| <b>Description</b>              | Configure an interface as a host-facing interface. IGMP queries received on these interfaces are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>                  | The interface can either be a host-side or multicast-routing device interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>         | <p>The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>The immediate-leave setting enables host tracking, meaning that the device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.</p> |

**NOTE:** Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.

## interface (Bridge Domains)

**Syntax**

```
interface interface-name {
 group-limit limit;
 host-only-interface;
 multicast-router-interface;
 static {
 group ip-address {
 source ip-address;
 }
 }
}
```

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Enable IGMP snooping on an interface and configure interface-specific properties.

**Options** *interface-name*—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify **all**.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Provide fine-tuning to allow for expected packet loss on a subnet. You can wait more intervals if subnet packet loss is high and IGMP report messages might be lost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>         | Define tracing operations for IGMP snooping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>             | The <b>traceoptions</b> feature is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached (<b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b> —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations.</li><li>• <b>client-notification</b>—Trace notifications.</li><li>• <b>general</b>—Trace general IGMP snooping protocol events.</li><li>• <b>group</b>—Trace group operations.</li><li>• <b>host-notification</b>—Trace host notifications.</li><li>• <b>leave</b>—Trace leave group messages (IGMPv2 only).</li><li>• <b>normal</b>—Trace normal IGMP snooping protocol events.</li><li>• <b>packets</b>—Trace all IGMP packets.</li></ul> |

- **policy**—Trace policy processing.
- **query**—Trace IGMP membership query messages.
- **report**—Trace membership report messages.
- **route**—Trace routing information.
- **state**—Trace IGMP state transitions.
- **task**—Trace routing protocol task processing.
- **timer**—Trace routing protocol timer processing.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify gigabytes

**Range:** 10 KB through 1 gigabytes

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

## Configuration Statements: MLD

## mld

```
Syntax mld {
 accounting;
 interface interface-name {
 (accounting | no-accounting);
 disable;
 group-limit limit;
 group-policy [policy-names];
 immediate-leave;
 oif-map [map-names];
 passive;
 ssm-map ssm-map-name;
 ssm-map-policy ssm-map-policy-name;
 static {
 group multicast-group-address {
 exclude;
 group-count number;
 group-increment increment;
 source ip-address {
 source-count number;
 source-increment increment;
 }
 }
 }
 version version;
 }
 maximum-transmit-rate packets-per-second;
 query-interval seconds;
 query-last-member-interval seconds;
 query-response-interval seconds;
 robust-count number;
 traceoptions {
 file filename <files number> <size size> <world-readable | no-world-readable>;
 flag flag <flag-modifier> <disable>;
 }
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols],  
[edit protocols]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Enable MLD on the routing device. MLD must be enabled for the routing device to receive multicast packets.

**Default** MLD is disabled on the routing device. MLD is automatically enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP).

**Options** The statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- *Enabling MLD*

## accounting (Protocols MLD Interface)

---

**Syntax** (accounting | no-accounting);

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols **mld interface** *interface-name*],  
[edit protocols **mld interface** *interface-name*]

**Release Information** Statement introduced in Junos OS Release 9.1.

**Description** Enable or disable the collection of MLD join and leave event statistics for an interface.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- *Example: Recording MLD Join and Leave Events*

## accounting (Protocols MLD)

---

**Syntax** accounting;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols **mld**],  
[edit protocols **mld**]

**Release Information** Statement introduced in Junos OS Release 9.1.

**Description** Enable the collection of MLD join and leave event statistics on the system.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- *Example: Recording MLD Join and Leave Events*

## disable (Protocols MLD)

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Configure a limit for the number of multicast groups (or [S,G] channels in MLDv2) allowed on a logical interface. After this limit is reached, new reports are ignored and all related flows are not flooded on the interface.</p> <p>To confirm the configured group limit on the interface, use the <a href="#">show mld interface</a> command.</p> |
| <b>Default</b>                  | By default, there is no limit to the number of multicast groups that can join the interface.                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><i>limit</i>—group value limit for the interface.</p> <p><b>Range:</b> 1 through 32767</p>                                                                                                                                                                                                                                                            |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                    |
| <b>Description</b>              | When a routing device running MLD version 1 or version 2 (MLDv1 or MLDv2), receives an MLD report, the routing device compares the group against the specified group policy and performs the action configured in that policy (for example, rejects the report). |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Specify the threshold at which a warning message is logged for the multicast groups received on a logical interface. The threshold is a percentage of the maximum number of multicast groups allowed on a logical interface.</p> <p>For example, if you configure a maximum number of 1,000 incoming multicast groups, and you configure a threshold value of 90 percent, warning messages are logged in the system log when the interface receives 900 groups.</p> <p>To confirm the configured group threshold on the interface, use the <a href="#">show mld interface</a> command.</p> |
| <b>Default</b>                  | By default, there is no configured threshold value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>value</b>—Percentage of the maximum number of multicast groups allowed on the interface that starts triggering the warning. You configure a percentage of the <b>group-limit</b> value that starts triggering the warnings. You must explicitly configure the <a href="#">group-limit</a> to configure a threshold value.</p> <p><b>Range:</b> 1 through 100</p>                                                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>The immediate leave setting is useful for minimizing the leave latency of MLD memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>The immediate-leave setting enables host tracking, meaning that the device keeps track of the hosts that send join messages. This allows MLD to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending MLD group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the MLD leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both MLD version 1 and MLD version 2.</p> <div>  <p><b>NOTE:</b> Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.</p> </div> |

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.<br><code>allow-receive</code> , <code>send-general-query</code> , and <code>send-group-query</code> options added in Junos OS Release 10.0. |
| <b>Description</b>         | Specify that MLD run on the interface and either not send and receive control traffic or selectively send and receive control traffic such as MLD reports, queries, and leaves.           |

**NOTE:** You can selectively activate up to two out of the three available options for the `passive` statement while keeping the other functions `passive` (inactive). Activating all three options is equivalent to not using the `passive` statement.

## static (Protocols MLD)

**Syntax**

```
static {
 group multicast-group-address {
 exclude;
 group-count number;
 group-increment increment;
 source ip-address {
 source-count number;
 source-increment increment;
 }
 }
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols **mld interface** *interface-name*],  
[edit protocols **mld interface** *interface-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Test multicast forwarding on an interface.

The **static** statement simulates MLD joins on a routing device statically on an interface without any MLD hosts. It is supported for both MLDv1 and MLDv2 joins. This statement is especially useful for testing multicast forwarding on an interface without a receiver host.

**NOTE:** To prevent joining too many groups accidentally, the **static** statement is not supported with the **interface all** statement.

The remaining statements are explained separately.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

**Related Documentation**

- *Enabling MLD Static Group Membership*

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>         | <p>Configure MLD tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>To trace the paths of multicast packets, use the <b>mtrace</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>             | The default MLD trace options are those inherited from the <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the file <b>mld-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>MLD Tracing Flags</b></p> <ul style="list-style-type: none"><li>• <b>leave</b>—Leave group messages.</li><li>• <b>mtrace</b>—Mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software.</li><li>• <b>packets</b>—All MLD packets.</li><li>• <b>query</b>—MLD membership query messages, including general and group-specific queries.</li></ul> |

- **report**—Membership report messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—Traces errors and significant events during normal packet processing

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                      |
| <b>Description</b>              | Configure a rendezvous point (RP) using MSDP to encapsulate multicast data received in MSDP register messages inside forwarded MSDP source-active messages.                                                                                                                                                                                                 |
| <b>Default</b>                  | If you do not include this statement, the RP encapsulates multicast data.                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <b>disable</b> —(Optional) Do not use MSDP data encapsulation.<br><b>enable</b> —Use MSDP data encapsulation.<br><b>Default:</b> <b>enable</b>                                                                                                                                                                                                              |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                         |

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Define an MSDP peer group. MSDP peers within groups share common tracing options, if present and not overridden for an individual peer with the [peer](#) statement. To configure multiple MSDP groups, include multiple **group** statements.

By default, the group's options are identical to the global MSDP options. To override the global options, include group-specific options within the **group** statement.

The group must contain at least one peer.

**Options** *group-name*—Name of the MSDP group.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

[edit routing-instances *instance-name* protocols msdp peer *address*],

**Release Information** Statement introduced in Junos OS Release 12.3.

**Description** Specify the hold-time period to use when maintaining a connection with the MSDP peer. If a keepalive message is not received for the hold-time period, the MSDP peer connection is terminated. According to the RFC 3618, *Multicast Source Discovery Protocol (MSDP)*, the recommended value for the hold-time period is 75 seconds.

The hold-time period must be longer than the keepalive interval.

You might want to change the hold-time period and keepalive timer for consistency in a multi-vendor environment.

**Default** In Junos OS, the default hold-time period is 75 seconds, and the default keepalive interval is 60 seconds.

**Options** *seconds*—Hold time.  
**Range:** 15 through 150 seconds  
**Default:** 75 seconds

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Specify the keepalive interval to use when maintaining a connection with the MSDP peer. If a keepalive message is not received for the hold-time period, the MSDP peer connection is terminated. According to the RFC 3618, <i>Multicast Source Discovery Protocol (MSDP)</i>, the recommended value for the keepalive timer is 60 seconds.</p> <p>The hold-time period must be longer than the keepalive interval.</p> <p>You might want to change the keepalive interval and hold-time period for consistency in a multi-vendor environment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>                  | In Junos OS, the default hold-time period is 75 seconds, and the default keepalive interval is 60 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | Configure the local end of an MSDP session. You must configure at least one peer for MSDP to function. When configuring a peer, you must include this statement. This address is used to accept incoming connections to the peer and to establish connections to the remote peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | <p>Define an MSDP peering relationship. An MSDP routing device must know which routing devices are its peers. You define the peer relationships explicitly by configuring the neighboring routing devices that are the MSDP peers of the local routing device. After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. To configure multiple MSDP peers, include multiple <b>peer</b> statements.</p> <p>By default, the peer's options are identical to the global or group-level MSDP options. To override the global or group-level options, include peer-specific options within the <b>peer (Protocols MSDP)</b> statement.</p> <p>At least one peer must be configured for MSDP to function. You must configure <b>address</b> and <b>local-address</b>.</p> |
| <b>Options</b>             | <p><b>address</b>—Name of the MSDP peer.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

---

## rib-group (Protocols MSDP)

---

**Syntax** `rib-group group-name;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols [msdp](#)],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols [msdp](#)],  
[edit protocols [msdp](#)],  
[edit routing-instances *routing-instance-name* protocols [msdp](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Associate a routing table group with MSDP.

**Options** *group-name*—Name of the routing table group. The name must be one that you defined with the **rib-groups** statement at the [edit routing-options] hierarchy level.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | <p>Specify the source address (SA) message hold time to use when maintaining a connection with the MSDP peer. Each entry in an SA cache has an associated hold time. The hold timer is started when an SA message is received by an MSDP peer. The timer is reset when another SA message is received before the timer expires. If another SA message is not received during the SA message hold-time period, the SA message is removed from the cache.</p> <p>You might want to change the SA message hold time for consistency in a multi-vendor environment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>         | <p>Configure MSDP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>             | The default MSDP trace options are those inherited from the routing protocol's <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the <b>msdp-log</b> file.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

**Range:** 2 through 1000 files

**Default:** 2 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### MSDP Tracing Flags

- **keepalive**—Keepalive messages
- **packets**—All MSDP packets
- **route**—MSDP changes to the routing table
- **source-active**—Source-active packets
- **source-active-request**—Source-active request packets
- **source-active-response**—Source-active response packets

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

***flag-modifier***—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow any user to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>              | Accept traffic from a remote source. A remote source is a source that is not on the same subnet as the incoming interface. This statement enables the remote source to be learned and advertised by MSDP so that receivers in other MSDP areas can join the source. You do not need to disable RPF checking, but you do need to ensure that the best path to reach the remote source is through the incoming interface.    |

| <b>Description</b>              | Multicast routing devices running PIM sparse mode often forward the same stream of multicast packets onto the same LAN through the rendezvous-point tree (RPT) and shortest-path tree (SPT). PIM assert messages help routing devices determine which routing device forwards the traffic and prunes the RPT for this group. By default, routing devices enter an assert cycle every 180 seconds. You can configure this assert timeout to be between 5 and 210 seconds. |
| <b>Options</b>                  | <b>seconds</b> —Time for routing device to wait before another assert message cycle.<br><b>Range:</b> 5 through 210 seconds<br><b>Default:</b> 180 seconds                                                                                                                                                                                                                                                                                                               |

The <b>backoff-period</b> statement configures the period that the acting DF waits between receiving a better DF Offer and sending the Pass message to transfer DF responsibility.</p>                                                                                                                                                                                                                                                                                       |
| <div>  <p><b>NOTE:</b> Junos OS checks rendezvous point (RP) unicast reachability before accepting incoming DF messages. DF messages for unreachable rendezvous points are ignored. This is needed to prevent the following example scenario. Routers A and B are downstream routing devices on the same LAN, and both are supposed to send DF election messages with an infinite metric on their upstream interfaces (reverse-path forwarding [RPF] interfaces). Router A has a higher IP address than Router B. When both routing devices lose the path to the RP, both send an Offer message with the infinite metric onto the LAN. Router A wins the election because it has a higher IP address, and Router B backs off as a result. After three Offer messages, according to RFC 5015, Router A looks up the RP and finds no path to the RP. As a result, Router A transitions to the Lose state and sends nothing. On the other hand, after backing off for an interval of 3 x the Offer period, Router B does not receive any messages, and resumes the DF election by sending a new Offer message. Hence, the pattern repeats indefinitely.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Description              | <p>Enable BFD failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the <b>clear bfd adaptation</b> command to return BFD interval timers to their configured values. The <b>clear bfd adaptation</b> command is hitless, meaning that the command does not affect traffic flow on the routing device.</p> <p>The remaining statement is explained separately.</p> |

 [edit routing-instances *routing-instance-name* protocols [pim](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Enable PIM on an interface and configure interface-specific properties.

**Options** *interface-name*—Name of the interface. Specify the full interface name, including the  
 physical and logical address components. To configure all interfaces, you can specify  
[all](#).

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify loose authentication checking on the BFD session. Use loose authentication for transitional periods only when authentication might not be configured at both ends of the BFD session.</p> <p>By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure <i>loose checking</i>. When loose checking is configured, packets are accepted without authentication being checked at each end of the session.</p> |

| <b>Release Information</b> | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | Configure the maximum number of specified PIM entries received by the device. If the device reaches the configured limit, no new entries are received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                            | <div>  <p><b>NOTE:</b> The maximum limit settings that you configure with the <b>maximum</b> and the <b>family</b> (<b>inet</b>   <b>inet6</b>) <b>maximum</b> statements are mutually exclusive. For example, if you configure a global maximum PIM join state limit, you cannot configure a limit at the family level for IPv4 or IPv6 joins. If you attempt to configure a limit at both the global level and the family level, the device will not accept the configuration.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>         | <p>Disable forwarding for bidirectional PIM routes during graceful restart recovery, both in cases of a routing protocol process (rpd) restart and graceful Routing Engine switchover.</p> <p>Bidirectional PIM accepts packets for a bidirectional route on multiple interfaces. This means that some topologies might develop multicast routing loops if all PIM neighbors are not synchronized with regard to the identity of the designated forwarder (DF) on each link. If one routing device is forwarding without actively participating in DF elections, particularly after unicast routing changes, multicast routing loops might occur.</p> <p>If graceful restart for PIM is enabled and the forwarding of packets on bidirectional routes is disallowed (by including the <b>no-bidirectional-mode</b> statement in the configuration), PIM behaves conservatively to avoid multicast routing loops during the recovery period. When the routing protocol process (rpd) restarts, all bidirectional routes are deleted. After graceful restart has completed, the routes are re-added, based on the converged unicast and bidirectional PIM state. While graceful restart is active, bidirectional multicast flows drop packets.</p> |
| <b>Default</b>             | If graceful restart for PIM is enabled and the bidirectional PIM is enabled, the default graceful restart behavior is to continue forwarding packets on bidirectional routes. If the gracefully restarting routing device was serving as a DF for some interfaces to rendezvous points, the restarting routing device sends a DF Winner message with a metric of 0 on each of these RP interfaces. This ensures that a neighbor routing device does not become the DF due to unicast topology changes that might occur during the graceful restart period. Sending a DF Winner message with a metric of 0 prevents another PIM neighbor from assuming the DF role until after graceful restart completes. When graceful restart completes, the gracefully restarted routing device sends another DF Winner message with the actual converged unicast metric.                                                                                                                                                                                                                                                                                                                                                                                     |

**NOTE:** Graceful Routing Engine switchover operates independently of the graceful restart behavior. If graceful Routing Engine switchover is configured without graceful restart, all PIM routes for all modes are deleted when the rpd process restarts. If graceful Routing Engine switchover is configured with graceful restart, the behavior is the same as described here, except that the recovery happens on the Routing Engine that assumes mastership.

| <b>Description</b>              | <p>Configure the designated forwarder (DF) election offer period for bidirectional PIM. When a DF election Offer or Winner message fails to be received, the message is retransmitted. The <b>offer-period</b> statement modifies the interval between repeated DF election messages. The <a href="#">robustness-count</a> statement determines the minimum number of DF election messages that must fail to be received for DF election to fail. To prevent routing loops, all routing devices on the link must have a consistent view of the DF. When the DF election fails because DF election messages are not received, forwarding on bidirectional PIM routes is suspended.</p> <p>If a routing device receives from a neighbor a better offer than its own, the routing device stops participating in the election for a period of <a href="#">robustness-count</a> * <b>offer-period</b>. Eventually, all routing devices except the best candidate stop sending Offer messages.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | When you configure both static RP mapping and dynamic RP mapping (such as auto-RP) in a single routing instance, allow the static mapping to take precedence for a given group range, and allow dynamic RP mapping for all other groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | Set the maximum time in milliseconds to delay sending override join messages for a multicast network that has join suppression enabled. When a router or switch sees a prune message for a join it is currently suppressing, it waits for the interval specified by the override timer before it sends an override join message.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | This is a random timer with a value in milliseconds.<br><b>Range:</b> 0 through maximum override value<br><b>Default:</b> 2000 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>              | Set a delay for implementing a PIM prune message on the upstream routing device on a multicast network for which join suppression has been enabled. The routing device waits for the prune pending period to detect whether a join message is currently being suppressed by another routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b> | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>         | Configure a limit for the number of incoming (S,G) PIM registers.                                                                                                                                                                                                                                                                                                                  |

**NOTE:** The maximum limit settings that you configure with the **maximum** and the **family (inet | inet6) maximum** statements are mutually exclusive. For example, if you configure a global maximum PIM register message limit, you cannot configure a limit at the family level for IPv4 or IPv6. If you attempt to configure a limit at both the global level and the family level, the device will not accept the configuration.

| <b>Description</b>              | Change the value of a tracking bit (T-bit) field in the LAN prune delay hello option from the default of 1 to 0, which enables join suppression for a multicast interface. When the network starts receiving multiple identical join messages, join suppression triggers a random timer with a value of 66 through 84 milliseconds ( $1.1 \times$ periodic through $1.4 \times$ periodic, where periodic is 60 seconds). This creates an interval during which no identical join messages are sent. Eventually, only one of the identical messages is sent. Join suppression is triggered each time identical messages are sent for the same join.                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Configure the designated forwarder (DF) election robustness count for bidirectional PIM. When a DF election Offer or Winner message fails to be received, the message is retransmitted. The <b>robustness-count</b> statement sets the minimum number of DF election messages that must fail to be received for DF election to fail. To prevent routing loops, all routers on the link must have a consistent view of the DF. When the DF election fails because DF election messages are not received, forwarding on bidirectional PIM routes is suspended.</p> <p>If a router receives from a neighbor a better offer than its own, the router stops participating in the election for a period of <b>robustness-count</b> * <code>offer-period</code>. Eventually, all routers except the best candidate stop sending Offer messages.</p> |
| <b>Options</b>                  | <p><i>number</i>—Number of transmission attempts for DF election messages.</p> <p><b>Range:</b> 1 through 10</p> <p><b>Default:</b> 3</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | Set the SPT threshold to infinity for a source-group address pair. Last-hop multicast routing devices running PIM sparse mode can forward the same stream of multicast packets onto the same LAN through an RPT rooted at the RP or an SPT rooted at the source. By default, last-hop routing devices transition to a direct SPT to the source. You can configure this routing device to set the SPT transition value to infinity to prevent this transition for any source-group address pair.<br><br>The remaining statements are explained separately. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b> | Statement introduced in Junos OS Release 8.2.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Support for BFD authentication introduced in Junos OS Release 9.6.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series. |
| <b>Description</b>         | Specify the threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.                                            |

.....

**NOTE:** The threshold value must be equal to or greater than the transmit interval.

The threshold time must be equal to or greater than the value specified in the [minimum-interval](#) or the [minimum-receive-interval](#) statement.

.....

| <b>Release Information</b> | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | Configure a threshold at which a warning message is logged when a certain number of PIM entries have been received by the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><i>value</i>—Threshold at which a warning message is logged. This is a percentage of the maximum number of entries accepted by the device as defined with the <b>maximum</b> statement. You can apply this threshold to incoming PIM join messages, PIM register messages, and group-to-RP mappings.</p> <p>For example, if you configure a maximum number of 1,000 incoming group-to-RP mappings, and you configure a threshold value of 90 percent, warning messages are logged in the system log when the device receives 900 group-to-RP mappings. The same formula applies to incoming PIM join messages and PIM register messages if configured with both the <b>maximum limit</b> and the <b>threshold value</b> statements.</p> <p><b>Default:</b> 1 through 100</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>         | <p>Configure PIM tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>             | The default PIM trace options are those inherited from the routing protocol's <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the <b>pim-log</b> file.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>PIM Tracing Flags</b></p> <ul style="list-style-type: none"><li>• <b>assert</b>—Assert messages</li><li>• <b>bidirectional-df-election</b>—Bidirectional PIM designated-forwarder (DF) election events</li></ul> |

- **bootstrap**—Bootstrap messages
- **cache**—Packets in the PIM sparse mode routing cache
- **graft**—Graft and graft acknowledgment messages
- **hello**—Hello packets
- **join**—Join messages
- **mt**—Multicast tunnel messages
- **nsr-synchronization**—Nonstop active routing (NSR) synchronization messages
- **packets**—All PIM packets
- **prune**—Prune messages
- **register**—Register and register stop messages
- **rp**—Candidate RP advertisements
- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 0 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>         | Define tracing operations for PIM snooping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Default</b>             | <p>The <b>traceoptions</b> feature is disabled by default.</p> <p>The default PIM trace options are those inherited from the routing protocol's <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>PIM Snooping Tracing Flags:</b></p> <ul style="list-style-type: none"> <li>• <b>all</b>—All tracing operations.</li> <li>• <b>general</b>—Trace general PIM snooping events.</li> <li>• <b>hello</b>—Trace hello packets.</li> <li>• <b>join</b>—Trace join messages.</li> <li>• <b>normal</b>—Trace normal PIM snooping events. If you do not specify this flag, only unusual or abnormal operations are traced.</li> <li>• <b>packets</b>—Trace all PIM packets.</li> <li>• <b>policy</b>—Trace policy processing.</li> <li>• <b>prune</b>—Trace prune messages.</li> <li>• <b>route</b>—Trace routing information.</li> <li>• <b>state</b>—Trace PIM state transitions.</li> <li>• <b>task</b>—Trace PIM protocol task processing.</li> <li>• <b>timer</b>—Trace PIM protocol timer processing.</li> </ul> |

***flag-modifier***—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers per flag:

- **detail**—Provide detailed trace information
- **disable**—Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

| <b>Description</b>              | <p>Specify the transmit interval for the <b>bfd-liveness-detection</b> statement. The negotiated transmit interval for a peer is the interval between the sending of BFD packets to peers. The receive interval for a peer is the minimum interval between receiving packets sent from its peer; the receive interval is not negotiated between peers. To determine the transmit interval, each peer compares its configured minimum transmit interval with its peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>List one or more tunnel-capable PICs to be used for creating multicast tunnel (<b>mt</b>) interfaces. Creating a PIC list enables you to control the load-balancing implementation.</p> <p>Tunnel-capable PICs include:</p> <ul style="list-style-type: none"><li>• Adaptive Services PIC</li><li>• Multiservices PIC or Multiservices DPC</li><li>• Tunnel Services PIC</li><li>• On MX Series routers, a PIC created with the <b>tunnel-services</b> statement at the [edit chassis fpc <i>slot-number</i> pic <i>number</i>] hierarchy level.</li></ul> <p>The physical position of the PIC in the routing device determines the multicast tunnel interface name. For example, if you have an Adaptive Services PIC installed in FPC slot 0 and PIC slot 0, the corresponding multicast tunnel interface name is <b>mt-0/0/0</b>. The same is true for Tunnel Services PICs, Multiservices PICs, and Multiservices DPCs.</p> |
| <b>Default</b>                  | Multicast tunnel interfaces are created on all available tunnel-capable PICs, based on a round-robin algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <b>mt-fpc/pic/port</b> —Interface that is automatically generated when a tunnel-capable PIC is installed in the routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Sample Output

### clear igmp statistics

The following sample output displays IGMP statistics information before and after the **clear igmp statistics** command is entered:

```

user@host> show igmp statistics
IGMP packet statistics for all interfaces
IGMP Message type Received Sent Rx errors
Membership Query 8883 459 0
V1 Membership Report 0 0 0
DVMRP 19784 35476 0
PIM V1 18310 0 0
Cisco Trace 0 0 0
V2 Membership Report 0 0 0
Group Leave 0 0 0
Mtrace Response 0 0 0
Mtrace Request 0 0 0
Domain Wide Report 0 0 0
V3 Membership Report 0 0 0

```

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                               |

**Table 279: show igmp group Output Fields**

| Field Name        | Field Description                                                                                                                                       | Level of Output |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>  | Name of the interface that received the IGMP membership report. A name of <b>local</b> indicates that the local routing device joined the group itself. | All levels      |
| <b>Group</b>      | Group address.                                                                                                                                          | All levels      |
| <b>Group Mode</b> | Mode the SSM group is operating in: <b>Include</b> or <b>Exclude</b> .                                                                                  | All levels      |
| <b>Source</b>     | Source address.                                                                                                                                         | All levels      |

Table 279: show igmp group Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                         | Level of Output |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Source timeout   | Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.      | detail          |
| Last reported by | Address of the host that last reported membership in this group.                                                                                                                                                          | All levels      |
| Timeout          | Time remaining until the group membership is removed.                                                                                                                                                                     | brief none      |
| Group timeout    | Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer. | detail          |
| Type             | Type of group membership: <ul style="list-style-type: none"> <li>• <b>Dynamic</b>—Host reported the membership.</li> <li>• <b>Static</b>—Membership is configured.</li> </ul>                                             | All levels      |

## Sample Output

### show igmp group (Include Mode)

```

user@host> show igmp group
Interface: t1-0/1/0.0
 Group: 232.1.1.1
 Group mode: Include
 Source: 10.0.0.2
 Last reported by: 10.9.5.2
 Timeout: 24 Type: Dynamic

| SSM map               | Name of the source-specific multicast (SSM) map (if configured) used on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| Configured Parameters | Information configured by the user: <ul style="list-style-type: none"> <li><b>IGMP Query Interval</b>—Interval (in seconds) at which this router sends membership queries when it is the querier.</li> <li><b>IGMP Query Response Interval</b>—Time (in seconds) that the router waits for a report in response to a general query.</li> <li><b>IGMP Last Member Query Interval</b>—Time (in seconds) that the router waits for a report in response to a group-specific query.</li> <li><b>IGMP Robustness Count</b>—Number of times the router retries a query.</li> </ul> | All levels      |
| Derived Parameters    | Derived information: <ul style="list-style-type: none"> <li><b>IGMP Membership Timeout</b>—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed.</li> <li><b>IGMP Other Querier Present Timeout</b>—Time (in seconds) that the router waits for the IGMP querier to send a query.</li> </ul>                                                                                                                                                                              | All levels      |

## Sample Output

### show igmp interface

```

user@host> show igmp interface
Interface: at-0/3/1.0
 Querier: 10.111.30.1
 State: Up Timeout: None Version: 2 Groups: 4
 SSM Map Policy: ssm-policy-A
Interface: so-1/0/0.0
 Querier: 10.111.10.1
 State: Up Timeout: None Version: 2 Groups: 2
 SSM Map Policy: ssm-policy-B
Interface: so-1/0/1.0
 Querier: 10.111.20.1
 State: Up Timeout: None Version: 2 Groups: 4
 SSM Map Policy: ssm-policy-C
Immediate Leave: On
Promiscuous Mode: Off

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0

```

### show igmp interface brief

The output for the **show igmp interface brief** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 3961](#).

### show igmp interface detail

The output for the **show igmp interface detail** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 3961](#).

### show igmp interface <interface-name>

```
user@host# show igmp interface ge-3/2/0.0
Interface: ge-3/2/0.0
Querier: 20.1.1.1
State: Up Timeout: None Version: 3 Groups: 1
Group limit: 8
Group threshold: 60
Group log-interval: 10
Immediate leave: Off
Promiscuous mode: Off
```

## show multicast pim-to-igmp-proxy

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Output Fields</b>                                | <a href="#">Table 281 on page 3963</a> describes the output fields for the <b>show multicast pim-to-igmp-proxy</b> command. Output fields are listed in the order in which they appear.                                                                                                                                                                                                                                                             |

**Table 281: show multicast pim-to-igmp-proxy Output Fields**

| Field Name                   | Field Description                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>              | Routing instance. Default instance is <b>master</b> (inet.0 routing table).                                                                           |
| <b>Proxy state</b>           | State of PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> . |
| <b><i>interface-name</i></b> | Name of upstream interface (no more than two allowed) on which PIM-to-IGMP message translation is configured.                                         |

## Sample Output

### show multicast pim-to-igmp-proxy

```
user@host> show multicast pim-to-igmp-proxy
Instance: master Proxy state: enabled
ge-0/1/0.1
ge-0/1/0.2
```

### show multicast pim-to-igmp-proxy instance

```
user@host> show multicast pim-to-igmp-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/1/0.1
```

## Operational Commands: IGMP Snooping

## clear igmp snooping membership

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                           |

Table 282: show igmp snooping interface Output Fields

| Field Name                   | Field Description                                                                              | Level of Output |
|------------------------------|------------------------------------------------------------------------------------------------|-----------------|
| Routing-instance             | Routing instance for IGMP snooping.                                                            | All levels      |
| Learning Domain              | Learning domain for snooping.                                                                  | All levels      |
| IGMP Query Interval          | Frequency (in seconds) with which this router sends membership queries when it is the querier. | detail          |
| IGMP Query Response Interval | Time (in seconds) that the router waits for a response to a general query.                     | detail          |

Table 282: show igmp snooping interface Output Fields (*continued*)

| Field Name                         | Field Description                                                                                                                    | Level of Output |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| IGMP Last Member Query Interval    | Time (in seconds) that the router waits for a report in response to a group-specific query.                                          | detail          |
| IGMP Robustness Count              | Number of times the router retries a query.                                                                                          | detail          |
| immediate-leave                    | State of immediate leave: <b>On</b> or <b>Off</b> .                                                                                  | All levels      |
| router-interface                   | Router interfaces that are part of this learning domain.                                                                             | All levels      |
| Group limit                        | Maximum number of (source,group) pairs allowed per interface. When a group limit is not configured, this field is not shown.         | All levels      |
| interface                          | Interfaces that are being snooped in this learning domain.                                                                           | All levels      |
| Groups                             | Number of groups on the interface.                                                                                                   | none            |
| State                              | State of the interface: <b>Up</b> or <b>Down</b> .                                                                                   | none            |
| Up Groups                          | Number of active multicast groups attached to the logical interface.                                                                 | All levels      |
| IGMP Membership Timeout            | Timeout for group membership. If no report is received for these groups before the timeout expires, the group membership is removed. | none            |
| IGMP Other Querier Present Timeout | Time that the router waits for the IGMP querier to send a query.                                                                     | none            |

## Sample Output

### show igmp snooping interface

```

user@host> show igmp snooping interface
Instance: bridge-domain bar

Learning-Domain: default
Interface: ge-0/1/0.200
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: yes
Interface: ge-0/1/2.200
 State: Up Groups: 2
 Immediate leave: On
 Router interface: no
Interface: ge-0/1/3.200
 State: Up Groups: 1
 Immediate leave: Off
 Router interface: no

Configured Parameters:
IGMP Query Interval: 130.0
IGMP Query Response Interval: 15.0

```

```
IGMP Last Member Query Interval: 2.0
IGMP Robustness Count: 3

Derived Parameters:
IGMP Membership Timeout: 405.0
IGMP Other Querier Present Timeout: 397.500
```

## Sample Output

### show igmp snooping interface (Group Limit Configured)

```
user@host> show igmp snooping interface instance vpls1
Instance: vpls1

Learning-Domain: default
Interface: ge-1/3/9.0
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: yes
Interface: ge-1/3/8.0
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: yes
 Group limit: 1000

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

## show igmp snooping membership

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 283: show igmp snooping membership Output Fields**

| Field Name      | Field Description                   | Level of Output |
|-----------------|-------------------------------------|-----------------|
| Instance        | Routing instance for IGMP snooping. | All levels      |
| Learning Domain | Learning domain for snooping.       | All levels      |

Table 283: show igmp snooping membership Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                    | Level of Output |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>        | Interface on which this router is a proxy.                                                                                                                                                                                                           | <b>detail</b>   |
| <b>Up Groups</b>        | Number of active multicast groups attached to the logical interface.                                                                                                                                                                                 | All levels      |
| <b>Group</b>            | Multicast group address in the membership database.                                                                                                                                                                                                  | All levels      |
| <b>Group Mode</b>       | Mode the SSM group is operating in: <b>Include</b> or <b>Exclude</b> .                                                                                                                                                                               | All levels      |
| <b>Source</b>           | Source address used on queries.                                                                                                                                                                                                                      | <b>detail</b>   |
| <b>Last reported by</b> | Address of source last replying to the query.                                                                                                                                                                                                        | <b>detail</b>   |
| <b>Group Timeout</b>    | Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer.                            | All levels      |
| <b>Timeout</b>          | Length of time (in seconds) left until the entry is purged.                                                                                                                                                                                          | <b>detail</b>   |
| <b>Type</b>             | Way that the group membership information was learned: <ul style="list-style-type: none"> <li>• <b>Dynamic</b>—Group membership was learned by the IGMP protocol.</li> <li>• <b>Static</b>—Group membership was learned by configuration.</li> </ul> | <b>detail</b>   |
| <b>Include receiver</b> | Source address of receiver included in membership with timeout (in seconds).                                                                                                                                                                         | <b>detail</b>   |

## Sample Output

### show igmp snooping membership

```

user@host> show igmp snooping membership
Instance: vpls2

Learning-Domain: vlan-id 2
Interface: ge-3/0/0.2
Up Groups: 0
Interface: ge-3/1/0.2
Up Groups: 0
Interface: ge-3/1/5.2
Up Groups: 0

Instance: vpls1

Learning-Domain: vlan-id 1
Interface: ge-3/0/0.1
Up Groups: 0
Interface: ge-3/1/0.1
Up Groups: 0
Interface: ge-3/1/5.1
Up Groups: 1
 Group: 225.10.10.1
 Group mode: Exclude

 Last reported by: Local
 Timeout: 0 Type: Dynamic

```

### show mld group brief

The output for the **show mld group brief** command is identical to that for the **show mld group** command. For sample output, see [show mld group \(Include Mode\) on page 3980](#) and [show mld group \(Exclude Mode\) on page 3981](#).

### show mld group detail (Include Mode)

```

user@host> show mld group detail
Interface: fe-0/1/2.0
 Group: ff02::1:ff05:1a67
 Group mode: Include
 Source: ::
 Last reported by: fe80::2e0:81ff:fe05:1a67
 Timeout: 224 Type: Dynamic
 Group: ff02::1:ffa8:c35e
 Group mode: Include
 Source: ::
 Last reported by: fe80::2e0:81ff:fe05:1a67
 Timeout: 220 Type: Dynamic

| Field Name            | Field Description                                                                              | Level of Output |
|-----------------------|------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>      | Name of the interface.                                                                         | All levels      |
| <b>Querier</b>        | Address of the router that has been elected to send membership queries.                        | All levels      |
| <b>State</b>          | State of the interface: <b>Up</b> or <b>Down</b> .                                             | All levels      |
| <b>SSM Map Policy</b> | Name of the source-specific multicast (SSM) map policy that has been applied to the interface. | All levels      |
| <b>SSM Map Policy</b> | Name of the source-specific multicast (SSM) map policy at the MLD interface.                   | All levels      |
| <b>Timeout</b>        | How long until the MLD querier is declared to be unreachable, in seconds.                      | All levels      |
| <b>Version</b>        | MLD version being used on the interface: 1 or 2.                                               | All levels      |

Table 286: show mld interface Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Groups</b>             | Number of groups on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels      |
| <b>Passive</b>            | <p>State of the passive mode option:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router can run IGMP or MLD on the interface but not send or receive control traffic such as IGMP or MLD reports, queries, and leaves.</li> <li>• <b>Off</b>—Indicates that the router can run IGMP or MLD on the interface and send or receive control traffic such as IGMP or MLD reports, queries, and leaves.</li> </ul> <p>The <b>passive</b> statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the <b>on</b> state declaration:</p> <ul style="list-style-type: none"> <li>• <b>send-general-query</b>—The interface sends general queries.</li> <li>• <b>send-group-query</b>—The interface sends group-specific and group-source-specific queries.</li> <li>• <b>allow-receive</b>—The interface receives control traffic</li> </ul> | All levels      |
| <b>OIF map</b>            | Name of the OIF map associated to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>SSM map</b>            | Name of the source-specific multicast (SSM) map used on the interface, if configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Group limit</b>        | Maximum number of groups allowed on the interface. Any memberships requested after the limit is reached are rejected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Group threshold</b>    | <p>Configured threshold at which a warning message is generated.</p> <p>This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Group log-interval</b> | Time (in seconds) between consecutive log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Immediate Leave</b>    | <p>State of the immediate leave option:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router removes a host from the multicast group as soon as the router receives a multicast listener done message from a host associated with the interface.</li> <li>• <b>Off</b>—Indicates that after receiving a multicast listener done message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels      |

Table 286: show mld interface Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Configured Parameters</b> | Information configured by the user. <ul style="list-style-type: none"> <li>• <b>MLD Query Interval (.1 secs)</b>—Interval at which this router sends membership queries when it is the querier.</li> <li>• <b>MLD Query Response Interval (.1 secs)</b>—Time that the router waits for a report in response to a general query.</li> <li>• <b>MLD Last Member Query Interval (.1 secs)</b>—Time that the router waits for a report in response to a group-specific query.</li> <li>• <b>MLD Robustness Count</b>—Number of times the router retries a query.</li> </ul> | All levels      |

If no report is received for these groups before the timeout expires, the group membership will be removed.</li> <li>• <b>MLD Other Querier Present Timeout (.1 secs)</b>—Time that the router waits for the IGMP querier to send a query.</li> </ul>                                                                                                                                                                        | All levels      |

## Sample Output

### show mld interface

```

user@host> show mld interface
Interface: fe-0/0/0
 Querier: None
 State: Up Timeout: 0 Version: 1 Groups: 0
 SSM Map Policy: ssm-policy-A
Interface: at-0/3/1.0
 Querier: 8038::c0a8:c345
 State: Up Timeout: None Version: 1 Groups: 0
 SSM Map Policy: ssm-policy-B
Interface: fe-1/0/1.0
 Querier: ::192.168.195.73
 State: Up Timeout: None Version: 1 Groups: 3
 SSM Map Policy: ssm-policy-C
 SSM map: ipv6map1
Immediate Leave: On

Configured Parameters:
MLD Query Interval (.1 secs): 1250
MLD Query Response Interval (.1 secs): 100
MLD Last Member Query Interval (.1 secs): 10
MLD Robustness Count: 2

Derived Parameters:
MLD Membership Timeout (.1secs): 2600
MLD Other Querier Present Timeout (.1 secs): 2550

```

### show mld interface brief

The output for the **show mld interface brief** command is identical to that for the **show mld interface** command. For sample output, see [show mld interface on page 3985](#).

### show mld interface detail

The output for the **show mld interface detail** command is identical to that for the **show mld interface** command. For sample output, see [show mld interface on page 3985](#).

### show mld interface <interface-name>

```
user@host# show mld interface ge-3/2/0.0
Interface: ge-3/2/0.0
Querier: 20.1.1.1
State: Up Timeout: None Version: 3 Groups: 1
Group limit: 8
Group threshold: 60
Group log-interval: 10
Immediate leave: Off
Promiscuous mode: Off
```

## show mld statistics

Output fields are listed in the order in which they appear.                                                                                                                                                                                                                                                        |

**Table 288: show multicast pim-to-mld-proxy Output Fields**

| Field Name            | Field Description                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Proxy state           | State of PIM-to-MLD message translation, also known as PIM-to-MLD proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> . |
| <i>interface-name</i> | Name of upstream interface (no more than two allowed) on which PIM-to-MLD message translation is configured.                                        |

## Sample Output

### show multicast pim-to-mld-proxy

```
user@host> show multicast pim-to-mld-proxy
Instance: master Proxy state: enabled
ge-0/5/0.1
ge-0/5/0.2
```

### show multicast pim-to-mld-proxy instance

```
user@host> show multicast pim-to-mld-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/5/0.1
```

## Operational Commands: MSDP

## show msdp

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                |

**Table 289: show msdp Output Fields**

| Field Name    | Field Description                                                                        | Level of Output |
|---------------|------------------------------------------------------------------------------------------|-----------------|
| Peer address  | IP address of the peer.                                                                  | All levels      |
| Local address | Local address of the peer.                                                               | All levels      |
| State         | Status of the MSDP connection: <b>Listen</b> , <b>Established</b> , or <b>Inactive</b> . | All levels      |
| Last up/down  | Time at which the most recent peer-state change occurred.                                | All levels      |

Table 289: show msdp Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                   | Level of Output |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Peer-Group           | Peer group name.                                                                                                                                                                    | All levels      |
| SA Count             | Number of source-active cache entries advertised by each peer that were accepted, compared to the number that were received, in the format <i>number-accepted/number-received</i> . | All levels      |
| Peer Connect Retries | Number of peer connection retries.                                                                                                                                                  | detail          |
| State timer expires  | Number of seconds before another message is sent to a peer.                                                                                                                         | detail          |
| Peer Times out       | Number of seconds to wait for a response from the peer before the peer is declared unavailable.                                                                                     | detail          |
| SA accepted          | Number of entries in the source-active cache accepted from the peer.                                                                                                                | detail          |
| SA received          | Number of entries in the source-active cache received by the peer.                                                                                                                  | detail          |

## Sample Output

### show msdp

```

user@host> show msdp
Peer address Local address State Last up/down Peer-Group SA Count
198.32.8.193 198.32.8.195 Established 5d 19:25:44 North23 120/150
198.32.8.194 198.32.8.195 Established 3d 19:27:27 North23 300/345
198.32.8.196 198.32.8.195 Established 5d 19:39:36 North23 10/13
198.32.8.197 198.32.8.195 Established 5d 19:32:27 North23 5/6
198.32.8.198 198.32.8.195 Established 3d 19:33:04 North23 2305/3000

```

### show msdp brief

The output for the **show msdp brief** command is identical to that for the **show msdp** command. For sample output, see [show msdp on page 3993](#).

### show msdp detail

```

user@host> show msdp detail
Peer: 10.255.70.15
Local address: 10.255.70.19
State: Established
Peer Connect Retries: 0
State timer expires: 22
Peer Times out: 49
SA accepted: 0
SA received: 0

```

## show msdp source

**Output Fields** Table 290 on page 3995 describes the output fields for the **show msdp source** command. Output fields are listed in the approximate order in which they appear.

**Table 290: show msdp source Output Fields**

| Field Name     | Field Description                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source address | IP address of the source.                                                                                                                                                                                                                                               |
| /Len           | Length of the prefix for this IP address.                                                                                                                                                                                                                               |
| Type           | Discovery method for this multicast source: <ul style="list-style-type: none"> <li>• <b>Configured</b>—Source-active limit explicitly configured for this source.</li> <li>• <b>Dynamic</b>—Source-active limit established when this source was discovered.</li> </ul> |
| Maximum        | Source-active limit applied to this source.                                                                                                                                                                                                                             |
| Threshold      | Source-active threshold applied to this source.                                                                                                                                                                                                                         |
| Exceeded       | Number of source-active messages received from this source exceeding the established maximum.                                                                                                                                                                           |

## Sample Output

**show msdp source**

```

user@host> show msdp source
Source address /Len Type Maximum Threshold Exceeded
0.0.0.0 /0 Configured 5 none 0
10.1.0.0 /16 Configured 500 none 0
10.1.1.1 /32 Configured 10000 none 0
10.1.1.2 /32 Dynamic 6936 none 0
10.1.5.5 /32 Dynamic 500 none 123
10.2.1.1 /32 Dynamic 2 none 0

```

## show msdp source-active

| <b>Output Fields</b>            | <a href="#">Table 291 on page 3997</a> describes the output fields for the <b>show msdp source-active</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 291: show msdp source-active Output Fields

| Field Name                              | Field Description                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                                                   |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                                                        |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.                                         |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).                                |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                                                        |
| Group address                           | Multicast address of the group.                                                                                                                            |
| Source address                          | IP address of the source.                                                                                                                                  |
| Peer address                            | IP address of the peer.                                                                                                                                    |
| Originator                              | Router ID configured on the source of the rendezvous point (RP) that originated the message, or the loopback address when the router ID is not configured. |
| Flags                                   | Flags: Accept, Reject, or Filtered.                                                                                                                        |

## Sample Output

### show msdp source-active

```

### show msdp source-active brief

The output for the **show msdp source-active brief** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 3997](#).

### show msdp source-active detail

The output for the **show msdp source-active detail** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 3997](#).

### show msdp source-active source

```
user@host> show msdp source-active source 192.168.215.246
```

```
Global active source limit exceeded: 0
```

```
Global active source limit maximum: 25000
```

```
Global active source limit threshold: 24000
```

```
Global active source limit log-warning: 100
```

```
Global active source limit log interval: 0
```

| Group address | Source address  | Peer address   | Originator     | Flags  |

| <b>Output Fields</b>            | <a href="#">Table 292 on page 3999</a> describes the output fields for the <b>show msdp statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                        |

**Table 292: show msdp statistics Output Fields**

| Field Name                              | Field Description                                                                                                           |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                    |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                         |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.          |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device). |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                         |
| Peer                                    | Address of peer.                                                                                                            |

Table 292: show msdp statistics Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Last State Change                   | How long ago the peer state changed.                                                                                                                |
| Last message received from the peer | How long ago the last message was received from the peer.                                                                                           |
| RPF Failures                        | Number of reverse path forwarding (RPF) failures.                                                                                                   |
| Remote Closes                       | Number of times the remote peer closed.                                                                                                             |
| Peer Timeouts                       | Number of peer timeouts.                                                                                                                            |
| SA messages sent                    | Number of source-active messages sent.                                                                                                              |
| SA messages received                | Number of source-active messages received.                                                                                                          |
| SA request messages sent            | Number of source-active request messages sent.                                                                                                      |
| SA request messages received        | Number of source-active request messages received.                                                                                                  |
| SA response messages sent           | Number of source-active response messages sent.                                                                                                     |
| SA response messages received       | Number of source-active response messages received.                                                                                                 |
| Active source exceeded              | Number of times this peer has exceeded configured source-active limits.                                                                             |
| Active source Maximum               | Configured number of active source messages accepted by this peer.                                                                                  |
| Active source threshold             | Configured threshold on this peer for applying random early discard (RED) to drop some but not all MSDP active source messages.                     |
| Active source log-warning           | Configured threshold on this peer at which a warning message is logged (percentage of the number of active source messages accepted by the device). |
| Active source log-interval          | Time (in seconds) between consecutive log messages on this peer.                                                                                    |
| Keepalive messages sent             | Number of keepalive messages sent.                                                                                                                  |
| Keepalive messages received         | Number of keepalive messages received.                                                                                                              |
| Unknown messages received           | Number of unknown messages received.                                                                                                                |

Table 292: show msdp statistics Output Fields (*continued*)

| Field Name              | Field Description                  |
|-------------------------|------------------------------------|
| Error messages received | Number of error messages received. |

## Sample Output

### show msdp statistics

```

user@host> show msdp statistics
Global active source limit exceeded: 0
Global active source limit maximum: 10
Global active source limit threshold: 8
Global active source limit log-warning: 60
Global active source limit log interval: 60

Peer: 10.255.245.39
Last State Change: 11:54:49 (00:24:59)
Last message received from peer: 11:53:32 (00:26:16)
RPF Failures: 0
Remote Closes: 0
Peer Timeouts: 0
SA messages sent: 376
SA messages received: 459
SA request messages sent: 0
SA request messages received: 0
SA response messages sent: 0
SA response messages received: 0
Active source exceeded: 0
Active source Maximum: 10
Active source threshold: 8
Active source log-warning: 60
Active source log-interval 120
Keepalive messages sent: 17
Keepalive messages received: 19
Unknown messages received: 0
Error messages received: 0

```

### show msdp statistics peer

```

user@host> show msdp statistics peer 10.255.182.140
Peer: 10.255.182.140
 Last State Change: 8:19:23 (00:01:08)
 Last message received from peer: 8:20:05 (00:00:26)
 RPF Failures: 0
 Remote Closes: 0

| <b>Output Fields</b>                                | <p>Table 293 on page 4003 describes the output fields for the <b>show multicast usage</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 293: show multicast usage Output Fields**

| Field Name      | Field Description                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------|
| <b>Instance</b> | Name of the routing instance. (Displayed when multicast is configured within a routing instance.) |

Table 293: show multicast usage Output Fields (*continued*)

| Field Name     | Field Description                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>   | Group address.                                                                                                                                                                           |
| <b>Sources</b> | Number of sources.                                                                                                                                                                       |
| <b>Packets</b> | Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays <b>unavailable</b> . |
| <b>Bytes</b>   | Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays <b>unavailable</b> .     |
| <b>Prefix</b>  | IP address.                                                                                                                                                                              |
| <b>/len</b>    | Prefix length.                                                                                                                                                                           |
| <b>Groups</b>  | Number of multicast groups.                                                                                                                                                              |

## Sample Output

### show multicast usage

```

user@host> show multicast usage
Group Sources Packets Bytes
228.0.0.0 1 52847 4439148
239.1.1.1 2 13450 1125530

Prefix /len Groups Packets Bytes
10.255.14.144 /32 2 66254 5561304
10.255.70.15 /32 1 43 3374...
```

### show multicast usage brief

The output for the **show multicast usage brief** command is identical to that for the **show multicast usage** command. For sample output, see [show multicast usage on page 4004](#).

### show multicast usage instance

```

user@host> show multicast usage instance VPN-A
Group Sources Packets Bytes
224.2.127.254 1 5538 509496
224.0.1.39 1 13 624
224.0.1.40 1 13 624

Prefix /len Groups Packets Bytes
192.168.195.34 /32 1 5538 509496
10.255.14.30 /32 1 13 624
10.255.245.91 /32 1 13 624
...
```

### show multicast usage detail

```
user@host> show multicast usage detail
```

| Group                                                   | Sources | Packets | Bytes   |
|---------------------------------------------------------|---------|---------|---------|

| <b>Release Information</b>      | Command introduced in Junos OS Release 10.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Redistribute the Protocol Independent Multicast (PIM) join states.</p> <p>You can find out if there are multiple paths available for a source (for example, an RP) with the output of the <b>show pim source</b> command.</p> <p>When you include the <b>join-load-balance</b> statement in the configuration, the PIM join states are distributed evenly on available equal-cost multipath links. When an upstream neighbor link fails, Junos OS redistributes the PIM join states to the remaining links. However, when new links are added or the failed link is restored, the existing PIM joins are not redistributed to the new link. New flows will be distributed to the new links. However, in a network without new joins and prunes, the new link is not used for multicast traffic. The <b>clear pim join-distribution</b> command redistributes the existing flows to the new upstream neighbors. Redistributing the existing flows causes traffic to be disrupted, so we recommend that you run the <b>clear pim join-distribution</b> command during a maintenance window.</p> |
| <b>Options</b>                  | <p><b>none</b>—Redistribute the PIM join states for the default master instance.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Redistribute the join states for a specific PIM-enabled routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Additional Information</b>   | The <b>clear pim join-distribution</b> command cannot be used to redistribute the PIM join states on a backup Routing Engine when nonstop active routing is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                           | Level of Output                                                      |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| <b>Interfaces</b> | Bidirectional PIM interfaces on this routing device. An interface can win the DF election ( <b>Win</b> ), lose the DF election ( <b>Lose</b> ), or be the RP link ( <b>RPL</b> ). The RP link is the interface directly connected to a subnet that contains a phantom RP address. A phantom RP address is an RP address that is not assigned to a routing device interface. | All levels<br><br><b>brief</b> displays the DF election winner only. |
| <b>DF</b>         | IP address of the designated forwarder.                                                                                                                                                                                                                                                                                                                                     | All levels                                                           |

| <b>Output Fields</b>                                | Table 296 on page 4031 describes the output fields for the <b>show pim bootstrap</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                              |

**Table 296: show pim bootstrap Output Fields**

| Field Name           | Field Description                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------|
| <b>Instance</b>      | Name of the routing instance.                                                                   |
| <b>BSR</b>           | Bootstrap router.                                                                               |
| <b>Pri</b>           | Priority of the routing device as elected to be the bootstrap router.                           |
| <b>Local address</b> | Local routing device address.                                                                   |
| <b>Pri</b>           | Local routing device address priority to be elected as the bootstrap router.                    |
| <b>State</b>         | Local routing device election state: <b>Candidate</b> , <b>Elected</b> , or <b>Ineligible</b> . |

Table 296: show pim bootstrap Output Fields (*continued*)

| Field Name | Field Description                                                                                    |
|------------|------------------------------------------------------------------------------------------------------|
| Timeout    | How long until the local routing device declares the bootstrap router to be unreachable, in seconds. |

## Sample Output

### show pim bootstrap

```
user@host> show pim bootstrap
Instance: PIM.master
```

| BSR                     | Pri | Local address           | Pri | State      | Timeout |
|-------------------------|-----|-------------------------|-----|------------|---------|
| None                    | 0   | 10.255.71.46            | 0   | InEligible | 0       |
| feco:1:1:1:1:0:aff:785c | 34  | feco:1:1:1:1:0:aff:7c12 | 0   | InEligible | 0       |

### show pim bootstrap instance

```
user@host> show pim bootstrap instance VPN-A
Instance: PIM.VPN-A
```

| BSR  | Pri | Local address   | Pri | State      | Timeout |
|------|-----|-----------------|-----|------------|---------|
| None | 0   | 192.168.196.105 | 0   | InEligible | 0       |

## show pim interfaces

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mode</b>         | <p>PIM mode running on the interface:</p> <ul style="list-style-type: none"> <li>• <b>B</b>—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers.</li> <li>• <b>S</b>—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic.</li> <li>• <b>Dense</b>—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.)</li> <li>• <b>Sparse-Dense</b>—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as <b>dense</b> is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as <b>sparse</b> is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules. (Not supported on QFX Series.)</li> </ul> <p>When sparse-dense mode is configured, the output includes both <b>S</b> and <b>D</b>. When bidirectional-sparse mode is configured, the output includes <b>S</b> and <b>B</b>. When bidirectional-sparse-dense mode is configured, the output includes <b>B</b>, <b>S</b>, and <b>D</b>.</p> |
| <b>IP</b>           | Version number of the address family on the interface: <b>4</b> (IPv4) or <b>6</b> (IPv6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>V</b>            | PIM version running on the interface: 1 or 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>State</b>        | <p>State of PIM on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—Bidirectional mode is enabled on the interface and on all PIM neighbors.</li> <li>• <b>DR</b>—Designated router.</li> <li>• <b>NotCap</b>—Bidirectional mode is not enabled on the interface. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 299: show pim neighbors Output Fields

| Field Name                                       | Field Description                                                                                                                                                                                                                                                                                              | Level of Output   |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Instance</b>                                  | Name of the routing instance.                                                                                                                                                                                                                                                                                  | All levels        |
| <b>Interface</b>                                 | Interface through which the neighbor is reachable.                                                                                                                                                                                                                                                             | All levels        |
| <b>Neighbor addr</b>                             | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                 | All levels        |
| <b>IP</b>                                        | IP version: 4 or 6.                                                                                                                                                                                                                                                                                            | All levels        |
| <b>V</b>                                         | PIM version running on the neighbor: 1 or 2.                                                                                                                                                                                                                                                                   | All levels        |
| <b>Mode</b>                                      | PIM mode of the neighbor: <b>Sparse</b> , <b>Dense</b> , <b>SparseDense</b> , or <b>Unknown</b> . When the neighbor is running PIM version 2, this mode is always <b>Unknown</b> .                                                                                                                             | All levels        |
| <b>Option</b>                                    | Can be one or more of the following: <ul style="list-style-type: none"> <li>• <b>B</b>—Bidirectional Capable.</li> <li>• <b>H</b>—Hello Option Holdtime.</li> <li>• <b>G</b>—Generation Identifier.</li> <li>• <b>P</b>—Hello Option DR Priority.</li> <li>• <b>L</b>—Hello Option LAN Prune Delay.</li> </ul> | <b>brief</b> none |
| <b>Uptime</b>                                    | Time the neighbor has been operational since the PIM process was last initialized, in the format <b>dd:hh:mm:ss ago</b> for less than a week and <b>nwnd:hh:mm:ss ago</b> for more than a week.                                                                                                                | All levels        |
| <b>Address</b>                                   | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>BFD</b>                                       | Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: <b>Enabled</b> , <b>Operational state is up</b> , or <b>Disabled</b> .                                                                                                                                 | <b>detail</b>     |
| <b>Hello Option Holdtime</b>                     | Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>Hello Default Holdtime</b>                    | Default holdtime and the time remaining if the <b>holdtime</b> option is not in the received hello message.                                                                                                                                                                                                    | <b>detail</b>     |
| <b>Hello Option DR Priority</b>                  | Designated router election priority. The range of values is 0 through 255.                                                                                                                                                                                                                                     | <b>detail</b>     |
| <b>Hello Option Generation ID</b>                | 9-digit or 10-digit number used to tag hello messages.                                                                                                                                                                                                                                                         | <b>detail</b>     |
| <b>Hello Option Bi-Directional PIM supported</b> | Neighbor can process bidirectional PIM messages.                                                                                                                                                                                                                                                               | <b>detail</b>     |
| <b>Hello Option LAN Prune Delay</b>              | Time to wait before the neighbor receives prune messages, in the format <b>delay nnn ms override nnnn ms</b> .                                                                                                                                                                                                 | <b>detail</b>     |

Table 299: show pim neighbors Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                   | Level of Output |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Join Suppression supported | Neighbor is capable of join suppression.                                                                                                                                                                                                                                            | detail          |

## Sample Output

### show pim neighbors

```

user@host> show pim neighbors
Instance: PIM.master
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface IP V Mode Option Uptime Neighbor addr
so-1/0/0.0 4 2 HPLG 00:07:10 10.111.10.2

```

### show pim neighbors brief

The output for the **show pim neighbors brief** command is identical to that for the **show pim neighbors** command. For sample output, see [show pim neighbors on page 4047](#).

### show pim neighbors instance

```

user@host> show pim neighbors instance VPN-A
Instance: PIM.VPN-A
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface IP V Mode Option Uptime Neighbor addr
at-0/3/1.0 4 2 HPLG 00:07:54 10.111.30.2
mt-1/1/0.32768 4 2 HPLG 00:07:22 10.10.47.101
so-1/0/1.0 4 2 HPLG 00:07:50 10.111.20.2

```

### show pim neighbors detail

```

user@host> show pim neighbors detail
Instance: PIM.master
Interface: ge-0/0/1.0

Table 300: show pim rps Output Fields (*continued*)

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| <b>Anycast-PIM Register State</b> | <p>If anycast RP is configured, the current register state for each group:</p> <ul style="list-style-type: none"> <li>• <b>Group</b>—Multicast group address.</li> <li>• <b>Source</b>—Multicast source address for which the PIM register is sent or received, depending on whether this routing device is a designated router facing an RP router, or is the local RP, respectively.</li> <li>• <b>Origin</b>—How the information was obtained: <ul style="list-style-type: none"> <li>• <b>DIRECT</b>—From a local attachment</li> <li>• <b>MSDP</b>—From the Multicast Source Discovery Protocol (MSDP)</li> <li>• <b>DR</b>—From the designated router</li> </ul> </li> </ul> | <b>extensive</b>     |
| <b>RP selected</b>                | For sparse mode and bidirectional mode, the identity of the RP for the specified group address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <i>group-address</i> |

## Sample Output

### show pim rps

```

user@host> show pim rps
Instance: PIM.master
Address family INET
RP address Type Mode Holdtime Timeout Groups Group prefixes
10.10.1.3 static bidir 150 None 2 224.1.3.0/24
 225.1.3.0/24
10.10.13.2 static bidir 150 None 2 224.1.1.0/24
 225.1.1.0/24

```

### show pim rps brief

The output for the **show pim rps brief** command is identical to that for the **show pim rps** command. For sample output, see [show pim rps on page 4052](#).

### show pim rps <group-address> (Bidirectional PIM)

```

user@host> show pim rps 224.1.1.1
Instance: PIM.master

224.1.0.0/16
 11.4.12.75 (Bidirectional)

RP selected: 11.4.12.75

```

### show pim rps <group-address> (PIM Dense Mode)

```

user@host> show pim rps 224.1.1.1
Instance: PIM.master

Dense Mode active for group 224.1.1.1

```

### show pim rps <group-address> (SSM Range Without asm-override-ssm Configured)

```

user@host> show pim rps 224.1.1.1

```

Instance: PIM.master

Source-specific Mode (SSM) active for group 224.1.1.1

#### show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Sparse-Mode RP)

user@host> show pim rps 224.1.1.1

Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16  
11.4.12.75

RP selected: 11.4.12.75

#### show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Bidirectional RP)

user@host> show pim rps 224.1.1.1

Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16  
11.4.12.75 (Bidirectional)

RP selected: (null)

#### show pim rps instance

user@host> show pim rps instance VPN-A

Instance: PIM.VPN-A

Address family INET

| RP address   | Type   | Holdtime | Timeout | Groups | Group prefixes |
|--------------|--------|----------|---------|--------|----------------|
| 10.10.47.100 | static | 0        | None    | 1      | 224.0.0.0/4    |

Address family INET6

#### show pim rps extensive (PIM Sparse Mode)

user@host> show pim rps extensive

Instance: PIM.master

Family: INET

RP: 10.255.245.91

Learned via: static configuration

Time Active: 00:05:48

Holdtime: 45 with 36 remaining

Device Index: 122

Subunit: 32768

Interface: pd-6/0/0.32768

Group Ranges:

224.0.0.0/4, 36s remaining

Active groups using RP:

225.1.1.1

total 1 groups active

Register State for RP:

| Group     | Source         | FirstHop      | RP Address    | State   | Timeout |

| <b>Output Fields</b>                                | <a href="#">Table 301 on page 4057</a> describes the output fields for the <b>show pim source</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 301: show pim source Output Fields

| Field Name         | Field Description                                                     |
|--------------------|-----------------------------------------------------------------------|
| Instance           | Name of the routing instance.                                         |
| Source             | Address of the source or reverse path.                                |
| Prefix/length      | Prefix and prefix length for the route used to reach the RPF address. |
| Upstream interface | RPF interface toward the source address.                              |
| Upstream Neighbor  | Address of the RPF neighbor used to reach the source address.         |

## Sample Output

### show pim source

```

user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
 Prefix 10.255.14.144/32
 Upstream interface Local
 Upstream neighbor Local

Source 10.255.70.15
 Prefix 10.255.70.15/32
 Upstream interface so-1/0/0.0
 Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6

```

### show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see [show pim source on page 4057](#).

### show pim source detail

```

user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
 Prefix 10.255.14.144/32
 Upstream interface Local
 Upstream neighbor Local
 Active groups:228.0.0.0
 239.1.1.1
 239.1.1.1

Source 10.255.70.15
 Prefix 10.255.70.15/32
 Upstream interface so-1/0/0.0
 Upstream neighbor 10.111.10.2
 Active groups:239.1.1.1

```

Instance: PIM.master Family: INET6

## show pim statistics

| <b>V2 Bootstrap</b>     | PIM version 2 bootstrap packets.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>V2 Assert</b>        | PIM version 2 assert packets.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>V2 Graft</b>         | PIM version 2 graft packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>V2 Graft Ack</b>     | PIM version 2 graft acknowledgment packets.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>V2 Candidate RP</b>  | PIM version 2 candidate RP packets.                                                                                                                                                                                                                                                                                                                                                                                     |

Table 302: show pim statistics Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                              |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>V2 State Refresh</b>                 | PIM version 2 control messages related to PIM dense mode (PIM-DM) state refresh.<br><br>State refresh is an extension to PIM-DM. It not supported in Junos OS. |
| <b>V2 DF Election</b>                   | PIM version 2 send and receive messages associated with bidirectional PIM designated forwarder election.                                                       |
| <b>V1 Query</b>                         | PIM version 1 query packets.                                                                                                                                   |
| <b>V1 Register</b>                      | PIM version 1 register packets.                                                                                                                                |
| <b>V1 Register Stop</b>                 | PIM version 1 register stop packets.                                                                                                                           |
| <b>V1 Join Prune</b>                    | PIM version 1 join and prune packets.                                                                                                                          |
| <b>V1 RP Reachability</b>               | PIM version 1 RP reachability packets.                                                                                                                         |
| <b>V1 Assert</b>                        | PIM version 1 assert packets.                                                                                                                                  |
| <b>V1 Graft</b>                         | PIM version 1 graft packets.                                                                                                                                   |
| <b>V1 Graft Ack</b>                     | PIM version 1 graft acknowledgment packets.                                                                                                                    |
| <b>AutoRP Announce</b>                  | Auto-RP announce packets.                                                                                                                                      |
| <b>AutoRP Mapping</b>                   | Auto-RP mapping packets.                                                                                                                                       |
| <b>AutoRP Unknown type</b>              | Auto-RP packets with an unknown type.                                                                                                                          |
| <b>Anycast Register</b>                 | Auto-RP announce packets.                                                                                                                                      |
| <b>Anycast Register Stop</b>            | Auto-RP announce packets.                                                                                                                                      |
| <b>Global Statistics</b>                | Summary of PIM statistics for all interfaces.                                                                                                                  |
| <b>Hello dropped on neighbor policy</b> | Number of hello packets dropped because of a configured neighbor policy.                                                                                       |
| <b>Unknown type</b>                     | Number of PIM control packets received with an unknown type.                                                                                                   |
| <b>V1 Unknown type</b>                  | Number of PIM version 1 control packets received with an unknown type.                                                                                         |
| <b>Unknown Version</b>                  | Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.                                                     |

Table 302: show pim statistics Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                         |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Neighbor unknown</b>                | Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.                    |
| <b>Bad Length</b>                      | Number of PIM control packets received for which the packet size does not match the PIM length field in the packet.       |
| <b>Bad Checksum</b>                    | Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet. |
| <b>Bad Receive If</b>                  | Number of PIM control packets received on an interface that does not have PIM configured.                                 |
| <b>Rx Bad Data</b>                     | Number of PIM control packets received that contain data for TCP Bad register packets.                                    |
| <b>Rx Intf disabled</b>                | Number of PIM control packets received on an interface that has PIM disabled.                                             |
| <b>Rx V1 Require V2</b>                | Number of PIM version 1 control packets received on an interface configured for PIM version 2.                            |
| <b>Rx V2 Require V1</b>                | Number of PIM version 2 control packets received on an interface configured for PIM version 1.                            |
| <b>Rx Register not RP</b>              | Number of PIM register packets received when the routing device is not the RP for the group.                              |
| <b>Rx Register no route</b>            | Number of PIM register packets received when the RP does not have a unicast route back to the source.                     |
| <b>Rx Register no decap if</b>         | Number of PIM register packets received when the RP does not have a de-encapsulation interface.                           |
| <b>Null Register Timeout</b>           | Number of NULL register timeout packets.                                                                                  |
| <b>RP Filtered Source</b>              | Number of PIM packets received when the routing device has a source address filter configured for the RP.                 |
| <b>Rx Unknown Reg Stop</b>             | Number of register stop messages received with an unknown type.                                                           |
| <b>Rx Join/Prune no state</b>          | Number of join and prune messages received for which the routing device has no state.                                     |
| <b>Rx Join/Prune on upstream if</b>    | Number of join and prune messages received on the interface used to reach the upstream routing device, toward the RP.     |
| <b>Rx Join/Prune for invalid group</b> | Number of join or prune messages received for invalid multicast group addresses.                                          |

Table 302: show pim statistics Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                                                                           |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Rx Join/Prune messages dropped</b> | Number of join and prune messages received and dropped.                                                                                                                     |
| <b>Rx sparse join for dense group</b> | Number of PIM sparse mode join messages received for a group that is configured for dense mode.                                                                             |
| <b>Rx Graft/Graft Ack no state</b>    | Number of graft and graft acknowledgment messages received for which the router or switch has no state.                                                                     |
| <b>Rx Graft on upstream if</b>        | Number of graft messages received on the interface used to reach the upstream routing device, toward the RP.                                                                |
| <b>Rx CRP not BSR</b>                 | Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.                                                                 |
| <b>Rx BSR when BSR</b>                | Number of BSR messages received in which the PIM message type is Bootstrap.                                                                                                 |
| <b>Rx BSR not RPF if</b>              | Number of BSR messages received on an interface that is not the RPF interface.                                                                                              |
| <b>Rx unknown hello opt</b>           | Number of PIM hello packets received with options that Junos OS does not support.                                                                                           |
| <b>Rx data no state</b>               | Number of PIM control packets received for which the routing device has no state for the data type.                                                                         |
| <b>Rx RP no state</b>                 | Number of PIM control packets received for which the routing device has no state for the RP.                                                                                |
| <b>Rx aggregate</b>                   | Number of PIM aggregate MDT packets received.                                                                                                                               |
| <b>Rx malformed packet</b>            | Number of PIM control packets received with a malformed IP unicast or multicast address family.                                                                             |
| <b>No RP</b>                          | Number of PIM control packets received with no RP address.                                                                                                                  |
| <b>No register encaps if</b>          | Number of PIM register packets received when the first-hop routing device does not have an encapsulation interface.                                                         |
| <b>No route upstream</b>              | Number of PIM control packets received when the routing device does not have a unicast route to the the interface used to reach the upstream routing device, toward the RP. |
| <b>Nexthop Unusable</b>               | Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.                                                  |
| <b>RP mismatch</b>                    | Number of PIM control packets received for which the routing device has an RP mismatch.                                                                                     |

Table 302: show pim statistics Output Fields (*continued*)

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RP mode mismatch</b>                    | RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>RPF neighbor unknown</b>                | Number of PIM control packets received for which the routing device has an unknown RPF neighbor for the source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Rx Joins/Prunes filtered</b>            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Tx Joins/Prunes filtered</b>            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Embedded-RP invalid addr</b>            | Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Embedded-RP limit exceed</b>            | Number of times the limit configured with the <b>maximum-rps</b> statement is exceeded. The <b>maximum-rps</b> statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Embedded-RP added</b>                   | <p>Number of packets in which the embedded RP for IPv6 is added.</p> <p>The following receive events trigger extraction of an IPv6 embedded RP address on the routing device:</p> <ul style="list-style-type: none"> <li>• Multicast Listener Discovery (MLD) report for an embedded RP multicast group address</li> <li>• PIM join message with an embedded RP multicast group address</li> <li>• Static embedded RP multicast group address associated with an interface</li> <li>• Packets sent to an embedded RP multicast group address received on the DR</li> </ul> <p>An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.</p> |
| <b>Embedded-RP removed</b>                 | Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Rx Register msgs filtering drop</b>     | Number of received register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Tx Register msgs filtering drop</b>     | Number of register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Rx Bidir Join/Prune on non-Bidir if</b> | Error counter for join and prune messages received on non-bidirectional PIM interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 302: show pim statistics Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                   |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Rx Bidir Join/Prune on non-DF if</b> | Error counter for join and prune messages received on non-designated forwarder interfaces.                                                                                          |
| <b>V4 (S,G) Maximum</b>                 | Maximum number of (S,G) IPv4 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted. |
| <b>V4 (S,G) Accepted</b>                | Number of accepted (S,G) IPv4 multicast routes.                                                                                                                                     |
| <b>V4 (S,G) Threshold</b>               | Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv4 multicast routes accepted by the device).                                            |
| <b>V4 (S,G) Log Interval</b>            | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| <b>V6 (S,G) Maximum</b>                 | Maximum number of (S,G) IPv6 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted. |
| <b>V6 (S,G) Accepted</b>                | Number of accepted (S,G) IPv6 multicast routes.                                                                                                                                     |
| <b>V6 (S,G) Threshold</b>               | Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv6 multicast routes accepted by the device).                                            |
| <b>V6 (S,G) Log Interval</b>            | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| <b>V4 (grp-prefix, RP) Maximum</b>      | Maximum number of group-to-rendezvous point (RP) IPv4 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.        |
| <b>V4 (grp-prefix, RP) Accepted</b>     | Number of accepted group-to-RP IPv4 multicast mappings.                                                                                                                             |
| <b>V4 (grp-prefix, RP) Threshold</b>    | Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv4 multicast mappings accepted by the device).                                    |
| <b>V4 (grp-prefix, RP) Log Interval</b> | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| <b>V6 (grp-prefix, RP) Maximum</b>      | Maximum number of group-to RP IPv6 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.                           |
| <b>V6 (grp-prefix, RP) Accepted</b>     | Number of accepted group-to-RP IPv6 multicast mappings.                                                                                                                             |

Table 302: show pim statistics Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                 |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>V6 (grp-prefix, RP) Threshold</b>    | Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv6 multicast mappings accepted by the device).                                                  |
| <b>V6 (grp-prefix, RP) Log Interval</b> | Time (in seconds) between consecutive log messages.                                                                                                                                               |
| <b>V4 Register Maximum</b>              | Maximum number of IPv4 PIM registers accepted for the VRF routing instance. If this number is met, additional PIM registers are not accepted.<br><br>You configure the register limits on the RP. |
| <b>V4 Register Accepted</b>             | Number of accepted IPv4 PIM registers.                                                                                                                                                            |
| <b>V4 Register Threshold</b>            | Threshold at which a warning message is logged (percentage of the maximum number of IPv4 PIM registers accepted by the device).                                                                   |
| <b>V4 Register Log Interval</b>         | Time (in seconds) between consecutive log messages.                                                                                                                                               |
| <b>V6 Register Maximum</b>              | Maximum number of IPv6 PIM registers accepted for the VRF routing instance. If this number is met, additional PIM registers are not accepted.<br><br>You configure the register limits on the RP. |
| <b>V6 Register Accepted</b>             | Number of accepted IPv6 PIM registers.                                                                                                                                                            |
| <b>V6 Register Threshold</b>            | Threshold at which a warning message is logged (percentage of the maximum number of IPv6 PIM registers accepted by the device).                                                                   |
| <b>V6 Register Log Interval</b>         | Time (in seconds) between consecutive log messages.                                                                                                                                               |

## Overview

---

- [Ethernet OAM Link Fault Management on page 4073](#)

## Ethernet OAM Link Fault Management

- [IEEE 802.3ah OAM Link-Fault Management Overview on page 4073](#)

### [IEEE 802.3ah OAM Link-Fault Management Overview](#)

---

Ethernet interfaces capable of running at 100 Mbps or faster on EX Series switches, MX Series, M Series (except M5 and M10 routers), and T Series routers support the IEEE 802.3ah standard for Operation, Administration, and Management (OAM). You can configure IEEE 802.3ah OAM on Ethernet point-to-point direct links or links across Ethernet repeaters. The IEEE 802.3ah standard meets the requirement for OAM capabilities as Ethernet moves from being solely an enterprise technology to being a WAN and access technology, as well as being backward-compatible with existing Ethernet technology. Junos OS supports IEEE 802.3ah link-fault management.

The features of link-fault management are:

- Discovery
- Link monitoring
- Remote fault detection
- Remote loopback

The following features are not supported:

- Ethernet running on top of a Layer 2 protocol, such as Ethernet over ATM, is not supported in OAM configurations.
- Remote loopback is not supported on the 10-Gigabit Ethernet LAN/WAN PIC with SFP+.

- The remote loopback feature mentioned in section 57.2.11 of IEEE 802.3ah is not supported on T4000 routers.

**NOTE:** Aggregated Ethernet member links will now use the physical MAC address as the source MAC address in 802.3ah OAM packets.

### [Configuring IEEE 802.3ah OAM Link-Fault Management](#)

You can configure threshold values for fault events that trigger the sending of link event TLVs when the values exceed the threshold. To set threshold values for fault events on an interface, include the **event-thresholds** statement at the **[edit protocols oam ethernet link-fault-management interface]** hierarchy level.

You can also configure OAM threshold values within an action profile and apply the action profile to multiple interfaces. To create an action profile, include the **action-profile** statement at the **[edit protocols oam ethernet link-fault-management]** hierarchy level.

You can configure Ethernet OAM either on an aggregate interface or on each of its member links. However, we recommend that you configure Ethernet OAM on the aggregate interface, and this will internally enable Ethernet OAM on the member links.

To view OAM statistics, use the **show oam ethernet link-fault-management** operational mode command. To clear OAM statistics, use the **clear oam ethernet link-fault-management statistics** operational mode command. To clear link-fault management state information and restart the link discovery process on Ethernet interfaces, use the **clear oam ethernet link-fault-management state** operational mode command. For more information about these commands, see the *Junos OS Operational Mode Commands*.

---

### Enabling IEEE 802.3ah OAM Support

To enable IEEE 802.3ah OAM support, include the **interface** statement at the **[edit protocols oam ethernet link-fault-management]** hierarchy level:

**[edit protocols oam ethernet link-fault-management interface interface-name]**

When you enable IEEE 802.3ah OAM on a physical interface, the discovery process is automatically triggered.

### Configuring Link Discovery

When the IEEE 802.3ah OAM protocol is enabled on a physical interface, the discovery process is automatically triggered. The discovery process permits Ethernet interfaces to discover and monitor the peer on the link if it also supports the IEEE 802.3ah standard.

You can specify the discovery mode used for IEEE 802.3ah OAM support. The discovery process is triggered automatically when OAM IEEE 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs.

To configure the discovery mode, include the **link-discovery** statement at the **[edit protocol oam ethernet link-fault-management interface *interface-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
 link-discovery (active | passive);
```

In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. After the discovery process has been initiated, both sides participate in discovery.

- [Junos® OS Ethernet Interfaces](#)

### [Configuring the OAM PDU Interval](#)

---

Periodic OAM PDUs are sent to perform link monitoring.

You can specify the periodic OAM PDU sending interval for fault detection.

To configure the sending interval, include the **pdu-interval** statement at the **[edit protocol oam ethernet link-fault-management interface *interface-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
 pdu-interval interval;
```

The periodic OAM PDU interval range is from 100 through 1000 milliseconds. The default sending interval is 1000 milliseconds.

- [Junos® OS Ethernet Interfaces](#)

### Configuring the OAM PDU Threshold

You can specify the number of OAM PDUs that an interface can miss before the link between peers is considered down.

To configure the number of PDUs that can be missed from the peer, include the **pdu-threshold** statement at the **[edit protocol oam ethernet link-fault-management interface *interface-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
 pdu-threshold threshold-value;
```

The threshold value range is from 3 through 10. The default is three PDUs.

### Configuring Threshold Values for Local Fault Events on an Interface

You can configure threshold values on an interface for the local errors that trigger the sending of link event TLVs.

To set the error threshold values for sending event TLVs, include the **frame-error**, **frame-period**, **frame-period-summary**, and **symbol-period** statements at the **[edit protocols**

**oam ethernet link-fault-management interface *interface-name* event-thresholds]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
event-thresholds {
 frame-error count;
 frame-period count;
 frame-period-summary count;
 symbol-period count;
}
```

**Related  
Documentation**

### Disabling the Sending of Link Event TLVs

You can disable the sending of link event TLVs.

To disable the monitoring and sending of PDUs containing link event TLVs in periodic PDUs, include the **no-allow-link-events** statement at the **[edit protocols oam ethernet link-fault-management interface *interface-name* negotiation-options]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name
 negotiation-options]
no-allow-link-events;
```

- *Junos® OS Ethernet Interfaces*

#### Detecting Remote Faults

Fault detection is either based on flags or fault event type, length, and values (TLVs) received in OAM protocol data units (PDUs). Flags that trigger a link fault are:

- Critical Event
- Dying Gasp
- Link Fault

The link event TLVs are sent by the remote DTE by means of event notification PDUs. Link event TLVs are:

- Errored Symbol Period Event
- Errored Frame Event
- Errored Frame Period Event
- Errored Frame Seconds Summary Event

### Configuring an OAM Action Profile

You can create an action profile to define event fault flags and thresholds and the action to be taken. You can then apply the action profile to one or more interfaces.

To configure an action profile, include the **action-profile** statement at the **[edit protocols oam ethernet link-fault-management]** hierarchy level:

```
action-profile profile-name {
 action {
 syslog;
 link-down;
 send-critical-event;
 }
 event {
 link-adjacency-loss;
 link-event-rate {
 10;
 }
 }
}
```

```

 frame-error count;
 frame-period count;
 frame-period-summary count;
 symbol-period count;
 }
 protocol-down;
}

```

#### Specifying the Actions to Be Taken for Link-Fault Management Events

You can specify the action to be taken by the system when the configured link-fault event occurs. Multiple action profiles can be applied to a single interface. For each action-profile, at least one event and one action must be specified. The actions are taken only when all of the events in the action profile are true. If more than one action is specified, all the actions are executed.

You might want to set a lower threshold for a specific action such as logging the error and set a higher threshold for another action such as sending a critical event TLV.

To specify the action, include the **action** statement at the **[edit protocols oam ethernet link-fault-management action-profile *profile-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management action-profile profile-name]
event {
 link-adjacency-loss;
 protocol-down;
}
action {
 syslog;
 link-down;
 send-critical-event;
}
```

To create a system log entry when the link-fault event occurs, include the **syslog** statement.

To administratively disable the link when the link-fault event occurs, include the **link-down** statement.

To send IEEE 802.3ah link event TLVs in the OAM PDU when a link-fault event occurs, include the **send-critical-event** statement.

**NOTE:** If multiple actions are specified in the action profile, all of the actions are executed in no particular order.

### Monitoring the Loss of Link Adjacency

You can specify actions be taken when link adjacency is lost. When link adjacency is lost, the system takes the action defined in the **action** statement of the action profile.

To configure the system to take action when link adjacency is lost, include the **link-adjacency-loss** statement at the **[edit protocols oam ethernet link-fault-management action-profile *profile-name* event]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management action-profile profile-name]
link-adjacency-loss;
```

## Monitoring Protocol Status

---

The CCC-DOWN flag is associated with a circuit cross-connect (CCC) connection, Layer 2 circuit, and Layer 2 VPN, which send the CCC-DOWN status to the kernel. The CCC-DOWN flag indicates that the CCC is down. The CCC-DOWN status is sent to the kernel when the CCC connection, Layer 2 circuit, or Layer 2 VPN is down. This in turn, brings down the CE-facing PE interface associated with the CCC connection, Layer 2 circuit, or Layer 2 VPN.

When the CCC-DOWN flag is signaled to the IEEE 802.3ah protocol, the system takes the action defined in the **action** statement of the action profile. For additional information about Layer 2 circuits, see the Junos OS Layer 2 Circuits Feature Guide, Junos OS VPNs Configuration Guide.

To monitor the IEEE 802.3ah protocol, on the CE-facing PE interface, include the **protocol-down** statement at the **[edit protocols oam ethernet link-fault-management action-profile *profile-name* event]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management action-profile profile-name]
protocol-down;
```

---

**NOTE:** If multiple events are specified in the action profile, all the events must occur before the specified action is taken.

---

### Configuring Threshold Values for Fault Events in an Action Profile

You can configure link event thresholds for received error events that trigger the action specified in the **action** statement. You can then apply the action profile to one or more interfaces.

To configure link event thresholds, include the **link-event-rate** statement at the **[edit protocols oam ethernet link-fault-management action-profile *profile-name* event]** hierarchy level:

```
link-event-rate {
 frame-error count;
 frame-period count;
 frame-period-summary count;
 symbol-period count;
}
```

## Applying an Action Profile

---

You can apply an action profile to one or more interfaces.

To apply an action profile to an interface, include the **apply-action-profile** statement at the **[edit protocols oam ethernet link-fault-management action-profile interface *interface-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
 apply-action-profile profile-name;
```

## Setting a Remote Interface into Loopback Mode

---

You can configure the software to set the remote DTE into loopback mode on the following interfaces:

- IQ2 and IQ2-E Gigabit Ethernet interfaces
- Ethernet interfaces on the MX Series routers or EX Series switches

Junos OS can place a remote DTE into loopback mode (if remote-loopback mode is supported by the remote DTE). When you place a remote DTE into loopback mode, the

interface receives the remote-loopback request and puts the interface into remote-loopback mode. When the interface is in remote-loopback mode, all frames except OAM PDUs are looped back without any changes made to the frames. OAM PDUs continue to be sent to the management plane and processed.

To configure remote loopback, include the **remote-loopback** statement at the **[edit protocol oam ethernet link-fault-management interface *interface-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
 remote-loopback;
```

To take the remote DTE out of loopback mode, remove the **remote-loopback** statement from the configuration.

#### Enabling Remote Loopback Support on the Local Interface

You can allow a remote DTE to set a local interface into remote loopback mode on IQ2 and IQ2-E Gigabit Ethernet interfaces and all Ethernet interfaces on the MX Series routers and EX Series switches. When a remote-loopback request is sent by a remote DTE, the Junos OS places the local interface into loopback mode. When an interface is in loopback mode, all frames except OAM PDUs are looped back without any changes to the frames.

OAM PDUs continue to be sent to the management plane and processed. By default, the remote loopback feature is not enabled.

To enable remote loopback, include the **allow-remote-loopback** statement at the **[edit protocol oam ethernet link-fault-management interface *interface-name* negotiation-options]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name
 negotiation-options]
allow-remote-loopback;
```

**NOTE:** Activation of OAM remote loopback may result in data frame loss.

#### Example: Configuring IEEE 802.3ah OAM Support on an Interface

Configure 802.3ah OAM support on a 10-Gigabit Ethernet interface:

```
[edit]
protocols {
 oam {
```

```

ethernet {
 link-fault-management {
 interface xe-0/0/0 {
 link-discovery active;
 pdu-interval 800;
 pdu-threshold 4;
 remote-loopback;
 negotiation-options {
 allow-remote-loopback;
 }
 event-thresholds {
 frame-error 30;
 frame-period 50;
 frame-period summary 40;
 symbol-period 20;
 }
 }
 }
}

```

**Hierarchy Level** [edit protocols oam]

**Release Information** Statement introduced in Junos OS Release 8.2.

**Description** For Ethernet interfaces on EX Series switches, and M320, MX Series, and T Series routers, provide fault signaling and detection for 802.3ah Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Threshold for sending frame error events or taking the action specified in the action profile.</p> <p>A frame error is any frame error on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value within the window.</p> <p>The window or period during which frame errors are counted is 5 seconds or multiples of it (with a maximum value of 1 minute). This window denotes the duration as intervals of 100 milliseconds, encoded as a 16-bit unsigned integer. This window is not configurable in Junos OS. According to the IEEE 802.3ah standard, the default value of the frame-errors window is 1 second. This window has a lower bound of 1 second and an upper bound of 1 minute.</p> |

| <b>Description</b>              | <p>Threshold for sending frame period error events or taking the action specified in the action profile.</p> <p>A frame error is any frame error on the underlying physical layer. The frame period threshold is reached when the number of frame errors reaches the configured value within the period window. The default period window is the number of minimum-size frames that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | For Ethernet interfaces on EX Series switches, and M320, M120, MX Series, and T Series routers, specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Management (OAM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs. |
| <b>Options</b>                  | (active   passive)—Passive or active mode. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. Once the discovery process is initiated, both sides participate in discovery.                                                             |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                             |

## Administration

---

- [Routine Monitoring on page 4116](#)
- [Operational Commands: General on page 4119](#)
- [Operational Commands: Port Mirroring on page 4139](#)
- [Operational Commands: Ethernet OAM Link Fault Management on page 4141](#)

## Routine Monitoring

- [Monitoring Traffic Through the Router or Switch on page 4116](#)

### Monitoring Traffic Through the Router or Switch

---

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. [Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 4116](#)
2. [Displaying Real-Time Statistics About an Interface on the Router or Switch on page 4117](#)

#### *Displaying Real-Time Statistics About All Interfaces on the Router or Switch*

|                |                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | Display real-time statistics about traffic passing through all interfaces on the router or switch. |
|----------------|----------------------------------------------------------------------------------------------------|

**Action** To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

### Sample Output

```
user@host> monitor interface traffic
host name Seconds:15 Time: 12:31:09
Interface Link Input packets (pps) Output packets (pps)
so-1/0/0 Down 0 (0) 0 (0)
so-1/1/0 Down 0 (0) 0 (0)
so-1/1/1 Down 0 (0) 0 (0)
so-1/1/2 Down 0 (0) 0 (0)
so-1/1/3 Down 0 (0) 0 (0)
t3-1/2/0 Down 0 (0) 0 (0)
t3-1/2/1 Down 0 (0) 0 (0)
t3-1/2/2 Down 0 (0) 0 (0)
t3-1/2/3 Down 0 (0) 0 (0)
so-2/0/0 Up 211035 (1) 36778 (0)
so-2/0/1 Up 192753 (1) 36782 (0)
so-2/0/2 Up 211020 (1) 36779 (0)
so-2/0/3 Up 211029 (1) 36776 (0)
so-2/1/0 Up 189378 (1) 36349 (0)
so-2/1/1 Down 0 (0) 18747 (0)
so-2/1/2 Down 0 (0) 16078 (0)
so-2/1/3 Up 0 (0) 80338 (0)
at-2/3/0 Up 0 (0) 0 (0)
at-2/3/1 Down 0 (0) 0 (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D
```

**Meaning** The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the C key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

### Displaying Real-Time Statistics About an Interface on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through an interface on the router or switch.

**Action** To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

```
user@host> monitor interface interface-name
```

### Sample Output

```
user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
Interface: so-0/0/1, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: OC3 Traffic statistics:
 Input bytes: 5856541 (88 bps)
 Output bytes: 6271468 (96 bps)
 Input packets: 157629 (0 pps)
 Output packets: 157024 (0 pps)
Encapsulation statistics:
```

```

Input keepalives: 42353
Output keepalives: 42320
LCP state: Opened
Error statistics:
Input errors: 0
Input drops: 0
Input framing errors: 0
Input runs: 0
Input giants: 0
Policed discards: 0
L3 incompletes: 0
L2 channel errors: 0
L2 mismatch timeouts: 0
Carrier transitions: 1
Output errors: 0
Output drops: 0
Aged packets: 0
Active alarms : None
Active defects: None
SONET error counts/seconds:
LOS count 1
LOF count 1
SEF count 1
ES-S 77
SES-S 77
SONET statistics:
BIP-B1 0
BIP-B2 0
REI-L 0
BIP-B3 0
REI-P 0
Received SONET overhead: F1 : 0x00 J0 : 0xZ

```

**Meaning** The sample output shows the input and output packets for a particular SONET interface (**so-0/0/1**). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see *Checklist for Tracking Error Conditions*.

To control the output of the command while it is running, use the keys shown in [Table 303 on page 418](#).

**Table 303: Output Control Keys for the monitor interface Command**

| Action                                                                                                                                                                                                                       | Key      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Display information about the next interface. The <b>monitor interface</b> command scrolls through the physical or logical interfaces in the same order that they are displayed by the <b>show interfaces terse</b> command. | <b>N</b> |
| Display information about a different interface. The command prompts you for the name of a specific interface.                                                                                                               | <b>I</b> |
| Freeze the display, halting the display of updated statistics.                                                                                                                                                               | <b>F</b> |
| Thaw the display, resuming the display of updated statistics.                                                                                                                                                                | <b>T</b> |

Table 303: Output Control Keys for the monitor interface Command (*continued*)

| Action                                                                                                                          | Key |
|---------------------------------------------------------------------------------------------------------------------------------|-----|
| Clear (zero) the current delta counters since <b>monitor interface</b> was started. It does not clear the accumulative counter. | C   |
| Stop the <b>monitor interface</b> command.                                                                                      | Q   |

See the *Junos OS Operational Mode Commands* for details on using match conditions with the **monitor traffic** command.

## Operational Commands: General

## monitor traffic

---

**Syntax**    monitor traffic  
              <brief | detail | extensive>  
              <absolute-sequence>  
              <count *count*>  
              <interface *interface-name*>  
              <layer2-headers>  
              <matching *matching*>  
              <no-domain-names>  
              <no-promiscuous>  
              <no-resolve>  
              <no-timestamp>  
              <print-ascii>  
              <print-hex>  
              <resolve-timeout>  
              <size *size*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display packet headers or packets received and sent from the Routing Engine.

---

**NOTE:**

- Using the **monitor-traffic** command can degrade router or switch performance.
  - Delays from DNS resolution can be eliminated by using the **no-resolve** option.
- 

---

**NOTE:** This command is not supported on the QFabric system.

---

**Options**    **none**—(Optional) Display packet headers transmitted through **fxp0**. On a TX Matrix Plus router, display packet headers transmitted through **em0**.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**absolute-sequence**—(Optional) Display absolute TCP sequence numbers.

**count *count***—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The **monitor traffic** command quits automatically after displaying the number of packets specified.

**interface *interface-name***—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

**layer2-headers**—(Optional) Display the link-level header on each line.

**matching *matching***—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

**no-domain-names**—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **team.company.net**.

**no-promiscuous**—(Optional) Do not put the interface into promiscuous mode.

**no-resolve**—(Optional) Suppress reverse lookup of the IP addresses.

**no-timestamp**—(Optional) Suppress timestamps on displayed packets.

**print-ascii**—(Optional) Display each packet in ASCII format.

**print-hex**—(Optional) Display each packet, except the link-level header, in hexadecimal format.

**resolve-timeout *timeout***—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

**size *size***—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

**Additional Information** In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

```
monitor traffic matching "expression"
```

Replace ***expression*** with one or more of the match conditions listed in [Table 304 on page 4122](#).

Table 304: Match Conditions for the monitor traffic Command

| Match Type    | Condition                                             | Description                                                                                                                                                                                                                                                                            |
|---------------|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Entity        | <b>host</b> [ <i>address</i>   <i>hostname</i> ]      | Matches packets that contain the specified address or hostname.<br><br>The protocol match conditions <b>arp</b> , <b>ip</b> , or <b>rarp</b> , or any of the directional match conditions can be prepended to the <b>host</b> match condition.                                         |
|               | <b>net</b> <i>address</i>                             | Matches packets with source or destination addresses containing the specified network address.                                                                                                                                                                                         |
|               | <b>net</b> <i>address mask mask</i>                   | Matches packets containing the specified network address and subnet mask.                                                                                                                                                                                                              |
|               | <b>port</b> ( <i>port-number</i>   <i>port-name</i> ) | Matches packets containing the specified source or destination TCP or UDP port number or port name.<br><br>In place of the numeric port address, you can specify a text synonym, such as <b>bgp</b> (179), <b>dhcp</b> (67), or <b>domain</b> (53) (the port numbers are also listed). |
| Directional   | <b>dst</b>                                            | Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                                  |
|               | <b>src</b>                                            | Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                                             |
|               | <b>src and dst</b>                                    | Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.                                                                                                                         |
|               | <b>src or dst</b>                                     | Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                        |
| Packet Length | <b>less</b> <i>value</i>                              | Matches packets shorter than or equal to the specified value, in bytes.                                                                                                                                                                                                                |
|               | <b>greater</b> <i>value</i>                           | Matches packets longer than or equal to the specified value, in bytes.                                                                                                                                                                                                                 |

Table 304: Match Conditions for the monitor traffic Command (*continued*)

| Match Type | Condition                                                | Description                                                                                                                                                                                                                                                                                                                     |
|------------|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol   | <b>amt</b>                                               | Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.                                                                                                                                                                                                |
|            | <b>arp</b>                                               | Matches all ARP packets.                                                                                                                                                                                                                                                                                                        |
|            | <b>ether</b>                                             | Matches all Ethernet packets.                                                                                                                                                                                                                                                                                                   |
|            | <b>ether (broadcast   multicast)</b>                     | Matches broadcast or multicast Ethernet frames. This match condition can be prepended with <b>src</b> and <b>dst</b> .                                                                                                                                                                                                          |
|            | <b>ether protocol (address   (arp   ip   rarp))</b>      | Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The <b>ether protocol</b> arguments <b>arp</b> , <b>ip</b> , and <b>rarp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ether protocol</b> match condition. |
|            | <b>icmp</b>                                              | Matches all ICMP packets.                                                                                                                                                                                                                                                                                                       |
|            | <b>ip</b>                                                | Matches all IP packets.                                                                                                                                                                                                                                                                                                         |
|            | <b>ip (broadcast   multicast)</b>                        | Matches broadcast or multicast IP packets.                                                                                                                                                                                                                                                                                      |
|            | <b>ip protocol (address   (icmp   igmp   tcp   udp))</b> | Matches packets with the specified address or protocol type. The <b>ip protocol</b> arguments <b>icmp</b> , <b>tcp</b> , and <b>udp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ip protocol</b> match condition.                                                 |
|            | <b>isis</b>                                              | Matches all IS-IS routing messages.                                                                                                                                                                                                                                                                                             |
|            | <b>rarp</b>                                              | Matches all RARP packets.                                                                                                                                                                                                                                                                                                       |
|            | <b>tcp</b>                                               | Matches all TCP datagrams.                                                                                                                                                                                                                                                                                                      |
|            | <b>udp</b>                                               | Matches all UDP datagrams.                                                                                                                                                                                                                                                                                                      |

To combine expressions, use the logical operators listed in [Table 305 on page 4123](#).

Table 305: Logical Operators for the monitor traffic Command

| Logical Operator (Highest to Lowest Precedence) | Description                                                                          |
|-------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>!</b>                                        | Logical NOT. If the first condition does not match, the next condition is evaluated. |

Table 305: Logical Operators for the monitor traffic Command (*continued*)

| Logical Operator (Highest to Lowest Precedence) | Description                                                                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| &&                                              | Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped. |
|                                                 | Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.  |
| ()                                              | Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).        |

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0"arithmetic_expression relational_operator arithmetic_expression
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are 1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in [Table 306 on page 4125](#).

**NOTE:** Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The **monitor traffic** command cannot apply match conditions to inbound traffic.
- The **monitor traffic interface** command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the match pipe option (`| match`) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see [Table 304 on page 4122](#).
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the **monitor traffic interface ae[x]** command for aggregated Ethernet interfaces (such as ae0) only shows inbound traffic data, the command does not show VLAN tag information in the output.

**Table 306: Arithmetic and Relational Operators for the monitor traffic Command**

| Arithmetic or Relational Operator                         | Description                                                                         |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>Arithmetic Operator</b>                                |                                                                                     |
| +                                                         | Addition operator.                                                                  |
| -                                                         | Subtraction operator.                                                               |
| /                                                         | Division operator.                                                                  |
| &                                                         | Bitwise AND.                                                                        |
| *                                                         | Bitwise exclusive OR.                                                               |
|                                                           | Bitwise inclusive OR.                                                               |
| <b>Relational Operator (Highest to Lowest Precedence)</b> |                                                                                     |
| <=                                                        | If the first expression is less than or equal to the second, the packet matches.    |
| >=                                                        | If the first expression is greater than or equal to the second, the packet matches. |
| <                                                         | If the first expression is less than the second, the packet matches.                |
| >                                                         | If the first expression is greater than the second, the packet matches.             |
| =                                                         | If the compared expressions are equal, the packet matches.                          |
| !=                                                        | If the compared expressions are unequal, the packet matches.                        |

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### monitor traffic count

```
user@host> monitor traffic count 2
listening on fxp0
04:35:49.814125 In my-server.home.net.1295 > my-server.work.net.telnet: . ack
4122529478 win 16798 (DF)
04:35:49.814185
Out my-server.work.net.telnet > my-server.home.net.1295: P
1:38(37) ack 0 win 17680 (DF) [tos 0x10]
```

### monitor traffic detail count

```
user@host> monitor traffic detail count 2
listening on fxp0
04:38:16.265864 In my-server.home.net.1295 > my-server.work.net.telnet: . ack
4122529971 win 17678 (DF) (ttl 121, id 6812)
04:38:16.265926
Out my-server.work.net.telnet.telnet > my-server.home.net.1295: P 1:38(37) ack 0
win 17680 (DF) [tos 0x10] (ttl 6)
```

### monitor traffic extensive (Absolute Sequence)

```
user@host> monitor traffic extensive no-domain-names no-resolve no-timestamp count 20
matching "tcp" absolute-sequence
listening on fxp0
In 207.17.136.193.179 > 192.168.4.227.1024: . 4042780859:4042780859(0)

                              `<verbose>`  
                              `<wait seconds>`

**Release Information**    Command introduced before Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Check host reachability and network connectivity. The **ping** command sends Internet Control Message Protocol (ICMP) ECHO\_REQUEST messages to elicit ICMP ECHO\_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

**Options** **host**—IP address or hostname of the remote system to ping.

**bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

**count requests**—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.

**detail**—(Optional) Include in the output the interface on which the ping reply was received.

**do-not-fragment**—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.

**NOTE:** In Junos OS Release 11.1 and later, when issuing the **ping** command for an IPv6 route with the **do-not-fragment** option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

**inet**—(Optional) Ping Packet Forwarding Engine IPv4 routes.

**inet6**—(Optional) Ping Packet Forwarding Engine IPv6 routes.

**interface source-interface**—(Optional) Interface to use to send the ping requests.

**interval seconds**—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.

**logical-system logical-system-name**—(Optional) Name of logical system from which to send the ping requests.

Alternatively, enter the **set cli logical-system logical-system-name** command and then run the **ping** command. To return to the main router or switch, enter the **clear cli logical-system** command.

**loose-source value**—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

**mac-address *mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**pattern *string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

**rapid**—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

**record-route**—(Optional) Record and report the packet's path (IPv4).

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

**size *bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is **0** through **65,468**. The default value is **56**, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**strict**—(Optional) Use the strict source route option (IPv4).

**strict-source *value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

**tos *type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is **0** through **255**.

**ttl *value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is **0** through **255**.

**verbose**—(Optional) Display detailed output.

**vpls *instance-name***—(Optional) Ping the instance to which this VPLS belongs.

**wait *seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is **10** seconds. If this option is used without the count option, a default count of **5** packets is used.

**Required Privilege Level**

network

**Related Documentation**

- [Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages on page 1803](#)

**List of Sample Output**    [ping hostname on page 4133](#)

[ping hostname rapid on page 4133](#)

[ping hostname size count on page 4133](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

## Sample Output

| <b>Description</b>         | Display the route that packets take to a specified network host. Use <b>traceroute</b> as a debugging tool to locate points of failure in a network.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>host</b>—IP address or name of remote host.</p> <p><b>as-number-lookup</b>—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.</p> <p><b>bypass-routing</b>—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.</p>                             |

**clns**—(Optional) Trace the route belonging to the Connectionless Network Service (CLNS).

**gateway address**—(Optional) Address of a router or switch through which the route transits.

**inet | inet6**—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

**interface *interface-name***—(Optional) Name of the interface over which to send packets.

**logical-system *logical-system-name***—(Optional) Perform this operation on all logical systems or on a particular logical system.

**monitor *host***—(Optional) Display real-time monitoring information for the specified host.

**mpls (*ldp FEC address* | *rsvp label-switched-path name*)**—(Optional) See *traceroute mpls ldp* and *traceroute mpls rsvp*.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**propagate-ttl**—(Optional) On the PE routing device, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only.

Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the **no-propagate-ttl** configuration statement.

**NOTE:** Using **propagate-ttl** with **traceroute** on the CE router does not show hop-by-hop information.

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the traceroute attempt.

**source *source-address***—(Optional) Source address of the outgoing traceroute packets.

**tos *value***—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is 0 through 255.

**ttl *value***—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is 0 through 128.

**wait *seconds***—(Optional) Maximum time to wait for a response to the traceroute request.

**Required Privilege Level**

network

**Output Fields** Table 307 on page 4136 describes the output fields for the **traceroute** command. Output fields are listed in the approximate order in which they appear.

**Table 307: traceroute Output Fields**

| Field Name             | Field Description                                             |
|------------------------|---------------------------------------------------------------|
| <b>traceroute to</b>   | IP address of the receiver.                                   |
| <b>hops max</b>        | Maximum number of hops allowed.                               |
| <b>byte packets</b>    | Size of packets being sent.                                   |
| <b>number-of-hops</b>  | Number of hops from the source to the named router or switch. |
| <b>router-name</b>     | Name of the router or switch for this hop.                    |
| <b>address</b>         | Address of the router or switch for this hop.                 |
| <b>Round trip time</b> | Average round-trip time, in milliseconds (ms).                |

## Sample Output

### traceroute

```
user@host> traceroute santacruz
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1 blue23 (10.168.1.254) 2.370 ms 2.853 ms 0.367 ms
 2 red14 (10.168.255.250) 0.778 ms 2.937 ms 0.446 ms
 3 yellow (10.156.169.254) 7.737 ms 89.905 ms 0.834 ms
```

### traceroute as-number-lookup host

```
user@host> traceroute as-number-lookup 10.100.1.1
traceroute to 10.100.1.1 (10.100.1.1), 30 hops max, 40 byte packets
 1 10.39.1.1 (10.39.1.1) 0.779 ms 0.728 ms 0.562 ms
 2 10.39.1.6 (10.39.1.6) [AS 32] 0.657 ms 0.611 ms 0.617 ms
 3 10.100.1.1 (10.100.1.1) [AS 10, 40, 50] 0.880 ms 0.808 ms 0.774 ms
```

### traceroute no-resolve

```
user@host> traceroute santacruz no-resolve
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1 10.168.1.254 0.458 ms 0.370 ms 0.365 ms
 2 10.168.255.250 0.474 ms 0.450 ms 0.444 ms
```

```
3 10.156.169.254 0.931 ms 0.876 ms 0.862 ms
```

### traceroute propagate-ttl

```
user@host> traceroute propagate-ttl 100.200.2.2 routing-instance VPN-A
traceroute to 100.200.2.2 (100.200.2.2) from 1.1.0.2, 30 hops max, 40 byte packets
```

```
1 1.2.0.2 (1.2.0.2) 2.456 ms 1.753 ms 1.672 ms
 MPLS Label=299776 CoS=0 TTL=1 S=0
 MPLS Label=299792 CoS=0 TTL=1 S=1
2 1.3.0.2 (1.3.0.2) 1.213 ms 1.225 ms 1.166 ms
 MPLS Label=299792 CoS=0 TTL=1 S=1
3 100.200.2.2 (100.200.2.2) 1.422 ms 1.521 ms 1.443 ms
```

### traceroute (Between CE Routers, Layer 3 VPN)

```
user@host> traceroute vpn09
traceroute to vpn09.skybank.net (10.255.14.179), 30 hops max, 40
byte packets
1 10.39.10.21 (10.39.10.21) 0.598 ms 0.500 ms 0.461 ms
2 10.39.1.13 (10.39.1.13) 0.796 ms 0.775 ms 0.806 ms
 MPLS Label=100006 CoS=0 TTL=1 S=1
3 vpn09.skybank.net (10.255.14.179) 0.783 ms 0.716 ms 0.686
```

### traceroute (Through an MPLS LSP)

```
user@host> traceroute mpls1
traceroute to 10.168.1.224 (10.168.1.224), 30 hops max, 40 byte packets
1 mpls1-sr0.company.net (10.168.200.101) 0.555 ms 0.393 ms 0.367 ms
 MPLS Label=1024 CoS=0 TTL=1
2 mpls5-lo0.company.net (10.168.1.224) 0.420 ms 0.394 ms 0.401 ms
```

## traceroute monitor

| <b>Release Information</b>      | Command introduced in Junos OS Release 8.0<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Display live monitoring of each hop in the route that packets take to a specified network host. Use as a debugging tool to locate points of failure in a network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b><i>host</i></b>—IP address or name of remote host.</p> <p><b><i>count value</i></b>—Number of ping requests, in packets, to send in summary mode. The default value is <b>10</b>.</p> <p><b><i>inet   inet6</i></b>—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.</p> <p><b><i>interval seconds</i></b>—(Optional) Number of seconds to wait before sending ping requests. The default value is <b>1</b>.</p> <p><b><i>no resolve</i></b>—(Optional) Do not attempt to display addresses symbolically.</p> <p><b><i>size value</i></b>—(Optional) Receive the specified number of bytes for each packet. The range is <b>0</b> through <b>65468</b> bytes. The default value is <b>64</b>.</p> <p><b><i>source source-address</i></b>—(Optional) Source address of the outgoing ping packets.</p> <p><b><i>summary</i></b>—(Optional) Generate and display a summary of live monitoring of each hop on the route that packets take to a specified network host.</p> |
| <b>Required Privilege Level</b> | network                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>List of Sample Output</b>    | <a href="#">traceroute monitor on page 4139</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Output Fields</b>            | <a href="#">Table 308 on page 4139</a> describes the output fields for the <b>traceroute monitor</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 308: traceroute monitor Output Fields

| Field Name   | Field Description                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Host</b>  | Hostname or IP address of the router at each hop.                                                                       |
| <b>Loss%</b> | Percent of packet loss. The number of ping responses divided by the number of ping requests, specified as a percentage. |
| <b>Snt</b>   | Number of ping requests sent to the router at this hop.                                                                 |
| <b>Last</b>  | Most recent round-trip time, in milliseconds, to the router at this hop.                                                |
| <b>Avg</b>   | Average round-trip time, in milliseconds, to the router at this hop.                                                    |
| <b>Best</b>  | Shortest round-trip time, in milliseconds, to the router at this hop.                                                   |
| <b>Wrst</b>  | Longest round-trip time, in milliseconds, to the router at this hop.                                                    |
| <b>StDev</b> | Standard deviation of round-trip times, in milliseconds, to the router at this hop.                                     |

## Sample Output

### traceroute monitor

```
user@host> traceroute monitor 10.16.0.1
```

| Host              | Loss% | Snt | Last | Avg | Best | Wrst | StDev |
|-------------------|-------|-----|------|-----|------|------|-------|
| 1. 10.17.41.254   | 0.0%  | 17  | 0.7  | 1.0 | 0.6  | 5.4  | 1.2   |
| 2. secret.net     | 0.0%  | 17  | 0.6  | 1.0 | 0.6  | 6.6  | 1.4   |
| 3. top-secret.net | 0.0%  | 17  | 0.6  | 0.6 | 0.6  | 0.6  | 0.0   |

## Operational Commands: Port Mirroring

## show analyzer

|                                 |                                                                                                                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <b>show analyzer <i>analyzer-name</i></b>                                                                                                                                   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                          |
| <b>Description</b>              | Display information about analyzers configured for port mirroring.                                                                                                          |
| <b>Options</b>                  | <b><i>analyzer-name</i></b> —(Optional) Displays the status of a specific analyzer on the switch.                                                                           |

| <b>Output Fields</b>            | <a href="#">Table 309 on page 4140</a> lists the output fields for the <b>command-name</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 309: show analyzer Output Fields**

| Field Name                          | Field Description                                                                                                                                                                                                                                                       |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Analyzer name</b>                | Displays the name of the analyzer.                                                                                                                                                                                                                                      |
| <b>Output interface</b>             | Specifies a local interface to which mirrored packets are sent. An analyzer can have output to either an interface or a VLAN, not both.                                                                                                                                 |
| <b>Output VLAN</b>                  | Specifies a VLAN to which mirrored packets are sent. An analyzer can have output to either an interface or a VLAN, not both.                                                                                                                                            |
| <b>Mirror ratio</b>                 | Displays the ratio of packets to be mirrored, between 1 and 2047 where 1 sends copies of all packets and 2047 sends copies of 1 out of every 2047 packets.                                                                                                              |
| <b>Loss priority</b>                | Displays the loss priority of mirrored packets. By default, loss priority is set to <b>low</b> , with mirrored traffic dropped in preference for regular traffic when capacity is exceeded. For analyzers with output to a VLAN, set the loss priority to <b>high</b> . |
| <b>Egress monitored interfaces</b>  | Displays interfaces for which traffic exiting the interfaces is mirrored.                                                                                                                                                                                               |
| <b>Ingress monitored interfaces</b> | Displays interfaces for which traffic entering the interfaces is mirrored.                                                                                                                                                                                              |
| <b>Ingress monitored VLANs</b>      | Displays VLANs for which traffic entering the VLAN is mirrored.                                                                                                                                                                                                         |

## Sample Output

### show analyzer

```
user@host> show analyzer
```

```
Analyzer name : employee-monitor
Output interface : ge-0/0/10.0
Output VLAN : remote-analyzer
Mirror ratio : 1
Loss priority : High
Egress monitored interfaces : ge-0/0/3.0
Ingress monitored interfaces : ge-0/0/0.0
Ingress monitored interfaces : ge-0/0/1.0
```

## Operational Commands: Ethernet OAM Link Fault Management

## show oam ethernet link-fault-management

|                                 |                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show oam ethernet link-fault-management<br><brief   detail><br><interface-name>                                                                                                                        |
| <b>Release Information</b>      | Command introduced in Junos OS Release 8.2.                                                                                                                                                            |
| <b>Description</b>              | On EX Series switches and M320, M120, MX Series, T320, and T640 routers, display Operation, Administration, and Management (OAM) link fault management information for Ethernet interfaces.            |
| <b>Options</b>                  | <b>brief   detail</b> —(Optional) Display the specified level of output.<br><br><b>interface-name</b> —(Optional) Display link fault management information for the specified Ethernet interface only. |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                   |
| <b>List of Sample Output</b>    | <a href="#">show oam ethernet link-fault-management brief on page 4146</a><br><a href="#">show oam ethernet link-fault-management detail on page 4146</a>                                              |
| <b>Output Fields</b>            | <a href="#">Table 310 on page 4142</a> lists the output fields for the <b>show oam ethernet link-fault-management</b> command. Output fields are listed in the approximate order in which they appear. |

Table 310: show oam ethernet link-fault-management Output Fields

| Field Name             | Field Description                                                                                                                                                                                                                              | Level of Output |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Status</b>          | Indicates the status of the established link.<br><br><ul style="list-style-type: none"> <li>• <b>Fail</b>—A link fault condition exists.</li> <li>• <b>Running</b>—A link fault condition does not exist.</li> </ul>                           | All levels      |
| <b>Discovery state</b> | State of the discovery mechanism:<br><br><ul style="list-style-type: none"> <li>• <b>Passive Wait</b></li> <li>• <b>Send Any</b></li> <li>• <b>Send Local Remote</b></li> <li>• <b>Send Local Remote Ok</b></li> <li>• <b>Fault</b></li> </ul> | All levels      |
| <b>Peer address</b>    | Address of the OAM peer.                                                                                                                                                                                                                       | All levels      |

Table 310: show oam ethernet link-fault-management Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Flags</b>                     | <p>Information about the interface. Possible values are described in the “Link Flags” section under “<a href="#">Common Output Fields Description</a>” on page 2376.</p> <ul style="list-style-type: none"> <li>• <b>Remote-Stable</b>—Indicates remote OAM client acknowledgment of and satisfaction with local OAM state information. <b>False</b> indicates that remote DTE either has not seen or is unsatisfied with local state information. <b>True</b> indicates that remote DTE has seen and is satisfied with local state information.</li> <li>• <b>Local-Stable</b>—Indicates local OAM client acknowledgment of and satisfaction with remote OAM state information. <b>False</b> indicates that local DTE either has not seen or is unsatisfied with remote state information. <b>True</b> indicates that local DTE has seen and is satisfied with remote state information.</li> <li>• <b>Remote-State-Valid</b>—Indicates the OAM client has received remote state information found within Local Information TLVs of received Information OAM PDUs. <b>False</b> indicates that OAM client has not seen remote state information. <b>True</b> indicates that the OAM client has seen remote state information.</li> </ul> | All levels      |
| <b>Remote loopback status</b>    | Indicates the remote loopback status. An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| <b>Remote entity information</b> | <p>Remote entity information.</p> <ul style="list-style-type: none"> <li>• <b>Remote MUX action</b>—Indicates the state of the multiplexer functions of the OAM sublayer. Device is forwarding non-OAM PDUs to the lower sublayer or discarding non-OAM PDUs.</li> <li>• <b>Remote parser action</b>—Indicates the state of the parser function of the OAM sublayer. Device is forwarding non-OAM PDUs to higher sublayer, looping back non-OAM PDUs to the lower sublayer, or discarding non-OAM PDUs.</li> <li>• <b>Discovery mode</b>—Indicates whether discovery mode is active or inactive.</li> <li>• <b>Unidirectional mode</b>—Indicates the ability to operate a link in a unidirectional mode for diagnostic purposes.</li> <li>• <b>Remote loopback mode</b>—Indicates whether remote loopback is supported or unsupported.</li> <li>• <b>Link events</b>—Indicates whether interpreting link events is supported or unsupported on the remote peer.</li> <li>• <b>Variable requests</b>—Indicates whether variable requests are supported. The Variable Request OAM PDU, is used to request one or more MIB variables from the remote peer.</li> </ul>                                                                        | All levels      |
| <b>OAM Receive Statistics</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                 |

## Sample Output

### show oam ethernet link-fault-management brief

```

user@host> show oam ethernet link-fault-management brief
Interface: ge-3/1/3
Status: Running, Discovery state: Send Any
Peer address: 00:90:69:72:2c:83
Flags:Remote-Stable Remote-State-Valid Local-Stable 0x50
Remote loopback status: Disabled on local port, Enabled on peer port
Remote entity information:
 Remote MUX action: discarding, Remote parser action: loopback
 Discovery mode: active, Unidirectional mode: unsupported
 Remote loopback mode: supported, Link events: supported
 Variable requests: unsupported

```

### show oam ethernet link-fault-management detail

```

user@host> show oam ethernet link-fault-management detail
Interface: ge-6/1/0
Status: Running, Discovery state: Send Any
Peer address: 00:90:69:0a:07:14
Flags:Remote-Stable Remote-State-Valid Local-Stable 0x50
OAM receive statistics:
 Information: 186365, Event: 0, Variable request: 0, Variable response: 0
 Loopback control: 0, Organization specific: 0

```

OAM transmit statistics:

| <b>Output Fields</b>            | <p><a href="#">Table 311 on page 4148</a> lists the output fields for the <b>show interfaces Fast Ethernet</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 311: show interfaces Fast Ethernet Output Fields**

| Field Name                | Field Description                                                                                                                                             | Level of Output              |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                               |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                               | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the "Enabled Field" section under " <a href="#">Common Output Fields Description</a> " on page 2376. | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                                           | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                                 | <b>detail extensive none</b> |

Table 311: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                   | Level of Output         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Link-level type</b>  | Encapsulation being used on the physical interface.                                                                                                                                                                                                 | All levels              |
| <b>MTU</b>              | Maximum transmission unit size on the physical interface.                                                                                                                                                                                           | All levels              |
| <b>Link-mode</b>        | Type of link connection configured for the physical interface: <b>Full-duplex</b> or <b>Half-duplex</b>                                                                                                                                             | <b>extensive</b>        |
| <b>Speed</b>            | Speed at which the interface is running.                                                                                                                                                                                                            | All levels              |
| <b>Loopback</b>         | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                                                                                                                      | All levels              |
| <b>Source filtering</b> | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                        | All levels              |
| <b>LAN-PHY mode</b>     | 10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.                                                       | All levels              |
| <b>WAN-PHY mode</b>     | 10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.                           | All levels              |
| <b>Unidirectional</b>   | Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.                                                                   | All levels              |
| <b>Flow control</b>     | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                            | All levels              |
| <b>Auto-negotiation</b> | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                           | All levels              |
| <b>Remote-fault</b>     | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul> | All levels              |
| <b>Device flags</b>     | Information about the physical device. Possible values are described in the "Device Flags" section under <a href="#">"Common Output Fields Description" on page 2376</a> .                                                                          | All levels              |
| <b>Interface flags</b>  | Information about the interface. Possible values are described in the "Interface Flags" section under <a href="#">"Common Output Fields Description" on page 2376</a> .                                                                             | All levels              |
| <b>Link flags</b>       | Information about the link. Possible values are described in the "Links Flags" section under <a href="#">"Common Output Fields Description" on page 2376</a> .                                                                                      | All levels              |
| <b>Wavelength</b>       | (10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).                                                                                                              | All levels              |

Table 311: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Frequency</b>               | (10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels                   |
| <b>CoS queues</b>              | Number of CoS queues configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> none |
| <b>Schedulers</b>              | (GigabitEthernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>             |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive</b>      |
| <b>Current address</b>         | Configured MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> none |
| <b>Hardware address</b>        | Hardware MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> none |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b> none |
| <b>Input Rate</b>              | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | None specified               |

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b> | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 311: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output         |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Output errors</b>            | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |
| <b>Egress queues</b>            | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |

Table 311: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output              |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul> | <b>detail extensive none</b> |
| <b>OTN FEC statistics</b>               | <p>The forward error correction (FEC) counters provide the following statistics:</p> <ul style="list-style-type: none"> <li>• <b>Corrected Errors</b>—The count of corrected errors in the last second.</li> <li>• <b>Corrected Error Ratio</b>—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.</li> </ul>                                                                                                                                                                                                                                                                                                                                                |                              |
| <b>PCS statistics</b>                   | <p>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</p> <ul style="list-style-type: none"> <li>• <b>Bit errors</b>—High bit error rate. Indicates the number of bit errors when the PCS receiver is operating in normal mode.</li> <li>• <b>Errored blocks</b>—Loss of block lock. The number of errored blocks when PCS receiver is operating in normal mode.</li> </ul>                                                                                                                                                                                                                                                    | <b>detail extensive</b>      |

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| MAC statistics                 | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <a href="#">show interfaces (10-Gigabit Ethernet)</a> command.</li> <li>• <b>Unicast packets</b>, <b>Broadcast packets</b>, and <b>Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of frames that exceed 1518 octets.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | extensive       |
| OTN Received Overhead Bytes    | APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | extensive       |

| <b>Filter statistics</b> | <p><b>Receive</b> and <b>Transmit</b> statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul> | <b>extensive</b> |
| <b>PMA PHY</b>           | <p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. | Received path trace, Transmitted path trace | <p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other routing device manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | extensive       |
| Packet Forwarding Engine configuration      | <p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | extensive       |

Table 311: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output              |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>CoS information</b>   | Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> <li>• <b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li>• <b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li>• <b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li>• <b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li>• <b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>• <b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li>• <b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul> | <b>extensive</b>             |
| <b>Logical Interface</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                              |
| <b>Logical interface</b> | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels                   |
| <b>Index</b>             | Index number of the logical interface, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>      | SNMP interface index number for the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive none</b> |
| <b>Generation</b>        | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>      |
| <b>Flags</b>             | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “ <a href="#">Common Output Fields Description</a> ” on page 2376.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels                   |

| <b>Transit statistics</b>       | Number and rate of bytes and packets transiting the switch.<br><br><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler. | <b>extensive</b>             |
| <b>Generation</b>               | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>      |

For example, 0 refers to the routing table inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| <b>Flags</b>                    | Information about protocol family flags. Possible values are described in the “Family Flags” section under “ <a href="#">Common Output Fields Description</a> ” on page 2376.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b>      |
| <b>Donor interface</b>          | (Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |
| <b>Preferred source address</b> | (Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Input Filters</b>            | Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b>      |
| <b>Output Filters</b>           | Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b>      |
| <b>Mac-Validate Failures</b>    | Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive none</b> |
| <b>Addresses, Flags</b>         | Information about the address flags. Possible values are described in the “Addresses Flags” section under “ <a href="#">Common Output Fields Description</a> ” on page 2376.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive none</b> |
| <b><i>protocol-family</i></b>   | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>brief</b>                 |
| <b>Flags</b>                    | Information about address flag (possible values are described in the “Addresses Flags” section under “ <a href="#">Common Output Fields Description</a> ” on page 2376.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive none</b> |
| <b>Destination</b>              | IP address of the remote side of the connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive none</b> |
| <b>Local</b>                    | IP address of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |
| <b>Broadcast</b>                | Broadcast address of the logical interlace.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive none</b> |

Table 311: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name | Field Description                                                 | Level of Output  |
|------------|-------------------------------------------------------------------|------------------|
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

## Sample Output

### show interfaces (Fast Ethernet)

```

user@host> show interfaces fe-0/0/0
Physical interface: fe-0/0/0, Enabled, Physical link is Up
 Interface index: 128, SNMP ifIndex: 22
 Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 CoS queues : 4 supported, 4 maximum usable queues
 Current address: 00:05:85:02:38:00, Hardware address: 00:05:85:02:38:00
 Last flapped : 2006-01-20 14:50:58 PST (2w4d 00:44 ago)
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)
 Active alarms : None
 Active defects : None
 Logical interface fe-0/0/0.0 (Index 66) (SNMP ifIndex 198)
 Flags: SNMP-Traps Encapsulation: ENET2
 Protocol inet, MTU: 1500
 Flags: None
 Addresses, Flags: Is-Preferred Is-Primary
 Destination: 10.10.10/24, Local: 10.10.10.1, Broadcast: 10.10.10.255

```

### show interfaces brief (Fast Ethernet)

```

user@host> show interfaces fe-0/0/0 brief
Physical interface: fe-0/0/0, Enabled, Physical link is Up
 Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Logical interface fe-0/0/0.0
 Flags: SNMP-Traps Encapsulation: ENET2
 inet 10.10.10.1/24

```

### show interfaces detail (Fast Ethernet)

```

user@host> show interfaces fe-0/0/0 detail
Physical interface: fe-0/0/0, Enabled, Physical link is Up
 Interface index: 128, SNMP ifIndex: 22, Generation: 5391
 Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 CoS queues : 4 supported, 4 maximum usable queues
 Hold-times : Up 0 ms, Down 0 ms
 Current address: 00:05:85:02:38:00, Hardware address: 00:05:85:02:38:00
 Last flapped : 2006-01-20 14:50:58 PST (2w4d 00:45 ago)
 Statistics last cleared: Never
 Traffic statistics:
 Input bytes : 0 0 bps
 Output bytes : 42 0 bps

```

```

Input packets: 0 0 pps
Output packets: 1 0 pps
Active alarms : None
Active defects : None
Logical interface fe-0/0/0.0 (Index 66) (SNMP ifIndex 198) (Generation 67)
 Flags: SNMP-Traps Encapsulation: ENET2
 Protocol inet, MTU: 1500, Generation: 105, Route table: 0
 Flags: Is-Primary, Mac-Validate-Strict
 Mac-Validate Failures: Packets: 0, Bytes: 0
 Addresses, Flags: Is-Preferred Is-Primary
 Destination: 10.10.10/24, Local: 10.10.10.1, Broadcast: 10.10.10.255,
 Generation: 136

```

### show interfaces extensive (Fast Ethernet)

```

user@host> show interfaces fe-0/0/0 extensive
Physical interface: fe-0/0/0, Enabled, Physical link is Up
Interface index: 128, SNMP ifIndex: 22, Generation: 5391
Link-level type: Ethernet, MTU: 1514, Link-mode: Full-duplex, Speed:
100mbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Enabled
Device flags : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
CoS queues : 4 supported, 4 maximum usable queues
Hold-times : Up 0 ms, Down 0 ms
Current address: 00:05:85:02:38:00, Hardware address: 00:05:85:02:38:00

|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                                                                                                                 |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                                                                                                                 | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <a href="#">“Common Output Fields Description” on page 2376</a> .                                                                                    | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                                                                                                                             | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                                                                                                                   | <b>detail extensive none</b> |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                               | <b>detail extensive</b>      |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                                                                                                                             | All levels                   |
| <b>MTU</b>                | Maximum transmission unit size on the physical interface.                                                                                                                                                                                       | All levels                   |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                                                                                                                                        | All levels                   |
| <b>Loopback</b>           | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                                                                                                                  | All levels                   |
| <b>Source filtering</b>   | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                    | All levels                   |
| <b>LAN-PHY mode</b>       | 10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.                                                   | All levels                   |
| <b>WAN-PHY mode</b>       | 10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.                       | All levels                   |
| <b>Unidirectional</b>     | Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.                                                               | All levels                   |
| <b>Flow control</b>       | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                        | All levels                   |
| <b>Auto-negotiation</b>   | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                       | All levels                   |
| <b>Remote-fault</b>       | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li><b>Online</b>—Autonegotiation is manually configured as online.</li> <li><b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul> | All levels                   |
| <b>Device flags</b>       | Information about the physical device. Possible values are described in the “Device Flags” section under <a href="#">“Common Output Fields Description” on page 2376</a> .                                                                      | All levels                   |
| <b>Interface flags</b>    | Information about the interface. Possible values are described in the “Interface Flags” section under <a href="#">“Common Output Fields Description” on page 2376</a> .                                                                         | All levels                   |

Table 312: show interfaces Gigabit Ethernet Output Fields (*continued*)

| Field Name                         | Field Description                                                                                                                                                                                                                                                           | Level of Output       |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| <b>Link flags</b>                  | Information about the link. Possible values are described in the “Links Flags” section under “ <a href="#">Common Output Fields Description</a> ” on page 2376.                                                                                                             | All levels            |
| <b>Wavelength</b>                  | (10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).                                                                                                                                      | All levels            |
| <b>Frequency</b>                   | (10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).                                                                                                                                            | All levels            |
| <b>CoS queues</b>                  | Number of CoS queues configured.                                                                                                                                                                                                                                            | detail extensive none |
| <b>Schedulers</b>                  | (Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.                                                                                                                                                                         | extensive             |
| <b>Hold-times</b>                  | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                                         | detail extensive      |
| <b>Current address</b>             | Configured MAC address.                                                                                                                                                                                                                                                     | detail extensive none |
| <b>Hardware address</b>            | Hardware MAC address.                                                                                                                                                                                                                                                       | detail extensive none |
| <b>Last flapped</b>                | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                        | detail extensive none |
| <b>Input Rate</b>                  | Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. | None specified        |
| <b>Output Rate</b>                 | Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.                                        | None specified        |
| <b>Statistics last cleared</b>     | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                           | detail extensive      |
| <b>Egress accounting overhead</b>  | Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.                                                                                                                                                                                 | detail extensive      |
| <b>Ingress accounting overhead</b> | Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.                                                                                                                                                                                | detail extensive      |

Table 312: show interfaces Gigabit Ethernet Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output         |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Traffic statistics</b> | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see <a href="#">Table 135 on page 1957</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Input errors</b>       | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |

Table 312: show interfaces Gigabit Ethernet Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output         |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Output errors</b>            | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |
| <b>Egress queues</b>            | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Queue counters (Egress)</b>  | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Ingress queues</b>           | Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>extensive</b>        |
| <b>Queue counters (Ingress)</b> | <p>CoS queue number and its associated user-configured forwarding class name. Table 312: show interfaces Gigabit Ethernet Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output              |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul> | <b>detail extensive none</b> |
| <b>OTN alarms</b>                       | Active OTN alarms identified on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>      |
| <b>OTN defects</b>                      | OTN defects received on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b>      |

The number of errored blocks when PCS receiver is operating in normal mode.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |

Table 312: show interfaces Gigabit Ethernet Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output  |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>MAC statistics</b>                 | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see <a href="#">Table 136 on page 1971</a></li> <li>• <b>Unicast packets</b>, <b>Broadcast packets</b>, and <b>Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of frames that exceed 1518 octets.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b> |
| <b>OTN Received Overhead Bytes</b>    | APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>extensive</b> |

Table 312: show interfaces Gigabit Ethernet Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Level of Output |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Filter statistics | <p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul> | extensive       |

| Received path trace, Transmitted path trace | <p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | extensive       |

Table 312: show interfaces Gigabit Ethernet Output Fields (*continued*)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output              |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>CoS information</b>   | Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> <li>• <b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li>• <b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li>• <b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li>• <b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li>• <b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>• <b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li>• <b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul> | <b>extensive</b>             |
| <b>Logical Interface</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                              |
| <b>Logical interface</b> | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels                   |
| <b>Index</b>             | Index number of the logical interface, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b> none |
| <b>SNMP ifIndex</b>      | SNMP interface index number for the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive</b> none |
| <b>Generation</b>        | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>      |
| <b>Flags</b>             | Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under " <a href="#">Common Output Fields Description</a> " on page 2376.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels                   |

| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>extensive</b>                   |
| <b>Local statistics</b>        | Number and rate of bytes and packets destined to the routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>                   |

Table 312: show interfaces Gigabit Ethernet Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Level of Output              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Transit statistics</b>       | Number and rate of bytes and packets transiting the switch.<br><br><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler. | <b>extensive</b>             |
| <b>Generation</b>               | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>      |
| <b>Route Table</b>              | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| <b>Flags</b>                    | Information about protocol family flags. Possible values are described in the “Family Flags” section under “ <a href="#">Common Output Fields Description</a> ” on page 2376.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b>      |
| <b>Donor interface</b>          | (Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |
| <b>Preferred source address</b> | (Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Input Filters</b>            | Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b>      |
| <b>Output Filters</b>           | Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b>      |
| <b>Mac-Validate Failures</b>    | Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive none</b> |
| <b>Addresses, Flags</b>         | Information about the address flags. Possible values are described in the “Addresses Flags” section under “ <a href="#">Common Output Fields Description</a> ” on page 2376.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive none</b> |
| <b><i>protocol-family</i></b>   | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>brief</b>                 |
| <b>Flags</b>                    | Information about address flag (possible values are described in the “Addresses Flags” section under “ <a href="#">Common Output Fields Description</a> ” on page 2376.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive none</b> |
| <b>Destination</b>              | IP address of the remote side of the connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive none</b> |
| <b>Local</b>                    | IP address of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |
| <b>Broadcast</b>                | Broadcast address of the logical interlace.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive none</b> |

Table 312: show interfaces Gigabit Ethernet Output Fields (*continued*)

| Field Name        | Field Description                                                 | Level of Output         |
|-------------------|-------------------------------------------------------------------|-------------------------|
| <b>Generation</b> | Unique number for use by Juniper Networks technical support only. | <b>detail extensive</b> |

For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. [Table 136 on page 1971](#) describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). In [Table 136 on page 1971](#), the **ge-0/3/0** interface is the inbound physical interface, and the **ge-0/0/0** interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit .50 (VLAN 50).

Table 313: Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type

| Interface Type              | Sample Command                               | Byte and Octet Counts Include                                                                                                                                                                                 | Comments                                                                                                                                      |
|-----------------------------|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Inbound physical interface  | <b>show interfaces ge-0/3/0 extensive</b>    | Traffic statistics:<br><br>Input bytes: 496 bytes per packet, representing the Layer 2 packet<br><br>MAC statistics:<br><br>Received octets: 500 bytes per packet, representing the Layer 2 packet + 4 bytes  | The additional 4 bytes are for the CRC.                                                                                                       |

## Layer 2 Port Mirroring Overview

---

On routing platforms and switches that contain an Internet Processor II ASIC, you can send a copy of any incoming packet from the routing platform or switch to an external host address or a packet analyzer for analysis. This is known as *port mirroring*. In Junos OS Release 9.3 and later, Juniper Networks MX Series 3D Universal Edge Routers in a Layer 2 environment support port mirroring for Layer 2 bridging traffic and virtual private LAN service (VPLS) traffic. In Junos OS Release 9.4 and later, MX Series routers in a Layer 2 environment also support port mirroring for Layer 2 VPN traffic over a circuit cross-connect (CCC) that transparently connects logical interfaces of the same type. In Junos OS Release 12.3R2, Juniper Networks EX Series switches support port mirroring for Layer 2 bridging traffic.

Layer 2 port mirroring enables you to specify the manner in which incoming and outgoing packets at specified ports are monitored and the manner in which copies of selected packets are forwarded to another destination, where the packets can be analyzed. MX Series routers and EX Series switches support Layer 2 port mirroring by performing flow monitoring functions using a class-of-service (CoS) architecture that is in concept similar to, but in particulars different from, other routing platforms and switches.

Like the M120 Multiservice Edge Router and M320 Multiservice Edge Routers, MX Series routers and EX Series switches support port mirroring of IPv4, IPv6, and VPLS packets simultaneously. However, the *Junos OS Layer 2 Configuration Guide* describes port mirroring only for Layer 2 bridging traffic (**family ethernet-switching**), Layer 2 VPLS traffic (**family vpls**) through an MX Series router, and Layer 2 VPN traffic that passes through a CCC (**family ccc**).

For general information about packet flow within MX Series routers and other routers, see the *Junos OS Class of Service Configuration Guide*.

In a Layer 3 environment, MX Series routers and EX Series switches support port mirroring of IPv4 (**family inet**) and IPv6 (**family inet6**) traffic. For information about Layer 3 port mirroring, see the *Routing Policy Configuration Guide*.

### Related Documentation

- [Layer 2 Port Mirroring Properties on page 4192](#)
- [Restrictions on Layer 2 Port Mirroring](#)
- [Application of Layer 2 Port Mirroring Types](#)

## Layer 2 Port Mirroring Properties

---

Port mirroring specifies the following types of properties:

- [Packet-Selection Properties on page 4193](#)
- [Packet Address Family on page 4193](#)
- [Mirror Destination Properties on page 4193](#)
- [Mirror-Once Option on page 4194](#)

### ***Packet-Selection Properties***

The packet-selection properties of Layer 2 port-mirroring specify how the sampled packets are to be selected for mirroring:

- The number of packets in each sample.
- The number of packets to mirror from each sample.
- The length to which mirrored packets are to be truncated.

### ***Packet Address Family***

The packet address family type specifies the type of traffic to be mirrored. In a Layer 2 environment, MX Series routers and EX Series switches support port mirroring for the following packet address families:

- Family type **ethernet-switching**—For mirroring VPLS traffic when the physical interface is configured with encapsulation type **ethernet-bridge**.
- Family type **ccc**—For mirroring Layer 2 VPN traffic.
- Family type **vpls**—For mirroring VPLS traffic.

**NOTE:** In typical applications, you send mirrored packets directly to an analyzer or a workstation for analysis, not to another router or switch. If you must send mirrored packets over a network, you should use tunnels. For Layer 2 VPN implementations, you can use the Layer 2 VPN routing instance type **l2vpn** to tunnel the packets to a remote destination.

For information about configuring a routing instance for Layer 2 VPN, see the *Junos OS VPNs Configuration Guide*. For a detailed Layer 2 VPN example configuration, see the *Junos OS Feature Guides*. For information about tunnel interfaces, see the *Junos® OS Network Interfaces*.

### ***Mirror Destination Properties***

For a given packet address family, the mirror destination properties of a Layer 2 port-mirroring instance specify how the selected packets are to be sent on a particular physical interface:

- The physical interface on which to send the selected packets.
- Whether filter checking is to be disabled for the mirror destination interface. By default, filter checking is enabled on all

**NOTE:** If you apply a filter to an interface that is also a Layer 2 port-mirroring destination, a commit failure occurs unless you have disabled filter checking for that mirror destination interface.

### **Mirror-Once Option**

If port mirroring is enabled at both ingress and egress interfaces, you can prevent the MX Series router and an EX Series switch from sending duplicate packets to the same destination (which would complicate the analysis of the mirrored traffic).

**NOTE:** The mirror-once port-mirroring option is a global setting. The option is independent of the packet selection properties and the packet family type-specific mirror destination properties.

- [Application of Layer 2 Port Mirroring Types](#)

---

### **Layer 2 Port Mirroring Global Instance**

On an MX Series router and on an EX Series switch, you can configure a set of port-mirroring properties that implicitly apply to packets received on all ports in the router (or switch) chassis. This set of port-mirroring properties is the *global instance* of Layer 2 port mirroring for the router or switch.

Within the global instance configuration, you can specify a set of mirror destination properties for each packet address family supported by Layer 2 port mirroring.

For a general description of Layer 2 port-mirroring properties, see “[Layer 2 Port Mirroring Properties](#)” on page 4192. For a comparison of the types of Layer 2 port mirroring available on an MX Series router and on an EX Series switch, see [Application of Layer 2 Port Mirroring Types](#).

### **Layer 2 Port Mirroring Named Instances**

This topic describes the following information:

- [Layer 2 Port Mirroring Named Instances Overview on page 4195](#)
- [Mirroring at Ports Grouped at the FPC Level on page 4195](#)
- [Mirroring at Ports Grouped at the PIC Level on page 4196](#)
- [Mirroring at a Group of Ports Bound to Multiple Named Instances on page 4196](#)

### Layer 2 Port Mirroring Named Instances Overview

On an MX Series router and on an EX Series switch, you can define a set of port-mirroring properties that you can explicitly bind to physical ports on the router or switch. This set of port mirroring properties is known as a *named instance* of Layer 2 port mirroring.

You can bind a named instance of Layer 2 port mirroring to physical ports associated with an MX Series router's or an EX Series switch's Packet Forwarding Engine components at different levels of the router (or switch) chassis:

- At the FPC level—You can bind a named instance to the physical ports associated with a specific Dense Port Concentrator (DPC) or to the physical ports associated with a specific Flexible Port Concentrator (FPC).
- At the PIC level—You can bind a named instance of port mirroring to a specific Packet Forwarding Engine (on a specific DPC) or to a specific PIC.

**NOTE:** MX Series routers support DPCs as well as FPCs and PICs. Unlike FPCs, DPCs do not support PICs. In the Junos OS CLI, however, you use FPC and PIC syntax to configure or display information about DPCs and the Packet Forwarding Engines on the DPCs.

The following points summarize the behavior of Layer 2 port mirroring based on named instances:

- The scope of packet selection is determined by the target of the binding—At the ports (or port) bound to a named instance of Layer 2 port mirroring, the router or switch selects input packets according to the packet-selection properties in the named instance.
- The destination of a selected packet is determined by the packet address family—Of the packets selected, the router or switch mirrors only the packets belonging to an address family for which the named instance of Layer 2 port mirroring specifies a set of mirror destination properties. In a Layer 2 environment, MX Series routers and EX Series switches support port mirroring of VPLS (**family ethernet-switching** or **family vpls**) traffic and Layer 2 VPN traffic with **family ccc**.

For a general description of Layer 2 port-mirroring properties, see "[Layer 2 Port Mirroring Properties](#)" on page 4192. For a comparison of the types of Layer 2 port mirroring available on an MX Series router and on an EX Series switch, see *Application of Layer 2 Port Mirroring Types*.

### Mirroring at Ports Grouped at the FPC Level

On an MX Series router and on an EX Series switch, you can bind a named instance of Layer 2 port mirroring to a specific DPC or FPC installed in the router (or switch) chassis. The port mirroring properties in the instance are applied to all Packet Forwarding Engines (and their associated ports) on the specified DPC or to all PICs (and their associated ports) installed in the specified FPC. Port mirroring properties that are bound to a DPC

or FPC override any port-mirroring properties bound at the global level or the MX Series router (or switch) chassis.

#### ***Mirroring at Ports Grouped at the PIC Level***

On an MX Series router and on an EX Series switch, you can bind a named instance of Layer 2 port mirroring to a specific Packet Forwarding Engine or PIC. The port-mirroring properties in that instance are applied to all ports associated with the specified Packet Forwarding Engine or PIC. Port-mirroring properties that are bound to a Packet Forwarding Engine or PIC override any port-mirroring properties bound at the DPC or FPC that contains them.

**NOTE:** For MX960 routers, there is a one-to-one mapping of Packet Forwarding Engines to Ethernet ports. Therefore, on MX960 routers only, you can configure port-specific bindings of port-mirroring instances.

#### ***Mirroring at a Group of Ports Bound to Multiple Named Instances***

On an MX Series router and on an EX Series switch, you can apply up to two named instances of Layer 2 port mirroring to the same group of ports within the router (or switch) chassis. By applying two different port-mirroring instances to the same DPC, FPC, Packet Forwarding Engine, or PIC, you can bind two distinct Layer 2 port mirroring specifications to a single group of ports.

**NOTE:** You can configure only one global instance of Layer 2 port mirroring on an MX Series router and on an EX Series switch.

**NOTE:** You can configure more than two port mirroring instances for each FPC by configuring inline port mirroring. For information on inline port mirroring, see [“Configuring Inline Port Mirroring” on page 4252](#).

#### **Layer 2 Port Mirroring of PE Router Logical Interfaces**

For an MX Series router or an EX Series switch configured as a provider edge (PE) router or PE switch on the customer-facing edge of a service provider network, you can apply a Layer 2 port-mirroring firewall filter at the following ingress and egress points to mirror

the traffic between the MX Series router (or an EX Series switch) and customer edge (CE) devices, such as routers and Ethernet switches.

[Table 314 on page 4197](#) describes the ways in which you can apply Layer 2 port-mirroring firewall filters to an MX Series router or an EX Series switch configured as a PE router or PE switch.

**Table 314: Application of Layer 2 Port Mirroring Firewall Filters on PE Routers and PE Switches**

| Point of Application                                             | Scope of Mirroring                                                                                                                                                                                                                                                                                                                                                                                             | Notes                                                                                                                                                                                                                                                                                                                                                                                                                  | Configuration Details                                                                                                                                                                                                                                                |

## **Layer 2 Port Mirroring Firewall Filters**

---

This topic describes the following information:

- [Layer 2 Port Mirroring Firewall Filters Overview on page 4198](#)
- [Mirroring of Packets Received or Sent on a Logical Interface on page 4199](#)
- [Mirroring of Packets Forwarded or Flooded to a VLAN on page 4199](#)
- [Mirroring of Packets Forwarded or Flooded to a VPLS Routing Instance on page 4200](#)

### **Layer 2 Port Mirroring Firewall Filters Overview**

On an MX Series router and on an EX Series switch, you can configure a firewall filter *term* to specify that Layer 2 port mirroring is to be applied to all packets at the interface to which the firewall filter is applied.

You can apply a Layer 2 port-mirroring firewall filter to the input or output logical interfaces (including aggregated Ethernet logical interfaces), to traffic forwarded or flooded to a VLAN, or traffic forwarded or flooded to a VPLS routing instance.

MX Series routers and EX Series switches support Layer 2 port mirroring of VPLS (**family ethernet-switching** or **family vpls**) traffic and Layer 2 VPN traffic with **family ccc** in a Layer 2 environment.

Within a firewall filter **term**, you can specify the Layer 2 port-mirroring properties under the **then** statement in either of the following ways:

- Implicitly reference the Layer 2 port mirroring properties in effect on the port.
- Explicitly reference a particular named instance of Layer 2 port mirroring.

**NOTE:** When configuring a Layer 2 port-mirroring firewall filter, do not include the optional **from** statement that specifies match conditions based on the route source address. Omit this statement so that all packets are considered to match and all *actions* and *action-modifiers* specified in the **then** statement are taken.

If you want to mirror all incoming packets, then you must not use the **from** statement; /\* comment: one configure filter terms with **from** if they are interested in mirroring only a subset of packet.

---

For a general description of Layer 2 port-mirroring properties, see “[Layer 2 Port Mirroring Properties](#)” on page 4192. For a comparison of the types of Layer 2 port mirroring available on an MX Series router and on an EX Series switch, see *Application of Layer 2 Port Mirroring Types*.

**NOTE:** If you associate integrated routing and bridging (IRB) with the VLAN (or VPLS routing instance), and also configure within the VLAN (or VPLS routing instance) a forwarding table filter with the `port-mirror` or `port-mirror-instance` action, then the IRB packet is mirrored as a Layer 2 packet. You can disable this behavior by configuring the `no-irb-layer-2-copy` statement in the VLAN (or VPLS routing instance).

For a detailed description of how to configure a Layer 2 port-mirroring firewall filter, see *Defining a Layer 2 Port-Mirroring Firewall Filter*.

For detailed information about how you can use Layer 2 port-mirroring firewall filters with MX Routers and EX Series switches configured as provider edge (PE) routers or PE switches, see “[Layer 2 Port Mirroring of PE Router Logical Interfaces](#)” on page 4196. For detailed information about configuring firewall filters in general (including in a Layer 3 environment), see the *Routing Policy Configuration Guide*.

#### ***Mirroring of Packets Received or Sent on a Logical Interface***

To mirror Layer 2 traffic received or sent on a logical interface, apply a port-mirroring firewall filter to the input or output of the interface.

A port-mirroring firewall filter can also be applied to an aggregated-Ethernet logical interface. For details, see *Layer 2 Port Mirroring of PE Router Aggregated Ethernet Interfaces*.

**NOTE:** If port-mirroring firewall filters are applied at both the input and output of a logical interface, two copies of each packet are mirrored. To prevent the router or switch from forwarding duplicate packets to the same destination, you can enable the “mirror-once” option for Layer 2 port mirroring in the global instance for the Layer 2 packet address family.

#### ***Mirroring of Packets Forwarded or Flooded to a VLAN***

To mirror Layer 2 traffic forwarded to or flooded to a VLAN, apply a port-mirroring firewall filter to the input to the forwarding table or flood table. Any packet received for the VLAN forwarding or flood table and that matches the filter conditions is mirrored.

For more information about VLANs, see *Layer 2 Bridge Domains Overview*. For information about flooding behavior in a VLAN, see *Layer 2 Learning and Forwarding for Bridge Domains Overview*.

**NOTE:** When you configure port mirroring on any interface under one VLAN, the mirrored packet can move to an external analyzer located under different VLANs.

### ***Mirroring of Packets Forwarded or Flooded to a VPLS Routing Instance***

To mirror Layer 2 traffic forwarded to or flooded to a VPLS routing instance, apply a port-mirroring firewall filter to the input to the forwarding table or flood table. Any packet received for the VPLS routing instance forwarding or flood table and that matches the filter condition is mirrored.

For more information about VPLS routing instances, see *Configuring a VPLS Routing Instance* and *Configuring VLAN Identifiers for Bridge Domains and VPLS Routing Instances*. For information about flooding behavior in VPLS, see the *Junos OS VPNs Configuration Guide*.

### **Layer 2 Port Mirroring to Multiple Destinations Using Next-Hop Groups**

On an MX Series router and on an EX Series switch, you can mirror traffic to multiple destinations by configuring next-hop groups in Layer 2 port-mirroring firewall filters applied to tunnel interfaces. The mirroring of packets to multiple destinations is also known as *multipacket port mirroring*,

**NOTE:** Junos OS Release 9.5 introduced support for Layer 2 port mirroring using next-hop groups on MX Series routers, but required installation of a Tunnel PIC. Beginning in Junos OS Release 9.6, Layer 2 port mirroring using next-hop groups on MX Series routers does not require Tunnel PICs.

On MX Series routers and on EX Series switches, you can define a firewall filter for mirroring packets to a next-hop group. The next-hop group can contain Layer 2 members, Layer 3 members, and subgroups that are either unit list (mirroring packets to each interface) or load-balanced (mirroring packets to one of several interfaces). The MX Series router and the EX Series switch supports up to 30 next-hop groups. Each next-hop group supports up to 16 next-hop addresses. Each next-hop group must specify at least two addresses.

To enable port mirroring to the members of a next-hop group, you specify the next-hop group as the filter action of a firewall filter, and then you apply the firewall filter to logical tunnel interfaces (**lt-**) or virtual tunnel interfaces (**vt-**) on the MX Series router or on the EX Series switch.

NOTE: The use of subgroups for load-balancing mirrored traffic is not supported.

Application of Layer 2 Port Mirroring Types

You can apply different sets of Layer 2 port-mirroring properties to the VPLS packets at different ingress or egress points of an MX Series or of an EX Series route.

[Table 315 on page 4201](#) describes the three types of Layer 2 port mirroring you can configure on an MX Series router and EX Series switch: the global instance, named instances, and firewall filters.

## Restrictions on Layer 2 Port Mirroring

The following restrictions apply to Layer 2 port mirroring:

- Only Layer 2 transit data (packets that contain chunks of data transiting the routing platform or switch as they are forwarded from a source to a destination) can be mirrored. Layer 2 local data (packets that contain chunks of data that are destined for or sent by the Routing Engine, such as Layer 2 control packets) are not mirrored.
- If you apply a port-mirroring filter to the output of a logical interface, only unicast packets are mirrored. To mirror broadcast packets, multicast packets, unicast packets with an unknown destination media access control (MAC) address, or packets with MAC entry in the destination MAC (DMAC) routing table, apply a filter to the input to the flood table of a VLAN or virtual private LAN service (VPLS) routing instance.
- The mirror destination device should be on a dedicated VLAN and should not participate in any bridging activity: The mirror destination device should not have a bridge to the ultimate traffic destination, and the mirror destination device should not send the mirrored packets back to the source address.
- For either the global port-mirroring instance or a named port-mirroring instance, you can configure only one mirror output interface per port-mirroring instance and packet address family. If you include more than one **interface** statement under the **family (ethernet-switching | ccc | vpls) output** statement, the previous **interface** statement is overridden.
- Layer 2 port-mirroring firewall filtering is not supported for logical systems.

In a Layer 2 port-mirroring firewall filter definition, the filter **action-modifier (port-mirror or port-mirror-instance *pm-instance-name*)** relies on port-mirroring properties defined in the global instance or named instances of Layer 2 port mirroring, which are configured under the **[edit forwarding-options port-mirroring]** hierarchy. Therefore, the filter **term** cannot support Layer 2 port mirroring for logical systems.

- For a Layer 2 port mirroring firewall filter in which you implicitly reference Layer 2 port mirroring properties by including the **port-mirror** statement, if multiple named instances of Layer 2 port mirroring are bound to the underlying physical interface, then only the first binding in the stanza (or the only binding) is used at the logical interface. This is done mainly for backward compatibility.
- Layer 2 port-mirroring firewall filters do not support the use of next-hop subgroups for load-balancing mirrored traffic.

## Behavior of Layer 2 Port Mirroring at Physical Interfaces

- [Precedence of Multiple Levels of Layer 2 Port Mirroring on a Physical Interface on page 4204](#)

### Precedence of Multiple Levels of Layer 2 Port Mirroring on a Physical Interface

You can bind different sets of Layer 2 port mirroring properties (the global instance and one or more named instances) at various levels of an MX Series router or of an EX Series switch chassis (at the chassis level, at the FPC level, or at the PIC level). Therefore, it is possible for a single group of physical interfaces to be bound to multiple Layer 2 port mirroring definitions.

If a group of ports (or, in the case of a PIC-level binding in an MX960 router, a single port) is bound to multiple Layer 2 port mirroring definitions, the router (or switch) applies the Layer 2 port-mirroring properties to those ports as follows:

1. **Chassis-level port-mirroring properties implicitly apply to all ports in the chassis.** If an MX Series router or an EX Series switch is configured with the global port-mirroring instance, those port mirroring properties apply to all ports. See *Configuring the Global Instance of Layer 2 Port Mirroring*.
2. **FPC-level port-mirroring properties override chassis-level properties.** If a DPC or FPC is bound to a named instance of port mirroring, those port mirroring properties apply to all ports associated with that DPC or FPC, overriding any port mirroring properties bound at the chassis level. See [“Binding Layer 2 Port Mirroring to Ports Grouped at the FPC Level” on page 4214](#).
3. **PIC-level port-mirroring properties override FPC-level properties.** If a Packet Forwarding Engine or PIC is bound to a named instance of port mirroring, those port mirroring properties apply to all ports associated with the Packet Forwarding Engine or PIC, overriding any port mirroring properties bound to those ports at the FPC level. See [“Binding Layer 2 Port Mirroring to Ports Grouped at the PIC Level” on page 4216](#).

### Layer 2 Port Mirroring of PE Router or PE Switch Logical Interfaces

For a router or switch configured as a provider edge (PE) device on the customer-facing edge of a service provider network, you can apply a Layer 2 port-mirroring firewall filter at the following ingress and egress points to mirror the traffic between the router or switch and customer edge (CE) devices, which are typically also routers and Ethernet switches.

[Table 314 on page 4197](#) describes the ways in which you can apply Layer 2 port-mirroring firewall filters to a router or switch configured as a PE device.

**Table 316: Application of Layer 2 Port Mirroring Firewall Filters on PE Devices**

| Point of Application                      | Scope of Mirroring                                                                                                                                                                                                                                                                                                                                               | Notes                                                                                                                                                                                                                                                                                                                                                                 | Configuration Details                                                                                                                                                                                                                                                     |

**Layer 2 Port Mirroring of PE Router or PE Switch Aggregated Ethernet Interfaces**

An aggregated Ethernet interface is a virtual aggregated link that consists of a set of physical interfaces of the same speed and operating in full-duplex link connection mode. You can configure aggregated Ethernet interfaces between CE devices and PE devices for VPLS routing instances. Traffic is load-balanced across all of the links in the aggregated interface. If one or more links in the aggregated interface fails, the traffic is switched to the remaining links.

You can apply a Layer 2 port-mirroring firewall filter to an aggregated Ethernet interface to configure port mirroring at the parent interface. However, if any child interfaces are bound to different Layer 2 port-mirroring instances, packets received at the child interfaces will be mirrored to the destinations specified by their respective port-mirroring instances. Thus, multiple child interfaces can mirror packets to multiple destinations.

For example, suppose the parent aggregated Ethernet interface instance **ae0** has two child interfaces:

- **xe-2/0/0**
- **xe-3/1/2**

Suppose that these child interfaces on **ae0** are bound to two different Layer 2 port-mirroring instances:

- **pm\_instance\_A**—A named instance of Layer 2 port mirroring, bound to child interface **xe-2/0/0**.

- **pm\_instance\_B**—A named instance of Layer 2 port mirroring, bound to child interface **xe-3/1/2**.

Now suppose you apply a Layer 2 port-mirroring firewall filter to the Layer 2 traffic sent on **ae0.0** (logical unit **0** on the aggregated Ethernet interface instance **0**). This enables port mirroring on **ae0.0**, which has the following effect on the processing of traffic received on the child interfaces for which Layer 2 port-mirroring properties are specified:

- The packets received on **xe-2/0/0.0** are mirrored to the output interfaces configured in port-mirroring instance **pm\_instance\_A**.
- The packets received on **xe-3/1/2.0** are mirrored to the output interfaces configured in port-mirroring instance **pm\_instance\_B**.

Because **pm\_instance\_A** and **pm\_instance\_B** can specify different packet-selection properties or mirror destination properties, the packets received on **xe-2/0/0.0** and **xe-3/1/2.0** can mirror different packets to different destinations.

### Configuring the Global Instance of Layer 2 Port Mirroring

---

On an MX Series router and on an EX Series switch, you can configure a set of Layer 2 port-mirroring properties that implicitly apply to packets received on all ports in the router (or switch) chassis.

To configure the global instance of Layer 2 port mirroring on an MX Series router and on an EX Series switch:

1. Enable configuration of the Layer 2 port mirroring:

```
[edit]
user@host# edit forwarding-options port-mirroring
```

2. Enable configuration of the packet-selection properties:

```
[edit forwarding-options port-mirroring]
user@host# edit input
```

3. Specify global-level packet-selection properties.

- a. Specify the number of packets to select:

```
[edit forwarding-options port-mirroring input]
user@host# set rate number
```

The valid range is 1 through 65535.

- b. Specify the number of packets to mirror from each selection:

```
[edit forwarding-options port-mirroring input]
user@host# set run-length number
```

The valid range is 0 through 20. The default value is 0.

- c. Specify the length to which mirrored packets are to be truncated:

```
[edit forwarding-options port-mirroring input]
user@host# set maximum-packet-length number
```

The valid range is 0 through 9216. The default value is 0, which means the mirrored packets are not truncated.

4. Specify the global-level Layer 2 address-type family from which traffic is to be selected for mirroring:

```
[edit forwarding-options port-mirroring input]
user@host# up
[edit forwarding-options port-mirroring]
user@host# edit family family
```

The value of the *family* option can be **ethernet-switching**, **ccc**, or **vpls**.

**NOTE:** Under the [edit forwarding-options port-mirroring] hierarchy level, the protocol family statement family ethernet-switching is an alias for family vpls. The command-line interface (CLI) displays Layer 2 port-mirroring configurations as family vpls, even for Layer 2 port-mirroring configured as family ethernet-switching. Use family ethernet-switching when the physical interface is configured with encapsulation ethernet-bridge.

5. Enable configuration of global-level mirror destination properties for this address family:

```
[edit forwarding-options port-mirroring family family]
user@host# edit output
```

6. Specify global-level mirror destination properties for this address family.

- a. Specify the physical interface on which to send the mirrored packets:

```
[edit forwarding-options port-mirroring family family output]
user@host# set interface interface-name
```

You can also specify an integrated routing and bridging (IRB) interface as the output interface.

- b. (Optional) Allow configuration of filters on the destination interface for the named port-mirroring instance:

```
[edit forwarding-options port-mirroring family family output]
user@host# set no-filter-check
```

7. (Optional) Specify that any packets selected for mirroring are to be mirrored only once to any mirroring destination:

```
[edit forwarding-options port-mirroring family family output]
user@host# up 2
[edit forwarding-options port-mirroring]
user@host# set mirror-once
```

**TIP:** Enable the mirror-once option when an MX Series router or an EX Series switch is configured to perform Layer 2 port mirroring at both ingress and egress interfaces, which could result in sending duplicate packets to the same destination (which would complicate the analysis of the mirrored traffic).

8. Verify the minimum configuration of the global instance of Layer 2 port mirroring:

```
[edit forwarding-options ...]
user@host# top
[edit]
user@host# show forwarding-options

forwarding-options {
```

```
port-mirroring {
 input { # Global packet-selection properties.
 maximum-packet-length number; # Default is 0.
 rate number;
 run-length number;
 }
 family (ccc | vpls) { # Address- type 'ethernet-switching' displays as 'vpls'.
 output { # Global mirror destination properties.
 interface interface-name;
 no-filter-check; # Optional. Allow filters on interface.
 }
 }
 mirror-once; # Optional. Mirror destinations do not receive duplicate packets.
}
```

---

**Defining a Named Instance of Layer 2 Port Mirroring**

---

On an MX Series router and on an EX Series switch, you can define a set of Layer 2 port-mirroring properties that you can bind to a particular Packet Forwarding Engine (at the PIC level of the router or switch chassis) or to a group of Packet Forwarding Engines (at the DPC or FPC level of the chassis).

To define a named instance of Layer 2 port mirroring on an MX Series router or on an EX Series switch:

1. Enable configuration of a named instance of Layer 2 port mirroring :

```
[edit]
user@host# edit forwarding-options port-mirroring instance pm-instance-name
```

2. Enable configuration of the packet-sampling properties:

```
[edit forwarding-options port-mirroring instance pm-instance-name]
user@host# edit input
```

3. Specify packet-selection properties:

a. Specify the number of packets to select:

```
[edit forwarding-options port-mirroring instance pm-instance-name input]
user@host# set rate number
```

The valid range is 1 through 65535.

b. Specify the number of packets to mirror from each selection:

```
[edit forwarding-options port-mirroring instance pm-named-instance input]
user@host# set run-length number
```

The valid range is 0 through 20. The default value is 0.

**NOTE:** The `run-length` statement is not supported on MX80 routers.

c. Specify the length to which mirrored packets are to be truncated:

```
[edit forwarding-options port-mirroring instance pm-instance-name input]
user@host# set maximum-packet-length number
```

The valid range is 0 through 9216. The default value is 0, which means the mirrored packets are not truncated.

**NOTE:** The `maximum-packet-length` statement is not supported on MX80 routers.

4. Enable configuration of the mirror destination properties for Layer 2 packets that are part of bridging domain, Layer 2 switching cross-connects, or virtual private LAN service (VPLS):

a. Specify the Layer 2 address family type of traffic to be mirrored:

```
[edit forwarding-options port-mirroring instance pm-instance-name input]
user@host# up
[edit forwarding-options port-mirroring instance pm-instance-name]
user@host# edit family family
```

The value of the `family` option can be `ethernet-switching`, `ccc`, or `vpls`.

**NOTE:** Under the `[edit forwarding-options port-mirroring]` hierarchy level, the protocol family statement `family ethernet-switching` is an alias for `family vpls`. The command-line interface (CLI) displays Layer 2 port-mirroring configurations as `family vpls`, even for Layer 2 port-mirroring configured as `family ethernet-switching`. Use `family ethernet-switching` when the physical interface is configured with `encapsulation ethernet-bridge`.

Enable configuration of the mirror destination properties:

- b. [edit forwarding-options port-mirroring instance *pm-instance-name* family *family*]  
user@host# edit output

5. Specify mirror destination properties.

- a. Specify the physical interface on which to send the mirrored packets:

```
[edit forwarding-options port-mirroring instance pm-instance-name family family
output]
user@host# set interface interface-name
```

- b. (Optional) Allow configuration of filters on the destination interface for the global port-mirroring instance:

```
[edit forwarding-options port-mirroring instance pm-instance-name family family
output]
user@host# set no-filter-check
```

**NOTE:** You cannot configure port mirroring instances on MX80 routers. You can only configure port mirroring at the global level on MX80 routers.

- 6. (Optional) Specify that any packets selected for mirroring are to be mirrored only once to any mirroring destination:

```
[edit forwarding-options port-mirroring instance pm-instance-name family family
output]
user@host# up 3
[edit forwarding-options port-mirroring]
user@host# set mirror-once
```

**TIP:** Enable the global mirror-once option when an MX Series router or an EX Series switch is configured to perform Layer 2 port mirroring at both ingress and egress interfaces, which could result in sending duplicate packets to the same destination (which in turn would complicate the analysis of the mirrored traffic).

- 7. To configure a mirroring destination for a different packet family type, repeat steps 4 through 6.

- 8. Verify the minimum configuration of the named instances of Layer 2 port mirroring:

```
[edit forwarding-options ...]
user@host# top
[edit]
user@host# show forwarding-options

forwarding-options {
 port-mirroring {
 ... optional-global-port-mirroring-configuration ...
 instance {
 pm-instance-name (# A named instance of port mirroring
 input { # Packet-selection properties
```

```

 maximum-packet-length number; # Default is 0.
 rate number;
 run-length number;
 }
 family (ccc | vpls) { # Address- type 'ethernet-switching' displays as 'vpls'.
 output { # Mirror destination properties
 interface interface-name;
 no-filter-check; # Optional. Allow filters on interface.
 }
 }
}
mirror-once; # Optional. Mirror destinations do not receive duplicate packets.
}

```

### Binding Layer 2 Port Mirroring to Ports Grouped at the FPC Level

---

On an MX Series router and on an EX Series switch, you can bind a named instance of Layer 2 port mirroring to a specific DPC or to a specific FPC in the router (or switch) chassis. This is known as binding a named instance of Layer 2 port mirroring *at the FPC level* of the router (or switch) chassis. The port mirroring properties specified in the named instance are applied to all physical ports associated with all Packet Forwarding Engines on the specified DPC or FPC.

**NOTE:** You can also bind a named instance of Layer 2 port mirroring to a specific Packet Forwarding Engine on a DPC or FPC in the router (or switch) chassis.

For any packet-type family supported by Layer 2 port mirroring

- Port mirroring properties bound to a specific DPC or FPC override any port-mirroring properties configured at the global level.
- Port mirroring properties bound to a specific Packet Forwarding Engine override any port-mirroring properties configured at the DPC or FPC level.

You can apply up to two named instances of Layer 2 port mirroring to the same group of ports within the router (or switch) chassis. By applying two different port-mirroring instances to the same DPC or FPC, you can bind two distinct Layer 2 port mirroring specifications to a single group of ports.

Before you begin, complete the following tasks:

- Define a named instance of Layer 2 port mirroring. See *Defining a Named Instance of Layer 2 Port Mirroring*.
- Display information about the number and types of DPCs or FPCs in the MX Series router and in the EX Series switch, the number of Packet Forwarding Engines on each, and the number and types of ports per Packet Forwarding Engine. See *Displaying Information About DPCs or FPCs in an MX Series Router*.

To bind a named instance of Layer 2 port-mirroring to a DPC or FPC and its Packet Forwarding Engines:

1. Enable configuration of the router (or switch) chassis properties:

```
[edit]
user@host# edit chassis
```

2. Enable configuration of a DPC (and its corresponding Packet Forwarding Engines) or an FPC (and its installed PICs):

```
[edit chassis]
user@host# edit fpc slot-number
```

3. Bind a named instance of Layer 2 port mirroring (*pm-instance-name*) to the DPC or FPC:

```
[edit chassis fpc slot-number]
user@host# set port-mirror-instance pm-instance-name
```
