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.10
```

- Two groups cannot share interface space. For example, the following configuration is not allowed because the three stanzas share the same space and interfere with one another—interface **ge-1/0/0.26** is common to all three.

```
dhcp-relay group diamond interface ge-1/0/0.10 upto ge-1/0/0.30
dhcp-local-server group ruby interface ge-1/0/0.25
dhcp-relay group sapphire interface ge-1/0/0.25 upto ge-1/0/0.35
```

- Two ranges cannot overlap, either within a group or across groups. Overlapping occurs when two interface ranges share common subunit space but neither range is a proper subset of the other. The following ranges overlap:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.20 upto ge-1/0/0.40
```

- A range can contain multiple nested ranges. A nested range is a proper subset of another range. When ranges are nested, the smallest matching range applies.

In the following example, the three ranges nest properly:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.12 upto ge-1/0/0.15 exclude
interface ge-1/0/0.25 upto ge-1/0/0.29 exclude
```

- Discrete interfaces take precedence over ranges. In the following example, interface **ge-1/0/0.20** takes precedence and enforces an interface client limit of 5.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.15 upto ge-1/0/0.25 exclude
interface ge-1/0/0.20 overrides interface-client-limit 5
```

Overriding Default DHCP Local Server Configuration Settings

Subscriber management enables you to override certain default DHCP and DHCPv6 local server configuration settings. You can override settings at the global level, for a named group of interfaces, or for a specific interface within a named group.

- To override global default DHCP local server configuration options, include the **overrides** statement and its subordinate statements at the **[edit system services dhcp-local-server]** or **[edit system services dhcp-local-server dhcpv6]** hierarchy level.
- To override DHCP local server configuration options for a named group of interfaces, include the statements at the **[edit system services dhcp-local-server group group-name]** or **[edit system services dhcp-local-server dhcpv6 group]** hierarchy level.
- To override DHCP local server configuration options for a specific interface within a named group of interfaces, include the statements at the **[edit system services dhcp-local-server group group-name interface]** or **[edit system services dhcp-local-server dhcpv6 group group-name interface]** hierarchy level.

To override default DHCP local server configuration settings:

1. Specify that you want to configure override options.

Global override:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

Group level override:

```
[edit system services dhcp-local-server]
user@host# edit group boston overrides
```

Per-interface override:

```
[edit system services dhcp-local-server]
user@host# edit group boston overrides interface fe-1/0/1.1
```

2. (Optional) Override the maximum number of DHCP clients allowed per interface.
See [“Specifying the Maximum Number of DHCP Clients Per Interface” on page 929](#).
3. (Optional) Override ARP table population in distrusted environments.
See [“Disabling ARP Table Population” on page 930](#).
4. (Optional) Configure DHCP client auto logout.
See [“Automatically Logging Out DHCP Clients” on page 932](#).
5. (Optional) Enable processing of information requests from clients.
See [“Enabling Processing of Client Information Requests” on page 933](#).
6. (Optional, DHCPv6 only) Specify a delegated pool name to use for DHCPv6 multiple address assignment.
See [“Specifying the Delegated Address Pool for IPv6 Prefix Assignment” on page 934](#).
7. (Optional, DHCPv6 only) Enable DHCPv6 rapid commit support.
See [“Enabling DHCPv6 Rapid Commit Support” on page 935](#).
8. (Optional) Delete DHCP override settings.
See [“Deleting DHCP Local Server and DHCP Relay Override Settings” on page 935](#).

**Related
Documentation**

- [Group-Specific DHCP Local Server Options on page 883](#)
- [Deleting DHCP Local Server and DHCP Relay Override Settings on page 935](#)

Specifying the Maximum Number of DHCP Clients Per Interface

By default, there is no limit to the number of DHCP local server or DHCP relay clients allowed on an interface. However, you can override the default setting and specify the maximum number of clients allowed per interface, in the range 1 through 500,000. When the number of clients on the interface reaches the specified limit, no additional DHCP Discover PDUs or DHCPv6 Solicit PDUs are accepted. When the number of clients subsequently drops below the limit, new clients are again accepted.

NOTE: The maximum number of DHCP (and DHCPv6) local server clients or DHCP (and DHCPv6) relay clients can also be specified by Juniper Networks VSA 26-143 during client login. The VSA-specified value always takes precedence if the `interface-client-limit` statement specifies a different number.

If the VSA-specified value differs with each client login, DHCP uses the largest limit set by the VSA until there are no clients on the interface.

To configure the maximum number of DHCP clients allowed per interface:

1. Specify that you want to configure override options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

2. Configure the maximum number of clients allowed per interface. (DHCP local server, DHCPv6 local server, DHCP relay agent and DHCPv6 relay agent all support the `interface-client-limit` statement.)

```
[edit system services dhcp-local-server overrides]
user@host# set interface-client-limit number
```

Related Documentation

Disabling ARP Table Population

By default, DHCP populates the ARP table with the MAC address of a client when the client binding is established. However, you may choose to use the DHCP `no-arp` statement to hide the subscriber MAC address or the DHCP client MAC address, as it appears in ARP table entries.

When running in a trusted environment (that is, when not using the **no-arp** statement), DHCP populates the ARP table with unique MAC addresses contained within the DHCP PDU for each DHCP client:

Table 71: ARP Table in Trusted Environment

IP Address	MAC Address
Client 1 IP Address	MAC A
Client 2 IP Address	MAC B
Client 3 IP Address	MAC C

In distrusted environments, you can specify the **no-arp** statement to hide the MAC addresses of clients. When you specify the **no-arp** statement, DHCP does not automatically populate the ARP table with MAC address information from the DHCP PDU for each client. Instead, the system performs an ARP to obtain the MAC address of each client and obtains the MAC address of the immediately attached device (for example, a DSLAM). DHCP populates the ARP table with the same interface MAC address (for example, MAC X from a DSLAM interface) for each client:

Table 72: ARP Table in Distrusted Environment

IP Address	MAC Address
Client 1 IP Address	MAC X
Client 2 IP Address	MAC X
Client 3 IP Address	MAC X

To disable ARP table population:

- Specify that you want to configure override options.
 - For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```
 - For DHCP relay:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```
- Disable ARP table population with client-specific information. (DHCP local server and DHCP relay agent both support the **no-arp** statement.)
 - For DHCP local server:

```
[edit system services dhcp-local-server overrides]
user@host# set no-arp
```
 - For DHCP relay:

```
[edit forwarding-options dhcp-relay overrides]
user@host# set no-arp
```

- [Deleting DHCP Local Server and DHCP Relay Override Settings on page 935](#)

Automatically Logging Out DHCP Clients

You can configure the extended DHCP local server and extended DHCP relay to automatically log out DHCP clients. Auto logout immediately releases an existing client when DHCP receives a discover packet that has the same DHCP option 60 and DHCP option 82 information as the existing client. DHCP then releases the existing client IP address without waiting for the normal lease expiration.

NOTE: When the existing client is released, the new client undergoes the normal authentication process. The new client might not receive the same IP address as the original client.

To configure DHCP client auto logout:

1. Specify that you want to configure override options.
 - For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```
 - For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```
2. Enable auto logout. (DHCP local server and DHCP relay agent both support the **client-discover-match** statement.)
 - For DHCP local server:

```
[edit system services dhcp-local-server overrides]
user@host# set client-discover-match
```
 - For DHCP relay:

```
[edit forwarding-options dhcp-relay overrides]
user@host# set client-discover-match
```

NOTE: If you change the auto logout configuration, existing clients continue to use the auto logout setting that was configured when they logged in. New clients use the new setting.

Enabling Processing of Client Information Requests

By default, DHCP local server and DHCPv6 local server do not respond to information request messages from the client. You can enable DHCP local server and DHCPv6 local server to process these messages and respond to them with an acknowledgment (ack or reply message, respectively) and the requested information.

DHCP relay agent automatically forwards the information request messages without modification to the configured server group by means of the interfaces configured for the respective server group. The messages are dropped if they are received on an unconfigured interface. DHCP relay proxy also supports forwarding these messages. You cannot disable forwarding of the information request messages.

Configure one or more local address pools if you want to use a local pool rather than one provided by AAA. See *Configuring an Address-Assignment Pool Name and Addresses*. For processing information request messages, the address configuration is not necessary. For DHCP local server, you must specify the IPv4 family; for DHCPv6 local server, you must specify the IPv6 family.

See *Configuring DHCP Client-Specific Attributes* for details about how to configure the information sought by clients that send information request messages.

To enable processing of DHCP client information request messages:

1. Specify that you want to configure override options.
 - For DHCP local server:

```
[edit system services dhcp-local-server overrides]
user@host# set process-inform
```
 - For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6 overrides]
user@host# set process-inform
```
2. (Optional) Specify a pool name from which DHCP information is returned to the client.
 - For DHCP local server:

```
[edit system services dhcp-local-server overrides process-inform]
```

```
user@host# set pool pool-name
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6 overrides process-inform]
```

```
user@host# set pool pool-name
```

Specifying the Delegated Address Pool for IPv6 Prefix Assignment

You can explicitly specify a delegated address pool:

- On routers—Subscriber management uses the pool to assign IPv6 prefixes for subscribers. You can specify the delegated address pool globally, for a specific group of interfaces, or for a particular interface.
- On switches—DHCP management uses the pool to assign IPv6 prefixes for DHCP clients. You can specify the delegated address pool globally, for a specific group of interfaces, or for a particular interface.

NOTE: You can also use by Juniper Networks VSA 26-161 to specify the delegated address pool. The VSA-specified value always takes precedence over the delegated-address statement.

To configure the delegated address pool for DHCPv6 local server:

1. Specify that you want to configure override options.

```
[edit system services dhcp-local-server dhcpv6]  
user@host# edit overrides
```

2. Configure the delegated address pool.

```
[edit system services dhcp-local-server dhcpv6 overrides]  
user@host# set delegated-pool paris-cable-12
```

Enabling DHCPv6 Rapid Commit Support

You can configure the extended DHCPv6 local server to support the DHCPv6 Rapid Commit option (DHCPv6 option 14). When rapid commit is enabled on the extended DHCPv6 local server, the server recognizes the Rapid Commit option in Solicit messages sent from the DHCPv6 client. (DHCPv6 clients are configured separately to include the DHCPv6 Rapid Commit option in the Solicit messages.) The server and client then use a two-message exchange (Solicit and Reply) to configure clients, rather than the default four-method exchange (Solicit, Advertise, Request, and Reply). The two-message exchange provides faster client configuration, and is beneficial in environments in which networks are under a heavy load.

You can configure the DHCPv6 local server to support the Rapid Commit option globally, for a specific group, or for a specific interface. By default, Rapid Commit support is disabled on the DHCPv6 local server.

To configure the DHCPv6 local server to support the DHCPv6 Rapid Commit option:

1. Specify that you want to configure override options.

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

2. Enable rapid commit support.

```
[edit system services dhcp-local-server dhcpv6 overrides]
user@host# set rapid-commit
```

Deleting DHCP Local Server and DHCP Relay Override Settings

You can delete override settings for DHCP local server and DHCP relay globally, for a named group, or for a specific interface within a named group. You can delete a specific override setting or all overrides.

- To delete a specific DHCP override setting at a particular hierarchy level, include the **overrides** statement with the appropriate subordinate statements. For example, to delete the DHCP local server override **no-arp** setting for a group named **marin20**:

```
[edit system services dhcp-local-server]
user@host# delete group marin20 overrides no-arp
```

- To delete all DHCP override settings at a hierarchy level, include the **overrides** statement without any subordinate statements. For example, to delete all DHCP relay overrides for interface **fxp0.0**, which is in group **marin20**:

```
[edit forwarding-options dhcp-relay]
user@host# delete group marin20 interface fxp0.0 overrides
```

Configuring Extended DHCP Local Server Dynamic Client Reconfiguration

The DHCP local server can initiate reconfiguration of its clients to avoid extended outages because of server configuration changes. In addition to requesting that the DHCP local server initiate reconfiguration, you can specify the reconfiguration behavior.

To configure dynamic reconfiguration of DHCP clients:

1. Enable dynamic reconfiguration with default values for all clients.

For DHCPv4:

```
[edit system services dhcp-local-server]
user@host# set reconfigure
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6]
user@host# set reconfigure
```

2. (Optional) Override the global configuration for a particular group of clients.

For DHCPv4:

```
[edit system services dhcp-local-server group-name]
user@host# set reconfigure
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 group group-name]
user@host# set reconfigure
```

3. (Optional) Configure how the server attempts reconfiguration.

See [“Configuring Dynamic Reconfiguration Attempts for DHCP Clients” on page 937](#).

4. (Optional) Configure the response to a failed reconfiguration.

See [“Configuring Deletion of the Client When Dynamic Reconfiguration Fails” on page 938](#).

5. (Optional) Configure the behavior in response to a RADIUS-initiated disconnect.

See [“Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect” on page 938](#).

6. (Optional) Configure a token for rudimentary server authentication.

See [“Configuring a Token for DHCP Local Server Authentication” on page 939](#).

7. (Optional) Initiate reconfiguration of some or all client bindings.

See [“Requesting DHCP Local Server to Initiate Reconfiguration of Client Bindings”](#) on page 940.

8. (Optional) Prevent DHCPv6 clients from binding if they do not support reconfigure messages.

See [“Preventing Binding of Clients That Do Not Support Reconfigure Messages”](#) on page 939.

Configuring Dynamic Reconfiguration Attempts for DHCP Clients

You can configure how many attempts the local server makes to initiate reconfiguration of the DHCP client by sending `forcerenew` messages. You can also specify how long the server waits between attempts. By default, eight attempts are made and the initial interval is two seconds.

Each successive attempt doubles the interval between attempts. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on. A group configuration takes precedence over a DHCP local server configuration.

(Optional) To configure DHCP local server reconfiguration behavior for all DHCP clients:

1. Specify the number of reconfiguration attempts.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set attempts 5
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set attempts 5
```

2. Specify the interval between reconfiguration attempts.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set timeout 8
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set timeout 8
```

To override the global configuration for a particular group of clients, include the statements at the `[edit system services dhcp-local-server group group-name reconfigure]` hierarchy level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure]` hierarchy level.

Related Documentation

- [Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 936](#)
- [attempts on page 999](#)
- [timeout on page 1062](#)

Configuring Deletion of the Client When Dynamic Reconfiguration Fails

You can configure the local server to delete the client when the maximum number of reconfiguration attempts has been made without success. By default, the client's original configuration is restored.

(Optional) To configure the DHCP local server to delete the client when reconfiguration is not successful, for all clients:

- Specify the client deletion.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set clear-on-abort
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set clear-on-abort
```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server group group-name reconfigure]` hierarchy level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure]` hierarchy level.

Related Documentation

- [Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 936](#)
- [clear-on-abort on page 1003](#)

Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect

You can configure the local server to reconfigure the client when the client receives a RADIUS-initiated disconnect. By default, the client is deleted when a RADIUS-initiated disconnect is received.

(Optional) To configure the DHCP local server to reconfigure the client instead of deleting the client when a RADIUS-initiated disconnect is received, for all clients:

- Specify the RADIUS-initiated disconnect trigger.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure trigger]
user@host# set radius-disconnect
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure trigger]
user@host# set radius-disconnect
```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server group group-name reconfigure trigger]`

hierarchy level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure trigger]` hierarchy level.

- Related Documentation**
- [Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 936](#)
 - [radius-disconnect on page 1051](#)
 - [trigger on page 1065](#)

Configuring a Token for DHCP Local Server Authentication

You can configure the local server to include a constant, unencoded token in the DHCP forcerenew message as part of the authentication option it sends to clients. The client compares the received token with a token already configured on the client. If the tokens do not match, the DHCP client discards the forcerenew message. Use of the token provides rudimentary protection against inadvertently instantiated DHCP servers.

(Optional) To configure the DHCP local server to include a token in the forcerenew message sent to the client, for all clients:

- Specify the token.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set token 8ysIU9E32k8r
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set token 8ysIU9E32k8r
```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server group group-name reconfigure]` hierarchy level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure]` hierarchy level.

- Related Documentation**
- [Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 936](#)
 - [token on page 1063](#)

Preventing Binding of Clients That Do Not Support Reconfigure Messages

The DHCPv6 client and server negotiate the use of reconfigure messages. When the client can accept reconfigure messages from the server, then the client includes the Reconfigure Accept option in both solicit and request messages sent to the server.

By default, the DHCPv6 server accepts solicit messages from clients regardless of whether they support reconfiguration. You can specify that the server require clients to accept reconfigure messages. In this case, the DHCPv6 server includes the Reconfigure Accept option in both advertise and reply messages when reconfiguration is configured for the client interface. Solicit messages from nonsupporting clients are discarded and the clients are not allowed to bind.

(Optional) To configure the DHCPv6 local server to require that all clients accept reconfiguration:

- Specify strict reconfiguration.

```
[edit system services dhcp-local-server dhcpv6 reconfigure]  
user@host# set strict
```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server dhcpv6 group group-name reconfigure]` hierarchy level.

The `show dhcpv6 server statistics` command displays a count of solicit messages that the server has discarded.

**Related
Documentation**

- [Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 936](#)
- [strict on page 1059](#)

Requesting DHCP Local Server to Initiate Reconfiguration of Client Bindings

You can request that the DHCP local server initiate reconfiguration of all of clients or only specified clients.

To request reconfiguration of all clients:

- Specify the `all` option.

For DHCPv4:

```
user@host> request dhcp server reconfigure all
```

For DHCPv6:

```
user@host> request dhcpv6 server reconfigure all
```

You can use any of the following methods to request reconfiguration of specific clients:

- Specify the IP address of the DHCP client.

For DHCPv4:

```
user@host> request dhcp server reconfigure 192.168.27.3
```

For DHCPv6:

```
user@host> request dhcpv6 server reconfigure 2001:bd8:1111:2222::
```

- Specify the client ID of a DHCPv6 client.

```
user@host> request dhcpv6 server reconfigure  
LL_TIME0x1-0x2e159c0-00:10:94:00:00:02
```

- Specify the session ID of a DHCPv6 client.

```
user@host> request dhcpv6 server reconfigure 5
```

- Specify the MAC address of a DHCPv4 client.

```
user@host> request dhcp server reconfigure 12:23:34:45:56:67
```

- Specify an interface; reconfiguration is attempted for all clients on this interface.

```
user@host> request dhcp server reconfigure interface fe-0/0/0.100
```

- Specify a logical system; reconfiguration is attempted for all clients or the specified clients in this logical system.

```
user@host> request dhcp server reconfigure all logical-system ls-bldg5
```

- Specify a routing instance; reconfiguration is attempted for all clients or the specified clients in this routing instance.

```
user@host> request dhcp server reconfigure all routing-instance ri-boston
```

Related Documentation

- [request dhcp server reconfigure on page 1168](#)

Configuring Detection of DHCP Local Server Client Connectivity

Liveness detection for DHCP subscriber IP sessions or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

NOTE: You can also configure DHCP liveness detection for DHCP relay.

To configure liveness detection for DHCP local server:

1. Specify that you want to configure liveness detection.

- For DHCP global configuration:

```
[edit system services dhcp-local-server]
user@host# edit liveness-detection
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name]
user@host# edit liveness-detection
```

NOTE: Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the [liveness-detection](#) statement, and any subsequent configuration statements, at the `[edit system services dhcp-local-server dhcpv6]` or `[edit system services dhcp-local-server dhcpv6 group group-name]` hierarchy level.

2. Specify that you want to configure the liveness detection method.

- For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection]
user@host# edit method
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection]
user@host# edit method
```

3. Specify the liveness detection method that you want DHCP to use.

NOTE: In this release, the only method supported for liveness detection is Bidirectional Forwarding Detection (BFD).

- For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection method]
user@host# edit bfd
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection method]
user@host# edit bfd
```

4. Configure the liveness detection method as desired.

See [“Example: Configuring Group Liveness Detection for DHCP Local Server Clients” on page 913](#) for an example of how to configure DHCPv4 groups for DHCP local server liveness detection.

5. Configure the action the router takes when a liveness detection failure occurs.

- For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection]
user@host# edit failure-action action
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection]
user@host# edit failure-action action
```

Attaching Dynamic Profiles to DHCP Subscriber Interfaces or DHCP Client Interfaces

This topic describes how to attach a dynamic profile to a DHCP subscriber interface or a DHCP client interface. When a DHCP subscriber or DHCP client logs in, the specified

dynamic profile is instantiated and the services defined in the profile are applied to the interface.

This topic contains the following sections:

- [Attaching a Dynamic Profile to All DHCP Subscriber or All DHCP Client Interfaces on page 943](#)
- [Attaching a Dynamic Profile to a Group of DHCP Subscriber Interfaces or a Group of DHCP Client Interfaces on page 943](#)

Attaching a Dynamic Profile to All DHCP Subscriber or All DHCP Client Interfaces

To attach a dynamic profile to all DHCP subscriber or all DHCP client interfaces:

1. At the DHCP configuration hierarchy, use the **dynamic-profile** statement to specify the name of the dynamic profile to attach to all interfaces.
 - For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# set dynamic-profile vod-profile-22
```
 - For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# set dynamic-profile vod-profile-west
```
2. (Routers only) Optionally, you can configure the attribute to use when attaching the specified profile.

You can include either the **aggregate-clients** option to enable multiple DHCP subscribers to share the same VLAN logical interface, or the **use-primary** option to specify that the primary dynamic profile is used. The **aggregate-clients** option does not apply to demux subscriber interfaces. The two options are mutually exclusive.

- To enable multiple subscribers to share the same VLAN logical interface:

```
[edit system services dhcp-local-server dynamic-profile]
user@host# set aggregate-clients merge
```

- To use the primary dynamic profile:

```
[edit forwarding-options dhcp-relay dynamic-profile]
user@host# set use-primary subscriber_profile
```

Attaching a Dynamic Profile to a Group of DHCP Subscriber Interfaces or a Group of DHCP Client Interfaces

Before you begin:

- Configure the interface group.

See [“Grouping Interfaces with Common DHCP Configurations” on page 926](#).

To attach a dynamic profile to a group of interfaces:

1. At the DHCP configuration hierarchy, specify the name of the interface group and the dynamic profile to attach to the group.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# set group boston dynamic-profile vod-profile-42
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# set group quebec dynamic-profile vod-profile-east
```

2. (Routers only) Optionally, you can configure the attribute to use when attaching the specified profile.

You can include either the **aggregate-clients** option to enable multiple DHCP subscribers to share the same VLAN logical interface, or the **use-primary** option to specify that the primary dynamic profile is used. The **aggregate-clients** option does not apply to demux subscriber interfaces. The two options are mutually exclusive.

- To enable multiple subscribers to share the same VLAN logical interface:

```
[edit system services dhcp-local-server dynamic-profile]
user@host# set aggregate-clients merge
```

- To use the primary dynamic profile:

```
[edit forwarding-options dhcp-relay dynamic-profile]
user@host# set use-primary subscriber_profile
```

Configuring DHCP Snooped Packets Forwarding Support for DHCP Local Server

You can configure how DHCP local server handles DHCP snooped packets. Depending on the configuration, DHCP local server either forwards or drops the snooped packets it receives.

Table 73 on page 945 indicates the action the router takes for DHCP local server snooped packets.

NOTE: Configured interfaces are those interfaces that have been configured with the **group** statement in the [edit system services dhcp-local-server] hierarchy. Non-configured interfaces are those that are in the logical system/routing instance but have not been configured by the **group** statement.

Table 73: Actions for DHCP Local Server Snooped Packets

forward-snooped-clients Configuration	Action on Configured Interfaces	Action on Non-Configured Interfaces
forward-snooped-clients not configured	dropped	dropped
all-interfaces	forwarded	forwarded
configured-interfaces	forwarded	dropped
non-configured-interfaces	dropped	forwarded

To configure DHCP snooped packet forwarding for DHCP local server:

1. Specify that you want to configure DHCP local server.

```
[edit]
user@host# edit system services dhcp-local-server
```

2. Enable DHCP snooped packet forwarding for DHCP local server.

```
[edit system services dhcp-local-server]
user@host# edit forward-snooped-clients
```

3. Specify the interfaces that are supported for snooped packet forwarding.

```
[edit system services dhcp-local-server forward-snooped-clients]
user@host# set (all-interfaces | configured-interfaces | non-configured-interfaces)
```

For example, to configure DHCP local server to forward DHCP snooped packets on only configured interfaces:

```
[edit]
system {
  services {
    dhcp-local-server {
      forward-snooped-clients configured-interfaces;
    }
  }
}
```

Configuring Passwords for Usernames

You can configure an optional password that the extended DHCP application presents to the external AAA authentication service to authenticate the specified username.

To configure a password that authenticates the username:

1. Specify that you want to configure authentication options.
 - For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit authentication
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit authentication
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit authentication
```

2. Configure the password. (DHCP local server, DHCPv6 local server, and DHCP relay agent all support the **password** statement.)

```
[edit system services dhcp-local-server authentication]
user@host# set password myPassword1234
```

- For information about supported characters in passwords, see “Configuring Special Requirements for Plain-Text Passwords” in the *Junos OS System Basics Configuration Guide*

Creating Unique Usernames for DHCP Clients

You can configure the extended DHCP application to include additional information in the username that is passed to the external AAA authentication service when the DHCP client logs in. This additional information enables you to construct usernames that uniquely identify subscribers (DHCP clients).

NOTE: If you do not include a username in the authentication configuration, the router (or switch) does not perform authentication; however, the IP address is provided by the local pool if it is configured.

When you use the DHCPv6 local server, you must configure authentication and the client username; otherwise client login fails.

The following list describes the optional information that you can include as part of the username:

- **circuit-type**—The circuit type used by the DHCP client, for example **enet**.
- **client-id**—The client identifier option (option 1). (DHCPv6 local server DHCPv6 relay agent only)

- **delimiter**—The delimiter character that separates components that make up the concatenated username. The default delimiter is a period (.). The semicolon (;) is not supported as a delimiter character.
- **domain-name**—The client domain name as a string. The router adds the @ delimiter to the username.
- **interface-name**—The interface name, including the interface device and associated VLAN IDs.
- **logical-system-name**—The name of the logical system, if the receiving interface is in a logical system.
- **mac-address**—The client MAC address, in a string of the format *xxxx.xxxx.xxxx*. (Not supported for DHCPv6 local server)
- **option-60**—The portion of the option 60 payload that follows the length field. (Not supported for DHCPv6 local server)
- **option-82 <circuit-id> <remote-id>**—The specified contents of the option 82 payload. (Not supported for DHCPv6 local server)
 - **circuit-id**—The payload of the Agent Circuit ID suboption.
 - **remote-id**—The payload of the Agent Remote ID suboption.
 - Both **circuit-id** and **remote-id**—The payloads of both suboptions, in the format: **circuit-id[delimiter]remote-id**.
 - Neither **circuit-id** or **remote-id**—The raw payload of the option 82 from the PDU is concatenated to the username.

NOTE: For DHCP relay agent, the option 82 value used in creating the username is based on the option 82 value that is encoded in the outgoing (relayed) PDU.

- **relay-agent-interface-id**—The Interface-ID option (option 18). (DHCPv6 local server only)
- **relay-agent-remote-id**—The DHCPv6 Relay Agent Remote-ID option (option 37). (DHCPv6 local server only)
- **relay-agent-subscriber-id**—(On routers only) The DHCPv6 Relay Agent Subscriber-ID option (option 38). (DHCPv6 local server only)
- **routing-instance-name**—The name of the routing instance, if the receiving interface is in a routing instance.
- **user-prefix**—A string indicating the user prefix.

The router (switch) creates the unique username by including the specified additional information in the following order, with the fields separated by a delimiter.

For DHCP local server and DHCP relay agent:

```
user-prefix[delimiter]mac-address[delimiter]logical-system-name[delimiter]  
routing-instance-name[delimiter]circuit-type[delimiter]interface-name[delimiter]option-82[delimiter]  
option-60@domain-name
```

For DHCPv6 local server:

```
user-prefix[delimiter]logical-system-name[delimiter]routing-instance-name[delimiter]  
circuit-type[delimiter]interface-name[delimiter]relay-agent-remote-id[delimiter]  
relay-agent-subscriber-id[delimiter]relay-agent-interface-id[delimiter]client-id@domain-name
```

To configure a unique username:

1. Specify that you want to configure authentication.

- For DHCP local server:

```
[edit system services dhcp-local-server]  
user@host# edit authentication
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]  
user@host# edit authentication
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]  
user@host# edit authentication
```

2. Specify that you want to include optional information in the username. (DHCP local server, DHCPv6 local server, and DHCP relay agent all support the **username-include** statement.)

```
[edit system services dhcp-local-server authentication]  
user@host# set username-include
```

3. (Optional) Specify the optional information you want to include in the username.

```
[edit system services dhcp-local-server authentication username-include]  
user@host# set username-include circuit-type  
user@host# set username-include domain-name isp55.com  
user@host# set username-include mac-address  
user@host# set username-include user-prefix wallybrown
```

The previous **username-include** configuration produces this unique username:

wallybrown.0090.1a01.1234.enet@isp55.com

Related Documentation

Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use

You can specify the match order in which the extended DHCP local server uses the client data to determine the address-assignment pool that provides the IP address and configuration for a DHCP client. You use the **pool-match-order** statement to specify the match order. If you do not specify the **pool-match-order**, the router (or switch) uses the default **ip-address-first** matching to select the address pool. After DHCP local server determines the address assignment pool to use, the server performs the matching based on the criteria you specified in the pool configuration.

In the default **ip-address-first** matching, the server selects the address-assignment pool to use by matching the IP address in the client DHCP request with the network address of the address-assignment pool. If the client request contains the gateway IP address (giaddr), the local server matches the giaddr to the address-assignment pool's address. If there is no giaddr in the request, then the DHCP local server matches the IP address of the receiving interface to the address of the address-assignment pool.

In **external-authority** matching, the DHCP local server receives the address assignment from an external authority, such as RADIUS or Diameter. If RADIUS is the external authority, the DHCP local server uses the Framed-IPv6-Pool attribute (RADIUS attribute 100) to select the pool. If Diameter is the external authority, the server uses the Diameter counterpart of the Framed-IPv6-Pool attribute to determine the pool.

For IPv4 address-assignment pools, you can optionally configure the extended DHCP local server to match the DHCP relay agent information option (option 82) in the client DHCP packets to a named range in the address-assignment pool used for the client. Named ranges are subsets within the overall address-assignment pool address range, which you can configure when you create the address-assignment pool.

NOTE: To use the DHCP local server option 82 matching feature with an IPv4 address-assignment pool, you must ensure that the **option-82** statement is included in the **dhcp-attributes** statement for the address-assignment pool.

To configure the matching order the extended DHCP local server uses to determine the address-assignment pool used for a client:

1. Access the **pool-match-order** configuration.

```
[edit system services dhcp-local-server]
user@host# edit pool-match-order
```

2. Specify the pool matching methods in the order in which the router (switch) performs the methods. You can specify the methods in any order. All methods are optional—the router (switch) uses the **ip-address-first** method by default.

- Configure the router (switch) to use an external addressing authority.

```
[edit system services dhcp-local-server pool-match-order]
user@host# set external-authority
```

- Configure the router (switch) to use the ip-address-first method.

```
[edit system services dhcp-local-server pool-match-order]  
user@host# set ip-address-first
```
- (IPv4 address-assignment pools only) Specify the option 82 matching method.

```
[edit system services dhcp-local-server pool-match-order]  
user@host# set option-82
```

Using External AAA Authentication Services with DHCP

The extended DHCP local server, including DHCPv6 local server, and the extended DHCP relay agent, including DHCPv6 relay agent, support the use of external AAA authentication services, such as RADIUS, to authenticate DHCP clients. When the extended DHCP local server or relay agent receives a discover PDU from a client, the extended DHCP application contacts the AAA server to authenticate the DHCP client. The extended DHCP application can obtain client addresses and DHCP configuration options from the external AAA authentication server.

NOTE: This section uses the term *extended DHCP application* to refer to both the extended DHCP local server and the extended DHCP relay agent.

The external authentication feature also supports AAA directed logout. If the external AAA service supports a user logout directive, the extended DHCP application honors the logout and responds as though it were requested by a CLI management command. All of the client state information and allocated resources are deleted at logout. The extended DHCP application supports directed logout using the list of configured authentication servers you specify with the **authentication-server** statement at the **[edit access profile profile-name]** hierarchy level.

You can configure either global authentication support or group-specific support.

You must configure the **username-include** statement to enable the use of authentication. The **password** statement is not required and does not cause DHCP to use authentication if the **username-include** statement is not included.

To configure DHCP local server and DHCP relay agent authentication support:

1. Specify that you want to configure authentication options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit authentication
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit authentication
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit authentication
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit authentication
```

2. (Optional) Configure a password that authenticates the username to the external authentication service.

See [“Configuring Passwords for Usernames” on page 945](#).

3. (Optional) Configure optional features to create a unique username.

See [“Creating Unique Usernames for DHCP Clients” on page 946](#).

Configuring DHCP Duplicate Client Support

You can optionally configure DHCP local server and DHCP relay to include a client subinterface when distinguishing between two clients that have the same MAC address or client ID. The configuration is a global setting for each logical system/routing instance.

To configure DHCP local server to include the client subinterface:

1. Specify that you want to configure DHCP local server.

```
[edit system services]
user@host# edit dhcp-local-server
```

2. Configure the optional duplicate client support.

```
[edit system services dhcp-local-server]
user@host# set duplicate-clients-on-interface
```

To configure DHCP relay agent to include the client subinterface:

1. Specify that you want to configure DHCP relay agent.

```
[edit forwarding-options]
user@host# edit dhcp-relay
```

2. Configure the optional duplicate client support.

```
[edit system services dhcp-relay]
user@host# set duplicate-clients-on-interface
```

Related Documentation

Grouping Interfaces with Common DHCP Configurations

You use the group feature to group together a set of interfaces and then apply a common DHCP configuration to the named interface group. The extended DHCP local server, DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent all support interface groups.

The following steps create a DHCP local server group; the steps are similar for the DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent.

To configure a DHCP local server interface group:

1. Specify that you want to configure DHCP local server.

```
[edit system services]
user@host# edit dhcp-local-server
```

2. Create the group and assign a name.

```
[edit system services dhcp-local-server]
user@host# edit group boston
```

3. Specify the names of one or more interfaces on which the extended DHCP application is enabled. You can repeat the `interface interface-name` statement to specify multiple interfaces within the group, but you cannot use the same interface in more than one group.

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.1
user@host# set interface fe-1/0/1.2
```

4. (Optional) You can use the `upto` option to specify a range of interfaces for a group.

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9
```

5. (Optional) You can use the `exclude` option to exclude a specific interface or a specified range of interfaces from the group. For example:

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.1 upto fe-1/0/1.102
user@host# set interface fe-1/0/1.6 exclude
user@host# set interface fe-1/0/1.70 upto fe-1/0/1.80 exclude
```

Guidelines for Configuring Interface Ranges

This topic describes guidelines to consider when configuring interface ranges for named interface groups for DHCP local server and DHCP relay. The guidelines refer to the following configuration statement:

```
user@host# set interface interface-name upto upto-interface-name
```

- The start subunit, **interface *interface-name***, serves as the key for the stanza. The remaining configuration settings are considered attributes.
- If the subunit is not included, an implicit **.0** subunit is enforced. The implicit subunit is applied to all interfaces when autoconfiguration is enabled. For example, **interface ge-2/2/2** is treated as **interface ge-2/2/2.0**.
- Ranged entries contain the **upto** option, and the configuration applies to all interfaces within the specified range. The start of a ranged entry must be less than the end of the range. Discrete entries apply to a single interface, except in the case of autoconfiguration, in which a **0** (zero) subunit acts as a wildcard.
- Interface stanzas defined within the same router or switch context are dependent and can constrain each other—both DHCP local server and DHCP relay are considered. Interface stanzas defined across different router (switch) contexts are independent and do not constrain one another.
- Each interface stanza, whether discrete or ranged, has a unique start subunit across a given router context. For example, the following configuration is not allowed within the same group because **ge-1/0/0.10** is the start subunit for both.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.10
```

- Two groups cannot share interface space. For example, the following configuration is not allowed because the three stanzas share the same space and interfere with one another—interface **ge-1/0/0.26** is common to all three.

```
dhcp-relay group diamond interface ge-1/0/0.10 upto ge-1/0/0.30
dhcp-local-server group ruby interface ge-1/0/0.26
dhcp-relay group sapphire interface ge-1/0/0.25 upto ge-1/0/0.35
```

- Two ranges cannot overlap, either within a group or across groups. Overlapping occurs when two interface ranges share common subunit space but neither range is a proper subset of the other. The following ranges overlap:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.20 upto ge-1/0/0.40
```

- A range can contain multiple nested ranges. A nested range is a proper subset of another range. When ranges are nested, the smallest matching range applies.

In the following example, the three ranges nest properly:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.12 upto ge-1/0/0.15 exclude
interface ge-1/0/0.25 upto ge-1/0/0.29 exclude
```

- Discrete interfaces take precedence over ranges. In the following example, interface **ge-1/0/0.20** takes precedence and enforces an interface client limit of 5.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.15 upto ge-1/0/0.25 exclude
interface ge-1/0/0.20 overrides interface-client-limit 5
```

Overriding the Default DHCP Relay Configuration Settings

You can override the default DHCP and DHCPv6 relay agent configuration settings at the global level, for a named group of interfaces, or for a specific interface within a named group.

- To override global default DHCP relay agent configuration options, include the **overrides** statement and its subordinate statements at the **[edit forwarding-options dhcp-relay]** hierarchy level.
- To override DHCP relay configuration options for a named group of interfaces, include the statements at the **[edit forwarding-options dhcp-relay group group-name]** hierarchy level.
- To override DHCP relay configuration options for a specific interface within a named group of interfaces, include the statements at the **[edit forwarding-options dhcp-relay group group-name interface]** hierarchy level.
- To configure overrides for DHCPv6 relay, use the supported statements at the **[edit forwarding-options dhcp-relay dhcpv6]** hierarchy level.

To override default DHCP relay agent configuration settings:

- Specify that you want to configure override options.

Global override:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

Group-level override:

```
[edit forwarding-options dhcp-relay]
user@host# edit group boston overrides
```

Per-interface override:

```
[edit forwarding-options dhcp-relay]
user@host# edit group boston interface fe-1/0/1.2 overrides
```

- (DHCPv4 only) Enable DHCP relay proxy mode.
See [“Enabling DHCP Relay Proxy Mode” on page 977](#).
- (DHCPv4 only) Overwrite the giaddr in DHCP packets that the DHCP relay agent forwards.
See [“Overwriting giaddr Information” on page 957](#).

4. (DHCPv4 only) Replace the IP source address in DHCP relay request and release packets with the gateway IP address (giaddr).
See [“Replacing the DHCP Relay Request and Release Packet Source Address” on page 957.](#)
5. (DHCPv4 only) Override the DHCP relay agent information option (option 82) in DHCP packets.
See [“Overriding Option 82 Information” on page 957.](#)
6. (DHCPv4 only) Override the setting of the broadcast bit in DHCP request packets and use the Layer 2 unicast transmission method.
See [“Using Layer 2 Unicast Transmission for DHCP Packets” on page 958.](#)
7. (DHCPv4 only) Trust DHCP client packets that have a giaddr of 0 and that contain option 82 information.
See [“Trusting Option 82 Information” on page 958.](#)
8. (DHCPv4 only) Override the ARP table population in distrusted environments.
See [“Disabling ARP Table Population” on page 930.](#)
9. (DHCPv4 and DHCPv6) Override the maximum number of DHCP clients allowed per interface.
See [“Specifying the Maximum Number of DHCP Clients Per Interface” on page 929.](#)
10. (DHCPv4 only) Configure client auto logout.
See [“DHCP Auto Logout Overview” on page 888.](#)
11. (DHCPv4 and DHCPv6) Enable or disable support for DHCP snooped clients on interfaces.
See [“Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent” on page 964.](#)
12. (DHCPv4 and DHCPv6) Send release messages to the DHCP server when clients are deleted.
See [“Sending Release Messages When Clients Are Deleted” on page 971.](#)
13. (DHCPv4 only) Disable the DHCP relay agent on specific interfaces.
See [“Disabling DHCP Relay” on page 983.](#)
14. (DHCPv4 and DHCPv6) Disable automatic binding of stray DHCP requests.
See [“Disabling Automatic Binding of Stray DHCP Requests” on page 972.](#)

Overwriting giaddr Information

You can configure the DHCP relay agent to change the gateway IP address (giaddr) field in packets that it forwards between a DHCP client and a DHCP server.

To overwrite the giaddr of every DHCP packet with the giaddr of the DHCP relay agent before forwarding the packet to the DHCP server:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that the giaddr of DHCP packets is overwritten.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set always-write-giaddr
```

Related Documentation

- [Extended DHCP Relay Agent Overview on page 900](#)
- [Overriding the Default DHCP Relay Configuration Settings on page 955](#)

Replacing the DHCP Relay Request and Release Packet Source Address

You can configure the DHCP relay agent to replace request and release packets with the gateway IP address (giaddr) before forwarding the packet to the DHCP server.

To replace the source address with giaddr:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that you want to replace the IP source address in DHCP relay request and release packets with the gateway IP address (giaddr).

```
[edit forwarding-options dhcp-relay overrides]
user@host# set replace-ip-source-with giaddr
```

- [Overriding the Default DHCP Relay Configuration Settings on page 955](#)

Overriding Option 82 Information

You can configure the DHCP relay agent to add or remove the DHCP relay agent information option (option 82) in DHCP packets.

This feature causes the DHCP relay agent to perform one of the following actions, depending on the configuration:

- If the DHCP relay agent is configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the DHCP packets and inserts the new values before forwarding the packets to the DHCP server.

- If the DHCP relay agent is not configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the packets, but does not add any new values before forwarding the packets to the DHCP server.

To override the default option 82 information in DHCP packets destined for a DHCP server:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that the option 82 information in DHCP packets is overwritten.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set always-write-option-82
```

Using Layer 2 Unicast Transmission for DHCP Packets

You can configure the DHCP relay agent to override the setting of the broadcast bit in DHCP request packets. DHCP relay agent then instead uses the Layer 2 unicast transmission method to send DHCP Offer reply packets and DHCP ACK reply packets from the DHCP server to DHCP clients during the discovery process.

To override the default setting of the broadcast bit in DHCP request packets:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that the DHCP relay agent uses the Layer 2 unicast transmission method.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set layer2-unicast-replies
```

**Related
Documentation**

- [Extended DHCP Relay Agent Overview on page 900](#)
- [Overriding the Default DHCP Relay Configuration Settings on page 955](#)

Trusting Option 82 Information

By default, the DHCP relay agent treats client packets with a giaddr of 0 (zero) and option 82 information as if the packets originated at an untrusted source, and drops them without further processing. You can override this behavior and specify that the DHCP relay agent process DHCP client packets that have a giaddr of 0 (zero) and contain option 82 information.

To configure DHCP relay agent to trust option 82 information:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- Specify that the DHCP relay agent process DHCP client packets with a giaddr of 0 and that contain option 82 information.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set trust-option-82
```

- [Extended DHCP Relay Agent Overview on page 900](#)
- [Overriding the Default DHCP Relay Configuration Settings on page 955](#)

Disabling ARP Table Population

By default, DHCP populates the ARP table with the MAC address of a client when the client binding is established. However, you may choose to use the DHCP **no-arp** statement to hide the subscriber MAC address or the DHCP client MAC address, as it appears in ARP table entries.

When running in a trusted environment (that is, when not using the **no-arp** statement), DHCP populates the ARP table with unique MAC addresses contained within the DHCP PDU for each DHCP client:

Table 74: ARP Table in Trusted Environment

IP Address	MAC Address
Client 1 IP Address	MAC A
Client 2 IP Address	MAC B
Client 3 IP Address	MAC C

In distrusted environments, you can specify the **no-arp** statement to hide the MAC addresses of clients. When you specify the **no-arp** statement, DHCP does not automatically populate the ARP table with MAC address information from the DHCP PDU for each client. Instead, the system performs an ARP to obtain the MAC address of each client and obtains the MAC address of the immediately attached device (for example, a DSLAM). DHCP populates the ARP table with the same interface MAC address (for example, MAC X from a DSLAM interface) for each client:

Table 75: ARP Table in Distrusted Environment

IP Address	MAC Address
Client 1 IP Address	MAC X
Client 2 IP Address	MAC X
Client 3 IP Address	MAC X

To disable ARP table population:

1. Specify that you want to configure override options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

- For DHCP relay:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Disable ARP table population with client-specific information. (DHCP local server and DHCP relay agent both support the **no-arp** statement.)

- For DHCP local server:

```
[edit system services dhcp-local-server overrides]
user@host# set no-arp
```

- For DHCP relay:

```
[edit forwarding-options dhcp-relay overrides]
user@host# set no-arp
```

Specifying the Maximum Number of DHCP Clients Per Interface

By default, there is no limit to the number of DHCP local server or DHCP relay clients allowed on an interface. However, you can override the default setting and specify the maximum number of clients allowed per interface, in the range 1 through 500,000. When the number of clients on the interface reaches the specified limit, no additional DHCP Discover PDUs or DHCPv6 Solicit PDUs are accepted. When the number of clients subsequently drops below the limit, new clients are again accepted.

NOTE: The maximum number of DHCP (and DHCPv6) local server clients or DHCP (and DHCPv6) relay clients can also be specified by Juniper Networks VSA 26-143 during client login. The VSA-specified value always takes precedence if the `interface-client-limit` statement specifies a different number.

If the VSA-specified value differs with each client login, DHCP uses the largest limit set by the VSA until there are no clients on the interface.

To configure the maximum number of DHCP clients allowed per interface:

1. Specify that you want to configure override options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

2. Configure the maximum number of clients allowed per interface. (DHCP local server, DHCPv6 local server, DHCP relay agent and DHCPv6 relay agent all support the **interface-client-limit** statement.)

```
[edit system services dhcp-local-server overrides]
user@host# set interface-client-limit number
```

Automatically Logging Out DHCP Clients

You can configure the extended DHCP local server and extended DHCP relay to automatically log out DHCP clients. Auto logout immediately releases an existing client when DHCP receives a discover packet that has the same DHCP option 60 and DHCP option 82 information as the existing client. DHCP then releases the existing client IP address without waiting for the normal lease expiration.

NOTE: When the existing client is released, the new client undergoes the normal authentication process. The new client might not receive the same IP address as the original client.

To configure DHCP client auto logout:

1. Specify that you want to configure override options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Enable auto logout. (DHCP local server and DHCP relay agent both support the **client-discover-match** statement.)

- For DHCP local server:

```
[edit system services dhcp-local-server overrides]
user@host# set client-discover-match
```

- For DHCP relay:

```
[edit forwarding-options dhcp-relay overrides]
user@host# set client-discover-match
```

NOTE: If you change the auto logout configuration, existing clients continue to use the auto logout setting that was configured when they logged in. New clients use the new setting.

DHCP Relay Agent Option 82 Value for Auto Logout

Table 76 on page 962 indicates how the DHCP relay agent determines the option 82 value used for the client auto logout feature. Depending on the configuration settings, DHCP relay agent takes the action indicated in the right column.

Table 76: DHCP Relay Agent Option 82 Value for Auto Logout

DHCP Relay Agent Configuration Settings				giaddr in non-snooped packet	Action Taken
DHCP Relay Configured with Option 82	Discover Packet Contains Option 82	Override "trust-option-82"	Override "always-write-option-82"		
No	No	—	—	—	No secondary search performed
No	Yes	Yes	—	—	Use option 82 from packet

Table 76: DHCP Relay Agent Option 82 Value for Auto Logout (*continued*)

DHCP Relay Agent Configuration Settings				giaddr in non-snooped packet	Action Taken
DHCP Relay Configured with Option 82	Discover Packet Contains Option 82	Override "trust-option-82"	Override "always-write-option-82"		
No	Yes	No	–	Zero	Drop packet
No	Yes	No	–	Non-zero	Use option 82 from packet
Yes	No	–	–	–	Use configured option 82
Yes	Yes	No	–	Zero	Drop packet
Yes	Yes	No	No	Non-zero	Use option 82 from packet
Yes	Yes	No	Yes	Non-zero	Overwrite the configured option 82
Yes	Yes	Yes	No	–	Use option 82 from packet
Yes	Yes	Yes	Yes	–	Overwrite the configured option 82

Configuring DHCP Snooping for DHCP Relay Agent

DHCP relay agent uses a two-part configuration to determine how to handle DHCP snooped packets. First, you enable or disable snooping support for DHCP relay agent and, optionally, override the default snooping configuration. Then you configure the forwarding action for snooped clients, which specifies whether DHCP relay agent forwards or drops snooped traffic.

To configure DHCP snooping for DHCP relay agent:

1. (DHCPv4 and DHCPv6) Enable or disable DHCP snooping. You can configure DHCP snooping globally, for a named group of interfaces, or for a specific interface.

See “Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent” on page 964.

2. (DHCPv4 only) Configure snooped packets forwarding support.

See [“Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent”](#) on page 969.

**Related
Documentation**

- [DHCP Snooping Support on page 887](#)
- [Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent on page 964](#)
- [Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent on page 969](#)
- [Example: Configuring DHCP Snooping Support for DHCP Relay Agent on page 921](#)

Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent

DHCP relay agent uses a two-part configuration to determine how to handle DHCP snooped packets. This topic describes the first procedure, in which you configure DHCP relay to either enable or disable support for snooped packets.

The second procedure, which applies only to DHCPv4 relay agent, is described in [“Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent”](#) on page 969, and configures the **forward-snooped-clients** statement, which determines whether the snooped packets are forwarded or dropped, depending on the type of interface.

NOTE: The router has a default global setting that specifies whether DHCP snooping support is enabled or disabled for DHCP relay. In Junos OS Release 10.0 and earlier, DHCP snooping is enabled by default. In Junos OS Release 10.1 and later, DHCP snooping is disabled by default.

You can override the default global DHCP snooping configuration and explicitly enable or disable DHCP snooping support. You can configure the explicit snooping support globally, for a group of interfaces, or for a specific interface in a group.

- To enable DHCP relay or DHCPv6 relay snooping support, include the **allow-snooped-clients** option in the **overrides** statement.
- To disable DHCP relay or DHCPv6 relay snooping support, include the **no-allow-snooped-clients** option in the **overrides** statement.

To enable or disable DHCP snooping support globally:

1. Specify that you want to configure DHCP relay agent.
 - For DHCP relay agent:

```
[edit]  
user@host# edit forwarding-options dhcp-relay
```
 - For DHCPv6 relay agent:

```
[edit]
user@host# edit forwarding-options dhcp-relay dhcpv6
```

2. Specify that you want to override the default configuration.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

3. Enable or disable DHCP snooping support.

- To enable DHCP snooping:

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay overrides]
user@host# set allow-snooped-clients
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 overrides]
user@host# set allow-snooped-clients
```

- To disable DHCP snooping:

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay overrides]
user@host# set no-allow-snooped-clients
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 overrides]
user@host# set no-allow-snooped-clients
```

For example, to enable global DHCP snooping support :

```
forwarding-options {
  dhcp-relay {
    overrides {
      allow-snooped-clients;
    }
  }
}
```

To enable or disable DHCP snooping support for a group of interfaces:

1. Specify that you want to configure DHCP relay agent.

- For DHCP relay agent:

```
[edit]
user@host# edit forwarding-options dhcp-relay
```

- For DHCPv6 relay agent:

```
[edit]
user@host# edit forwarding-options dhcp-relay dhcpv6
```

2. Specify the named group.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit group group-name
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit group group-name
```

3. Specify that you want to override the default configuration.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name]
user@host# edit overrides
```

4. Enable or disable DHCP snooping support.

- To enable DHCP snooping:

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name overrides]
user@host# set allow-snooped-clients
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name overrides]
user@host# set allow-snooped-clients
```

- To disable DHCP snooping:

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name overrides]
user@host# set no-allow-snooped-clients
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name overrides]
user@host# set no-allow-snooped-clients
```

For example, to enable DHCP snooping support on all interfaces in group **boston**:

```
forwarding-options {
  dhcp-relay {
    group boston {
      overrides {
        allow-snooped-clients;
      }
    }
  }
}
```

To enable or disable DHCP snooping support on a specific interface:

1. Specify that you want to configure DHCP relay agent.

- For DHCP relay agent:

```
[edit]
user@host# edit forwarding-options dhcp-relay
```

- For DHCPv6 relay agent:

```
[edit]
user@host# edit forwarding-options dhcp-relay dhcpv6
```

2. Specify the named group containing the interface.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit group group-name
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit group group-name
```

3. Specify the interface for which you want to configure DHCP snooping.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name]
user@host# edit interface interface-name
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name]
user@host# edit interface interface-name
```

4. Specify that you want to override the default configuration on the interface.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name interface interface-name]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name interface
interface-name]
user@host# edit overrides
```

5. Enable or disable DHCP snooping support.

- To enable DHCP snooping:
 - For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name interface interface-name overrides]
user@host# set allow-snooped-clients
```
 - For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name interface interface-name overrides]
user@host# set allow-snooped-clients
```
- To disable DHCP snooping:
 - For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name interface interface-name overrides]
user@host# set no-allow-snooped-clients
```
 - For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name interface interface-name overrides]
user@host# set no-allow-snooped-clients
```

For example, to disable DHCP snooping support on interface **ge-2/1/8.0** in group **boston**:

```
forwarding-options {
  dhcp-relay {
    group boston {
      interface ge-2/1/8.0 {
        overrides {
          no-allow-snooped-clients;
        }
      }
    }
  }
}
```

To enable DHCPv6 snooping support on interface **ge-3/2/1.1** in group **sunnyvale**:

```
forwarding-options {
  dhcp-relay {
    dhcpv6 {
      group sunnyvale {
        interface ge-3/2/1.1 {
          overrides {
            allow-snooped-clients;
          }
        }
      }
    }
  }
}
```

Related Documentation

- [DHCP Snooping Support on page 887](#)
- [Overriding the Default DHCP Relay Configuration Settings on page 955](#)

Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent

You can configure how DHCP relay agent handles DHCP snooped packets. Depending on the configuration, DHCP relay agent either forwards or drops the snooped packets it receives.

DHCP relay uses a two-part configuration to determine how to handle DHCP snooped packets. This topic describes how you use the [forward-snooped-clients](#) statement to manage whether DHCP relay agent forwards or drops snooped packets, depending on the type of interface on which the packets are snooped. In the other part of the DHCP relay agent snooping configuration, which is described in “[Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent](#)” on page 964, you enable or disable the DHCP relay snooping feature.

[Table 77 on page 969](#) shows the action the router or switch takes on snooped packets when DHCP snooping is enabled by the [allow-snooped-clients](#) statement.

[Table 78 on page 970](#) shows the action the router (or switch) takes on snooped packets when DHCP snooping is disabled by the [no-allow-snooped-clients](#) statement.

The router or switch also uses the configuration of the DHCP relay agent forwarding support to determine how to handle snooped BOOTREPLY packets. [Table 79 on page 970](#) shows the action the router (or switch) takes for the snooped BOOTREPLY packets.

NOTE: Configured interfaces have been configured with the `group` statement in the `[edit forwarding-options dhcp-relay]` hierarchy. Non-configured interfaces are in the logical system/routing instance but have not been configured by the `group` statement.

Table 77: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Enabled

forward-snooped-clients Configuration	Action on Configured Interfaces	Action on Non-Configured Interfaces
<code>forward-snooped-clients</code> not configured	snooped packets result in subscriber (DHCP client) creation	dropped
<code>all-interfaces</code>	forwarded	forwarded
<code>configured-interfaces</code>	forwarded	dropped

Table 77: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Enabled (*continued*)

forward-snooped-clients Configuration	Action on Configured Interfaces	Action on Non-Configured Interfaces
non-configured-interfaces	snooped packets result in subscriber (DHCP client) creation	forwarded

Table 78: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Disabled

forward-snooped-clients Configuration	Action on Configured Interfaces	Action on Non-Configured Interfaces
forward-snooped-clients not configured	dropped	dropped
all-interfaces	dropped	forwarded
configured-interfaces	dropped	dropped
non-configured-interfaces	dropped	forwarded

Table 79: Actions for Snooped BOOTREPLY Packets

forward-snooped-clients Configuration	Action
forward-snooped-clients not configured	snooped BOOTREPLY packets dropped if client is not found
forward-snooped-clients all configurations	snooped BOOTREPLY packets forwarded if client is not found

To configure DHCP snooped packet forwarding and BOOTREPLY snooped packet forwarding for DHCP relay agent:

- Specify that you want to configure DHCP relay agent.

```
[edit]
user@host# edit forwarding-options dhcp-relay
```
- Enable DHCP snooped packet forwarding.

```
[edit forwarding-options dhcp-relay]
user@host# edit forward-snooped-clients
```
- Specify the interfaces that are supported for snooped packet forwarding.

```
[edit forwarding-options dhcp-relay forward-snooped-clients]
user@host# set (all-interfaces | configured-interfaces | non-configured-interfaces)
```

For example, to configure DHCP relay agent to forward DHCP snooped packets on only configured interfaces:

```
[edit]
forwarding-options {
  dhcp-relay {
    forward-snooped-clients configured-interfaces;
  }
}
```

**Related
Documentation**

- [DHCP Snooping Support on page 887](#)
- [Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent on page 964](#)

[Sending Release Messages When Clients Are Deleted](#)

By default, when DHCP relay and relay proxy delete a client, they do not send a release message to the DHCP server. You can override the default behavior and configure DHCP relay and relay proxy to send a release message whenever they delete a client. The release message sent by DHCP relay and relay proxy includes option 82 information.

NOTE: In Junos OS Release 10.1 and earlier, DHCP relay sends a release message to the DHCP server when the `client-discover-match` statement is included as a DHCP relay override. In Junos OS Release 10.2 and later, you must include the `send-release-on-delete` statement to configure DHCP relay and relay proxy to send the release message when the `client-discover-match` statement is included.

You can use the `[edit forwarding-options dhcp-relay dhcpv6]` hierarchy level to override the default behavior for DHCPv6 relay agent.

To send a release message:

1. Specify that you want to configure override options.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

2. Specify that you want DHCP relay and relay proxy (or DHCPv6 relay agent) to send a release message when clients are deleted.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set send-release-on-delete
```

 - [Overriding the Default DHCP Relay Configuration Settings on page 955](#)

Disabling Automatic Binding of Stray DHCP Requests

DHCP requests that are received but have no entry in the database are known as stray requests. By default, DHCP relay, DHCP relay proxy, and DHCPv6 relay agent attempt to bind the requesting client by creating a database entry and forwarding the request to the DHCP server. If the server responds with an ACK, the client is bound and the ACK is forwarded to the client. If the server responds with a NAK, the database entry is deleted and the NAK is forwarded to the client. This behavior occurs regardless of whether authentication is configured.

You can override the default configuration at the global level, for a named group of interfaces, or for a specific interface within a named group. Overriding the default causes DHCP relay, DHCP relay proxy, and DHCPv6 relay agent to drop all stray requests instead of attempting to bind the clients.

NOTE: In Junos OS Release 10.4 and later, automatic binding of stray requests is enabled by default.

In Junos OS Release 10.3 and earlier releases, automatic binding of stray requests is disabled by default. In those releases, DHCP relay drops stray requests and forwards a NAK to the client when authentication is configured. Otherwise, DHCP relay attempts to bind the requesting client. In those releases, DHCP relay proxy always drops stray requests and forwards a NAK to the client, regardless of the authentication configuration.

- To disable automatic binding behavior, include the **no-bind-on-request** statement when you configure DHCP overrides at the global, group, or interface level.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set no-bind-on-request
```

- To override the default behavior for DHCPv6 relay agent, configure the override at the **[edit forwarding-options dhcp-relay dhcpv6]** hierarchy level.

```
[edit forwarding-options dhcp-relay dhcpv6 overrides]
user@host# set no-bind-on-request
```

The following two examples show a configuration that disables automatic binding of stray requests for a group of interfaces and a configuration that disables automatic binding on a specific interface.

To disable automatic binding of stray requests on a group of interfaces:

1. Specify the named group.

```
[edit forwarding-options dhcp-relay]
user@host# edit group boston
```

2. Specify that you want to configure overrides.

```
[edit forwarding-options dhcp-relay group boston]
user@host# edit overrides
```

3. Disable automatic binding for the group.

```
[edit forwarding-options dhcp-relay group boston overrides]
user@host# set no-bind-on-request
```

To disable automatic binding of stray requests on a specific interface:

1. Specify the named group of which the interface is a member.

```
[edit forwarding-options dhcp-relay]
user@host# edit group boston
```

2. Specify the interface on which you want to disable automatic binding.

```
[edit forwarding-options dhcp-relay group boston]
user@host# edit interface fe-1/0/1.2
```

3. Specify that you want to configure overrides.

```
[edit forwarding-options dhcp-relay group boston interface fe-1/0/1.2]
user@host# edit overrides
```

4. Disable automatic binding on the interface.

```
[edit forwarding-options dhcp-relay group boston interface fe-1/0/1.2 overrides]
user@host# set no-bind-on-request
```

Enabling and Disabling Insertion of Option 82 Information

You can enable or disable support for the DHCP relay agent information option (option 82) in packets destined for a DHCP server. You can configure option 82 support globally or for a named group of interfaces.

To restore the default behavior (option 82 information is not inserted into DHCP packets), you use the **delete relay-option-82** statement.

To configure support for the DHCP relay agent information option 82, you use the **relay-option-82** statement.

The following sections describe the option 82 operations you can configure:

- [Configuring Agent Circuit ID Information on page 974](#)
- [Configuring an Option 82 Prefix on page 974](#)
- [Using a Textual Description in Option 82 on page 976](#)

Configuring Agent Circuit ID Information

You use the **relay-option-82** statement to enable insertion of option 82 information in DHCP packets. You must also specify at least the **circuit-id** statement to include the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option.

If you specify the **circuit-id** statement, the format of the Agent Circuit ID information for Fast Ethernet (**fe**) or Gigabit Ethernet (**ge**) interfaces is one of the following, depending on your network configuration:

- For Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual local area networks (VLANs) or stacked VLANs (S-VLANs):

`(fe | ge)-fpc/pic/port`

- For Fast Ethernet or Gigabit Ethernet interfaces that use VLANs:

`(fe | ge)-fpc/pic/port:vlan-id`

- For Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs:

`(fe | ge)-fpc/pic/port:svlan-id-vlan-id`

To enable insertion of option 82 information:

1. Specify that you want to configure option 82 support.

```
[edit forwarding-options dhcp-relay]
user@host# edit relay-option-82
```

2. Specify insertion of the Agent Circuit ID suboption.

```
[edit forwarding-options dhcp-relay relay-option-82]
user@host# set circuit-id
```

Configuring an Option 82 Prefix

You can include an optional prefix to the base option 82 information in DHCP packets destined for a DHCP server.

The prefix is separated from the option 82 Agent Circuit ID information by a colon (:), and can include any combination of the **host-name**, **logical-system-name**, and **routing-instance-name** options. The DHCP relay agent obtains the values for the **host-name**, **logical-system-name**, and **routing-instance-name** as follows:

- If you include the **host-name** option, the DHCP relay agent uses the hostname of the router configured with the **host-name** statement at the **[edit system]** hierarchy level.
- If you include the **logical-system-name** option, the DHCP relay agent uses the logical system name configured with the **logical-system** statement at the **[edit logical-system]** hierarchy level.
- If you include the **routing-instance-name** option, the DHCP relay agent uses the routing instance name configured with the **routing-instance** statement at the **[edit routing-instances]** hierarchy level or at the **[edit logical-system logical-system-name routing-instances]** hierarchy level.

If you include the hostname and either or both of the logical system name and the routing instance name in the prefix, the hostname is followed by a forward slash (/). If you include both the logical system name and the routing instance name in the prefix, these values are separated by a semicolon (;).

The following examples show several possible formats for the Agent Circuit ID information when you specify the **prefix** statement for Fast Ethernet (**fe**) or Gigabit Ethernet (**ge**) interfaces with S-VLANs.

- If you include only the hostname in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

hostname:(fe | ge)-fpc/pic/port:svlan-id-vlan-id

- If you include only the logical system name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

logical-system-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id

- If you include only the routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id

- If you include both the hostname and the logical system name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

host-name/logical-system-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id

- If you include both the logical system name and the routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

logical-system-name;routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id

- If you include the hostname, logical system name, and routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

host-name/logical-system-name;routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id

For Fast Ethernet or Gigabit Ethernet interfaces that use VLANs but not S-VLANs, only the **vlan-id** value appears in the Agent Circuit ID format. For Fast Ethernet or Gigabit Ethernet interfaces that do not use VLANs or S-VLANs, neither the **vlan-id** value nor the **svlan-id** value appears.

To configure an optional prefix with the option 82 information:

1. Specify that you want to configure option 82 support.

```
[edit forwarding-options dhcp-relay]
user@host# edit relay-option-82
```

2. Specify insertion of the Agent Circuit ID information.

```
[edit forwarding-options dhcp-relay relay-option-82]
user@host# edit circuit-id
```

3. Specify that the prefix is included in the option 82 information. In this example, the prefix includes the hostname and logical system name

```
[edit forwarding-options dhcp-relay relay-option-82 circuit-id]
user@host# set prefix host-name logical-system-name
```

Using a Textual Description in Option 82

By default, when DHCP option 82 is inserted into client packets, the Agent Circuit ID suboption includes the interface identifier. You can optionally configure that the Agent Circuit ID suboption include the textual description that is configured for the interface instead of the interface identifier. You can use the textual description for either the logical interface or the device interface.

You can include the textual interface description in the Agent Circuit ID suboption for static interfaces. The textual description is configured using the **description** statement at the **[edit interfaces interface-name]** hierarchy level. If you specify that the textual description is used and no description is configured for the interface, DHCP relay defaults to using the interface identifier.

To configure the DHCP relay option 82 suboption to include the textual interface description:

1. Specify that you want to configure option 82 support.

```
[edit forwarding-options dhcp-relay]
user@host# edit relay-option-82
```

2. Specify insertion of the Agent Circuit ID information.

```
[edit forwarding-options dhcp-relay relay-option-82]
user@host# edit circuit-id
```

3. Specify that the textual description is included in the option 82 information. In this example, the option 82 information includes the description used for the device interface.

```
[edit forwarding-options dhcp-relay relay-option-82 circuit-id]
user@host# set use-interface-description device
```

Configuring Server Groups

You can configure a named group of DHCP servers for use by the extended DHCP relay agent on the router or switch.

You specify the name of the DHCP server group and the IP addresses of one or more DHCP servers that belong to this group. You can configure a maximum of five IP addresses per named server group.

To configure a named server group:

1. Specify the name of the server group.

```
[edit forwarding-options dhcp-relay]
user@host# set server-group myServerGroup
```

2. Add the IP addresses of the DHCP servers belonging to the group.

```
[edit forwarding-options dhcp-relay server-group myServerGroup]
user@host# set 192.168.100.50
```

```
user@host# set 192.168.100.75
```

Related Documentation

- [Extended DHCP Relay Agent Overview on page 900](#)

Configuring Active Server Groups

You can configure an active server group. Using an active server group enables you to apply a common DHCP relay agent configuration to a named group of DHCP server addresses.

Use the statement at the **[edit ... dhcpv6]** hierarchy levels to configure DHCPv6 support.

To configure an active server group:

- Specify the name of the active server group.

```
[edit forwarding-options dhcp-relay]
user@host# set active-server-group myServerGroup
```

To create an active server group as a global DHCP relay agent configuration option, include the **active-server-group** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level. To have the group apply only to a named group of interfaces, include the **active-server-group** statement at the **[edit forwarding-options dhcp-relay group group-name]** hierarchy level.

Including the **active-server-group** statement at the **[edit forwarding-options dhcp-relay group group-name]** hierarchy level (as a group-specific option) overrides the effect of including the **active-server-group** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level as a global option.

Enabling DHCP Relay Proxy Mode

You can enable DHCP relay proxy mode on all interfaces or a group of interfaces.

To enable DHCP relay proxy mode:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Enable DHCP relay proxy mode.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set proxy-mode
```

Attaching Dynamic Profiles to DHCP Subscriber Interfaces or DHCP Client Interfaces

This topic describes how to attach a dynamic profile to a DHCP subscriber interface or a DHCP client interface. When a DHCP subscriber or DHCP client logs in, the specified dynamic profile is instantiated and the services defined in the profile are applied to the interface.

This topic contains the following sections:

- [Attaching a Dynamic Profile to All DHCP Subscriber or All DHCP Client Interfaces on page 978](#)
- [Attaching a Dynamic Profile to a Group of DHCP Subscriber Interfaces or a Group of DHCP Client Interfaces on page 979](#)

Attaching a Dynamic Profile to All DHCP Subscriber or All DHCP Client Interfaces

To attach a dynamic profile to all DHCP subscriber or all DHCP client interfaces:

1. At the DHCP configuration hierarchy, use the **dynamic-profile** statement to specify the name of the dynamic profile to attach to all interfaces.
 - For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# set dynamic-profile vod-profile-22
```
 - For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# set dynamic-profile vod-profile-west
```
2. (Routers only) Optionally, you can configure the attribute to use when attaching the specified profile.

You can include either the **aggregate-clients** option to enable multiple DHCP subscribers to share the same VLAN logical interface, or the **use-primary** option to specify that the primary dynamic profile is used. The **aggregate-clients** option does not apply to demux subscriber interfaces. The two options are mutually exclusive.

- To enable multiple subscribers to share the same VLAN logical interface:

```
[edit system services dhcp-local-server dynamic-profile]
user@host# set aggregate-clients merge
```

- To use the primary dynamic profile:

```
[edit forwarding-options dhcp-relay dynamic-profile]
user@host# set use-primary subscriber_profile
```

Attaching a Dynamic Profile to a Group of DHCP Subscriber Interfaces or a Group of DHCP Client Interfaces

Before you begin:

- Configure the interface group.

See “[Grouping Interfaces with Common DHCP Configurations](#)” on page 926.

To attach a dynamic profile to a group of interfaces:

1. At the DHCP configuration hierarchy, specify the name of the interface group and the dynamic profile to attach to the group.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# set group boston dynamic-profile vod-profile-42
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# set group quebec dynamic-profile vod-profile-east
```

2. (Routers only) Optionally, you can configure the attribute to use when attaching the specified profile.

You can include either the **aggregate-clients** option to enable multiple DHCP subscribers to share the same VLAN logical interface, or the **use-primary** option to specify that the primary dynamic profile is used. The **aggregate-clients** option does not apply to demux subscriber interfaces. The two options are mutually exclusive.

- To enable multiple subscribers to share the same VLAN logical interface:

```
[edit system services dhcp-local-server dynamic-profile]
user@host# set aggregate-clients merge
```

- To use the primary dynamic profile:

```
[edit forwarding-options dhcp-relay dynamic-profile]
user@host# set use-primary subscriber_profile
```

Inserting DHCPv6 Interface-ID Option (Option 18) In DHCPv6 Packets

You can configure DHCPv6 relay agent to insert the DHCPv6 Interface-ID (Option 18) in the packets that the relay sends to a DHCPv6 server. You can optionally include a prefix, which can include any combination of hostname, logical system name, and routing instance name. You can also specify that the packets include the textual interface description instead of the interface identifier.

NOTE: If you configure the optional Steps 2 or 3, and the specified information does not exist (for example, there is no interface description), DHCPv6 relay ignores the optional configuration and inserts the interface identifier in the packets.

To insert the DHCPv6 Interface-ID option (Option 18) in DHCPv6 packets :

1. Configure the DHCPv6 relay to include Option 18.

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit relay-agent-interface-id
```

2. (Optional) Specify the prefix to include in Option 18.

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set prefix prefix
```

3. (Optional) Specify that the Option 18 include the textual description of the interface. You can specify either the **logical** interface description or the **device** interface description.

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set use-interface-description (logical | device)
```

DHCP Liveness Detection Overview

Unlike PPP, DHCP does not define a native keepalive mechanism as part of either the DHCPv4 or DHCPv6 protocols. Without a keepalive mechanism, DHCP local server, DHCP relay, or DHCP relay proxy is unable to quickly detect if it has lost connectivity with a subscriber or a DHCP client; and it must rely on standard DHCP subscriber session or DHCP client session termination messages.

DHCP clients often do not send DHCP release messages prior to exiting the network. The discovery of their absence is dependent on existing DHCP lease time and release request mechanisms. These mechanisms are often considered insufficient when serving as session health checks for clients in a DHCP subscriber access or a DHCP-managed network. Because DHCP lease times are typically too long to provide an adequate response time for a session health failure, and configuring short DHCP lease times can pose an undue burden on control plane processing, implementing a DHCP liveness detection mechanism enables better monitoring of bound DHCP clients. When configured with a liveness detection protocol, if a given subscriber (or client) fails to respond to a configured number of consecutive liveness detection requests, the subscriber (or client) binding is deleted and its resources released.

DHCP liveness detection for DHCP subscriber IP or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of

consecutive attempts, then the liveness detection check fails and a failure action is implemented.

Using DHCP liveness detection, IP sessions are acted upon as soon as liveness detection checks fail. This faster response time serves to:

- Provide more accurate time-based accounting of subscriber (or DHCP client) sessions.
- Better preserve router (switch) resources.
- Help to reduce the window of vulnerability to some security attacks.

Examples of liveness detection protocols include Bidirectional Forwarding Detection (BFD) for both DHCPv4 and DHCPv6 subscribers, IPv4 Address Resolution Protocol (ARP) for DHCPv4 subscribers, and IPv6 Neighbor Unreachability Detection for DHCPv6 subscribers.

NOTE: This release supports only BFD for DHCPv4 and DHCPv6 liveness detection.

When configuring BFD liveness detection, keep the following in mind:

- You can configure DHCPv4 and DHCPv6 liveness detection either globally or per DHCPv4 or DHCPv6 group.
- DHCPv4 or DHCPv6 subscriber access clients that do not support BFD are not affected by the liveness detection configuration. These clients can continue to access the network (once validated) even if BFD liveness detection is enabled on the router (or switch).
- When configured, DHCPv4 or DHCPv6 initiates liveness detection checks for relevant clients (that is, clients that support BFD) when those clients enter a bound state.
- After protocol-specific messages are initiated for a BFD client, they are periodically sent to the subscriber (or client) IP address of the client and responses to those liveness detection requests are expected within a configured amount of time.
- If liveness detection responses are not received from clients that support BFD within the configured amount of time for a configured number of consecutive attempts, the liveness detection check is deemed to have failed and a configured failure action is implemented.

Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity

Liveness detection for DHCP subscriber IP or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients must respond to liveness detection requests within a specified amount of time.

If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

NOTE: You can also configure DHCP liveness detection for DHCP local server.

To configure liveness detection for DHCP relay:

1. Specify that you want to configure liveness detection.

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay]
user@host# edit liveness-detection
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name]
user@host# edit liveness-detection
```

NOTE: Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the **liveness-detection** statement, and any subsequent configuration statements, at the [edit forwarding-options dhcp-relay dhcpv6] or [edit forwarding-options dhcp-relay dhcpv6 group *group-name*] hierarchy level.

2. (Optional) Specify that you want to use DHCP relay proxy mode.

```
[edit forwarding-options dhcp-relay group group-name]
user@host# set overrides proxy-mode
```

3. Specify that you want to configure the liveness detection method.

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay liveness-detection]
user@host# edit method
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name liveness-detection]
user@host# edit method
```

4. Specify the liveness detection method that you want DHCP to use.

NOTE: In this release, the only method supported for liveness detection is Bidirectional Forwarding Detection (BFD).

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay liveness-detection method]
user@host# edit bfd
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name liveness-detection method]
user@host# edit bfd
```

5. Configure the liveness detection method as desired.

See *Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients* for an example of how to globally configure DHCP relay liveness detection.

6. Configure the action the router takes when a liveness detection failure occurs.

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay liveness-detection]
user@host# edit failure-action action
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name liveness-detection]
user@host# edit failure-action action
```

Disabling DHCP Relay

You can disable DHCP relay on all interfaces or a group of interfaces.

To disable DHCP relay agent:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Disable the DHCP relay agent.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set disable-relay
```

attempts (DHCP Local Server)

Syntax	<code>attempts attempt-count;</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server reconfigure],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 reconfigure],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> reconfigure],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure],</p> <p>[edit system services dhcp-local-server reconfigure],</p> <p>[edit system services dhcp-local-server dhcpv6 reconfigure],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> reconfigure],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure]</p>
Release Information	<p>Statement introduced in Junos OS Release 10.0.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the [edit ... dhcpv6 ...] hierarchy levels introduced in Junos OS Release 10.4.</p>
Description	Configure how many attempts are made to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces before reconfiguration is considered to have failed. A group configuration takes precedence over a DHCP local server configuration.
Options	<p><i>attempt-count</i>—Maximum number of attempts.</p> <p>Range: 1 through 10</p> <p>Default: 8</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

clear-on-abort (DHCP Local Server)

Syntax	clear-on-abort;
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> reconfigure],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server reconfigure],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 reconfigure],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> reconfigure],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure],</p> <p>[edit system services dhcp-local-server reconfigure],</p> <p>[edit system services dhcp-local-server dhcpv6 reconfigure],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> reconfigure],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure]</p>
Release Information	<p>Statement introduced in Junos OS Release 10.0.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the [edit ... dhcpv6 ...] hierarchy levels introduced in Junos OS Release 10.4.</p>
Description	Delete all DHCP clients or only the DHCP clients serviced by the specified group of interfaces when reconfiguration fails; that is, when the maximum number of retry attempts have been made without success. A group configuration takes precedence over a DHCP local server configuration.
Default	Restores the original client configuration when reconfiguration fails.
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 936 • Configuring Deletion of the Client When Dynamic Reconfiguration Fails on page 938

client-discover-match (DHCP Local Server)

Syntax	client-discover-match <option60-and-option82>;
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server overrides],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> overrides],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server overrides],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> overrides],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server overrides],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> overrides],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server overrides],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> overrides],</p> <p>[edit system services dhcp-local-server overrides],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> overrides],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> interface <i>interface-name</i> overrides]</p>
Release Information	<p>Statement introduced in Junos OS Release 9.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
Description	<p>Configure DHCP local server to use option 60 and option 82 information to uniquely identify DHCP subscribers or clients when primary subscriber or client identification fails. The statement always uses the option60-and-option82 option. Specifying the option has no effect.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Extended DHCP Local Server Overview on page 876• Overriding Default DHCP Local Server Configuration Settings on page 928

client-id (DHCP Local Server)

Syntax	client-id;
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication username-include],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication username-include],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication username-include],</p> <p>[edit system services dhcp-local-server dhcpv6 authentication username-include],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication username-include]</p>
Release Information	<p>Statement introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
Description	Specify that the DHCPv6 Client-ID option (option 1) in the client PDU name is concatenated with the username during the subscriber authentication or client authentication process.
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

delegated-pool (DHCP Local Server)

Syntax	<code>delegated-pool <i>pool-name</i>;</code>
Hierarchy Level	<code>[edit system services dhcp-local-server dhcpv6 overrides],</code> <code>[edit system services dhcp-local-server dhcpv6 group group-name overrides],</code> <code>[edit system services dhcp-local-server dhcpv6 group group-name interface <i>interface-name</i></code> <code>overrides],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system</code> <code>services dhcp-local-server dhcpv6 ...],</code> <code>[edit logical-systems <i>logical-system-name</i> system services system services dhcp-local-server</code> <code>dhcpv6 ...],</code> <code>[edit routing-instances <i>routing-instance-name</i> system services system services</code> <code>dhcp-local-server dhcpv6 ...]</code>
Release Information	Statement introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Description	Specify the address pool that assigns the IA_PD address. A pool specified by RADIUS VSA 26-161 takes precedence over the pool specified by this delegated-pool statement.
Options	<i>pool-name</i> —Name of the address-assignment pool.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Specifying the Delegated Address Pool for IPv6 Prefix Assignment on page 934• Overriding Default DHCP Local Server Configuration Settings on page 928

delimiter (DHCP Local Server)

Syntax	<code>delimiter <i>delimiter-character</i>;</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group group-name authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group group-name authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group group-name authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group group-name authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group group-name authentication username-include],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group group-name authentication username-include],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server authentication username-include],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication username-include],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group group-name authentication username-include],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group group-name authentication username-include],</p> <p>[edit system services dhcp-local-server authentication username-include],</p> <p>[edit system services dhcp-local-server dhcpv6 authentication username-include],</p> <p>[edit system services dhcp-local-server dhcpv6 group group-name authentication username-include],</p> <p>[edit system services dhcp-local-server group group-name authentication username-include]</p>
Release Information	Statement introduced in Junos OS Release 9.1.
Description	<p>Specify the character used as the delimiter between the concatenated components of the username.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
Options	<i>delimiter-character</i> —Character that separates components that make up the concatenated username. You cannot use the semicolon (;) as a delimiter.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

 [bfd](#)]

Release Information Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description Enable failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. For example, the timers can adapt to a higher value if the adjacency fails, or a neighbor can negotiate a higher value for a timer than the one configured.

The remaining statement is explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information	<p>Statement introduced in Junos OS Release 9.0.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p> <p>requested-ip-network-match option introduced in Junos OS Release 12.2 (MX Series routers only).</p>
Description	<p>Configure Dynamic Host Configuration Protocol (DHCP) local server options on the router or switch and enable the router or switch to function as an extended DHCP local server. The DHCP local server receives DHCP request and reply packets from DHCP clients and then responds with an IP address and other optional configuration information to the client.</p> <p>The extended DHCP local server is incompatible with the DHCP server on J Series routers and so is not supported on J Series routers. Also, the DHCP local server and the DHCP/BOOTP relay server, which are configured under the [edit forwarding-options helpers] hierarchy level, cannot both be enabled on the router or switch at the same time. The extended DHCP local server is fully compatible with the extended DHCP relay feature.</p> <p>The dhcpv6 stanza configures the router or switch to support Dynamic Host Configuration Protocol for IPv6 (DHCPv6). The DHCPv6 local server is fully compatible with the extended DHCP local server and the extended DHCP relay feature.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 20px;">  <p>NOTE: When you configure the dhcp-local-server statement at the routing instance hierarchy level, you must use a routing instance type of virtual-router.</p> </div> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

[edit routing-instances *routing-instance-name* system services *dhcp-local-server*],
[edit system services *dhcp-local-server*]

Release Information Statement introduced in Junos OS Release 9.6.
Statement introduced in Junos OS Release 12.3 for EX Series switches.

Description Configure DHCPv6 local server options on the router or switch and enable the router or switch to function as a server for the DHCP protocol for IP version 6 (IPv6). The DHCPv6 local server sends and receives packets using the IPv6 protocol and informs IPv6 of the routing requirements of router clients. The local server works together with the AAA service framework to control subscriber access (or DHCP client access) and accounting.

The DHCPv6 local server is fully compatible with the extended DHCP local server and DHCP relay agent.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information Statement introduced in Junos OS Release 9.0.
 Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
 Options **upto** and **exclude** introduced in Junos OS Release 9.1.

Description Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP local server is enabled. You can repeat the **interface *interface-name*** statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP relay agent.

NOTE: DHCP values are supported in Integrated Routing and Bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. For additional information about how to configure IRB, see the *JUNOS® MX Series 3D Universal Edge Routers Solutions, Release 12.3*.

Options **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

interface-name—Name of the interface. You can repeat this option multiple times.

upto-interface-name—Upper end of the range of interfaces; the lower end of the range is the ***interface-name*** entry. The interface device name of the ***upto-interface-name*** must be the same as the device name of the ***interface-name***.

The remaining statements are explained separately.

Required Privilege Level	system—To view this statement in the configuration.
	system-control—To add this statement to the configuration.
