- [Verifying Graceful Restart Operation on page 2271](#)

Example: Managing Helper Modes for OSPF Graceful Restart

- [Requirements on page 2164](#)
- [Overview on page 2164](#)
- [Configuration on page 2164](#)
- [Verification on page 2165](#)

Requirements

M Series or T Series routers running Junos OS Release 11.4 or later and EX Series switches.

Overview

Junos OS Release 11.4 extends OSPF graceful restart support to include restart signaling-based helper mode. Both standard (RFC 3623-based) and restart signaling-based helper modes are enabled by default, irrespective of the graceful-restart configuration status on the routing device.

Junos OS, however, enables you to choose between the helper modes with the **helper-disable <standard | restart-signaling | both>** statement.

Configuration

Both standard and restart signaling-based helper modes are enabled by default, irrespective of the graceful-restart configuration status on the routing device. Junos OS allows you to disable or enable the helper modes based on your requirements.

To configure the helper mode options for graceful restart:

1. To enable graceful restart, add the **graceful-restart** statement at the **[edit routing-options]** hierarchy level.

```
[edit routing-options]
user@host# set graceful-restart
```

The helper modes, both standard and restart signaling-based, are enabled by default.

2. To disable one or both of the helper modes, add the **helper-disable <both | restart-signaling | standard>** statement at the **[edit protocols ospf graceful-restart]** hierarchy level.

- To disable both standard and restart signaling-based helper modes:

```
[edit protocols ospf graceful-restart]
user@host# set helper-disable both
```

- To disable only the restart signaling-based helper mode:

```
[edit protocols ospf graceful-restart]
user@host# set helper-disable restart-signaling
```

- To disable only the standard helper mode:

```
[edit protocols ospf graceful-restart]
user@host# set helper-disable standard
```

NOTE: You must commit the configuration before the change takes effect.

The last committed statement always takes precedence over the previous one.

3. To enable one or both of the helper modes when the helper modes are disabled, delete the **helper-disable <both | restart-signaling | standard>** statement from the **[edit protocols ospf graceful-restart]** hierarchy level.

- To enable both standard and restart signaling-based helper modes:

```
[edit protocols ospf graceful-restart]
user@host# delete helper-disable
```

- To enable the restart signaling-based helper mode:

```
[edit protocols ospf graceful-restart]
user@host# delete helper-disable restart-signaling
```

- To enable the standard helper mode:

```
[edit protocols ospf graceful-restart]
user@host# delete helper-disable standard
```

NOTE: You must commit the configuration before the change takes effect.

The last committed statement always takes precedence over the previous one.

Verification

Confirm that the configuration is working properly.

- [Verifying OSPF Graceful Restart and Helper Mode Configuration on page 2165](#)

Verifying OSPF Graceful Restart and Helper Mode Configuration

Purpose Verify the OSPF graceful restart and helper mode configuration on a router.

- Action**
- Enter the **run show ospf overview** command from configuration mode.

```
user@host# run show ospf overview
```

```
~
~
~
Restart: Enabled
  Restart duration: 180 sec
  Restart grace period: 210 sec
  Graceful restart helper mode: Enabled
  Restart-signaling helper mode: Enabled
~
~
~
```

Meaning The output shows that graceful restart and both of the helper modes are enabled.

graceful-restart (Enabling Globally)

Syntax	<pre>graceful-restart { disable; helper-disable; maximum-helper-recovery-time <i>seconds</i>; maximum-helper-restart-time <i>seconds</i>; notify-duration <i>seconds</i>; recovery-time <i>seconds</i>; restart-duration <i>seconds</i>; stale-routes-time <i>seconds</i>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options], [edit routing-options], [edit routing-instances <i>routing-instance-name</i> routing-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	<p>Configure graceful restart globally to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally.</p> <p>For VPNs, the graceful-restart statement allows a router whose VPN control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers.</p> <p>For BGP, if you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.</p>
Default	Graceful restart is disabled by default.
Options	The remaining statements are explained separately.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Enabling Graceful Restart on page 2127• Configuring Routing Protocols Graceful Restart on page 2128• Configuring Graceful Restart for MPLS-Related Protocols on page 2134• Configuring VPN Graceful Restart on page 2136• Configuring Logical System Graceful Restart on page 2137• Graceful Restart Configuration Statements• Configuring Graceful Restart for QFabric Systems

helper-disable (Multiple Protocols)

Syntax	helper-disable;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols (isis ldp ospf ospf3 rsvp) graceful-restart], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ldp ospf ospf3) graceful-restart], [edit protocols (isis ldp ospf ospf3 rsvp) graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols (ldp ospf ospf3) graceful-restart]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Disable helper mode for graceful restart. When helper mode is disabled, a router or switch cannot help a neighboring router that is attempting to restart.
Default	Helper mode is enabled by default for these supported protocols: IS-IS, LDP, OSPF/OSPFv3, and RSVP.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Routing Protocols Graceful Restart on page 2128 • Configuring Graceful Restart for MPLS-Related Protocols on page 2134

maximum-helper-recovery-time

Syntax	maximum-helper-recovery-time <i>seconds</i> ;
Hierarchy Level	[edit protocols rsvp graceful-restart], [edit logical-systems <i>logical-system-name</i> protocols rsvp graceful-restart]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Specify the length of time the router or switch retains the state of its Resource Reservation Protocol (RSVP) neighbors while they undergo a graceful restart.
Options	<p><i>seconds</i>—Length of time that the router retains the state of its Resource Reservation Protocol (RSVP) neighbors while they undergo a graceful restart.</p> <p>Range: 1 through 3600</p> <p>Default: 180</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Graceful Restart Options for RSVP, CCC, and TCC on page 2135 • maximum-helper-restart-time (RSVP) on page 2170

maximum-helper-restart-time (RSVP)

Syntax	maximum-helper-restart-time <i>seconds</i> ;
Hierarchy Level	[edit protocols rsvp graceful-restart], [edit logical-systems <i>logical-system-name</i> protocols rsvp graceful-restart]
Release Information	Statement introduced in Junos OS Release 8.3.
Description	Specify the length of time the router or switch waits after it discovers that a neighboring router has gone down before it declares the neighbor down. This value is applied to all RSVP neighbor routers and should be based on the time that the slowest RSVP neighbor requires for restart.
Options	seconds —The time the router or switch waits after it discovers that a neighboring router has gone down before it declares the neighbor down. Range: 1 through 1800 Default: 60
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Graceful Restart Options for RSVP, CCC, and TCC on page 2135• maximum-helper-recovery-time on page 2169

maximum-neighbor-reconnect-time

Syntax	maximum-neighbor-reconnect-time <i>seconds</i> ;
Hierarchy Level	[edit protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
Release Information	Statement introduced in Junos OS Release 9.1.
Description	Specify the maximum length of time allowed to reestablish connection from a restarting neighbor.
Options	seconds —Maximum time allowed for reconnection. Range: 30 through 300
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Configuration: NSB

- [Configuring Nonstop Bridging on page 2180](#)
- [Resetting Local Statistics on page 2181](#)

Configuring Nonstop Bridging

This section includes the following topics:

- [Enabling Nonstop Bridging on page 2180](#)
- [Synchronizing the Routing Engine Configuration on page 2180](#)
- [Verifying Nonstop Bridging Operation on page 2181](#)

Enabling Nonstop Bridging

Nonstop bridging requires you to configure graceful Routing Engine switchover (GRES). To enable graceful Routing Engine switchover, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level:

```
[edit chassis redundancy]
graceful-switchover;
```

By default, nonstop bridging is disabled. To enable nonstop bridging, include the **nonstop-bridging** statement at the **[edit protocols layer2-control]** hierarchy level:

```
[edit protocols layer2-control]
nonstop-bridging;
```

To disable nonstop active routing, remove the **nonstop-bridging** statement from the **[edit protocols layer2-control]** hierarchy level.

Synchronizing the Routing Engine Configuration

When you configure nonstop bridging, you must also include the **commit synchronize** statement at the **[edit system]** hierarchy level so that, by default, when you issue the **commit** command, the configuration changes are synchronized on both Routing Engines.

If you issue the **commit synchronize** command at the **[edit]** hierarchy level on the backup Routing Engine, the Junos OS displays a warning and commits the candidate configuration.

NOTE: A newly inserted backup Routing Engine automatically synchronizes its configuration with the master Routing Engine configuration.

When you configure nonstop bridging, you can bring the backup Routing Engine online after the master Routing Engine is already running. There is no requirement to start the two Routing Engines simultaneously.

Verifying Nonstop Bridging Operation

When you enable nonstop bridging, you can issue Layer 2 Control Protocol-related operational mode commands on the backup Routing Engine. However, the output of the commands might not match the output of the same commands issued on the master Routing Engine.

Related Documentation

- [Nonstop Bridging System Requirements on page 2071](#)
- [nonstop-bridging on page 2182](#)
- [Configuring Nonstop Bridging on EX Series Switches \(CLI Procedure\)](#)

Resetting Local Statistics

After a graceful Routing Engine switchover, we recommend that you issue the **clear interface statistics** (*interface-name* | **all**) command to reset the cumulative values for local statistics on the new master Routing Engine.

 - *[edit protocols] Hierarchy Level*

nonstop-bridging

Syntax	nonstop-bridging;
Hierarchy Level	[edit protocols layer2-control]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	For routing platforms with two Routing Engines, configure a master Routing Engine to switch over gracefully to a backup Routing Engine and preserve Layer 2 Control Protocol (L2CP) information.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Synchronizing the Routing Engine Configuration on page 2183• Configuring Nonstop Bridging on page 2180• <i>Configuring Nonstop Bridging on EX Series Switches (CLI Procedure)</i>

Configuration: NSR

- [Configuring Nonstop Active Routing on page 2183](#)
- [Tracing Nonstop Active Routing Synchronization Events on page 2185](#)
- [Example: Configuring Nonstop Active Routing on page 2189](#)

Configuring Nonstop Active Routing

This section includes the following topics:

- [Enabling Nonstop Active Routing on page 2183](#)
- [Synchronizing the Routing Engine Configuration on page 2183](#)
- [Verifying Nonstop Active Routing Operation on page 2184](#)

Enabling Nonstop Active Routing

Nonstop active routing (NSR) requires you to configure graceful Routing Engine switchover (GRES). To enable graceful Routing Engine switchover, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level:

```
[edit chassis redundancy]
graceful-switchover;
```

By default, nonstop active routing is disabled. To enable nonstop active routing, include the **nonstop-routing** statement at the **[edit routing-options]** hierarchy level:

```
[edit routing-options]
nonstop-routing;
```

To disable nonstop active routing, remove the **nonstop-routing** statement from the **[edit routing-options]** hierarchy level.

NOTE: When you enable nonstop active routing, you cannot enable automatic route distinguishers for multicast VPN routing instances. Automatic route distinguishers are enabled by configuring the **route-distinguisher-id** statement at the **[edit routing-instances instance-name]** hierarchy level; for more information, see the *Junos OS VPNs Configuration Guide*.

To enable the routing platform to switch over to the backup Routing Engine when the routing protocol process (rpd) fails rapidly three times in succession, include the **other-routing-engine** statement at the **[edit system processes routing failover]** hierarchy level.

For more information about the **other-routing-engine** statement, see the *Junos OS System Basics Configuration Guide*.

Synchronizing the Routing Engine Configuration

When you configure nonstop active routing, you must also include the **commit synchronize** statement at the **[edit system]** hierarchy level so that configuration changes are synchronized on both Routing Engines:

```
[edit system]
commit synchronize;
```

If you try to commit the nonstop active routing configuration without including the **commit synchronize** statement, the commit fails.

If you configure the **commit synchronize** statement at the **[edit system]** hierarchy level and issue a commit in the master Routing Engine, the master configuration is automatically synchronized with the backup.

However, if the backup Routing Engine is down when you issue the commit, the Junos OS displays a warning and commits the candidate configuration in the master Routing Engine. When the backup Routing Engine comes up, its configuration will automatically be synchronized with the master.

NOTE: A newly inserted backup Routing Engine automatically synchronizes its configuration with the master Routing Engine configuration.

When you configure nonstop active routing, you can bring the backup Routing Engine online after the master Routing Engine is already running. There is no requirement to start the two Routing Engines simultaneously.

Verifying Nonstop Active Routing Operation

To see whether or not nonstop active routing is enabled, issue the **show task replication** command. For BGP nonstop active routing, you can also issue the **show bgp replication** command.

For more information about these commands, see the *Junos OS Operational Mode Commands* and *Junos OS Operational Mode Commands*, respectively.

When you enable nonstop active routing or graceful Routing Engine switchover and issue routing-related operational mode commands on the backup Routing Engine (such as **show route**, **show bgp neighbor**, **show ospf database**, and so on), the output might not match the output of the same commands issued on the master Routing Engine. For example, it is normal for the routing table on the backup Routing Engine to contain persistent phantom routes that are not present in the routing table on the master Routing Engine.

To display BFD state replication status, issue the **show bfd session** command. The **replicated** flag appears in the output for this command when a BFD session has been replicated to the backup Routing Engine. For more information, see the *Junos OS Operational Mode Commands*.

Tracing Nonstop Active Routing Synchronization Events

To track the progress of nonstop active routing synchronization between Routing Engines, you can configure nonstop active routing trace options flags for each supported protocol and for BFD sessions and record these operations to a log file.

To configure nonstop active routing trace options for supported routing protocols, include the **nsr-synchronization** statement at the **[edit protocols *protocol-name* traceoptions flag]** hierarchy level and optionally specify one or more of the **detail**, **disable**, **receive**, and **send** options:

```
[edit protocols]
bgp {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
isis {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
ldp {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
mpls {
  traceoptions {
    flag nsr-synchronization;
    flag nsr-synchronization-detail;
  }
}
msdp {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
(ospf | ospf3) {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
rip {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
ripng {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
pim {
  traceoptions {
```

```
        flag nsr-synchronization <detail> <disable> <receive> <send>;
    }
}
```

To configure nonstop active routing trace options for BFD sessions, include the **nsr-synchronization** and **nsr-packet** statements at the **[edit protocols bfd traceoptions flag]** hierarchy level.

```
[edit protocols]
bfd {
  traceoptions {
    flag nsr-synchronization;
    flag nsr-packet;
  }
}
```

To trace the Layer 2 VPN signaling state replicated from routes advertised by BGP, include the **nsr-synchronization** statement at the **[edit routing-options traceoptions flag]** hierarchy level. This flag also traces the label and logical interface association that VPLS receives from the kernel replication state.

```
[edit routing-options]
traceoptions {
  flag nsr-synchronization;
}
```

Description	<p>Define tracing operations that track all routing protocol functionality in the routing device.</p> <p>To specify more than one tracing operation, include multiple flag statements.</p>
Default	If you do not include this statement, no global tracing operations are performed.
Options	<p>Values:</p> <p>disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. We recommend that you place global routing protocol tracing output in the file routing-log.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and</p>

so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals
- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-packet**—Detailed trace information for BFD nonstop active routing only
- **nsr-synchronization**—Tracing operations for nonstop active routing
- **nsr-synchronization-detail**—(MPLS only) Tracing operations for nonstop active routing in detail
- **parse**—Configuration parsing
- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

commit synchronize

Syntax	commit synchronize;
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 10.4 for EX Series switches.
Description	For devices with multiple Routing Engines only. Configure the commit command to automatically result in a commit synchronize action between dual Routing Engines within the same chassis. The Routing Engine on which you execute the commit command (the requesting Routing Engine) copies and loads its candidate configuration to the other (the responding) Routing Engine. Each Routing Engine then performs a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines.

NOTE: When you configure nonstop active routing (NSR), you must include the **commit synchronize** statement. Otherwise, the commit operation fails.

On the TX Matrix router, synchronization only occurs between the Routing Engines within the same chassis and when synchronization is complete, the new configuration is then distributed to the Routing Engines on the T640 routers. That is, the master Routing Engine on the TX Matrix router distributes the configuration to the master Routing Engine on each T640 router. Likewise, the backup Routing Engine on the TX Matrix router distributes the configuration to the backup Routing Engine on each T640 router.

In EX Series Virtual Chassis configurations:

- On EX4200 switches in Virtual Chassis, synchronization occurs between the switch in the master role and the switch in the backup role.
- On EX8200 switches in a Virtual Chassis, synchronization occurs only between the master and backup XRE200 External Routing Engines.

Options	<p>and-quit—(Optional) (EX Series only) Quit configuration mode if the commit synchronization succeeds.</p> <p>comment—(Optional) (EX Series only) Write a message to the commit log.</p> <p>and-force—(Optional) (EX Series only) Force a commit synchronization on the other Routing Engine (ignore warnings).</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

Configuration: Unified ISSU

- [Best Practices on page 2197](#)
- [Before You Begin on page 2197](#)
- [Performing a Unified ISSU on page 2200](#)
- [Verifying a Unified ISSU on page 2212](#)
- [Managing and Tracing BFD Sessions During Unified ISSU Procedures on page 2212](#)

Best Practices

When you are planning to perform a unified in-service software upgrade (unified ISSU), choose a time when your network is as stable as possible. As with a normal upgrade, Telnet sessions, SNMP, and CLI access are briefly interrupted. In addition, the following restrictions apply:

- The master Routing Engine and backup Routing Engine must be running the same software version before you can perform a unified ISSU.
- During a unified ISSU, you cannot bring any PICs online or offline.
- Unicast RPF-related statistics are not saved across a unified ISSU, and the unicast RPF counters are reset to zero during a unified ISSU.

Related Documentation	<ul style="list-style-type: none"> • Before You Begin on page 2197 • Performing a Unified ISSU on page 2200 • Verifying a Unified ISSU on page 2212 • Troubleshooting Unified ISSU Problems on page 2278
------------------------------	--

Before You Begin

Before you begin a unified ISSU, complete the tasks in the following sections:

1. [Verify That the Master and Backup Routing Engines Are Running the Same Software Version on page 2198](#)
2. [Back Up the Router Software on page 2198](#)
3. [Verify That Graceful Routing Engine Switchover and Nonstop Active Routing Are Configured on page 2199](#)

Verify That the Master and Backup Routing Engines Are Running the Same Software Version

To verify that both Routing Engines are running the same version of software, issue the following command:

```
{master}
user@host> show version invoke-on all-routing-engines
re0:
-----
Hostname: host
Model: m320
JUNOS Base OS boot [9.0-20071210.0]
JUNOS Base OS Software Suite [9.0-20071210.0]

JUNOS Routing Software Suite [9.0-20071210.0]
```

If both Routing Engines are not running the same software version, issue the **request system software add** command on the desired Routing Engine so that the software version is the same. For more information, see the *Installation and Upgrade Guide*.

Back Up the Router Software

As a preventive measure in case any problems occur during an upgrade, issue the **request system snapshot** command on *each* Routing Engine to back up the system software to the router's hard disk. The following is an example of issuing the command on the master Routing Engine:

```
{master}
user@host> request system snapshot
Verifying compatibility of destination media partitions...
Running newfs (220MB) on hard-disk media / partition (ad1s1a)...
Running newfs (24MB) on hard-disk media /config partition (ad1s1e)...
Copying '/dev/ad0s1a' to '/dev/ad1s1a' .. (this may take a few minutes)
Copying '/dev/ad0s1e' to '/dev/ad1s1e' .. (this may take a few minutes)
The following filesystems were archived: / /config
```

NOTE: The root file system is backed up to `/altroot`, and `/config` is backed up to `/altconfig`. After you issue the `request system snapshot` command, the router's flash and hard disks are identical. You can return to the previous version of the software only by booting the router from removable media. For more information about the `request system snapshot` command, see the *Junos OS System Basics Configuration Guide*.

Verify That Graceful Routing Engine Switchover and Nonstop Active Routing Are Configured

Before you begin a unified ISSU, ensure that graceful Routing Engine switchover and nonstop active routing are configured on your router.

1. To verify graceful Routing Engine switchover is configured, on the backup Routing Engine (**re1**) issue the `show system switchover` command. The output should be similar to the following example. The **Graceful switchover** field state must be **On**.

```
{backup}
user@host> show system switchover
Graceful switchover: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady State
```

2. To verify nonstop active routing is configured, on the master Routing Engine (**re0**) issue the `show task replication` command. The output should be similar to the following example.

```
{master}
user@host> show task replication
Stateful Replication: Enabled
RE mode: Master

Protocol                Synchronization Status
OSPF                    Complete
IS-IS                   Complete
```

If graceful Routing Engine switchover and nonstop active routing are not configured, complete the following steps:

1. On the master Routing Engine (**re0**), enable graceful Routing Engine switchover. Include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level.
2. On the master Routing Engine, enable nonstop active routing. Include the **commit synchronize** statement at the **[edit system]** hierarchy level and the **nonstop-routing** statement at the **[edit routing-options]** hierarchy level.
3. On the master Router Engine, issue the **commit** command.

The system provides the following confirmation that the master and backup Routing Engines are synchronized:

```
re0:
configuration check succeeds
```

```

- [Best Practices on page 2197](#)
- [Performing a Unified ISSU on page 2200](#)
- [Verifying a Unified ISSU on page 2212](#)
- [Troubleshooting Unified ISSU Problems on page 2278](#)

Performing a Unified ISSU

You can perform a unified ISSU in one of three ways:

1. [Upgrading and Rebooting Both Routing Engines Automatically on page 2200](#)
2. [Upgrading Both Routing Engines and Rebooting the New Backup Routing Engine Manually on page 2204](#)
3. [Upgrading and Rebooting Only One Routing Engine on page 2209](#)

Upgrading and Rebooting Both Routing Engines Automatically

When you issue the **request system software in-service-upgrade** command with the **reboot** option, the system automatically upgrades both Routing Engines to the newer software and reboots both Routing Engines. This option enables you to complete the unified ISSU with a single command.

To perform a unified ISSU using the **request system software in-service-upgrade package-name reboot** command, complete the following steps:

1. Download the software package from the Juniper Networks Support website, <http://www.juniper.net/support/>. Choose the Canada and U.S., Worldwide, or Junos-FIPS edition. Place the package on a local server. To download the package, you must have a service contract and an access account. If you do not have an access account, complete the registration form at the Juniper Networks website: <https://www.juniper.net/registration/Register.jsp>.
2. Copy the package to the router. We recommend that you copy it to the **/var/tmp** directory, which is a large file system on the hard disk.

user@host>file copy ftp://username:prompt@ftp.hostname.net/filename/var/tmp/filename
3. To verify the current software version running on both Routing Engines, on the master Routing Engine issue the **show version invoke-on all-routing-engines** command. The following example shows that both Routing Engines are running an image of Junos OS, Release 9.0, that was built on December 11, 2007:

```
{backup}
```

```
user@host> show version invoke-on all-routing-engines
re0:
```

```

```

6. To make **re0** the master Routing Engine, issue the following command:

```
{backup}

user@host> request chassis routing-engine master acquire
Attempt to become the master routing engine ? [yes,no] (no) yes

Resolving mastership...
Complete. The local routing engine becomes the master.

{master}
user@host>
```

7. Issue the **request system snapshot** command on *each* Routing Engine to back up the system software to the router's hard disk.

NOTE: The root file system is backed up to **/altroot**, and **/config** is backed up to **/altconfig**. After you issue the **request system snapshot** command, the router's flash and hard disks are identical. You can return to the previous version of the software only by booting the router from removable media.

Upgrading Both Routing Engines and Rebooting the New Backup Routing Engine Manually

When you issue the **request system software in-service-upgrade** command without any options, the system upgrades and reboots the new master Routing Engine to the newer software. The new software is placed on the new backup (old master) Routing Engine; however, to complete the upgrade, you must issue the **request system reboot** command on the new backup Routing Engine.

To perform a unified ISSU using the **request system software in-service-upgrade package-name** command without any options, complete the following steps:

1. Download the software package from the Juniper Networks Support website, <http://www.juniper.net/support/>. Choose the Canada and U.S., Worldwide, or Junos-FIPS edition. Place the package on a local server. To download the package, you must have a service contract and an access account. If you do not have an access account, complete the registration form at the Juniper Networks website: <https://www.juniper.net/registration/Register.jsp>.
2. Copy the package to the router. We recommend that you copy it to the **/var/tmp** directory, which is a large file system on the hard disk.

```
user@host>file copy ftp://username:prompt@ftp.hostname.net/filename/var/tmp/filename
```

3. To verify the current software version running on both Routing Engines, on the master Routing Engine, issue the **show version invoke-on all-routing-engines** command. The following example shows that both Routing Engines are running Junos OS Release 9.0R1:

```
{master}
```

```
user@host> show version invoke-on all-routing-engines

```

JUNOS Online Documentation [9.0R1.2]
 JUNOS Routing Software Suite [9.0R1.2]

9. To make **re0** the master Routing Engine, issue the following command:

```
{backup}

user@host> request chassis routing-engine master acquire
Attempt to become the master routing engine ? [yes,no] (no) yes

Resolving mastership...
Complete. The local routing engine becomes the master.

{master}
user@host>
```

10. Issue the **request system snapshot** command on *each* Routing Engine to back up the system software to the router's hard disk.

NOTE: The root file system is backed up to **/altroot**, and **/config** is backed up to **/altconfig**. After you issue the **request system snapshot** command, the router's flash and hard disks are identical. You can return to the previous version of the software only by booting the router from removable media.

Upgrading and Rebooting Only One Routing Engine

When you issue the **request system software in-service-upgrade** command with the **no-old-master-upgrade** option, the system upgrades and reboots only the new master Routing Engine. To upgrade the new backup (former master) Routing Engine, you must issue the **request system software add** command.

To perform a unified ISSU using the **request system software in-service-upgrade package-name no-old-master-upgrade** commands, complete the following steps:

1. Download the software package from the Juniper Networks Support website, <http://www.juniper.net/support/>. Choose the Canada and U.S., Worldwide, or Junos-FIPS edition. Place the package on a local server. To download the package, you must have a service contract and an access account. If you do not have an access account, complete the registration form at the Juniper Networks website: <https://www.juniper.net/registration/Register.jsp>.

2. Copy the package to the router. We recommend that you copy it to the **/var/tmp** directory, which is a large file system on the hard disk.

```
user@host> file copy ftp://username:prompt@ftp.hostname.net/filename/var/tmp/filename
```

3. To verify the current software version running on both Routing Engines, on the master Routing Engine issue the **show version invoke-on all-routing-engines** command. The following example shows that both Routing Engines are running an image of Junos OS Release 9.0 that was built on December 11, 2007:

```
{backup}

Managing and Tracing BFD Sessions During Unified ISSU Procedures

Bidirectional Forwarding Detection (BFD) sessions temporarily increase their detection and transmission timers during unified ISSU procedures. After the upgrade, these timers revert to the values in use before the unified ISSU started. The BFD process replicates the unified ISSU state and timer values to the backup Routing Engine for each session.

No additional configuration is necessary to enable unified ISSU for BFD. However, you can disable the BFD timer negotiation during the unified ISSU by including the **no-issu-timer-negotiation** statement at the **[edit protocols bfd]** hierarchy level:

```
[edit protocols bfd]
no-issu-timer-negotiation;
```

If you configure this statement, the BFD timers maintain their original values during unified ISSU.

CAUTION: The sessions might flap during unified ISSU or Routing Engine switchover, depending on the detection intervals.

For more information about BFD, see the *Junos OS Routing Protocols Configuration Guide*.

To configure unified ISSU trace options for BFD sessions, include the **issu** statement at the **[edit protocols bfd traceoptions flag]** hierarchy level.

```
[edit protocols]
bfd {
  traceoptions {
    flag issu;
  }
}
```

Configuration Statements: Unified ISSU

bfd

Syntax	<pre> bfd { traceoptions { file <i>filename</i> <files <i>number</i>> <match <i>regular-expression</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i> <<i>flag-modifier</i>> <disable>; } } </pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols],</p> <p>[edit protocols],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols]</p>
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Configure trace options for Bidirectional Forwarding Protocol (BFD) traffic.
Default	If you do not include this statement, no BFD tracing operations are performed.
Options	<p>disable—(Optional) Disable the BFD tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the /var/log directory. We recommend that you place global routing protocol tracing output in the routing-log file.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p>Range: 2 through 1000 files</p> <p>Default: 2 files</p> <p>flag <i>flag</i>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. These are the BFD protocol tracing options:</p> <ul style="list-style-type: none"> • adjacency—Trace adjacency messages. • all—Trace all options for BFD. • error—Trace all errors. • event—Trace all events. • issu—Trace in-service software upgrade (ISSU) packet activity.

- **nsr-packet**—Trace non-stop-routing (NSR) packet activity.
- **nsr-synchronization**—Trace NSR synchronization events.
- **packet**—Trace all packets.
- **pipe**—Trace pipe messages.
- **pipe-detail**—Trace pipe messages in detail.
- **ppm-packet**—Trace packet activity by periodic packet management (PPM).
- **state**—Trace state transitions.
- **timer**—Trace timer processing.

match *regular-expression*—(Optional) Regular expression for lines to be logged.

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the trace file again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level	routing and trace—To view this statement in the configuration.
	routing-control and trace-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Example: Configuring BFD for Static Routes on page 3197

no-issu-timer-negotiation

Syntax	no-issu-timer-negotiation;
Hierarchy Level	[edit protocols bfd], [edit logical-systems <i>logical-system-name</i> protocols bfd], [edit routing-instances <i>routing-instance-name</i> protocols bfd]
Release Information	Statement introduced in Junos OS Release 9.1.
Description	Disable unified ISSU timer negotiation for Bidirectional Forwarding Detection (BFD) sessions.

CAUTION: The sessions might flap during unified ISSU or Routing Engine switchover, depending on the detection intervals.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Configuring the Startup Period for VRRP Operations

To configure the startup period for VRRP operations, include the **startup-silent-period** statement at the **[edit protocols vrrp]** hierarchy level:

```
[edit protocols vrrp]
  startup-silent-period seconds;
```

NOTE: During the silent startup period, the `show vrrp detail` command output shows a value of 0 for Master priority, and your own IP address for Master router. These values indicate that the Master selection is not completed yet, and these values can be ignored.

- [Configuring Basic VRRP Support on page 2220](#)
- [Configuring VRRP Authentication \(IPv4 Only\) on page 2222](#)
- [Example: Configuring VRRP on page 2237](#)

Configuring Basic VRRP Support

An interface can be a member of one or more VRRP groups. To configure basic VRRP support, configure VRRP groups on interfaces by including the **vrrp-group** statement:

```
vrrp-group group-id {
  priority number;
  virtual-address [ addresses ];
}
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet address *address*]

To configure basic VRRP for IPv6 support, configure VRRP group support on interfaces by including the **vrrp-inet6-group** statement:

```
vrrp-inet6-group group-id {
  priority number;
  virtual-inet6-address [ addresses ];
  virtual-link-local-address ipv6-address;
}
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet6 address *address*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet6 address *address*]

Within a VRRP group, the master virtual router and the backup virtual router must be configured on two different routing platforms.

For each VRRP group, you must configure the following:

- Group identifier—Assign a value from 0 through 255.

- Address of one or more virtual routers that are members of the VRRP group—Normally, you configure only one virtual IP address per group. However, you can configure up to eight addresses. Do not include a prefix length in a virtual IP address. The following considerations apply to configuring a virtual IP address:
 - The virtual router IP address must be the same for all routing platforms in the VRRP group.
 - If you configure a virtual IP address to be the same as the physical interface's address, the interface becomes the master virtual router for the group. In this case, you must configure the priority to be 255, and you must configure preemption by including the **preempt** statement.
 - If the virtual IP address you choose is not the same as the physical interface's address, you must ensure that the virtual IP address does not appear anywhere else in the routing platform's configuration. Verify that you do not use this address for other interfaces, for the IP address of a tunnel, or for the IP address of static ARP entries.
 - You cannot configure a virtual IP address to be the same as the interface's address for an aggregated Ethernet interface. This configuration is not supported.
 - For VRRP for IPv6, the EUI-64 option cannot be used. In addition, the Duplicate Address Detection (DAD) process will not run for virtual IPv6 addresses.
 - You cannot configure the same virtual IP address on interfaces that belong to the same logical system and routing instance combination. However, you can configure the same virtual IP address on interfaces that belong to different logical system and routing instance combinations.
- Virtual link-local address—(VRRP for IPv6 only) You must explicitly define a virtual link-local address for each VRRP for IPv6 group. Otherwise, when you attempt to commit the configuration, the commit request fails. The virtual link-local address must be on the same subnet as the physical interface address.

- Priority for this routing platform to become the master virtual router—Configure the value used to elect the master virtual router in the VRRP group. It can be a number from 1 through 255. The default value for backup routers is 100. A larger value indicates a higher priority. The routing platform with the highest priority within the group becomes the master router.

NOTE: If there are two or more backup routers with the same priority, the router that has the highest primary address becomes the master.

NOTE: Mixed tagging (configuring two logical interfaces on the same Ethernet port, one with single-tag framing and one with dual-tag framing) is supported only for interfaces on Gigabit Ethernet IQ2 and IQ PICs. If you include the `flexible-vlan-tagging` statement at the `[edit interfaces interface-name]` hierarchy level for a VRRP-enabled interface on a PIC that does not support mixed tagging, VRRP on that interface is disabled. In the output of the `show vrrp summary` command, the interface status is listed as Down.

NOTE: If you enable MAC source address filtering on an interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the `source-address-filter` statement at the `[edit interfaces interface-name]` hierarchy level. (For more information, see the *Junos® OS Network Interfaces*.) MAC addresses ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are reserved for VRRP, as defined in RFC 2378. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

Configuring VRRP Authentication (IPv4 Only)

VRRP (IPv4 only) protocol exchanges can be authenticated to guarantee that only trusted routing platforms participate in routing in an autonomous system (AS). By default, VRRP authentication is disabled. You can configure one of the following authentication methods. Each VRRP group must use the same method.

- Simple authentication—Uses a text password included in the transmitted packet. The receiving routing platform uses an authentication key (password) to verify the packet.
- Message Digest 5 (MD5) algorithm—Creates the authentication data field in the IP authentication header. This header is used to encapsulate the VRRP PDU. The receiving routing platform uses an authentication key (password) to verify the authenticity of the IP authentication header and VRRP PDU.

To enable authentication and specify an authentication method, include the **authentication-type** statement:

authentication-type *authentication*;

authentication can be **simple** or **md5**. The authentication type must be the same for all routing platforms in the VRRP group.

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

If you include the **authentication-type** statement, you can configure a key (password) on each interface by including the **authentication-key** statement:

authentication-key *key*;

key (the password) is an ASCII string. For simple authentication, it can be from 1 through 8 characters long. For MD5 authentication, it can be from 1 through 16 characters long. If you include spaces, enclose all characters in quotation marks (" "). The key must be the same for all routing platforms in the VRRP group.

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

NOTE: When VRRPv3 is enabled, the **authentication-type** and **authentication-key** statements cannot be configured for any VRRP groups. Therefore, if authentication is required, you need to configure alternative non-VRRP authentication mechanisms.

- [Configuring Basic VRRP Support on page 2220](#)
- [Example: Configuring VRRP on page 2237](#)

Configuring the Advertisement Interval for the VRRP Master Router

By default, the master router sends VRRP advertisement packets every second to all members of the VRRP group. These packets indicate that the master router is still operational. If the master router fails or becomes unreachable, the backup router with the highest priority value becomes the new master router.

You can modify the advertisement interval in seconds or in milliseconds. The interval must be the same for all routing platforms in the VRRP group.

For VRRP for IPv6, you must configure IPv6 router advertisements for the interface on which VRRP is configured to send IPv6 router advertisements for the VRRP group. To do so, include the **interface *interface-name*** statement at the **[edit protocols router-advertisement]** hierarchy level. (For information about this statement and guidelines, see the *Junos OS Routing Protocols Configuration Guide*.) When an interface receives an IPv6 router solicitation message, it sends an IPv6 router advertisement to all VRRP groups configured on it. In the case of logical systems, IPv6 router advertisements are not sent to VRRP groups.

NOTE: The master VRRP for an IPv6 router must respond to a router solicitation message with the virtual IP address of the router. However, when the **interface *interface-name*** statement is included at the **[edit protocols router-advertisement]** hierarchy level, the backup VRRP for an IPv6 router might send a response before the VRRP master responds, so that the default route of the client is not set to the master VRRP router's virtual IP address. To avoid this situation, include the **virtual-router-only** statement at the **[edit protocols router-advertisement interface *interface-name*]** hierarchy level. When this statement is included, router advertisements are sent only for VRRP IPv6 groups configured on the interface (if the groups are in the master state). You must include this statement on both the master and backup VRRP for IPv6 routers.

This topic contains the following sections:

- [Modifying the Advertisement Interval in Seconds on page 2224](#)
- [Modifying the Advertisement Interval in Milliseconds on page 2225](#)

Modifying the Advertisement Interval in Seconds

To modify the time, in seconds, between the sending of VRRP advertisement packets, include the **advertise-interval** statement:

advertise-interval *seconds*;

The interval can be from 1 through 255 seconds.

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

NOTE: When VRRPv3 is enabled, the `advertise-interval` statement cannot be used to configure advertisement intervals. Instead, use the `fast-interval` statement to configure advertisement intervals.

Modifying the Advertisement Interval in Milliseconds

To modify the time, in milliseconds, between the sending of VRRP advertisement packets, include the `fast-interval` statement:

```
fast-interval milliseconds;
```

The interval can be from 10 through 40,950 milliseconds.

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]

NOTE: In the VRRP PDU, Junos OS sets the advertisement interval to 0. When you configure VRRP with other vendors' routers, the `fast-interval` statement works correctly only when the other routers also have an advertisement interval set to 0 in the VRRP PDUs. Otherwise, Junos OS interprets other routers' settings as advertisement timer errors.

To modify the time, in milliseconds, between the sending of VRRP for IPv6 advertisement packets, include the `inet6-advertise-interval` statement:

```
inet6-advertise-interval ms;
```

The range of values is from 100 through 40,950 milliseconds (ms).

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* vrrp-inet6-group *group-id*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* vrrp-inet6-group *group-id*]

NOTE: When VRRPv3 is enabled, the `inet6-advertise-interval` statement cannot be used to configure advertisement intervals. Instead, use the `fast-interval` statement to configure advertisement intervals.

Configuring a Backup Router to Preempt the Master Router

By default, a higher-priority backup router preempts a lower-priority master router. To explicitly enable the master router to be preempted, include the **preempt** statement:

```
preempt;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]

To prohibit a higher-priority backup router from preempting a lower-priority master router, include the **no-preempt** statement:

```
no-preempt;
```

- [Example: Configuring VRRP on page 2237](#)

Modifying the Preemption Hold-Time Value

The hold time is the maximum number of seconds that can elapse before a higher-priority backup router preempts the master router. You might want to configure a hold time so that all Junos OS components converge before preemption.

By default, the hold-time value is 0 seconds. A value of 0 means that preemption can occur immediately after the backup router comes online. Note that the hold time is counted from the time the backup router comes online. The hold time is only valid when the VRRP router is just coming online.

To modify the preemption hold-time value, include the **hold-time** statement:

```
hold-time seconds;
```

The hold time can be from 0 through 3600 seconds.

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id* preempt]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id* preempt]**

Configuring Asymmetric Hold Time for VRRP Routers

In Junos OS Release 9.5 and later, the **asymmetric-hold-time** statement at the **[edit protocols vrrp]** hierarchy level enables you to configure a VRRP master router to switch over to the backup router immediately—that is, without waiting for the priority hold time to expire—when a tracked interface or route goes down or when the bandwidth of a tracked interface decreases. Such events can cause an immediate reduction in the priority based on the configured priority cost for the event, and trigger a mastership election.

However, when the tracked route or interface comes up again, or when the bandwidth for a tracked interface increases, the backup (original master) router waits for the hold time to expire before it updates the priority and initiates the switchover if the priority is higher than the priority for the VRRP master (original backup) router.

If the **asymmetric-hold-time** statement is not configured, the VRRP master waits for the hold time to expire before it initiates a switchover when a tracked route goes down.

Example: Configuring Asymmetric Hold Time

```
[edit]
user@host# set protocols vrrp asymmetric-hold-time
[edit]
user@host# show protocols vrrp
asymmetric-hold-time;
```

Configuring an Interface to Accept Packets Destined for the Virtual IP Address

In VRRP implementations where the router acting as the master router is not the IP address owner—the IP address owner is the router that has the interface whose actual IP address is used as the virtual router's IP address (virtual IP address)—the master router accepts only the ARP packets from the packets that are sent to the virtual IP address. Junos OS enables you to override this limitation with the help of the **accept-data** configuration. When the **accept-data** statement is included in the configuration, the master router accepts all packets sent to the virtual IP address even when the master router is not the IP address owner.

NOTE: If the master router is the IP address owner or has its priority set to 255, the master router, by default, accepts all packets addressed to the virtual IP address. In such cases, the **accept-data** configuration is not required.

To configure an interface to accept all packets sent to the virtual IP address, include the **accept-data** statement:

```
accept-data;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]**

To prevent a master router that is the IP address owner or has its priority set to 255 from accepting packets other than the ARP packets addressed to the virtual IP address, include the **no-accept-data** statement:

```
no-accept-data;
```

**NOTE:**

- If you want to restrict the incoming IP packets to ICMP packets only, you must configure firewall filters to accept only ICMP packets.
- If you include the `accept-data` statement, your routing platform configuration does not comply with RFC 3768 (see section 6.4.3 of RFC 3768, *Virtual Router Redundancy Protocol (VRRP)*).

- [VRRP Configuration Hierarchy](#)
- [Example: Configuring VRRP on page 2237](#)

Configuring a Logical Interface to Be Tracked

VRRP can track whether a logical interface is up, down, or not present, and can also dynamically change the priority of the VRRP group based on the state of the tracked logical interface, triggering a new master router election. VRRP can also track the operational speed of a logical interface and dynamically update the priority of the VRRP group when the speed crosses a configured threshold.

When interface tracking is enabled, you cannot configure a priority of 255 (a priority of 255 designates the master router). For each VRRP group, you can track up to 10 logical interfaces.

To configure a logical interface to be tracked, include the following statements:

```
track {
  interface interface-name {
    bandwidth-threshold bits-per-second priority-cost priority;
    priority-cost priority;
  }
  priority-hold-time seconds;
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* *vrrp-group group-id*]
- [edit interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* *vrrp-inet6-group group-id*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet address *address* *vrrp-group group-id*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* *vrrp-inet6-group group-id*]

The interface specified is the interface to be tracked for the VRRP group. The priority hold time is the minimum length of time that must elapse between dynamic priority changes. A tracking event, such as an interface state change (up or down) or a change in bandwidth, triggers one of the following responses:

- The first tracking event initiates the priority hold timer, and also initializes the pending priority based on the current priority and the priority cost. However, the current priority remains unchanged.
- A tracking event or a manual configuration change that occurs while the priority hold timer is on triggers a pending priority update. However, the current priority remains unchanged.

This ensures that Junos OS does not initiate mastership elections every time a tracked interface flaps.

When the priority hold time expires, the current priority inherits the value from the pending priority, and the pending priority ceases.

NOTE: If you have configured **asymmetric-hold-time**, VRRP does not wait for the priority hold time to expire before initiating mastership elections if a tracked interface fails (state changes from up to down), or if the available bandwidth for a tracked interface decreases. For more information about **asymmetric-hold-time**, see [“Configuring Asymmetric Hold Time for VRRP Routers” on page 2227](#).

The bandwidth threshold specifies a threshold for the tracked interface. When the bandwidth of the tracked interface drops below the configured bandwidth threshold value, the VRRP group uses the bandwidth threshold priority cost. You can track up to five bandwidth threshold statements for each tracked interface.

The priority cost is the value to be subtracted from the configured VRRP priority when the tracked logical interface goes down, forcing a new master router election. The value can be from 1 through 254. The sum of the costs for all tracked logical interfaces or routes must be less than or equal to the configured priority of the VRRP group.

If you are tracking more than one interface, the router applies the sum of the priority costs for the tracked interfaces (at most, only one priority cost for each tracked interface) to the VRRP group priority. However, the interface priority cost and bandwidth threshold priority cost values for each VRRP group are not cumulative. The router uses only one priority cost to a tracked interface as indicated in [Table 165 on page 2230](#):

Table 165: Interface State and Priority Cost Usage

Tracked Interface State	Priority Cost Usage
Down	priority-cost priority
Not down; media speed below one or more bandwidth thresholds	Priority-cost of the lowest applicable bandwidth threshold

You must configure an interface priority cost only if you have configured no bandwidth thresholds. If you have not configured an interface priority cost value, and the interface is down, the interface uses the bandwidth threshold priority cost value of the lowest bandwidth threshold.

Related Documentation

- [Understanding VRRP on page 2110](#)
- [VRRP Configuration Hierarchy](#)
- [Configuring a Route to Be Tracked on page 2231](#)
- [Example: Configuring VRRP on page 2237](#)

Configuring a Route to Be Tracked

VRRP can track whether a route is reachable (that is, the route exists in the routing table of the routing instance included in the configuration) and dynamically change the priority of the VRRP group based on the reachability of the tracked route, triggering a new master router election.

To configure a route to be tracked, include the following statements:

```
track {
  priority-hold-time seconds;
  route prefix/prefix-length routing-instance instance-name priority-cost priority;
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* *vrrp-group group-id*]
- [edit interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* *vrrp-inet6-group group-id*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet address *address* *vrrp-group group-id*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* *vrrp-inet6-group group-id*]

The route prefix specified is the route to be tracked for the VRRP group. The priority hold time is the minimum length of time that must elapse between dynamic priority changes. A route tracking event, such as adding a route to or removing a route from the routing table, might trigger one or more of the following:

- The first tracking event initiates the priority hold timer, and also initializes the pending priority based on the current priority and the priority cost. However, the current priority remains unchanged.
- A tracking event or a manual configuration change that occurs while the priority hold timer is on triggers a pending priority update. However, the current priority remains unchanged.

When the priority hold time expires, the current priority inherits the value from the pending priority, and the pending priority ceases.

This ensures that Junos OS does not initiate mastership elections every time a tracked route flaps.

NOTE: If you have configured `asymmetric-hold-time`, VRRP does not wait for the priority hold time to expire before initiating mastership elections if a tracked route is removed from the routing table. For more information about `asymmetric-hold-time`, see [“Configuring Asymmetric Hold Time for VRRP Routers” on page 2227](#).

The routing instance is the routing instance in which the route is to be tracked. If the route is in the default, or global, routing instance, specify the instance name as **default**.

NOTE: Tracking a route that belongs to a routing instance from a different logical system is not supported.

The priority cost is the value to be subtracted from the configured VRRP priority when the tracked route goes down, forcing a new master router election. The value can be from 1 through 254. The sum of the costs for all tracked logical interfaces or routes must be less than or equal to the configured priority of the VRRP group.

Configuring Inheritance for a VRRP Group

Junos OS enables you to configure VRRP groups on the various subnets of a VLAN to inherit the state and configuration of one of the groups, which is known as the *active VRRP group*. When the `vrrp-inherit-from` configuration statement is included in the configuration, only the active VRRP group, from which the other VRRP groups are inheriting the state, sends out frequent VRRP advertisements, and processes incoming VRRP advertisements. The groups that are inheriting the state do not process any incoming VRRP advertisement because the state is always inherited from the active VRRP group. However, the groups that are inheriting the state do send out VRRP advertisements once every 2 to 3 minutes to facilitate MAC address learning on the switches placed between the VRRP routers.

If the `vrrp-inherit-from` statement is not configured, each of the VRRP master groups in the various subnets on the VLAN sends out separate VRRP advertisements and adds to the traffic on the VLAN.

To configure inheritance for a VRRP group, include the **vrrp-inherit-from** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* *vrrp-group group-id*]** hierarchy level.

```
[edit interfaces interface-name unit logical-unit-number family inet address address
  vrrp-group group-id]
vrrp-inherit-from vrrp-group;
```

When you configure a group to inherit a state from another group, the inheriting groups and the active group must be on the same physical interface and logical system. However, the groups do not need to necessarily be on the same routing instance (as was in Junos OS releases earlier than 9.6), VLAN, or logical interface.

When you include the **vrrp-inherit-from** statement for a VRRP group, the VRRP group inherits the following parameters from the active group:

- **advertise-interval**
- **authentication-key**
- **authentication-type**
- **fast-interval**
- **preempt | no-preempt**
- **priority**
- **track interfaces**
- **track route**

However, you can configure the **accept-data | no-accept-data** statement for the group to specify whether the interface should accept packets destined for the virtual IP address.

Related Documentation

- [Understanding VRRP on page 2110](#)
- [VRRP Configuration Hierarchy](#)

Configuring the Silent Period

The silent period starts when the interface state is changed from down to up. During this period, the Master Down Event is ignored. Configure the silent period interval to avoid alarms caused by the delay or interruption of the incoming VRRP advertisement packets during the interface startup phase.

To configure the silent period interval that the Master Down Event timer ignores, include the **startup-silent-period** statement at the **[edit protocols vrrp]** hierarchy level:

```
[edit protocols vrrp]
startup-silent-period seconds;
```

NOTE: During the silent startup period, the `show vrrp detail` command output shows a value of 0 for Master priority and your IP address for Master router. These values indicate that the Master selection is not completed yet, and these values can be ignored.

When you have configured **startup-silent-period**, the Master Down Event is ignored until the **startup-silent-period** expires.

For example, configure a VRRP group, *vrrp-group1*, with an advertise interval of 1 second, startup silent period of 10 seconds, and an interface *interface1* with a priority less than 255.

When *interface1* transitions from down to up:

- The *vrrp-group1* group moves to the backup state, and starts the Master Down Event timer (3 seconds; three times the value of the advertise interval, which is 1 second in this case).
- If no VRRP PDU is received during the 3-second period, the **startup-silent-period** (10 seconds in this case) is checked, and if the startup silent period has not expired, the Master Down Event timer is restarted. This is repeated until the **startup-silent-period** expires. In this example, the Master Down Event timer runs four times (12 seconds) by the time the 10-second startup silent period expires.
- If no VRRP PDU is received by the end of the fourth 3-second cycle, *vrrp-group1* takes over mastership.

- [VRRP Configuration Hierarchy](#)
- [startup-silent-period on page 2261](#)

Configuring Passive ARP Learning for Backup VRRP Routers

By default, the backup VRRP router drops ARP requests for the VRRP-IP to VRRP-MAC address translation. This means that the backup router does not learn the ARP (IP-to-MAC address) mappings for the hosts sending the requests. When it detects a failure of the master router and transitions to become the new master router, the backup router must learn all the entries that were present in the ARP cache of the master router. In environments with many directly attached hosts, such as metro Ethernet environments, the number of ARP entries to learn can be high. This can cause a significant transition delay, during which the traffic transmitted to some of the hosts might be dropped.

Passive ARP learning enables the ARP cache in the backup router to hold approximately the same contents as the ARP cache in the master router, thus preventing the problem of learning ARP entries in a burst. To enable passive ARP learning, include the **passive-learning** statement at the **[edit system arp]** hierarchy level:

```
[edit system arp]
passive-learning;
```

We recommend setting passive learning on both the backup and master VRRP routers. Doing so prevents the need to manually intervene when the master router becomes the backup router. While a router is operating as the master router, the passive learning configuration has no operational impact. The configuration takes effect only when the router is operating as a backup router.

For information about configuring gratuitous ARP and the ARP aging timer, see the *Junos OS System Basics Configuration Guide*.

**Related
Documentation**

- [Understanding VRRP on page 2110](#)
- [VRRP Configuration Hierarchy](#)

Enabling the Distributed Periodic Packet Management Process for VRRP

Typically, VRRP advertisements are sent by the VRRP process (vrrpd) on the master VRRP router at regular intervals to let other members of the group know that the VRRP master router is operational.

When the vrrpd process is busy and does not send VRRP advertisements, the backup VRRP routers might assume that the master router is down and take over as the master router, causing unnecessary flaps. This takeover might occur even though the original master router is still active and available, and might resume sending advertisements after the traffic has decreased. To address this problem and to reduce the load on the vrrpd process, Junos OS uses the periodic packet management process (ppmd) to send VRRP advertisements on behalf of the vrrpd process. However, you can further delegate the job of sending VRRP advertisements to the distributed ppm process that resides on the Packet Forwarding Engine.

The ability to delegate the sending of VRRP advertisements to the distributed ppm process ensures that the VRRP advertisements are sent even when the ppm process—which is now responsible for sending VRRP advertisements—is busy. Such delegation prevents the possibility of false alarms when the ppm process is busy. The ability to delegate the sending of VRRP advertisements to distributed ppm also adds to scalability because the load is shared across multiple ppm instances and is not concentrated on any single unit.

NOTE: CPU-intensive VRRP advertisements, such as advertisements with MD5 authentication or those sent and received over logical interfaces, such as Aggregated Ethernet interfaces, continue to be processed by the VRRP process on the Routing Engine even when distributed ppm is enabled.

To configure the distributed ppm process to send VRRP advertisements, include the **delegate-processing** statement at the **[edit protocols vrrp]** hierarchy level:

```
[edit protocols vrrp]
  delegate-processing;
```

- *VRRP Configuration Hierarchy*

Configuring VRRP to Improve Convergence Time

You can enable faster convergence time for the configured Virtual Router Redundancy Protocol (VRRP), thereby reducing the traffic restoration time to less than 1 second. To improve the convergence time for VRRP, perform the following tasks.

Before you begin, configure VRRP. See [“Example: Configuring VRRP” on page 2237](#).

1. Configure the distributed periodic packet management (PPM) process to send VRRP advertisements when the VRRP process is busy.

[edit]

user@host# **set protocols vrrp delegate-processing**

2. Disable the skew timer to reduce the time required to transition to the master state.

[edit]

user@host# **set protocols vrrp skew-timer-disable**

NOTE: When there is only one master router and one backup router in the network deployment, you can disable the skew timer, thereby reducing the time required to transition to the master state.

3. Configure the number of fast advertisements that can be missed by a backup router before it starts transitioning to the master state.

[edit]

user@host# **set protocols vrrp global-advertisement-threshold *advertisement-value***

4. Configure VRRP groups on the various subnets of a VLAN to inherit the state and to configure one of the groups.

[edit]

user@host# **set interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id***

5. Verify the configuration in operational mode.

[edit]

user@host> **show protocols vrrp**

**NOTE:**

- The reduction in convergence time is not applicable when VRRP is configured over integrated routing and bridging (IRB) interfaces, aggregated Ethernet interfaces, and multichassis link aggregation group (MC-LAG) interfaces.
- Compared to other routers, the convergence time and the traffic restoration time are less for MX Series routers with MPCs.
- Reduction in convergence time is applicable for all types of configurations at the physical interface, but the convergence time might not be less than 1 second for all the configurations. The convergence time depends on the number of groups that are transitioning from the backup to the master state and the interval at which these groups are transitioning.

Example: Configuring VRRP

Configure one master (Router A) and one backup (Router B) routing platform. The address configured in the **virtual-address** statements differs from the addresses configured in the **address** statements. When you configure multiple VRRP groups on an interface, you configure one to be the master virtual router for that group.

On Router A

```
[edit interfaces]
ge-0/0/0 {
  unit 0 {
    family inet {
      address 192.168.1.20/24 {
        vrrp-group 27 {
          virtual-address 192.168.1.15;
          priority 254;
          authentication-type simple;
          authentication-key booJUM;
        }
      }
    }
  }
}
```

On Router B

```
[edit interfaces]
ge-4/2/0 {
  unit 0 {
    family inet {
      address 192.168.1.24/24 {
```

Configuring One Router to Be the Master Virtual Router for the Group

```

    vrrp-group 27 {
        virtual-address 192.168.1.15;
        priority 200;
        authentication-type simple;
        authentication-key booJUM;
    }
}
}
}
}

```

```

[edit interfaces]
ge-0/0/0 {
    unit 0 {
        family inet {
            address 192.168.1.20/24 {
                vrrp-group 2 {
                    virtual-address 192.168.1.20;
                    priority 255;
                    advertise-interval 3;
                    preempt;
                }
                vrrp-group 10 {
                    virtual-address 192.168.1.55;
                    priority 201;
                    advertise-interval 3;
                }
                vrrp-group 1 {
                    virtual-address 192.168.1.54;
                    priority 22;
                    advertise-interval 4;
                }
            }
        }
    }
}
}
}

```

Configuring VRRP and MAC Source Address Filtering

The VRRP group number is the decimal equivalent of the last byte of the virtual MAC address.

```

[edit interfaces]
ge-5/2/0 {
    gigether-options {
        source-filtering;
        source-address-filter {
            00:00:5e:00:01:0a; # Virtual MAC address
        }
    }
    unit 0 {
        family inet {
            address 192.168.1.10/24 {
                vrrp-group 10; # VRRP group number
                virtual-address 192.168.1.10;
                priority 255;
                preempt;
            }
        }
    }
}

```

```

    }
  }
}

```

Example: Configuring VRRP for IPv6

Configure VRRP properties for IPv6 in one master (Router A) and one backup (Router B).

On Router A

```

[edit interfaces]
ge-1/0/0 {
  unit 0 {
    family inet6 {
      address fe80::5:0:0:6/64;
      address fec0::5:0:0:6/64 {
        vrrp-inet6-group 3; # VRRP inet6 group number
        virtual-inet6-address fec0::5:0:0:7;
        virtual-link-local-address fe80::5:0:0:7;
        priority 200;
        preempt;
      }
    }
  }
}

[edit protocols]
router-advertisement {
  interface ge-1/0/0.0 {
    prefix fec0::/64;
    max-advertisement-interval 4;
  }
}

```

On Router B

```

[edit interfaces]
ge-1/0/0 {
  unit 0 {
    family inet6 {
      address fe80::5:0:0:8/64;
      address fec0::5:0:0:8/64 {
        vrrp-inet6-group 3; # VRRP inet6 group number
        virtual-inet6-address fec0::5:0:0:7;
        virtual-link-local-address fe80::5:0:0:7;
        priority 100;
        preempt;
      }
    }
  }
}

```

```
}

[edit protocols]
router-advertisement {
  interface ge-1/0/0.0 {
    prefix fec0::/64;
    max-advertisement-interval 4;
  }
}
```

[Example: Configuring VRRP Route Tracking](#)

Configure Routers R1 and R2 to run VRRP. Configure static routes and a policy for exporting the static routes on Router R3. The VRRP routing instances on R2 track the routes that are advertised by R3.

On Router R1

```
[edit interfaces]
ge-1/0/3 {
  unit 0 {
    vlan-id 1;
    family inet {
      address 200.100.50.2/24 {
        vrrp-group 0 {
          virtual-address 200.100.50.101;
          priority 195;
        }
      }
    }
  }
}
```

On Router R2

```
[edit interfaces]
ge-1/0/1 {
  unit 0 {
    vlan-id 1;
    family inet {
      address 200.100.50.1/24 {
        vrrp-group 0 {
          virtual-address 200.100.50.101;
          priority 200;
          track {
            route 59.0.58.153/32 routing-instance default priority-cost 5;
            route 59.0.58.154/32 routing-instance default priority-cost 5;
            route 59.0.58.155/32 routing-instance default priority-cost 5;
          }
        }
      }
    }
  }
}
```

```

    }
  }
}

```

On Router R3

```

[edit]
policy-options {
  policy-statement static-policy {
    term term1 {
      then accept;
    }
  }
}
protocols {
  ospf {
    export static-policy;
    reference-bandwidth 4g;
    area 0.0.0.0 {
      interface all;
      interface fxp0.0 {
        disable;
      }
    }
  }
}
routing-options {
  static {
    route 59.0.0.153/32 next-hop 45.45.45.46;
    route 59.0.0.154/32 next-hop 45.45.45.46;
    route 59.0.0.155/32 next-hop 45.45.45.46;
  }
}

Tracing VRRP Operations

To trace VRRP operations, include the **traceoptions** statement at the **[edit protocols vrrp]** hierarchy level.

By default, VRRP logs the error, data carrier detect (DCD) configuration, and routing socket events in a file in the **/var/log** directory. By default, this file is named **/var/log/vrrpd**. The default file size is 1 megabyte (MB), and three files are created before the first one gets overwritten.

To change the configuration of the logging file, include the **traceoptions** statement at the **[edit protocols vrrp]** hierarchy level:

```
[edit protocols vrrp]
traceoptions {
  file filename <files number> <match regular-expression> <microsecond-stamp>
    <size size> <world-readable | no-world-readable>;
  flag flag;
  no-remote-trace;
}
flag flag;
```

You can specify the following VRRP tracing flags:

- **all**—Trace all VRRP operations.
- **database**—Trace all database changes.
- **general**—Trace all general events.
- **interfaces**—Trace all interface changes.
- **normal**—Trace all normal events.
- **packets**—Trace all packets sent and received.
- **state**—Trace all state transitions.
- **timer**—Trace all timer events.

[\[edit protocols vrrp\] Hierarchy Level](#)

The following statement hierarchy can also be included at the **[edit logical-systems *logical-system-name*]** hierarchy level.

```
protocols {
  vrrp {
    asymmetric-hold-time;
    delegate-processing;
    failover-delay milliseconds;
    global-advertisements-threshold advertisement-value;
    skew-timer-disable;
    startup-silent-period seconds;
    traceoptions {
      file <filename> <files number> <match regular-expression> <microsecond-stamp>
        <size maximum-file-size> <world-readable | no-world-readable>;
      flag flag;
      no-remote-trace;
    }
  }
}
```

```
        version-3;  
    }  
}
```

advertise-interval

Syntax	<code>advertise-interval seconds;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
Description	Configure the interval between Virtual Router Redundancy Protocol (VRRP) IPv4 advertisement packets. All routers in the VRRP group must use the same advertisement interval.
<div>  <p>NOTE: When VRRPv3 is enabled, the <code>advertise-interval</code> statement cannot be used to configure advertisement intervals. Instead, use the <code>fast-interval</code> statement to configure advertisement intervals.</p> </div>	
Options	<i>seconds</i> —Interval between advertisement packets. Range: 1 through 255 seconds Default: 1 second
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring the Advertisement Interval for the VRRP Master Router on page 2224 • fast-interval on page 2251 • inet6-advertise-interval on page 2254 • version-3 on page 2265

asymmetric-hold-time

Syntax	asymmetric-hold-time;
Hierarchy Level	[edit protocols vrrp]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Enable the VRRP master router to switch over to the backup router immediately, without waiting for the priority hold time to expire, when a route goes down. However, when the route comes back online, the backup router that is acting as the master waits for the priority hold time to expire before switching the mastership back to the original master VRRP router.
Default	asymmetric-hold-time is disabled.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Asymmetric Hold Time for VRRP Routers on page 2227

authentication-key

Syntax	<code>authentication-key key;</code>
Hierarchy Level	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> vrrp-group <i>group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> vrrp-group <i>group-id</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
Description	<p>Configure a Virtual Router Redundancy Protocol (VRRP) IPv4 authentication key. You also must specify a VRRP authentication scheme by including the authentication-type statement.</p> <p>All routers in the VRRP group must use the same authentication scheme and password.</p>
	<div>  <p>NOTE: When VRRPv3 is enabled, the authentication-type and authentication-key statements cannot be configured for any VRRP groups.</p> </div>
Options	<p>key—Authentication password. For simple authentication, it can be 1 through 8 characters long. For Message Digest 5 (MD5) authentication, it can be 1 through 16 characters long. If you include spaces, enclose all characters in quotation marks (" ").</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring VRRP Authentication (IPv4 Only) on page 2222 • Configuring VRRP Authentication (IPv4 Only) • authentication-type on page 2248 • version-3 on page 2265

authentication-type

Syntax	<code>authentication-type <i>authentication</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
Description	Enable Virtual Router Redundancy Protocol (VRRP) IPv4 authentication and specify the authentication scheme for the VRRP group. If you enable authentication, you must specify a password by including the authentication-key statement. All routers in the VRRP group must use the same authentication scheme and password.

NOTE: When VRRPv3 is enabled, the **authentication-type** and **authentication-key** statements cannot be configured for any VRRP groups.

Options	<i>authentication</i> —Authentication scheme: <ul style="list-style-type: none">• simple—Use a simple password. The password is included in the transmitted packet, so this method of authentication is relatively insecure.• md5—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing platform uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme. Default: none (no authentication is performed).
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring VRRP Authentication (IPv4 Only) on page 2222• Configuring VRRP Authentication (IPv4 Only)• authentication-key on page 2247• version-3 on page 2265

bandwidth-threshold

Syntax	<code>bandwidth-threshold <i>bits-per-second</i> priority-cost <i>priority</i>;</code>
Hierarchy Level	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> track interface <i>interface-name</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i> track interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> track interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i> track interface <i>interface-name</i>]</p>
Release Information	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
Description	Specify the bandwidth threshold for Virtual Router Redundancy Protocol (VRRP) logical interface tracking.
Options	<p><i>bits-per-second</i>—Bandwidth threshold for the tracked interface. When the bandwidth of the tracked interface drops below the specified value, the VRRP group uses the bandwidth threshold priority cost value. You can include up to five bandwidth threshold statements for each interface you track.</p> <p>Range: 1 through 10000000000000 bits per second</p> <p><i>priority-cost priority</i>—The value subtracted from the configured VRRP priority when the tracked interface or route is down to force a new master router election. The sum of all the costs for all interfaces or routes that are tracked must be less than or equal to the configured priority of the VRRP group.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

global-advertisements-threshold

Syntax	<code>global-advertisements-threshold <i>advertisement-value</i>;</code>
Hierarchy Level	[edit protocols vrrp]
Release Information	Statement introduced in Junos OS Release 12.2.
Description	Configure the number of fast advertisements that can be missed by a backup router before the master router is declared as down.

NOTE:

- The advertisement value configured using the `global-advertisements-threshold` statement is applicable to all the Virtual Router Redundancy Protocol (VRRP) groups in the system.
 - Setting the advertisement value of the `global-advertisements-threshold` configuration to 1 is not recommended for a scaled configuration with an aggressive advertisement interval. For example, if you have 1000 VRRP groups with an advertisement interval of 100 ms, then do not set the `global-advertisements-threshold` value to 1.
 - Changing the advertisement value of the `global-advertisements-threshold` configuration during runtime can result in unpredictable behavior by the VRRP state machine. For example, momentary ownership change from the master router to the backup router and vice versa. Therefore, avoid changing the advertisement value of the `global-advertisements-threshold` statement during runtime.
-

Options	<i>advertisement-value</i> —Number of VRRP advertisements missed before the master router is declared as down. Range: 1 through 15 Default: 3
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

skew-timer-disable

Syntax	skew-timer-disable;
Hierarchy Level	[edit protocols vrrp]
Release Information	Statement introduced in Junos OS Release 12.2.
Description	Disable the skew timer, thereby reducing the time required to transition from the backup state to the master state.
	<div>  <p>NOTE: The <code>skew-timer-disable</code> statement is used when there is only one master router and one backup router in the network.</p> </div>
Default	By default, the skew timer is enabled for all the VRRP groups.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Improving the Convergence Time for VRRP on page 2114 • Configuring VRRP to Improve Convergence Time on page 2236

startup-silent-period

Syntax	startup-silent-period <i>seconds</i> ;
Hierarchy Level	[edit protocols vrrp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
Description	Instruct the system to ignore the Master Down Event when an interface transitions from the down state to the up state. This statement is used to avoid incorrect error alarms caused by the delay or interruption of incoming Virtual Router Redundancy Protocol (VRRP) advertisement packets during the interface startup phase.
Options	<p><i>seconds</i>—Number of seconds for the startup period.</p> <p>Default: 4 seconds</p> <p>Range: 1 through 2000 seconds</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

traceoptions (Protocols VRRP)

Syntax	<pre>traceoptions { file <i>filename</i> <files <i>number</i>> <match <i>regular-expression</i>> <microsecond-stamp> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i>; no-remote-trace; }</pre>
Hierarchy Level	[edit protocols vrrp]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	<p>Define tracing operations for the Virtual Router Redundancy Protocol (VRRP) process.</p> <p>To specify more than one tracing operation, include multiple flag statements.</p> <p>By default, VRRP logs the error, dcd configuration, and routing socket events in a file in the directory /var/log.</p>
Default	If you do not include this statement, no VRRP-specific tracing operations are performed.
Options	<p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. By default, VRRP tracing output is placed in the file vrrpd.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten.</p> <p>Range: 0 through 4,294,967,296 files</p> <p>Default: 3 files</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p>flag <i>flag</i>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. These are the VRRP-specific tracing options:</p> <ul style="list-style-type: none">• all—All VRRP tracing operations• database—Database changes• general—General events• interfaces—Interface changes• normal—Normal events• packets—Packets sent and received

- **state**—State transitions

- **timer**—Timer events

match *regular-expression*—(Optional) Refine the output to include only those lines that match the given regular expression.

microsecond-stamp—(Optional) Provide a timestamp with microsecond granularity.

no-world-readable—(Optional) Restrict users from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes, megabytes, or gigabytes. When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

Range: 10 KB through the maximum file size supported on your routing platform

Default: 1 MB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

world-readable—(Optional) Allow users to read the log file.

Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

version-3

Syntax	version-3;
Hierarchy Level	[edit protocols vrrp]
Release Information	Statement introduced in Junos OS Release 12.2.
Description	Enable Virtual Router Redundancy Protocol version 3 (VRRPv3).

NOTE:

- Even though the version-3 statement can be configured only at the [edit protocols vrrp] hierarchy level, VRRPv3 is enabled on all the configured logical systems as well.
 - When enabling VRRPv3, you must ensure that VRRPv3 is enabled on all the VRRP routers in the network. This is because VRRPv3 does not interoperate with the previous versions of VRRP.
-

Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Junos OS Support for VRRPv3 on page 2111 • <i>VRRP Configuration Hierarchy</i> • <i>VRRP for IPv6 Configuration Hierarchy</i>

virtual-address

Resetting Local Statistics

When you enable graceful Routing Engine switchover, the master Routing Engine configuration is copied and loaded to the backup Routing Engine. User files, accounting information, and trace options information are not replicated to the backup Routing Engine.

When a graceful Routing Engine switchover occurs, local statistics such as process statistics and networking statistics are displayed as a cumulative value from the time the process first came online. Because processes on the master Routing Engine can start at different times from the processes on the backup Routing Engine, the statistics on the two Routing Engines for the same process might differ. After a graceful Routing Engine switchover, we recommend that you issue the **clear interface statistics** (*interface-name* | **all**) command to reset the cumulative values for local statistics. Forwarding statistics are not affected by graceful Routing Engine switchover.

For information about how to use the **clear** command to clear statistics and protocol database information, see the *Junos OS Operational Mode Commands*.

.....

NOTE: The **clear firewall** command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover.

.....

Tracing Restart Signaling-Based Helper Mode Events for OSPF Graceful Restart

Junos OS provides a tracing option to log restart signaling-based helper mode events for OSPF graceful restart. To enable tracing for restart signaling-based helper mode events, include the **traceoptions flag restart-signaling** statement at the **[edit protocols ospf]** hierarchy level.

To enable tracing for restart signaling-based events:

1. Create a log file for saving the log.

```
[edit protocols ospf]
user@host# set traceoptions file ospf-log
```

where *ospf-log* is the name of the log file.

2. Enable tracing for restart signaling-based helper mode events.

```
[edit protocols ospf]
user@host# set traceoptions flag restart-signaling
```

3. Commit the configuration.

```
[edit protocols ospf]
user@host# commit
```

The logs are saved to the *ospf-log* file in the */var/log* folder.

Viewing the Log File

To view the restart signaling-based events from the log file, type:

```
user@host> file show /var/log/ospf-log | match "restart signaling"
Jun 25 14:44:08.890216 OSPF Restart Signaling: Start helper mode for nbr ip
14.19.3.2 id 10.10.10.1
Jun 25 14:44:11.358636 OSPF restart signaling: Received DBD with R bit set from
nbr ip=14.19.3.2 id=10.10.10.1. Start oob-resync.
Jun 25 14:44:11.380198 OSPF restart signaling: Received DBD with LR bit on from
nbr ip=14.19.3.2 id=10.10.10.1. Save its oob-resync capability 1
Jun 25 14:44:11.467200 OSPF restart signaling: nbr fsm for nbr ip=14.19.3.2
id=10.10.10.1 moving to state Full. Reset oob-resync parameters.
```

Verifying Graceful Restart Operation

This topic contains the following sections:

- [Graceful Restart Operational Mode Commands on page 2271](#)
- [Verifying BGP Graceful Restart on page 2272](#)
- [Verifying IS-IS and OSPF Graceful Restart on page 2273](#)
- [Verifying CCC and TCC Graceful Restart on page 2273](#)

Graceful Restart Operational Mode Commands

To verify proper operation of graceful restart, use the following commands:

- **show bgp neighbor** (for BGP graceful restart)
- **show log** (for IS-IS and OSPF/OSPFv3 graceful restart)
- **show (ospf | ospfv3) overview** (for OSPF/OSPFv3 graceful restart)

- **show rsvp neighbor detail** (for RSVP graceful restart—helper router)
- **show rsvp version** (for RSVP graceful restart—restarting router)
- **show ldp session detail** (for LDP graceful restart)
- **show connections** (for CCC and TCC graceful restart)
- **show route instance detail** (for Layer 3 VPN graceful restart and for any protocols using graceful restart in a routing instance)
- **show route protocol l2vpn** (for Layer 2 VPN graceful restart)

For more information about these commands and a description of their output fields, see the *Junos OS Operational Mode Commands*.

Verifying BGP Graceful Restart

To view graceful restart information for BGP sessions, use the **show bgp neighbor** command:

```
user@PE1> show bgp neighbor 192.255.10.1
Peer: 192.255.10.1+179 AS 64595 Local: 192.255.5.1+1106 AS 64595

Verifying IS-IS and OSPF Graceful Restart

To view graceful restart information for IS-IS and OSPF, configure traceoptions (see [“Tracking Graceful Restart Events” on page 2134](#)).

Here is the output of a traceoptions log from an OSPF restarting router:

```
Oct  8 05:20:12 Restart mode - sending grace lsas
Oct  8 05:20:12 Restart mode - estimated restart duration timer triggered
Oct  8 05:20:13 Restart mode - Sending more grace lsas
```

Here is the output of a traceoptions log from an OSPF helper router:

```
Oct  8 05:20:14 Helper mode for neighbor 192.255.5.1
Oct  8 05:20:14 Received multiple grace lsa from 192.255.5.1
```

Verifying CCC and TCC Graceful Restart

To view graceful restart information for CCC and TCC connections, use the **show connections** command. The following example assumes four remote interface CCC connections between CE1 and CE2:

```
user@PE1> show connections
CCC and TCC connections [Link Monitoring On]
Legend for status (St)           Legend for connection types
UN -- uninitialized             if-sw: interface switching
NP -- not present               rmt-if: remote interface switching
WE -- wrong encapsulation       lsp-sw: LSP switching
DS -- disabled
Dn -- down
-> -- only outbound conn is up  Legend for circuit types
<- -- only inbound conn is up  intf -- interface
Up -- operational              tlsp -- transmit LSP
RmtDn -- remote CCC down       rlsp -- receive LSP
Restart -- restarting
```

Operational Commands

show system switchover

Syntax	show system switchover
Syntax (TX Matrix Router)	show system switchover <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system switchover <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system switchover <all-members> <local> <member <i>member-id</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display whether graceful Routing Engine switchover is configured, the state of the kernel replication (ready or synchronizing), any replication errors, and whether the primary and standby Routing Engines are using compatible versions of the kernel database.

NOTE: Issue the `show system switchover` command *only* on the backup Routing Engine. This command is *not* supported on the master Routing Engine, because the kernel-replication process daemon does not run on the master Routing Engine. This process runs only on the backup Routing Engine.

Beginning Junos OS Release 9.6, the `show system switchover` command has been deprecated on the master Routing Engine on all routers other than a TX Matrix (switch-card chassis) or a TX Matrix Plus (switch-fabric chassis) router.

However, in a routing matrix, if you issue the `show system switchover` command on the master Routing Engine of the TX Matrix router (or switch-card chassis), the CLI displays graceful switchover information for the master Routing Engine of the T640 routers (or line-card chassis) in the routing matrix. Likewise, if you issue the `show system switchover` command on the master Routing Engine of a TX Matrix Plus router (or switch-fabric chassis), the CLI displays output for the master Routing Engine of T1600 routers (or line-card chassis) in the routing matrix.

Options **all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix router and the T640 routers configured in the routing matrix. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all

Routing Engines on the TX Matrix Plus router and the T1600 routers configured in the routing matrix.

all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.

all-members—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on all members of the Virtual Chassis configuration.

lcc *number*—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for a specific T640 router (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for a specific T1600 router (or line-card chassis) connected to the TX Matrix Plus router. Replace ***number*** with 0.

local—(MX Series routers only) (Optional) Display graceful Routing Engines switchover information for all Routing Engines on the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus router only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix Plus router (or switch-fabric chassis).

Additional Information If you issue the **show system switchover** command on a TX Matrix backup Routing Engine, the command is broadcast to all the T640 backup Routing Engines that are connected to it.

Likewise, if you issue the **show system switchover** command on a TX Matrix Plus backup Routing Engine, the command is broadcast to all the T1600 backup Routing Engines that are connected to it.

If you issue the **show system switchover** command on the active Routing Engine in the master router of an MX Series Virtual Chassis, the router displays an error message that graceful Routing Engine switchover (GRES) is not enabled on this member.

[show system switchover all-lcc \(Routing Matrix\) on page 2277](#)

Output Fields Table 166 on page 2277 describes the output fields for the **show system switchover** command. Output fields are listed in the approximate order in which they appear.

Table 166: show system switchover Output Fields

Field Name	Field Description
Graceful switchover	Display graceful Routing Engine switchover status: <ul style="list-style-type: none"> • On—Indicates graceful-switchover is specified for the routing-options configuration command. • Off—Indicates graceful-switchover is not specified for the routing-options configuration command.
Configuration database	State of the configuration database: <ul style="list-style-type: none"> • Ready—Configuration database has synchronized. • Synchronizing—Configuration database is synchronizing. Displayed when there are updates within the last 5 seconds. • Synchronize failed—Configuration database synchronize process failed.
Kernel database	State of the kernel database: <ul style="list-style-type: none"> • Ready—Kernel database has synchronized. • Synchronizing—Kernel database is synchronizing. Displayed when there are updates within the last 5 seconds. • Version incompatible—The primary and standby Routing Engines are running incompatible kernel database versions. • Replication error—An error occurred when the state was replicated from the primary Routing Engine. Inspect <code>/var/log/ksyncd</code> for possible causes, or notify Juniper Networks customer support.
Peer state	Routing Engine peer state: <ul style="list-style-type: none"> • Steady State—Peer completed switchover transition. • Peer Connected—Peer in switchover transition.

Troubleshooting Unified ISSU

- [Troubleshooting Unified ISSU Problems on page 2278](#)

Troubleshooting Unified ISSU Problems

If the unified ISSU procedure stops progressing, complete the following steps:

1. Open a new session on the master Routing Engine and issue the **request system software abort in-service-upgrade** command.
2. Check the existing router session to verify that the upgrade has been aborted.

An “ISSU: aborted!” message is provided. Additional system messages provide you with information about where the upgrade stopped and recommendations for the next step to take.

For more information about the **request system software abort in-service-upgrade** command, see the *Junos OS Operational Mode Commands*.

- [Load Balancing and Ethernet Link Aggregation Overview on page 2281](#)

Aggregated Ethernet Interfaces Overview

Link aggregation of Ethernet interfaces is defined in the IEEE 802.3ad standard. The Junos implementation of 802.3ad balances traffic across the member links within an aggregated Ethernet bundle based on the Layer 3 information carried in the packet. This implementation uses the same load-balancing algorithm used for per-flow load balancing.

NOTE: For information about configuring circuit cross-connects over aggregated Ethernet, see *Circuit and Translational Cross-Connects Overview*.

Platform Support for Aggregated Ethernet Interfaces

You configure an aggregated Ethernet virtual link by specifying the link number as a physical device and then associating a set of ports that have the same speed and are in full-duplex mode. The physical interfaces can be Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ, Gigabit Ethernet IQ2 and IQ2-E, or 10-Gigabit Ethernet IQ2 and IQ2-E. Generally, you cannot use a combination of these interfaces within the same aggregated link; however, you can combine Gigabit Ethernet and Gigabit Ethernet IQ interfaces in a single aggregated Ethernet bundle.

The following routers support a maximum of 16 physical interfaces per single aggregated Ethernet bundle:

- M120
- M320
- All MX Series 3D Universal Edge Routers
- All T Series routers

All other routers support a maximum of 8 physical interfaces per aggregated Ethernet bundle.

On M Series and T Series routers, you can create a maximum of 1024 logical interfaces on an aggregated Ethernet interface.

Aggregated Ethernet interfaces can use interfaces from different FPCs, DPCs, PICs, or MPCs.

Configuration Guidelines for Aggregated Ethernet Interfaces

Simple filters are not supported for interfaces in aggregated Ethernet bundles:

- On M Series routers, simple filters are supported in Gigabit Ethernet Enhanced Intelligent Queuing interfaces only, except when the interface is part of an aggregated Ethernet bundle.
- On MX Series routers, simple filters are supported in Enhanced Queuing Dense Port Concentrator (EQ DPC) interfaces only, except when the interface is part of an aggregated Ethernet bundle.

For more information about simple filters, see the *Junos OS Class of Service Configuration Guide*.

On the aggregated bundle, no IQ-specific capabilities such as MAC accounting, VLAN rewrites, and VLAN queuing are available. For more information about IQ-specific capabilities, see *Gigabit Ethernet Accounting and Policing Overview*.

Use the **show interfaces aggregate-interface extensive** and **show interfaces aggregate.logical-interface** commands to show the bandwidth of the aggregate. Also, the SNMP object identifier **ifSpeed/ifHighSpeed** shows the corresponding bandwidth on the aggregate logical interface if it is configured properly.

Aggregated Ethernet interfaces can be either tagged or untagged, with LACP enabled or disabled. Aggregated Ethernet interfaces on MX Series routers support the configuration of **flexible-vlan-tagging**, **native-vlan-id**, and on dual-tagged frames, which consist of the following configuration statements:

- **inner-tag-protocol-id**
- **inner-vlan-id**
- **pop-pop**
- **pop-swap**

- [push-push](#)
- [swap-push](#)
- [swap-swap](#)

In all cases, you must set the number of aggregated Ethernet interfaces on the chassis. You can also set the link speed and the minimum links in a bundle.

Load Balancing and Ethernet Link Aggregation Overview

You can create a link aggregation group (LAG) for a group of Ethernet ports. Layer 2 bridging traffic is load balanced across the member links of this group, making the configuration attractive for congestion concerns as well as for redundancy. You can configure up to 480 LAG bundles on a Juniper Networks MX Series Ethernet Services Router. Each LAG bundle contains up to 16 links.

By default, the hash key mechanism to load-balance frames across LAG interfaces is based on Layer 2 fields (such as frame source and destination address) as well as the input logical interface (unit). The default LAG algorithm is optimized for Layer 2 switching. You can also configure the load balancing hash key for Layer 2 traffic to use fields in the Layer 3 and Layer 4 headers using the **payload** statement, see “[Configuring Load Balancing on a LAG Link](#)” on page 2304. In a Layer 2 switch, one link is overutilized and other links are underutilized.

IP-Directed Broadcast Overview

- [Understanding Targeted Broadcast on page 2282](#)

Understanding Targeted Broadcast

Targeted broadcast is a process of flooding a target subnet with Layer 3 broadcast IP packets originating from a different subnet. The intent of targeted broadcast is to flood the target subnet with the broadcast packets on a LAN interface without broadcasting to the entire network. Targeted broadcast is configured with various options on the egress interface of the router or switch and the IP packets are broadcast only on the LAN (egress) interface. Targeted broadcast helps you implement remote administration tasks such as backups and wake-on LAN (WOL) on a LAN interface, and supports virtual routing and forwarding (VRF) instances.

Regular Layer 3 broadcast IP packets originating from a subnet are broadcast within the same subnet. When these IP packets reach a different subnet, they are forwarded to the Routing Engine (to be forwarded to other applications). Because of this, remote administration tasks such as backups cannot be performed on a particular subnet through another subnet. As a workaround you can enable targeted broadcast, to forward broadcast packets that originate from a different subnet.

Layer 3 broadcast IP packets have a destination IP address that is a valid broadcast address for the target subnet. These IP packets traverse the network in the same way as unicast IP packets until they reach the destination subnet. In the destination subnet, if the receiving router has targeted broadcast enabled on the egress interface, the IP packets are forwarded to an egress interface and the Routing Engine or to an egress interface only. The IP packets are then translated into broadcast IP packets which flood the target subnet only through the LAN interface (if there is no LAN interface, the packets are discarded), and all hosts on the target subnet receive the IP packets. If targeted broadcast is not enabled on the receiving router, the IP packets are treated as regular Layer 3 broadcast IP packets and are forwarded to the Routing Engine. If targeted broadcast is enabled without any options, the IP packets are discarded.

Targeted broadcast can be configured to forward the IP packets only to an egress interface, which is helpful when the router is flooded with packets to process, or to both an egress interface and the Routing Engine.

NOTE: Any firewall filter that is configured on the Routing Engine loopback interface (lo0) cannot be applied to IP packets that are forwarded to the Routing Engine as a result of a targeted broadcast. This is because broadcast packets are forwarded as flood next hop and not as local next hop traffic, and you can only apply a firewall filter to local next hop routes for traffic directed towards the Routing Engine.

Reverse Path Forwarding

- [Understanding Unicast Reverse Path Forwarding on page 2283](#)
- [Understanding Multicast Reverse Path Forwarding on page 2283](#)

Understanding Unicast Reverse Path Forwarding

IP spoofing can occur during a denial-of-service (DoS) attack. IP spoofing allows an intruder to pass IP packets to a destination as genuine traffic, when in fact the packets are not actually meant for the destination. This type of spoofing is harmful because it consumes the destination's resources.

A unicast reverse-path-forwarding (RPF) check is a tool to reduce forwarding of IP packets that might be spoofing an address. A unicast RPF check performs a route table lookup on an IP packet's source address, and checks the incoming interface. The router or switch determines whether the packet is arriving from a path that the sender would use to reach the destination. If the packet is from a valid path, the router or switch forwards the packet to the destination address. If it is not from a valid path, the router or switch discards the packet. Unicast RPF is supported for the IPv4 and IPv6 protocol families, as well as for the virtual private network (VPN) address family.

NOTE: Reverse path forwarding is not supported on the interfaces you configure as tunnel sources. This affects only the transit packets exiting the tunnel.

Related Documentation

- [Example: Configuring Unicast Reverse-Path-Forwarding Check](#)

Understanding Multicast Reverse Path Forwarding

Unicast forwarding decisions are typically based on the destination address of the packet arriving at a router. The unicast routing table is organized by destination subnet and mainly set up to forward the packet toward the destination.

In multicast, the router or switch forwards the packet away from the source to make progress along the distribution tree and prevent routing loops. The router's or switch's multicast forwarding state runs more logically by organizing tables based on the reverse path, from the receiver back to the root of the distribution tree. This process is known as *reverse-path forwarding (RPF)*.

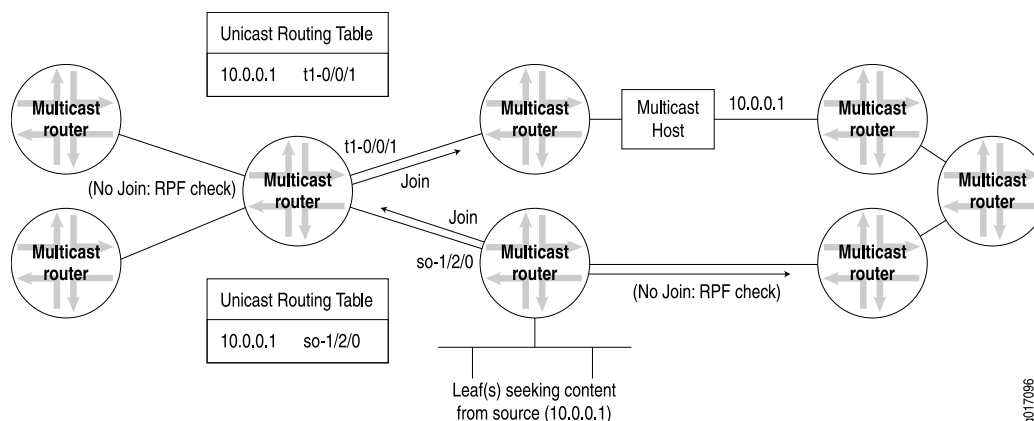

The router or switch adds a branch to a distribution tree depending on whether the request for traffic from a multicast group passes the reverse-path-forwarding check (RPF check). Every multicast packet received must pass an RPF check before it is eligible to be replicated or forwarded on any interface.

The RPF check is essential for every router's multicast implementation. When a multicast packet is received on an interface, the router or switch interprets the source address in the multicast IP packet as the destination address for a unicast IP packet. The source multicast address is found in the unicast routing table, and the outgoing interface is

determined. If the outgoing interface found in the unicast routing table is the same as the interface that the multicast packet was received on, the packet passes the RPF check. Multicast packets that fail the RPF check are dropped because the incoming interface is not on the *shortest path* back to the source.

Figure 27 on page 2284 shows how multicast routers can use the unicast routing table to perform an RPF check and how the results obtained at each router determine where join messages are sent.

Figure 27: Multicast Routers and the RPF Check

Routers and switches can build and maintain separate tables for RPF purposes. The router must have some way to determine its RPF interface for the group, which is the interface topologically closest to the root. For greatest efficiency, the distribution tree follows the shortest-path tree topology. The RPF check helps to construct this tree.

RPF Table

The RPF table plays the key role in the multicast router or switch. The RPF table is consulted for every RPF check, which is performed at intervals on multicast packets entering the multicast router. Distribution trees of all types rely on the RPF table to form properly, and the multicast forwarding state also depends on the RPF table.

RPF checks are performed only on unicast addresses to find the upstream interface for the multicast source or RP.

The routing table used for RPF checks can be the same routing table used to forward unicast IP packets, or it can be a separate routing table used only for multicast RPF checks. In either case, the RPF table contains only unicast routes, because the RPF check is performed on the source address of the multicast packet, not the multicast group destination address, and a multicast address is forbidden from appearing in the source address field of an IP packet header. The unicast address can be used for RPF checks because there is only one source host for a particular stream of IP multicast content for a multicast group address, although the same content could be available from multiple sources.

If the same routing table used to forward unicast packets is also used for the RPF checks, the routing table is populated and maintained by the traditional unicast routing protocols such as BGP, IS-IS, OSPF, and the Routing Information Protocol (RIP). If a dedicated

multicast RPF table is used, this table must be populated by some other method. Some multicast routing protocols (such as the Distance Vector Multicast Routing Protocol [DVMRP]) essentially duplicate the operation of a unicast routing protocol and populate a dedicated RPF table. Others, such as PIM, do not duplicate routing protocol functions and must rely on some other routing protocol to set up this table, which is why PIM is *protocol independent*.

Some traditional routing protocols such as BGP and IS-IS now have extensions to differentiate between different sets of routing information sent between routers and switches for unicast and multicast. For example, there is multiprotocol BGP (MBGP) and multitopology routing in IS-IS (M-IS-IS). IS-IS routes can be added to the RPF table even when special features such as traffic engineering and “shortcuts” are turned on. Multicast Open Shortest Path First (MOSPF) also extends OSPF for multicast use, but goes further than MBGP or M-IS-IS and makes MOSPF into a complete multicast routing protocol on its own. When these routing protocols are used, routes can be tagged as multicast RPF routers and used by the receiving router differently than the unicast routing information.

Using the main unicast routing table for RPF checks provides simplicity. A dedicated routing table for RPF checks allows a network administrator to set up separate paths and routing policies for unicast and multicast traffic, allowing the multicast network to function more independently of the unicast network.

By default, PIM uses **inet.0** as its reverse-path forwarding (RPF) routing table group. PIM uses an RPF routing table group to resolve its RPF neighbor for a particular multicast source address and for the RP address. PIM can optionally use **inet.2** as its RPF routing table group. The **inet.2** routing table is organized more efficiently for RPF checks.

Once configured, the RPF routing table must be applied to a PIM as a routing table group.

Configuring a Layer 2 Virtual Switch

A Layer 2 virtual switch, which isolates a LAN segment with its spanning-tree protocol instance and separates its VLAN ID space, filters and forwards traffic only at the data link layer. Each VLAN consists of a set of logical ports that participate in Layer 2 learning and forwarding. A virtual switch represents a Layer 2 network.

Two main types of interfaces are used in virtual switch hierarchies:

- Layer 2 logical interface—This type of interface uses the VLAN-ID as a virtual circuit identifier and the scope of the VLAN-ID is local to the interface port. This type of interface is often used in service-provider-centric applications.
- Access or trunk interface—This type of interface uses a VLAN-ID with global significance. The access or trunk interface is implicitly associated with VLANs based on VLAN membership. Access or trunk interfaces are typically used in enterprise-centric applications.

NOTE: The difference between access interfaces and trunk interfaces is that access interfaces can be part of one VLAN only and the interface is normally attached to an end-user device (packets are implicitly associated with the configured VLAN). In contrast, trunk interfaces multiplex traffic from multiple VLANs and usually interconnect switches.

To configure a Layer 2 virtual switch, include the following statements:

```
[edit]
routing-instances {
  routing-instance-name (
    instance-type virtual-switch;
    vlans vlan-name{
      vlan-id (all | none | number);
      [...configure optional VLAN parameters]
    }
  }
}
```

```
}
}
```

To enable a virtual switch, you must specify **virtual-switch** as the **instance-type**.

The VLANs that are specified with the **vlan-id** statement are included in the virtual switch.

You can configure other optional VLAN parameters in the virtual switch.

Related Documentation

- [Configuring a Layer 2 Virtual Switch with a Layer 2 Trunk Port on page 1848](#)

Configuring a Layer 2 Virtual Switch with a Layer 2 Trunk Port

You can associate one or more Layer 2 trunk interfaces with a virtual switch.

A virtual switch configured with a Layer 2 trunk port also supports IRB within a VLAN. IRB provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. Only an interface configured with the **interface-mode (access | trunk)** statement can be associated with a virtual switch. An access interface enables you to accept packets with no VLAN identifier.

In addition, you can configure Layer 2 learning and forwarding properties for the virtual switch.

To configure a virtual switch with a Layer 2 trunk interface, include the following statements:

```
[edit]
routing-instances {
  routing-instance-name {
    instance-type virtual-switch;
    interface interface-name;
    vlans name {
      vlan-id (all | none | number);
      [...configure optional VLAN parameters]
    }
  }
}
```

Related Documentation

- [Configuring a Layer 2 Virtual Switch on page 1847](#)

Understanding Layer 2 Virtual Switches Instances

At Layer 2, you can group one or more VLANs into a single routing instance to form a virtual switch instance. A virtual switch instance is composed of VLANs. The virtual switch instance isolates a LAN segment and contains most Layer 2 functions, such as spanning-tree protocol instances and VLAN ID spaces, into its own smaller, logical network. Splitting Layer 2 traffic using virtual switch instances allows you to more logically organize your Layer 2 traffic into multiple “virtual” Layer 2 networks.

A default virtual switch, called default-switch, is automatically created when a virtual switch is configured. All Layer 2 traffic not assigned to a VLAN in a virtual switch automatically becomes part of the default virtual switch.

You can configure a virtual switch to participate only in Layer 2 bridging and optionally to perform Layer 3 routing. In addition, you can configure spanning-tree protocols (STPs) within the virtual switch to prevent forwarding loops. For more information about how to configure Layer 2 logical ports on an interface, see the *Junos® OS Network Interfaces*.

You can associate one or more logical interfaces configured as trunk interfaces with a virtual switch. A trunk interface, or Layer 2 trunk port, enables you to configure a logical interface to represent multiple VLANs on the physical interface. For more information about how to configure trunk interfaces, see the *Junos® OS Network Interfaces*.

You can also configure Layer 2 forwarding and learning properties for the virtual switch.

- [Configuring a Layer 2 Virtual Switch with a Layer 2 Trunk Port on page 1848](#)
- [Configuring a Layer 2 Control Protocol Routing Instance](#)

Configuring VLAN Encapsulation

To configure encapsulation on an interface, enter the **encapsulation** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]  
encapsulation type;
```

The following list contains important notes regarding encapsulation:

- Ethernet interfaces in VLAN mode can have multiple logical interfaces. In CCC and VPLS modes, VLAN IDs from 1 through 511 are reserved for normal VLANs, and VLAN IDs 512 through 4094 are reserved for CCC or VPLS VLANs. For 4-port Fast Ethernet interfaces, you can use VLAN IDs 512 through 1024 for CCC or VPLS VLANs.
- For encapsulation type **flexible-ethernet-services**, all VLAN IDs are valid.
- For some encapsulation types, including flexible Ethernet services, Ethernet VLAN CCC, and VLAN VPLS, you can also configure the encapsulation type that is used inside the VLAN circuit itself. To do this, include the **encapsulation** statement:

```
encapsulation (vlan-ccc | vlan-tcc | vlan-vpls);
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**
- You cannot configure a logical interface with VLAN CCC or VLAN VPLS encapsulation unless you also configure the physical device with the same encapsulation or with flexible Ethernet services encapsulation. In general, the logical interface must have a VLAN ID of 512 or higher; if the VLAN ID is 511 or lower, it will be subject to the normal destination filter lookups in addition to source address filtering. However if you configure flexible Ethernet services encapsulation, this VLAN ID restriction is removed.

In general, you configure an interface's encapsulation at the `[edit interfaces interface-name]` hierarchy level.

Example: Configuring VLAN Encapsulation on a Gigabit Ethernet Interface

Configure VLAN CCC encapsulation on a Gigabit Ethernet interface:

```
interfaces ge-2/1/0 {
  vlan-tagging;
  encapsulation vlan-ccc;
  unit 0 {
    encapsulation vlan-ccc;
    vlan-id 600;
  }
}
```

Example: Configuring VLAN Encapsulation on an Aggregated Ethernet Interface

Configure VLAN CCC encapsulation on an aggregated Gigabit Ethernet interface:

```
interfaces ae0 {
  vlan-tagging;
  encapsulation vlan-vpls;
  unit 0 {
    vlan-id 100;
  }
}
```

 - [Junos® OS Ethernet Interfaces](#)

Rewriting the Inner and Outer VLAN Tags

On Ethernet IQ, IQ2 and IQ2-E interfaces, on MX Series router Gigabit Ethernet, Tri-Rate Ethernet copper, and 10-Gigabit Ethernet interfaces, and on aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs on MX Series routers, to replace both the inner and the outer VLAN tags of the incoming frame with a user-specified VLAN tag value, include the **swap-swap** statement in the input VLAN map or output VLAN map:

```
swap-swap;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number input-vlan-map]`
- `[edit interfaces interface-name unit logical-unit-number output-vlan-map]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number input-vlan-map]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number output-vlan-map]`

See *Configuring Inner and Outer TPIDs and VLAN IDs* and *Configuring Inner and Outer TPIDs and VLAN IDs* for information about configuring inner and outer VLAN ID values and inner and outer TPID values required for VLAN maps.

- Related Documentation
- [input-vlan-map on page 1893](#)
 - [output-vlan-map on page 1911](#)
 - [swap-swap on page 1927](#)
 - *unit*
 - *Junos® OS Ethernet Interfaces*

Rewriting the VLAN Tag on Tagged Frames

To rewrite the VLAN tag on all tagged frames entering the interface to a specified VLAN ID and TPID, include the **swap**, **tag-protocol-id**, and **vlan-id** statements in the input VLAN map:

```
input-vlan-map {  
  swap;  
  vlan-id number;  
  tag-protocol-id tpid;  
}
```

To rewrite the VLAN tag on all tagged frames exiting the interface to a specified VLAN ID and TPID, include the **swap** and **tag-protocol-id** statements in the output VLAN map:

```
output-vlan-map {  
  swap;  
  vlan-id number;  
  tag-protocol-id tpid;  
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* **input-vlan-map**]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* **input-vlan-map**]

You cannot include both the **swap** statement and the **vlan-id** statement in the output VLAN map configuration. If you include the **swap** statement in the configuration, the VLAN ID in outgoing frames is rewritten to the VLAN ID bound to the logical interface. For more information about binding a VLAN ID to the logical interface, see *802.1Q VLANs Overview*.

The swap operation works on the outer tag only, whether or not you include the **stacked-vlan-tagging** statement in the configuration. For more information, see *Examples: Stacking and Rewriting Gigabit Ethernet IQ VLAN Tags*.

Binding VLAN IDs to Logical Interfaces

The following sections describe how to configure logical interfaces to receive and forward VLAN-tagged frames:

- [Binding VLAN IDs to Logical Interfaces Overview on page 2291](#)
- [Binding a VLAN ID to a Logical Interface on page 2292](#)
- [Binding a Range of VLAN IDs to a Logical Interface on page 2292](#)
- [Binding a List of VLAN IDs to a Logical Interface on page 2294](#)

Binding VLAN IDs to Logical Interfaces Overview

To configure a logical interface to receive and forward VLAN-tagged frames, you must bind a VLAN ID, a range of VLAN IDs, or a list of VLAN IDs to the logical interface.

[Table 167 on page 2291](#) lists the configuration statements you use to bind VLAN IDs to logical interfaces, organized by scope of the VLAN IDs used to match incoming packets:

Table 167: Configuration Statements Used to Bind VLAN IDs to Logical Interfaces

Scope of VLAN ID Matching	Type of VLAN Framing Supported on the Logical Interface	
	Single-Tag Framing	Dual-Tag Framing
VLAN ID	<code>vlan-id <i>vlan-id</i>;</code>	<code>vlan-tags outer <i>tpid</i>.<<i>vlan-id</i>> inner <i>tpid</i><i>vlan-id</i>;</code>
VLAN ID Range	<code>vlan-id-range <i>vlan-id-vlan-id</i>;</code>	<code>vlan-tags outer <i>tpid.vlan-id</i> inner-range <i>tpid.vlan-id-vlan-id</i>;</code>
VLAN ID List	<code>vlan-id-list [<i>vlan-id</i> <i>vlan-id-vlan-id</i>];</code>	<code>vlan-tags outer <<i>tpid</i>.><i>vlan-id</i> inner-list [<i>vlan-id</i> <i>vlan-id-vlan-id</i>];</code>

You can include all of the statements at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`

NOTE: The inner-list option of the `vlan-tags` statement does not support Tag Protocol ID (TPID) values.

Binding a VLAN ID to a Logical Interface

A logical interface that you have associated (bound) to a particular VLAN ID will receive and forward incoming frames that contain a matching VLAN ID.

Binding a VLAN ID to a Single-Tag Logical Interface

To bind a VLAN ID to a single-tag logical interface, include the `vlan-id` statement:

```
vlan-id vlan-id;
```

You can include the statement at the following hierarchy levels:

- [edit interfaces *ethernet-interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *ethernet-interface-name* unit *logical-unit-number*]

To configure an Ethernet interface to support single-tag logical interfaces, include the `vlan-tagging` statement at the [edit interfaces *ethernet-interface-name*] hierarchy level. To support mixed tagging, include the `flexible-vlan-tagging` statement instead.

Binding a VLAN ID to a Dual-Tag Logical Interface

To bind a VLAN ID to a dual-tag logical interface, include the `vlan-tags` statement:

```
vlan-tags inner <tpid>vlan-id outer <tpid>vlan-id;
```

You can include the statement at the following hierarchy levels:

- [edit interfaces *ethernet-interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *ethernet-interface-name* unit *logical-unit-number*]

To configure an Ethernet interface to support dual-tag logical interfaces, include the `stacked-vlan-tagging` statement at the [edit interfaces *ethernet-interface-name*] hierarchy level. To support mixed tagging, include the `flexible-vlan-tagging` statement instead.

Binding a Range of VLAN IDs to a Logical Interface

A VLAN range can be used by service providers to interconnect multiple VLANs belonging to a particular customer over multiple sites. Using a VLAN ID range conserves switch resources and simplifies configuration.

Binding a Range of VLAN IDs to a Single-Tag Logical Interface

To bind a range of VLAN IDs to a single-tag logical interface, include the `vlan-id-range` statement:

```
vlan-id-range vlan-id-vlan-id;
```

You can include the statement at the following hierarchy levels:

- [edit interfaces *ethernet-interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *ethernet-interface-name* unit *logical-unit-number*]

To configure an Ethernet interface to support single-tag logical interfaces, include the **vlan-tagging** statement at the [edit interfaces *ethernet-interface-name*] hierarchy level. To support mixed tagging, include the **flexible-vlan-tagging** statement instead.

Binding a Range of VLAN IDs to a Dual-Tag Logical Interface

To bind a range of VLAN IDs to a dual-tag logical interface, include the **vlan-tags** statement. Use the **inner-list** option to specify the VLAN IDs as an inclusive range by separating the starting VLAN ID and ending VLAN ID with a hyphen.

```
vlan-tags inner-list [ vlan-id vlan-id-vlan-id ] outer <tpid.>vlan-id;
```

You can include the statement at the following hierarchy levels:

- [edit interfaces *ethernet-interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *ethernet-interface-name* unit *logical-unit-number*]

To configure an Ethernet interface to support dual-tag logical interfaces, include the **stacked-vlan-tagging** statement at the [edit interfaces *ethernet-interface-name*] hierarchy level. To support mixed tagging, include the **flexible-vlan-tagging** statement instead.

Example: Binding Ranges VLAN IDs to Logical Interfaces

The following example configures two different ranges of VLAN IDs on two different logical ports:

```
[edit interfaces]
ge-3/0/0 {
  unit 0 {
    encapsulation vlan-bridge;
    vlan-id-range 500-600;
  }
}
ge-3/0/1 {
  flexible-vlan-tagging;
  unit 0 {
    encapsulation vlan-bridge;
    vlan-id-range 200-300;
  }
  unit 1 {
    encapsulation vlan-bridge;
    vlan-tags outer 1000 inner-range 100-200;
  }
}
```

Binding a List of VLAN IDs to a Logical Interface

In Junos OS Release 9.5 and later, on MX Series routers and in Junos OS Release 12.2R2 and later on EX Series switches, you can bind a list of VLAN IDs to a single logical interface, eliminating the need to configure a separate logical interface for every VLAN or VLAN range. A logical interface that accepts packets tagged with any VLAN ID specified in a VLAN ID list is called a *VLAN-bundled* logical interface.

You can use VLAN-bundled logical interfaces to configure circuit cross-connects between Layer 2 VPN routing instances or Layer 2 circuits. Using VLAN-bundled logical interfaces simplifies configuration and reduces use of system resources such as logical interfaces, next hops, and circuits.

As an alternative to configuring multiple logical interfaces (one for each VLAN ID and one for each range of VLAN IDs), you can configure a single VLAN-bundled logical interface based on a list of VLAN IDs.

NOTE: The `vlan-id` option is not supported to achieve VLAN normalization on VPLS instances that are configured with `vlan-id-list`. However, you can use the `vlan-maps` option to achieve VLAN normalization.

Binding a List of VLAN IDs to a Single-Tag Logical Interface

To bind a list of VLAN IDs to a single-tag logical interface, include the `vlan-id-list` statement. Specify the VLAN IDs in the list individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

```
vlan-id-list [ vlan-id vlan-id–vlan-id ];
```

You can include the statement at the following hierarchy levels:

- [edit interfaces *ethernet-interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *ethernet-interface-name* unit *logical-unit-number*]

To configure an Ethernet interface to support single-tag logical interfaces, include the `vlan-tagging` statement at the [edit interfaces *ethernet-interface-name*] hierarchy level. To support mixed tagging, include the `flexible-vlan-tagging` statement instead.

Binding a List of VLAN IDs to a Dual-Tag Logical Interface

To bind a list of VLAN IDs to a dual-tag logical interface, include the `vlan-tags` statement. Use the `inner-list` option to specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both:

```
vlan-tags inner-list [ vlan-id vlan-id–vlan-id ] outer <tpid>vlan-id;
```

NOTE: The `inner-list` option of the `vlan-tags` statement does not support Tag Protocol ID (TPID) values.

You can include the statement at the following hierarchy levels:

- [edit interfaces *ethernet-interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *ethernet-interface-name* unit *logical-unit-number*]

To configure an Ethernet interface to support dual-tag logical interfaces, include the **stacked-vlan-tagging** statement at the [edit interfaces *ethernet-interface-name*] hierarchy level. To support mixed tagging, include the **flexible-vlan-tagging** statement instead.

Example: Binding Lists of VLAN IDs to Logical Interfaces

The following example configures two different lists of VLAN IDs on two different logical ports:

```
[edit interfaces]
ge-1/1/0 {
  vlan-tagging; # Only for single-tagging
  encapsulation flexible-ethernet-services;
  unit 10 {
    encapsulation vlan-ccc;
    vlan-id-list [20 30–40 45];
  }
}
ge-1/1/1 {
  flexible-vlan-tagging; # Only for mixed tagging
  encapsulation flexible-ethernet-services;
  unit 10 {
    encapsulation vlan-ccc;
    vlan-id-list [1 10 20 30–40];
  }
  unit 20 {
    encapsulation vlan-ccc;
    vlan-tags outer 200 inner-list [50–60 80 90–100];
  }
}
```

In the example configuration above, **ge-1/1/0** supports single-tag logical interfaces, and **ge-1/1/1** supports mixed tagging. The single-tag logical interfaces **ge-1/1/0.10** and **ge-1/1/1.20** each bundle lists of VLAN IDs. The dual-tag logical interface **ge-1/1/1.20** bundles lists of inner VLAN IDs.

TIP: You can group a range of identical interfaces into an interface range and then apply a common configuration to that interface range. For example, in the above example configuration, both interfaces **ge-1/1/0** and **ge-1/1/1** have the same physical encapsulation type of **flexible-ethernet-services**. Thus you can define an interface range with the interfaces **ge-1/1/0** and **ge-1/1/1** as its members and apply the encapsulation type **flexible-ethernet-services** to that defined interface range. For more information about interface ranges, see *Configuring Interface Ranges*.

 - [Configuring Interface Ranges](#)
 - [Junos® OS Ethernet Interfaces](#)

Configuring a Logical Interface for Access Mode

Enterprise network administrators can configure a single logical interface to accept untagged packets and forward the packets within a specified VLAN. A logical interface configured to accept untagged packets is called an *access interface* or *access port*.

`interface-mode access;`

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family ethernet-switching]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family ethernet-switching]`

When an untagged or tagged packet is received on an access interface, the packet is accepted, the VLAN ID is added to the packet, and the packet is forwarded within the VLAN that is configured with the matching VLAN ID.

The following example configures a logical interface as an access port with a VLAN ID of 20 on routers and switches that support the enhanced Layer 2 software:

```
[edit interfaces ge-1/2/0]
unit 1 {
  family ethernet-switching {
    interface-mode access;
    vlan members 20;
  }
}
```

- [802.1Q VLANs Overview](#)
 - [Junos® OS Ethernet Interfaces](#)

Configuring Junos OS for Supporting Aggregated Devices

Junos OS supports the aggregation of physical devices into defined virtual links, such as the link aggregation of Ethernet interfaces defined by the IEEE 802.3ad standard.

Tasks for configuring aggregated devices are:

- [Configuring Virtual Links for Aggregated Devices on page 2297](#)
- [Configuring LACP Link Protection at the Chassis Level on page 2297](#)
- [Enabling LACP Link Protection on page 2298](#)
- [Configuring System Priority on page 2298](#)
- [Configuring the Maximum Links Limit on page 2298](#)

Configuring Virtual Links for Aggregated Devices

To define virtual links, you need to specify the associations between physical and logical devices within the **[edit interfaces]** hierarchy, and assign the correct number of logical devices by including the **device-count** statement at the **[edit chassis aggregated-devices ethernet]** and **[edit chassis aggregated-devices sonet]** hierarchy levels:

```
[edit chassis]
aggregated-devices {
  ethernet {
    device-count number;
  }
  sonet {
    device-count number;
  }
}
```

The maximum number of Ethernet logical interfaces that you can configure is 128. On M Series and T Series routers, you can configure a maximum number of 128 aggregated interfaces. On MX Series routers, you can configure a maximum of 480 aggregated interfaces. The aggregated interfaces are numbered from **ae0** through **ae127** for M Series and T Series routers, and the aggregated interfaces (LAG bundles) are numbered from **ae0** through **ae479** on MX Series routers. The maximum number of SONET/SDH logical interfaces is 16. The aggregated SONET/SDH interfaces are numbered from **as0** through **as15**.

Configuring LACP Link Protection at the Chassis Level

Link Aggregation Control Protocol (LACP) is one method of bundling several physical interfaces to form one logical interface. You can configure both VLAN-tagged and untagged aggregated Ethernet with or without LACP enabled. LACP exchanges are made between actors and partners. An actor is the local interface in an LACP exchange. A partner is the remote interface in an LACP exchange.

LACP link protection enables you to force active and standby links within an aggregated Ethernet. You configure LACP link protection by using the **link-protection** and **system-priority** statements at either the chassis or interface level and by configuring port priority at the interface level using the **system-priority** statement. Configuring LACP parameters at the chassis level results in all aggregated Ethernet interfaces using the defined values unless overridden by the LACP configuration on a specific interface.

```
[edit chassis]
aggregated-devices {
  ethernet {
    lacp {
      link-protection {
        non-revertive;
      }
      system-priority priority;
    }
  }
}
```

NOTE: LACP link protection also uses port priority. You can configure port priority at the Ethernet interface `[gigether-options]` hierarchy level using the `port-priority` statement. If you choose not to configure port priority, LACP link protection uses the default value for port priority (127).

Enabling LACP Link Protection

To enable LACP link protection for aggregated Ethernet interfaces on the chassis, use the `link-protection` statement at the `[edit chassis aggregated-devices ethernet lacp]` hierarchy level:

```
[edit chassis aggregated-devices ethernet lacp]
link-protection {
  non-revertive;
}
```

By default, LACP link protection reverts to a higher-priority (lower-numbered) link when that higher-priority link becomes operational or a link is added to the aggregator that is determined to be higher in priority. However, you can suppress link calculation by adding the `non-revertive` statement to the LACP link protection configuration. In nonrevertive mode, after a link is active and collecting and distributing packets, the subsequent addition of a higher-priority (better) link does not result in a switch, and the current link remains active.

CAUTION: If both ends of an aggregator have LACP link protection enabled, make sure to configure both ends of the aggregator to use the same mode. Mismatching LACP link protection modes can result in lost traffic.

Configuring System Priority

To configure LACP system priority for aggregated Ethernet interfaces on the chassis, use the `system-priority` statement at the `[edit chassis aggregated-devices ethernet lacp]` hierarchy level:

```
[edit chassis aggregated-devices ethernet lacp]
system-priority priority;
```

The system priority is a 2-octet binary value that is part of the LACP system ID. The LACP system ID consists of the system priority as the two most-significant octets and the interface MAC address as the six least-significant octets. The system with the numerically lower value for system priority has the higher priority. By default, system priority is 127, with a range of 0 through 65,535.

Configuring the Maximum Links Limit

To configure the maximum links limit, use the `maximum-links` statement at the `[edit chassis aggregated-devices]` hierarchy level:

```
[edit chassis aggregated-devices]
maximum-links maximum-links-limit;
```

Related Documentation

- [Configuring an Aggregated Ethernet Interface](#)
- [Junos® OS Ethernet Interfaces](#)
- [Configuring Aggregated Ethernet Interfaces on PTX Series Packet Transport Switches](#)

Configuring an Aggregated Ethernet Interface

You can associate a physical interface with an aggregated Ethernet interface.

To configure an aggregated Ethernet interface:

1. Specify that you want to configure the link aggregation group interface.

```
user@host# edit interfaces interface-name
```

2. Configure the aggregated Ethernet interface.

```
[edit interfaces interface-name]
user@host# set ether-options 802.3ad aex
```

You specify the interface instance number *x* to complete the link association; *x* can be from 0 through 480, for a total of 480 aggregated interfaces on MX Series routers or EX9200 switches. You must also include a statement defining **aex** at the **[edit interfaces]** hierarchy level. You can optionally specify other physical properties that apply specifically to the aggregated Ethernet interfaces; for details, see *Ethernet Interfaces Overview*.

NOTE: In general, aggregated Ethernet bundles support the features available on all supported interfaces that can become a member link within the bundle. As an exception, Gigabit Ethernet IQ features and some newer Gigabit Ethernet features are not supported in aggregated Ethernet bundles.

Gigabit Ethernet IQ and SFP interfaces can be member links, but IQ- and SFP-specific features are not supported on the aggregated Ethernet bundle even if all the member links individually support those features.

You need to configure the correct link speed for the aggregated Ethernet interface to eliminate any warning message.

NOTE: Before you commit an aggregated Ethernet configuration, ensure that link mode is not configured on any member interface of the aggregated Ethernet bundle; otherwise, the configuration commit check fails.

Related Documentation

- [Configuring an Aggregated Ethernet Interface on page 2299](#)
- [Configuring the Number of Aggregated Ethernet Interfaces on the Device \(Enhanced Layer 2 Software CLI Procedure\) on page 2300](#)
- [Deleting an Aggregated Ethernet Interface on page 2300](#)
- [Aggregated Ethernet Interfaces Overview on page 2279](#)

- *Junos® OS Ethernet Interfaces*

Deleting an Aggregated Ethernet Interface

There are two approaches to deleting an aggregated Ethernet interface:

- You can delete an aggregated Ethernet interface from the interface configuration. The Junos OS removes the configuration statements related to **aex** and sets this interface to down state.
- You can also permanently remove the aggregated Ethernet interface from the device configuration by deleting it from the device-count on the routing device.

To delete an aggregated Ethernet interface:

1. Delete the aggregated Ethernet configuration.

This step changes the interface state to down and removing the configuration statements related to **aex**.

```
[edit]
user@host# delete interfaces aex
```

2. Delete the interface from the device count.

```
[edit]
user@host# delete chassis aggregated-devices ethernet device-count
```

- [Aggregated Ethernet Interfaces Overview on page 2279](#)
- *Junos® OS Ethernet Interfaces*

Configuring the Number of Aggregated Ethernet Interfaces on the Device (Enhanced Layer 2 Software CLI Procedure)

By default, no aggregated Ethernet interfaces are created. You must set the number of aggregated Ethernet interfaces on the routing device before you can configure them.

On MX Series routers and EX9200 switches, you can configure a maximum of 480 aggregated interfaces. The aggregated interfaces (LAG bundles) are numbered from **ae0** through **ae479** on MX Series routers and EX9200 switches.

1. Specify that you want to access the aggregated Ethernet configuration on the device.

```
user@host# edit chassis aggregated-devices ethernet
```

2. Set the number of aggregated Ethernet interfaces.

```
[edit chassis aggregated-devices ethernet]
user@host# set device-count number
```

You must also specify the constituent physical links by including the **802.3ad** statement at the `[edit interfaces interface-name ether-options]` or `[edit interfaces interface-name ether-options]` hierarchy level.

Related Documentation

- For information about physical links, see [Configuring an Aggregated Ethernet Interface on page 2299](#)
- *Junos® OS Ethernet Interfaces*
- For information about configuring aggregated devices, see the *Junos OS System Basics Configuration Guide*.

Example: Configuring Aggregated Ethernet Interfaces

Aggregated Ethernet interfaces can use interfaces from different FPCs, DPCs, or PICs. The following configuration is sufficient to get an aggregated Gigabit Ethernet interface up and running.

```
[edit chassis]
aggregated-devices {
  ethernet {
    device-count 15;
  }
}

[edit interfaces]
ge-1/3/0 {
  gigether-options {
    802.3ad ae0;
  }
}
ge-2/0/1 {
  gigether-options {
    802.3ad ae0;
  }
}
ae0 {
  aggregated-ether-options {
    link-speed 1g;
    minimum-links 1;
  }
}
vlan-tagging;
unit 0 {
  vlan-id 1;
  family inet {
    address 14.0.100.50/24;
  }
}
unit 1 {
  vlan-id 1024;
  family inet {
    address 14.0.101.50/24;
  }
}
```

```
unit 2 {  
    vlan-id 1025;  
    family inet {  
        address 14.0.102.50/24;  
    }  
}  
unit 3 {  
    vlan-id 4094;  
    family inet {  
        address 14.0.103.50/24;  
    }  
}
```

- Related Documentation**
- [Junos® OS Ethernet Interfaces](#)
 - [Configure 'link-speed' for Gigabit Ethernet based Aggregate Ethernet interface bundles](#)

Configuring Tagged Aggregated Ethernet Interfaces

To specify aggregated Ethernet interfaces, include the **vlan-tagging** statement at the **[edit interfaces aex]** hierarchy level:

```
[edit interfaces aex]  
vlan-tagging;
```

You must also include the **vlan-id** statement:

```
vlan-id number;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

For more information about the **vlan-tagging** and **vlan-id** statements, see *802.1Q VLANs Overview*.

- Related Documentation**
- [vlan-id](#)
 - [vlan-tagging on page 2373](#)

Configuring Untagged Aggregated Ethernet Interfaces

When you configure an untagged Aggregated Ethernet interface, the existing rules for untagged interfaces apply. These rules are as follows:

- You can configure only one logical interface (unit 0) on the port. The logical unit 0 is used to send and receive LACP or marker protocol data units (PDUs) to and from the individual links.
- You cannot include the **vlan-id** statement in the configuration of the logical interface.

Configure an untagged aggregated Ethernet interface by omitting the **vlan-tagging** and **vlan-id** statements from the configuration:

```
[edit interfaces]
ge-1/1/1 {
  ether-options {
    802.3ad ae0;
  }

- *Junos® OS Ethernet Interfaces*

Configuring Aggregated Ethernet Minimum Links

On aggregated Ethernet interfaces, you can configure the minimum number of links that must be up for the bundle as a whole to be labeled **up**. By default, only one link must be up for the bundle to be labeled **up**.

To configure the minimum number of links:

1. Specify that you want to configure the aggregated Ethernet options.

```
user@host# edit interfaces interface-name aggregated-ether-options
```
2. Configure the minimum number of links.

```
[edit interfaces interface-name aggregated-ether-options]
```

`user@host# set minimum-links number`

On M120, M320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, and EX 9200 switches, the valid range for **minimum-links *number*** is 1 through 16. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled **up**.

On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for **minimum-links *number*** is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled **up**.

On EX8200 switches, the range of valid values for **minimum-links *number*** is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled **up**.

If the number of links configured in an aggregated Ethernet interface is less than the minimum link value configured under the **aggregated-ether-options** statement, the configuration commit fails and an error message is displayed.

Configuring Load Balancing on a LAG Link

You can configure the load balancing hash key for Layer 2 traffic to use fields in the Layer 3 and Layer 4 headers inside the frame payload for load-balancing purposes using the **payload** statement. You can configure the statement to look at **layer-3** (and **source-ip-only** or **destination-ip-only** packet header fields) or **layer-4** fields. You configure this statement at the **[edit forwarding-options hash-key family multiservice]** hierarchy level.

You can configure Layer 3 or Layer 4 options, or both. The **source-ip-only** or **destination-ip-only** options are mutually exclusive. The **layer-3-only** statement is not available on MX Series routers.

NOTE: For Dense Port Concentrators (DPC), any change in the hash key configuration requires a reboot for the changes to take effect. For Modular Port Concentrators (MPC) the reboot is not required.

For more information about link aggregation group (LAG) configuration, see the *Junos® OS Network Interfaces*.

**Related
Documentation**

- [Load Balancing and Ethernet Link Aggregation on page 2281](#)
- [Load Balancing on a LAG Link on page 2305](#)

Example: Configuring Load Balancing on a LAG Link

This example configures the load-balancing hash key to use the source Layer 3 IP address option and Layer 4 header fields as well as the source and destination MAC addresses for load balancing on a link aggregation group (LAG) link:

```
[edit]
forwarding-options {
  hash-key {
    family multiservice {
      source-mac;
      destination-mac;
      payload {
        ip {
          layer-3 {
            source-ip-only;
          }
          layer-4;
        }
      }
    }
  }
}
```

Configuring Multichassis Link Aggregation

On MX Series routers and EX Series switches, multichassis link aggregation (MC-LAG) enables a device to form a logical LAG interface with two or more other devices. MC-LAG provides additional benefits over traditional LAG in terms of node level redundancy, multi-homing support, and loop-free Layer 2 network without running Spanning Tree Protocol (STP). MC-LAG can be configured for VPLS routing instance, CCC application, and Layer 2 circuit encapsulation types.

The MC-LAG devices use Inter-Chassis Communication Protocol (ICCP) to exchange the control information between two MC-LAG network devices.

On one end of MC-LAG is a MC-LAG client device that has one or more physical links in a link aggregation group (LAG). This client device does not need to be aware of MC-LAG. On the other side of MC-LAG are two MC-LAG network devices. Each of these network devices has one or more physical links connected to a single client device. The network devices coordinate with each other to ensure that data traffic is forwarded properly.

MC-LAG includes the following functionality:

- Active standby mode is supported using Link Aggregation Control Protocol (LACP)
- MC-LAG operates only between two chassis.
- Layer 2 circuit functions are supported with **ether-ccc** encapsulation.
- VPLS functions are supported with **ether-vpls** and **vlan-vpls**.

NOTE: Ethernet connectivity fault management (CFM) specified in IEEE 802.1ag standard for Operation, Administration, and Management (OAM) is *not* supported on MC-LAG interfaces.

To enable MC-LAG, include the **mc-ae** statement at the **[edit interfaces aeX aggregated-ether-options]** hierarchy level along with either the **ethernet-bridge**, **encapsulation ethernet-ccc**, **encapsulation ethernet-vpls**, or **flexible-ethernet-services** statement at the **[edit interfaces aeX]** hierarchy level. You also need to configure the **lACP** statement and the **admin-key** and **system-id** statements at the **[edit interfaces aeX aggregated-ether-options]** hierarchy level:

```
[edit interfaces aeX]
encapsulation (ethernet-bridge | ethernet-ccc | ethernet-vpls | flexible-ethernet-services);
aggregated-ether-options {
  lACP {
    active;
    admin-key number;
    system-id mac-address;
    system-priority number;
  }
  mc-ae {
    chassis-id chassis-id;
    events {
      iccp-peer-down {
        force-icl-down;
        prefer-status-control-active;
      }
    }
    mc-ae-id mc-ae-id;
    mode (active-active | active-standby);
    redundancy-group group-id;
    status-control (active | standby);
  }
}
```

NOTE: When you configure the **prefer-status-control-active** statement, you must also configure the **status-control active** statement. If you configure the **status-control standby** statement with the **prefer-status-control-active** statement, the system issues a warning.

To delete a MC-LAG interface from the configuration, issue the **delete interfaces aeX aggregated-ether-options mc-ae** command at the **[edit]** hierarchy level in configuration mode:

```
[edit]
user@host# delete interfaces aeX aggregated-ether-options mc-ae
```

Configuring Aggregated Ethernet LACP

For aggregated Ethernet interfaces, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure both VLAN-tagged and untagged aggregated Ethernet with or without LACP enabled.

For Multichassis Link Aggregation (MC-LAG), you must specify the **system-id** and **admin key**. MC-LAG peers use the same **system-id** while sending the LACP messages. The **system-id** can be configured on the MC-LAG network device and synchronized between peers for validation.

LACP exchanges are made between actors and partners. An actor is the local interface in an LACP exchange. A partner is the remote interface in an LACP exchange.

LACP is defined in IEEE 802.3ad, *Aggregation of Multiple Link Segments*.

LACP was designed to achieve the following:

- Automatic addition and deletion of individual links to the aggregate bundle without user intervention
- Link monitoring to check whether both ends of the bundle are connected to the correct group

The Junos OS implementation of LACP provides link monitoring but not automatic addition and deletion of links.

The LACP mode can be active or passive. If the actor and partner are both in passive mode, they do not exchange LACP packets, which results in the aggregated Ethernet links not coming up. If either the actor or partner is active, they do exchange LACP packets. By default, LACP is turned off on aggregated Ethernet interfaces. If LACP is configured, it is in passive mode by default. To initiate transmission of LACP packets and response to LACP packets, you must configure LACP in active mode.

To enable LACP active mode, include the **lACP** statement at the **[edit interfaces interface-name aggregated-ether-options]** hierarchy level, and specify the **active** option:

```
[edit interfaces interface-name aggregated-ether-options]
lACP {
  active;
}
```

NOTE: The LACP process exists in the system only if you configure the system in either active or passive LACP mode.

To restore the default behavior, include the **lACP** statement at the **[edit interfaces *interface-name* aggregated-ether-options]** hierarchy level, and specify the **passive** option:

```
[edit interfaces interface-name aggregated-ether-options]
lACP {
  passive;
}
```

Starting with Junos OS release 12.2, you can also configure LACP to override the IEEE 802.3ad standard and to allow the standby link always to receive traffic. Overriding the default behavior facilitates subsecond failover.

To override the IEEE 802.3ad standard and facilitate subsecond failover, include the **fast-failover** statement at the **[edit interfaces *interface-name* aggregated-ether-options lACP]** hierarchy level.

For more information, see the following sections:

- [Configuring the LACP Interval on page 2308](#)
- [Configuring LACP Link Protection on page 2309](#)
- [Configuring LACP System Priority on page 2310](#)

- [Configuring LACP administrative Key on page 2310](#)
- [Configuring LACP Port Priority on page 2311](#)
- [Tracing LACP Operations on page 2311](#)
- [LACP Limitations on page 2312](#)
- [Example: Configuring Aggregated Ethernet LACP on page 2312](#)

Configuring the LACP Interval

By default, the actor and partner send LACP packets every second. You can configure the interval at which the interfaces send LACP packets by including the **periodic** statement at the **[edit interfaces *interface-name* aggregated-ether-options lACP]** hierarchy level:

```
[edit interfaces interface-name aggregated-ether-options lACP]
periodic interval;
```

The interval can be fast (every second) or slow (every 30 seconds). You can configure different periodic rates on active and passive interfaces. When you configure the active and passive interfaces at different rates, the transmitter honors the receiver's rate.

NOTE: Source address filtering does not work when LACP is enabled.

Percentage policers are not supported on aggregated Ethernet interfaces with the CCC protocol family configured. For more information about percentage policers, see the *Routing Policy Configuration Guide*.

Generally, LACP is supported on all untagged aggregated Ethernet interfaces. For more information, see *Configuring Untagged Aggregated Ethernet Interfaces*.

Configuring LACP Link Protection

NOTE: When using LACP link protection, you can configure only two member links to an aggregated Ethernet interface: one active and one standby.

To force active and standby links within an aggregated Ethernet, you can configure LACP link protection and system priority at the aggregated Ethernet interface level using the **link-protection** and **system-priority** statements. Configuring values at this level results in only the configured interfaces using the defined configuration. LACP interface configuration also enables you to override global (chassis) LACP settings.

LACP link protection also uses port priority. You can configure port priority at the Ethernet interface **[ether-options]** hierarchy level using the **port-priority** statement. If you choose not to configure port priority, LACP link protection uses the default value for port priority (127).

NOTE: LACP link protection supports per-unit scheduling configuration on aggregated Ethernet interfaces.

To enable LACP link protection for an aggregated Ethernet interfaces, use the **link-protection** statement at the **[edit interfaces aeX aggregated-ether-options lacp]** hierarchy level:

```
[edit interfaces aeX aggregated-ether-options lacp]
link-protection;
  disable;
  revertive;
  non-revertive;
}
```

By default, LACP link protection reverts to a higher-priority (lower-numbered) link when that higher-priority link becomes operational or a link is added to the aggregator that is determined to be higher in priority. However, you can suppress link calculation by adding the **non-revertive** statement to the LACP link protection configuration. In nonrevertive mode, once a link is active and collecting and distributing packets, the subsequent addition of a higher-priority (better) link does not result in a switch and the current link remains active.

If LACP link protection is configured to be nonrevertive at the global (**[edit chassis]** hierarchy) level, you can add the **revertive** statement to the LACP link protection configuration to override the nonrevertive setting for the interface. In revertive mode, the addition of a higher-priority link to the aggregator results in LACP performing a priority recalculation and switching from the current active link to the new active link.

CAUTION: If both ends of an aggregator have LACP link protection enabled, make sure to configure both ends of the aggregator to use the same mode. Mismatching LACP link protection modes can result in lost traffic.

We strongly recommend you to use LACP on both ends of the aggregator, when you connect an aggregated Ethernet interface with two member interfaces to any other vendor device. Otherwise, the vendor device (say a Layer 2 switch, or a router), will not be able to manage the traffic coming from the two link aggregated Ethernet bundle. As a result, you might observe the vendor device sending back the traffic to the backup member link of the aggregated Ethernet interface.

Currently, MX-MPC2-3D, MX-MPC2-3D-Q, MX-MPC2-3D-EQ, MX-MPC1-3D, MX-MPC1-3D-Q, and MPC-3D-16XGE-SFP do not drop traffic coming back to the backup link, whereas DPCE-R-Q-20GE-2XGE, DPCE-R-Q-20GE-SFP, DPCE-R-Q-40GE-SFP, DPCE-R-Q-4XGE-XFP, DPCE-X-Q-40GE-SFP, and DPCE-X-Q-4XGE-XFP drop traffic coming to the backup link.

Configuring LACP System Priority

To configure LACP system priority for aggregated Ethernet interfaces on the interface, use the **system-priority** statement at the **[edit interfaces aeX aggregated-ether-options lacp]** hierarchy level:

```
[edit interfaces aeX aggregated-ether-options lacp]
system-priority;
```

The system priority is a 2-octet binary value that is part of the LACP system ID. The LACP system ID consists of the system priority as the two most-significant octets and the interface MAC address as the six least-significant octets. The system with the numerically lower value for system priority has the higher priority. By default, system priority is 127, with a range of 0 to 65,535.

Configuring LACP System Identifier

To configure the LACP system identifier for aggregated Ethernet interfaces, use the **system-id** statement at the **[edit interfaces aeX aggregated-ether-options lacp]** hierarchy level:

```
[edit interfaces aeX aggregated-ether-options lacp]
system-id system-id;
```

The user-defined system identifier in LACP enables two ports from two separate devices to act as though they were part of the same aggregate group.

The system identifier is a 48-bit (6-byte) globally unique field. It is used in combination with a 16-bit system-priority value, which results in a unique LACP system identifier.

Configuring LACP administrative Key

To configure an administrative key for LACP, include the **admin-key number** statement at the **edit interfaces aex aggregated-ether-options lacp** hierarchy level:

```
[edit interfaces ae x aggregated-ether-options-lacp]
admin-key number;
```

NOTE: You must configure MC-LAG to configure the `admin-key` statement. For more information about MC-LAG, see [“Configuring Multichassis Link Aggregation” on page 2305](#).

Configuring LACP Port Priority

To configure LACP port priority for aggregated Ethernet interfaces, use the `port-priority` statement at the `[edit interfaces interface-name ether-options 802.3ad aeX lacp]` or `[edit interfaces interface-name ether-options 802.3ad aeX lacp]` hierarchy levels:

```
[edit interfaces interface-name ether-options 802.3ad aeX lacp]
port-priority priority;
```

The port priority is a 2-octet field that is part of the LACP port ID. The LACP port ID consists of the port priority as the two most-significant octets and the port number as the two least-significant octets. The system with the numerically lower value for port priority has the higher priority. By default, port priority is 127, with a range of 0 to 65,535.

Port aggregation selection is made by each system based on the highest port priority and are assigned by the system with the highest priority. Ports are selected and assigned starting with the highest priority port of the highest priority system and working down in priority from there.

NOTE: Port aggregation selection (discussed above) is performed for the active link when LACP link protection is enabled. Without LACP link protection, port priority is not used in port aggregation selection.

Tracing LACP Operations

To trace the operations of the LACP process, include the `traceoptions` statement at the `[edit protocols lacp]` hierarchy level:

```
[edit protocols lacp]
traceoptions {
  file <filename> <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

You can specify the following flags in the `protocols lacp traceoptions` statement:

- **all**—All LACP tracing operations
- **configuration**—Configuration code
- **packet**—Packets sent and received
- **process**—LACP process events
- **protocol**—LACP protocol state machine
- **routing-socket**—Routing socket events
- **startup**—Process startup events

For general information about tracing, see the tracing and logging information in the *Junos OS System Basics Configuration Guide*.

LACP Limitations

LACP can link together multiple different physical interfaces, but only features that are supported across all of the linked devices will be supported in the resulting link aggregation group (LAG) bundle. For example, different PICs can support a different number of forwarding classes. If you use link aggregation to link together the ports of a PIC that supports up to 16 forwarding classes with a PIC that supports up to 8 forwarding classes, the resulting LAG bundle will only support up to 8 forwarding classes. Similarly, linking together a PIC that supports WRED with a PIC that does not support it will result in a LAG bundle that does not support WRED.

Example: Configuring Aggregated Ethernet LACP

Configure aggregated Ethernet LACP over a VLAN-tagged interface:

```
LACP with      [edit interfaces]
VLAN-Tagged    ge--1/1/1 {
Aggregated Ethernet ether-options {
                  802.3ad ae0;
                  }
                }
                ae0 {
                  aggregated-ether-options {
                    lACP {
                      active;
                    }
                  }
                  vlan-tagging;
                  unit 0 {
                    vlan-id 100;
                    family inet {
                      address 10.1.1.2/24 {
                        vrrp-group 0 {
                          virtual-address 10.1.1.4;
                          priority 200;
                        }
                      }
                    }
                  }
                }
              }
```

```
}

```

Configure aggregated Ethernet LACP over an untagged interface:

LACP with Untagged Aggregated Ethernet

```
[edit interfaces]
ge-1/1/1 {
  ether-options-options {
    802.3ad ae0;
  }
}
ae0 {
  aggregated-ether-options {
    lacp {
      active;
    }
  }
  unit 0 {
    family inet {
      address 10.1.1.2/24 {
        vrrp-group 0 {
          virtual-address 10.1.1.4;
          priority 200;
        }
      }
    }
  }
}
}
```

Configuring Targeted Broadcast

You can configure targeted broadcast with different options to forward the IP packets destined for a Layer 3 broadcast address to an egress interface and the Routing Engine or to an egress interface only. The packets are broadcast only if the egress interface is a LAN interface.

To enable targeted broadcast:

1. Configure the physical interface:

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the logical unit number:

```
[edit interfaces interface-name]
user@host# edit unit logical-unit-number
```

3. Configure the protocol family *inet*:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@host# edit family inet
```

4. Configure targeted broadcast:

```
[edit interfaces interface-name unit logical-unit-number family inet]
user@host# edit targeted-broadcast
```

5. Specify one of the following options:

- To send packets to the egress interface and to the Routing Engine:

```
[edit interfaces interface-name unit logical-unit-number family inet
targeted-broadcast]
user@host# set forward-and-send-to-re
```

- To send packets to only the egress interface:

```
[edit interfaces interface-name unit logical-unit-number family inet
targeted-broadcast]
user@host# set forward-only
```

6. Verify the configuration. The following example configures targeted broadcast to both the egress interface and the Routing Engine:

```
[edit interfaces interface-name unit logical-unit-number family inet targeted-broadcast]
user@host# up
user@host# show
targeted-broadcast {
  forward-and-send-to-re;
}
```

- [Understanding Targeted Broadcast on page 2282](#)

Configuring Unicast RPF

For interfaces that carry IPv4 or IPv6 traffic, you can reduce the impact of denial of service (DoS) attacks by configuring unicast reverse path forwarding (RPF). Unicast RPF helps determine the source of attacks and rejects packets from unexpected source addresses on interfaces where unicast RPF is enabled.

NOTE: If you want to configure unicast RPF, your router must be equipped with the Internet Processor II application-specific integrated circuit (ASIC).

If you enable unicast RPF on live traffic, some packets are dropped while the packet forwarding components are updating.

For transit packets exiting the router through the tunnel, forwarding path features, such as RPF, forwarding table filtering, source class usage, and destination class usage are not supported on the interfaces you configure as the output interface for tunnel traffic. For firewall filtering, you must allow the output tunnel packets through the firewall filter applied to input traffic on the interface that is the next-hop interface towards the tunnel destination.

The following sections describe unicast RPF in detail:

- [Configuring Unicast RPF Strict Mode on page 2315](#)
- [Configuring Unicast RPF Loose Mode on page 2316](#)
- [Unicast RPF and Default Routes on page 2317](#)
- [Unicast RPF with Routing Asymmetry on page 2318](#)
- [Configuring Unicast RPF on a VPN on page 2318](#)
- [Example: Configuring Unicast RPF on page 2319](#)

Configuring Unicast RPF Strict Mode

In strict mode, unicast RPF checks whether the incoming packet has a source address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source address prefix.

If the incoming packet fails the unicast RPF check, the packet is not accepted on the interface. When a packet is not accepted on an interface, unicast RPF counts the packet and sends it to an optional fail filter. If the fail filter is not configured, the default action is to silently discard the packet.

The optional fail filter allows you to apply a filter to packets that fail the unicast RPF check. You can define the fail filter to perform any filter operation, including accepting, rejecting, logging, sampling, or policing.

When unicast RPF is enabled on an interface, Bootstrap Protocol (BOOTP) packets and Dynamic Host Configuration Protocol (DHCP) packets are not accepted on the interface. To allow the interface to accept BOOTP packets and DHCP packets, you must apply a fail filter that accepts all packets with a source address of **0.0.0.0** and a destination address of **255.255.255.255**. For a configuration example, see [“Example: Configuring Unicast RPF” on page 2319](#).

For more information about unicast RPF, see the *Junos OS Routing Protocols Configuration Guide*. For more information about defining fail filters, see the *Routing Policy Configuration Guide*.

To configure unicast RPF, include the **rpf-check** statement:

```
rpf-check <fail-filter filter-name>;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6)]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family (inet | inet6)]**

Using unicast RPF can have several consequences when implemented with traffic filters:

- RPF fail filters are evaluated after input filters and before output filters.
- If you configure a filter counter for packets dropped by an input filter, and you want to know the total number of packets dropped, you must also configure a filter counter for packets dropped by the RPF check.

- To count packets that fail the RPF check and are accepted by the RPF fail filter, you must configure a filter counter.
- If an input filter forwards packets anywhere other than the **inet.0** or **inet6.0** routing tables, the unicast RPF check is not performed.
- If an input filter forwards packets anywhere other than the routing instance the input interface is configured for, the unicast RPF check is not performed.

Configuring Unicast RPF Loose Mode

By default, unicast RPF uses strict mode. Unicast RPF loose mode is similar to unicast RPF strict mode and has the same configuration restrictions. The only check in loose mode is whether the packet has a source address with a corresponding prefix in the routing table; loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. If a corresponding prefix is not found, unicast RPF loose mode does not accept the packet. As in strict mode, loose mode counts the failed packet and optionally forwards it to a fail filter, which either accepts, rejects, logs, samples, or polices the packet.

To configure unicast RPF loose mode, include the **mode**:

```
mode loose;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) rpf-check <fail-filter *filter-name*>]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) rpf-check <fail-filter *filter-name*>]

Configuring Unicast RPF Loose Mode with Ability to Discard Packets

Starting with Junos OS Release 12.1, unicast RPF loose mode has the ability to discard packets with the source address pointing to the discard interface. This feature is supported on MX Series routers and on T Series routers with Type 1 FPCs, Type 2 FPCs, and Type 3 FPCs. Using unicast RPF loose mode, along with Remote Triggered Black Hole (RTBH) filtering, provides an efficient way to discard packets coming from known attack sources. BGP policies in edge routers ensure that packets with untrusted source addresses have their next hop set to a discard route. When a packet arrives at the router with an untrusted source address, unicast RPF performs a route lookup of the source address. Because the source address route points to a discard next hop, the packet is dropped and a counter is incremented. This feature is supported on both IPv4 (**inet**) and IPv6 (**inet6**) address families.

To configure unicast RPF loose mode with the ability to discard packets, include the **rpf-loose-mode-discard family inet** statement at the [edit forwarding-options] hierarchy level:

```
rpf-loose-mode-discard {  
  family {  
    inet;  
  }  
}
```

Unicast RPF and Default Routes

When the active route cannot be chosen from the routes in a routing table, the router chooses a default route. A default route is equivalent to an IP address of 0.0.0.0/0. If you configure a default route, and you configure unicast RPF on an interface that the default route uses, unicast RPF behaves differently than it does otherwise. For information about configuring default routes, see the *Junos OS Routing Protocols Configuration Guide*.

To determine whether the default route uses an interface, enter the **show route** command:

```
user@host> show route address
```

address is the next-hop address of the configured default route. The default route uses the interfaces shown in the output of the **show route** command.

The following sections describe how unicast RPF behaves when a default route uses an interface and when a default route does not use an interface:

- [Unicast RPF Behavior with a Default Route on page 2317](#)
- [Unicast RPF Behavior Without a Default Route on page 2317](#)

Unicast RPF Behavior with a Default Route

If you configure a default route that uses an interface configured with unicast RPF, unicast RPF behaves as follows:

- Loose mode—All packets are automatically accepted. For this reason, we recommend that you not configure unicast RPF loose mode on interfaces that the default route uses.
- Strict mode—The packet is accepted when either of the following is true:
 - The source address of the packet matches any of the routes (either default or learned) that can be originated from the interface. Note that routes can have multiple destinations associated with them; therefore, if one of the destinations matches the incoming interface of the packet, the packet is accepted.
 - The source address of the packet does not match any of the routes.

The packet is not accepted when either of the following is true:

- The source address of the packet does not match a prefix in the routing table.
- The interface does not expect to receive a packet with this source address prefix.

Unicast RPF Behavior Without a Default Route

If you do not configure a default route, or if the default route does not use an interface configured with unicast RPF, unicast RPF behaves as described in “[Configuring Unicast RPF Strict Mode](#)” on page 2315 and “[Configuring Unicast RPF Loose Mode](#)” on page 2316. To summarize, unicast RPF without a default route behaves as follows:

- Strict mode—The packet is not accepted when either of the following is true:

- The packet has a source address that does not match a prefix in the routing table.
- The interface does not expect to receive a packet with this source address prefix.
- Loose mode—The packet is not accepted when the packet has a source address that does not match a prefix in the routing table.

Unicast RPF with Routing Asymmetry

In general, we recommend that you not enable unicast RPF on interfaces that are internal to the network because internal interfaces are likely to have *routing asymmetry*. Routing asymmetry means that a packet's outgoing and return paths are different. Routers in the core of the network are more likely to have asymmetric reverse paths than routers at the customer or provider edge. [Figure 28 on page 2318](#) shows unicast RPF in an environment with routing asymmetry.

Figure 28: Unicast RPF with Routing Asymmetry

In [Figure 28 on page 2318](#), if you enable unicast RPF on interface `so-0/0/0`, traffic destined for Router A is not rejected. If you enable unicast RPF on interface `so-1/0/1`, traffic from Router A is rejected.

If you need to enable unicast RPF in an asymmetric routing environment, you can use fail filters to allow the router to accept incoming packets that are known to be arriving by specific paths. For an example of a fail filter that accepts packets with a specific source and destination address, see [“Example: Configuring Unicast RPF” on page 2319](#).

Configuring Unicast RPF on a VPN

You can configure unicast RPF on a VPN interface by enabling unicast RPF on the interface and including the `interface` statement at the `[edit routing-instances routing-instance-name]` hierarchy level.

You can configure unicast RPF only on the interfaces you specify in the routing instance. This means the following:

- For Layer 3 VPNs, unicast RPF is supported on the CE router interface.
- Unicast RPF is not supported on core-facing interfaces.
- For virtual-router routing instances, unicast RPF is supported on all interfaces you specify in the routing instance.
- If an input filter forwards packets anywhere other than the routing instance the input interface is configured for, the unicast RPF check is not performed.

For more information about VPNs and virtual-router routing instances, see the *Junos OS VPNs Configuration Guide*. For more information about FBF, see the *Junos OS Routing Protocols Configuration Guide*.

Example: Configuring Unicast RPF on a VPN

Configure unicast RPF on a Layer 3 VPN interface:

```
[edit interfaces]
so-0/0/0 {
  unit 0 {
    family inet {
      rpf-check;
    }
  }
}
[edit routing-instance]
VPN-A {
  interface so-0/0/0.0;
}
```

Example: Configuring Unicast RPF

Configure unicast RPF strict mode, and apply a fail filter that allows the interface to accept BOOTP packets and DHCP packets. The filter accepts all packets with a source address of 0.0.0.0 and a destination address of 255.255.255.255.

```
[edit firewall]
filter rpf-special-case-dhcp-bootp {
  term allow-dhcp-bootp {
    from {
      source-address {
        0.0.0.0/32;
      }
      address {
        255.255.255.255/32;
      }
    }
    then {
      count rpf-dhcp-bootp-traffic;
      accept;
    }
  }
  term default {
    then {
      log;
      reject;
    }
  }
}
[edit]
interfaces {
  so-0/0/0 {
    unit 0 {
      family inet {
        rpf-check fail-filter rpf-special-case-dhcp-bootp;
      }
    }
  }
}
```

Layer 2 Routing Instances Configuration Hierarchy

Use the **vpls** routing instance type for point-to-multipoint LAN implementations between a set of sites in a VPN.

To configure routing instances for Layer 2 networks, include the following statements:

```

routing-instances {
  routing-instance-name {
    access {
      address-assignment {
        ... same statements as in the address-assignment subhierarchy in [edit access]
        Hierarchy Level ...
      }
      address-protection;
      description text;
      egress-protection {
        context-identifier context-id;
      }
      forwarding-options {
        ...forwarding-options...
      }
      instance-role role;
      instance-type type;
      interface interface-name;
      l2-domain-id-for-l3 id;
      l2vpn-id community;
      layer3-domain-identifier identifier;
      multicast-snooping-options {
        ... same statements as in [edit multicast-snooping-options] Hierarchy Level EXCEPT
        FOR ...
      }
      traceoptions {...} # NOT valid at this level
    }
    no-irb-layer-2-copy;
    no-local-switching;
    no-vrf-advertise;
    no-vrf-propagate-ttl;

      mac-table-size limit {
        packet-action drop;
      }
      no-mac-learning;
      static-mac mac-address;
    }
  }
}
}
}

```

With the exception of the **instance-type virtual-switch** statement (which configures a virtual-switch routing instance), you can include the statements at the following hierarchy levels:

- **[edit]**
- **[edit logical-systems *logical-system-name*]**

The **instance-type virtual-switch** statement is not supported at the **[edit logical-systems *logical-system-name*]** hierarchy level.

bandwidth (Interfaces)

Syntax	<code>bandwidth rate;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure an informational-only bandwidth value for an interface. This statement is valid for all logical interface types except multilink and aggregated interfaces.

NOTE: We recommend that you be careful when setting this value. Any interface bandwidth value that you configure using the `bandwidth` statement affects how the interface cost is calculated for a dynamic routing protocol, such as OSPF. By default, the interface cost for a dynamic routing protocol is calculated using the following formula:

$$\text{cost} = \text{reference-bandwidth} / \text{bandwidth},$$

where bandwidth is the physical interface speed. However, if you specify a value for bandwidth using the `bandwidth` statement, that value is used to calculate the interface cost, rather than the actual physical interface bandwidth.

Options	rate —Peak rate, in bits per second (bps) or cells per second (cps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation c ; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps. Range: Not limited.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> Configuring the Interface Bandwidth

chassis-id

Syntax	<code>chassis-id <i>chassis-id</i>;</code>
Hierarchy Level	[edit]interfaces aggregated-ether-options mc-ae]
Release Information	Statement introduced in Junos OS Release 12.2 for the QFX Series. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Description	Specify the chassis ID of the multichassis aggregated Ethernet interface device. LACP uses the chassis ID to calculate the port number of the multichassis link aggregation group (MC-LAG) physical member links.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

filter

Syntax	<pre>filter { group <i>filter-group-number</i>; input <i>filter-name</i>; input-list [<i>filter-names</i>]; output <i>filter-name</i>; output-list [<i>filter-names</i>]; }</pre>
Hierarchy Level	<pre>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	<p> NOTE: On EX Series switches, the <code>group</code>, <code>input-list</code>, <code>output-filter</code> statements are not supported under the <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>inet</i>]</code>, <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>inet6</i>]</code>, and <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>mpls</i>]</code> hierarchies.</p> <p>Apply a filter to an interface. You can also use filters for encrypted traffic. When you configure filters, you can configure them under the family <code>ethernet-switching</code>, <code>inet</code>, <code>inet6</code>, <code>mpls</code>, or <code>vpls</code> only.</p>
Options	<p>group <i>filter-group-number</i>—Define an interface to be part of a filter group. Range: 1 through 255</p> <p>input <i>filter-name</i>—Name of one filter to evaluate when packets are received on the interface.</p> <p>output <i>filter-name</i>—Name of one filter to evaluate when packets are transmitted on the interface.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

flow-control

Syntax	(flow-control no-flow-control);
Hierarchy Level	[edit interfaces <i>interface-name</i> aggregated-ether-options], [edit interfaces <i>interface-name</i> ether-options], [edit interfaces <i>interface-name</i> fastether-options], [edit interfaces <i>interface-name</i> ggether-options], [edit interfaces <i>interface-name</i> multiservice-options], [edit interfaces interface-range <i>name</i> aggregated-ether-options], [edit interfaces interface-range <i>name</i> ether-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 in EX Series switches. Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Description	For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.
	<div>  <p>NOTE: On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.</p> </div>
Default	Flow control is enabled.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring Flow Control</i> • <i>Configuring Gigabit Ethernet Interfaces (CLI Procedure)</i>

forward-and-send-to-re

Syntax	forward-and-send-to-re;
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet targeted-broadcast], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet targeted-broadcast]
Release Information	Statement introduced in Junos OS Release 10.2.
Description	Specify that IP packets destined for a Layer 3 broadcast address be forwarded to an egress interface and the Routing Engine. The packets are broadcast only if the egress interface is a LAN interface.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

gratuitous-arp-reply

Syntax	(gratuitous-arp-reply no-gratuitous-arp-reply);
Hierarchy Level	[edit interfaces <i>interface-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 in EX Series switches. Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Description	For Ethernet interfaces, enable updating of the ARP cache for replies received in response to gratuitous ARP requests.
Default	Updating of the ARP cache is disabled on all Ethernet interfaces.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring Gratuitous ARP</i>• no-gratuitous-arp-request on page 2358

group (RPF Selection)

Syntax	<pre>group group-address{ source source-address { next-hop next-hop-address; } wildcard-source { next-hop next-hop-address; } }</pre>
Hierarchy Level	[edit routing-instances <i>routing-instance-name</i> edit protocols pim rpf-selection]
Release Information	Statement introduced in JUNOS Release 10.4. Statement introduced in Junos OS Release 11.3 for the QFX Series.
Description	Configure the PIM group address for which you configure RPF selection group (RPF Selection) .
Default	By default, PIM RPF selection is not configured.
Options	group-address —PIM group address for which you configure RPF selection.
Required Privilege Level	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Example: Configuring PIM RPF Selection

l2-domain-id-for-l3

Syntax	<pre>l2-domain-id-for-l3 id;</pre>
Hierarchy Level	[edit routing-instances <i>instance-name</i>]
Release Information	Statement introduced in Junos OS Release 12.3R2.
Description	Specify a Layer 2 domain ID within a routing instance.
Options	id —Layer 2 identification number.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring a Layer 2 Virtual Switch on page 1847

lACP (Aggregated Ethernet)

Syntax	<pre>lACP { (active passive); admin-key key; fast-failover; link-protection { disable; (revertive non-revertive); } periodic interval; system-id mac-address; system-priority priority; }</pre>
Hierarchy Level	[edit interfaces aex aggregated-ether-options]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>fast-failover option introduced in Junos OS Release 12.2.</p>
Description	For aggregated Ethernet interfaces only, configure Link Aggregation Control Protocol (LACP).
Default	If you do not specify LACP as either active or <i>passive</i> , LACP remains passive.
Options	<p>active—Initiate transmission of LACP packets.</p> <p>admin-key number—Specify an administrative key for the router or switch.</p>
	<div>  <p>NOTE: You must also configure Multichassis Link Aggregation (MC-LAG) when you configure the admin-key.</p> </div>
	<p>passive—Respond to LACP packets.</p> <p>fast-failover—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

link-protection

Syntax	<pre>link-protection { disable; (revertive non-revertive); }</pre>
Hierarchy Level	<p>[edit interfaces aex aggregated-ether-options]</p> <p>[edit interfaces aex aggregated-ether-options <i>lACP</i>]</p>
Release Information	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for disable, revertive, and non-revertive statements added in Junos OS Release 9.3.</p>
Description	<p>On the router, for aggregated Ethernet interfaces only, configure link protection. In addition to enabling link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the primary and backup statements at the [edit interfaces <i>ge-fpc/pic/port</i> gigether-options 802.3ad aex] hierarchy level or the [edit interfaces <i>fe-fpc/pic/port</i> fastether-options 802.3ad aex] hierarchy level.</p> <p>On the switch, you can configure either Junos OS link protection for aggregated Ethernet interfaces or the LACP standards link protection for aggregated Ethernet interfaces.</p> <p>For Junos OS link protection, specify link-protection at the following hierarchy levels:</p> <ul style="list-style-type: none"> • [edit interfaces <i>ge-fpc/pic/port</i> ether-options 802.3ad aex] • [edit interfaces <i>xe-fpc/pic/port</i> ether-options 802.3ad aex] <p>For LACP standards link protection, specify link-protection at the following hierarchy levels:</p> <ul style="list-style-type: none"> • For global LACP link protection, specify at [edit chassis aggregated-devices ethernet lACP] • For a specific aggregated Ethernet interface, specify at [edit interfaces aeX aggregated-ether-options lACP]
Options	The statements are explained separately.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring Aggregated Ethernet Link Protection</i> • <i>Configuring LACP Link Protection of Aggregated Ethernet Interfaces (CLI Procedure)</i>

mc-ae-id

Syntax	<code>mc-ae-id mc-ae-id;</code>
Hierarchy Level	[edit interfaces aggregated-ether-options mc-ae]
Release Information	Statement introduced in Junos OS Release 12.2 for the QFX Series. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Description	Specify the multichassis aggregated Ethernet (MC-AE) identification number of the MC-AE that a given aggregated Ethernet interface belongs to. The two peers that host a given multichassis link aggregation group (MC-LAG) must have the same multichassis aggregated Ethernet ID.
Options	Range: 1 through 65535.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

mode (QFX Series)

Syntax	<code>mode active-active ;</code>
Hierarchy Level	[edit interfaces aggregated-ether-options mc-ae]
Release Information	Statement introduced in Junos OS Release 12.2 for the QFX Series. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Description	Configure the multichassis link aggregation group (MC-LAG) to be in active-active mode. In active-active mode, all of the members of the MC-LAG will be active on both routing or switching devices. Only active-active mode is supported at this time.
Options	active-active —Specify that all of the members of the MC-LAG will be active on both routing or switching devices.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	

mode (Interfaces)

Syntax	mode loose;
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family (inet inet6) rpf-check], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family (inet inet6) rpf-check]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Check whether the packet has a source address with a corresponding prefix in the routing table. If a corresponding prefix is not found, unicast reverse path forwarding (RPF) loose mode does not accept the packet. Unlike strict mode, loose mode does not check whether the interface expects to receive a packet with a specific source address prefix.
Default	If you do not include this statement, unicast RPF is in strict mode.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Unicast RPF Strict Mode on page 2315

multicast-rpf-routes

Syntax	multicast-rpf-routes;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols isis traffic-engineering family inet shortcuts], [edit logical-systems <i>logical-system-name</i> routing-instances traffic-engineering family inet shortcuts], [edit protocols isis traffic-engineering family inet shortcuts], [edit routing-instances <i>routing-instance-name</i> protocols isis traffic-engineering family inet shortcuts]
Release Information	Statement introduced in Junos OS Release 9.3.
Description	Install unicast IPv4 routes into the multicast routing table (inet.2) for multicast reverse-path-forwarding (RPF) checks. Traffic engineering shortcuts must be enabled. IPv4 multicast topology must not be enabled. Label-switched paths (LSPs) must not be advertised into IS-IS.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Example: Enabling IS-IS Traffic Engineering Support

next-hop (PIM RPF Selection)

Syntax	<code>next-hop <i>next-hop-address</i>;</code>
Hierarchy Level	[edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection group <i>group-address</i> source <i>source-address</i>], [edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection group <i>group-address</i> wildcard-source], [edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection prefix-list <i>prefix-list-addresses</i> source <i>source-address</i>], [edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection prefix-list <i>prefix-list-addresses</i> wildcard-source]
Release Information	Statement introduced in JUNOS Release 10.4. Statement introduced in Junos OS Release 11.3 for the QFX Series.
Description	Configure the specific next-hop address for the PIM group source.
Options	<i>next-hop-address</i> —Specific next-hop address for the PIM group source.
Required Privilege Level	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.

no-gratuitous-arp-request

Syntax	<code>no-gratuitous-arp-request;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Description	For Ethernet interfaces, do not respond to gratuitous ARP requests.
Default	Gratuitous ARP responses are enabled on all Ethernet interfaces.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring Gratuitous ARP</i>• gratuitous-arp-reply on page 2351

no-local-switching

Syntax	no-local-switching;
Hierarchy Level	[edit routing-instances <i>instance-name</i>]
Release Information	Statement introduced in Junos OS Release 12.3R2.
Description	Specify that access ports in this routing instance do not forward packets to each other.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring a Layer 2 Virtual Switch on page 1847

policer (MAC)

Syntax	<pre>policer { input <i>cos-policer-name</i>; output <i>cos-policer-name</i>; }</pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> accept-source-mac mac-address <i>mac-address</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> accept-source-mac mac-address <i>mac-address</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Description	For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), configure MAC policing.
<div> NOTE: On MX Series routers with Gigabit Ethernet or Fast Ethernet PICs, the following considerations apply:</div> <ul style="list-style-type: none">• Interface counters do not count the 7-byte preamble and 1-byte frame delimiter in Ethernet frames.• In MAC statistics, the frame size includes MAC header and CRC before any VLAN rewrite/imposition rules are applied.• In traffic statistics, the frame size encompasses the L2 header without CRC after any VLAN rewrite/imposition rule.	
Options	<p>input <i>cos-policer-name</i>—Name of one policer to specify the premium bandwidth and aggregate bandwidth.</p> <p>output <i>cos-policer-name</i>—Name of one policer to specify the premium bandwidth and aggregate bandwidth.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring MAC Address Filtering</i>

prefix-list (PIM RPF Selection)

Syntax	<pre> prefix-list <i>prefix-list-addresses</i> { source <i>source-address</i> { next-hop <i>next-hop-address</i>; } wildcard-source { next-hop <i>next-hop-address</i>; } } </pre>
Hierarchy Level	<p>[edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection group <i>group-address</i> source <i>source-address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection group <i>group-address</i> wildcard-source],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection prefix-list <i>prefix-list-addresses</i> source <i>source-address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection prefix-list <i>prefix-list-addresses</i> wildcard-source]</p>
Release Information	<p>Statement introduced in Junos OS Release 10.4.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	(Optional) Configure a list of prefixes (addresses) for multiple PIM groups.
Options	<p><i>prefix-list-addresses</i>—List of prefixes (addresses) for multiple PIM groups.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>view-level—To view this statement in the configuration.</p> <p>control-level—To add this statement to the configuration.</p>

redundancy-group

Syntax	<code>redundancy-group <i>group-id</i>;</code>
Hierarchy Level	<code>[edit interfaces aggregated-ether-options mc-ae]</code>
Release Information	Statement introduced in Junos OS Release 12.2 for the QFX Series. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Description	Specify the redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Multichassis Link Aggregation on page 2305

rpf-check (Dynamic Profiles)

Syntax	<pre>rpf-check { mode loose; }</pre>
Hierarchy Level	<code>[edit dynamic-profiles <i>profile-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.6.
Description	Check whether traffic is arriving on an expected path. You can include this statement with the inet protocol family only. The remaining statements are explained separately.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Unicast RPF Strict Mode on page 2315

rpf-check (interfaces)

Syntax	<pre>rpf-check { fail-filter <i>filter-name</i>; mode loose; }</pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	<p>Check whether traffic is arriving on an expected path. You can include this statement with the inet or inet6 protocol family only.</p> <p>The mode statement is explained separately.</p>
Options	fail-filter —A filter to evaluate when packets are received on the interface. If the RPF check fails, this optional filter is evaluated. If the fail filter is not configured, the default action is to silently discard the packet.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

rpf-check-policy (Routing Options RPF)

Syntax	<code>rpf-check-policy [<i>policy-names</i>];</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast], [edit logical-systems <i>logical-system-name</i> routing-options multicast], [edit routing-instances <i>routing-instance-name</i> routing-options multicast], [edit routing-options multicast]
Release Information	Statement introduced in Junos OS Release 8.1. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
Description	Apply policies for disabling RPF checks on arriving multicast packets. The policies must be correctly configured.
Options	<i>policy-names</i> —Name of one or more multicast RPF check policies.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring RPF Policies</i>

rpf-loose-mode-discard

Syntax	<pre>rpf-loose-mode-discard { family { inet; inet6; } }</pre>
Hierarchy Level	[edit forwarding-options]
Release Information	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Description	Configure unicast reverse path forwarding (unicast RPF) loose mode with the ability to discard packets with the source address pointing to the discard next hop.
Options	inet —IPv4 address family. inet6 —IPv6 address family.
Required Privilege Level	interface-control —To view this statement in the configuration. interface-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Unicast RPF on page 2314

rpf-selection

Syntax	<pre>rpf-selection { group group-address { source source-address { next-hop next-hop-address; } wildcard-source { next-hop next-hop-address; } } prefix-list prefix-list-addresses { source source-address { next-hop next-hop-address; } wildcard-source { next-hop next-hop-address; } } }</pre>
Hierarchy Level	[edit routing-instances <i>routing-instance-name</i> protocols pim]
Release Information	Statement introduced in JUNOS Release 10.4. Statement introduced in Junos OS Release 11.3 for the QFX Series.
Description	Configure the PIM RPF next-hop neighbor for a specific group and source for a VRF routing instance. The remaining statements are explained separately.
Default	If you omit the rpf-selection statement, PIM RPF checks typically choose the best path determined by the unicast protocol for all multicast flows.
Options	source-address —Specific source address for the PIM group.
Required Privilege Level	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring PIM RPF Selection</i>

source (PIM RPF Selection)

status-control

Syntax	<code>status-control (active standby);</code>
Hierarchy Level	[edit interfaces aggregated-ether-options mc-ae]
Release Information	Statement introduced in Junos OS Release 12.2 for the QFX Series. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Description	Specify whether a peer hosting a multichassis link aggregation group (MC-LAG) is primary or secondary. Primary is considered active, and secondary is considered standby.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

targeted-broadcast

Syntax	targeted-broadcast { forward-and-send-to-re; forward-only; }
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet]
Release Information	Statement introduced in Junos OS Release 10.2.
Description	<p>Specify the IP packets destined for a Layer 3 broadcast address to be forwarded to both an egress interface and the Routing Engine, or to an egress interface only. The packets are broadcast only if the egress interface is a LAN interface.</p> <p>The statements are explained separately.</p>
Default	When this statement is not included, broadcast packets are sent to the Routing Engine only.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Targeted Broadcast on page 2313• Understanding Targeted Broadcast on page 2282

traceoptions (Individual Interfaces)

Syntax	<pre> traceoptions { file <i>filename</i> <files <i>name</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i>; match; } </pre>
Hierarchy Level	[edit interfaces <i>interface-name</i>]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p>
Description	<p>Define tracing operations for individual interfaces.</p> <p>To specify more than one tracing operation, include multiple flag statements.</p> <p>The interfaces traceoptions statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system syslog file in the directory /var/log.</p>
Default	If you do not include this statement, no interface-specific tracing operations are performed.
Options	<p>file name—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. By default, interface process tracing output is placed in the file files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.dcd.</p> <p>match—(Optional) Regular expression for lines to be traced.</p> <p>no-world-readable—(Optional) Prevent any user from reading the log file.</p> <p>world-readable—(Optional) Allow any user to read the log file.</p> <p>size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. The following are the interface-specific tracing options.</p> <ul style="list-style-type: none"> • all—All interface tracing operations • event—Interface events

- **ipc**—Interface interprocess communication (IPC) messages
- **media**—Interface media changes
- **q921**—Trace ISDN Q.921 frames
- **q931**—Trace ISDN Q.931 frames

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

wildcard-source (PIM RPF Selection)

Syntax	wildcard-source { next-hop next-hop-address; }
Hierarchy Level	[edit routing-instances routing-instance-name protocols pim rpf-selection group group-address], [edit routing-instances routing-instance-name protocols pim rpf-selection prefix-list prefix-list-addresses]
Release Information	Statement introduced in Junos OS Release 10.4. Statement introduced in Junos OS Release 11.3 for the QFX Series.
Description	Use a wildcard for the multicast source instead of (or in addition to) a specific multicast source. The remaining statements are explained separately.
Required Privilege Level	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Example: Configuring PIM RPF Selection

Administration

- [Routine Monitoring on page 2374](#)
- [Operational Commands on page 2376](#)

Routine Monitoring

- [Monitor Statistics for a Fast Ethernet or Gigabit Ethernet Interface on page 2374](#)

Monitor Statistics for a Fast Ethernet or Gigabit Ethernet Interface

Purpose	To monitor statistics for a Fast Ethernet or Gigabit Ethernet interface, use the following Junos OS CLI operational mode command:
Action	user@host> monitor interface (fe-fpc/pic/port ge-fpc/pic/port)

CAUTION: We recommend that you use the monitor interface *fe-fpc/pic/port* or monitor interface *ge-fpc/pic/port* command only for diagnostic purposes. Do not leave these commands on during normal router or switch operations because real-time monitoring of traffic consumes additional CPU and memory resources.

Sample Output

The following sample output is for a Fast Ethernet interface:

```

user@host> monitor interface fe-2/1/0
Interface: fe-2/1/0, Enabled, Link is Up
Encapsulation: Ethernet, Speed: 100mbps
Traffic statistics:
  Input bytes:          282556864218 (14208 bps)      [40815]
  Output bytes:         42320313078 (384 bps)        [890]
  Input packets:        739373897 (11 pps)           [145]
  Output packets:       124798688 (1 pps)            [14]
Error statistics:
  Input errors:          0                          [0]
  Input drops:           0                          [0]
  Input framing errors:  0                          [0]
  Policed discards:     6625892                     [6]
  L3 incompletes:        75                         [0]
  L2 channel errors:    0                          [0]
  L2 mismatch timeouts: 0                          [0]
  Carrier transitions:   1                          [0]
  Output errors:         0                          [0]
  Output drops:         0                          [0]
  Aged packets:         0                          [0]
Active alarms : None
Active defects: None
Input MAC/Filter statistics:
  Unicast packets       464751787                   [154]
  Packet error count    0                          [0]

```

Meaning Use the information from this command to help narrow down possible causes of an interface problem.

NOTE: If you are accessing the router or switch from the console connection, make sure you set the CLI terminal type using the `set cli terminal` command.

The statistics in the second column are the cumulative statistics since the last time they were cleared using the `clear interfaces statistics interface-name` command. The statistics in the third column are the cumulative statistics since the `monitor interface interface-name` command was executed.

If the input errors are increasing, verify the following:

1. Check the cabling to the router and have the carrier verify the integrity of the line. To verify the integrity of the cabling, make sure that you have the correct cables for the interface port. Make sure you have single-mode fiber cable for a single-mode interface and multimode fiber cable for a multimode interface.
2. For a fiber-optic connection, measure the received light level at the receiver end and make sure that it is within the receiver specification of the Ethernet interface. See *Fiber-Optic Ethernet Interface Specifications* for the fiber-optic Ethernet interface specifications.

3. Measure the transmit light level on the Tx port to verify that it is within specification. See *Fiber-Optic Ethernet Interface Specifications* for the optical specifications.

Operational Commands

- [Common Output Fields Description on page 2376](#)

Common Output Fields Description

This chapter explains the content of the output fields, which appear in the output of most **show interfaces** commands.

Destination Class Field

For the logical interface, the **Destination class** field provides the names of destination class usage (DCU) counters per family and per class for a particular interface. The counters display packets and bytes arriving from designated user-selected prefixes. For example:

Destination class	Packets (packet-per-second)	Bytes (bits-per-second)
gold	1928095	161959980
	(889)	(597762)
bronze	0	0
	(0)	(0)
silver	0	0
	(0)	(0)

Enabled Field

For the physical interface, the **Enabled** field provides information about the state of the interface, displaying one or more of the following values:

- **Administratively down, Physical link is Down**—The interface is turned off, and the physical link is inoperable and cannot pass packets even when it is enabled. To change the interface state to **Enabled**, use the following command:

```
user@host# set interfaces interface enable
```

Manually verify the connections to bring the physical link up.

- **Administratively down, Physical link is Up**—The interface is turned off, but the physical link is operational and can pass packets when it is enabled. To change the interface state to **Enabled**, use the following command:

```
user@host# set interfaces interface enable
```

- **Enabled, Physical link is Down**—The interface is turned on, but the physical link is inoperable and cannot pass packets. Manually verify the connections to bring the physical link up.
- **Enabled, Physical link is Up**—The interface is turned on, and the physical link is operational and can pass packets.

Filters Field

For the logical interface, the **Filters** field provides the name of the firewall filters to be evaluated when packets are received or transmitted on the interface. The format is **Filters: Input: *filter-name* and Filters: Output: *filter-name***. For example:

```
Filters: Input: sample-all
Filters: Output: cp-ftp
```

Flags Fields

The following sections provide information about flags that are specific to interfaces:

- [Addresses, Flags Field on page 2377](#)
- [Device Flags Field on page 2377](#)
- [Family Flags Field on page 2378](#)
- [Interface Flags Field on page 2379](#)
- [Link Flags Field on page 2379](#)
- [Logical Interface Flags Field on page 2380](#)

Addresses, Flags Field

The **Addresses, Flags** field provides information about the addresses configured for the protocol family on the logical interface and displays one or more of the following values:

- **Dest-route-down**—The routing process detected that the link was not operational and changed the interface routes to nonforwarding status
- **Is-Default**—The default address of the router used as the source address by SNMP, ping, traceroute, and other network utilities.
- **Is-Preferred**—The default local address for packets originating from the local router and sent to destinations on the subnet.
- **Is-Primary**—The default local address for broadcast and multicast packets originated locally and sent out the interface.
- **Preferred**—This address is a candidate to become the preferred address.
- **Primary**—This address is a candidate to become the primary address.

Device Flags Field

The **Device flags** field provides information about the physical device and displays one or more of the following values:

- **Down**—Device has been administratively disabled.
- **Hear-Own-Xmit**—Device receives its own transmissions.
- **Link-Layer-Down**—The link-layer protocol has failed to connect with the remote endpoint.
- **Loopback**—Device is in physical loopback.

- **Loop-Detected**—The link layer has received frames that it sent, thereby detecting a physical loopback.
- **No-Carrier**—On media that support carrier recognition, no carrier is currently detected.
- **No-Multicast**—Device does not support multicast traffic.
- **Present**—Device is physically present and recognized.
- **Promiscuous**—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media.
- **Quench**—Transmission on the device is quenched because the output buffer is overflowing
- **Recv-All-Multicasts**—Device is in multicast promiscuous mode and therefore provides no multicast filtering.
- **Running**—Device is active and enabled.

Family Flags Field

The **Family flags** field provides information about the protocol family on the logical interface and displays one or more of the following values:

- **DCU**—Destination class usage is enabled.
- **Dest-route-down**—The software detected that the link is down and has stopped forwarding the link's interface routes.
- **Down**—Protocol is inactive.
- **Is-Primary**—Interface is the primary one for the protocol.
- **Mac-Validate-Loose**—Interface is enabled with loose MAC address validation.
- **Mac-Validate-Strict**—Interface is enabled with strict MAC address validation.
- **Maximum labels**—Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.
- **MTU-Protocol-Adjusted**—The effective MTU is not the configured value in the software.
- **No-Redirects**—Protocol redirects are disabled.
- **Primary**—Interface can be considered for selection as the primary family address.
- **Protocol-Down**—Protocol failed to negotiate correctly.
- **SCU-in**—Interface is configured for source class usage input.
- **SCU-out**—Interface is configured for source class usage output.
- **send-bcast-packet-to-re**—Interface is configured to forward IPv4 broadcast packets to the Routing Engine.
- **targeted-broadcast**—Interface is configured to forward IPv4 broadcast packets to the LAN interface and the Routing Engine.

- **Unnumbered**—Protocol family is configured for unnumbered Ethernet. An unnumbered Ethernet interface borrows an IPv4 address from another interface, which is referred to as the donor interface.
- **Up**—Protocol is configured and operational.
- **uRPF**—Unicast Reverse Path Forwarding is enabled.

Interface Flags Field

The **Interface flags** field provides information about the physical interface and displays one or more of the following values:

- **Admin-Test**—Interface is in test mode and some sanity checking, such as loop detection, is disabled.
- **Disabled**—Interface is administratively disabled.
- **Down**—A hardware failure has occurred.
- **Hardware-Down**—Interface is nonfunctional or incorrectly connected.
- **Link-Layer-Down**—Interface keepalives have indicated that the link is incomplete.
- **No-Multicast**—Interface does not support multicast traffic.
- **No-receive No-transmit**—Passive monitor mode is configured on the interface.
- **Point-To-Point**—Interface is point-to-point.
- **Pop all MPLS labels from packets of depth**—MPLS labels are removed as packets arrive on an interface that has the **pop-all-labels** statement configured. The depth value can be one of the following:
 - **1**—Takes effect for incoming packets with one label only.
 - **2**—Takes effect for incoming packets with two labels only.
 - **[1 2]**—Takes effect for incoming packets with either one or two labels.
- **Promiscuous**—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses.
- **Recv-All-Multicasts**—Interface is in multicast promiscuous mode and provides no multicast filtering.
- **SNMP-Traps**—SNMP trap notifications are enabled.
- **Up**—Interface is enabled and operational.

Link Flags Field

The **Link flags** field provides information about the physical link and displays one or more of the following values:

- **ACFC**—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option.
- **Give-Up**—Link protocol does not continue connection attempts after repeated failures.

- **Loose-LCP**—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational.
- **Loose-LMI**—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational.
- **Loose-NCP**—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational.
- **No-Keepalives**—Link protocol keepalives are disabled.
- **PFC**—Protocol field compression is configured. The PPP session negotiates the PFC option.

Logical Interface Flags Field

The **Logical interface flags** field provides information about the logical interface and displays one or more of the following values:

- **ACFC Encapsulation**—Address control field Compression (ACFC) encapsulation is enabled (negotiated successfully with a peer).
- **Device-down**—Device has been administratively disabled.
- **Disabled**—Interface is administratively disabled.
- **Down**—A hardware failure has occurred.
- **Clear-DF-Bit**—GRE tunnel or IPsec tunnel is configured to clear the Don't Fragment (DF) bit.
- **Hardware-Down**—Interface protocol initialization failed to complete successfully.
- **PFC**—Protocol field compression is enabled for the PPP session.
- **Point-To-Point**—Interface is point-to-point.
- **SNMP-Traps**—SNMP trap notifications are enabled.
- **Up**—Interface is enabled and operational.

Label-Switched Interface Traffic Statistics Field

When you use the **vrf-table-label** statement to configure a VRF routing table, a label-switched interface (LSI) logical interface label is created and mapped to the VRF routing table.

Any routes present in a VRF routing table and configured with the **vrf-table-label** statement are advertised with the LSI logical interface label allocated for the VRF routing table. When packets for this VPN arrive on a core-facing interface, they are treated as if the enclosed IP packet arrived on the LSI interface and are then forwarded and filtered based on the correct table. For more information on the **vrf-table-label** statement, including a list of supported interfaces, see the *Junos VPNs Configuration Guide*.

If you configure the **family mpls** statement at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level and you also configure the **vrf-table-label** statement at the **[edit routing-instances *routing-instance-name*]** hierarchy level, the output for the

show interface *interface-name* extensive command includes the following output fields about the LSI traffic statistics:

- **Input bytes**—Number of bytes entering the LSI and the current throughput rate in bits per second (bps).
- **Input packets**—Number of packets entering the LSI and the current throughput rate in packets per second (pps).

NOTE: If LSI interfaces are used with VPLS when **no-tunnel-services** is configured or L3VPN when **vrf-table-label** configuration is applied inside the routing-instance, the **Input packets** field associated with the core-facing interfaces may not display the correct value. Only the Input counter is affected because the LSI is used to receive traffic from the remote PEs. Traffic that arrives on an LSI interface might not be counted at both the Traffic Statistics and the Label-switched interface (LSI) traffic statistics levels.

This note applies to the following platforms:

- M Series routers with -E3 FPC model numbers or configured with an Enhanced CFEB (CFEB-E), and M120 routers
- MX Series routers with DPC or ADPC only

The following example shows the LSI traffic statistics that you might see as part of the output of the **show interface *interface-name* extensive** command:

Label-switched interface (LSI) traffic statistics:

Input bytes:	0	0 bps
Input packets:	0	0 pps

Policer Field

For the logical interface, the **Policer** field provides the policers that are to be evaluated when packets are received or transmitted on the interface. The format is **Policer: Input: *type-fpc/picport-in-policer*, Output: *type-fpc/pic/port-out-policer***. For example:

Policer: Input: at-1/2/0-in-policer, Output: at-2/4/0-out-policer

Protocol Field

For the logical interface, the **Protocol** field indicates the protocol family or families that are configured on the interface, displaying one or more of the following values:

- **aenet**—Aggregated Ethernet. Displayed on Fast Ethernet interfaces that are part of an aggregated Ethernet bundle.
- **ccc**—Circuit cross-connect (CCC). Configured on the logical interface of CCC physical interfaces.
- **inet**—IP version 4 (IPv4). Configured on the logical interface for IPv4 protocol traffic, including Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), Internet Control Message Protocol (ICMP), and Internet Protocol Control Protocol (IPCP).

- **inet6**—IP version 6 (IPv6). Configured on the logical interface for IPv6 protocol traffic, including Routing Information Protocol for IPv6 (RIPng), Intermediate System-to-Intermediate System (IS-IS), and BGP.
- **iso**—International Organization for Standardization (ISO). Configured on the logical interface for IS-IS traffic.
- **mlfr-uni-nni**—Multilink Frame Relay (MLFR) FRF.16 user-to-network network-to-network (UNI NNI). Configured on the logical interface for link services bundling.
- **mlfr-end-to-end**—Multilink Frame Relay end-to-end. Configured on the logical interface for multilink bundling.
- **mlppp**—Multilink Point-to-Point Protocol (MLPPP). Configured on the logical interface for multilink bundling.
- **mpls**—Multiprotocol Label Switching (MPLS). Configured on the logical interface for participation in an MPLS path.
- **pppoe**—Point-to-Point Protocol over Ethernet (PPPoE). Configured on Ethernet interfaces enabled to support multiple protocol families.
- **tcc**—Translational cross-connect (TCC). Configured on the logical interface of TCC physical interfaces.
- **tnp**—Trivial Network Protocol (TNP). Used to communicate between the Routing Engine and the router's packet forwarding components. The Junos OS automatically configures this protocol family on the router's internal interfaces only.
- **vpls**—Virtual private LAN service (VPLS). Configured on the logical interface on which you configure VPLS.

RPF Failures Field

For the logical interface, the **RPF Failures** field provides information about the amount of incoming traffic (in packets and bytes) that failed a unicast reverse path forwarding (RPF) check on a particular interface. The format is **RPF Failures: Packets: xx,Bytes: yy**. For example:

RPF Failures: Packets: 0, Bytes:0

Source Class Field

For the logical interface, the **Source class** field provides the names of source class usage (SCU) counters per family and per class for a particular interface. The counters display packets and bytes arriving from designated user-selected prefixes. For example:

Source class	Packets (packet-per-second)	Bytes (bits-per-second)
gold	1928095	161959980
(889)	(597762)
bronze	0	0
(0)	(0)
silver	0	0
(0)	(0)

clear interfaces statistics

Syntax	clear interfaces statistics (all <i>interface-name</i>)
Release Information	Command introduced before Junos OS Release 7.4.
Description	Set interface statistics to zero. If you issue the clear interfaces statistics <i>interface-name</i> command and then perform a graceful Routing Engine switchover, the interface statistics are not cleared on the new master. Reissue the command to clear the interface statistics again.
Options	all —Set statistics on all interfaces to zero. <i>interface-name</i> —Set statistics on a particular interface to zero.
Required Privilege Level	clear
List of Sample Output	clear interfaces statistics on page 2383
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear interfaces statistics

```
user@host> clear interfaces statistics
```

show interfaces (10-Gigabit Ethernet)

Syntax	<code>show interfaces <i>xe-fpc/pic/port</i></code> <code><brief detail extensive terse></code> <code><descriptions></code> <code><media></code> <code><snmp-index <i>snmp-index</i>></code> <code><statistics></code>
Release Information	Command introduced in Junos OS Release 8.0.
Description	(M320, M120, MX Series, and T Series routers and EX Series switches only) Display status information about the specified 10-Gigabit Ethernet interface.
Options	<p><code><i>xe-fpc/pic/port</i></code>—Display standard information about the specified 10-Gigabit Ethernet interface.</p> <p><code>brief detail extensive terse</code>—(Optional) Display the specified level of output.</p> <p><code>descriptions</code>—(Optional) Display interface description strings.</p> <p><code>media</code>—(Optional) Display media-specific information about network interfaces.</p> <p><code>snmp-index <i>snmp-index</i></code>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><code>statistics</code>—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
List of Sample Output	<p>show interfaces extensive (10-Gigabit Ethernet, LAN PHY Mode, IQ2) on page 2399</p> <p>show interfaces extensive (10-Gigabit Ethernet, WAN PHY Mode) on page 2402</p> <p>show interfaces extensive (10-Gigabit Ethernet, DWDM OTN PIC) on page 2404</p> <p>show interfaces extensive (10-Gigabit Ethernet, LAN PHY Mode, Unidirectional Mode) on page 2406</p> <p>show interfaces extensive (10-Gigabit Ethernet, LAN PHY Mode, Unidirectional Mode, Transmit-Only) on page 2406</p> <p>show interfaces extensive (10-Gigabit Ethernet, LAN PHY Mode, Unidirectional Mode, Receive-Only) on page 2407</p>
Output Fields	See Table 135 on page 1957 for the output fields for the show interfaces (10-Gigabit Ethernet) command.

Table 168: show interfaces Gigabit Ethernet Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 2376 .	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces.	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 2376 .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 2376 .	All levels

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Link flags	Information about the link. Possible values are described in the “Links Flags” section under “ Common Output Fields Description ” on page 2376.	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Schedulers	(Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Hardware MAC address.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
Output Rate	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Egress accounting overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	detail extensive
Ingress accounting overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	detail extensive

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Output bytes—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 135 on page 1957.</p>	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code> statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues	Total number of egress queues supported on the specified interface.	detail extensive
Queue counters (Egress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	extensive
Queue counters (Ingress)	<p>CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	extensive

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Active alarms and Active defects	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
OTN alarms	Active OTN alarms identified on the interface.	detail extensive
OTN defects	OTN defects received on the interface.	detail extensive
OTN FEC Mode	<p>The FECmode configured on the interface.</p> <ul style="list-style-type: none"> • efec—Enhanced forward error correction (EFEC) is configured to detect and correct bit errors. • gfec—G.709 Forward error correction (GFEC) mode is configured to detect and correct bit errors. • none—FEC mode is not configured. 	detail extensive
OTN Rate	<p>OTN mode.</p> <ul style="list-style-type: none"> • fixed-stuff-bytes—Fixed stuff bytes 11.0957 Gbps. • no-fixed-stuff-bytes—No fixed stuff bytes 11.0491 Gbps. • pass-through—Enable OTN passthrough mode. • no-pass-through—Do not enable OTN passthrough mode. 	detail extensive
OTN Line Loopback	Status of the line loopback, if configured for the DWDM OTN PIC. Its value can be: enabled or disabled .	detail extensive
OTN FEC statistics	<p>The forward error correction (FEC) counters for the DWDM OTN PIC.</p> <ul style="list-style-type: none"> • Corrected Errors—The count of corrected errors in the last second. • Corrected Error Ratio—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits. 	detail extensive
OTN FEC alarms	<p>OTN FEC excessive or degraded error alarms triggered on the interface.</p> <ul style="list-style-type: none"> • FEC Degrade—OTU FEC Degrade defect. • FEC Excessive—OTU FEC Excessive Error defect. 	detail extensive
OTN OC	<p>OTN OC defects triggered on the interface.</p> <ul style="list-style-type: none"> • LOS—OC Loss of Signal defect. • LOF—OC Loss of Frame defect. • LOM—OC Loss of Multiframe defect. • Wavelength Lock—OC Wavelength Lock defect. 	detail extensive

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
OTN OTU	OTN OTU defects detected on the interface <ul style="list-style-type: none"> • AIS—OTN AIS alarm. • BDI—OTN OTU BDI alarm. • IAE—OTN OTU IAE alarm. • TTIM—OTN OTU TTIM alarm. • SF—OTN ODU bit error rate fault alarm. • SD—OTN ODU bit error rate defect alarm. • TCA-ES—OTN ODU ES threshold alarm. • TCA-SES—OTN ODU SES threshold alarm. • TCA-UAS—OTN ODU UAS threshold alarm. • TCA-BBE—OTN ODU BBE threshold alarm. • BIP—OTN ODU BIP threshold alarm. • BBE—OTN OTU BBE threshold alarm. • ES—OTN OTU ES threshold alarm. • SES—OTN OTU SES threshold alarm. • UAS—OTN OTU UAS threshold alarm. 	detail extensive
Received DAPI	Destination Access Port Interface (DAPI) from which the packets were received.	detail extensive
Received SAPI	Source Access Port Interface (SAPI) from which the packets were received.	detail extensive
Transmitted DAPI	Destination Access Port Interface (DAPI) to which the packets were transmitted.	detail extensive
Transmitted SAPI	Source Access Port Interface (SAPI) to which the packets were transmitted.	detail extensive
PCS statistics	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. <ul style="list-style-type: none"> • Bit errors—High bit error rate. Indicates the number of bit errors when the PCS receiver is operating in normal mode. • Errored blocks—Loss of block lock. The number of errored blocks when PCS receiver is operating in normal mode. 	detail extensive

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 136 on page 1971 • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—Number of frames that exceed 1518 octets. • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0. 	extensive
PMA PHY	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PHY Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
WIS section	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B1—Bit interleaved parity for SONET section overhead • SEF—Severely errored framing • LOL—Loss of light • LOF—Loss of frame • ES-S—Errored seconds (section) • SES-S—Severely errored seconds (section) • SEFS-S—Severely errored framing seconds (section) 	extensive
WIS line	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B2—Bit interleaved parity for SONET line overhead • REI-L—Remote error indication (near-end line) • RDI-L—Remote defect indication (near-end line) • AIS-L—Alarm indication signal (near-end line) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • ES-L—Errored seconds (near-end line) • SES-L—Severely errored seconds (near-end line) • UAS-L—Unavailable seconds (near-end line) • ES-LFE—Errored seconds (far-end line) • SES-LFE—Severely errored seconds (far-end line) • UAS-LFE—Unavailable seconds (far-end line) 	extensive

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
WIS path	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the attached Ethernet device, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is None. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution—Information from the link partner: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). 	extensive
Received path trace, Transmitted path trace	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.</p>	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under "Common Output Fields Description" on page 2376 .	All levels

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
VLAN-Tag	<p>Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags.</p> <ul style="list-style-type: none"> push—An outer VLAN tag is pushed in front of the existing VLAN tag. pop—The outer VLAN tag of the incoming frame is removed. swap—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information. push—An outer VLAN tag is pushed in front of the existing VLAN tag. push-push—Two VLAN tags are pushed in from the incoming frame. swap-push—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. swap-swap—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value. pop-swap—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. pop-pop—Both the outer and inner VLAN tags of the incoming frame are removed. 	brief detail extensive none
Demux:	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> Source Family Inet Destination Family Inet 	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “ Common Output Fields Description ” on page 2376.	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	extensive
Local statistics	Number and rate of bytes and packets destined to the routing device.	extensive

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under “ Common Output Fields Description ” on page 2376.	detail extensive
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	detail extensive none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	detail extensive none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	detail extensive
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	detail extensive
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “ Common Output Fields Description ” on page 2376.	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Flags	Information about address flag (possible values are described in the “Addresses Flags” section under “ Common Output Fields Description ” on page 2376.	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interlace.	detail extensive none

Table 168: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. [Table 136 on page 1971](#) describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). In [Table 136 on page 1971](#), the **ge-0/3/0** interface is the inbound physical interface, and the **ge-0/0/0** interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit .50 (VLAN 50).

Table 169: Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type

Interface Type	Sample Command	Byte and Octet Counts Include	Comments
Inbound physical interface	show interfaces ge-0/3/0 extensive	Traffic statistics: Input bytes: 496 bytes per packet, representing the Layer 2 packet MAC statistics: Received octets: 500 bytes per packet, representing the Layer 2 packet + 4 bytes	The additional 4 bytes are for the CRC.
Inbound logical interface	show interfaces ge-0/3/0.50 extensive	Traffic statistics: Input bytes: 478 bytes per packet, representing the Layer 3 packet	
Outbound physical interface	show interfaces ge-0/0/0 extensive	Traffic statistics: Input bytes: 490 bytes per packet, representing the Layer 3 packet + 12 bytes MAC statistics: Received octets: 478 bytes per packet, representing the Layer 3 packet	For input bytes, the additional 12 bytes includes 6 bytes for the destination MAC address + 4 bytes for VLAN + 2 bytes for the Ethernet type.
Outbound logical interface	show interfaces ge-0/0/0.50 extensive	Traffic statistics: Input bytes: 478 bytes per packet, representing the Layer 3 packet

show interfaces (Discard)

Syntax	<pre>show interfaces dsc <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display status information about the specified discard interface.
Options	<p>dsc—Display standard information about the specified discard interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—This option is not relevant for the discard interface and always shows a value of 0.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) This option is not relevant for the discard interface and always shows a value of 0.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <i>show interfaces (ATM)</i> <i>show interfaces routing</i>
List of Sample Output	show interfaces dsc on page 2412 show interfaces dsc brief on page 2412 show interfaces dsc detail on page 2412 show interfaces dsc extensive on page 2413
Output Fields	Table 170 on page 2409 lists the output fields for the show interfaces (discard) command. Output fields are listed in the approximate order in which they appear.

Table 170: Discard show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface, whether the interface is enabled, and the state of the physical interface: Up or Down .	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none

Table 170: Discard show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Type	Type of interface. Software-Pseudo indicates a standard software interface with no associated hardware device.	All levels
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be Internal or External .	brief detail extensive
Speed	Speed at which the interface is running.	brief detail extensive
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under " Common Output Fields Description " on page 2376.	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under " Common Output Fields Description " on page 2376.	All levels
Link type	Encapsulation being used on the physical interface.	detail extensive
Link flags	Information about the link. Possible values are described in the "Link Flags" section under " Common Output Fields Description " on page 2376.	detail extensive
Physical info	Information about the physical interface.	detail extensive
Hold-times	Current interface hold-time up and hold-time down. Value is in milliseconds.	detail extensive
Current address, Hardware address	Configured MAC address and hardware MAC address.	detail extensive
Alternate link address	Backup address of the link.	detail extensive
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive

Table 170: Discard show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface. • Input packets, Output packets—Number of packets received and transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface:</p> <ul style="list-style-type: none"> • Errors—Sum of incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. 	detail extensive
Output errors	<p>(Extensive only) Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	detail extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Table 170: Discard show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “ Common Output Fields Description ” on page 2376.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , or mpls .	All levels
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive

show interfaces (Gigabit Ethernet)

Syntax	<code>show interfaces <i>ge-fpc/pic/port</i></code> <code><brief detail extensive terse></code> <code><descriptions></code> <code><media></code> <code><snmp-index <i>snmp-index</i>></code> <code><statistics></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M Series, T Series, and MX Series routers and EX Series switches only) Display status information about the specified Gigabit Ethernet interface.
Options	<p><code><i>ge-fpc/pic/port</i></code>—Display standard information about the specified Gigabit Ethernet interface.</p> <p><code>brief detail extensive terse</code>—(Optional) Display the specified level of output.</p> <p><code>descriptions</code>—(Optional) Display interface description strings.</p> <p><code>media</code>—(Optional) Display media-specific information about network interfaces.</p> <p><code>snmp-index <i>snmp-index</i></code>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><code>statistics</code>—(Optional) Display static interface statistics.</p>
Additional Information	In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.
Required Privilege Level	view

Output Fields	Table 137 on page 1982 describes the output fields for the show interfaces (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see Table 138 on page 1995 .

Table 171: show interfaces Gigabit Ethernet Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 2376 .	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces.	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 2376 .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 2376 .	All levels

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Link flags	Information about the link. Possible values are described in the “Links Flags” section under “ Common Output Fields Description ” on page 2376.	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Schedulers	(Gigabit Ethernet intelligent queuing 2 [IQ2] interfaces only) Number of CoS schedulers configured.	extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds (ms).	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Hardware MAC address.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None
Output Rate	Output rate in bps and pps.	None
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Egress accounting overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	detail extensive
Ingress accounting overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	detail extensive

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Output bytes—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the show interfaces (10-Gigabit Ethernet) command.</p>	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues	Total number of egress queues supported on the specified interface.	detail extensive
Queue counters (Egress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	extensive
Queue counters (Ingress)	<p>CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	extensive

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Active alarms and Active defects	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
Interface transmit statistics	<p>(On MX Series devices) Status of the interface-transmit-statistics configuration: Enabled or Disabled.</p> <ul style="list-style-type: none"> • Enabled—When the interface-transmit-statistics statement is included in the configuration. If this is configured, the interface statistics show the actual transmitted load on the interface. • Disabled—When the interface-transmit-statistics statement is not included in the configuration. If this is not configured, the interface statistics show the offered load on the interface. 	detail extensive
OTN FEC statistics	<p>The forward error correction (FEC) counters provide the following statistics:</p> <ul style="list-style-type: none"> • Corrected Errors—The count of corrected errors in the last second. • Corrected Error Ratio—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits. 	detail extensive
PCS statistics	<p>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</p> <ul style="list-style-type: none"> • Bit errors—High bit error rate. Indicates the number of bit errors when the PCS receiver is operating in normal mode. • Errored blocks—Loss of block lock. The number of errored blocks when the PCS receiver is operating in normal mode. 	detail extensive

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the show interfaces (10-Gigabit Ethernet) command. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> • Packet length exceeds 1518 octets, or • Packet length exceeds MRU • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. <p>NOTE: The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the VLAN tagged frames field displays 0 when the show interfaces command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.</p> <ul style="list-style-type: none"> • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0. 	extensive
PMA PHY	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PHY Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
WIS section	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B1—Bit interleaved parity for SONET section overhead • SEF—Severely errored framing • LOL—Loss of light • LOF—Loss of frame • ES-S—Errored seconds (section) • SES-S—Severely errored seconds (section) • SEFS-S—Severely errored framing seconds (section) 	extensive
WIS line	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B2—Bit interleaved parity for SONET line overhead • REI-L—Remote error indication (near-end line) • RDI-L—Remote defect indication (near-end line) • AIS-L—Alarm indication signal (near-end line) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • ES-L—Errored seconds (near-end line) • SES-L—Severely errored seconds (near-end line) • UAS-L—Unavailable seconds (near-end line) • ES-LFE—Errored seconds (far-end line) • SES-LFE—Severely errored seconds (far-end line) • UAS-LFE—Unavailable seconds (far-end line) 	extensive

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
WIS path	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B3—Bit interleaved parity for SONET section overhead • REI-P—Remote error indication • LOP-P—Loss of pointer (path) • AIS-P—Path alarm indication signal • RDI-P—Path remote defect indication • UNEQ-P—Path unequipped • PLM-P—Path payload (signal) label mismatch • ES-P—Errored seconds (near-end STS path) • SES-P—Severely errored seconds (near-end STS path) • UAS-P—Unavailable seconds (near-end STS path) • SES-PFE—Severely errored seconds (far-end STS path) • UAS-PFE—Unavailable seconds (far-end STS path) 	extensive

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner—Information from the remote Ethernet device: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the link partner, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the link partner. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), Symmetric/Asymmetric (link partner supports PAUSE on receive and transmit or only PAUSE on transmit), and None (link partner does not support flow control). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution—Information from the local Ethernet device: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the local device. For Gigabit Ethernet interfaces, advertised capabilities are Symmetric/Asymmetric (local device supports PAUSE on receive and transmit or only PAUSE on receive) and None (local device does not support flow control). Depending on the result of the negotiation with the link partner, local resolution flow control type will display Symmetric (local device supports PAUSE on receive and transmit), Asymmetric (local device supports PAUSE on receive), and None (local device does not support flow control). • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). 	extensive
Received path trace, Transmitted path trace	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
CoS information	<p>Information about the CoS queue for the physical interface.</p> <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under " Common Output Fields Description " on page 2376.	All levels

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
VLAN-Tag	<p>Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags.</p> <ul style="list-style-type: none"> • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • pop—The outer VLAN tag of the incoming frame is removed. • swap—The outer VLAN tag of the incoming frame is overwritten with the user-specified VLAN tag information. • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • push-push—Two VLAN tags are pushed in from the incoming frame. • swap-push—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • swap-swap—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user-specified VLAN tag value. • pop-swap—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • pop-pop—Both the outer and inner VLAN tags of the incoming frame are removed. 	brief detail extensive none
Demux	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> • Source Family Inet • Destination Family Inet 	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels
ACI VLAN: Dynamic Profile	Name of the dynamic profile that defines the agent circuit identifier (ACI) interface set. If configured, the ACI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ACI information.	brief detail extensive none
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “ Common Output Fields Description ” on page 2376.	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Dynamic Profile	(MX Series routers with Trio MPCs only) Name of the dynamic profile that was used to create this interface configured with a Point-to-Point Protocol over Ethernet (PPPoE) family.	detail extensive none
Service Name Table	(MX Series routers with Trio MPCs only) Name of the service name table for the interface configured with a PPPoE family.	detail extensive none
Max Sessions	(MX Series routers with Trio MPCs only) Maximum number of PPPoE logical interfaces that can be activated on the underlying interface.	detail extensive none

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Duplicate Protection	(MX Series routers with Trio MPCs only) State of PPPoE duplicate protection: On or Off . When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	extensive
Local statistics	Number and rate of bytes and packets destined to the router.	extensive
Transit statistics	<p>Number and rate of bytes and packets transiting the switch.</p> <p>NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p>	extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. Possible values are described in the "Family Flags" section under " Common Output Fields Description " on page 2376.	detail extensive
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	detail extensive none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	detail extensive none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	detail extensive

Table 171: show interfaces Gigabit Ethernet Output Fields (*continued*)

Field Name	Field Description	Level of Output
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	detail extensive
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 2376 .	detail extensive none
protocol-family	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Flags	Information about the address flag. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 2376 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Table 172: Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type

Interface Type	Sample Command	Byte and Octet Counts Include	Comments
Inbound physical interface	show interfaces ge-0/3/0 extensive	<p>Traffic statistics:</p> <p>Input bytes: 496 bytes per packet, representing the Layer 2 packet</p> <p>MAC statistics:</p> <p>Received octets: 500 bytes per packet, representing the Layer 2 packet + 4 bytes</p>	The additional 4 bytes are for the CRC.
Inbound logical interface	show interfaces ge-0/3/0.50 extensive	<p>Traffic statistics:</p> <p>Input bytes: 478 bytes per packet, representing the Layer 3 packet</p>	

Table 172: Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type (*continued*)

Interface Type	Sample Command	Byte and Octet Counts Include	Comments
Outbound physical interface	show interfaces ge-0/0/0 extensive	<p>Traffic statistics:</p> <p>Input bytes: 490 bytes per packet, representing the Layer 3 packet + 12 bytes</p> <p>MAC statistics:</p> <p>Received octets: 478 bytes per packet, representing the Layer 3 packet</p>	For input bytes, the additional 12 bytes include 6 bytes for the destination MAC address plus 4 bytes for VLAN plus 2 bytes for the Ethernet type.
Outbound logical interface	show interfaces ge-0/0/0.50 extensive	<p>Traffic statistics:</p> <p>Input bytes: 478 bytes per packet, representing the Layer 3 packet</p>	

Sample Output

show interfaces (Gigabit Ethernet)

```

user@host> show interfaces ge-3/0/2
Physical interface: ge-3/0/2, Enabled, Physical link is Up
  Interface index: 167, SNMP ifIndex: 35
  Link-level type: 52, MTU: 1522, Speed: 1000mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled
  Remote fault: Online
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x4000
  CoS queues     : 4 supported, 4 maximum usable queues

```

NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics displayed in the **show interfaces** command output might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the interface counters. For detailed information, see the description of the logical interface **Transit statistics** fields in [Table 137 on page 1982](#).

Output Fields	Table 173 on page 2437 lists the output fields for the show interfaces (Serial) command. Output fields are listed in the approximate order in which they appear.

Table 173: show interfaces (Serial) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels

Table 173: show interfaces (Serial) Output Fields (*continued*)

Field Name	Field Description	Level of Output
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 2376 .	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Type	Type of interface.	All levels
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit (MTU) size on the physical interface.	All levels
Maximum speed	Maximum speed. The nonconfigurable value is 16,384 kbps.	detail extensive none
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 2376 .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 2376 .	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 2376 .	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Keepalive settings	(PPP and HDLC) Configured settings for keepalive packets. <ul style="list-style-type: none"> Interval <i>seconds</i>—Time between successive keepalive requests. The range of values, in seconds, is 10 to 32,767. The default value is 10. Up-count <i>number</i>—Number of keepalive packets a destination must receive to change a link's status from down to up. The range of values is 1 to 255. The default value is 1. Down-count <i>number</i>—Number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 to 255. The default value is 3. 	All levels
Keepalive	(PPP and HDLC) Information about keepalive packets. <ul style="list-style-type: none"> Input: <i>number (hh:mm:ss ago)</i>—Number of keepalive packets received by PPP and the time since the last keepalive packet was received. Output: <i>number (hh:mm:ss ago)</i>—Number of keepalive packets sent by PPP and the time since the last keepalive packet was sent. 	brief none

Table 173: show interfaces (Serial) Output Fields (*continued*)

Field Name	Field Description	Level of Output
Keepalive statistics	(PPP and HDLC) Information about keepalive packets. <ul style="list-style-type: none"> • Input: <i>number (last seen hh:mm:ss ago)</i>—Number of keepalive packets received by PPP and the time since the last keepalive packet was received. • Output: <i>number (last seen hh:mm:ss ago)</i>—Number of keepalive packets sent by PPP and the time since the last keepalive packet was sent. 	detail extensive
LCP state	(PPP) Link Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—LCP negotiation is incomplete (not yet completed or has failed). • Not-configured—LCP is not configured on the interface. • Opened—LCP negotiation is successful. 	detail extensive none
NCP state	(PPP) Network Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—NCP negotiation is incomplete (not yet completed or has failed). • Not-configured—NCP is not configured on the interface. • Opened—NCP negotiation is successful. 	detail extensive none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. <ul style="list-style-type: none"> • Chap-Chal-received—Challenge was received but response not yet sent. • Chap-Chal-sent—Challenge was sent. • Chap-Resp-received—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • Chap-Resp-sent—Response was sent for the challenge received. • Closed—CHAP authentication is incomplete. • Failure—CHAP authentication failed. • Not-configured—CHAP is not configured on the interface. • Success—CHAP authentication was successful. 	detail extensive none
CoS queues	Number of CoS queues configured.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified

Table 173: show interfaces (Serial) Output Fields (*continued*)

Field Name	Field Description	Level of Output
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeds the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues supported	Total number of egress queues supported on the specified interface. Displayed with the statistics option.	detail extensive
Egress queues in use	Total number of egress queues in use on the specified interface. Displayed with the statistics option.	detail extensive

Table 173: show interfaces (Serial) Output Fields (*continued*)

Field Name	Field Description	Level of Output
Queue counters	CoS queue number and its associated user-configured forwarding class name. Displayed with the statistics option. <ul style="list-style-type: none"> Queued packets—Number of queued packets. Transmitted packets—Number of transmitted packets. Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Serial media information	Information about the physical media: <ul style="list-style-type: none"> Line protocol—eia530, eia530a, rs232, rs449, v.35, or x.21. Resync history—Information about resynchronization events: <ul style="list-style-type: none"> Sync loss count—Number of times the synchronization was lost. Data signal—(X.21 and V.35) Information about the data signal: <ul style="list-style-type: none"> Rx Clock—Receive clock status: OK (DTE is receiving the receive clock signal) or Not detected (receive clock signal is not being received). Control signals—Information about modem control signals: <ul style="list-style-type: none"> Local mode:DCE (data communication equipment) or DTE (data terminal equipment) To DCE—Control signals that the Serial PIC sent to the DCE: DTR (Data Terminal Ready:up or down) or RTS (Request To Send: up or down.) From DC—Control signals that the Serial PIC received from the DCE: CTS (Clear To Send: up or down), DCD (Data Carrier Detect: up or down), DSR (Data Set Ready: up or down), or TM (Test Mode: up or down). Clocking mode—Clocking used for the transmit clock: <ul style="list-style-type: none"> dte—Transmit clock is generated by DTE. dce—Transmit clock is generated by the DCE and is looped back as the transmit clock. loop-timed—Receive clock from the DCE is looped back as the transmit clock. Clock rate—Rate, in megahertz (MHz), at which the clock is configured. Loopback—Configured loopback mode for the interface: dce-remote, dce-local, liu, local, or none. Tx clock—Clocking phase of the transmit clock: invert (transmit clock polarity is inverted) or non-invert (transmit clock polarity is not inverted). Line encoding—Type of line encoding used: nrz (nonreturn to zero) or nrzi (return to zero inverted). 	detail extensive
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> Destination slot—FPC slot number. PLP byte—Packet Level Protocol byte. 	extensive

Table 173: show interfaces (Serial) Output Fields (*continued*)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface: <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 2376 .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the source and destination address are also displayed.	brief
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , mpls .	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 2376 .	detail extensive

Table 173: show interfaces (Serial) Output Fields (*continued*)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 2376 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Sample Output

show interfaces (Serial, EIA-530)

```

user@host> show interfaces se-5/0/1

show interfaces extensive

Syntax show interfaces extensive

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.

Description Display extensive information about all interfaces configured on the router.

NOTE:

- At some times, the cumulative byte counters displayed with the `show interfaces extensive` command on the 10-Gigabit Ethernet MPC with SFP+ is not always increasing and cumulative and does not give the correct results. There is a time lag in collecting these statistics, during which the display might decrease or go from a nonzero number to zero. Eventually, the counter will display the correct result.
 - When the `show interfaces extensive` command is executed on a router with an MPC or a T4000 Type 5 FPC, the *Input packet rejects* counter of the *Filter statistics* field also displays statistics related to the following packet errors:
 - Invalid VLAN range
 - Tagged packet received on an untagged interface
 - When the `show interfaces extensive` command is executed on an interface that is configured on a T4000 Type 5 FPC, the *IPv6 transit statistics* field displays:
 - Total statistics (sum of transit and local statistics) at the physical interface level
 - Transit statistics at the logical interface level
 - When the `show interfaces extensive` command is executed on an aggregate interface in a T1600 Core Router, the *IPv6 Input bytes* is displayed for an aggregate interface. However, the *IPv6 Input bytes* is always zero on a member link of an aggregated bundle even when there are IPv6 transit traffic on the member link. This is because the logical interface index of the aggregate logical interface is updated but not the logical interface of the member links in the channel lookup table.
-

Options This command has no options.

Output Fields For more information, see the output fields table for the particular interface type in which you are interested. For information about destination class and source class statistics, see the “Destination Class Field” section and the “Source Class Field” section under [“Common Output Fields Description” on page 2376](#). For sample output for specific interfaces, see the other topics in this collection.

Sample Output

show interfaces extensive (Circuit Emulation)

If a Circuit Emulation (CE) PIC is configured for SAToP pseudowire, then pseudowire statistics are displayed in the CE information section of the show interface extensive output. If SAToP pseudowire is not configured on the CE PIC, then all the CE information counters will be displayed as 0 (zero).

```

show interfaces queue

Syntax	<pre>show interfaces queue <aggregate remaining-traffic> <both-ingress-egress> <egress> <forwarding-class forwarding-class> <ingress> <interface-name interface-name> <l2-statistics> <remaining-traffic></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>both-ingress-egress, egress, and ingress options introduced in Junos OS Release 7.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>l2-statistics option introduced in Junos OS Release 12.1.</p>
Description	Display class-of-service (CoS) queue information for physical interfaces.
Options	<p>none—Show detailed CoS queue statistics for all physical interfaces.</p> <p>aggregate—(Optional) Display the aggregated queuing statistics of all logical interfaces that have traffic-control profiles configured. (Not on the QFX Series.)</p> <p>both-ingress-egress—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics. (Not on the QFX Series.)</p> <p>egress—(Optional) Display egress queue statistics.</p> <p>forwarding-class forwarding-class—(Optional) Forwarding class name for this queue. Shows detailed CoS statistics for the queue associated with the specified forwarding class.</p> <p>ingress—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics. (Not on the QFX Series.)</p> <p>interface-name interface-name—(Optional) Show detailed CoS queue statistics for the specified interface.</p> <p>l2-statistics—(optional) Display layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles</p>

Overhead for Layer 2 Statistics

Transmitted packets and transmitted byte counts are displayed for the layer 2 level with the addition of encapsulation overheads applied for fragmentation, as shown in [Table 140 on page 2012](#). Others counters, such as packets and bytes queued (input) and drop counters, are displayed at the layer 3 level. In the case of link fragmentation and interleaving (LFI) for which not fragmentation is applied, corresponding layer 2 overheads are added, as shown in [Table 140 on page 2012](#).

Table 174: Layer 2 Overhead, Transmitted Packets/Bytes

Protocol	Fragmentation		LFI
	First fragmentation	Second to n fragmentations	
	Bytes	Bytes	
MLPPP (Long)	13	12	8
MLPPP (short)	11	10	8
MLFR (FRF15)	12	10	8
MFR (FRF16)	10	8	-
MCMLPPP(Long)	13	12	-
MCMLPPP(Short)	11	10	-

Layer 2 Statistics - Fragmentation Overhead Calculation

MLPPP/MC-MLPPP Overhead details:

=====

Fragment 1:

```

Outer PPP header           : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
Inner PPP header           : 1 byte
HDLC flag and FCS bytes    : 4 bytes

```

Fragments 2 .. n :

```

Outer PPP header           : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
HDLC flag and FCS bytes    : 4 bytes

```

MLFR (FRF15) Overhead details:

=====

Fragment 1:

```

Framereelay header        : 2 bytes
Control,NLPID             : 2 bytes
Fragmentaion header       : 2 bytes
Inner proto               : 2 bytes
HDLC flag and FCS         : 4 bytes

```

Fragments 2 ...n :

```

Framereelay header        : 2 bytes
Control,NLPID             : 2 bytes
Fragmentaion header       : 2 bytes
HDLC flag and FCS         : 4 bytes

```

MFR (FRF16) Overhead details:

=====

```

Fragment 1:
  Fragmentation header : 2 bytes
  Framereelay header   : 2 bytes
  Inner proto          : 2 bytes
  HDLC flag and FCS    : 4 bytes

Fragments 2 ...n :
  Fragmentation header : 2 bytes
  Framereelay header   : 2 bytes
  HDLC flag and FCS    : 4 bytes

```

Overhead with LFI

```

MLPPP(Long & short sequence):
=====
  Outer PPP header : 4 bytes
  HDLC flag and FCS : 4 bytes

MLFR (FRF15):
=====
  Framereelay header : 2 bytes
  Control,NLPID      : 2 bytes
  HDLC flag and FCS  : 4 bytes

```

The following examples show overhead for different cases:

- A 1000-byte packet is sent to a mlppp bundle without any fragmentation. At the layer 2 level, bytes transmitted is 1013 in 1 packet. This overhead is for MLPPP long sequence encap.
- A 1000-byte packet is sent to a mlppp bundle with a fragment threshold of 250byte. At the layer 2 level, bytes transmitted is 1061 bytes in 5 packets.
- A 1000-byte LFI packet is sent to an mlppp bundle. At the layer 2 level, bytes transmitted is 1008 in 1 packet.

remaining-traffic—(Optional) Display the queuing statistics of all logical interfaces that do not have traffic-control profiles configured. (Not on the QFX Series.)

Additional Information On M Series routers (except for the M320 and M120 routers), this command is valid only for a PIC installed on an enhanced Flexible PIC Concentrator (FPC).

Queue statistics for aggregated interfaces are supported on the M Series and T Series routers only. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can view the statistics for a child interface by using the **show interfaces statistics** command for that child interface.

When you configure tricolor marking on a 10-port 1-Gigabit Ethernet PIC, for queues 6 and 7 only, the output does not display the number of queued bytes and packets, or the number of bytes and packets dropped because of RED. If you do not configure tricolor marking on the interface, these statistics are available for all queues.

For the 4-port Channelized OC12 IQE PIC and 1-port Channelized OC48 IQE PIC, the **Packet Forwarding Engine Chassis Queues** field represents traffic bound for a particular

physical interface on the PIC. For all other PICs, the **Packet Forwarding Engine Chassis Queues** field represents the total traffic bound for the PIC.

For Gigabit Ethernet IQ2 PICs, the **show interfaces queue** command output does not display the number of tail-dropped packets. This limitation does not apply to Packet Forwarding Engine chassis queues.

When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.

The behavior of the **egress** queues for the **Routing Engine-Generated Traffic** is not same as the configured queue for MLPPP and MFR configurations.

For information about how to configure CoS, see the *Junos® OS Network Interfaces*. For related CoS operational mode commands, see the *Junos OS Operational Mode Commands*.

- [show interfaces queue l2-statistics \(lsq interface\) on page 2504](#)

Output Fields [Table 141 on page 2014](#) lists the output fields for the **show interfaces queue** command. Output fields are listed in the approximate order in which they appear.

Table 175: show interfaces queue Output Fields

Field Name	Field Description
Physical interface	Name of the physical interface.
Enabled	State of the interface. Possible values are described in the "Enabled Field" section under " Common Output Fields Description " on page 2376.
Interface index	Physical interface's index number, which reflects its initialization sequence.
SNMP ifIndex	SNMP index number for the interface.
Forwarding classes supported	Total number of forwarding classes supported on the specified interface.

Table 175: show interfaces queue Output Fields (*continued*)

Field Name	Field Description
Forwarding classes in use	Total number of forwarding classes in use on the specified interface.
Ingress queues supported	On Gigabit Ethernet IQ2 PICs only, total number of ingress queues supported on the specified interface.
Ingress queues in use	On Gigabit Ethernet IQ2 PICs only, total number of ingress queues in use on the specified interface.
Output queues supported	Total number of output queues supported on the specified interface.
Output queues in use	Total number of output queues in use on the specified interface.
Egress queues supported	Total number of egress queues supported on the specified interface.
Egress queues in use	Total number of egress queues in use on the specified interface.
Queue	Queue number.
Queue counters (Ingress)	<p>CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism.
Burst size	(Logical interfaces on IQ PICs only) Maximum number of bytes up to which the logical interface can burst. The burst size is based on the shaping rate applied to the interface.
Forwarding classes	Forwarding class name.
Queued Packets	<p>Number of packets queued to this queue.</p> <p>NOTE: For Gigabit Ethernet IQ2 interfaces, the Queued Packets count is calculated by the Junos OS interpreting one frame buffer as one packet. If the queued packets are very large or very small, the calculation might not be completely accurate for transit traffic. The count is completely accurate for traffic terminated on the router.</p>
Queued Bytes	<p>Number of bytes queued to this queue. The byte counts vary by PIC type. For more information, see Table 142 on page 2017.</p>
Transmitted Packets	<p>Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the Packet Forwarding Engine Chassis Queues field) shows the prefragmentation values.</p> <p>NOTE: For layer 2 statistics, see “Overhead for Layer 2 Statistics” on page 2011</p>

Table 175: show interfaces queue Output Fields (*continued*)

Field Name	Field Description
Transmitted Bytes	<p>Number of bytes transmitted by this queue. The byte counts vary by PIC type. For more information, see Table 142 on page 2017.</p> <p>NOTE: On MX Series routers, this number can be inaccurate when you issue the command for a physical interface repeatedly and in quick succession, because the statistics for the child nodes are collected infrequently. Wait ten seconds between successive iterations to avoid this situation.</p> <p>NOTE: For layer 2 statistics, see “Overhead for Layer 2 Statistics” on page 2011</p>
Tail-dropped packets	Number of packets dropped because of tail drop.
RED-dropped packets	<p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> • (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> • Low, non-TCP—Number of low-loss priority non-TCP packets dropped because of RED. • Low, TCP—Number of low-loss priority TCP packets dropped because of RED. • High, non-TCP—Number of high-loss priority non-TCP packets dropped because of RED. • High, TCP—Number of high-loss priority TCP packets dropped because of RED. • (J Series routers and MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> • Low—Number of low-loss priority packets dropped because of RED. • Medium-low—Number of medium-low loss priority packets dropped because of RED. • Medium-high—Number of medium-high loss priority packets dropped because of RED. • High—Number of high-loss priority packets dropped because of RED.
RED-dropped bytes	<p>Number of bytes dropped because of RED. The byte counts vary by PIC type. For more information, see Table 142 on page 2017.</p> <ul style="list-style-type: none"> • (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> • Low, non-TCP—Number of low-loss priority non-TCP bytes dropped because of RED. • Low, TCP—Number of low-loss priority TCP bytes dropped because of RED. • High, non-TCP—Number of high-loss priority non-TCP bytes dropped because of RED. • High, TCP—Number of high-loss priority TCP bytes dropped because of RED. • (J Series routers only) The output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> • Low—Number of low-loss priority bytes dropped because of RED. • Medium-low—Number of medium-low loss priority bytes dropped because of RED. • Medium-high—Number of medium-high loss priority bytes dropped because of RED. • High—Number of high-loss priority bytes dropped because of RED.

Byte counts vary by PIC type. [Table 142 on page 2017](#) shows how the byte counts on the outbound interfaces vary depending on the PIC type. [Table 142 on page 2017](#) is based on the assumption that outbound interfaces are sending IP traffic with 478 bytes per packet.

Table 176: Byte Count by PIC Type

PIC Type	Output Level	Byte Count Includes	Comments
Gigabit Ethernet IQ and IQE PICs	Interface	<p>Queued: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes</p> <p>Transmitted: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes</p> <p>RED dropped: 496 bytes per packet representing 478 bytes of Layer 3 packet + 18 bytes</p>	<p>The 12 additional bytes include 6 bytes for the destination MAC address + 4 bytes for the VLAN + 2 bytes for the Ethernet type.</p> <p>For RED dropped, 6 bytes are added for the source MAC address.</p>
	Packet forwarding component	<p>Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> <p>Transmitted: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p>	—
Non-IQ PIC	Interface	<p>T Series, TX Series, T1600, and MX Series routers:</p> <ul style="list-style-type: none"> Queued: 478 bytes of Layer 3 packet. Transmitted: 478 bytes of Layer 3 packet. <p>T4000 routers with Type 5 FPCs :</p> <ul style="list-style-type: none"> Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead 8 bytes preamble + 12 bytes Inter frame Gap. Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead 8 bytes preamble + 12 bytes Interframe Gap. <p>M Series routers:</p> <ul style="list-style-type: none"> Queued: 478 bytes of Layer 3 packet. Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead. <p>PTX Series Packet Transport Switches:</p> <ul style="list-style-type: none"> Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes FCS + the full Layer 1 overhead of the MAC header DA + SA + EtherType (non-VLAN). Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead of the MAC header DA + SA + EtherType (non-VLAN). RED dropped: 478 bytes of Layer 3 packet + 22 bytes special header. To the TQ, this packet has 4 bytes more than queued or transmitted. 	<p>The Layer 2 overhead is 14 bytes for non-VLAN traffic and 18 bytes for VLAN traffic.</p>

Table 176: Byte Count by PIC Type (*continued*)

PIC Type	Output Level	Byte Count Includes	Comments
IQ and IQE PICs with a SONET/SDH interface	Interface	<p>Queued: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p> <p>Transmitted: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p> <p>RED dropped: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p>	The additional 4 bytes are for the Layer 2 Point-to-Point Protocol (PPP) header.
	Packet forwarding component	<p>Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> <p>Transmitted: 486 bytes per packet, representing 478 bytes of Layer 3 packet + 8 bytes</p>	For transmitted packets, the additional 8 bytes includes 4 bytes for the PPP header and 4 bytes for a cookie.
Non-IQ PIC with a SONET/SDH interface	Interface	<p>T Series, TX Series, T1600, and MX Series routers:</p> <ul style="list-style-type: none"> Queued: 478 bytes of Layer 3 packet. Transmitted: 478 bytes of Layer 3 packet. <p>M Series routers:</p> <ul style="list-style-type: none"> Queued: 478 bytes of Layer 3 packet. Transmitted: 483 bytes per packet, representing 478 bytes of Layer 3 packet + 5 bytes RED dropped: 478 bytes per packet, representing 478 bytes of Layer 3 packet 	For transmitted packets, the additional 5 bytes includes 4 bytes for the PPP header and 1 byte for the packet loss priority (PLP).
Interfaces configured with Frame Relay Encapsulation	Interface	The default Frame Relay overhead is 7 bytes. If you configure the Frame Check Sequence (FCS) to 4 bytes, then the overhead increases to 10 bytes.	
1-port 10-Gigabit Ethernet IQ2 and IQ2-E PICs	Interface	<p>Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.</p> <p>Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.</p>	The Layer 2 overhead is 18 bytes for non-VLAN traffic and 22 bytes for VLAN traffic.
4-port 1G IQ2 and IQ2-E PICs	Packet forwarding component	Queued: 478 bytes of Layer 3 packet.	—
8-port 1G IQ2 and IQ2-E PICs		Transmitted: 478 bytes of Layer 3 packet.	

Sample Output

show interfaces queue (Aggregated Ethernet on a T320 Router)

The following example shows that the aggregated Ethernet interface, **ae1**, has traffic on queues **af1** and **af12**:

```

user@host> show interfaces queue ae1
Physical interface: ae1, Enabled, Physical link is Up

EX Series Switch Software Features Overview

This topic lists the Juniper Networks EX Series Ethernet Switches software features, the Juniper Networks Junos operating system (Junos OS) release in which they were introduced, and the first Junos OS release for each switch.

NOTE: For Virtual Chassis features, see *EX Series Virtual Chassis Software Features Overview*.

NOTE: In all tables in this topic, “N.S.” = “Not supported”, and “—” = “Not applicable”.

The Junos OS release for software features on a switch cannot be earlier than the first Junos OS release for that switch.

Table 177: First Junos OS Release for Each EX Series Switch

Switch	Junos OS Release
EX2200 switches*	Junos OS Release 10.1R1 *EX2200-C models: Junos OS Release 11.3R1
EX3200 switches	Junos OS Release 9.0R1
EX3300 switches	Junos OS Release 11.3R1
EX4200 switches	Junos OS Release 9.0R1
EX4300 switches	Junos OS Release 13.2X50-D10
EX4500 switches**	Junos OS Release 10.2R1* **EX4500-C models: Junos OS Release 10.3R2
EX4550 switches	Junos OS Release 12.2R1
EX6200 switch	Junos OS Release 11.3R2
EX8208 switches	Junos OS Release 9.4R1
EX8216 switches	Junos OS Release 9.5R1
EX9200 switches	Junos OS Release 12.3R2

Table 178: Access Control Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
802.1X authentication (port-based, multiple supplicant)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.2R1	N.S.
802.1X authentication with authentication bypass	10.1R1	9.0R2	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.2R1	N.S.
802.1X authentication with VLAN assignment, VoIP VLAN support	10.1R1	9.0R1	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.
802.1X user-based dynamic firewall filters	10.1R1	9.0R2	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.

Table 178: Access Control Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
802.1X user-based dynamic firewall filters on multiple-suplicant ports	10.1R1	9.5R2	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.
802.1X per-user statistics	10.1R1	9.2R1	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R1	10.3R1	N.S.
Authentication fallback	11.3R1	10.3R1	12.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	N.S.	N.S.
Captive portal authentication for Layer 3 interfaces	11.3R1	10.1R1	N.S.	13.2X50 - D10	12.1R1	12.2R1	N.S.	N.S.	N.S.
Captive portal authentication for Layer 2 interfaces	11.3R1	10.3R1	12.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	N.S.	N.S.
Energy Efficient Ethernet (EEE)	N.S.	N.S.	12.2R1	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.
Infranet Controller (IC) as an external captive-portal server	12.2R1	12.2R1	12.2R1	N.S.	12.2R1	12.2R1	N.S.	N.S.	N.S.
MAC RADIUS authentication	10.1R1	9.3R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.3R1	N.S.
NetBIOS snooping	11.3R5	11.1R1	11.3R5	N.S.	N.S.	N.S.	11.3R5	11.1R1	N.S.
Server fail fallback	10.1R1	9.3R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.2R1	N.S.
TACACS+	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	12.3R2

Table 179: Administration Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
System logging (syslog) over IPv4	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	12.3R2
System logging (syslog) over IPv6	10.3R1	9.3R2	11.3R1	13.2X50 - D10	10.4R1	12.2R1	11.3R2	10.1R1	12.3R2
System snapshot	N.S.	10.0R1	N.S.	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.0R1	12.3R2

Table 180: Class-of-Service (CoS) Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Class of service (CoS)—Class-based queuing with prioritization, Layer 2 and Layer 3 classification, rewrite, and queuing; strict priority queuing on egress	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	See Table 63 for a list of EX9200 CoS features
CoS—DSCP, IEEE 802.1p, and IP precedence packet rewrites on RVIs or IRB interfaces	N.S.	9.5R1	11.3R1	N.S.	10.2R1	12.2R1	11.3R2	9.4R1	
CoS—Interface-specific classifiers on RVIs or IRB interfaces	N.S.	9.4R1	11.3R1	13.2X50 - D10	11.3R1	12.2R1	N.S.	10.2R1	
CoS—Multidestination	—	—	—	—	—	—	N.S.	9.5R1	
CoS—Per-interface classification	N.S.	9.3R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.2R1	
CoS support on link aggregation groups (LAGs)	10.1R1	9.2R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	9.4R1	
CoS support on RVIs or IRB interfaces	10.3R1	9.4R1	11.3R1	13.2X50 - D10 (classifiers only; rewrites N.S.)	10.4R1	12.2R1	N.S.	9.4R1	
DSCP setting on ingress interface	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R1	
Flexible CoS-outer 802.1p marking	N.S.	9.6R1	12.3R1	N.S.	12.1R1	12.2R1	N.S.	N.S.	
Interface-specific CoS rewrite rules	10.3R1	9.4R1	N.S.		11.2R1	12.2R1	N.S.	10.2R1	

Table 180: Class-of-Service (CoS) Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
				13.2X50 - D10 (for Layer 3 interfaces; IRB interfaces and Layer 3 subinterfaces N.S.)					
Junos EZQoS for CoS	10.1R1	9.3R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Port shaping and queue shaping	10.1R1	9.3R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.1R1	
Re-marking of bridged packets	11.2R1	9.4R1	N.S.	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.2R1	
Shaped-deficit weighted round-robin (SDWRR)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Single-rate two-color marking	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	

Table 181: Class-of-Service (CoS) Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Assigning forwarding class and DSCP value for Routing Engine generated traffic	12.3R2
BA classification for VPLS based on IEEE 802.1p bits	12.3R2
Classification—Associate packets with CoS servicing levels. Types of classification: <ul style="list-style-type: none"> • Behavior aggregate (BA)—Operates on packets as they enter the switch • Multifield classification—Examines multiple fields in packets. • Fixed classification—Associate a forwarding class with a packet regardless of packet contents. 	12.3R2
Classification and DSCP marking of distributed protocol handler traffic	12.3R2
Classification of control-plane traffic	12.3R2
CoS classification and rewrite for IRB and Layer 2 interfaces and for other Layer 3 interfaces. Port-level queuing, scheduling, and shaping are supported.	12.3R2

Table 181: Class-of-Service (CoS) Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Egress GRE classification based on DSCP	12.3R2
IEEE 802.1p inheritance push and swap from transparent tags configuration	12.3R2
Elevated packet drops during oversubscription	12.3R2
Layer 2 policers for the ingress and egress interfaces. Policer types: <ul style="list-style-type: none"> • Single-rate two-color • Single-rate three-color (color-blind and color-aware) • Two-rate three-color (color-blind and color-aware) 	12.3R2
Independent values for DSCP and EXP bits	12.3R2
Apply CoS schedulers on ingress interfaces	12.3R2
Ingress DSCP bits for multicast traffic over Layer 3 VPNs	12.3R2
Layer 2 traffic policing	12.3R2
Policer support for aggregated Ethernet bundles (link aggregation groups, or LAGs)	12.3R2
Queuing support for logical tunnel interfaces	12.3R2
Rate-limit and excess rate or excess priority option	12.3R2
Re-marking of MVPN GRE encapsulation DSCP at ASBR	12.3R2
Scheduling	12.3R2
Set IPv6 DSCP and MPLS EXP independently	12.3R2
Set IPv6 DiffServ code point (DSCP) and MPLS EXP independently	12.3R2
Support for Layer 2 policers at the VLAN level	12.3R2
Support for applying a transmit rate limit to logical interfaces on Type 1, 2, or 3 Multiservices PICs	12.3R2
Support for configuring ToS rewrite rules so that DSCP bits of GRE packets are consistent with service providers' CoS policy	12.3R2
Support for copying the TOS bits to the outer IP header on GRE tunnel traffic sent by the Routing Engine	12.3R2
Support for setting the forwarding class and DSCP value for traffic generated by the Routing Engine	12.3R2
Unified command to display all CoS statistics	12.3R2

Table 182: Converged Networks (LAN and SAN) Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
NOTE: The EX4500 switch models that support Fibre Channel over Ethernet features must be Converged Enhanced Ethernet (CEE) capable. The CEE-capable EX4500 switch models have a “-C” in the hardware model number. See <i>EX4500 Switch Models</i> .									
Data Center Bridging Capability Exchange protocol (DCBX)	N.S.	N.S.	N.S.	N.S.	11.3R1	12.2R1	N.S.	N.S.	N.S.
DCBX application protocol TLV exchange	N.S.	N.S.	N.S.	N.S.	12.1R1	12.2R1	N.S.	N.S.	N.S.
FIP snooping	N.S.	N.S.	N.S.	N.S.	10.4R1	12.2R1	N.S.	N.S.	N.S.
Priority-based flow control (PFC)	N.S.	N.S.	N.S.	N.S.	10.4R1	12.2R1	N.S.	N.S.	N.S.

Table 183: Device Security Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Automatic recovery for port error disable conditions	10.1R1	9.6R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.0R1	N.S.
Storm control (broadcast and unicast)	10.1R1	9.1R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	N.S.
Storm control (multicast)	10.3R2	10.3R2	N.S.	13.2X50 - D10	10.3R2	12.2R1	11.3R2	10.3R2	N.S.
Unknown Layer 2 unicast forwarding	10.1R1	9.3R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.0R1	12.3R2

Table 184: High Availability and Resiliency Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
NOTE: For complete lists of Virtual Chassis features, see <i>EX Series Virtual Chassis Software Features Overview</i> .									See Table 3 for a list of EX9200 HA features.
Graceful protocol restart for BGP	–	9.0R2	N.S.	13.2X50 - D10	–	–	11.3R2	9.4R1	
Graceful protocol restart for IS-IS	–	9.3R2	N.S.	13.2X50 - D10	–	–	11.3R2	9.4R1	
Graceful protocol restart for OSPF	–	9.0R2	N.S.	13.2X50 - D10	–	–	11.3R2	9.4R1	
Graceful protocol restart for RSVP and LDP	N.S.	N.S.	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	12.3R1	
GRES for ARP entries, forwarding database, and Layer 3 protocols	–	9.2R1 (Virtual Chassis only)	11.3R1	13.2X50 - D10	11.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	11.3R2	9.4R1	
GRES for IGMP snooping	–	11.3R1 (Virtual Chassis only)	12.1R1 (Virtual Chassis only)	13.2X50 - D10	11.4R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	11.3R1	
GRES for LACP	N.S.	11.3R1	N.S.	13.2X50 - D10	11.3R1	12.2R1	N.S.	11.3R1	
GRES for Layer 2 and Layer 3 VPN LSPs	N.S.	N.S.	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	12.3R1	
GRES for port security (DHCP snooping, DAI, and IP source guard)	–	9.2R1 (Virtual Chassis only)	N.S.	13.2X50 - D10	–	–	11.3R2	9.6R1	
LACP support for dual-homing applications in data centers	10.1R1	10.0R1	N.S.	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.0R1	
Link Aggregation Control Protocol (LACP)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Link aggregation groups (LAGs)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	

Table 184: High Availability and Resiliency Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Nonstop active routing (NSR) for BGP, IS-IS, IGMP with BFD, and RIP	—	11.1R1 (Virtual Chassis only)	12.1R1 (Virtual Chassis only)	N.S.	11.3R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	11.3R2	11.1R1	
Nonstop active routing (NSR) for IPv6 IS-IS, RIPng, and OSPFv3 with BFD	—	12.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	12.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	11.2R1	
Nonstop active routing (NSR) for OSPFv2	—	11.1R1	12.1R1 (Virtual Chassis only)	N.S.	11.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	11.3R2	10.4R1	
Nonstop active routing (NSR) for Protocol Independent Multicast (PIM)	N.S.	12.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	12.2R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	11.4R2	
Nonstop active routing (NSR) for RSVP and LDP	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R1	
Nonstop bridging (NSB) for LAGs and LACP	—	11.4R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	11.4R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	12.1R1	11.3R1	
Nonstop bridging (NSB) for LLDP and LLDP-MED	—	11.3R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	N.S.	N.S.	N.S.	11.3R1	
Nonstop bridging (NSB) for spanning-tree protocols	—	11.3R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	12.1R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	12.1R1	11.3R1	
Nonstop software upgrade (NSSU)	—	12.1R1 (Virtual Chassis only)	12.2R1 (Virtual Chassis only)	N.S.	12.1R1 (Virtual Chassis only)	12.1R1 (Virtual Chassis only)	12.2R1	10.4R1	
Power budget management	—	—	N.S.	13.2X50 - D10	—	—	11.3R2	10.2R1	
	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	11.4R1	

Table 184: High Availability and Resiliency Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Virtual Router—Network Time Protocol (NTP), system logging, Simple Network Management Protocol (SNMP), RADIUS, and TACACS support in a virtual router									
Virtual Router Redundancy Protocol (VRRP)	12.3R1	9.0R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Virtual Router Redundancy Protocol (VRRP)—Support for multiple VRRP owners per physical interface	12.3R1	12.3R1	12.3R1	N.S.	12.3R1	12.3R1	N.S.	12.3R1	
Virtual Router Redundancy Protocol (VRRP) for IPv6 (except authentication type and authentication key)	N.S.	10.2R1	12.3R1	13.2X50 - D10	11.2R1	12.2R1	12.1R1	10.1R1	

Table 185: High Availability and Resiliency Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Graceful Routing Engine switchover (GRES)	12.3R2
Nonstop active routing (NSR) support for Protocol Independent Multicast (PIM) for IPv4 and IPv6	12.3R2
Nonstop active routing (NSR) support for VPLS and for LDP-based VPLS	12.3R2
Nonstop active routing (NSR) support for LDP OAM features	12.3R2
Nonstop active routing (NSR) support for Layer 2 VPNs	12.3R2
Unified ISSU (requires EX9200-40T or EX9200-40F line cards)	12.3R3

Table 185: High Availability and Resiliency Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Virtual Router Redundancy Protocol version 3 (VRRPv3)	12.3R2

Table 186: Interfaces Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Digital optical monitoring (DOM)	N.S.	10.0R1	11.3R1	13.2X50 - D10	N.S.	N.S.	N.S.	10.0R1	See Table 186 for a list of EX9200 interfaces features.
Interface ranges	10.1R1	10.0R1	11.3R1	13.2X50 - D10	10.2R	12.2R1	11.3R2	10.1R1	
IPv4 over generic routing encapsulation (GRE) tunnels—encapsulation support	N.S.	12.1R1	N.S.	N.S.	N.S.	N.S.	N.S.	12.1R1	
IPv4 over generic routing encapsulation (GRE) tunnels—de-encapsulation support	N.S.	12.1R1	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R1	
IPv6 over generic routing encapsulation (GRE) tunnels using IPv4 transport—encapsulation support	N.S.	12.1R1	N.S.	N.S.	N.S.	N.S.	N.S.	12.1R1	
IPv6 over generic routing encapsulation (GRE) tunnels using IPv4 transport—de-encapsulation support	N.S.	12.1R1	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R1	
IP directed broadcast	11.3R1	9.4R1	12.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Time domain reflectometry (TDR)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	N.S.	N.S.	11.3R2	9.4R1	
Unicast reverse-path forwarding (RPF)	N.S.	9.3R2	12.3R1	13.2X50 - D10	11.2R1	12.2R1	11.3R2	10.1R1	
	N.S.	9.2R1	N.S.	13.2X50 - D10	11.2R1	12.2R1	11.3R2	9.4R1	

Table 186: Interfaces Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
VLAN-tagged Layer 3 subinterfaces									

Table 187: Interfaces Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
ICMP redirect	12.3R2
Clear MAC address information	12.3R2
IPv6 subnet support on loopback interfaces	12.3R2
IPv6 support for unnumbered Ethernet interfaces	12.3R2
Multichassis link aggregation (MC-LAG)	12.3R2
Nonstop active routing (NSR) support for Bidirectional Forwarding Detection (BFD)	12.3R2
Protection against distributed denial-of-service (DDOS) attacks	12.3R2
Software support for IPv4 to IPv6 transition	12.3R2
Static mapping for port forwarding	12.3R2
Support for active monitoring on logical systems	12.3R2
Support for VRF in Routing Engine-based sampling	12.3R2
Support for integrated routing and bridging (IRB) MAC synchronization in MC-LAG for aggregated Ethernet	12.3R2
Targeted broadcast for virtual routing and forwarding (VRF) instances	12.3R2
Trunk interface enhancements: <ul style="list-style-type: none"> Configure a single logical trunk interface to support a list of VLANs or to accept packets with no VLAN tag. Configure multiple logical trunk interfaces on a single physical interface. 	12.3R2
Unicast reverse-path forwarding (RPF) loose mode, with ability to discard packets with source addresses pointing to the discard interface	12.3R2
Unnumbered Ethernet—Configure IPv4 processing on interfaces without assigning explicit IP addresses to the interfaces.	12.3R2
VLAN rewrite operations on incoming and outgoing frames	12.3R2

Table 188: IP Address Management Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
DHCP server and relay with option 82 for Layer 2 VLANs	10.1R1	9.3R2	11.3R1	N.S.	10.2R1	12.2R1	11.3R2	9.4R1	See Table 189 for a list of EX9200 IP address management features.
DHCP server and relay with option 82 for Layer 3 interfaces	10.1R1	9.0R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
DNS for IPv6	N.S.	9.3R2	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	N.S.	
Local DHCP server	10.1R1	9.3R2	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	9.4R1	
Virtual router aware DHCP (VR-aware DHCP)	N.S.	12.3R1	N.S.	13.2X50 - D10	12.3R1	12.3R1	N.S.	12.3R1	
Virtual router aware DHCPv6 (VR-aware DHCPv6)	N.S.	N.S.	N.S.	13.2X50 - D10	12.3R1	12.3R1	12.3R1	N.S.	
Static addresses	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	9.4R1	

Table 189: IP Address Management Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
DHCP server and relay	12.3R2
DHCPv6 local server	12.3R2
DHCPv6 support	12.3R2
Distinguishing DHCP duplicate clients by subinterface	12.3R2
Dynamic reconfiguration of extended DHCP and DHCPv6 local server clients	12.3R2
Dynamic IPv6 filters	12.3R2
Expression support for dynamic profiles	12.3R2
Extended DHCP relay proxy	12.3R2

Table 189: IP Address Management Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Optional disabling of automatic ARP table population	12.3R2
IPv6 address assignment pools	12.3R2
Overriding DHCP settings on specific interfaces	12.3R2
Per-interface DHCP tracing operations	12.3R2
S-VLAN-based shaping for dynamic profiles	12.3R2
Sending a DHCP relay and relay proxy release message	12.3R2
Specifying the DHCP source address used for IP packets	12.3R2
Support for MAC address validation	12.3R2
Support for address pool threshold traps	12.3R2
Address assignment pools	12.3R2
Per-interface DHCP lease limits	12.3R2

Table 190: IPv6 Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
NOTE: A separate software license is required for IPv6. See Understanding Software Licenses for EX Series Switches .									
Application identification (APPID) for IPv6 packets	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R2
BFD for IPv6	N.S.	12.3R1	N.S.	13.2X50 - D10	12.3R1	12.3R1	N.S.	12.3R1	12.3R2 (also for static routes)

RIPng	N.S.	9.3R1	12.3R1	13.2X50 - D10	11.1R1	12.2R1	12.1R1	10.1R1	12.3R2
VRRPv3 (RFC 5798 compliance, ability to send SNMP traps)	N.S.	12.3R1	N.S.	13.2X50 - D10	12.3R1	12.3R1	N.S.	12.3R1	12.3R2

NOTE: Compliance with RFC 4291

EX Series switches drop the following types of illegal IPv6 packets:

- Packets that have a link-local source or destination address. Because link-local addresses are intended to be used for addressing only on a single link, EX Series switches do not forward any packets with such addresses to other links.
- Packets with the IPv6 unspecified source address 0:0:0:0:0:0:0:0.
- Packets that are to be sent outside a node but have the IPv6 loopback address 0:0:0:0:0:0:0:1 as the source address. When IPv6 packets are received on an interface, EX Series switches drop packets that have the loopback address as the destination address.

EX Series switches do not support Subnet-Router Anycast address.

Table 191: Layer 2 Network Protocols Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
802.1Q VLAN tagging	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	See Table 82 for a list of EX9200 Layer 2 networking protocols features.
Edge virtual bridging (EVB) support with virtual Ethernet port aggregator (VEPA)	N.S.	N.S.	N.S.	N.S.	12.1R1	12.2R1	N.S.	12.1R1	
Ethernet ring protection switching (ERPS, G.8032/Y.1344)	12.1R1	12.1R1	12.3R1	13.2X50 - D10	12.3R1	12.3R1	N.S.	12.3R1	
Layer 2 protocol tunneling (L2PT)	11.1R1	10.0R1	12.3R1	N.S.	11.2R1	12.2R1	12.1R1	N.S.	
Link Layer Discovery Protocol (LLDP)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Link Layer Discovery Protocol—Media Endpoint Discovery (LLDP-MED) with voice over IP (VoIP) integration	10.1R1	9.0R2	11.3R1	13.2X50 - D10	N.S.	N.S.	N.S.	N.S.	
MAC-based VLANs	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Multiple VLAN Registration Protocol (MVRP, IEEE 802.1ak)	11.3R1	10.0R1	12.3R1	13.2X50 - D10	11.2R1	12.2R1	12.1R1	10.0R1	
Private VLANs (PVLANS)	11.1R1	9.3R2	12.1R1	N.S.	11.2R1	12.2R1	11.3R2	10.1R1	
Private VLANs (PVLANS) support across switches	11.1R1	10.4R1	12.1R1	N.S.	11.2R1	12.2R1	11.3R2	11.2R1	
Proxy ARP—Restricted	10.1R1	10.0R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.0R1	

Table 191: Layer 2 Network Protocols Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Proxy ARP—Unrestricted	10.1R1	9.6R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	10.0R1	
Proxy ARP per VLAN	10.1R1	10.1R1	N.S.	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.1R1	
Q-in-Q tunneling	11.1R1	9.3R2	11.4R1	N.S.	11.2R1	12.2R1	12.1R1	11.1R1	
Q-in-Q VLAN extended support for multiple S-VLANs per access interface, firewall-filter-based VLAN assignment, and RVIs or IRB interfaces	N.S.	9.6R1	12.3R1	N.S.	11.2R1	12.2R1	12.1R1	11.1R1	
Redundant trunk groups	10.1R1	9.0R2	11.3R1	13.2X50 - D10	11.2R1	12.2R1	11.3R2	9.4R1	
Routed VLAN interfaces (RVIs)—Also known as integrated routing and bridging (IRB) interfaces	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
VLAN ID translation	11.1R1	10.0R1	N.S.	N.S.	11.2R1	12.2R1	N.S.	11.1R1	
VLAN ranges	10.1R1	9.2R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	

Table 192: Layer 2 Networking Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
VLANs and virtual switching	12.3R2
DHCP support for integrated routing and bridging (IRB)	12.3R2
MC-LAG support for IGMP snooping in IRB	12.3R2
Hash-key load-balancing support for Layer 3 and Layer 4 fields	12.3R2

Table 192: Layer 2 Networking Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
IP multicast over Layer 2 trunk port support	12.3R2
Integrated routing and bridging (IRB)	12.3R2
Layer 2 Ethernet OAM: <ul style="list-style-type: none"> Distributed periodic packet management process (ppmd) for improved scaling Graceful Routing Engine switchover (GRES) Remote defect indication (RDI) Configuration of action profiles 	12.3R2
Layer 2 address learning in logical systems	12.3R2
Layer 2 forwarding support for bridging and VPLS	12.3R2
Layer 2 policer statistics MIB	12.3R2
Firewall filter match conditions for Layer 2 bridging and VPLS	12.3R2
Next-hop groups using either IP addresses or Layer 2 addresses for the next hop	12.3R2
Unicast reverse-path forwarding (RPF) loose mode, with ability to discard packets with source addresses pointing to the discard interface	12.3R2
Spanning-tree protocols support for Layer 2 bridging and VPLS	12.3R2
VLAN rewrite operations on incoming and outgoing frames	12.3R2
STP root guard (root protection)	12.3R2
Support for Layer 2 and Layer 2.5 features: <ul style="list-style-type: none"> Extensive set of Layer 2 label-manipulation capabilities, Q-in-Q support MC-LAG active / standby and MC-LAG active / active xSTP protocol support Integrated Routing and Bridging (IRB) interface support IGMP snooping for multichassis link aggregation group (MC-LAG) interfaces Configurable label block sizes for VPLS Connectivity fault management process flooding to interfaces based on mesh groups Layer 2 address learning in logical systems Virtual switch support, providing virtual Layer 2 switch instances with separate Layer 2 learning domains, isolated 4K VLAN ID spaces, and STP instances Ethernet Ring Protocol (ERP) for multiple ring instances on the same physical ring Transit and bypass static label-switched paths (LSPs) Layer 2 Gigabit Ethernet logical interface policing Static LSP statistics Multiple VLAN Registration Protocol (MVRP)—IEEE 802.1ak-2007 	12.3R2

Table 192: Layer 2 Networking Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
VPLS root protection topology change-action control	12.3R2
VLAN ranges	12.3R2
Q-in-Q VLAN extended support for multiple S-VLANs per access interface, firewall-filter-based VLAN assignment, and RVIs or IRB interfaces	12.3R2
Q-in-Q tunneling	12.3R2
Proxy ARP—Unrestricted and restricted	12.3R2
MAC-based VLANs	12.3R2
Link Layer Discovery Protocol (LLDP)	12.3R2
Layer 2 protocol tunneling (L2PT)	12.3R2

Table 193: Layer 3 Protocols Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Bidirectional Forwarding Detection (BFD)	11.3R1	9.0R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	9.4R1	See Table 193 for a list of EX9200 Layer 3 protocols features.
Border Gateway Protocol (BGP)	N.S.	9.0R2	12.1R1	13.2X50 - D10	11.1R1	12.2R1	11.3R2	9.4R1	
Multiprotocol Border Gateway Protocol (MBGP)	N.S.	9.3R1	12.3R1	13.2X50 - D10	11.2R1	12.2R1	12.1R1	9.4R1	

A separate software license is required for BGP and MBGP. See [Understanding Software Licenses for EX Series Switches](#).

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
OSPFv2	11.1R1	9.0R2	11.4R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
OSPFv3 IPsec support	N.S.	10.3R1	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	N.S.	
Routing Information Protocol version 1 (RIPv1) and RIPv2	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Static routes	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Virtual routing and forwarding (VRF) with IPv4—Virtual routing instances	12.3R1	9.2R1	12.3R1	13.2X50 - D10	11.1R1	12.2R1	11.3R2	9.6R1	
VRF with IPv4—Virtual routing instances for PIM and IGMP	N.S.	10.0R1	N.S.	13.2X50 - D10	11.1R1	12.2R1	11.3R2	10.0R1	
VRF with IPv4—Virtual routing instances for IGMP snooping	N.S.	11.4R1	N.S.	13.2X50 - D10	12.1R1	12.2R1	N.S.	11.3R1	
VRF with IPv6—Virtual routing instances for multicast traffic	N.S.	10.1R1	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	10.1R1	
VRF with IPv6—Virtual routing instances for unicast traffic	N.S.	10.1R1	12.3R1	13.2X50 - D10	N.S.	N.S.	N.S.	10.1R1	

Table 194: Layer 3 Protocols Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Accumulated IGP attribute for BGP	12.3R2
Advertisement of the best external BGP path to internal peers	12.3R2

Table 194: Layer 3 Protocols Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Alias support for local autonomous system numbers for BGP	12.3R2
BFD liveness detection	12.3R2
BFD protocol support for OSPFv3	12.3R2
BGP remote next-hop support for single-hop EBGP peers	12.3R2
BGP support for 4-byte autonomous system numbers	12.3R2
BGP support for MDT-SAFI updates without a route target	12.3R2
Behavior change for BGP-independent autonomous system (AS) domains	12.3R2
Bidirectional Forwarding Detection (BFD) hold-down timer	12.3R2
Distributed periodic packet management support for aggregate interfaces	12.3R2
Egress filtering PIMv4/v6 join messages	12.3R2
For internal BGP (IBGP), advertise multiple paths to a destination	12.3R2
Frequent BGP keepalive messages and short BGP hold time	12.3R2
Hitless authentication key rollover for IS-IS	12.3R2
Hub-and-spoke support for multiprotocol BGP-based multicast VPNs with PIM-SSM GRE S-PMSI transport	12.3R2
IPv4 subnet support on loopback interfaces	12.3R2
IS-IS hold-down timer for subsequent SPF calculations	12.3R2
Keepalive support for GRE interfaces	12.3R2
Multitopology routing (MTR)	12.3R2
Nonstop active routing (NSR) support for the Routing Information Protocol (RIP) and RIP next generation (RIPng)	12.3R2
Nonstop active routing (NSR) support	12.3R2
OSPF graceful restart enhancement	12.3R2
OSPF hold-down timer for subsequent SPF calculations	12.3R2
Only the system log notes failure to add routes	12.3R2

Table 194: Layer 3 Protocols Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Origin validation for BGP	12.3R2
PIM join suppression support	12.3R2
Priority assignment for prefixes in OSPF import policies	12.3R2
Reduction in flooding of self-originated OSPF LSAs	12.3R2
Support for BFD over multihop static routes	12.3R2
Support for BFD on logical switches	12.3R2
Support for IPSec authentication for OSPFv2	12.3R2
Support for OSPF database protection for OSPF and OSPFv3	12.3R2
Support for OSPF export and import policies for network-summary LSAs	12.3R2
Support for alternate loop-free routes for IS-IS and OSPF	12.3R2
Support for clearing the VPN tag	12.3R2
Support for disabling the attribute set messages on independent AS domains for BGP loop detection	12.3R2
Support for disabling traps for passive OSPFv2 interfaces	12.3R2
Support for display of flood next-hop branch overflow condition	12.3R2
Support for dropping and ignoring path attributes during BGP neighbor updates	12.3R2
Support for the algorithm that determines the single best path to skip the step that evaluates an AS path	12.3R2
Support for limiting the number of prefixes accepted from a BGP peer	12.3R2
Support for multiarea adjacency in OSPFv2	12.3R2
Support for multiple address families in OSPFv3	12.3R2
Support for route leaking when the switch is in overload mode	12.3R2
Support for route-filter-based BGP outbound route filtering	12.3R2
Support for the BGP Monitoring Protocol	12.3R2
Support to hold down BGP peering sessions after a nonstop active routing (NSR) switchover Timer to delay MED updates for routes advertised by BGP groups or peers configured with the metric-out igp statement Virtual Router Redundancy Protocol (VRRP)	12.3R2

Table 194: Layer 3 Protocols Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Timer to delay MED updates for routes advertised by BGP groups or peers configured with the metric-out igp statement	12.3R2
Virtual Router Redundancy Protocol (VRRP)	12.3R2

MPLS Layer 2 VPN over CCC	N.S.	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.1R1	
MPLS Layer 2 VPN over VLAN CCC	N.S.	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.3R1	
MPLS OAM-LSP ping	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	11.1R1	
MPLS over untagged Layer 3 interfaces	N.S.	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.1R1	
MPLS with class of service (CoS)	N.S.	9.5R1	N.S.	N.S.	12.2R5	12.2R5	N.S.	12.1R1	
MPLS Layer 3 VPNs	N.S.	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.1R1	
MPLS with RSVP-based label-switched paths (LSPs)	N.S.	9.5R1	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.1R1	
	N.S.	N.S.	N.S.	N.S.			N.S.	12.1R1	

Table 196: MPLS Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Layer 3 subinterfaces as MPLS core interfaces					12.2R1 See Note at end of table.	12.2R1 See Note at end of table.			
Routed VLAN interfaces (RVIs) as MPLS core interfaces	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.1R1	
Path maximum transmission unit (MTU) and unicast reverse-path forwarding (RPF) checks for VPNs	N.S.	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.1R1	
Resource Reservation Protocol—traffic engineering (RSVP-TE)	N.S.	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.1R1	
Standby secondary path protection	N.S.	12.1R1	N.S.	N.S.	12.2R1	12.2R1	N.S.	11.1R1	
Static label-switched paths (LSPs)	N.S.	N.S.	N.S.	N.S.	12.2R1	12.2R1	N.S.	12.1R1	

NOTE: Layer 3 subinterfaces as MPLS core interfaces—For EX4500 and EX4550 switches to support Layer 3 subinterfaces as MPLS core interfaces, the peer switch that the Layer 3 subinterfaces connect to, must be an EX8200 switch.

IP over MPLS—The EX4500 and EX4550 switches do not support IP over MPLS (single MPLS label in the packet) when the switch is positioned as a non-penultimate-hop popping (non-PHP) switch.

Table 197: MPLS Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
---------	------------------

A separate software license is required for MPLS. See [Understanding Software Licenses for EX Series Switches](#).

Table 197: MPLS Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Bypass static LSPs	12.3R2
LDP LSP action based on a BFD failure event	12.3R2
LDP downstream on demand	12.3R2
LDP, BGP, and VPLS interworking	12.3R2
P2MP LSP traceroute	12.3R2
Static LSP: <ul style="list-style-type: none"> • Revert timer • Statistics • Traceoptions • At the ingress switch • At the transit switch 	12.3R2
Statistics for P2MP LSPs	12.3R2

Table 198: Multicast Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
IGMP (Internet Group Management Protocol) version 1 (IGMPv1) and IGMPv2	11.1R1	9.0R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	See Table 195 for a list of EX9200 multicast features
IGMP filtering	11.3R1	9.5R1	12.3R1	13.2X50 - D10	11.3R1	11.3R1	11.3R1	9.5R1	
IGMP snooping with RVIs or IRB interfaces	10.1R1	9.2R1	12.1R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	9.4R1	
IGMPv3	11.1R1	9.3R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.6R1	
IGMPv1 and IGMPv2 snooping	10.1R1	9.1R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
IGMPv3 snooping	10.1R1	9.6R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.6R1	
Multicast Listener Discovery version 1 and 2 (MLDv1 and MLDv2)	N.S.	10.1R1	N.S.	13.2X50 - D10	11.2R1	12.2R1	12.1R1	10.2R1	
Multicast Listener Discovery version 1 (MLDv1) snooping (MLDv1 snooping)	12.1R1	12.1R1	12.1R1	N.S.	12.1R1	12.2R1	12.1R1	12.1R1	
Multicast Listener Discovery version 2 (MLDv2) snooping (MLDv2 snooping)	12.1R1	12.1R1	12.1R1	N.S.	12.1R1	12.2R1	12.1R1	12.1R1	
Multicast Source Discovery Protocol (MSDP)	N.S.	9.4R1	12.3R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	9.4R1	
See the Junos OS Multicast Protocols Configuration Guide .									
Multicast VLAN registration (MVR)	11.3R1	9.6R1	12.1R1	N.S.	N.S.	N.S.	N.S.	N.S.	
	11.1R1	9.2R1	12.1R1		11.2R1	12.2R1	11.3R2	9.4R1	

Table 198: Multicast Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Protocol Independent Multicast dense mode (PIM DM)				13.2X50 - D10					
See the Junos OS Multicast Protocols Configuration Guide .									
Protocol Independent Multicast sparse mode (PIM SM)	11.1R1	9.0R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
See the Junos OS Multicast Protocols Configuration Guide .									
Protocol Independent Multicast source-specific multicast (PIM SSM)	11.1R1	9.3R1	12.1R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
See the Junos OS Multicast Protocols Configuration Guide .									
Single-source multicast	N.S.	9.0R2	N.S.	13.2X50 - D10	N.S.	N.S.	N.S.	9.4R1	

Table 199: Multicast Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
BFD for PIM—IPv6	12.3R2
BFD support for ECMP LSPs signaled using LDP	12.3R2
Bidirectional PIM (RFC 5015)	12.3R2
Control of PIM resources for multicast VPNs	12.3R2
Disable PIM for IPv6 only	12.3R2
Dynamic reuse of data multicast distribution tree (MDT) group addresses	12.3R2
Flexible configuration for IGMP or MLD static-join	12.3R2
IGMPv3 and MLDv2 full support	12.3R2

Table 199: Multicast Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
IGMP and MLD enhancements— <ul style="list-style-type: none"> • immediate-leave (IGMP and MLD) • promiscuous-mode (IGMP only) 	12.3R2
IGMP and PIM support for unnumbered interfaces	12.3R2
IGMP join and leave recording for system or for specific interfaces	12.3R2
IGMP and MLD source or group access lists and MLD join and leave recording	12.3R2
IGMP and MLD support for dynamic interfaces	12.3R2
Independently configurable loopback addresses for VRF VPNs	12.3R2
Internet multicast using ingress replication provider tunnels	12.3R2
Software support for configuring accept any-source multicast (ASM) join messages (*;G) for group addresses	12.3R2
Software support for configuring a provider network to operate in source-specific multicast (SSM) mode	12.3R2
LDP signaling for point-to-multipoint LSPs in next-generation MBGP multicast VPNs	12.3R2
Load-balancing PIM join messages on multicast VPNs	12.3R2
Multicast flow maps	12.3R2
Nonstop active routing (NSR) PIM for Draft-Rosen VPNs	12.3R2
PIM automatic make-before-break (MBB) join load balancing	12.3R2
PIM join load balancing	12.3R2
Source-specific multicast (SSM)-map definition for different groups to different sources	12.3R2
Support for filtering unwanted PIM neighbors	12.3R2
Support for multicast output interface (OIF) mapping	12.3R2
Translation of PIM join/prune messages to IGMP or MLD report/leave messages	12.3R2
Turn off spanning-tree interface state in multicast snooping	12.3R2

Table 200: Network Management and Monitoring Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
802.1ag Ethernet OAM connectivity fault management (CFM)	11.2R1	10.2R1	12.3R1	13.2X50 - D10	12.2R1	12.2R1	N.S.	11.4R1	See Table 200-99 for a list of EX9200 network management and monitoring features.
Ethernet frame delay measurement (ETH-DM, Y.1731)	N.S.	11.4R1 (EX4200 only)	N.S.	13.2X50 - D10	11.4R1	12.2R1	N.S.	11.4R1	
Ethernet OAM link fault management (LFM—also known as Ethernet in the First Mile, EFM)	11.1R1	9.4R1	12.2R1	13.2X50 - D10	12.2R1	12.2R1	N.S.	10.0R1	
Port mirroring	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Port mirroring enhancements <ul style="list-style-type: none"> • Layer 3 interface support • Multiple VLAN support 	N.S.	9.5R1	N.S.	—	N.S.	N.S.	N.S.	9.5R1	
Port mirroring enhancements <ul style="list-style-type: none"> • For remote port mirroring, ingress and egress options on VLAN member interfaces on the intermediate (transit) switch to avoid flooding mirrored traffic to those interfaces 	N.S.	10.0R1	N.S.	—	N.S.	N.S.	N.S.	N.S.	
	N.S.	N.S.	N.S.	13.2X50 - D10	11.2R1	12.2R1	N.S.	N.S.	

Table 200: Network Management and Monitoring Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Port mirroring support for multiple analyzers per session									
Real-time performance monitoring (RPM)	10.1R1	9.3R2	12.2R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	10.1R1	
Real-time performance monitoring (RPM)—hardware timestamps with RVIs or IRB interfaces	N.S.	10.3R1	12.2R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	10.3R1	
Real-time performance monitoring (RPM)—client and server on same interface	10.3R1	10.3R1	12.2R1	13.2X50 - D10	11.1R1	12.2R1	N.S.	10.3R1	
Routing Engine Software Development Kit (SDK)	N.S.	12.2R1	12.2R1 (EX4200 only)	N.S.	12.2R1	12.2R1	N.S.	12.2R1	
RMON	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
sFlow monitoring technology	11.1R1	9.3R2	12.1R1	13.2X50 - D10	11.2R1	12.2R1	12.1R1	10.0R1	
sFlow monitoring technology—Persistent IP addresses for agent IDs and use in datagrams	11.1R1	10.2R1	N.S.	13.2X50 - D10	N.S.	N.S.	12.1R1	10.2R1	
Simple Network Management Protocol version 1 (SNMPv1), SNMPv2, and SNMPv3	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
	11.1R1	11.1R1	12.1R2		11.1R1	12.2R1	N.S.	12.1R1	

Table 200: Network Management and Monitoring Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Uplink failure detection				13.2X50 - D10					

Table 201: Network Management and Monitoring Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Junos OS XML API and scripting—NETCONF Java toolkit for rapid development of Java applications to manage devices running Junos OS	12.3R2
Junos OS XML API and scripting—NETCONF Perl client installation—Supports loading prerequisites from Comprehensive Perl Archive Network (CPAN) global repository	12.3R2
Junos OS XML API and scripting—NETCONF tracing operations	12.3R2
Junos OS XML API and scripting: <ul style="list-style-type: none"> • Dedicated directory for user script library • Global variable provided to Junos OS automation scripts • References to a correlating event in a policy action • Trigger a policy based on the event count • Unique filenames for uploaded files • Upload files created by event scripts • XML schemata for Junos OS XML operational tag elements • jcs:open() extension function support for routing instances 	12.3R2
Configuration options to filter out interfaces from SNMP Get and GetNext operations	12.3R2
Enhanced SNMP support for logical switches and routing instances	12.3R2
Generating SNMP traps when MAC address table is full	12.3R2
Junos OS MIB support for VPLS	12.3R2
MIB support for VRF route entries	12.3R2
Proxy SNMP agent	12.3R2
SNMP MIB support for OSPFv3	12.3R2
SNMP poll and trap support for DHCP leases	12.3R2
SNMP support for the DHCP bindings table	12.3R2
SNMP support for the authd daemon and for radius-acc-server-mib and radius-auth-server-mib	12.3R2

Table 201: Network Management and Monitoring Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
SNMP support for spanning-tree protocols	12.3R2
Support for Internet draft draft-ietf-bfd-mib-02.txt—MIB for BFD liveness detection	12.3R2
Support for MIB objects in accounting profiles	12.3R2
Support for an enterprise-specific event MIB (mib-jnx-event.txt)	12.3R2
Support for sending traps over routing instances	12.3R2
Support for adding lists of clients to the SNMP community	12.3R2
Support for the enterprise-specific Packet Forwarding Engine MIB (mib-jnx-pfe.txt)	12.3R2
Support for the pimNeighborLoss trap	12.3R2
Support for trap spoofing	12.3R2
IEEE 802.3ah link fault management (LFM) for Ethernet OAM (also known as Ethernet in the First Mile, or EFM)	12.3R2
Port mirroring of Layer 2 VLAN and VPLS traffic	12.3R2
Fast update filters for dynamic profiles	12.3R2
Flow aggregation to multiple collectors	12.3R2
IPv6 flow aggregation templates	12.3R2
Inline flow monitoring	12.3R2

Table 202: Port Security Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Automatic recovery for port error disable conditions	10.1R1	9.6R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.0R1	N.S.
DHCP option 82	10.1R1	9.3R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	9.4R1	12.3R2
DHCP snooping	10.1R1	9.0R2	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.

Table 202: Port Security Features on Switches by Junos OS Release (*continued*)

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Dynamic ARP inspection (DAI)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.
IP source guard	10.1R1	9.2R1	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.
Layer 3 virtual private network (VPN) for IPv4 (RFC 2547 and 4364)	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R2
Layer 3 virtual private network (VPN) for IPv6 through IPv4 MPLS	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R2
MAC limiting	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	12.3R2
MAC address limit per port	10.1R1	9.0R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.3R1	12.3R2
MAC limiting per port and per VLAN (VLAN membership MAC limit)	12.3R1	12.3R1	12.3R1	13.2X50 - D10	12.3R1	12.3R1	12.3R1	12.3R1	12.3R2
MAC move limiting	10.1R1	9.0R2	11.3R1	13.2X50 - D10	N.S.	N.S.	11.3R2	N.S.	N.S.
Persistent MAC learning (sticky MAC)	11.4R1	11.4R1	12.3R1	13.2X50 - D10	11.4R1	12.2R1	11.4R1	11.4R1	N.S.
Persistent storage for DHCP snooping	10.1R1	9.4R1	11.3R1	13.2X50 - D10	12.1R1	12.2R1	11.3R2	10.3R1	N.S.
Self-signed digital certificates for enabling SSL services	11.1R1	11.1R1	N.S.	13.2X50 - D10	11.1R1	12.2R1	12.1R1	11.1R1	N.S.
Static ARP support	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	12.3R2

Table 203: Power over Ethernet (PoE) Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Link Layer Discovery Protocol (LLDP) with granular Power over Ethernet (PoE) management	12.2R1	12.2R1 (EX4200-24PX and EX4200-48PX models only)	12.2R1	13.2X50 - D10	N.S.	N.S.	12.2R1	12.2R1	N.S.
NOTE: EX4200 switches must be running PoE controller software firmware version 4.04 or later to support the Link Layer Discovery Protocol (LLDP) with granular Power over Ethernet (PoE) management feature. See show chassis firmware detail and request system firmware upgrade poe to check or upgrade this firmware.									N.S.
Power over Ethernet (PoE)	10.1R1	9.0R2	11.3R1	13.2X50 - D10	—	—	11.3R2	11.2R1	N.S.
Power over Ethernet Plus (PoE+)	10.3R1	11.2R1 (EX4200-24PX and EX4200-48PX models only)	11.3R1	13.2X50 - D10	—	—	11.3R2	11.2R1	N.S.
Power over Ethernet (PoE) power management mode	10.1R1	9.3R2	11.3R1	13.2X50 - D10	—	—	11.3R2	11.2R1	N.S.

Table 204: Routing Policy and Packet Filtering Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Dynamic allocation of TCAM memory to firewall filters	10.1R1	10.0R1	11.3R1	–	10.2R1	12.2R1	N.S.	10.3R1	See Table 203 for a list of EX9200 routing policy and firewall filter features.
Firewall filters and rate limiting	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
For a list of supported firewall filter match conditions and actions, see <i>Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches</i> .									
Firewall filters on LAGs	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	N.S.	10.0R1	
Firewall filters on the loopback interface	10.1R1	9.2R1	11.3R1	13.2X50 - D10	11.1R1	12.2R1	12.1R1	9.6R1	
For a list of supported firewall filter match conditions and actions on a loopback interface, see <i>Support for Match Conditions and Actions for Loopback Firewall Filters on Switches</i> .									
Firewall filters on the management interface	11.3R1	10.4R1	N.S.	13.2X50 - D10	10.4R1	12.2R1	12.1R1	10.4R1	
Firewall filters on the virtual management interface	–	10.4R1 (EX4200 Virtual Chassis only)	N.S.	13.2X50 - D10	–	–	–	–	
Firewall filters with IPv6	11.3R1	10.1R1	12.3R1	13.2X50 - D10	12.1R1	12.2R1	12.1R1	10.3R1	
Policing	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Tricolor marking policers	11.2R1	11.2R1	11.4R8	N.S.	12.1R1	12.2R1	11.3R1	N.S.	

Table 205: Routing Policy and Firewall Filters on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Access and access-internal routes	12.3R2
Extension of numeric-range match conditions in firewall filters	12.3R2
Aggregate policer support for different family address types configured on the same interface	12.3R2

Table 205: Routing Policy and Firewall Filters on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Authentication for BFD (MD5/SHA1)	12.3R2
BGP multipath link-bandwidth attribute	12.3R2
DHCP state persistence for DHCP relay agent	12.3R2
Dynamic configuration support for routing policies	12.3R2
Extended DHCP relay agent	12.3R2
Filter-based forwarding to a specific outgoing interface or destination IP address	12.3R2
Firewall filters within logical systems	12.3R2
IEEE 802.1p priority match conditions for Layer 2 VPN firewall filters	12.3R2
Filter-based forwarding to a specific outgoing interface or destination IP address	12.3R2
Layer 2 Gigabit Ethernet logical interface extended policing support	12.3R2
Layer 2 support for firewall filter match conditions	12.3R2
Load balancing of VPLS traffic	12.3R2
Option 60 support for extended DHCP relay agents	12.3R2
Policers on physical interfaces	12.3R2
Firewall filters feature support	12.3R2
Support for policers that limit traffic on logical interfaces in ingress or egress directions	12.3R2
Support for policers that rate-limit based on a percentage of physical port speed on an interface	12.3R2
Support for the discard action for tricolor marking policers applied to firewall filters	12.3R2
Support for the prefix-list match condition for firewall filters for the VPLS protocol family	12.3R2
Support for enhanced policer statistics	12.3R2
Support for MAC address validation	12.3R2
Tricolor marking policers	12.3R2

Table 206: Spanning-Tree Protocols Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
BPDU protection for spanning-tree protocols	10.1R1	9.1R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	See Table 206 for a list of EX9200 spanning-tree protocols features.
BPDU filter	12.2R1	12.2R1	12.2R1	13.2X50 - D10	12.2R1	12.2R1	12.2R1	12.2R1	
Distributed periodic packet management (PPM) for Spanning Tree Protocols	N.S.	12.3R1	N.S.	N.S.	N.S.	N.S.	N.S.	12.3R1	
Loop protection for spanning-tree protocols	10.1R1	9.1R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Root protection for spanning-tree protocols	10.1R1	9.1R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Spanning tree: <ul style="list-style-type: none"> • RSTP and VSTP concurrent configuration 	N.S.	10.2R1	12.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	10.2R1	
Spanning tree: <ul style="list-style-type: none"> • Spanning Tree Protocol (STP) • Rapid Spanning Tree Protocol (RSTP) • Multiple Spanning Tree Protocol (MSTP) 	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Spanning tree: <ul style="list-style-type: none"> • VLAN Spanning Tree Protocol (VSTP) 	10.1R1	9.4R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.6R1	

Table 207: Spanning-Tree Protocols Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Spanning tree: <ul style="list-style-type: none">• Spanning Tree Protocol (STP)• Rapid Spanning Tree Protocol (RSTP)• Multiple Spanning Tree Protocol (MSTP)• VLAN Spanning Tree Protocol (VSTP)	12.3R2
Root protection for spanning-tree protocols	12.3R2
Loop protection for spanning-tree protocols	12.3R2
Distributed periodic packet management (PPM) for Spanning Tree Protocols	12.3R2
BPDU filter	12.3R2

Table 208: System Management Features on Switches by Junos OS Release

Feature	EX2200	EX3200, EX4200	EX3300	EX4300	EX4500	EX4550	EX6200	EX8200	EX9200
Autoinstallation of configuration files	10.1R1	9.4R1	11.3R1	N.S.	10.2R1	12.2R1	11.3R2	N.S.	See Table 209 for a list of EX9200 system management features.
Automatic software download	10.1R1	9.6R1	11.3R1	N.S.	10.2R1	12.2R1	11.3R2	9.6R1	
Automatic repair of corrupted partition when booting from alternate partition	12.3R1	12.3R1	12.3R1	13.2X50 - D10	12.3R1	12.3R1	12.3R1	12.3R1	
Configuration rollback	10.1R1	9.0R2	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R2	9.4R1	
Zero Touch Provisioning (EZ Touchless Provisioning using DHCP)	12.2R1	12.2R1	12.2R5	N.S.	12.2R1	12.2R1	N.S.	N.S.	
J-Web interface, for switch configuration and management	10.1R1 (12.1R1 for EX2200-C switches)	9.0R2	12.1R1	13.2X50 - D10	10.2R1	12.2R1	12.1R1	9.4R1

LCD panel management support	–	9.0R1	11.3R1	13.2X50 - D10	10.2R1	12.2R1	11.3R1	9.4R1	
Online insertion and removal (OIR) of uplink modules	–	10.0R1	–	13.2X50 - D10	11.1R1	12.2R1	–	–	

Table 209: System Management Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Configuration rollback	12.3R2

Table 210: User Interface and Configuration Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Device-initiated SSH connection (outbound SSH)	12.3R2
Dynamic IPv6 filters	12.3R2
Dynamic configuration of the switch advertisement protocol	12.3R2
Dynamic profiles support by extended DHCP local server and extended DHCP relay agent	12.3R2
Enhanced IPv6 statistics	12.3R2
Extended DHCP local server	12.3R2
IGMP dynamic profiles	12.3R2
Extended DHCP local server	12.3R2
Protection for device configuration	12.3R2
RADIUS MSCHAPv2 protocol support for administrator authentication, password aging, and update	12.3R2
Limit configuration command output	12.3R2
Remote tracing	12.3R2
Support for CLI edit mode wildcard range	12.3R2
Support for configuring ARP aging time for a logical interface	12.3R2
Support for configuring a proxy server for downloading licenses	12.3R2
Support for configuring time-based user access	12.3R2
Support for logical router system administrators	12.3R2

Table 211: VPN Features on EX9200 Switches by Junos OS Release

Feature	Junos OS Release
Aggregated Ethernet interfaces for VPLS routing instances	12.3R2
BGP autodiscovery for LDP VPLS (FEC 129)	12.3R2
Clearing MAC addresses for better convergence	12.3R2
Configurable label block sizes for VPLS	12.3R2
Disable TTL propagation behavior for the routes in a VRF routing instance	12.3R2

Table 211: VPN Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
EXP-based traffic classification for VPLS	12.3R2
Enhanced show interface command for Layer 3 VPN functionality	12.3R2
Expanded interface support for the vrf-table-label statement	12.3R2
Extranet next-generation MVPN GRE tunnels for Layer 3 VPNs	12.3R2
GRE tunnels for Layer 3 VPNs Ignore MTU mismatch on Layer 2 circuits Integrated routing and bridging support for inter-AS VPLS between BGP-signaled VPLS and LDP-signaled VPLS LDP-based VPLS Label allocation and substitution policy	12.3R2
Ignore MTU mismatch on Layer 2 circuits	12.3R2
Integrated routing and bridging support for inter-AS VPLS between BGP-signaled VPLS and LDP-signaled VPLS	12.3R2
LDP-based VPLS	12.3R2
Label allocation and substitution policy	12.3R2
Layer 2 VPN multihoming	12.3R2
Layer 3 VPN BGP routes and labels	12.3R2
Layer 3 VPN localization	12.3R2
Load balancing and IP header filtering for Layer 3 VPNs	12.3R2
Local switching support for the ignore-encapsulation-mismatch statement	12.3R2
Multipath load balancing for EBGp and IBGP VPNs	12.3R2
Multiple logical trunk interfaces per physical interface	12.3R2
Multiprotocol BGP-based multicast VPN	12.3R2
NTP support for IPv4 VRF and IPv6 VRF	12.3R2
Nonstop active routing support for Layer 3 VPNs	12.3R2
PIM source-specific multicast (PIM-SSM) provider tunnel support added to Multiprotocol BGP-based multicast VPNs	12.3R2
Point-to-multipoint LSP support for VPLS	12.3R2
Point-to-multipoint LSP support for multicast VPNs	12.3R2

Table 211: VPN Features on EX9200 Switches by Junos OS Release (*continued*)

Feature	Junos OS Release
Proxy BGP route target filtering	12.3R2
Static VPLS	12.3R2
Static route target filtering	12.3R2
Support for autorp, BSR, PIM dense mode and mtrace for next-generation multicast VPNs	12.3R2
VLAN range for Layer 2 VPN	12.3R2
VPLS automatic site ID	12.3R2
VPLS automatic site ID for nonstop active routing	12.3R2
VPLS ping	12.3R2
VPLS trunk interfaces	12.3R2
eBGP and iBGP load-balancing support for MVPN and PIM	12.3R2

Configuration

- [Configuration Statements on page 2553](#)

Configuration Statements

- [\[edit protocols bgp\] Hierarchy Level on page 2553](#)

[edit protocols bgp] Hierarchy Level

Several statements in the **[edit protocols mpls]** hierarchy are valid at numerous locations within it. To make the complete hierarchy easier to read, the repeated statements are listed in “[Common BGP Family Options](#)” on page 369 and that section is referenced at the appropriate locations in “[Complete \[edit protocols bgp\] Hierarchy](#)” on page 369.

- [Common BGP Family Options on page 2553](#)
- [Complete \[edit protocols bgp\] Hierarchy on page 2554](#)

Common BGP Family Options

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit protocols bgp\] Hierarchy](#)” on page 369 instead of the statements being repeated.

- **[edit protocols bgp family inet (any | flow | labeled-unicast | multicast | unicast)]**
- **[edit protocols bgp family inet6 (any | labeled-unicast | multicast | unicast)]**
- **[edit protocols bgp family (inet-mdt | inet-mvpn | inet6-mvpn | l2vpn) signaling]**
- **[edit protocols bgp family inet-vpn (any | flow | multicast | unicast)]**
- **[edit protocols bgp family inet6-vpn (any | multicast | unicast)]**
- **[edit protocols bgp family iso-vpn unicast]**

The common BGP family options are as follows:

```
accepted-prefix-limit {
    maximum number;
    teardown <percentage> <idle-timeout (forever | minutes)>;
}
damping;
loops number;
prefix-limit {
    maximum number;
    teardown <percentage> <idle-timeout (forever | minutes)>;
}
rib-group group-name;
topology name {
    community {
```

```
    target identifier;  
  }  
}
```

Complete [edit protocols bgp] Hierarchy

The statement hierarchy listed in this section can also be included at the [edit logical-systems *logical-system-name*] hierarchy level.

advertise-external

Syntax	<code>advertise-external {conditional};</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit protocols bgp group <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>neighbor-address</i>]</p>
Release Information	<p>Statement introduced in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Specify BGP to advertise the best external route into an IBGP mesh group, a route reflector cluster, or an AS confederation even if the best route is an internal route. In order to configure the advertise-external statement on a route reflector, you must disable intracluster reflection with the no-client-reflect statement. The advertise-external statement is supported at both the group and neighbor level. If you configure the statement at the neighbor level, you must configure it for all neighbors in a group. Otherwise, the group is automatically split into different groups.</p>
	<div>  <p>NOTE: When configuring the advertise-external statement for an AS confederation, it is recommended that EBGp peers belonging to different autonomous systems are configured in a separate EBGp peer group. This ensures consistency while BGP sends the best external route to peers in the configured peer group.</p> </div>
Options	<p>conditional—(Optional) Advertise the best external path only if the route selection process reaches the point at which the multiple exit discriminator (MED) metric is evaluated. The conditional option restricts advertisement to when the best external path and the active path are equal until the MED step of the route selection process. This implies that external routes with a longer AS path length than the active path, for instance, are not advertised. The criteria used for selecting the best external path is the same whether or not the conditional option is configured.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

advertise-inactive

Syntax	advertise-inactive;
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit protocols bgp], [edit protocols bgp group <i>group-name</i>], [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Configure the routing table to export to BGP the best route learned by BGP even if Junos OS did not select this route to be an active route.</p> <p>One way to achieve multivendor compatibility is to include the advertise-inactive statement in the external BGP (EBGP) configuration. By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. The advertise-inactive statement causes Junos OS to advertise the best BGP route that is inactive because of IGP preference. When you use the advertise-inactive statement, the Junos OS device uses, for example, the OSPF route for forwarding, and the other vendor's device uses the EBGP route for forwarding. However, from the perspective of an EBGP peer in a neighboring AS, both vendors' devices appear to behave the same way.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

aggregate-label

Syntax	aggregate-label { community <i>community-name</i> ; }
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols bgp family inet labeled-unicast], [edit logical-systems <i>logical-system-name</i> protocols bgp family inet6 labeled-unicast], [edit logical-systems <i>logical-system-name</i> protocols bgp family inet-vpn unicast], [edit logical-systems <i>logical-system-name</i> protocols bgp family inet-vpn6 unicast], [edit protocols bgp family inet labeled-unicast], [edit protocols bgp family inet6 labeled-unicast], [edit protocols bgp family inet-vpn unicast], [edit protocols bgp family inet6-vpn unicast]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify matching criteria (in the form of a community) such that all routes which match are assigned the same VPN label, selected from one of the several routes in the set defined by this criteria. This reduces the number of VPN labels that the router must consider, and aggregates the received labels.
Options	community <i>community-name</i> —Specify the name of the community to which to apply the aggregate label.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

as-override

Syntax	as-override;
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit protocols bgp group <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	Compare the AS path of an incoming advertised route with the AS number of the BGP peer under the group and replace all occurrences of the peer AS number in the AS path with its own AS number before advertising the route to the peer.
<div>  <p>NOTE: The as-override statement is specific to a particular BGP group. This statement does not affect peers from the same remote AS configured in different groups.</p> </div>	
<p>Enabling the AS override feature allows routes originating from an AS to be accepted by a router residing in the same AS. Without AS override enabled, the routing device refuses the route advertisement once the AS path shows that the route originated from its own AS. This is done by default to prevent route loops. The as-override statement overrides this default behavior.</p> <p>Note that enabling the AS override feature may result in routing loops. Use this feature only for specific applications that require this type of behavior, and in situations with strict network control. One application is the IGP protocol between the provider edge routing device and the customer edge routing device in a virtual private network.</p>	
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

autonomous-system

Syntax	<pre>autonomous-system <i>autonomous-system</i> <asdot-notation> <loops <i>number</i>> { independent-domain <no-attrset>; }</pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit routing-options]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>asdot-notation option introduced in Junos OS Release 9.3.</p> <p>asdot-notation option introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>no-attrset option introduced in Junos OS Release 10.4.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>
Description	<p>Specify the routing device's AS number.</p> <p>An autonomous system (AS) is a set of routing devices that are under a single technical administration and that generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices. An AS appears to other ASs to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it. ASs are identified by a number that is assigned by the Network Information Center (NIC) in the United States (http://www.isi.edu).</p> <p>If you are using BGP on the routing device, you must configure an AS number.</p> <p>The AS path attribute is modified when a route is advertised to an EBGP peer. Each time a route is advertised to an EBGP peer, the local routing device prepends its AS number to the existing path attribute, and a value of 1 is added to the AS number.</p> <p>In Junos OS Release 9.1 and later, the numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i><16-bit high-order value in decimal>.<16-bit low-order value in decimal></i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.</p>
Options	<p><i>autonomous-system</i>—AS number. Use a number assigned to you by the NIC.</p>

Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format for 4-byte AS numbers

In this example, the 4-byte AS number 65,546 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 65546;
}
```

Range: 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

In this example, 1.10 is the AS-dot notation format for 65,546:

```
[edit]
routing-options {
  autonomous-system 1.10;
}
```

Range: 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

In this example, the 2-byte AS number 60,000 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 60000;
}
```

asdot-notation—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

Default: Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

loops number—(Optional) Specify the number of times detection of the AS number in the AS_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

Range: 1 through 10

Default: 1

.....

NOTE: When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the loops statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the **independent-domain** option if the loops statement must be enabled only on a subset of routing instances.

.....

The remaining statement is explained separately.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Release Information Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
detection-time threshold and **transmit-interval threshold** options introduced in Junos OS Release 8.2
Support for logical routers introduced in Junos OS Release 8.3.
Support for IBGP and multihop EBGP sessions introduced in Junos OS Release 8.3.
holddown-interval statement introduced in Junos OS Release 8.5. You can configure this statement only for EBGP peers at the **[edit protocols bgp group *group-name* neighbor *address*]** hierarchy level.
no-adaptation statement introduced in Junos OS Release 9.0.
Support for BFD authentication introduced in Junos OS Release 9.6.

Support for BFD on IPv6 interfaces with BGP introduced in Junos OS Release 11.2.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Configure bidirectional failure detection (BFD) timers and authentication for BGP.

For IBGP and multihop EBGP support, configure the **bfd-liveness-detection** statement at the global **[edit bgp protocols]** hierarchy level. You can also configure IBGP and multihop support for a routing instance or a logical system.

Options **authentication algorithm** *algorithm-name* (Optional)—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**.

authentication key-chain *key-chain-name* (Optional)—Associate a security key with the specified BFD session using the name of the security keychain. The keychain name must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold *milliseconds* (Optional)—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

holddown-interval *milliseconds* (Optional)—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. When you configure the hold-down interval for the BFD protocol for EBGp, the BFD session is unaware of the BGP session during this time. In this case, if the BGP session goes down during the configured hold-down interval, BFD already assumes it is down and does not send a state change notification. The **holddown-interval** statement is supported only for EBGp peers at the **[edit protocols bgp group group-name neighbor address]** hierarchy level. If the BFD session goes down and then comes back up during the configured hold-down interval, the timer is restarted. You must configure the hold-down interval on both EBGp peers. If you configure the hold-down interval for a multihop EBGp session, you must also configure a local IP address by including the **local-address** statement at the **[edit protocols bgp group group-name]** hierarchy level.

Range: 0 through 255,000

Default: 0

minimum-interval *milliseconds* (Required)—Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately (using the **minimum-receive-interval** and **transmit-interval** statements).

Range: 1 through 255,000

minimum-receive-interval *milliseconds* (Optional)—Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000

multiplier *number* (Optional)—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

no-adaptation (Optional)—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable to not to have BFD adaptation enabled in your network.

transmit-interval threshold *milliseconds* (Optional)—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

transmit-interval minimum-interval *milliseconds* (Optional)—Configure only the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session.

Range: 1 through 255,000

version (Optional)—Configure the BFD version to detect.

Range: 1 or **automatic** (autodetect the BFD version)

Default: **automatic**

The remaining statements are explained separately.

Required Privilege	routing—To view this statement in the configuration.
Level	routing-control—To add this statement to the configuration.

cluster

Syntax	<code>cluster <i>cluster-identifier</i>;</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp group <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	Specify the cluster identifier to be used by the route reflector cluster in an internal BGP group.

CAUTION:

If you configure both route reflection and VPNs on the same routing device, the following modifications to the route reflection configuration cause current BGP sessions to be reset:

- Adding a cluster ID—If a BGP session shares the same AS number with the group where you add the cluster ID, all BGP sessions are reset regardless of whether the BGP sessions are contained in the same group.
- Creating a new route reflector—If you have an IBGP group with an AS number and create a new route reflector group with the same AS number, all BGP sessions in the IBGP group and the new route reflector group are reset.

NOTE: If you change the address family specified in the [edit protocols bgp family] hierarchy level, all current BGP sessions on the routing device are dropped and then reestablished.

Options	<i>cluster-identifier</i> —4-byte number (such as an IPv4 address).
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

damping (Protocols BGP)

Syntax	damping;
Hierarchy Level	<pre> [edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp family <i>family</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp family <i>family</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp family <i>family</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp family <i>family</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> family <i>family</i>], [edit protocols bgp], [edit protocols bgp], [edit protocols bgp group <i>group-name</i>], [edit protocols bgp group <i>group-name</i> family <i>family</i>], [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit protocols bgp group <i>group-name</i> neighbor <i>address</i> family <i>family</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp family <i>family</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> family <i>family</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>] [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> family <i>family</i>] </pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Support for flap damping at the address family level introduced in Junos OS Release 12.2.</p>
Description	<p>Enable route flap damping. BGP route flapping describes the situation in which BGP systems send an excessive number of update messages to advertise network reachability information. Flap damping reduces the number of update messages sent between BGP</p>

peers, thereby reducing the load on these peers, without adversely affecting the route convergence time for stable routes.

You typically apply flap damping to external BGP (EBGP) routes (that is, to routes in different ASs). You can also apply it within a confederation, between confederation member ASs. Because routing consistency within an AS is important, do not apply flap damping to internal BGP (IBGP) routes. (If you do, it is ignored.) The exception to this rule is when flap damping is applied at the address family level. When you apply flap damping at the address family level, it works for both IBGP and EBGP.

Default Flap damping is disabled on the routing device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>inet-mvpn and inet6-mvpn statements introduced in Junos OS Release 8.4.</p> <p>inet-mdt statement introduced in Junos OS Release 9.4.</p> <p>Support for the loops statement introduced in Junos OS Release 9.6.</p>
Description	<p>Enable multiprotocol BGP (MP-BGP) by configuring BGP to carry network layer reachability information (NLRI) for address families other than unicast IPv4, to specify MP-BGP to carry NLRI for the IPv6 address family, or to carry NLRI for VPNs.</p>

- Options**
- any**—Configure the family type to be both unicast and multicast.
 - inet**—Configure NLRI parameters for IPv4.
 - inet6**—Configure NLRI parameters for IPv6.
 - inet-mdt**—Configure NLRI parameters for the multicast distribution tree (MDT) subaddress family identifier (SAFI) for IPv4 traffic in Layer 3 VPNs.
 - inet-mvpn**—Configure NLRI parameters for IPv4 for multicast VPNs.
 - inet6-mvpn**—Configure NLRI parameters for IPv6 for multicast VPNs.
 - inet-vpn**—Configure NLRI parameters for IPv4 for Layer 3 VPNs.
 - inet6-vpn**—Configure NLRI parameters for IPv6 for Layer 3 VPNs.
 - iso-vpn**—Configure NLRI parameters for IS-IS for Layer 3 VPNs.
 - l2vpn**—Configure NLRI parameters for IPv4 for MPLS-based Layer 2 VPNs and VPLS.
 - labeled-unicast**—Configure the family type to be labeled-unicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by labeled-unicast for resolving the labeled-unicast routes. This statement is supported only with **inet** and **inet6**.
 - multicast**—Configure the family type to be multicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by multicast for resolving the multicast routes.
 - unicast**—Configure the family type to be unicast. This means that the BGP peers only carry the unicast routes that are being used for unicast forwarding purposes. The default family type is **unicast**.

The remaining statements are explained separately.

- Required Privilege Level**
- routing—To view this statement in the configuration.
 - routing-control—To add this statement to the configuration.

graceful-restart (Protocols BGP)

Syntax	<pre> graceful-restart { disable; restart-time seconds; stale-routes-time seconds; } </pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit protocols bgp], [edit protocols bgp group <i>group-name</i>], [edit protocols bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
Description	<p>Enable graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default.</p> <p>To configure the duration of the BGP graceful restart period, include the restart-time statement at the [edit protocols bgp graceful-restart] hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the stale-routes-time statement at the [edit protocols bgp graceful-restart] hierarchy level.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> NOTE: If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.</p> </div> <p>Configure graceful restart globally at the [edit routing-options] or [edit routing-instances <i>instance-name</i> routing-options] hierarchy level to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.</p> <p>The remaining statements are explained separately.</p>

Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
Description	<p>Define a BGP peer group. BGP peer groups share a common type, peer autonomous system (AS) number, and cluster ID, if present. To configure multiple BGP groups, include multiple group statements.</p> <p>By default, the group's options are identical to the global BGP options. To override the global options, include group-specific options within the group statement.</p> <p>The group statement is one of the statements you must include in the configuration to run BGP on the routing device.</p> <p>Each group must contain at least one peer.</p>
Options	<p>group-name—Name of the BGP group.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

hold-time (Protocols BGP)

Syntax	<code>hold-time seconds;</code>
Hierarchy Level	<pre>[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i> <i>neighbor address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name neighbor address</i>], [edit protocols bgp], [edit protocols bgp <i>group group-name</i>], [edit protocols bgp <i>group group-name neighbor address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i> <i>neighbor address</i>]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Specify the hold-time value to use when negotiating a connection with the peer. The hold-time value is advertised in open packets and indicates to the peer the length of time that it should consider the sender valid. If the peer does not receive a keepalive, update, or notification message within the specified hold time, the BGP connection to the peer is closed and routing devices through that peer become unavailable.</p> <p>The hold time is three times the interval at which keepalive messages are sent.</p> <p>BGP on the local routing device uses the smaller of either the local hold-time value or the peer's hold-time value received in the open message as the hold time for the BGP connection between the two peers.</p> <p>Starting in Junos OS Release 12.3, the BGP hold-time value can be zero (0). This implies that the speaker does not expect keepalive messages from its peer to maintain the BGP session. When negotiating between two peers, if one side requests a nonzero hold time and the other requests a zero hold time, the negotiation settles on the nonzero value and keepalive intervals are determined accordingly. Both sides must be set to zero for keepalive messages to stop being sent.</p>
Options	<p>seconds—Hold time.</p> <p>Range: 10 through 65,535 seconds (or 0 for infinite hold time)</p> <p>Default: 90 seconds</p>

TIP: When you set a hold-time value of 1 through 19 seconds, we recommend that you also configure the BGP `precision-timers` statement. The `precision-timers` statement ensures that if scheduler slip messages occur, the routing device continues to send keepalive messages. When the `precision-timers` statement is included, keepalive message generation is performed in a dedicated kernel thread, which helps to prevent BGP session flaps.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

keep

Syntax	keep (all none);
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp group <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Control whether or not Junos OS keeps in memory and hides certain routes.</p> <p>If the keep none statement is used, Junos OS does not retain in memory and hide routes that are rejected because of a BGP import policy. Nor does BGP keep in memory and hide routes that are declared unfeasible due to BGP sanity checks. The keep none statement causes Junos OS to discard from memory the routes that are rejected due to BGP-specific logic or BGP evaluation. When a route is rejected because of some non-BGP-specific reason, the keep none statement has no effect on this route. This rejected route is retained in memory and hidden even though keep none is configured. An example of this type of hidden route is a route for which the protocol nexthop is unresolved.</p> <p>The routing table can retain the route information learned from BGP in one of the following ways:</p> <ul style="list-style-type: none"> • Default (omit the keep statement)—Keep all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS. • keep all—Keep all route information that was learned from BGP. • keep none—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking, such as AS path or next hop. When you configure keep none for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.

In an AS path healing situation, routes with looped paths theoretically could become usable during a soft reconfiguration when the AS path loop limit is changed. However, there is a significant memory usage difference between the default and **keep all**.

Consider the following scenarios:

- A peer readvertises routes back to the peer from which it learned them.

This can happen in the following cases:

- Another vendor's routing device advertises the routes back to the sending peer.
- The Junos OS peer's default behavior of not readvertising routes back to the sending peer is overridden by configuring **advertise-peer-as**.
- A provider edge (PE) routing device discards any VPN route that does not have any of the expected route targets.

When **keep all** is configured, the behavior of discarding routes received in the above scenarios is overridden.

CAUTION: When you configure **keep (all | none)**, the associated BGP sessions are restarted.

Default By default, BGP retains incoming rejected routes in memory and hides them. If you do not include the **keep** statement, most routes are retained in the routing table. BGP keeps all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.

Options **all**—Retain all routes.

none—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking. When **keep none** is configured for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Specify the address of the local end of a BGP session. This address is used to accept incoming connections to the peer and to establish connections to the remote peer. When none of the operational interfaces are configured with the specified local address, a session with a BGP peer is placed in the idle state.</p> <p>You generally configure a local address to explicitly configure the system's IP address from BGP's point of view. This IP address can be either an IPv6 or IPv4 address. Typically, an IP address is assigned to a loopback interface, and that IP address is configured here.</p> <p>For internal BGP (IBGP) peering sessions, generally the loopback interface (lo0) is used to establish connections between the IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address, the IBGP peering session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peering session also goes up and down. Thus, the loopback interface provides fault tolerance in case the physical interface or the link goes down, if the device has link redundancy.</p> <p>When a device peers with a remote device's loopback interface address, the local device expects BGP update messages to come from (be sourced by) the remote device's loopback interface address. The local-address statement enables you to specify the source information in BGP update messages. If you omit the local-address statement, the expected source of BGP update messages is based on the device's source address selection rules, which normally result in the egress interface address being the expected source of update messages. When this happens, the peering session is not established because a mismatch exists between the expected source address (the egress interface</p>

of the peer) and the actual source (the loopback interface of the peer). To ensure that the expected source address matches the actual source address, specify the loopback interface address in the **local-address** statement.

NOTE: Although a BGP session can be established when only one of the paired routing devices has **local-address** configured, we strongly recommend that you configure **local-address** on both paired routing devices for IBGP and multihop EBGP sessions. The **local-address** statement ensures that deterministic fixed addresses are used for the BGP session end-points.

If you include the **default-address-selection** statement in the configuration, the software chooses the system default address as the source for most locally generated IP packets. For protocols in which the local address is unconstrained by the protocol specification, for example IBGP and multihop EBGP, if you do not configure a specific local address when configuring the protocol, the local address is chosen using the same methods as other locally generated IP packets.

Default If you do not configure a local address, BGP uses the routing device's source address selection rules to set the local address.

Options **address**—IPv6 or IPv4 address of the local end of the connection.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Description	<p>Specify the local autonomous system (AS) number. An AS is a set of routing devices that are under a single technical administration and generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices.</p> <p>Internet service providers (ISPs) sometimes acquire networks that belong to a different AS. When this occur, there is no seamless method for moving the BGP peers of the acquired network to the AS of the acquiring ISP. The process of configuring the BGP peers with the new AS number can be time-consuming and cumbersome. In this case, it might not be desirable to modify peer arrangements or configuration. During this kind of transition period, it can be useful to configure BGP-enabled devices in the new AS to use the former AS number in BGP updates. This former AS number is called a <i>local</i> AS.</p>

NOTE: If you are using BGP on the routing device, you must configure an AS number before you specify the local as number.

In Junos OS Release 9.1 and later, the AS numeric range in plain-number format is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For

example, the 4-byte AS number of 65546 in plain-number format is represented as 1.10 in the AS-dot notation format.

Options **alias**—(Optional) Configure the local AS as an alias of the global AS number configured for the router at the **[edit routing-options]** hierarchy level. As a result, a BGP peer considers any local AS to which it is assigned as equivalent to the primary AS number configured for the routing device. When you use the **alias** option, only the AS (global or local) used to establish the BGP session is prepended in the AS path sent to the BGP neighbor.

autonomous-system—AS number.

Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format

Range: 0.0 through 65535.65535 in AS-dot notation format

loops number—(Optional) Specify the number of times detection of the AS number in the AS_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

NOTE: If you configure the local AS values for any BGP group, the detection of routing loops is performed using both the AS and the local AS values for all BGP groups.

If the local AS for the EBGP or IBGP peer is the same as the current AS, do not use the **local-as** statement to specify the local AS number.

When you configure the local AS within a VRF, this impacts the AS path loop-detection mechanism. All of the **local-as** statements configured on the device are part of a single AS domain. The AS path loop-detection mechanism is based on looking for a matching AS present in the domain.

Range: 1 through 10

Default: 1

no-prepend-global-as—(Optional) Specify to strip the global AS and to prepend only the local AS in AS paths sent to external peers.

private—(Optional) Configure to use the local AS only during the establishment of the BGP session with a BGP neighbor but to hide it in the AS path sent to external BGP peers. Only the global AS is included in the AS path sent to external peers.

NOTE: The **private** and **alias** options are mutually exclusive. You cannot configure both options with the same **local-as** statement.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

metric-out (Protocols BGP)

Syntax	<code>metric-out (<i>metric</i> <i>minimum-igp offset</i> <i>igp</i> (<i>delay-med-update</i> <i>offset</i>);</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name neighbor address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name neighbor address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <i>group group-name</i>],</p> <p>[edit protocols bgp <i>group group-name neighbor address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name neighbor address</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Option delay-med-update introduced in Junos OS Release 9.0.</p>
Description	<p>Specify the metric for all routes sent using the multiple exit discriminator (MED, or MULTI_EXIT_DISC) path attribute in update messages. This path attribute is used to discriminate among multiple exit points to a neighboring AS. If all other factors are equal, the exit point with the lowest metric is preferred.</p> <p>You can specify a constant metric value by including the metric option. For configurations in which a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the multihop command—you can specify a variable metric by including the minimum-igp or igp option.</p> <p>You can increase or decrease the variable metric calculated from the IGP metric (either from the igp or minimum-igp statement) by specifying a value for offset. The metric is increased by specifying a positive value for offset, and decreased by specifying a negative value for offset.</p> <p>In Junos OS Release 9.0 and later, you can specify that a BGP group or peer not advertise updates for the MED path attributes used to calculate IGP costs for BGP next hops unless the MED is lower. You can also configure an interval to delay when MED updates are sent by including the med-igp-update-interval minutes statement at the [edit routing-options] hierarchy level.</p>
Options	<p>delay-med-update—Specify that a BGP group or peer configured with the metric-out igp statement not advertise MED updates unless the current MED value is lower than</p>

the previously advertised MED value, or another attribute associated with the route has changed, or the BGP peer is responding to a refresh route request.

NOTE: You cannot configure the `delay-med-update` statement at the global BGP level.

igp—Set the metric to the most recent metric value calculated in the IGP to get to the BGP next hop. Routes learned from an EBGP peer usually have a next hop on a directly connected interface and thus the IGP value is equal to zero. This is the value advertised.

metric—Primary metric on all routes sent to peers.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: No metric is sent.

minimum-igp—Set the metric to the minimum metric value calculated in the IGP to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value. When you change a neighbor's export policy from any configuration to a configuration that sets the minimum IGP offset on an exported route, the advertised MED is not updated if the value would increase as a result, even if the previous configuration does not use a minimum IGP-based MED value. This behavior helps to prevent unnecessary route flapping when an IGP cost changes, by not forcing a route update if the metric value increases past the previous lowest known value.

offset—Increases or decreases the metric by this value.

Range: -2^{31} through $2^{31} - 1$

Default: None

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Configure TCP path maximum transmission unit (MTU) discovery.</p> <p>TCP path MTU discovery enables BGP to automatically discover the best TCP path MTU for each BGP session. In Junos OS, TCP path MTU discovery is disabled by default for all BGP neighbor sessions.</p> <p>When MTU discovery is disabled, TCP sessions that are not directly connected transmit packets of 512-byte maximum segment size (MSS). These small packets minimize the chances of packet fragmentation at a device along the path to the destination. However, because most links use an MTU of at least 1500 bytes, 512-byte packets do not result in the most efficient use of link bandwidth. For directly connected EBGP sessions, MTU mismatches prevent the BGP session from being established. As a workaround, enable path MTU discovery within the EBGP group.</p> <p>Path MTU discovery dynamically determines the MTU size on the network path between the source and the destination, with the goal of avoiding IP fragmentation. Path MTU discovery works by setting the Don't Fragment (DF) bit in the IP headers of outgoing packets. When a device along the path has an MTU that is smaller than the packet, the device drops the packet. The device also sends back an ICMP Fragmentation Needed (Type 3, Code 4) message that contains the device's MTU, thus allowing the source to reduce its path MTU appropriately. The process repeats until the MTU is small enough to traverse the entire path without fragmentation.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Explicitly configure a neighbor (peer). To configure multiple BGP peers, include multiple **neighbor** statements.

By default, the peer's options are identical to those of the group. You can override these options by including peer-specific option statements within the **neighbor** statement.

The **neighbor** statement is one of the statements you can include in the configuration to define a minimal BGP configuration on the routing device. (You can include an **allow all** statement in place of a **neighbor** statement.)

Options **address**—IPv6 or IPv4 address of a single peer.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

no-aggregator-id

Syntax	no-aggregator-id;
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp group <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Prevent different routing devices within an AS from creating aggregate routes that contain different AS paths.</p> <p>Junos OS performs route aggregation, which is the process of combining the characteristics of different routes so that only a single route is advertised. Aggregation reduces the amount of information that BGP must store and exchange with other BGP systems. When aggregation occurs, the local routing device adds the local AS number and the router ID to the aggregator path attribute. The no-aggregator-id statement causes Junos OS to place a 0 in the router ID field and thus eliminate the possibility of having multiple aggregate advertisements in the network, each with different path information.</p>
Default	If you omit this statement, the router ID is included in the BGP aggregator path attribute.
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

no-validate

Syntax	<code>no-validate <i>policy-name</i>;</code>
Hierarchy Level	<code>[edit protocols bgp group <i>group-name</i> family (inet inet flow)],</code> <code>[edit protocols bgp group <i>group-name</i> neighbor address <i>family</i> (inet inet flow)],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> family (inet inet flow)],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor address <i>family</i> (inet inet flow)]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>When BGP is carrying flow-specification network layer reachability information (NLRI) messages, the no-validate statement omits the flow route validation procedure after packets are accepted by a policy.</p> <p>The receiving BGP-enabled device accepts a flow route if it passes the following criteria:</p> <ul style="list-style-type: none"> • The originator of a flow route matches the originator of the best match unicast route for the destination address that is embedded in the route. • There are no more specific unicast routes, when compared to the destination address of the flow route, for which the active route has been received from a different next-hop autonomous system. <p>The first criterion ensures that the filter is being advertised by the next-hop used by unicast forwarding for the destination address embedded in the flow route. For example, if a flow route is given as 10.1.1.1, proto=6, port=80, the receiving BGP-enabled device selects the more specific unicast route in the unicast routing table that matches the destination prefix 10.1.1.1/32. On a unicast routing table containing 10.1/16 and 10.1.1/24, the latter is chosen as the unicast route to compare against. Only the active unicast route entry is considered. This follows the concept that a flow route is valid if advertised by the originator of the best unicast route.</p> <p>The second criterion addresses situations in which a given address block is allocated to different entities. Flows that resolve to a best-match unicast route that is an aggregate route are only accepted if they do not cover more specific routes that are being routed to different next-hop autonomous systems.</p> <p>You can bypass the validation process and use your own specific import policy. To disable the validation procedure and use an import policy instead, include the no-validate statement in the configuration.</p> <p>Flow routes configured for VPNs with family inet-vpn are not automatically validated, so the no-validate statement is not supported at the <code>[edit protocols bgp group <i>group-name</i> family inet-vpn]</code> hierarchy level. No validation is needed if the flow routes are configured locally between devices in a single AS.</p>

Options *policy-name*—Import policy to match NLRI messages.

Required Privilege routing—To view this statement in the configuration.
Level routing-control—To add this statement to the configuration.

peer-as (Protocols BGP)

Syntax	<code>peer-as <i>autonomous-system</i>;</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp group <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Specify the neighbor (peer) autonomous system (AS) number.</p> <p>For EBGP, the peer is in another AS, so the AS number you specify in the peer-as statement must be different from the local router's AS number, which you specify in the autonomous-system statement. For IBGP, the peer is in the same AS, so the two AS numbers that you specify in the autonomous-system and peer-as statements must be the same.</p> <p>The AS numeric range in plain-number format has been extended in Junos OS Release 9.1 to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of the Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i><16-bit high-order value in decimal>.<16-bit low-order value in decimal></i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.</p> <p>With the introduction of 4-byte AS numbers, you might have a combination of routers that support 4-byte AS numbers and 2-byte AS numbers. For more information about what happens when establishing BGP peer relationships between 4-byte and 2-byte capable routers, see the following topics:</p>

- *Establishing a Peer Relationship Between a 4-Byte Capable Router and a 2-Byte Capable Router Using a 2-Byte AS Number in the Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview.*
- *Establishing a Peer Relationship Between a 4-Byte Capable Router and a 2-Byte Capable Router Using a 4-Byte AS Number in the Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview.*

Options *autonomous-system*—AS number.

Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format for 4-byte AS numbers

Range: 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

Range: 0.0 through 65535.65535 in AS-dot notation format for 4-byte AS numbers

Required Privilege routing—To view this statement in the configuration.

Level routing-control—To add this statement to the configuration.

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 9.0 for EX Series switches.
 Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description When advertising AS paths to remote systems, have the local system strip private AS numbers from the AS path. The numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. If the AS path contains the AS number of the external BGP (EBGP) neighbor, BGP does not remove the private AS number.

NOTE: As of Junos OS 10.0R2 and higher, if there is a need to send prefixes to an EBGP peer that has an AS number that matches an AS number in the AS path, consider using the `as-override` statement instead of the `remove-private` statement.

The operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.

The Junos OS recognizes the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document.

The set of reserved AS numbers is in the range from 64,512 through 65,535.

Options **all**—Remove all private AS numbers from the original path. Do not stop the process of removing private AS numbers, even if a public AS number is encountered.

nearest—When you use the **all** and **replace** options, choose the last (right-most) public AS number encountered in the original AS path for the replacement value, as the AS path is processed from left to right. If no public AS number is encountered, the default replacement value is used. (See the **replace** option for information about the default replacement value.)

replace—When you use the **all** option, instead of removing private AS numbers, perform a replace operation. The default replacement value for the private AS number is the local AS number at the BGP group level for the BGP peer. If you are unsure about the replacement value, check the local AS value displayed in the output of the **show bgp group group-name** command.

Required Privilege	routing—To view this statement in the configuration.
Level	routing-control—To add this statement to the configuration.

tcp-mss (Protocols BGP)

Syntax	<code>tcp-mss <i>segment-size</i>;</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols bgp],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor</code> <code> <i>neighbor-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code> bgp],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code> bgp group <i>group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code> bgp group <i>group-name</i> neighbor <i>neighbor-name</i>],</code> <code>[edit protocols bgp],</code> <code>[edit protocol bgp group <i>group-name</i>],</code> <code>[edit protocols bgp group <i>group-name</i> neighbor <i>neighbor-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor</code> <code> <i>neighbor-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 8.1. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
Description	Configure the maximum segment size (MSS) for the TCP connection for BGP neighbors. The MSS is only valid in increments of 2 KB. The value used is based on the value set, but is rounded down to the nearest multiple of 2048.
Options	<i>segment-size</i> —MSS for the TCP connection. Range: 1 through 4096
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Limiting TCP Segment Size for BGP</i>

traceoptions (Protocols BGP)

Syntax	<pre> traceoptions { file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i> <flag-modifier> <disable>; } </pre>
Hierarchy Level	<pre> [edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group</i> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>], [edit protocols bgp], [edit protocols bgp <i>group</i> <i>group-name</i>], [edit protocols bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>] </pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>4byte-as statement introduced in Junos OS Release 9.2.</p> <p>4byte-as statement introduced in Junos OS Release 9.2 for EX Series switches.</p>
Description	Configure BGP protocol-level tracing options. To specify more than one tracing operation, include multiple flag statements.
<div>  <p>NOTE: The traceoptions statement is not supported on QFabric systems.</p> </div>	
Default	The default BGP protocol-level tracing options are inherited from the routing protocols traceoptions statement included at the [edit routing-options] hierarchy level. The default group-level trace options are inherited from the BGP protocol-level traceoptions statement. The default peer-level trace options are inherited from the group-level traceoptions statement.
Options	<p>disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>name</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. We recommend that you place BGP tracing output in the file bgp-log.</p>

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file.0***, then ***trace-file.1***, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

BGP Tracing Flags

- **4byte-as**—4-byte AS events.
- **bfd**—BFD protocol events.
- **damping**—Damping operations.
- **graceful-restart**—Graceful restart events.
- **keepalive**—BGP keepalive messages. If you enable the the BGP **update** flag only, received keepalive messages do not generate a trace message.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **open**—Open packets. These packets are sent between peers when they are establishing a connection.
- **packets**—All BGP protocol packets.
- **refresh**—BGP refresh packets.
- **update**—Update packets. These packets provide routing updates to BGP systems. If you enable only this flag, received keepalive messages do not generate a trace message. Use the **keepalive** flag to generate a trace message for keepalive messages.

Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **filter**—Provide filter trace information. Applies only to **route** and **damping** tracing flags.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.

clear bgp damping

Syntax	clear bgp damping <logical-system (all <i>logical-system-name</i>)> < <i>prefix</i> >
Syntax (EX Series Switch and QFX Series)	clear bgp damping < <i>prefix</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Clear BGP route flap damping information.
Options	<p>none—Clear all BGP route flap damping information.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><i>prefix</i>—(Optional) Clear route flap damping information for only the specified destination prefix.</p>
Required Privilege Level	clear

```

clear bgp neighbor

Syntax	<pre>clear bgp neighbor <as <i>as-number</i>> <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <neighbor> <soft soft-inbound> <soft-minimum-igp></pre>
Syntax (EX Series Switch and QFX Series)	<pre>clear bgp neighbor <as <i>as-number</i>> <instance <i>instance-name</i>> <neighbor> <soft soft-inbound> <soft-minimum-igp></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Perform one of the following tasks:</p> <ul style="list-style-type: none">• Change the state of one or more BGP neighbors to IDLE. For neighbors in the ESTABLISHED state, this command drops the TCP connection to the neighbors and then reestablishes the connection.• (soft or soft-inbound keyword only) Reapply export policies or import policies, respectively, and send refresh updates to one or more BGP neighbors without changing their state.
Options	<p>none—Change the state of all BGP neighbors to IDLE.</p> <p>as <i>as-number</i>—(Optional) Apply this command only to neighbors in the specified autonomous system (AS).</p> <p>instance <i>instance-name</i>—(Optional) Apply this command only to neighbors for the specified routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>neighbor—(Optional) IP address of a BGP peer. Apply this command only to the specified neighbor.</p> <p>soft—(Optional) Reapply any export policies and send refresh updates to neighbors without clearing the state.</p> <p>soft-inbound—(Optional) Reapply any import policies and send refresh updates to neighbors without clearing the state.</p>

soft-minimum-igp—(Optional) Provides soft refresh of the outbound state when the interior gateway protocol (IGP) metric is reset.

Required Privilege Level clear

clear bgp table

Syntax	<code>clear bgp table <i>table-name</i></code> <code><logical-system (all <i>logical-system-name</i>)></code>
Syntax (EX Series Switch and QFX Series)	<code>clear bgp table <i>table-name</i></code>
Release Information	Command introduced in Junos OS Release 9.0. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Request that BGP refresh routes in a specified routing table.
Options	<code>logical-system (all <i>logical-system-name</i>)</code> —(Optional) Perform this operation on all logical systems or on a particular logical system. <code>table-name</code> —Request that BGP refresh routes in the specified table.
Additional Information	In some cases, a prefix limit is associated with a routing table for a VPN instance. When this limit is exceeded (for example, because of a network misconfiguration), some routes might not be inserted in the table. Such routes need to be added to the table after the network issue is resolved. Use the clear bgp table command to request that BGP refresh routes in a VPN instance table.
Required Privilege Level	clear

show bgp bmp

Syntax	show bgp bmp
Release Information	Command introduced in Junos OS Release 9.5. Command introduced in Junos OS Release 9.5 for EX Series switches.
Description	Display information about the BGP Monitoring Protocol (BMP).
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show bgp bmp on page 2646
Output Fields	Table 212 on page 2646 lists the output fields for the show bgp bmp command. Output fields are listed in the approximate order in which they appear.

Table 212: show bgp bmp Output Fields

Field Name	Field Description
BMP station address/port	IP address and port number of the monitoring station to which BGP Monitoring Protocol (BMP) statistics are sent.
BMP session state	Status of the BMP session: UP or DOWN .
Memory consumed by BMP	Memory used by the active BMP session.
Statistics timeout	Amount of time, in seconds, between transmissions of BMP data to the monitoring station.
Memory limit	Threshold, in bytes, at which the routing device stops collecting BMP data.
Memory-connect retry timeout	Amount of time, in seconds, after which the routing device attempts to resume a BMP session that was ended after the configured memory threshold was exceeded.

Sample Output

show bgp bmp

```

user@host> show bgp bmp
  BMP station address/port: 172.24.24.157+5454
  BMP session state: DOWN
  Memory consumed by BMP: 0
  Statistics timeout: 15
  Memory limit: 10485760
  Memory connect retry timeout: 600

```

show bgp group

Syntax	<pre>show bgp group <brief detail summary> <group-name> <exact-instance instance-name> <instance instance-name> <logical-system (all logical-system-name)> <rtf></pre>
Syntax (EX Series Switch and QFX Series)	<pre>show bgp group <brief detail summary> <group-name> <exact-instance instance-name> <instance instance-name></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>exact-instance option introduced in Junos OS Release 11.4.</p>
Description	Display information about the configured BGP groups.
Options	<p>none—Display group information about all BGP groups.</p> <p>brief detail summary—(Optional) Display the specified level of output.</p> <p>group-name—(Optional) Display group information for the specified group.</p> <p>exact-instance instance-name—(Optional) Display information for the specified instance only.</p> <p>instance instance-name—(Optional) Display information about BGP groups for all routing instances whose name begins with this string (for example, cust1, cust11, and cust111 are all displayed when you run the show bgp group instance cust1 command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>rtf—(Optional) Display BGP group route targeting information.</p>
Required Privilege Level	view
List of Sample Output	<p>show bgp group on page 2652</p> <p>show bgp group brief on page 2652</p> <p>show bgp group detail on page 2653</p> <p>show bgp group rtf detail on page 2654</p> <p>show bgp group summary on page 2654</p>

Output Fields Table 213 on page 2649 describes the output fields for the **show bgp group** command. Output fields are listed in the approximate order in which they appear.

Table 213: show bgp group Output Fields

Field Name	Field Description	Level of Output
Group Type or Group	Type of BGP group: Internal or External .	All levels
group-index	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.	rtf detail
AS	AS number of the peer. For internal BGP (IBGP), this number is the same as Local AS .	brief detail none
Local AS	AS number of the local routing device.	brief detail none
Name	Name of a specific BGP group.	brief detail none
Index	Unique index number of a BGP group.	brief detail none
Flags	Flags associated with the BGP group. This field is used by Juniper Networks customer support.	brief detail none
Remove-private options	Options associated with the remove-private statement.	brief detail none
Holdtime	Maximum number of seconds allowed to elapse between successive keepalive or update messages that BGP receives from a peer in the BGP group, after which the connection to the peer is closed and routing devices through that peer become unavailable.	brief detail none
Export	Export policies configured for the BGP group with the export statement.	brief detail none
MED tracks IGP metric update delay	Time, in seconds, that updates to multiple exit discriminator (MED) are delayed. Also displays the time remaining before the interval is set to expire	All levels
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.	brief detail none
Total peers	Total number of peers in the group.	brief detail none
Established	Number of peers in the group that are in the established state.	All levels

Table 213: show bgp group Output Fields (*continued*)

Field Name	Field Description	Level of Output
Active/Received/Accepted/Damped	<p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established in the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> If a peer is not established, the field shows the state of the peer session: Active, Connect, or Idle. If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the inet.0 (main) and inet.2 (multicast) routing tables. For example, 8/10/10/2 and 2/4/4/0 indicate the following: <ul style="list-style-type: none"> 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the inet.0 routing table. 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the inet.2 routing table. 	summary
ip-addresses	List of peers who are members of the group. The address is followed by the peer's port number.	All levels
Route Queue Timer	Number of seconds until queued routes are sent. If this time has already elapsed, this field displays the number of seconds by which the updates are delayed.	detail
Route Queue	Number of prefixes that are queued up for sending to the peers in the group.	detail
inet.number	<p>Number of active, received, accepted, and damped routes in the routing table. For example, inet.0: 7/10/9/0 indicates the following:</p> <ul style="list-style-type: none"> 7 active routes, 10 received routes, 9 accepted routes, and no damped routes from a BGP peer appear in the inet.0 routing table. 	none

Table 213: show bgp group Output Fields (*continued*)

Field Name	Field Description	Level of Output
Table inet.number	Information about the routing table. <ul style="list-style-type: none"> • Received prefixes—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • Active prefixes—Number of prefixes received from the peer that are active in the routing table. • Suppressed due to damping—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. • Advertised prefixes—Number of prefixes advertised to a peer. • Received external prefixes—Total number of prefixes from the external BGP (EBGP) peers, both active and inactive, that are in the routing table. • Active external prefixes—Number of prefixes received from the EBGP peers that are active in the routing table. • Externals suppressed—Number of routes received from EBGP peers currently inactive because of damping or other reasons. • Received internal prefixes—Total number of prefixes from the IBGP peers, both active and inactive, that are in the routing table. • Active internal prefixes—Number of prefixes received from the IBGP peers that are active in the routing table. • Internals suppressed—Number of routes received from IBGP peers currently inactive because of damping or other reasons. • RIB State—Status of the graceful restart process for this routing table: BGP restart is complete, BGP restart in progress, VPN restart in progress, or VPN restart is complete. 	detail
Groups	Total number of groups.	All levels
Peers	Total number of peers.	All levels
External	Total number of external peers.	All levels
Internal	Total number of internal peers.	All levels
Down peers	Total number of unavailable peers.	All levels
Flaps	Total number of flaps that occurred.	All levels
Table	Name of a routing table.	brief , none
Tot Paths	Total number of routes.	brief , none
Act Paths	Number of active routes.	brief , none
Suppressed	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.	brief , none

Table 213: show bgp group Output Fields (*continued*)

Field Name	Field Description	Level of Output
History	Number of withdrawn routes stored locally to keep track of damping history.	brief, none
Damp State	Number of active routes with a figure of merit greater than zero, but lower than the threshold at which suppression occurs.	brief, none
Pending	Routes being processed by the BGP import policy.	brief, none
Group	Group the peer belongs to in the BGP configuration.	detail
Receive mask	Mask of the received target included in the advertised route.	detail
Entries	Number of route entries received.	detail
Target	Route target that is to be passed by route-target filtering. If a route advertised from the provider edge (PE) routing device matches an entry in the route-target filter, the route is passed to the peer.	detail
Mask	Mask which specifies that the peer receive routes with the given route target.	detail

show bgp neighbor

Syntax	<pre>show bgp neighbor <exact-instance <i>instance-name</i>> <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <neighbor-address> <orf (detail <i>neighbor-address</i>)</pre>
Syntax (EX Series Switch and QFX Series)	<pre>show bgp neighbor <instance <i>instance-name</i>> <exact-instance <i>instance-name</i>> <neighbor-address> <orf (<i>neighbor-address</i> detail)</pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>orf option introduced in Junos OS Release 9.2.</p> <p>exact-instance option introduced in Junos OS Release 11.4.</p>
Description	Display information about BGP peers.
Options	<p>none—Display information about all BGP peers.</p> <p>exact-instance <i>instance-name</i>—(Optional) Display information for the specified instance only.</p> <p>instance <i>instance-name</i>—(Optional) Display information about BGP peers for all routing instances whose name begins with this string (for example, cust1, cust11, and cust111 are all displayed when you run the show bgp neighbor instance cust1 command).</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>neighbor-address—(Optional) Display information for only the BGP peer at the specified IP address.</p> <p>orf (detail <i>neighbor-address</i>)—(Optional) Display outbound route-filtering information for all BGP peers or only for the BGP peer at the specified IP address. The default is to display brief output. Use the detail option to display detailed output.</p>
Additional Information	For information about the local-address , nlri , hold-time , and preference statements, see the <i>Junos OS Routing Protocols Configuration Guide</i> .

Output Fields Table 214 on page 2656 describes the output fields for the **show bgp neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 214: show bgp neighbor Output Fields

Field Name	Field Description
Peer	Address of the BGP neighbor. The address is followed by the neighbor port number.
AS	AS number of the peer.
Local	Address of the local routing device. The address is followed by the peer port number.
Type	Type of peer: Internal or External .
State	<p>Current state of the BGP session:</p> <ul style="list-style-type: none"> • Active—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • Connect—BGP is waiting for the transport protocol connection to be completed. • Established—The BGP session has been established, and the peers are exchanging update messages. • Idle—This is the first stage of a connection. BGP is waiting for a Start event. • OpenConfirm—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • OpenSent—BGP has sent an open message and is waiting to receive an open message from the peer.
Flags	<p>Internal BGP flags:</p> <ul style="list-style-type: none"> • Aggregate Label—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label. • CleanUp—The peer session is being shut down. • Delete—This peer has been deleted. • Idled—This peer has been permanently idled. • ImportEval—At the last commit operation, this peer was identified as needing to reevaluate all received routes. • Initializing—The peer session is initializing. • SendRtn—Messages are being sent to the peer. • Sync—This peer is synchronized with the rest of the peer group. • TryConnect—Another attempt is being made to connect to the peer. • Unconfigured—This peer is not configured. • WriteFailed—An attempt to write to this peer failed.

Table 214: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Last state	<p>Previous state of the BGP session:</p> <ul style="list-style-type: none"> • Active—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • Connect—BGP is waiting for the transport protocol connection to be completed. • Established—The BGP session has been established, and the peers are exchanging update messages. • Idle—This is the first stage of a connection. BGP is waiting for a Start event. • OpenConfirm—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • OpenSent—BGP has sent an open message and is waiting to receive an open message from the peer.
Last event	<p>Last activity that occurred in the BGP session:</p> <ul style="list-style-type: none"> • Closed—The BGP session closed. • ConnectRetry—The transport protocol connection failed, and BGP is trying again to connect. • HoldTime—The session ended because the hold timer expired. • KeepAlive—The local routing device sent a BGP keepalive message to the peer. • Open—The local routing device sent a BGP open message to the peer. • OpenFail—The local routing device did not receive an acknowledgment of a BGP open message from the peer. • RecvKeepAlive—The local routing device received a BGP keepalive message from the peer. • RecvNotify—The local routing device received a BGP notification message from the peer. • RecvOpen—The local routing device received a BGP open message from the peer. • RecvUpdate—The local routing device received a BGP update message from the peer. • Start—The peering session started. • Stop—The peering session stopped. • TransportError—A TCP error occurred.
Last error	<p>Last error that occurred in the BGP session:</p> <ul style="list-style-type: none"> • Cease—An error occurred, such as a version mismatch, that caused the session to close. • Finite State Machine Error—In setting up the session, BGP received a message that it did not understand. • Hold Time Expired—The session's hold time expired. • Message Header Error—The header of a BGP message was malformed. • Open Message Error—A BGP open message contained an error. • None—No errors occurred in the BGP session. • Update Message Error—A BGP update message contained an error.
Export	Name of the export policy that is configured on the peer.
Import	Name of the import policy that is configured on the peer.

Table 214: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Options	Configured BGP options: <ul style="list-style-type: none"> • AddressFamily—Configured address family: inet or inet-vpn. • AuthKeyChain—Authentication key change is enabled. • DropPathAttributes—Certain path attributes are configured to be dropped from neighbor updates during inbound processing. • GracefulRestart—Graceful restart is configured. • HoldTime—Hold time configured with the hold-time statement. The hold time is three times the interval at which keepalive messages are sent. • IgnorePathAttributes—Certain path attributes are configured to be ignored in neighbor updates during inbound processing. • Local Address—Address configured with the local-address statement. • Multihop—Allow BGP connections to external peers that are not on a directly connected network. • NLRI—Configured MBGP state for the BGP group: multicast, unicast, or both if you have configured nlri any. • Peer AS—Configured peer autonomous system (AS). • Preference—Preference value configured with the preference statement. • Refresh—Configured to refresh automatically when the policy changes. • Rib-group—Configured routing table group.
Path-attributes dropped	Path attribute codes that are dropped from neighbor updates.
Path-attributes ignored	Path attribute codes that are ignored during neighbor updates.
Authentication key change	(appears only if the authentication-keychain statement has been configured) Name of the authentication keychain enabled.
Authentication algorithm	(appears only if the authentication-algorithm statement has been configured) Type of authentication algorithm enabled: hmac or md5 .
Address families configured	Names of configured address families for the VPN.
Local Address	Address of the local routing device.
Remove-private options	Options associated with the remove-private statement.
Holdtime	Hold time configured with the hold-time statement. The hold time is three times the interval at which keepalive messages are sent.
Flags for NLRI inet-label-unicast	Flags related to labeled-unicast: <ul style="list-style-type: none"> • TrafficStatistics—Collection of statistics for labeled-unicast traffic is enabled.

Table 214: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Traffic statistics	Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> • Options—Options configured for collecting statistics about labeled-unicast traffic. • File—Name and location of statistics log files. • size—Size of all the log files, in bytes. • files—Number of log files.
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.
Preference	Preference value configured with the preference statement.
Outbound Timer	Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the out-delay parameter is configured to a non-zero value.
Number of flaps	Number of times the BGP session has gone down and then come back up.
Peer ID	Router identifier of the peer.
Group index	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.
Peer index	Index that is unique within the BGP group to which the peer belongs.
Local ID	Router identifier of the local routing device.
Local Interface	Name of the interface on the local routing device.
Active holdtime	Hold time that the local routing device negotiated with the peer.
Keepalive Interval	Keepalive interval, in seconds.
BFD	Status of BFD failure detection.
Local Address	Name of directly connected interface over which direct EBGP peering is established.
NLRI for restart configured on peer	Names of address families configured for restart.
NLRI advertised by peer	Address families supported by the peer: unicast or multicast .
NLRI for this session	Address families being used for this session.
Peer supports Refresh capability	Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> .
Restart time configured on peer	Configured time allowed for restart on the neighbor.

Table 214: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Stale routes from peer are kept for	When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.
Peer does not support Restarter functionality	Graceful restart restarter-mode is disabled on the peer.
Peer does not support Receiver functionality	Graceful restart helper-mode is disabled on the peer.
Restart time requested by this peer	Restart time requested by this neighbor during capability negotiation.
Restart flag received from the peer	When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the end-of-rib marker from the speaker before advertising routing information to the speaker.
NLRI that peer supports restart for	Neighbor supports graceful restart for this address family.
NLRI peer can save forwarding state	Neighbor supporting this address family saves all forwarding states.
NLRI that peer saved forwarding for	Neighbor saves all forwarding states for this address family.
NLRI that restart is negotiated for	Router supports graceful restart for this address family.
NLRI of received end-of-rib markers	Address families for which end-of-routing-table markers are received from the neighbor.
NLRI of all end-of-rib markers sent	Address families for which end-of-routing-table markers are sent to the neighbor.
Peer supports 4 byte AS extension (peer-as 1)	Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.
NLRIs for which peer can receive multiple paths	Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route. Possible value is inet-unicast .
NLRIs for which peer can send multiple paths: inet-unicast	Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route. Possible value is inet-unicast .

Table 214: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Table inet.number	<p>Information about the routing table:</p> <ul style="list-style-type: none"> • RIB State—BGP is in the graceful restart process for this routing table: restart is complete or restart in progress. • Bit—Number that represents the entry in the routing table for this peer. • Send state—State of the BGP group: in sync, not in sync, or not advertising. • Active prefixes—Number of prefixes received from the peer that are active in the routing table. • Received prefixes—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • Accepted prefixes—Total number of prefixes from the peer that have been accepted by a routing policy. • Suppressed due to damping—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.
Last traffic (seconds)	Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.
Input messages	Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Output messages	Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Input dropped path attributes	<p>Information about dropped path attributes:</p> <ul style="list-style-type: none"> • Code—Path attribute code. • Count—Path attribute count.
Input ignored path attributes	<p>Information about ignored path attributes:</p> <ul style="list-style-type: none"> • Code—Path attribute code. • Count—Path attribute count.
Output queue	Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs.
Trace options	Configured tracing of BGP protocol packets and operations.
Trace file	Name of the file to receive the output of the tracing operation.
Filter Updates rcv	<p>(orf option only) Number of outbound-route filters received for each configured address family.</p> <p>NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.</p>

Table 214: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Immediate	(orf option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes. NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Filter	(orf option only) Type of prefix filter received: prefix-based or extended-community .
Received filter entries	(orf option only) List of received filters displayed.
seq	(orf option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.
prefix	(orf option only) Address for the prefix entry that matches the filter.
minlength	(orf option only) Minimum prefix length, in bits, required to match this prefix.
maxlength	(orf option only) Maximum prefix length, in bits, required to match this prefix.
match	(orf option only) For this prefix match, whether to permit or deny route updates.

Syntax (EX Series Switch and QFX Series)	<pre>show bgp summary <exact-instance <i>instance-name</i>> <instance <i>instance-name</i>></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>exact-instance option introduced in Junos OS Release 11.4.</p>
Description	Display BGP summary information.
Options	<p>none—Display BGP summary information for all routing instances.</p> <p>exact-instance <i>instance-name</i>—(Optional) Display information for the specified instance only.</p> <p>instance <i>instance-name</i>—(Optional) Display information for all routing instances whose name begins with this string (for example, cust1, cust11, and cust111 are all displayed when you run the show bgp summary instance cust1 command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
List of Sample Output	<p>show bgp summary (When a Peer Is Not Established) on page 2672</p> <p>show bgp summary (When a Peer Is Established) on page 2672</p> <p>show bgp summary (CLNS) on page 2672</p> <p>show bgp summary (Layer 2 VPN) on page 2672</p> <p>show bgp summary (Layer 3 VPN) on page 2673</p>
Output Fields	<p>Table 215 on page 2669 describes the output fields for the show bgp summary command. Output fields are listed in the approximate order in which they appear.</p>

Table 215: show bgp summary Output Fields

Field Name	Field Description
Groups	Number of BGP groups.
Peers	Number of BGP peers.

Table 215: show bgp summary Output Fields (*continued*)

Field Name	Field Description
Down peers	Number of down BGP peers.
Table	Name of routing table.
Tot Paths	Total number of paths.
Act Paths	Number of active routes.
Suppressed	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.
History	Number of withdrawn routes stored locally to keep track of damping history.
Damp State	Number of routes with a figure of merit greater than zero, but still active because the value has not reached the threshold at which suppression occurs.
Pending	Routes in process by BGP import policy.
Peer	Address of each BGP peer. Each peer has one line of output.
AS	Peer's AS number.
InPkt	Number of packets received from the peer.
OutPkt	Number of packets sent to the peer.
OutQ	Number of BGP packets that are queued to be transmitted to a particular neighbor. It normally is 0 because the queue usually is emptied quickly.
Flaps	Number of times the BGP session has gone down and then come back up.
Last Up/Down	Last time since the neighbor transitioned to or from the established state.

Table 215: show bgp summary Output Fields (*continued*)

Field Name	Field Description
State #Active /Received/Accepted /Damped	<p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established on the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> If a peer is not established, the field shows the state of the peer session: Active, Connect, or Idle. In general, the Idle state is the first stage of a connection. BGP is waiting for a Start event. A session can be idle for other reasons as well. The reason that a session is idle is sometimes displayed. For example: Idle (Removal in progress) or Idle (LicenseFailure). If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the inet.0 (main) and inet.2 (multicast) routing tables. For example, 8/10/10/2 and 2/4/4/0 indicate the following: <ul style="list-style-type: none"> 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the inet.0 routing table. 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the inet.2 routing table. If a BGP session is established in a routing instance, the field indicates the established (Establ) state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, Establ VPN-AB.inet.0: 2/4/0 indicates the following: <ul style="list-style-type: none"> The BGP session is established. Routes are received in the VPN-AB.inet.0 routing table. The local routing device has two active routes, four received routes, and no damped routes from a BGP peer. <p>When a BGP session is established, the peers are exchanging update messages.</p>

show policy damping

Syntax	show policy damping <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switch and QFX Series)	show policy damping
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Display information about BGP route flap damping parameters.
Options	<p>none—Display information about BGP route flap damping parameters.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Additional Information	In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • “Configuring BGP Flap Damping Parameters” in the <i>Routing Policy Configuration Guide</i> • clear bgp damping on page 2641 • <i>show route damping</i>
List of Sample Output	show policy damping on page 2675
Output Fields	Table 216 on page 2674 describes the output fields for the show policy damping command. Output fields are listed in the approximate order in which they appear.

Table 216: show policy damping Output Fields

Field Name	Field Description
Halflife	Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes.

Table 216: show policy damping Output Fields (*continued*)

Field Name	Field Description
Reuse merit	Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.
Suppress/cutoff merit	Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.
Maximum suppress time	Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.
Computed values	<ul style="list-style-type: none"> • Merit ceiling—Maximum merit that a flapping route can collect. • Maximum decay—Maximum decay half-life, in minutes.

Sample Output

show policy damping

```

user@host> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "standard-damping":
  Halflife: 10 minutes
  Reuse merit: 4000 Suppress/cutoff merit: 8000
  Maximum suppress time: 30 minutes
  Computed values:
    Merit ceiling: 32120
    Maximum decay: 12453

authentication-key (Protocols IS-IS)

Syntax	authentication-key <i>key</i> ;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols isis level <i>level-number</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis level <i>level-number</i>], [edit protocols isis level <i>level-number</i>], [edit routing-instances <i>routing-instance-name</i> protocols isis level <i>level-number</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	<p>Authentication key (password). Neighboring routing devices use the password to verify the authenticity of packets sent from this interface. For the key to work, you also must include the authentication-type statement.</p> <p>All routing devices must use the same password. If you are using the Junos OS IS-IS software with another implementation of IS-IS, the other implementation must be configured to use the same password for the domain, the area, and all interfaces adjacent to the Juniper Networks routing device.</p>
Default	If you do not include this statement and the authentication-type statement, IS-IS authentication is disabled.
Options	key —Authentication password. The password can be up to 1024 characters long. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

CAUTION: A simple password for authentication is truncated if it exceeds 254 characters.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

authentication-type (Protocols IS-IS)

Syntax	<code>authentication-type <i>authentication</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols isis level level-number], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis level level-number], [edit protocols isis level level-number], [edit routing-instances <i>routing-instance-name</i> protocols isis level level-number]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	Enable authentication and specify the authentication scheme for IS-IS. If you enable authentication, you must specify a password by including the authentication-key statement.
Default	If you do not include this statement and the authentication-key statement, IS-IS authentication is disabled.
Options	<i>authentication</i> —Authentication scheme: <ul style="list-style-type: none">• md5—Use HMAC authentication in combination with MD5. HMAC-MD5 authentication is defined in RFC 2104, <i>HMAC: Keyed-Hashing for Message Authentication</i>.• simple—Use a simple password for authentication. The password is included in the transmitted packet, making this method of authentication relatively insecure. We recommend that you <i>not</i> use this authentication method.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

bfd-liveness-detection (Protocols IS-IS)

Syntax	<pre> bfd-liveness-detection { authentication { algorithm <i>algorithm-name</i>; key-chain <i>key-chain-name</i>; loose-check; } detection-time { threshold <i>milliseconds</i>; } minimum-interval <i>milliseconds</i>; minimum-receive-interval <i>milliseconds</i>; multiplier <i>number</i>; no-adaptation; transmit-interval { minimum-interval <i>milliseconds</i>; threshold <i>milliseconds</i>; } version (1 automatic); } </pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i>],</p> <p>[edit protocols isis interface <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>detection-time threshold and transmit-interval threshold options added in Junos OS Release 8.2.</p> <p>Support for logical systems introduced in Junos OS Release 8.3.</p> <p>no-adaptation statement introduced in Junos OS Release 9.0.</p> <p>authentication algorithm, authentication key-chain, and authentication loose-check options introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
Description	Configure bidirectional failure detection timers and authentication.
Options	<p>authentication algorithm <i>algorithm-name</i> —Configure the algorithm used to authenticate the specified BFD session: simple-password, keyed-md5, keyed-sha-1, meticulous-keyed-md5, meticulous-keyed-sha-1.</p> <p>authentication key-chain <i>key-chain-name</i> —Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the authentication-key-chains key-chain statement at the [edit security] hierarchy level.</p> <p>authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication might not be configured at both ends of the BFD session.</p>

detection-time threshold *milliseconds*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

minimum-interval *milliseconds*—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

Range: 1 through 255,000

minimum-receive-interval *milliseconds*—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

Range: 1 through 255,000

multiplier *number*—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

no-adaptation—Specify that BFD sessions not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold *milliseconds*—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

transmit-interval minimum-interval *milliseconds*—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

Range: 1 through 255,000

version—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version)

Default: automatic

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

export (Protocols IS-IS)

Syntax	<code>export [<i>policy-names</i>];</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols isis],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>isis],</code> <code>[edit protocols isis],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols isis]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	<p>Apply one or more policies to routes being exported from the routing table into IS-IS.</p> <p>All routing protocols store the routes that they learn in the routing table. The routing table uses this collected route information to determine the active routes to destinations. The routing table then installs the active routes into its forwarding table and exports them into the routing protocols. It is these exported routes that the protocols advertise.</p> <p>For each protocol, you control which routes the protocol stores in the routing table and which routes the routing table exports into the protocol from the routing table by defining a <i>routing policy</i> for that protocol.</p> <div><p>NOTE: For IS-IS, you cannot apply routing policies that affect how routes are imported into the routing table; doing so with a link-state protocol can easily lead to an inconsistent topology database.</p></div>
Options	<i>policy-names</i> —Name of one or more policies.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Redistributing OSPF Routes into IS-IS</i>• Example: Configuring an IS-IS Default Route Policy on Logical Systems on page 3356

external-preference (Protocols IS-IS)

hello-padding

Syntax	hello-padding (adaptive disable loose strict);
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i>], [edit protocols isis interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	<p>Configure padding on hello packets to accommodate asymmetrical maximum transfer units (MTUs) from different hosts.</p> <p>This helps to prevent a premature adjacency Up state when one routing device's MTU does not meet the requirements to establish the adjacency.</p> <p>As an OSI Layer 2 protocol, IS-IS does not support data fragmentation. Therefore, maximum packet sizes must be established and supported between two routers. During adjacency establishment, the IS-IS protocol makes sure that the link supports a packet size of 1492 bytes by padding outgoing hello packets up to the maximum packet size of 1492 bytes.</p> <p>This is the default behavior of the Junos OS IS-IS implementation. However, Junos OS provides an option to disable hello padding that can override this behavior.</p> <p>There are four types of hello padding:</p> <ul style="list-style-type: none">• Adaptive padding—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state type, length, and value (TLV) tuple. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. Adaptive padding has more overhead than loose padding and is able to detect MTU asymmetry from one side of the connection. This one-sided detection can result in generation of extra link-state PDUs that are flooded throughout the network. Specify the adaptive option to configure enough padding to establish an adjacency to neighbors.• Disabled padding—Padding is disabled on all types of interfaces for all adjacency states. Specify the disable option to accommodate interfaces that support less than the default packet size of 1492 bytes.• Loose padding (the default)—The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. Loose padding might not be able to detect certain situations such as asymmetrical MTUs between the routing devices. Specify the loose option to configure enough padding to initialize an adjacency to neighbors.

- **Strict padding**—Padding is done on all interface types and for all adjacency states, and is continuous. Strict padding has the most overhead. The advantage is that strict padding detects MTU issues on both sides of a link. Specify the **strict** option to configure padding to allow all adjacency states with neighbors.

Options **adaptive**—Configure padding until the neighbor adjacency is established and active.

disable—Disable padding on all types of interfaces for all adjacency states.

loose—Configure padding until the state of the adjacency is initialized.

strict—Configure padding for all adjacency states.

Required Privilege Level routing—To view this statement in the configuration.
 routing-control—To add this statement to the configuration.

hold-time (Protocols IS-IS)

Syntax	<code>hold-time seconds;</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</code> <code>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	<p>Set the length of time a neighbor considers this router to be operative (up) after receiving a hello packet. If the neighbor does not receive another hello packet within the specified time, it marks this routing device as inoperative (down). The hold time itself is advertised in the hello packets.</p> <p>The hold time specifies how long a neighbor should consider this routing device to be operative without receiving another hello packet. If the neighbor does not receive a hello packet from this routing device within the hold time, it marks the routing device as being unavailable.</p>
Options	<p>seconds—Hold-time value, in seconds.</p> <p>Range: 3 through 65,535 seconds, or 1 to send out hello packets every 333 milliseconds</p> <p>Default: 9 seconds (for designated intermediate system [DIS] routers), 27 seconds (for non-DIS routers; three times the default hello interval)</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring IS-IS</i>• hello-interval on page 2691

ignore-attached-bit

Syntax	ignore-attached-bit;
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols isis],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis],</p> <p>[edit protocols isis],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
Description	<p>Ignore the attached bit on IS-IS Level 1 routers. Configuring this statement enables the routing device to ignore the attached bit on incoming Level 1 link-state PDUs. If the attached bit is ignored, no default route, which points to the routing device which has set the attached bit, is installed.</p> <p>There might be times, such as during a denial-of-service (DoS) attack, that you do not want a Level 1 router to be able to forward traffic based on a default route.</p> <p>To prevent a routing device from being able to reach interarea destinations, you can prevent the routing device from installing the default route without affecting the status of its IS-IS adjacencies. The ignore-attached-bit statement is used to tell the routing device to ignore the presence of the attached bit in Level 1 link-state PDUs, which blocks the installation of the IS-IS default route.</p>
Default	The ignore-attached-bit statement is disabled by default.
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

lsp-interval

Syntax	<code>lsp-interval milliseconds;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i>], [edit protocols isis interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	<p>Configure the link-state PDU interval time.</p> <p>By default, the routing device sends one link-state PDU packet out an interface every 100 milliseconds. To disable the transmission of all link-state PDUs, set the interval to 0.</p> <p>Link-state PDU throttling by use of the lsp-interval statement controls the flooding pace to neighboring routing devices in order to not overload them.</p> <p>Also, consider that control traffic (such as link-state PDUs and related packets) might delay user traffic (information packets) because control traffic always has precedence in terms of scheduling on the routing device interface cards. Unfortunately, the control traffic transmission rate is not decreased on low-bandwidth interfaces, such as DS-0 or fractional T1 and E1 interface. Line control traffic stays the same. On a low-bandwidth circuit that is transmitting 30 full-MTU-sized packets, there is not much bandwidth left over for other types of packets.</p>
Default	By default, the routing device sends one link-state PDU out an interface every 100 milliseconds.
Options	<p>milliseconds—Number of milliseconds between the sending of link-state PDUs. Specifying a value of 0 blocks all link-state PDU transmission.</p> <p>Range: 0 through 1000 milliseconds</p> <p>Default: 100 milliseconds</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring the Transmission Frequency for Link-State PDUs on IS-IS Interfaces</i>

lsp-lifetime

Syntax	<code>lsp-lifetime <i>seconds</i>;</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols isis],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis],</p> <p>[edit protocols isis],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
Description	<p>Specify how long a link-state PDU originating from the routing device should persist in the network. The routing device sends link-state PDUs often enough so that the link-state PDU lifetime never expires.</p> <p>Because link-state PDUs have a maximum lifetime, they need to be refreshed. Refreshing means that a routing device needs to re-originate its link-state PDUs periodically. The re-origination interval must be less than the link-state PDU's lifetime. For example, if the link-state PDU is valid for 1200 seconds, the routing device needs to refresh the link-state PDU in less than 1200 seconds to avoid removal of the link-state PDU from the link-state database by other routing devices. The recommended maximum link-state PDU origination interval is the lifetime minus 300 seconds. So, in a default environment this would be 900 seconds. In Junos OS, the refresh interval is derived from the lifetime and is equal to the lifetime minus 317 seconds. You can change the lifetime to a higher value to reduce the number of refreshes in the network. (You would rarely want to increase the number of refreshes.) Often these periodic link-state PDU refreshes are referred to as refresh noise, and network administrators want to reduce this noise as much as possible.</p> <p>The show isis overview command displays the link-state PDU lifetime.</p>
Default	By default, link-state PDUs are maintained in network databases for 1200 seconds (20 minutes) before being considered invalid. This length of time, called the <i>LSP lifetime</i> , normally is sufficient to guarantee that link-state PDUs never expire.
Options	<p><i>seconds</i>—link-state PDU lifetime, in seconds.</p> <p>Range: 350 through 65,535 seconds</p> <p>Default: 1200 seconds</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • <i>Example: Configuring the Transmission Frequency for Link-State PDUs on IS-IS Interfaces</i> • http://www.juniper.net/us/en/training/certification/JNCIP_studyguide.pdf

max-areas

Syntax	<code>max-areas <i>number</i>;</code>

metric (Protocols IS-IS)

Syntax	<code>metric <i>metric</i>;</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
Description	Specify the metric value for the level.

All IS-IS routes have a cost, which is a routing metric that is used in the IS-IS link-state calculation. The cost is an arbitrary, dimensionless integer that can be from 1 through 63, or from 1 through 16,777,215 ($2^{24} - 1$) if you are using wide metrics.

Similar to other routing protocols, IS-IS provides a way of exporting routes from the routing table into the IS-IS network. When a route is exported into the IS-IS network without a specified metric, IS-IS uses default metric values for the route, depending on the protocol that was used to learn the route.

Table 217 on page 2710 depicts IS-IS route export metric default values.

Table 217: Default Metric Values for Routes Exported into IS-IS

Protocol Used for Learning the Route	Default Metric Value
Direct	10
Static	Same as reported by the protocol used for exporting the route
Aggregate	10
Generate	10
RIP	Same as reported by the protocol used for exporting the route
OSPF	Same as reported by the protocol used for exporting the route
BGP	10

The default metric values behavior can be customized by using routing policies.

Options	<i>metric</i> —Metric value.
	Range: 1 through 63, or 1 through 16,777,215 (if you have configured wide metrics)

Default: 10 (for all interfaces except lo0), 0 (for the lo0 interface)

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Example: Enabling Wide IS-IS Metrics for Traffic Engineering</i> • <i>te-metric</i> • wide-metrics-only on page 2735

no-adjacency-holddown

Syntax	no-adjacency-holddown;

overload (Protocols IS-IS)

Syntax	<pre>overload { advertise-high-metrics; allow-route-leaking; timeout <i>seconds</i>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols <i>isis</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <i>isis</i>], [edit protocols <i>isis</i>], [edit routing-instances <i>routing-instance-name</i> protocols <i>isis</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	<p>Configure the local routing device so that it appears to be overloaded. This statement causes the routing device to continue participating in IS-IS routing, but prevents it from being used for transit traffic. Traffic destined to immediately attached subnets continues to transit the routing device.</p> <p>You can also advertise maximum link metrics in network layer reachability information (NLRI) instead of setting the overload bit.</p> <p>You configure or disable overload mode in IS-IS with or without a timeout. Without a timeout, overload mode is set until it is explicitly deleted from the configuration. With a timeout, overload mode is set if the time elapsed since the IS-IS instance started is less than the specified timeout.</p> <p>A timer is started for the difference between the timeout and the time elapsed since the instance started. If the time elapsed after the IS-IS instance is enabled is less than the specified timeout, overload mode is set. When the timer expires, overload mode is cleared. In overload mode, the routing device IS-IS advertisements are originated with the overload bit set. This causes the transit traffic to take paths around the routing device. However, the overloaded routing device's own links are still accessible.</p> <p>The value of the overload bit depends on these three scenarios:</p> <ol style="list-style-type: none">1. When the overload bit has already been set to a given value and the routing process is restarted: Link-state PDUs are regenerated with the overload bit cleared.2. When the overload bit is reset to a lesser value while the routing process is running: Link-state PDUs are regenerated with the overload bit cleared.3. When the overload bit is reset to a greater value while the routing process is running: Link-state PDUs are regenerated with the overload bit set to the difference between the old and new value. <p>In overload mode, the routing device advertisement is originated with all the transit routing device links (except stub) set to a metric of 0xFFFF. The stub routing device links are</p>

advertised with the actual cost of the interfaces corresponding to the stub. This causes the transit traffic to avoid the overloaded routing device and take paths around the routing device.

To understand the reason for setting the overload bit, consider that BGP converges slowly. It is not very good at detecting that a neighbor is down because it has slow-paced keepalive timers. Once the BGP neighbor is determined to be down, it can take up to 2 minutes for a BGP router to declare the neighbor down. IS-IS is much quicker. IS-IS only takes 10-30 seconds to detect absent peers. It is the slowness of BGP, more precisely the slowness of internal BGP (IBGP), that necessitates the use of the overload bit. IS-IS and BGP routing are mutually dependent on each other. If both do not converge at the same time, traffic is dropped without notification (black holed).

You might want to configure the routing device so that it appears to be overloaded when you are restarting routing on the device. Setting the overload bit for a fixed amount of time right after a restart of the routing protocol process (rpd) ensures that the router does not receive transit traffic while the routing protocols (especially IBGP) are still converging.

Setting the overload bit is useful when performing hardware or software maintenance work on a routing device. After the maintenance work, clear the overload bit to carry on forwarding transit traffic. Manual clearing of the overload bit is not always possible. What is needed is an automated way of clearing the overload bit after some amount of time. Most networks use a time value of 300 seconds. This 5-minute value provides a good balance, allowing time to bring up even large internal IBGP meshes, while still relatively quick.

Another appropriate application for setting for the overload bit is on dedicated devices such as BGP route reflectors, which are intentionally not meant to carry any transit traffic. In this case, you would not use the timer.

You can verify that the overload bit is set by running the **show isis database** command.

Options **advertise-high-metrics**—Advertise maximum link metrics in NLRIs instead of setting the overload bit.

The **advertise-high-metric** setting is only valid while the routing device is in overload mode.

When **advertise-high-metric** is configured, IS-IS does not set the overload bit. Rather, it sets the metric to 63 or 16,777,214, depending whether wide metrics are enabled. This allows the overloaded routing device to be used for transit as a last resort.

An L1-L2 router in overload mode stops leaking route information between L1 and L2 levels and clears its attached bit. This is also true when **advertise-high-metrics** is configured.

allow-route-leaking—Enable leaking of route information into the network even if the overload bit is set.

NOTE: The **allow-route-leaking** option does not work if the routing device is in dynamic overload mode. Dynamic overload can occur if the device has exceeded its resource limits, such as the prefix limit.

timeout seconds—Number of seconds at which the overloading is reset.

Range: 60 through 1800 seconds

Default: 0 seconds

Required Privilege Level routing—To view this statement in the configuration.
 routing-control—To add this statement to the configuration.

reference-bandwidth (Protocols IS-IS)

Syntax	<code>reference-bandwidth <i>reference-bandwidth</i>;</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols <i>isis</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <i>isis</i>],</code> <code>[edit protocols <i>isis</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <i>isis</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	<p>Optimize routing based on bandwidth by setting the reference bandwidth used in calculating the default interface cost.</p> <p>All IS-IS interfaces have a cost, which is a routing metric that is used in the IS-IS link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics. When there are several equal-cost routes to a destination, traffic is distributed equally among them.</p> <p>The cost of a route is described by a single dimensionless metric that is determined using the following formula:</p> $\text{cost} = \text{reference-bandwidth} / \text{bandwidth}$ <p>For example, if you set the reference bandwidth to 1 Gbps (that is, <i>reference-bandwidth</i> is set to 1,000,000,000), a 100-Mbps interface has a routing metric of 10.</p> <p>All IS-IS interfaces have a cost, which is a routing metric that is used in the IS-IS link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics.</p>
Options	<p><i>reference-bandwidth</i>—Reference bandwidth value in bits per second.</p> <p>Range: 9600 through 1,000,000,000,000 bps</p> <p>Default: None</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

spf-options (Protocols IS-IS)

Syntax	<pre>spf-options { delay <i>milliseconds</i>; holddown <i>milliseconds</i>; rapid-runs <i>number</i>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols <i>isis</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <i>isis</i>], [edit protocols <i>isis</i>], [edit routing-instances <i>routing-instance-name</i> protocols <i>isis</i>]
Release Information	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	<p>Configure options for running the shortest-path-first (SPF) algorithm.</p> <p>Running the SPF algorithm is usually the beginning of a series of larger system-wide events. For example, the SPF algorithm can lead to interior gateway protocol (IGP) prefix changes, which then lead to BGP nexthop resolution changes. Consider what happens if there are rapid link changes in the network. The local routing device can become overwhelmed. This is why it sometimes makes sense to throttle the scheduling of the SPF algorithm.</p> <p>You can configure the following SPF options:</p> <ul style="list-style-type: none">• The delay in the time between the detection of a topology change and when the SPF algorithm actually runs.• The maximum number of times that the SPF algorithm can run in succession before the hold-down timer begins.• The time to hold down, or wait, before running another SPF calculation after the SPF algorithm has run in succession the configured maximum number of times. <p>If the network stabilizes during the hold-down period and the SPF algorithm does not need to run again, the system reverts to the configured values for the delay and rapid-runs statements.</p>
Options	<p>delay <i>milliseconds</i>—Time interval between the detection of a topology change and when the SPF algorithm runs.</p> <p>Range: 50 through 1000 milliseconds</p> <p>Default: 200 milliseconds</p> <p>holddown <i>milliseconds</i>—Time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession.</p> <p>Range: 2000 through 10,000 milliseconds</p> <p>Default: 5000 milliseconds</p>

rapid-runs *number*—Maximum number of times the SPF algorithm can run in succession.
After the maximum is reached, the holddown interval begins.

Range: 1 through 5

Default: 3

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traceoptions (Protocols IS-IS)

Syntax	<pre>traceoptions { file <i>name</i> <size <i>size</i>> <files <i>number</i>> <world-readable no-world-readable>; flag <i>flag</i> <flag-modifier> <disable>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols isis], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis], [edit protocols isis], [edit routing-instances <i>routing-instance-name</i> protocols isis]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	Configure IS-IS protocol-level tracing options. To specify more than one tracing operation, include multiple flag statements.

NOTE: The **traceoptions** statement is not supported on QFabric systems.

Default	The default IS-IS protocol-level tracing options are those inherited from the routing protocols traceoptions statement included at the [edit routing-options] hierarchy level.
Options	<p>disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>name</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks (" "). All files are placed in the directory /var/log. We recommend that you place IS-IS tracing output in the file isis-log.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p>Range: 2 through 1000 files</p> <p>Default: 10 files</p> <p>flag <i>flag</i>—Tracing operation to perform. To specify more than one flag, include multiple flag statements.</p> <p>IS-IS Protocol-Specific Tracing Flags</p>

- **csn**—Complete sequence number PDU (CSNP) packets
- **error**—Errored IS-IS packets
- **graceful-restart**—Graceful restart operation
- **hello**—Hello packets
- **ldp-synchronization**—Synchronization between IS-IS and LDP
- **lsp**—Link-state PDUs
- **lsp-generation**—Link-state PDU generation packets
- **packets**—All IS-IS protocol packets
- **psn**—Partial sequence number PDU (PSNP) packets
- **spf**—Shortest-path-first calculations

Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations, including adjacency changes

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level	routing and trace—To view this statement in the configuration.
	routing-control and trace-control—To add this statement to the configuration.

wide-metrics-only

Syntax	wide-metrics-only;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols isis level level-number], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis level level-number], [edit protocols isis level level-number], [edit routing-instances <i>routing-instance-name</i> protocols isis level level-number]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	Configure IS-IS to generate metric values greater than 63 on a per IS-IS level basis. Normally, IS-IS metrics can have values up to 63, and IS-IS generates two type, length, and value (TLV) tuples, one for an IS-IS adjacency and the second for an IP prefix. To allow IS-IS to support traffic engineering, a second pair of TLVs has been added to IS-IS, one for IP prefixes and the second for IS-IS adjacency and traffic engineering information. With these TLVs, IS-IS metrics can have values up to 16,777,215 ($2^{24} - 1$). To configure IS-IS to generate only the new pair of TLVs and thus to allow the wider range of metric values, include the wide-metrics-only statement.
Default	By default, Junos OS supports the sending and receiving of wide metrics. Junos OS allows a maximum metric value of 63 and generates both pairs of TLVs.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

clear isis database

Syntax	clear isis database <entries> <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)> <purge>
Syntax (EX Series Switches and QFX Series)	clear isis database <entries> <instance <i>instance-name</i> > <purge>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. purge option introduced in Junos OS Release 9.0. Command introduced in Junos OS Release 12.1 for the QFX Series.
Description	Remove the entries from the IS-IS link-state database, which contains prefixes and topology information. You can also use purge with any of the options to initiate a network-wide purge of link-state PDUs rather than the local deletion of entries from the IS-IS link-state database.
<div> CAUTION: In a production network, the purge command option might cause short-term network-wide traffic disruptions.</div>	
Options	none —Remove all entries from the IS-IS link-state database for all routing instances. entries —(Optional) Name of the database entry. instance <i>instance-name</i> —(Optional) Clear all entries for the specified routing instance. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. purge —(Optional) Discard all entries in the IS-IS link-state database.
Required Privilege Level	clear

Output Fields	Table 218 on page 2744 describes the output fields for the show isis adjacency command. Output fields are listed in the approximate order in which they appear.	

Table 218: show isis adjacency Output Fields

Field Name	Field Description	Level of Output
Interface	Interface through which the neighbor is reachable.	All levels

Table 218: show isis adjacency Output Fields (*continued*)

Field Name	Field Description	Level of Output
System	System identifier (sysid), displayed as a name, if possible.	brief
L or Level	Level: <ul style="list-style-type: none"> • 1—Level 1 only • 2—Level 2 only • 3—Level 1 and Level 2 An exclamation point (!) preceding the level number indicates that the adjacency is missing an IP address.	All levels
State	State of the adjacency: Up , Down , New , One-way , Initializing , or Rejected .	All levels
Hold (secs)	Remaining hold time of the adjacency.	brief
SNPA	Subnetwork point of attachment (MAC address of the next hop).	brief
Expires in	How long until the adjacency expires, in seconds.	detail
Priority	Priority to become the designated intermediate system.	detail extensive
Up/Down transitions	Count of adjacency status changes from Up to Down or from Down to Up .	detail
Last transition	Time of the last Up/Down transition.	detail
Circuit type	Bit mask of levels on this interface: 1=Level 1 router; 2=Level 2 router; 3=both Level 1 and Level 2 router.	detail
Speaks	Protocols supported by this neighbor.	detail extensive
MAC address	MAC address of the interface.	detail extensive
Topologies	Supported topologies.	detail extensive
Restart capable	Whether a neighbor is capable of graceful restart: Yes or No .	detail extensive
Adjacency advertisement: Advertise	This routing device has signaled to advertise this interface to its neighbors in their link-state PDUs.	detail extensive
Adjacency advertisement: Suppress	This neighbor has signaled not to advertise the interface in the routing device's outbound link-state PDUs.	detail extensive
IP addresses	IP address of this neighbor.	detail extensive

Table 218: show isis adjacency Output Fields (*continued*)

Field Name	Field Description	Level of Output
Transition log	<p>List of recent transitions, including:</p> <ul style="list-style-type: none"> • When—Time at which an IS-IS adjacency transition occurred. • State—Current state of the IS-IS adjacency (up, down, or rejected). <ul style="list-style-type: none"> • Up—Adjacency is up and operational. • Down—Adjacency is down and not available. • Rejected—Adjacency has been rejected. • Event—Type of transition that occurred. <ul style="list-style-type: none"> • Seenself—Possible routing loop has been detected. • Interface down—IS-IS interface has gone down and is no longer available. • Error—Adjacency error. • Down reason—Reason that an IS-IS adjacency is down: <ul style="list-style-type: none"> • 3-Way Handshake Failed—Connection establishment failed. • Address Mismatch—Address mismatch caused link failure. • Aged Out—Link expired. • ISO Area Mismatch—IS-IS area mismatch caused link failure. • Bad Hello—Unacceptable hello message caused link failure. • BFD Session Down—Bidirectional failure detection caused link failure. • Interface Disabled—IS-IS interface is disabled. • Interface Down—IS-IS interface is unavailable. • Interface Level Disabled—IS-IS level is disabled. • Level Changed—IS-IS level has changed on the adjacency. • Level Mismatch—Levels on adjacency are not compatible. • MPLS LSP Down—Label-switched path (LSP) is unavailable. • MT Topology Changed—IS-IS topology has changed. • MT Topology Mismatch—IS-IS topology is mismatched. • Remote System ID Changed—Adjacency peer system ID changed. • Protocol Shutdown—IS-IS protocol is disabled. • CLI Command—Adjacency brought down by user. • Unknown—Unknown. 	extensive

Sample Output

show isis adjacency

```

user@host> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
at-2/3/0.0         ranier      3 Up          23

```

show isis adjacency brief

The output for the **show isis adjacency brief** command is identical to that for the **show isis adjacency** command. For sample output, see [show isis adjacency on page 2746](#).

show isis adjacency detail

```
user@host> show isis adjacency detail
ranier
  Interface: at-2/3/0.0, Level: 3, State: Up, Expires in 21 secs
  Priority: 0, Up/Down transitions: 1, Last transition: 00:01:09 ago
  Circuit type: 3, Speaks: IP, IPv6
  Topologies: Unicast
  Restart capable: Yes
  IP addresses: 11.1.1.2
```

show isis adjacency extensive

```
user@host> show isis adjacency extensive
ranier
  Interface: at-2/3/0.0, Level: 3, State: Up, Expires in 22 secs
  Priority: 0, Up/Down transitions: 1, Last transition: 00:01:16 ago
  Circuit type: 3, Speaks: IP, IPv6
  Topologies: Unicast
  Restart capable: Yes
  IP addresses: 11.1.1.2
  Transition log:
  When           State      Event      Down reason
  Wed Nov  8 21:24:25  Up        Seenself

show isis authentication

Syntax	show isis authentication <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switches and QFX Series)	show isis authentication <instance <i>instance-name</i> >
Release Information	Command introduced in Junos OS Release 7.5. Command introduced in Junos OS Release 9.0 for EX Series switches. Support for hitless authentication key rollover introduced in Junos OS Release 11.2. Command introduced in Junos OS Release 12.1 for the QFX Series.
Description	Display information about IS-IS authentication.
Options	<p>none—Display information about IS-IS authentication.</p> <p>instance <i>instance-name</i>—(Optional) Display IS-IS authentication for the specified routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
List of Sample Output	show isis authentication on page 2749 show isis authentication (With Hitless Authentication Key Rollover Configured) on page 2749
Output Fields	Table 219 on page 2748 describes the output fields for the show isis authentication command. Output fields are listed in the approximate order in which they appear.

Table 219: show isis authentication Output Fields

Field Name	Field Description
Interface	Interface name.
Level	IS-IS level.
IIH Auth	IS-IS Hello (IIH) packet authentication type. Displays the name of the active keychain if hitless authentication key rollover is configured.
CSN Auth	Complete sequence number authentication type.
PSN Auth	Partial sequence number authentication type.

Table 219: show isis authentication Output Fields (*continued*)

Field Name	Field Description
L1 LSP Authentication	Layer 1 link-state PDU authentication type.
L2 LSP Authentication	Layer 2 link-state PDU authentication type.

Sample Output

show isis authentication

```

user@host> show isis authentication
Interface          Level IIH Auth  CSN Auth  PSN Auth
at-2/3/0.0         1      Simple   Simple    Simple
                   2      MD5      MD5       MD5

L1 LSP Authentication: Simple
L2 LSP Authentication: MD5

```

show isis authentication (With Hitless Authentication Key Rollover Configured)

```

user@host> show isis authentication
Interface          Level IIH Auth  CSN Auth  PSN Auth
so-0/1/3.0         2      hakrhello MD5       MD5

L2 LSP Authentication: MD5

```

show isis backup coverage

Syntax	show isis backup coverage <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switches and QFX Series)	show isis backup coverage <instance <i>instance-name</i> >
Release Information	Command introduced in Junos OS Release 9.5. Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
Description	Display information about the level of backup coverage available.
Options	<p>none—Display information about the level of backup coverage available for all the nodes and prefixes in the network.</p> <p>instance <i>instance-name</i>—(Optional) Display information about the level of backup coverage for a specific IS-IS routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>Example: Configuring Link and Node Protection for IS-IS Routes</i> • show isis backup label-switched-path on page 2752
List of Sample Output	show isis backup coverage on page 2751
Output Fields	Table 220 on page 2750 lists the output fields for the show isis backup coverage command. Output fields are listed in the approximate order in which they appear.

Table 220: show isis backup coverage Output Fields

Field Name	Field Description
Topology	Type of topology or address family: IPV4 Unicast or IPV6 Unicast .
Level	IS-IS level: <ul style="list-style-type: none"> • 1—Level 1 • 2—Level 2
Node	By topology, the percentage of all routes configured on the node that are protected through backup coverage.

Table 220: show isis backup coverage Output Fields (*continued*)

Field Name	Field Description
IPv4	Percentage of IPv4 unicast routes that are protected through backup coverage.
IPv6	Percentage of IPv6 unicast routes that are protected through backup coverage.
CLNS	Percentage of Connectionless Network Service (CLNS) routes that are protected through backup coverage.

Sample Output

show isis backup coverage

```
user@host> show isis backup coverage
Backup Coverage:
  Topology  Level  Node   IPv4   IPv6   CLNS
  IPv4 Unicast    2  28.57% 22.22% 0.00% 0.00%
  IPv6 Unicast    2   0.00% 0.00% 0.00% 0.00%
```

show isis backup label-switched-path

Syntax	show isis backup label-switched-path <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switches and QFX Series)	show isis backup label-switched-path
Release Information	Command introduced in Junos OS Release 9.5. Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
Description	Display information about MPLS label-switched-paths (LSPs) designated as backup routes for IS-IS routes.
Options	none —Display information about MPLS LSPs designated as backup routes for IS-IS routes. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>Example: Configuring Link and Node Protection for IS-IS Routes</i> • show isis backup coverage on page 2750
List of Sample Output	show isis backup label-switched-path on page 2753
Output Fields	Table 221 on page 2752 lists the output fields for the show isis backup label-switched-path command. Output fields are listed in the approximate order in which they appear.

Table 221: show isis backup label-switched-path Output Fields

Field Name	Field Description
Backup MPLS LSPs	List of MPLS LSPs designated as backup paths for IS-IS routes.
Egress	IP address of the egress routing device for the LSP.
Status	State of the LSP: <ul style="list-style-type: none"> • Up—The routing device can detect RSVP hello messages from the neighbor. • Down—The routing device has received one of the following indications: <ul style="list-style-type: none"> • Communication failure from the neighbor. • Communication from IGP that the neighbor is unavailable. • Change in the sequence numbers in the RSVP hello messages sent by the neighbor. • Deleted—LSP is no longer available as a backup path.

Table 221: show isis backup label-switched-path Output Fields (*continued*)

Field Name	Field Description
Last change	Time elapsed since the neighbor state changed either from up to down or from down to up. The format is <i>hh:mm:ss</i> .
TE-metric	Configured traffic engineering metric.
Metric	Configured metric.

Sample Output

show isis backup label-switched-path

```
user@host> show isis backup label-switched-path
Backup MPLS LSPs:
f-to-g, Egress: 192.168.1.4, Status: up, Last change: 06:12:03
TE-metric: 9, Metric: 0
```

show isis backup spf results

Syntax	<code>show isis backup spf results</code> <code><instance <i>instance-name</i>></code> <code><level (1 2)></code> <code><logical-system (all <i>logical-system-name</i>)></code> <code><no-coverage></code> <code><topology (ipv4-unicast ipv6-multicast ipv6-unicast unicast)></code>
Syntax (EX Series Switches)	<code>show isis backup spf results</code> <code><instance <i>instance-name</i>></code> <code><level (1 2)></code> <code><no-coverage></code> <code><topology (ipv4-unicast unicast)></code>
Release Information	Command introduced in Junos OS Release 9.5.
Description	Display information about IS-IS shortest-path-first (SPF) calculations for backup paths.
Options	<p>none—Display information about IS-IS SPF calculations for all backup paths for all destination nodes.</p> <p>instance <i>instance-name</i>—(Optional) Display SPF calculations for backup paths for the specified routing instance.</p> <p>level (1 2)—(Optional) Display SPF calculations for the backup paths for the specified IS-IS level.</p> <p>logical-system <i>logical-system-name</i>—(Optional) Display SPF calculations for the backup paths for all logical systems or on a particular logical system.</p> <p>no-coverage—(Optional) Display SPF calculations only for destinations that do not have backup coverage.</p> <p>topology (ipv4-multicast ipv6-multicast ipv6-unicast unicast)—(Optional) Display SPF calculations for backup paths for the specified topology only.</p>

Output Fields	Table 222 on page 2755 lists the output fields for the show isis backup spf results command. Output fields are listed in the approximate order in which they appear.

Table 222: show isis backup spf results Output Fields

Field Name	Field Description
<i>node-name</i>	Name of the destination node.
Address	Address of the destination node.
Primary next-hop	Interface and name of the node of the primary next hop to reach the destination.
Root	Name of the next-hop neighbor.
Metric	Metric to the node.
Eligible	Indicates that the next-hop neighbor has been designated as a backup path to the destination node.
Backup next-hop	Name of the interface of the backup next hop.
SNPA	Subnetwork point of attachment (MAC address of the next hop).
LSP	Name of the MPLS label-switched path (LSP) designated as a backup path.
Not eligible	Indicates that the next-hop neighbor cannot function as a backup path to the destination.
Reason	Describes why the next-hop neighbor is designated as Not eligible as a backup path.

Output Fields Table 223 on page 2759 describes the output fields for the **show isis database** command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your customer support representative.

Table 223: show isis database Output Fields

Field Name	Field Description	Level of Output
Interface name	Name of the interface on which the link-state PDU has been received; always IS-IS for this command.	All levels
level	Level of intermediate system: <ul style="list-style-type: none"> • 1—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system. • 2—Intermediate system routes between areas and toward other ASs. 	All levels
LSP ID	Link-state PDU identifier.	All levels
Sequence	Sequence number of the link-state PDU.	All levels
Checksum	Checksum value of the link-state PDU.	All levels
Lifetime (secs)	Remaining lifetime of the link-state PDU, in seconds.	All levels
Attributes	Attributes of the specified database: L1 , L2 , Overload , or Attached (L1 only).	none brief
# LSPs	Total number of link-state PDUs in the specified link-state database.	none brief
IP prefix	Prefix advertised by this link-state PDU.	detail extensive
IS neighbor	IS-IS neighbor of the advertising system.	detail extensive
ES neighbor	(J Series routers only) An ES-IS neighbor of the advertising system.	detail extensive
IP prefix	IPv4 prefix advertised by this link-state PDU.	detail extensive
V6 prefix	IPv6 prefix advertised by this link-state PDU.	detail extensive
Metric	Metric of the prefix or neighbor.	detail extensive
Header	<ul style="list-style-type: none"> • LSP ID—Link state PDU identifier of the header. • Length—Header length. • Allocated Length—Amount of length available for the header. • Router ID—Address of the local routing device. • Remaining Lifetime—Remaining lifetime of the link-state PDU, in seconds. 	extensive

Table 223: show isis database Output Fields (*continued*)

Field Name	Field Description	Level of Output
Packet	<ul style="list-style-type: none"> • LSP ID—The identifier for the link-state PDU. • Length—Packet length. • Lifetime—Remaining lifetime, in seconds. • Checksum—The checksum of the link-state PDU. • Sequence—The sequence number of the link-state PDU. Every time the link-state PDU is updated, this number increments. • Attributes—Packet attributes. • NLPID—Network layer protocol identifier. • Fixed length—Specifies the set length for the packet. 	extensive
TLVs	<ul style="list-style-type: none"> • Area Address—Area addresses that the routing device can reach. • Speaks—Supported routing protocols. • IP router id—ID of the routing device (usually the IP address). • IP address—IPv4 address. • Hostname—Assigned name of the routing device. • IP prefix—IP prefix of the routing device. • Metric—IS-IS metric that measures the cost of the adjacency between the originating routing device and the advertised routing device. • IP extended prefix—Extended IP prefix of the routing device. • IS neighbor—Directly attached neighbor's name and metric. • IS extended neighbor—Directly attached neighbor's name, metric, and IP address. 	extensive

Sample Output

show isis database

```

user@host> show isis database
IS-IS level 1 link-state database:

show isis hostname

Syntax	show isis hostname <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switches and QFX Series)	show isis hostname
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
Description	Display IS-IS hostname database information.
Options	none —Display IS-IS hostname database information. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
List of Sample Output	show isis hostname on page 2765
Output Fields	Table 224 on page 2765 describes the output fields for the show isis hostname command. Output fields are listed in the approximate order in which they appear.

Table 224: show isis hostname Output Fields

Field Name	Field Description
System Id	System identifier mapped to the hostname.
Hostname	Hostname mapped to the system identifier.
Type	Type of mapping between system identifier and hostname. <ul style="list-style-type: none">• Dynamic—Hostname mapping determined as described in RFC 2763, <i>Dynamic Hostname Exchange Mechanism for IS-IS</i>.• Static—Hostname mapping configured by user.

Sample Output

show isis hostname

user@host> show isis hostname		
IS-IS hostname database:		
System Id	Hostname	Type
1921.6800.4201	isis1	Dynamic
1921.6800.4202	isis2	Static
1921.6800.4203	isis3	Dynamic

show isis interface

Syntax	<pre>show isis interface <brief detail extensive> <interface-name> <logical-system (all logical-system-name)></pre>
Syntax (EX Series Switches and QFX Series)	<pre>show isis interface <brief detail extensive> <interface-name></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p>
Description	<p>Display status information about IS-IS-enabled interfaces.</p> <div data-bbox="474 823 542 892" data-label="Image"> </div> <p>NOTE: If the configured metric for an IS-IS level is above 63, and the wide-metrics-only statement is not configured, the show isis interface detail command and the show isis interface extensive command display 63 as the metric value for that level. Configure the wide-metrics-only statement to generate metric values greater than 63 on a per IS-IS level basis.</p> <p>The show isis interface command displays the configured metric value for an IS-IS level irrespective of whether is configured or not.</p>
Options	<p>none—Display standard information about all IS-IS-enabled interfaces.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>interface-name—(Optional) Display information about the specified interface only.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <i>Example: Enabling Wide IS-IS Metrics for Traffic Engineering</i>

Output Fields	<p>Table 225 on page 2767 describes the output fields for the show isis interface command. Output fields are listed in the approximate order in which they appear.</p>

Table 225: show isis interface Output Fields

Field Name	Field Description	Level of Output
<i>interface-name</i>	Name of the interface.	detail
Designated router	Routing device selected by other routers that is responsible for sending link-state advertisements that describe the network. Used only on broadcast networks.	detail
Index	Interface index assigned by the Junos OS kernel.	detail
State	Internal implementation information.	detail
Circuit id	Circuit identifier.	detail
Circuit type	Circuit type: <ul style="list-style-type: none"> • 1—Level 1 only • 2—Level 2 only • 3—Level 1 and Level 2 	detail
LSP interval	Interval between link-state PDUs sent from the interface.	detail
CSNP interval	Interval between complete sequence number PDUs sent from the interface.	detail extensive
Sysid	System identifier.	detail
Interface	Interface through which the adjacency is made.	none brief
L or Level	Level: <ul style="list-style-type: none"> • 1—Level 1 only • 2—Level 2 only • 3—Level 1 and Level 2 	All levels
CirID	Circuit identifier.	none brief
Level 1 DR	Level 1 designated intermediate system.	none brief
Level 2 DR	Level 2 designated intermediate system.	none brief
L1/L2 Metric	Interface's metric for Level 1 and Level 2. If there is no information, the metric is 0.	none brief
Adjacency advertisement: Advertise	This routing device has signaled to advertise this interface to its neighbors in their label-switched paths (LSPs).	detail extensive
Adjacency advertisement: Suppress	This neighbor has signaled not to advertise this interface in the routing device's outbound LSPs.	detail extensive
Adjacencies	Number of adjacencies established on this interface.	detail

Table 225: show isis interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
Priority	Priority value for this interface.	detail
Metric	Metric value for this interface.	detail
Hello(s) / Hello Interval	Interface's hello interval.	detail extensive
Hold(s) / Hold Time	Interface's hold time.	detail extensive
Designated Router	Router responsible for sending network link-state advertisements, which describe all the routing devices attached to the network.	detail
Hello padding	Type of hello padding: <ul style="list-style-type: none"> • Adaptive—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state TLV. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. • Loose—(Default) The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. • Strict—Padding is performed on all interface types and for all adjacency states, and is continuous. 	extensive
LDP sync state	Current LDP synchronization state: in sync , in holddown , or not supported .	extensive
reason	Reason for being in the LDP sync state.	extensive
config holdtime	Configured value of the hold timer.	extensive
remaining	If the state is not in sync and the hold time is not infinity, then this field displays the remaining hold time in seconds.	extensive

Sample Output

show isis interface

```

user@host> show isis interface
IS-IS interface database:
Interface          L CirID Level 1 DR      Level 2 DR      L1/L2 Metric
at-2/3/0.0         3   0x1 Point to Point    Point to Point    10/10
1o0.0              0   0x1 Passive           Passive           0/0

```

show isis interface brief

The output for the **show isis interface brief** command is identical to that for the **show isis interface** command. For sample output, see [show isis interface on page 2768](#).

Syntax	show isis overview <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switches and QFX Series)	show isis overview <instance <i>instance-name</i> >
Release Information	Command introduced in Junos OS Release 8.5. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
Description	Display IS-IS overview information.
Options	none —Display standard overview information about IS-IS for all routing instances. instance <i>instance-name</i> —(Optional) Display overview information for the specified routing instance. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
List of Sample Output	show isis overview on page 2771
Output Fields	Table 226 on page 2770 lists the output fields for the show isis overview command. Output fields are listed in the approximate order in which they appear.

Table 226: show isis overview Output Fields

Field Name	Field Description
Instance	IS-IS routing instance.
Router ID	Router ID of the routing device.
Adjacency holddown	Adjacency holddown capability: enabled or disabled .
Maximum Areas	Maximum number of IS-IS areas advertised by the routing device.
LSP life time	Lifetime of the link-state PDU, in seconds.
Attached bit evaluation	Attached bit capability: enabled or disabled .
SPF delay	Delay before performing consecutive shortest-path-first (SPF) calculations.
SPF holddown	Delay before performing additional SPF calculations after the maximum number of consecutive SPF calculations is reached.

Table 226: show isis overview Output Fields (*continued*)

Field Name	Field Description
SPF rapid runs	Maximum number of SPF calculations that can be performed in succession before the holddown timer begins.
Overload bit at startup is set	Overload bit capability is enabled.
Overload high metrics	Overload high metrics capability: enabled or disabled .
Overload timeout	Time period after which overload is reset and the time that remains before the timer is set to expire.
Traffic engineering	Traffic engineering capability: enabled or disabled .
Restart	Graceful restart capability: enabled or disabled .
Restart duration	Time period for complete reacquisition of IS-IS neighbors.
Helper mode	Graceful restart helper capability: enabled or disabled .
Level	IS-IS level: <ul style="list-style-type: none"> • 1—Level 1 information • 2—Level 2 information
IPv4 is enabled	IP Protocol version 4 capability is enabled.
IPv6 is enabled	IP Protocol version 6 capability is enabled.
CLNS is enabled	(J Series routers only) OSI CLNP capability is enabled.
Internal route preference	Preference value of internal routes.
External route preference	Preference value of external routes.
Wide area metrics are enabled	Wide area metrics capability is enabled.
Narrow metrics are enabled	Narrow metrics capability is enabled.

Sample Output

show isis overview

```

user@host> show isis overview
Instance: master
Router ID: 192.168.1.220
Adjacency holddown: enabled

```

Maximum Areas: 3
LSP life time: 65535
Attached bit evaluation: enabled
SPF delay: 200 msec, SPF holddown: 5000 msec, SPF rapid runs: 3
Overload bit at startup is set
 Overload high metrics: disabled
 Overload timeout: 300 sec, expires in 295 seconds
IPv4 is enabled, IPv6 is enabled
Traffic engineering: enabled
Restart: Enabled
 Restart duration: 210 sec
 Helper mode: Enabled
Level 1
 Internal route preference: 15
 External route preference: 160
 Wide metrics are enabled, Narrow metrics are enabled
Level 2
 Internal route preference: 18
 External route preference: 165
 Wide metrics are enabled

show isis route

Syntax	<pre>show isis route <destination> <inet inet6> <instance instance-name> <logical-system (all logical-system-name)> <topology (ipv4-multicast ipv6-multicast ipv6-unicast unicast)></pre>
Syntax (EX Series Switches and QFX Series)	<pre>show isis route <destination> <inet inet6> <instance instance-name> <topology (ipv4-multicast ipv6-multicast ipv6-unicast unicast)></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p>
Description	Display the routes in the IS-IS routing table.
Options	<p>none—Display all routes in the IS-IS routing table for all supported address families for all routing instances.</p> <p>destination—(Optional) Destination address for the route.</p> <p>inet inet6—(Optional) Display inet (IPv4) or inet6 (IPv6) routes, respectively.</p> <p>instance instance-name—(Optional) Display routes for the specified routing instance only.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>topology (ipv4-multicast ipv6-multicast ipv6-unicast unicast)—(Optional) Display routes for the specified topology only, or use unicast to display information, if available, for both IPv4 and IPv6 unicast topologies.</p>
Required Privilege Level	view
List of Sample Output	<p>show isis route logical-system on page 2774</p> <p>show isis route (CLNS) on page 2774</p> <p>show isis route on page 2775</p>
Output Fields	<p>Table 227 on page 2773 describes the output fields for the show isis route command. Output fields are listed in the approximate order in which they appear.</p>

Table 227: show isis route Output Fields

Field Name	Field Description
Current version	Number of the current version of the IS-IS routing table.

Table 227: show isis route Output Fields (*continued*)

Field Name	Field Description
L1	Version of Level 1 SPF that was run.
L2	Version of Level 2 SPF that was run.
Prefix	Destination of the route.
L	IS-IS level: <ul style="list-style-type: none"> • 1—Level 1 only • 2—Level 2 only • 3—Level 1 and Level 2
Version	Version of SPF that generated the route.
Metric	Metric value associated with the route.
Type	Metric type: int (internal) or ext (external).
Interface	Interface to the next hop.
Via	System identifier of the next hop, displayed as a name if possible.
ISO Routes	ISO routing table entries.
snpa	MAC address.

show isis spf

Syntax	show isis spf (brief log results) <instance <i>instance-name</i> > <level (1 2)> <logical-system (all <i>logical-system-name</i>)> <topology (ipv4-multicast ipv6-multicast ipv6-unicast unicast)>
Syntax (EX Series Switches)	show isis spf (brief log results) <instance <i>instance-name</i> > <level (1 2)> <topology (ipv4-multicast ipv6-multicast ipv6-unicast unicast)>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display information about IS-IS shortest-path-first (SPF) calculations.
Options	<p>brief—Display an overview of SPF calculations.</p> <p>instance <i>instance instance-name</i>—(Optional) Display SPF calculations for the specified routing instance.</p> <p>level (1 2)—(Optional) Display SPF calculations for the specified IS-IS level.</p> <p>log—Display the log of SPF calculations.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>results—Display the results of SPF calculations.</p> <p>topology (ipv4-multicast ipv6-multicast ipv6-unicast unicast)—(Optional) Display SPF calculations for the specified topology only.</p>
Required Privilege Level	view
List of Sample Output	show isis spf log on page 2778 show isis spf results logical-system on page 2779 show isis spf results (CLNS) on page 2780
Output Fields	Table 228 on page 2777 describes the output fields for the show isis spf command. Output fields are listed in the approximate order in which they appear.

Table 228: show isis spf Output Fields

Field Name	Field Description
Node	System ID of a node.
Metric	Metric to the node.

Table 228: show isis spf Output Fields (*continued*)

Field Name	Field Description
Interface	Interface of the next hop.
Via	System ID of the next hop.
SNPA	Subnetwork point of attachment (MAC address of the next hop).
Start time	(log option only) Time that the SPF computation started.
Elapsed (secs)	(log option only) Length of time, in seconds, required to complete the SPF computation.
Count	(log option only) Number of times the SPF was triggered.
Reason	(log option only) Reason that the SPF computation was completed.

Sample Output

show isis spf log

show isis statistics

Syntax	show isis statistics <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switches and QFX Series)	show isis statistics <instance <i>instance-name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
Description	Display statistics about IS-IS traffic.
Options	none —Display IS-IS traffic statistics for all routing instances. instance <i>instance-name</i> —(Optional) Display statistics for the specified routing instance. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• clear isis statistics on page 2742
List of Sample Output	show isis statistics on page 2784
Output Fields	Table 229 on page 2783 describes the output fields for the show isis statistics command. Output fields are listed in the approximate order in which they appear.

Table 229: show isis statistics Output Fields

Field Name	Field Description
PDU type	<p>PDU type:</p> <ul style="list-style-type: none"> • CSNP—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU. • IIH—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems. • LSP—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area. • PSNP—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device. • Unknown—The PDU type is unknown.
Received	Number of PDUs received since IS-IS started or since the statistics were set to zero.
Processed	Number of PDUs received less the number dropped.
Drops	Number of PDUs dropped.
Sent	Number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Rexmit	Number of PDUs retransmitted since IS-IS started or since the statistics were set to zero.
Total packets received/sent	Total number of PDUs received and transmitted since IS-IS started or since the statistics were set to zero.
SNP queue length	Number of CSPN and PSNP packets currently waiting in the queue for processing. This value is almost always 0.
LSP queue length	Number of link-state PDUs waiting in the queue for processing. This value is almost always 0.
SPF runs	Number of shortest-path-first (SPF) calculations that have been performed. If this number is incrementing rapidly, it indicates that the network is unstable.
Fragments rebuilt	Number of link-state PDU fragments that the local system has computed.
LSP regenerations	Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.
Purges initiated	Number of purges that the system initiated. A purge is initiated if the software decides that a link-state PDU must be removed from the network.

Sample Output

Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Specify the area identifier for this routing device to use when participating in OSPF routing. All routing devices in an area must use the same area identifier to establish adjacencies.</p> <p>Specify multiple area statements to configure the routing device as an area border router. An area border router does not automatically summarize routes between areas. Use the area-range statement to configure route summarization. By definition, an area border router must be connected to the backbone area either through a physical link or through a virtual link. To create a virtual link, include the virtual-link statement.</p> <p>To specify that the routing device is directly connected to the OSPF backbone, include the area 0.0.0.0 statement.</p> <p>All routing devices on the backbone must be contiguous. If they are not, use the virtual-link statement to create the appearance of connectivity to the backbone.</p>

You can also configure any interface that belongs to one or more topologies to advertise the direct interface addresses without actually running OSPF on that interface. By default, OSPF must be configured on an interface in order for direct interface addresses to be advertised as interior routes.

NOTE: If you configure an interface with the **passive** statement, it applies to all the topologies to which the interface belongs. You cannot configure an interface as passive for only one specific topology and have it remain active for any other topologies to which it belongs.

Options	area-id —Area identifier. The identifier can be up to 32 bits. It is common to specify the area number as a simple integer or an IP address. Area number 0.0.0.0 is reserved for the OSPF backbone area.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

area-range

Syntax	area-range <i>network/mask-length</i> <exact> <override-metric <i>metric</i> > <restrict>;
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3) area <i>area-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3) area <i>area-id</i> nssa],</p> <p>[edit logical-systems <i>logical-system-name</i> realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area <i>area-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area <i>area-id</i> nssa],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i>],</p> <p>[edit protocols (ospf ospf3) area <i>area-id</i>],</p> <p>[edit protocols (ospf ospf3) area <i>area-id</i> nssa],</p> <p>[edit protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area <i>area-id</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area <i>area-id</i> nssa],</p> <p>[edit routing-instances <i>routing-instance-name</i> realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>(Area border routers only) For an area, summarize a range of IP addresses when sending summary link advertisements (within an area). To summarize multiple ranges, include multiple area-range statements.</p> <p>For a not-so-stubby area (NSSA), summarize a range of IP addresses when sending NSSA link-state advertisements. The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas. To specify multiple prefixes, include multiple area-range statements. All external routes learned within the area that do not fall into one of the prefixes are advertised individually to other areas.</p>
Default	By default, area border routing devices do not summarize routes being sent from one area to other areas, but rather send all routes explicitly.
Options	<p>exact—(Optional) Summarization of a route is advertised only when an exact match is made with the configured summary range.</p> <p>mask-length—Number of significant bits in the network mask.</p> <p>network—IP address. You can specify one or more IP addresses.</p>

override-metric *metric*—(Optional) Override the metric for the IP address range and configure a specific metric value.

restrict—(Optional) Do not advertise the configured summary. This hides all routes that are contained within the summary, effectively creating a route filter.

Range: 1 through 16,777,215

Required Privilege	routing—To view this statement in the configuration.
Level	routing-control—To add this statement to the configuration.

Related Documentation	<ul style="list-style-type: none">• <i>Example: Summarizing Ranges of Routes in OSPF Link-State Advertisements</i>

bandwidth-based-metrics

Syntax	<pre>bandwidth-based-metrics { bandwidth <i>value</i>; metric <i>number</i>; }</pre>
Hierarchy Level	<pre>[edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3) area <i>area-id</i> interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> protocols ospf area <i>area-id</i> interface <i>interface-name</i> topology <i>topology-name</i>], [edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area <i>area-id</i> interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> protocols ospf area <i>area-id</i> interface <i>interface-name</i> topology <i>topology-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instances</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>], [edit protocols (ospf ospf3) area <i>area-id</i> interface <i>interface-name</i>], [edit protocols ospf area <i>area-id</i> interface <i>interface-name</i> topology <i>topology-name</i>], [edit protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area <i>area-id</i> interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols ospf area <i>area-id</i> interface <i>interface-name</i> topology <i>topology-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>]</pre>
Release Information	<p>Statement introduced in Junos OS Release 9.5.</p> <p>Statement introduced in Junos OS Release 9.5 for EX Series switches.</p>
Description	<p>Specify a set of bandwidth threshold values and associated metric values for an OSPF interface or for a topology on an OSPF interface. When the bandwidth of an interface changes, Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value.</p>
Options	<p>bandwidth <i>value</i>—Specify the bandwidth threshold in bits per second.</p> <p>Range: 9600 through 1,000,000,000,000,000</p> <p>metric <i>number</i>—Specify a metric value to associate with a specific bandwidth value.</p> <p>Range: 1 through 65,535</p>

NOTE: You must also configure a static metric value for the OSPF interface or topology with the metric statement. Junos OS uses this value to calculate the cost of a route from the OSPF interface or topology if the bandwidth for the interface is higher than of any bandwidth threshold values configured for bandwidth-based metrics.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth</i>• metric on page 2824• <i>Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth</i>

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 9.0 for EX Series switches.
 detection-time threshold and **transmit-interval threshold** options added in Junos OS Release 8.2.
 Support for logical systems introduced in Junos OS Release 8.3.
 no-adaptation option introduced in Junos OS Release 9.0.
 no-adaptation option introduced in Junos OS Release 9.0 for EX Series switches.
 Support for OSPFv3 introduced in Junos OS Release 9.3.
 Support for OSPFv3 introduced in Junos OS Release 9.3 for EX Series switches.
 full-neighbors-only option introduced in Junos OS Release 9.5.
 full-neighbors-only option introduced in Junos OS Release 9.5 for EX Series switches.

authentication algorithm, **authentication key-chain**, and **authentication loose-check** options introduced in Junos OS Release 9.6.

Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Configure bidirectional failure detection timers and authentication for OSPF.

The remaining statements are explained separately.

Options **authentication algorithm** *algorithm-name*—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

authentication key-chain *key-chain-name*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold *milliseconds*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

full-neighbors-only—Establish BFD sessions only for OSPF neighbors in the full state. The default behavior is to establish BFD sessions for all OSPF neighbors.

minimum-interval *milliseconds*—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** and **minimum-receive-interval** statements.

Range: 1 through 255,000 milliseconds

minimum-receive-interval *milliseconds*—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

Range: 1 through 255,000 milliseconds

multiplier *number*—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

no-adaptation—Specify that BFD sessions should not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold *milliseconds*—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

transmit-interval minimum-interval *milliseconds*—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established

a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

Range: 1 through 255,000

version—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

Default: **automatic**

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

graceful-restart (Protocols OSPF)

Syntax	<pre> graceful-restart { disable; helper-disable (standard restart-signaling both); no-strict-lsa-checking; notify-duration <i>seconds</i>; restart-duration <i>seconds</i>; }</pre>
Hierarchy Level	<pre> [edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3)], [edit protocols (ospf ospf3)], [edit routing-instances <i>routing-instance-name</i> protocols ospf]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for the no-strict-lsa-checking statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the helper mode standard, restart-signaling, and both options introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
Description	<p>Configure graceful restart for OSPF.</p> <p>Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the [edit routing-options] hierarchy level.</p>
Options	<p>disable—Disable graceful restart for OSPF.</p> <p>helper-disable (standard restart-signaling both)—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The standard, restart-signaling, and both options are only supported for OSPFv2. Specify standard to disable helper mode for standard graceful restart (based on RFC 3623). Specify restart-signaling to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify both to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.</p> <p>Default: Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.</p> <p>no-strict-lsa-checking—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.</p>

NOTE: The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both

statements at the same time, the routing device displays a warning message when you enter the `show protocols (ospf | ospf3)` command.

.....
notify-duration seconds—Estimated time needed to send out purged grace LSAs over all the interfaces.

Range: 1 through 3600 seconds

Default: 30 seconds

restart-duration seconds—Estimated time needed to reacquire a full OSPF neighbor from each area.

Range: 1 through 3600 seconds

Default: 180 seconds

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the **topology** statement introduced in Junos OS Release 9.0.
Support for the **topology** statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the **realm** statement introduced in Junos OS Release 9.2.
Support for the **realm** statement introduced in Junos OS Release 9.2 for EX Series switches.
Support for the **no-interface-state-traps** statement introduced in Junos OS Release 10.3.
This statement is supported only for OSPFv2.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Enable OSPF routing on a routing device interface.

You must include at least one **interface** statement in the configuration to enable OSPF on the routing device.

Options **interface-name**—Name of the interface. Specify the interface by IP address or interface name for OSPFv2, or only the interface name for OSPFv3. Using both the interface name and IP address of the same interface produces an invalid configuration. To configure all interfaces, you can specify **all**. Specifying a particular interface and **all** produces an invalid configuration.

.....
NOTE: For nonbroadcast interfaces, specify the IP address of the nonbroadcast interface as *interface-name*.
.....

The remaining statements are explained separately.

.....
NOTE: You cannot run both OSPF and ethernet-tcc encapsulation between two Juniper Networks routing devices.
.....

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

retransmit-interval (OSPF)

Syntax	<code>retransmit-interval seconds;</code>
Hierarchy Level	<pre> [edit logical-systems <i>logical-system-name</i> protocols ospf area <i>area-id</i> peer-interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3) area <i>area-id</i> interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3) area <i>area-id</i> virtual-link], [edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area <i>area-id</i> interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area <i>area-id</i> virtual-link], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>], [edit protocols ospf area <i>area-id</i> peer-interface <i>interface-name</i>], [edit protocols (ospf ospf3) area <i>area-id</i> interface <i>interface-name</i>], [edit protocols (ospf ospf3) area <i>area-id</i> virtual-link], [edit protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area <i>area-id</i> interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area <i>area-id</i> virtual-link], [edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>] </pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.</p>
Description	Specify how long the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements (LSAs) to an interface's neighbors.
Options	<p>seconds—Interval to wait.</p> <p>Range: 1 through 65,535 seconds</p> <p>Default: 5 seconds</p>

NOTE: You must configure LSA retransmit intervals to be equal to or greater than 3 seconds to avoid triggering a retransmit trap, because Junos OS delays LSA acknowledgments by up to 2 seconds.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

spf-options (Protocols OSPF)

Syntax	<pre>spf-options { delay <i>milliseconds</i>; holddown <i>milliseconds</i>; rapid-runs <i>number</i>; }</pre>
Hierarchy Level	<pre>[edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3)], [edit logical-systems <i>logical-system-name</i> protocols ospf topology (default ipv4-multicast <i>name</i>)], [edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf topology (default ipv4-multicast <i>name</i>)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast)], [edit protocols (ospf ospf3)], [edit protocols ospf topology (default ipv4-multicast <i>name</i>)], [edit protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast)], [edit routing-instances <i>routing-instance-name</i> protocols (ospf ospf3)], [edit routing-instances <i>routing-instance-name</i> protocols ospf topology (default ipv4-multicast <i>name</i>)], [edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast)]</pre>
Release Information	<p>Statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for Multitopology Routing introduced in Junos OS Release 9.0.</p> <p>Support for Multitopology Routing introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Configure options for running the shortest-path-first (SPF) algorithm. You can configure the following:</p> <ul style="list-style-type: none">• A delay for when to run the SPF algorithm after a network topology change is detected.• The maximum number of times the SPF algorithm can run in succession.• A hold-down interval after the SPF algorithm runs the maximum number of times. <p>Running the SPF algorithm is usually the beginning of a series of larger system-wide events. For example, the SPF algorithm can lead to interior gateway protocol (IGP) prefix changes, which then lead to BGP nexthop resolution changes. Consider what happens if there are rapid link changes in the network. The local routing device can become overwhelmed. This is why it sometimes makes sense to throttle the scheduling of the SPF algorithm.</p>

Options	delay <i>milliseconds</i> —Time interval between the detection of a topology change and when the SPF algorithm runs. Range: 50 through 8000 milliseconds Default: 200 milliseconds
	holddown <i>milliseconds</i> —Time interval to hold down, or to wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession. Range: 2000 through 20,000 milliseconds Default: 5000 milliseconds
	rapid-runs <i>number</i> —Maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the hold down interval begins. Range: 1 through 10 Default: 3
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring SPF Algorithm Options for OSPF</i>• <i>Example: Configuring Multitopology Routing Based on Applications</i>• <i>Example: Configuring Multitopology Routing Based on a Multicast Source</i>

stub

Syntax	<code>stub <default-metric metric> <(no-summaries summaries)>;</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3) area area-id],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area area-id],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast)],</p> <p>[edit protocols (ospf ospf3) area area-id],</p> <p>[edit protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf ospf3) area area-id],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast ipv4-multicast ipv6-multicast)]</p>

traceoptions (Protocols OSPF)

Syntax	<pre>traceoptions { file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i> <flag-modifier> <disable>; }</pre>
Hierarchy Level	<pre>[edit logical-systems <i>logical-system-name</i> protocols (<i>ospf</i> <i>ospf3</i>)], [edit logical-systems <i>logical-system-name</i> protocols ospf3 <i>realm</i> (ipv4-unicast ipv4-multicast ipv6-multicast)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<i>ospf</i> <i>ospf3</i>)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 <i>realm</i> (ipv4-unicast ipv4-multicast ipv6-multicast)], [edit protocols (<i>ospf</i> <i>ospf3</i>)], [edit protocols ospf3 <i>realm</i> (ipv4-unicast ipv4-multicast ipv6-multicast)], [edit routing-instances <i>routing-instance-name</i> protocols (<i>ospf</i> <i>ospf3</i>)], [edit routing-instances <i>routing-instance-name</i> protocols ospf3 <i>realm</i> (ipv4-unicast ipv4-multicast ipv6-multicast)]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Configure OSPF protocol-level tracing options.</p> <p>To specify more than one tracing operation, include multiple flag statements.</p>

NOTE: The **traceoptions** statement is not supported on QFabric systems.

Default	The default OSPF protocol-level tracing options are those inherited from the routing protocols traceoptions statement included at the [edit routing-options] hierarchy level.
Options	<p>disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. We recommend that you place OSPF tracing output in the file ospf-log.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p>

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

OSPF Tracing Flags

- **database-description**—Database description packets, which are used in synchronizing the OSPF and OSPFv3 topological database.
- **error**—OSPF and OSPFv3 error packets.
- **event**—OSPF and OSPFv3 state transitions.
- **flooding**—Link-state flooding packets.
- **graceful-restart**—Graceful-restart events.
- **hello**—Hello packets, which are used to establish neighbor adjacencies and to determine whether neighbors are reachable.
- **ldp-synchronization**—Synchronization events between OSPF and LDP.
- **lsa-ack**—Link-state acknowledgment packets, which are used in synchronizing the OSPF topological database.
- **lsa-analysis**—Link-state analysis. Specific to the Juniper Networks implementation of OSPF, Junos OS performs LSA analysis before running the shortest-path-first (SPF) algorithm. LSA analysis helps to speed the calculations performed by the SPF algorithm.
- **lsa-request**—Link-state request packets, which are used in synchronizing the OSPF topological database.
- **lsa-update**—Link-state updates packets, which are used in synchronizing the OSPF topological database.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **on-demand**—Trace demand circuit extensions.
- **packet-dump**—Content of selected packet types.
- **packets**—All OSPF packets.
- **restart-signaling**—(OSPFv2 only) Restart-signaling graceful restart events.
- **spf**—Shortest-path-first (SPF) calculations.

Global Tracing Flags

- **all**—All tracing operations.
- **general**—A combination of the **normal** and **route** trace operations.
- **normal**—All normal operations. If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions.
- **route**—Routing table changes.
- **state**—State transitions.
- **task**—Routing protocol task processing.
- **timer**—Routing protocol timer processing.

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level	routing and trace—To view this statement in the configuration.
	routing-control and trace-control—To add this statement to the configuration.

traffic-engineering (OSPF)

Syntax	<pre> traffic-engineering { <advertise-unnumbered-interfaces>; <credibility-protocol-preference>; ignore-lsp-metrics; multicast-rpf-routes; no-topology; shortcuts { lsp-metric-into-summary; } } </pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3)],</p> <p>[edit protocols (ospf ospf3)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf ospf3)]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>multicast-rpf-routes option introduced in Junos OS Release 7.5.</p> <p>advertise-unnumbered-interfaces option introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for OSPFv3 (ospf3) introduced in Junos OS Release 9.4.</p> <p>Support for OSPFv3 (ospf3) introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>credibility-protocol-preference statement introduced in Junos OS Release 9.4.</p> <p>credibility-protocol-preference statement introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	Enable the OSPF traffic engineering features.
Default	Traffic engineering support is disabled.
Options	<p>advertise-unnumbered-interfaces—(Optional) (OSPFv2 only) Include the link-local identifier in the link-local traffic-engineering link-state advertisement. This statement must be included on both ends of an unnumbered link to allow an ingress LER to update the link in its traffic engineering database and use it for CSPF calculations. The link-local identifier is then used by RSVP to signal unnumbered interfaces as defined in RFC 3477.</p> <p>credibility-protocol-preference—(Optional) (OSPFv2 only) Use the configured preference value for OSPF routes to calculate the traffic engineering database credibility value used to select IGP routes. Use this statement to override the default behavior, in which the traffic engineering database prefers IS-IS routes even if OSPF routes are configured with a lower, that is, preferred, preference value. For example, OSPF routes have a default preference value of 10, whereas IS-IS Level 1 routes have a default preference value of 15. When protocol preference is enabled, the credibility value is determined by deducting the protocol preference value from a base value of 512. Using default protocol preference values, OSPF has a credibility value of 502,</p>

whereas IS-IS has a credibility value of 497. Because the traffic engineering database prefers IGP routes with the highest credibility value, OSPF routes are now preferred.

multicast-rpf-routes—(Optional) (OSPFv2 only) Install routes for multicast RPF checks into the **inet.2** routing table. The **inet.2** routing table consists of unicast routes used for multicast RPF lookup. RPF is an antispoofing mechanism used to check whether the packet is coming in on an interface that is also sending data back to the packet source.

NOTE: You must enable OSPF traffic engineering shortcuts to use the **multicast-rpf-routes** statement. You must not allow LSP advertisements into OSPF when configuring the **multicast-rpf-routes** statement.

no-topology—(Optional) (OSPFv2 only) Disable the dissemination of the link-state topology information.

The remaining statements are explained separately.

Required Privilege Level	routing—To view this statement in the configuration.
	routing-control—To add this statement to the configuration.

Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2.</p> <p>Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.</p>
Description	<p>Flood Type 7 default link-state advertisements (LSAs) if the no-summaries statement is configured.</p> <p>By default, when the no-summaries statement is configured, a Type 3 LSA is injected into not-so-stubby areas (NSSAs) for Junos OS Release 5.0 and later. To support backward compatibility with earlier Junos OS releases, include the type-7 statement. This statement enables NSSA ABRs to advertise a Type 7 default LSA into the NSSA if you have also included the no-summaries statement in the configuration.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

virtual-link

Syntax	<pre>virtual-link neighbor-id <i>router-id</i> transit-area <i>area-id</i> { disable; authentication key <key-id identifier>; dead-interval <i>seconds</i>; hello-interval <i>seconds</i>; ipsec-sa <i>name</i>; retransmit-interval <i>seconds</i>; transit-delay <i>seconds</i>; }</pre>
Hierarchy Level	<pre>[edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3) <i>area area-id</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf <i>area area-id</i>], [edit protocols (ospf ospf3) <i>area area-id</i>], [edit routing-instances <i>routing-instance-name</i> protocols ospf <i>area area-id</i>]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	<p>For backbone areas only, create a virtual link to use in place of an actual physical link. All area border routers and other routing devices on the backbone must be contiguous. If this is not possible and there is a break in OSPF connectivity, use virtual links to create connectivity to the OSPF backbone. When configuring virtual links, you must configure links on the two routing devices that form the end points of the link, and both of these routing devices must be area border routers. You cannot configure links through stub areas.</p>
Options	<p>neighbor-id <i>router-id</i>—IP address of the routing device at the remote end of the virtual link.</p> <p>transit-area <i>area-id</i>—Area identifier of the area through which the virtual link transits. Virtual links are not allowed to transit the backbone area.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

Operational Commands

clear (ospf | ospf3) database

Syntax clear (ospf | ospf3) database
<advertising-router (*router-id* | self)>
<area *area-id*>
<asbrsummary>
<external>
<instance *instance-name*>
<inter-area-prefix>
<inter-area-router>
<intra-area-prefix>
<link-local>
<logical-system (all | *logical-system-name*)>
<lsa-id *lsa-id*>
<netsummary>
<network>
<nssa>
<opaque-area>
<purge>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
<router>

Syntax (EX Series Switch and QFX Series) clear (ospf | ospf3) database
<advertising-router (*router-id* | self)>
<area *area-id*>
<asbrsummary>
<external>
<instance *instance-name*>
<inter-area-prefix>
<inter-area-router>
<intra-area-prefix>
<link-local>
<lsa-id *lsa-id*>
<netsummary>
<network>
<nssa>
<opaque-area>
<purge>
<router>

Release Information Command introduced before Junos OS Release 7.4.
advertising-router *router-id*, **area** *area-id*, **asbrsummary**, **external**, **inter-area-prefix**, **inter-area-router**, **intra-area-prefix**, **link-local**, **lsa-id** *lsa-id*, **netsummary**, **network**, **nssa**, **opaque-area**, and **router** options added in Junos OS Release 8.3. You must use the **purge** command with these options.
Command introduced in Junos OS Release 9.0 for EX Series switches.
realm option added in Junos OS Release 9.2.
advertising-router (*router-id* | **self**) option added in Junos OS Release 9.5.
advertising-router (*router-id* | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine. You can also use the **purge** command with any of the options to discard rather than delete the specified LSA entries.

CAUTION: This command is useful only for testing. Use it with care, because it causes significant network disruption.

Options

- none**—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.
- advertising-router** (*router-id* | **self**)—(Optional) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.
- area** *area-id*—(Optional) Discard entries for the LSAs in the specified area.
- asbrsummary**—(Optional) Discard summary AS boundary router LSA entries.
- external**—(Optional) Discard external LSAs.
- instance** *instance-name*—(Optional) Delete or discard entries for the specified routing instance only.
- inter-area-prefix**—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.
- inter-area-router**—(OSPFv3 only) (Optional) Discard interarea router LSAs.
- intra-area-prefix**—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.
- logical-system** (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.
- link-local**—(Optional) Delete link-local LSAs.
- lsa-id** *lsa-id*—(Optional) Discard the LSA entries with the specified LSA identifier.
- netsummary**—(Optional) Discard summary network LSAs.
- network**—(Optional) Discard network LSAs.
- nssa**—(Optional) Discard not-so-stubby area (NSSA) LSAs.
- opaque-area**—(Optional) Discard opaque area-scope LSAs.
- realm** (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Discard router LSAs.

purge—(Optional) Discard all entries in the link-state advertisement database. All link-state advertisements are set to **MAXAGE** and are flooded. The database is repopulated when the originators of the link-state advertisements receive the **MAXAGE** link-state advertisements and reissue them.

Output Fields Table 230 on page 2866 lists the output fields for the **show (ospf | ospf3) interface** command. Output fields are listed in the approximate order in which they appear.

Table 230: show (ospf | ospf3) interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface running OSPF version 2 or OSPF version 3.	All levels
State	State of the interface: BDR , Down , DR , DRother , Loop , PtToPt , or Waiting .	All levels
Area	Number of the area that the interface is in.	All levels
DR ID	Address of the area's designated router.	All levels
BDR ID	Backup designated router for a particular subnet.	All levels
Nbrs	Number of neighbors on this interface.	All levels
Type	Type of interface: LAN , NBMA , P2MP , P2P , or Virtual .	detail extensive
Address	IP address of the neighbor.	detail extensive
Mask	Netmask of the neighbor.	detail extensive
Prefix-length	(OSPFv3) IPv6 prefix length, in bits.	detail extensive
OSPF3-Intf-Index	(OSPFv3) OSPF version 3 interface index.	detail extensive
MTU	Interface maximum transmission unit (MTU).	detail extensive
Cost	Interface cost (metric).	detail extensive
DR addr	Address of the designated router.	detail extensive
BDR addr	Address of the backup designated router.	detail extensive
Adj count	Number of adjacent neighbors.	detail extensive
Secondary	Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface for only one area.	detail extensive
Flood Reduction	Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the DoNotAge bit set. As a result, LSAs are refreshed only when a change occurs.	extensive

Table 230: show (ospf | ospf3) interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
Priority	Router priority used in designated router (DR) election on this interface.	detail extensive
Flood list	List of link-state advertisements (LSAs) that might be about to flood this interface.	extensive
Ack list	Acknowledgment list. List of pending acknowledgments on this interface.	extensive
Descriptor list	List of packet descriptors.	extensive
Hello	Configured value for the hello timer.	detail extensive
Dead	Configured value for the dead timer.	detail extensive
Auth type	(OSPFv2) Authentication mechanism for sending and receiving OSPF protocol packets: <ul style="list-style-type: none"> • MD5—The MD5 mechanism is configured in accordance with RFC 2328. • None—No authentication method is configured. • Password—A simple password (RFC 2328) is configured. 	detail extensive
Topology	(Multiarea adjacency) Name of topology: default or <i>name</i> .	
LDP sync state	(OSPFv2 and LDP synchronization) Current state of LDP synchronization: in sync , in holddown , and not supported .	extensive
reason	(OSPFv2 and LDP synchronization) Reason for the current state of LDP synchronization. The LDP session might be up or down, or adjacency might be up or down.	extensive
config holdtime	(OSPFv2 and LDP synchronization) Configured value of the hold timer. If the state is not synchronized, and the hold time is not infinity, the remaining field displays the number of seconds that remain until the configured hold timer expires.	extensive
IPSec SA name	(OSPFv2) Name of the IPSec security association name.	detail extensive
Active key ID	(OSPFv2 and MD5) Number from 0 to 255 that uniquely identifies an MD5 key.	detail extensive
Start time	(OSPFv2 and MD5) Time at which the routing device starts using an MD5 key to authenticate OSPF packets transmitted on the interface on which this key is configured. To authenticate received OSPF protocol packets, the key becomes effective immediately after the configuration is committed. If the start time option is not configured, the key is effective immediately for send and receive and is displayed as Start time 1970 Jan 01 00:00:00 PST .	detail extensive
ReXmit	Configured value for the Retransmit timer.	detail extensive
Stub, Not Stub, or Stub NSSA	Type of area.	detail extensive

show (ospf | ospf3) io-statistics

Syntax	show (ospf ospf3) io-statistics <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switch and QFX Series)	show (ospf ospf3) io-statistics
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Display Open Shortest Path First (OSPF) input and output statistics.
Options	<p>none—Display OSPF input and output statistics.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> clear (ospf ospf3) statistics on page 2862
List of Sample Output	show ospf io-statistics on page 2871
Output Fields	Table 231 on page 2871 lists the output fields for the show ospf io-statistics command. Output fields are listed in the approximate order in which they appear.

Table 231: show (ospf | ospf3) io-statistics Output Fields

Field Name	Field Description
Packets read	Number of OSPF packets read since the last time the routing protocol was started.
average per run	Total number of packets divided by the total number of times the OSPF read operation is scheduled to run.
max run	Maximum number of packets for a given run among all scheduled runs.
Receive errors	Number of faulty packets received with errors.

Sample Output

show ospf io-statistics

```
user@host> show ospf io-statistics
```

```
Packets read: 7361, average per run: 1.00, max run: 1
```

Receive errors:
None

show (ospf | ospf3) log

Syntax	show (ospf ospf3) log <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)> <realm (ipv4-multicast ipv4-unicast ipv6-multicast)> <topology <i>topology-name</i> >
Syntax (EX Series Switch and QFX Series)	show (ospf ospf3) log <instance <i>instance-name</i> > <topology <i>topology-name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. topology option introduced in Junos OS Release 9.0. topology option introduced in Junos OS Release 9.0 for EX Series switches. realm option introduced in Junos OS Release 9.2. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Display the entries in the Open Shortest Path First (OSPF) log of SPF calculations.
Options	<p>none—Display entries in the OSPF log of SPF calculations for all routing instances.</p> <p>instance <i>instance-name</i>—(Optional) Display entries for the specified routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>topology <i>topology-name</i>—(Optional) (OSPFv2 only) Display entries for the specified topology.</p> <p>realm (ipv4-multicast ipv4-unicast ipv6-multicast)—(OSPFv3 only) (Optional) Display entries for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.</p>
Required Privilege Level	view
List of Sample Output	show ospf log on page 2874 show ospf log topology voice on page 2874
Output Fields	Table 232 on page 2873 lists the output fields for the show (ospf ospf3) log command. Output fields are listed in the approximate order in which they appear.

Table 232: show (ospf | ospf3) log Output Fields

Field Name	Field Description
When	Time, in weeks (w) and days (d), since the SPF calculation was made.

Table 232: show (ospf | ospf3) log Output Fields (*continued*)

Field Name	Field Description
Type	Type of calculation: Cleanup, External, Interarea, NSSA, Redist, SPF, Stub, Total, or Virtuallink.
Elapsed	Amount of time, in seconds, that elapsed during the operation, or the time required to complete the SPF calculation. The start time is the time displayed in the When field.

Sample Output

show (ospf | ospf3) neighbor

Syntax	<pre>show (ospf ospf3) neighbor <brief detail extensive> <area <i>area-id</i>> <instance (all <i>instance-name</i>)> <interface <i>interface-name</i>> <logical-system (all <i>logical-system-name</i>)> <neighbor> <realm (ipv4-multicast ipv4-unicast ipv6-multicast)></pre>
Syntax (EX Series Switches and QFX Series)	<pre>show (ospf ospf3) neighbor <brief detail extensive> <area <i>area-id</i>> <instance (all <i>instance-name</i>)> <interface <i>interface-name</i>> <neighbor></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>instance all option introduced in Junos OS Release 9.1.</p> <p>instance all option introduced in Junos OS Release 9.1 for EX Series switches.</p> <p>area, interface, and realm options introduced in Junos OS Release 9.2.</p> <p>area and interface options introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	<p>Display information about OSPF neighbors.</p> <p>CPU utilization might increase while the device learns its OSPF neighbors. We recommend that you use the show (ospf ospf3) neighbor command after the device learns and establishes OSPF neighbor adjacencies. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the show (ospf ospf3) neighbor command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the CLI.</p>
Options	<p>none—Display standard information about all OSPF neighbors for all routing instances.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>area <i>area-id</i>—(Optional) Display information about the OSPF neighbors for the specified area.</p> <p>instance (all <i>instance-name</i>)—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.</p> <p>interface <i>interface-name</i>—(Optional) Display information about OSPF neighbors for the specified logical interface.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>

neighbor—(Optional) Display information about the specified OSPF neighbor.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Table 233: show (ospf | ospf3) neighbor Output Fields

Field Name	Field Description	Level of Output
Address	Address of the neighbor.	All levels
Interface	Interface through which the neighbor is reachable.	All levels

Table 233: show (ospf | ospf3) neighbor Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	<p>State of the neighbor:</p> <ul style="list-style-type: none"> • Attempt—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor. • Down—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the Down state, although at a reduced frequency. • Exchange—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged. • ExStart—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number. • Full—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements. • Init—A hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state might occur, for example, because the routing device itself did not appear in the neighbor's hello packet. • Loading—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the Exchange state. • 2Way—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state 2Way or greater. 	All levels
ID	Router ID of the neighbor.	All levels
Pri	Priority of the neighbor to become the designated router.	All levels
Dead	Number of seconds until the neighbor becomes unreachable.	All levels
Link state acknowledgment list	Number of link-state acknowledgments received.	extensive
Link state retransmission list	<p>Total number of link-state advertisements retransmitted. For extensive output only, the following information is also displayed:</p> <ul style="list-style-type: none"> • Type—Type of link advertisement: ASBR, Sum, Extern, Network, NSSA, OpaqArea, Router, or Summary. • LSA ID—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device. • Adv rtr—Address of the routing device that sent the advertisement. • Seq—Link sequence number of the advertisement. 	detail extensive

Table 233: show (ospf | ospf3) neighbor Output Fields (*continued*)

Field Name	Field Description	Level of Output
Neighbor-address	(OSPFv3 only) If the neighbor uses virtual links, the Neighbor-address is the site-local, local, or global address. If the neighbor uses a physical interface, the Neighbor-address is an IPv6 link-local address.	detail extensive
area	Area that the neighbor is in.	detail extensive
OSPF3-Intf-Index	(OSPFv3 only) Displays the OSPFv3 interface index.	detail extensive
opt	Option bits received in the hello packets from the neighbor.	detail extensive
DR or DR-ID	Address of the designated router.	detail extensive
BDR or BDR-ID	Address of the backup designated router.	detail extensive
Up	Length of time since the neighbor came up.	detail extensive
adjacent	Length of time since the adjacency with the neighbor was established.	detail extensive

show (ospf | ospf3) overview

Syntax	show (ospf ospf3) overview <brief extensive> <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)> <realm (ipv4-multicast ipv4-unicast ipv6-multicast)>
Syntax (EX Series Switch and QFX Series)	show (ospf ospf3) overview <brief extensive> <instance <i>instance-name</i> >
Release Information	Command introduced in Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. realm option introduced in Junos OS Release 9.2. Database protection introduced in Junos 10.2. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Display Open Shortest Path First (OSPF) overview information.
Options	<p>none—Display standard information about all OSPF neighbors for all routing instances.</p> <p>brief extensive—(Optional) Display the specified level of output.</p> <p>instance <i>instance-name</i>—(Optional) Display all OSPF interfaces under the named routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>realm (ipv4-multicast ipv4-unicast ipv6-multicast)—(Optional) (OSPFv3 only) Display information about the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.</p>
Required Privilege Level	view
List of Sample Output	show ospf overview on page 2884 show ospf overview (With Database Protection) on page 2885 show ospf3 overview (With Database Protection) on page 2885 show ospf overview extensive on page 2885
Output Fields	Table 234 on page 2882 lists the output fields for the show ospf overview command. Output fields are listed in the approximate order in which they appear.

Table 234: show ospf overview Output Fields

Field name	Field Description	Level of Output
Instance	OSPF routing instance.	All levels

Table 234: show ospf overview Output Fields (*continued*)

Field name	Field Description	Level of Output
Router ID	Router ID of the routing device.	All levels
Route table index	Route table index.	All levels
Configured overload	Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires.	All levels
Topology	Topology identifier.	All levels
Prefix export count	Number of prefixes exported into OSPF.	All levels
Full SPF runs	Number of complete Shortest Path First calculations.	All levels
SPF delay	Delay before performing consecutive Shortest Path First calculations.	All levels
SPF holddown	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.	All levels
SPF rapid runs	Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.	All levels
LSA refresh time	Refresh period for link-state advertisement (in minutes).	All levels
Database protection state	Current state of database protection.	All levels
Warning threshold	Threshold at which a warning message is logged (percentage of maximum LSA count).	All levels
Non self-generated LSAs	Number of LSAs whose router ID is not equal to the local router ID: Current , Warning (threshold), and Allowed .	All levels
Ignore time	How long the database has been in the ignore state.	All levels
Reset time	How long the database must stay out of the ignore or isolated state before it returns to normal operations.	All levels
Ignore count	Number of times the database has been in the ignore state: Current and Allowed .	All levels
Restart	Graceful restart capability: enabled or disabled .	All levels
Restart duration	Time period for complete reacquisition of OSPF neighbors.	All levels
Restart grace period	Time period for which the neighbors should consider the restarting routing device as part of the topology.	All levels

Table 234: show ospf overview Output Fields (*continued*)

Field name	Field Description	Level of Output
Graceful restart helper mode	(OSPFv2) Standard graceful restart helper capability (based on RFC 3623): enabled or disabled .	All levels
Restart-signaling helper mode	(OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): enabled or disabled .	All levels
Helper mode	(OSPFv3) Graceful restart helper capability: enabled or disabled .	All levels
Trace options	OSPF-specific trace options.	extensive
Trace file	Name of the file to receive the output of the tracing operation.	extensive
Area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Stub type	Stub type of area: Normal Stub , Not Stub , or Not so Stubby Stub .	All levels
Authentication Type	Type of authentication: None , Password , or MD5 . NOTE: The Authentication Type field refers to the authentication configured at the [edit protocols ospf area area-id] level. Any authentication configured for an interface in this area will not affect the value of this field.	All levels
Area border routers	Number of area border routers.	All levels
Neighbors	Number of autonomous system boundary routers.	All levels

show (ospf | ospf3) route

Syntax	<pre>show (ospf ospf3) route <brief detail extensive> <abr asbr extern inter intra> <destination> <instance (default ipv4-multicast <i>instance-name</i>)> <logical-system (default ipv4-multicast <i>logical-system-name</i>)> <network> <no-backup-coverage> <realm (ipv4-multicast ipv4-unicast ipv6-multicast)> <router> <topology (default ipv4-multicast <i>topology-name</i>)> <transit></pre>
Syntax (EX Series Switch and QFX Series)	<pre>show (ospf ospf3) route <brief detail extensive> <abr asbr extern inter intra> <destination> <instance <i>instance-name</i> <network> <no-backup-coverage> <router> <topology (default ipv4-multicast <i>topology-name</i>)> <transit></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>topology option introduced in Junos OS Release 9.0.</p> <p>realm option introduced in Junos OS Release 9.2.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	Display the entries in the Open Shortest Path First (OSPF) routing table.
Options	<p>none—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.</p> <p>destination—Display routes to the specified IP address (with optional destination prefix length).</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>abr—(Optional) Display routes to area border routers.</p> <p>asbr—(Optional) Display routes to autonomous system border routers.</p> <p>extern—(Optional) Display external routes.</p> <p>inter—(Optional) Display interarea routes.</p> <p>intra—(Optional) Display intra-area routes.</p>

instance (**default** | **ipv4-multicast** | *instance-name*)—(Optional) Display entries for the default routing instance, the IPv4 multicast routing instance, or for the specified routing instance.

logical-system (**default** | **ipv4-multicast** | *logical-system-name*)—(Optional) Perform this operation on the default logical system, the IPv4 multicast logical system, or on a particular logical system.

network—(Optional) Display routes to networks.

no-backup-coverage—(Optional) Display routes with no backup coverage.

realm (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Display routes to all routers.

topology (**default** | **ipv4-multicast** | *topology-name*)—(OSPFv2 only) (Optional) Display routes for the default OSPF topology, IPv4 multicast topology, or for a particular topology.

transit—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

Required Privilege Level view

[show ospf route topology voice on page 2891](#)

Output Fields [Table 235 on page 2888](#) list the output fields for the **show (ospf | ospf3) route** command. Output fields are listed in the approximate order in which they appear.

Table 235: show (ospf | ospf3) route Output Fields

Field Name	Field Description	Output Level
Topology	Name of the topology.	All levels
Prefix	Destination of the route.	All levels
Path type	How the route was learned: <ul style="list-style-type: none"> Inter—Interarea route Ext1—External type 1 route Ext2—External type 2 route Intra—Intra-area route 	All levels

Table 235: show (ospf | ospf3) route Output Fields (*continued*)

Field Name	Field Description	Output Level
Route type	The type of routing device from which the route was learned: <ul style="list-style-type: none"> • AS BR—Route to AS border router. • Area BR—Route to area border router. • Area/AS BR—Route to router that is both an Area BR and AS BR. • Network—Network router. • Router—Route to a router that is neither an Area BR nor an AS BR. • Transit—(OSPFv3 only) Route to a pseudonode representing a transit network, LAN, or nonbroadcast multiaccess (NBMA) link. • Discard—Route to a summary discard. 	All levels
NH Type	Next-hop type: LSP or IP .	All levels
Metric	Route's metric value.	All levels
NH-interface	(OSPFv3 only) Interface through which the route's next hop is reachable.	All levels
NH-addr	(OSPFv3 only) IPv6 address of the next hop.	All levels
NextHop Interface	(OSPFv2 only) Interface through which the route's next hop is reachable.	All levels
Nexthop addr/label	(OSPFv2 only) If the NH Type is IP , then it is the address of the next hop. If the NH Type is LSP , then it is the name of the label-switched path.	All levels
Area	Area ID of the route.	detail
Origin	Router from which the route was learned.	detail
Type 7	Route was learned through a not-so-stubby area (NSSA) link-state advertisement (LSA).	detail
P-bit	Route was learned through NSSA LSA and the propagate bit was set.	detail
Fwd NZ	Forwarding address is nonzero. Fwd NZ is only displayed if the route is learned through an NSSA LSA.	detail
optional-capability	Optional capabilities propagated in the router LSA. This field is in the output for intra-area router routes only (when Route Type is Area BR , AS BR , Area/AS BR , or Router), not for interarea router routes or network routes. Three bits in this field are defined as follows: <ul style="list-style-type: none"> • 0x4 (V)—Routing device is at the end of a virtual active link. • 0x2 (E)—Routing device is an autonomous system boundary router. • 0x1 (B)—Routing device is an area border router. 	detail

Table 235: show (ospf | ospf3) route Output Fields (*continued*)

Field Name	Field Description	Output Level
priority	The priority assigned to the prefix: <ul style="list-style-type: none"> • high • medium • low <p>NOTE: The priority field applies only to routes of type Network.</p>	detail

show (ospf | ospf3) statistics

Syntax	show (ospf ospf3) statistics <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)> <realm (ipv4-multicast ipv4-unicast ipv6-multicast)>
Syntax (EX Series Switch and QFX Series)	show (ospf ospf3) statistics <instance <i>instance-name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. realm option introduced in Junos OS Release 9.2. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Display OSPF statistics.
Options	<p>none—Display OSPF statistics for all routing instances.</p> <p>instance <i>instance-name</i>—(Optional) Display all statistics for the specified routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>realm (ipv4-multicast ipv4-unicast ipv6-multicast)—(Optional) (OSPFv3 only) Display all statistics for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.</p>

Output Fields	Table 236 on page 2893 lists the output fields for the show (ospf ospf3) statistics command. Output fields are listed in the approximate order in which they appear.

Table 236: show (ospf | ospf3) statistics Output Fields

Field Name	Field Description
Packet type	Type of OSPF packet.
Total Sent/Total Received	Total number of packets sent and received.
Last 5 seconds Sent/Last 5 seconds Received	Total number of packets sent and received in the last 5 seconds.

Table 236: show (ospf | ospf3) statistics Output Fields (*continued*)

Field Name	Field Description
DBDs retransmitted	Total number of database description packets retransmitted, and number retransmitted in the last 5 seconds.
LSAs flooded	Total number of link-state advertisements flooded, and number flooded in the last 5 seconds.
LSAs flooded high-prio	<p>Total number of high priority link-state advertisements flooded, and number flooded in the last 5 seconds.</p> <p>A link-state advertisement is deemed a high priority if it has changed since it was last sent.</p>
LSAs retransmitted	Total number of link-state advertisements retransmitted, and number retransmitted in the last 5 seconds.
LSAs transmitted to nbr	Total number of link-state advertisements transmitted to a neighbor, and number transmitted in the last 5 seconds.
LSAs requested	Total number of link-state advertisements requested by neighboring devices, and number requested in the last 5 seconds.
LSAs acknowledged	Total number of link-state advertisements acknowledged, and number acknowledged in the last 5 seconds.
Flood queue depth	Total number of entries in the extended queue.
Total rexmit entries	Total number of retransmission entries waiting to be sent from the OSPF routing instance.
db summaries	Total number of database description summaries waiting to be sent from the OSPF routing instance.
lsreq entries	Total number of link-state request entries waiting to be sent from the OSPF routing instance.
Receive errors	<p>Number and type of receive errors. Some sample receive errors include:</p> <ul style="list-style-type: none"> • mtu mismatches • no interface found • no virtual link found • nssa mismatches • stub area mismatches • subnet mismatches <p>If there are no receive errors, the output displays none.</p>

show ospf database

Syntax	<pre>show ospf database <brief detail extensive summary> <advertising-router (address self)> <area area-id> <asbrsummary> <external> <instance instance-name> <link-local> <logical-system (all logical-system-name)> <lsa-id lsa-id> <netsummary> <network> <nssa> <opaque-area> <router></pre>
Syntax (EX Series Switches and QFX Series)	<pre>show ospf database <brief detail extensive summary> <advertising-router (address self)> <area area-id> <asbrsummary> <external> <instance instance-name> <link-local> <lsa-id lsa-id> <netsummary> <network> <nssa> <opaque-area> <router></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>advertising-router self (address self) option introduced in Junos OS Release 9.5.</p> <p>advertising-router self (address self) option introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	Display the entries in the OSPF version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.
Options	<p>none—Display standard information about entries in the OSPFv2 link-state database for all routing instances.</p> <p>brief detail extensive summary—(Optional) Display the specified level of output.</p> <p>advertising-router (address self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.</p> <p>area area-id—(Optional) Display the LSAs in a particular area.</p>

asbrsummary—(Optional) Display summary AS boundary router LSA entries.

external—(Optional) Display external LSAs.

instance *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

netsummary—(Optional) Display summary network LSAs.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Display opaque area-scope LSAs.

router—(Optional) Display information about router LSAs.

Output Fields

[Table 237 on page 2898](#) describes the output fields for the **show ospf database** command. Output fields are listed in the approximate order in which they appear.

Table 237: show ospf database Output Fields

Field Name	Field Description	Level of Output
area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Type	Type of link advertisement: ASBRSum , Extern , Network , NSSA , OpaqArea , Router , or Summary .	All levels
ID	LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.	All levels
Adv Rtr	Address of the routing device that sent the advertisement.	All levels
Seq	Link sequence number of the advertisement.	All levels

Table 237: show ospf database Output Fields (*continued*)

Field Name	Field Description	Level of Output
Age	Time elapsed since the LSA was originated, in seconds.	All levels
Opt	Optional OSPF capabilities associated with the LSA.	All levels
Cksum	Checksum value of the LSA.	All levels
Len	Length of the advertisement, in bytes.	All levels
Router	Router link-state advertisement information: <ul style="list-style-type: none"> • bits—Flags describing the routing device that generated the LSP. • link count—Number of links in the advertisement. • id—ID of a routing device or subnet on the link. • data—For stub networks, the subnet mask. Otherwise, the IP address of the routing device that generated the LSP. • type—Type of link. It can be PointToPoint, Transit, Stub, or Virtual. • TOS count—Number of type-of-service (ToS) entries in the advertisement. • TOS 0 metric—Metric for ToS 0. • TOS—Type-of-service (ToS) value. • metric—Metric for the ToS. 	detail extensive
Network	Network link-state advertisement information: <ul style="list-style-type: none"> • mask—Network mask. • attached router—ID of the attached neighbor. 	detail extensive
Summary	Summary link-state advertisement information: <ul style="list-style-type: none"> • mask—Network mask. • TOS—Type-of-service (ToS) value. • metric—Metric for the ToS. 	detail extensive
Gen timer	How long until the LSA is regenerated.	extensive
Aging timer	How long until the LSA expires.	extensive
Installed <i>hh:mm:ss</i> ago	How long ago the route was installed.	extensive
expires in <i>hh:mm:ss</i>	How long until the route expires.	extensive
sent <i>hh:mm:ss</i> ago	How long ago the LSA was sent.	extensive
Last changed <i>hh:mm:ss</i> ago	How long ago the route was changed.	extensive
Change count	Number of times the route has changed.	extensive

Table 237: show ospf database Output Fields (*continued*)

Field Name	Field Description	Level of Output
Ours	Indicates that this is a local advertisement.	extensive
Router LSAs	Number of router link-state advertisements in the link-state database.	summary
Network LSAs	Number of network link-state advertisements in the link-state database.	summary
Summary LSAs	Number of summary link-state advertisements in the link-state database.	summary
NSSA LSAs	Number of not-so-stubby area link-state advertisements in the link-state database.	summary

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>realm option introduced in Junos OS Release 9.2.</p> <p>advertising-router (address self) option introduced in Junos Release 9.5.</p> <p>advertising-router (address self) option introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	Display the entries in the OSPF version 3 (OSPFv3) link-state database, which contains data about link-state advertisement (LSA) packets.
Options	<p>none—Display standard information about all entries in the OSPFv3 link-state database.</p> <p>brief detail extensive summary—(Optional) Display the specified level of output.</p> <p>advertising-router (address self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.</p>

area *area-id*—(Optional) Display the LSAs in a particular area.

external—(Optional) Display external LSAs.

instance *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

inter-area-prefix—(Optional) Display information about interarea-prefix LSAs.

inter-area-router—(Optional) Display information about interarea-router LSAs.

intra-area-prefix—(Optional) Display information about intra-area-prefix LSAs.

link—(Optional) Display information about link LSAs.

link-local—(Optional) Display information about link-local LSAs.

logical-system (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

realm (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family other than IPv6 unicast, which is the default.

router—(Optional) Display information about router LSAs.

List of Sample Output [show ospf3 database brief on page 2911](#)
[show ospf3 database extensive on page 2911](#)
[show ospf3 database summary on page 2914](#)

Output Fields [Table 238 on page 2906](#) lists the output fields for the **show ospf3 database** command. Output fields are listed in the approximate order in which they appear.

Table 238: show ospf3 database Output Fields

Field Name	Field Description	Level of Output
OSPF link state database, area <i>area-number</i>	Entries in the link-state database for this area.	brief detail extensive
OSPF AS SCOPE link state database	Entries in the AS scope link-state database.	brief detail extensive

Table 238: show ospf3 database Output Fields (*continued*)

Field Name	Field Description	Level of Output
OSPF Link-Local link state database, interface <i>interface-name</i>	Entries in the link-local link-state database for this interface.	brief detail extensive
area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Type	Type of link advertisement: Extern , InterArPfx , InterArRtr , IntraArPrx , Link , Network , NSSA , or Router .	brief detail extensive
ID	Link identifier included in the advertisement. An asterisk (*) preceding the identifier marks database entries that originated from the local routing device.	brief detail extensive
Adv Rtr	Address of the routing device that sent the advertisement.	brief detail extensive
Seq	Link sequence number of the advertisement.	brief detail extensive
Age	Time elapsed since the LSA was originated, in seconds.	brief detail extensive
Cksum	Checksum value of the LSA.	brief detail extensive
Len	Length of the advertisement, in bytes.	brief detail extensive
Router (Router Link-State Advertisements)		
bits	Flags describing the routing device that generated the LSP.	detail extensive
Options	Option bits carried in the router LSA.	detail extensive
For Each Router Link		
Type	Type of interface. The value of all other output fields describing a routing device interface depends on the interface's type: <ul style="list-style-type: none"> • PointToPoint (1)—Point-to-point connection to another routing device. • Transit (2)—Connection to a transit network. • Virtual (4)—Virtual link. 	detail extensive
Loc-if-id	Local interface ID assigned to the interface that uniquely identifies the interface with the routing device.	detail extensive
Nbr-if-id	Interface ID of the neighbor's interface for this routing device link.	detail extensive
Nbr-rtr-id	Router ID of the neighbor routing device (for type 2 interfaces, the attached link's designated router).	detail extensive
Metric	Cost of the router link.	detail extensive
Gen timer	How long until the LSA is regenerated, in the format <i>hours:minutes:seconds</i> .	extensive

Table 238: show ospf3 database Output Fields (*continued*)

Field Name	Field Description	Level of Output
Aging timer	How long until the LSA expires, in the format <i>hours:minutes:seconds</i> .	extensive
Installed <i>nn:nn:nn</i> ago	How long ago the route was installed, in the format <i>hours:minutes:seconds</i> .	extensive
expires in <i>nn:nn:nn</i>	How long until the route expires, in the format <i>hours:minutes:seconds</i> .	extensive
sent <i>nn:nn:nn</i> ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format <i>hours:minutes:seconds</i> .	extensive
Ours	Indicates that this is a local advertisement.	extensive
Network (Network Link-State Advertisements)		
Options	Option bits carried in the network LSA.	detail extensive
Attached Router	Router IDs of each of the routing devices attached to the link. Only routing devices that are fully adjacent to the designated router are listed. The designated router includes itself in this list.	detail extensive
InterArPfx (Interarea-Prefix Link-State Advertisements)		
Prefix	IPv6 address prefix.	detail extensive
Prefix-options	Option bit associated with the prefix.	detail extensive
Metric	Cost of this route. Expressed in the same units as the interface costs in the router LSAs. When the interarea-prefix LSA is describing a route to a range of addresses, the cost is set to the maximum cost to any reachable component of the address range.	detail extensive
Gen timer	How long until the LSA is regenerated, in the format <i>hours:minutes:seconds</i> .	extensive
Aging timer	How long until the LSA expires, in the format <i>hours:minutes:seconds</i> .	extensive
Installed <i>nn:nn:nn</i> ago	How long ago the route was installed, in the format <i>hours:minutes:seconds</i> .	extensive
expires in <i>nn:nn:nn</i>	How long until the route expires, in the format <i>hours:minutes:seconds</i> .	extensive
sent <i>nn:nn:nn</i> ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format <i>hours:minutes:seconds</i> .	extensive
Ours	Indicates that this is a local advertisement.	extensive
InterArRtr (Interarea-Router Link-State Advertisements)		
Dest-router-id	Router ID of the routing device described by the LSA.	detail extensive
options	Optional capabilities supported by the routing device.	detail extensive

Table 238: show ospf3 database Output Fields (*continued*)

Field Name	Field Description	Level of Output
Metric	Cost of this route. Expressed in the same units as the interface costs in the router LSAs. When the interarea-prefix LSA is describing a route to a range of addresses, the cost is set to the maximum cost to any reachable component of the address range.	detail extensive
Prefix	IPv6 address prefix.	extensive
Prefix-options	Option bit associated with the prefix.	extensive
Extern (External Link-State Advertisements)		
Prefix	IPv6 address prefix.	detail extensive
Prefix-options	Option bit associated with the prefix.	detail extensive
Metric	Cost of the route, which depends on the value of Type .	detail extensive
Type <i>n</i>	Type of external metric: Type 1 or Type 2 .	detail extensive
Aging timer	How long until the LSA expires, in the format <i>hours:minutes:seconds</i> .	extensive
Installed <i>nn:nn:nn</i> ago	How long ago the route was installed, in the format <i>hours:minutes:seconds</i> .	extensive
expires in <i>nn:nn:nn</i>	How long until the route expires, in the format <i>hours:minutes:seconds</i> .	extensive
sent <i>nn:nn:nn</i> ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format <i>hours:minutes:seconds</i> .	extensive
Link (Link-State Advertisements)		
IPv6-Address	IPv6 link-local address on the link for which this link LSA originated.	detail extensive
Options	Option bits carried in the link LSA.	detail extensive
priority	Router priority of the interface attaching the originating routing device to the link.	detail extensive
Prefix-count	Number of IPv6 address prefixes contained in the LSA. The rest of the link LSA contains a list of IPv6 prefixes to be associated with the link.	detail extensive
Prefix	IPv6 address prefix.	detail extensive
Prefix-options	Option bit associated with the prefix.	detail extensive
Gen timer	How long until the LSA is regenerated, in the format <i>hours:minutes:seconds</i> .	extensive
Aging timer	How long until the LSA expires, in the format <i>hours:minutes:seconds</i> .	extensive

Table 238: show ospf3 database Output Fields (*continued*)

Field Name	Field Description	Level of Output
Installed <i>nn:nn:nn</i> ago	How long ago the route was installed, in the format <i>hours:minutes:seconds</i> .	extensive
expires in <i>nn:nn:nn</i>	How long until the route expires, in the format <i>hours:minutes:seconds</i> .	extensive
sent <i>nn:nn:nn</i> ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format <i>hours:minutes:seconds</i> .	extensive
Ours	Indicates that this is a local advertisement.	extensive
IntraArPfx (Intra-Area-Prefix Link-State Advertisements)		
Ref-lsa-type	LSA type of the referenced LSA. <ul style="list-style-type: none"> Router—Address prefixes are associated with a router LSA. Network—Address prefixes are associated with a network LSA. 	detail extensive
Ref-lsa-id	Link-state ID of the referenced LSA.	detail extensive
Ref-router-id	Advertising router ID of the referenced LSA.	detail extensive
Prefix-count	Number of IPv6 address prefixes contained in the LSA. The rest of the link LSA contains a list of IPv6 prefixes to be associated with the link.	detail extensive
Prefix	IPv6 address prefix.	detail extensive
Prefix-options	Option bit associated with the prefix.	detail extensive
Metric	Cost of this prefix. Expressed in the same units as the interface costs in the router LSAs.	detail extensive
Gen timer	How long until the LSA is regenerated, in the format <i>hours:minutes:seconds</i> .	extensive
Aging timer	How long until the LSA expires, in the format <i>hours:minutes:seconds</i> .	extensive
Installed <i>hh:mm:ss</i> ago	How long ago the route was installed, in the format <i>hours:minutes:seconds</i> .	extensive
expires in <i>hh:mm:ss</i>	How long until the route expires, in the format <i>hours:minutes:seconds</i> .	extensive
sent <i>hh:mm:ss</i> ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format <i>hours:minutes:seconds</i> .	extensive
<i>n</i> Router LSAs	Number of router LSAs in the link-state database.	summary
<i>n</i> Network LSAs	Number of network LSAs in the link-state database.	summary
<i>n</i> InterArPfx LSAs	Number of interarea-prefix LSAs in the link-state database.	summary

Table 238: show ospf3 database Output Fields (*continued*)

Field Name	Field Description	Level of Output
<i>n</i> InterArRtr LSAs	Number of interarea-router LSAs in the link-state database.	summary
<i>n</i> IntraArPfx LSAs	Number of intra-area-prefix LSAs in the link-state database.	summary
Externals	Display of the external LSA database.	summary
<i>n</i> Extern LSAs	Number of external LSAs in the link-state database.	summary
Interface <i>interface-name</i>	Name of the interface for which link-local LSA information is displayed.	summary
<i>n</i> Link LSAs	Number of link LSAs in the link-state database.	summary

RIP Overview

RIP is an interior gateway protocol (IGP) that uses a distance-vector algorithm to determine the best route to a destination, using the hop count as the metric.

In a RIP network, each router's forwarding table is distributed among the nodes through the flooding of routing table information. Because topology changes are flooded throughout the network, every node maintains the same list of destinations. Packets are then routed to these destinations based on path-cost calculations done at each node in the network.

NOTE: In general, the term *RIP* refers to RIP version 1 and RIP version 2.

This topic contains the following sections:

- [Distance-Vector Routing Protocols on page 2915](#)
- [RIP Protocol Overview on page 2916](#)
- [RIP Packets on page 2917](#)
- [Maximizing Hop Count on page 2918](#)
- [Split Horizon and Poison Reverse Efficiency Techniques on page 2918](#)
- [Limitations of Unidirectional Connectivity on page 2919](#)

Distance-Vector Routing Protocols

Distance-vector routing protocols transmit routing information that includes a distance vector, typically expressed as the number of hops to the destination. This information is flooded out all protocol-enabled interfaces at regular intervals (every 30 seconds in the case of RIP) to create a network map that is stored in each node's local topology database. [Figure 29 on page 2916](#) shows how distance-vector routing works.

Figure 29: Distance-Vector Protocol

g015005

In [Figure 29 on page 2916](#), Routers A and B have RIP enabled on adjacent interfaces. Router A has known RIP neighbors Routers C, D, and E, which are 1, 2, and 3 hops away, respectively. Router B has known RIP neighbors Routers X, Y, and Z, which are 1, 2, and 3 hops away, respectively. Every 30 seconds, each router floods its entire routing table information out all RIP-enabled interfaces. In this case, flooding exchanges routing table information across the RIP link.

When Router A receives routing information from Router B, it adds 1 to the hop count to determine the new hop count. For example, Router X has a hop count of 1, but when Router A imports the route to X, the new hop count is 2. The imported route also includes information about where the route was learned, so that the original route is imported as a route to Router X through Router B with a hop count of 2.

When multiple routes to the same host are received, RIP uses the distance-vector algorithm to determine which path to import into the forwarding table. The route with the smallest hop count is imported. If there are multiple routes with the same hop count, all are imported into the forwarding table, and traffic is sent along the paths in round-robin fashion.

RIP Protocol Overview

The RIP IGP uses the Bellman-Ford, or *distance-vector*, algorithm to determine the best route to a destination. RIP uses the hop count as the metric. RIP enables hosts and routers to exchange information for computing routes through an IP-based network. RIP is intended to be used as an IGP in reasonably homogeneous networks of moderate size.

The Junos® operating system (Junos OS) supports RIP versions 1 and 2.

NOTE: RIP is not supported for multipoint interfaces.

RIP version 1 packets contain the minimal information necessary to route packets through a network. However, this version of RIP does not support authentication or subnetting.

RIP uses User Datagram Protocol (UDP) port 520.

RIP has the following architectural limitations:

- The longest network path cannot exceed 15 hops (assuming that each network, or hop, has a cost of 1).
- RIP depends on counting to infinity to resolve certain unusual situations—When the network consists of several hundred routers, and when a routing loop has formed, the amount of time and network bandwidth required to resolve a next hop might be great.
- RIP uses only a fixed metric to select a route. Other IGPs use additional parameters, such as measured delay, reliability, and load.

RIP Packets

RIP packets contain the following fields:

- **Command**—Indicates whether the packet is a request or response message. Request messages seek information for the router's routing table. Response messages are sent periodically and also when a request message is received. Periodic response messages are called *update messages*. Update messages contain the command and version fields and 25 destinations (by default), each of which includes the destination IP address and the metric to reach that destination.

NOTE: Beginning with Junos OS Release 11.1, three additional command field types are available to support RIP demand circuits. When you configure an interface for RIP demand circuits, the command field indicates whether the packet is an update request, update response, or update acknowledge message. Neighbor interfaces send updates on demand, not periodically. These command field types are only valid on interfaces configured for RIP demand circuits. For more detailed information, see [“RIP Demand Circuits Overview” on page 2984](#).

- **Version number**—Version of RIP that the originating router is running.
- **Address family identifier**—Address family used by the originating router. The family is always IP.
- **Address**—IP address included in the packet.
- **Metric**—Value of the metric advertised for the address.
- **Mask**—Mask associated with the IP address (RIP version 2 only).
- **Next hop**—IP address of the next-hop router (RIP version 2 only).

Routing information is exchanged in a RIP network by RIP request and RIP response packets. A router that has just booted can broadcast a RIP request on all RIP-enabled interfaces. Any routers running RIP on those links receive the request and respond by sending a RIP response packet immediately to the router. The response packet contains the routing table information required to build the local copy of the network topology map.

In the absence of RIP request packets, all RIP routers broadcast a RIP response packet every 30 seconds on all RIP-enabled interfaces. The RIP broadcast is the primary way in which topology information is flooded throughout the network.

Once a router learns about a particular destination through RIP, it starts a timer. Every time it receives a new response packet with information about the destination, the router resets the timer to zero. However, if the router receives no updates about a particular destination for 180 seconds, it removes the destination from its RIP routing table.

In addition to the regular transmission of RIP packets every 30 seconds, if a router detects a new neighbor or detects that an interface is unavailable, it generates a triggered update. The new routing information is immediately broadcast out all RIP-enabled interfaces, and the change is reflected in all subsequent RIP response packets.

Maximizing Hop Count

The successful routing of traffic across a RIP network requires that every node in the network maintain the same view of the topology. Topology information is broadcast between RIP neighbors every 30 seconds. If Router A is many hops away from a new host, Router B, the route to B might take significant time to propagate through the network and be imported into Router A's routing table. If the two routers are 5 hops away from each other, Router A cannot import the route to Router B until 2.5 minutes after Router B is online (30 seconds per hop). For large numbers of hops, the delay becomes prohibitive. To help prevent this delay from growing arbitrarily large, RIP enforces a maximum hop count of 15 hops. Any prefix that is more than 15 hops away is treated as unreachable and assigned a hop count equal to infinity. This maximum hop count is called the *network diameter*.

Split Horizon and Poison Reverse Efficiency Techniques

Because RIP functions by periodically flooding the entire routing table out to the network, it generates a lot of traffic. The split horizon and poison reverse techniques can help reduce the amount of network traffic originated by RIP hosts and make the transmission of routing information more efficient.

If a router receives a set of route advertisements on a particular interface, RIP determines that those advertisements do not need to be retransmitted out the same interface. This technique, known as *split horizon*, helps limit the amount of RIP routing traffic by eliminating information that other neighbors on that interface have already learned.

[Figure 30 on page 2918](#) shows an example of the split horizon technique.

Figure 30: Split Horizon Example

In [Figure 30 on page 2918](#), Router A advertises routes to Routers C, D, and E to Router B. In this example, Router A can reach Router C in 2 hops. When Router A advertises the route to Router B, Router B imports it as a route to Router C through Router A in 3 hops. If Router

B then readvertised this route to Router A, Router A would import it as a route to Router C through Router B in 4 hops. However, the advertisement from Router B to Router A is unnecessary, because Router A can already reach the route in 2 hops. The split horizon technique helps reduce extra traffic by eliminating this type of route advertisement.

Similarly, the poison reverse technique helps to optimize the transmission of routing information and improve the time to reach network convergence. If Router A learns about unreachable routes through one of its interfaces, it advertises those routes as unreachable (hop count of 16) out the same interface. [Figure 31 on page 2919](#) shows an example of the poison reverse technique.

Figure 31: Poison Reverse Example

In [Figure 31 on page 2919](#), Router A learns through one of its interfaces that routes to Routers C, D, and E are unreachable. Router A readvertises those routes out the same interface as unreachable. The advertisement informs Router B that Routers C, D, and E are definitely not reachable through Router A.

Limitations of Unidirectional Connectivity

Because RIP processes routing information based solely on the receipt of routing table updates, it cannot ensure bidirectional connectivity. As [Figure 32 on page 2919](#) shows, RIP networks are limited by their unidirectional connectivity.

Figure 32: Limitations of Unidirectional Connectivity

In [Figure 32 on page 2919](#), Routers A and D flood their routing table information to Router B. Because the path to Router E has the fewest hops when routed through Router A, that route is imported into Router B's forwarding table. However, suppose that Router A can

transmit traffic but is not receiving traffic from Router B because of an unavailable link or invalid routing policy. If the only route to Router E is through Router A, any traffic destined for Router A is lost, because bidirectional connectivity was never established.

OSPF establishes bidirectional connectivity with a three-way handshake.

RIP Configuration Overview

To achieve basic connectivity between all RIP hosts in a RIP network, you enable RIP on every interface that is expected to transmit and receive RIP traffic, as described in the steps that follow.

To configure a RIP network:

1. Configure network interfaces. See the *Junos OS Interfaces Configuration Guide for Security Devices*.
2. Define RIP groups, which are logical groupings of interfaces, and add interfaces to the groups. Then, configure a routing policy to export directly connected routes and routes learned through RIP routing exchanges. See [“Example: Configuring a Basic RIP Network” on page 2922](#).
3. (Optional) Configure metrics to control traffic through the RIP network. See [“Example: Controlling Traffic in a RIP Network with an Incoming Metric” on page 2960](#) and [“Example: Controlling Traffic in a RIP Network with an Outgoing Metric” on page 2962](#).
4. (Optional) Configure authentication to ensure that only trusted routers participate in the autonomous system’s routing. See [“Enabling Authentication with Plain-Text Passwords \(CLI Procedure\)” on page 2933](#) and [“Enabling Authentication with MD5 Authentication \(CLI Procedure\)” on page 2933](#).

Supported RIP and RIPng Standards

Junos OS substantially supports the following RFCs, which define standards for RIP (for IP version 4 [IPv4]) and RIP next generation (RIPng, for IP version 6 [IPv6]).

Junos OS supports authentication for all RIP protocol exchanges (MD5 or simple authentication).

- RFC 1058, *Routing Information Protocol*
- RFC 2080, *RIPng for IPv6*

- RFC 2082, *RIP-2 MD5 Authentication*

Multiple keys using distinct key IDs are not supported.

- RFC 2453, *RIP Version 2*

The following RFC does not define a standard, but provides information about RIPvng. The IETF classifies it as “Informational.”

- RFC 2081, *RIPvng Protocol Applicability Statement*

- [Example: Configuring a Basic RIP Network on page 2922](#)

Understanding Basic RIP Routing

RIP is an interior gateway protocol (IGP) that routes packets within a single autonomous system (AS). By default, RIP does not advertise the subnets that are directly connected through the device's interfaces. For traffic to pass through a RIP network, you must create a routing policy to export these routes. Advertising only the direct routes propagates the

routes to the immediately adjacent RIP-enabled router only. To propagate all routes through the entire RIP network, you must configure the routing policy to export the routes learned through RIP.

Example: Configuring a Basic RIP Network

This example shows how to configure a basic RIP network.

- [Requirements on page 2922](#)
- [Overview on page 2922](#)
- [Configuration on page 2922](#)
- [Verification on page 2925](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

Overview

In this example, you configure a basic RIP network, create a RIP group called **rip-group**, and add the directly connected interfaces to the RIP group. Then you configure a routing policy to advertise direct routes using policy statement **advertise-routes-through-rip**.

By default, Junos OS does not advertise RIP routes, not even routes that are learned through RIP. To advertise RIP routes, you must configure and apply an export routing policy that advertises RIP-learned and direct routes.

In Junos OS, you do not need to configure the RIP version. RIP version 2 is used by default.

To use RIP on the device, you must configure RIP on all of the RIP interfaces within the network. [Figure 33 on page 2922](#) shows the topology used in this example.

Figure 33: Sample RIP Network Topology

“CLI Quick Configuration” on [page 2922](#) shows the configuration for all of the devices in [Figure 33 on page 2922](#). The section “Step-by-Step Procedure” on [page 2923](#) describes the steps on Device R1.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

Device R2

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

Device R3

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure a basic RIP network:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

```

```

user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32

```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}
```

```
user@R1# show protocols
rip {
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1;
  }
}
```

```
user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Checking the Routing Table on page 2925](#)
- [Looking at the Routes That Device R1 Is Advertising to Device R2 on page 2925](#)
- [Looking at the Routes That Device R1 Is Receiving from Device R2 on page 2926](#)
- [Verifying the RIP-Enabled Interfaces on page 2926](#)
- [Verifying the Exchange of RIP Messages on page 2926](#)
- [Verifying Reachability of All Hosts in the RIP Network on page 2927](#)

Checking the Routing Table

Purpose Verify that the routing table is populated with the expected routes..

Action From operational mode, enter the **show route protocol rip** command.

```
user@R1> show route protocol rip
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30      *[RIP/100] 00:59:15, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
172.16.2.2/32   *[RIP/100] 02:52:48, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
172.16.3.3/32   *[RIP/100] 00:45:05, metric 3, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32  *[RIP/100] 02:52:48, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32  *[RIP/100] 00:45:05, metric 3, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
224.0.0.9/32    *[RIP/100] 00:45:09, metric 1
                 MultiRecv
```

Meaning The output shows that the routes have been learned from Device R2 and Device R3.

If you were to delete the **from protocol rip** condition in the routing policy on Device R2, the remote routes from Device R3 would not be learned on Device R1.

Looking at the Routes That Device R1 Is Advertising to Device R2

Purpose Verify that Device R1 is sending the expected routes.

Action From operational mode, enter the **show route advertising-protocol rip** command.

```
user@R1> show route advertising-protocol rip 10.0.0.1
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.0.1/32   *[Direct/0] 05:18:26
                 > via lo0.1
192.168.1.1/32  *[Direct/0] 05:18:25
                 > via lo0.1
```

Meaning Device R1 is sending routes to its directly connected networks.

Looking at the Routes That Device R1 Is Receiving from Device R2

Purpose Verify that Device R1 is receiving the expected routes.

Action From operational mode, enter the **show route receive-protocol rip** command.

```
user@R1> show route receive-protocol rip 10.0.0.2
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30          * [RIP/100] 02:31:22, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
172.16.2.2/32       * [RIP/100] 04:24:55, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
172.16.3.3/32       * [RIP/100] 02:17:12, metric 3, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32      * [RIP/100] 04:24:55, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32      * [RIP/100] 02:17:12, metric 3, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
```

Meaning Device R1 is receiving from Device R2 all of Device R2's directly connected networks. Device R1 is also receiving from Device R2 all of Device R3's directly connected networks, which Device R2 learned from Device R3 through RIP.

Verifying the RIP-Enabled Interfaces

Purpose Verify that all RIP-enabled Interfaces are available and active.

Action From operational mode, enter the **show rip neighbor** command.

```
user@R1> show rip neighbor
```

Neighbor	Local State	Source Address	Destination Address	Send Mode	Receive Mode	In Met
fe-1/2/0.1	Up	10.0.0.1	224.0.0.9	mcast	both	1

Meaning The output shows that the RIP-enabled interface on Device R1 is operational.

In general for this command, the output shows a list of the RIP neighbors that are configured on the device. Verify the following information:

- Each configured interface is present. Interfaces are listed in alphabetical order.
- Each configured interface is up. The state of the interface is listed in the **Local State** column. A state of **Up** indicates that the link is passing RIP traffic. A state of **Dn** indicates that the link is not passing RIP traffic. In a point-to-point link, this state generally means that either the end point is not configured for RIP or the link is unavailable.

Verifying the Exchange of RIP Messages

Purpose Verify that RIP messages are being sent and received on all RIP-enabled interfaces.

Action From operational mode, enter the **show rip statistics** command.

```

user@R1> show rip statistics
RIPv2 info: port 520; holddown 120s.
      rts learned  rts held down  rqsts dropped  resps dropped
              5              0              0              0

fe-1/2/0.1: 5 routes learned; 2 routes advertised; timeout 180s; update interval
30s
Counter              Total    Last 5 min  Last minute
-----
Updates Sent          2669         10         2
Triggered Updates Sent      2         0         0
Responses Sent          0         0         0
Bad Messages           0         0         0
RIPv1 Updates Received     0         0         0
RIPv1 Bad Route Entries    0         0         0
RIPv1 Updates Ignored      0         0         0
RIPv2 Updates Received    2675        11         2
RIPv2 Bad Route Entries    0         0         0
RIPv2 Updates Ignored      0         0         0
Authentication Failures    0         0         0
RIP Requests Received     0         0         0
RIP Requests Ignored       0         0         0
none                     0         0         0

```

Meaning The output shows the number of RIP routes learned. It also shows the number of RIP updates sent and received on the RIP-enabled interfaces. Verify the following information:

- The number of RIP routes learned matches the number of expected routes learned. Subnets learned by direct connectivity through an outgoing interface are not listed as RIP routes.
- RIP updates are being sent on each RIP-enabled interface. If no updates are being sent, the routing policy might not be configured to export routes.
- RIP updates are being received on each RIP-enabled interface. If no updates are being received, the routing policy might not be configured to export routes on the host connected to that subnet. The lack of updates might also indicate an authentication error.

Verifying Reachability of All Hosts in the RIP Network

Purpose Use the **traceroute** command on each loopback address in the network to verify that all hosts in the RIP network are reachable from each Juniper Networks device.

Action From operational mode, enter the **traceroute** command.

```

user@R1> traceroute 192.168.3.3
traceroute to 192.168.3.3 (192.168.3.3), 30 hops max, 40 byte packets
 1  10.0.0.2 (10.0.0.2)  1.094 ms  1.028 ms  0.957 ms
 2  192.168.3.3 (192.168.3.3)  1.344 ms  2.245 ms  2.125 ms

```

Meaning Each numbered row in the output indicates a routing hop in the path to the host. The three-time increments indicate the round-trip time (RTT) between the device and the hop for each traceroute packet.

To ensure that the RIP network is healthy, verify the following information:

- The final hop in the list is the host you want to reach.
- The number of expected hops to the host matches the number of hops in the traceroute output. The appearance of more hops than expected in the output indicates that a network segment is probably unreachable. It might also indicate that the incoming or outgoing metric on one or more hosts has been set unexpectedly.

Example: Configuring Authentication for RIP Routes

- [Understanding RIP Authentication on page 2928](#)
- [Example: Configuring Route Authentication for RIP on page 2928](#)
- [Enabling Authentication with Plain-Text Passwords \(CLI Procedure\) on page 2933](#)
- [Enabling Authentication with MD5 Authentication \(CLI Procedure\) on page 2933](#)

Understanding RIP Authentication

RIPv2 provides authentication support so that RIP links can require authentication keys (passwords) before they become active. Authentication provides an additional layer of security on the network beyond the other security features. By default, this authentication is disabled.

Authentication keys can be specified in either plain-text or MD5 form. Authentication requires all routers within the RIP network or subnetwork to have the same authentication type and key (password) configured.

This type of authentication is not supported on RIPv1 networks.

Example: Configuring Route Authentication for RIP

This example shows how to configure authentication for a RIP network.

- [Requirements on page 2928](#)
- [Overview on page 2928](#)
- [Configuration on page 2929](#)
- [Verification on page 2932](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

Overview

You can configure the router to authenticate RIP route queries. By default, authentication is disabled. You can use one of the following authentication methods:

- Simple authentication—Uses a text password that is included in the transmitted packet. The receiving router uses an authentication key (password) to verify the packet.

- MD5 authentication—Creates an encoded checksum that is included in the transmitted packet. The receiving router uses an authentication key (password) to verify the packet's MD5 checksum.

This example shows MD5 authentication.

Figure 34 on page 2929 shows the topology used in this example.

Figure 34: RIP Authentication Network Topology

"CLI Quick Configuration" on page 2929 shows the configuration for all of the devices in Figure 34 on page 2929. The section "Step-by-Step Procedure" on page 2930 describes the steps on Device R1.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set protocols rip authentication-type md5
set protocols rip authentication-key "$9$ONLRBhreK87dsM8i.5FAtM8XxNb"
set protocols rip traceoptions file rip-authentication-messages
set protocols rip traceoptions flag auth
set protocols rip traceoptions flag packets
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

Device R2

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set protocols rip authentication-type md5
set protocols rip authentication-key "$9$Lf1Xds2gJDHmoJCu1hKvoJGUjq"

```

```
set protocols rip traceoptions file rip-authentication-messages
set protocols rip traceoptions flag auth
set protocols rip traceoptions flag packets
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

Device R3

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip authentication-type md5
set protocols rip authentication-key "$9$G.UkP5T39tOz3K87V4oz36/Cu"
set protocols rip traceoptions file rip-authentication-messages
set protocols rip traceoptions flag auth
set protocols rip traceoptions flag packets
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure RIP authentication:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

```
user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

5. Require MD5 authentication for RIP route queries received on an interface.

The passwords must match on neighboring RIP routers. If the password does not match, the packet is rejected. The password can be from 1 through 16 contiguous characters long and can include any ASCII strings.

Do not enter the password as shown here. The password shown here is the encrypted password that is displayed in the configuration after the actual password is already configured.

```
[edit protocols rip]
user@R1# set authentication-type md5
user@R1# set authentication-key "$9$ONLRBhreK87dsM8i.5FAAtM8XxNb"
```

6. Configure tracing operations to track authentication.

```
[edit protocols rip traceoptions]
user@R1# set file rip-authentication-messages
user@R1# set flag auth
user@R1# set flag packets
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  traceoptions {
    file rip-authentication-messages;
    flag auth;
    flag packets;
  }
}
```

```

authentication-type md5;
authentication-key "$9$ONLRBhreK87dsM8i.5FAtM8XxNb"; ## SECRET-DATA
group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1;
}
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
    term 1 {
        from protocol [ direct rip ];
        then accept;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Checking for Authentication Failures on page 2932](#)
- [Verifying That MD5 Authentication Is Enabled in RIP Update Packets on page 2933](#)

Checking for Authentication Failures

Purpose Verify that there are no authentication failures.

Action From operational mode, enter the **show rip statistics** command.

```

user@R1> show rip statistics
RIPv2 info: port 520; holddown 120s.
      rts learned  rts held down  rqsts dropped  resps dropped
              5              0              0              0

fe-1/2/0.1: 5 routes learned; 2 routes advertised; timeout 180s; update interval
30s
Counter              Total    Last 5 min  Last minute
-----
Updates Sent          2669         10          2
Triggered Updates Sent      2          0          0
Responses Sent          0          0          0
Bad Messages           0          0          0
RIPv1 Updates Received      0          0          0
RIPv1 Bad Route Entries      0          0          0
RIPv1 Updates Ignored        0          0          0
RIPv2 Updates Received    2675         11          2
RIPv2 Bad Route Entries      0          0          0
RIPv2 Updates Ignored        0          0          0
Authentication Failures      0          0          0
RIP Requests Received        0          0          0
RIP Requests Ignored         0          0          0
none                      0          0          0

```

Meaning The output shows that there are no authentication failures.

Verifying That MD5 Authentication Is Enabled in RIP Update Packets

Purpose

Use tracing operations to verify that MD5 authentication is enabled in RIP updates.

Action

From operational mode, enter the **show log** command.

user@R1> **show log rip-authentication-messages | match md5**
Feb 15 15:45:13.969462 sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:45:43.229867 sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:46:13.174410 sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:46:42.716566 sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:47:11.425076 sending msg 0xb9a8c04, 3 rtes (needs MD5)
...

Meaning

The **(needs MD5)** output shows that all route updates require MD5 authentication.

Enabling Authentication with Plain-Text Passwords (CLI Procedure)

To configure authentication that requires a plain-text password to be included in the transmitted packet, enable simple authentication by performing these steps on all RIP devices in the network:

1. Navigate to the top of the configuration hierarchy.
2. Perform the configuration tasks described in [Table 239 on page 2933](#).
3. If you are finished configuring the router, commit the configuration.

Table 239: Configuring Simple RIP Authentication

Task	CLI Configuration Editor
Navigate to Rip level in the configuration hierarchy.	From the [edit] hierarchy level, enter edit protocols rip
Set the authentication type to simple .	Set the authentication type to simple : set authentication-type simple
Set the authentication key to a simple-text password. The password can be from 1 through 16 contiguous characters long and can include any ASCII strings.	Set the authentication key to a simple-text password: set authentication-key password

Enabling Authentication with MD5 Authentication (CLI Procedure)

To configure authentication that requires an MD5 password to be included in the transmitted packet, enable MD5 authentication by performing these steps on all RIP devices in the network:

1. Navigate to the top of the configuration hierarchy.
2. Perform the configuration tasks described in [Table 240 on page 2934](#).
3. If you are finished configuring the router, commit the configuration.

Table 240: Configuring MD5 RIP Authentication

Task	CLI Configuration Editor
Navigate to Rip level in the configuration hierarchy.	From the [edit] hierarchy level, enter edit protocols rip
Set the authentication type to MD5 .	Set the authentication type to md5 : set authentication-type md5
Set the MD5 authentication key (password). The key can be from 1 through 16 contiguous characters long and can include any ASCII strings.	Set the MD5 authentication key: set authentication-key password

Related Documentation

- [Example: Configuring RIP on page 2921](#)

Example: Configuring BFD for RIP

This example shows how to configure Bidirectional Forwarding Detection (BFD) for a RIP network.

- [Requirements on page 2934](#)
- [Overview on page 2934](#)
- [Configuration on page 2936](#)
- [Verification on page 2938](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

Overview

To enable failure detection, include the **bfd-liveness-detection** statement:

```

bfd-liveness-detection {
  detection-time {
    threshold milliseconds;
  }
  minimum-interval milliseconds;
  minimum-receive-interval milliseconds;
  multiplier number;
  no-adaptation;
  transmit-interval {
    threshold milliseconds;
    minimum-interval milliseconds;
  }
  version (1 | automatic);
}

```

Optionally, you can specify the threshold for the adaptation of the detection time by including the **threshold** statement. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a system log message are sent.

To specify the minimum transmit and receive interval for failure detection, include the **minimum-interval** statement. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval at which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. This examples sets a minimum interval of 600 milliseconds.

NOTE: BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with nonstop active routing configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

You can optionally specify the minimum transmit and receive intervals separately.

To specify only the minimum receive interval for failure detection, include the **minimum-receive-interval** statement. This value represents the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,00 milliseconds.

To specify only the minimum transmit interval for failure detection, include the **transmit-interval minimum-interval** statement. This value represents the minimum interval at which the local routing device transmits hello packets to the neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds.

To specify the number of hello packets not received by a neighbor that causes the originating interface to be declared down, include the **multiplier** statement. The default is 3, and you can configure a value in the range from 1 through 255.

To specify the threshold for detecting the adaptation of the transmit interval, include the **transmit-interval threshold** statement. The threshold value must be greater than the transmit interval.

To specify the BFD version used for detection, include the **version** statement. The default is to have the version detected automatically.

You can trace BFD operations by including the **traceoptions** statement at the **[edit protocols bfd]** hierarchy level.

In Junos OS Release 9.0 and later, you can configure BFD sessions not to adapt to changing network conditions. To disable BFD adaptation, include the **no-adaptation** statement. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

Figure 35 on page 2936 shows the topology used in this example.

Figure 35: RIP BFD Network Topology

“CLI Quick Configuration” on page 2936 shows the configuration for all of the devices in Figure 35 on page 2936. The section “Step-by-Step Procedure” on page 2937 describes the steps on Device R1.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

Device R2

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

Device R3

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure a BFD for a RIP network:

1. Configure the network interfaces.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```

[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1

```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```

[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept

```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```

[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip

```

5. Enable BFD.

```

[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection minimum-interval 600

```

6. Configure tracing operations to track BFD messages.

```
[edit protocols bfd traceoptions]
```

```
user@R1# set file bfd-trace
```

```
user@R1# set flag all
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
```

```
fe-1/2/0 {  
  unit 1 {  
    family inet {  
      address 10.0.0.1/30;  
    }  
  }  
}
```

```
user@R1# show protocols
```

```
bfd {  
  traceoptions {  
    file bfd-trace;  
    flag all;  
  }  
}  
rip {  
  group rip-group {  
    export advertise-routes-through-rip;  
    bfd-liveness-detection {  
      minimum-interval 600;  
    }  
    neighbor fe-1/2/0.1;  
  }  
}
```

```
user@R1# show policy-options
```

```
policy-statement advertise-routes-through-rip {  
  term 1 {  
    from protocol [ direct rip ];  
    then accept;  
  }  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying That the BFD Sessions Are Up on page 2939](#)
- [Checking the BFD Trace File on page 2939](#)

Verifying That the BFD Sessions Are Up

Purpose Make sure that the BFD sessions are operating.

Action From operational mode, enter the **show bfd session** command.

```
user@R1> show bfd session
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier
10.0.0.2	Up	fe-1/2/0.1	1.800	0.600	3

```
1 sessions, 1 clients
```

```
Cumulative transmit rate 1.7 pps, cumulative receive rate 1.7 pps
```

Meaning The output shows that there are no authentication failures.

Checking the BFD Trace File

Purpose Use tracing operations to verify that BFD packets are being exchanged.

Action From operational mode, enter the **show log** command.

```
user@R1> show log bfd-trace
```

```
Feb 16 10:26:32 PPM Trace: BFD periodic xmit to 10.0.0.2 (IFL 124, rtbl 53, single-hop port)
```

```
Feb 16 10:26:32 Received Downstream TraceMsg (24) len 86:
```

```
Feb 16 10:26:32 IfIndex (3) len 4: 0
```

```
Feb 16 10:26:32 Protocol (1) len 1: BFD
```

```
Feb 16 10:26:32 Data (9) len 61: (hex) 42 46 44 20 70 61 63 6b 65 74 20 66 72 6f 6d 20 31 30 2e
```

```
Feb 16 10:26:32 PPM Trace: BFD packet from 10.0.0.1 (IFL 73, rtbl 56, ttl 255) absorbed
```

```
Feb 16 10:26:32 Received Downstream TraceMsg (24) len 60:
```

```
Feb 16 10:26:32 IfIndex (3) len 4: 0
```

```
Feb 16 10:26:32 Protocol (1) len 1: BFD
```

```
Feb 16 10:26:32 Data (9) len 35: (hex) 42 46 44 20 70 65 72 69 6f 64 69 63 20 78 6d 69 74 20 6f
```

```
...
```

Meaning The output shows the normal functioning of BFD.

Related Documentation

- [Understanding BFD for RIP](#)

Example: Configuring BFD Authentication for RIP

- [Understanding BFD Authentication for RIP on page 2939](#)
- [Example: Configuring BFD Authentication for RIP on page 2941](#)

Understanding BFD Authentication for RIP

BFD enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when running BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels. Beginning with Junos OS Release 9.6, Junos OS supports authentication

for BFD sessions running over RIP. BFD authentication is only supported in the domestic image and is not available in the export image.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and the level of authentication that can be configured:

- [BFD Authentication Algorithms on page 2940](#)
- [Security Authentication Keychains on page 2941](#)
- [Strict Versus Loose Authentication on page 2941](#)

BFD Authentication Algorithms

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

NOTE: Nonstop active routing is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

Security Authentication Keychains

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

Strict Versus Loose Authentication

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

Example: Configuring BFD Authentication for RIP

This example shows how to configure Bidirectional Forwarding Detection (BFD) authentication for a RIP network.

- [Requirements on page 2941](#)
- [Overview on page 2941](#)
- [Configuration on page 2942](#)
- [Verification on page 2946](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

The devices must be running Junos OS Release 9.6 or later.

Overview

Only three steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the RIP protocol.
2. Associate the authentication keychain with the RIP protocol.

3. Configure the related security authentication keychain.

Figure 36 on page 2942 shows the topology used in this example.

Figure 36: RIP BFD Authentication Network Topology

"CLI Quick Configuration" on page 2942 shows the configuration for all of the devices in Figure 36 on page 2942. The section "Step-by-Step Procedure" on page 2943 describes the steps on Device R1.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

```
Device R1
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set protocols rip group rip-group bfd-liveness-detection authentication key-chain bfd-rip
set protocols rip group rip-group bfd-liveness-detection authentication algorithm
    keyed-md5
set protocols rip group rip-group bfd-liveness-detection authentication loose-check
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
    direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
    rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set security authentication-key-chains key-chain bfd-rip key 53 secret
    "$9$5d1V2aZGi.fzDiORSeXxDikqmT"
set security authentication-key-chains key-chain bfd-rip key 53 start-time
    "2012-2-16.12:00:00 -0800"

Device R2
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set protocols rip group rip-group bfd-liveness-detection authentication key-chain bfd-rip
set protocols rip group rip-group bfd-liveness-detection authentication algorithm
    keyed-md5
```

```

set protocols rip group rip-group bfd-liveness-detection authentication loose-check
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set security authentication-key-chains key-chain bfd-rip key 53 secret
  "$9$d1V2aZGi.fzDiORSeXxDikqmT"
set security authentication-key-chains key-chain bfd-rip key 53 start-time
  "2012-2-16.12:00:00 -0800"

```

Device R3

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set protocols rip group rip-group bfd-liveness-detection authentication key-chain bfd-rip
set protocols rip group rip-group bfd-liveness-detection authentication algorithm
  keyed-md5
set protocols rip group rip-group bfd-liveness-detection authentication loose-check
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set security authentication-key-chains key-chain bfd-rip key 53 secret
  "$9$d1V2aZGi.fzDiORSeXxDikqmT"
set security authentication-key-chains key-chain bfd-rip key 53 start-time
  "2012-2-16.12:00:00 -0800"

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure a BFD authentication:

1. Configure the network interfaces.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```

[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1

```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```

[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept

```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

5. Enable BFD.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection minimum-interval 600
```

6. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use.

NOTE: Nonstop active routing is not supported with **meticulous-keyed-md5** and **meticulous-keyed-sha-1** authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection authentication algorithm keyed-md5
```

7. Specify the keychain to be used to associate BFD sessions on RIP with the unique security authentication keychain attributes.

The keychain you specify must match a keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection authentication key-chain bfd-rip
```

8. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection authentication loose-check
```

9. Specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 7.
- At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security authentication-key-chains key-chain bfd-rip]
user@R1# set key 53 secret "$9$d1V2aZGi.fzDiORSeXxDikqmT"
user@R1# set key 53 start-time "2012-2-16.12:00:00 -0800"
```

10. Configure tracing operations to track BFD authentication.

```
[edit protocols bfd traceoptions]
```

```

user@R1# set file bfd-trace
user@R1# set flag all

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show security** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}

user@R1# show protocols
bfd {
  traceoptions {
    file bfd-trace;
    flag all;
  }
}
rip {
  group rip-group {
    export advertise-routes-through-rip;
    bfd-liveness-detection {
      minimum-interval 600;
    }
    neighbor fe-1/2/0.1;
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}

user@R1# show security
authentication-key-chains {
  key-chain bfd-rip {
    key 53 {
      secret "$9$d1V2aZGi.fzDiORSeXxDikqmT"; ## SECRET-DATA
      start-time "2012-2-16.12:00:00 -0800";
    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying That the BFD Sessions Are Authenticated on page 2946](#)
- [Viewing Extensive Information About the BFD Authentication on page 2946](#)
- [Checking the BFD Trace File on page 2947](#)

Verifying That the BFD Sessions Are Authenticated

Purpose Make sure that the BFD sessions are authenticated.

Action From operational mode, enter the **show bfd session detail** command.

```
user@R1> show bfd session detail
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier
10.0.0.2	Up	fe-1/2/0.1	1.800	0.600	3

Client RIP, TX interval 0.600, RX interval 0.600, **Authenticate**
 Session up time 01:39:34
 Local diagnostic None, remote diagnostic None
 Remote state Up, version 1
 Logical system 6, routing table index 53

1 sessions, 1 clients
 Cumulative transmit rate 1.7 pps, cumulative receive rate 1.7 pps

Meaning **Authenticate** is displayed to indicate that BFD authentication is configured.

Viewing Extensive Information About the BFD Authentication

Purpose View the keychain name, the authentication algorithm and mode for each client in the session, and the BFD authentication configuration status.

Action From operational mode, enter the **show bfd session extensive** command.

```
user@R1> show bfd session extensive
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier
10.0.0.2	Up	fe-1/2/0.1	1.800	0.600	3

Client RIP, TX interval 0.600, RX interval 0.600, **Authenticate**
keychain bfd-rip, algo keyed-md5, mode loose
 Session up time 01:46:29
 Local diagnostic None, remote diagnostic None
 Remote state Up, version 1
 Logical system 6, routing table index 53
 Min async interval 0.600, min slow interval 1.000
 Adaptive async TX interval 0.600, RX interval 0.600
 Local min TX interval 0.600, minimum RX interval 0.600, multiplier 3
 Remote min TX interval 0.600, min RX interval 0.600, multiplier 3
 Local discriminator 225, remote discriminator 226
 Echo mode disabled/inactive
Authentication enabled/active, keychain bfd-rip, algo keyed-md5, mode loose
 Session ID: 0x300501

1 sessions, 1 clients
 Cumulative transmit rate 1.7 pps, cumulative receive rate 1.7 pps

Meaning The output shows the keychain name, the authentication algorithm and mode for the client in the session, and the BFD authentication configuration status.

Checking the BFD Trace File

Purpose Use tracing operations to verify that BFD packets are being exchanged.

Action From operational mode, enter the **show log** command.

```
user@R1> show log bfd-trace
Feb 16 10:26:32 PPM Trace: BFD periodic xmit to 10.0.0.2 (IFL 124, rtbl 53,
single-hop port)
Feb 16 10:26:32 Received Downstream TraceMsg (24) len 86:
Feb 16 10:26:32   IfIndex (3) len 4: 0
Feb 16 10:26:32   Protocol (1) len 1: BFD
Feb 16 10:26:32   Data (9) len 61: (hex) 42 46 44 20 70 61 63 6b 65 74 20 66 72
6f 6d 20 31 30 2e
Feb 16 10:26:32 PPM Trace: BFD packet from 10.0.0.1 (IFL 73, rtbl 56, ttl 255)
absorbed
Feb 16 10:26:32 Received Downstream TraceMsg (24) len 60:
Feb 16 10:26:32   IfIndex (3) len 4: 0
Feb 16 10:26:32   Protocol (1) len 1: BFD
Feb 16 10:26:32   Data (9) len 35: (hex) 42 46 44 20 70 65 72 69 6f 64 69 63 20
78 6d 69 74 20 6f
...
```

Meaning The output shows the normal functioning of BFD.

- [Example: Configuring Point-to-Multipoint RIP Networks on page 2948](#)

Configuring Point-to-Multipoint RIP Networks Overview

A point-to-multipoint RIP network consists of a device having two or more peers on a single interface. All the devices forming a point-to-multipoint connection are placed in a single broadcast domain.

In a RIP network, a device can have a single peer or multiple peers for an interface. However, the demand circuit feature implementation in a RIP network requires the use of a single RIP peer. When you configure the following statements, a RIP network with demand circuits can also be configured to have multiple peers on an interface:

- Configuring the interface type to be a multipoint interface by using the **interface-type (Protocols RIP) p2mp** statement.
- Enabling dynamic peer discovery by using the **dynamic-peers** statement (SRX Series devices only).

NOTE: Before configuring the [dynamic-peers](#) statement, IPsec must be configured and IPsec tunnels must be set up by configuring IPsec parameters. Without IPsec configuration, the remote peers have to be explicitly configured at the RIP protocol level by using the [peer address](#) statement. See *Configuring Security Associations for IPsec on an ES PIC* for more details.

- Configuring peers by using the [peer address](#) statement.

```
[edit]
protocols {
  rip {
    group red {
      neighbor fe-0/1/3 {
        interface-type (Protocols RIP) p2mp;
        peer address; (or use dynamic-peers;)
      }
    }
  }
}
```

The [show rip statistics peer address](#) command can be used to display the RIP statistics at the peer level. The [clear rip statistics peer address](#) command can be used to clear the RIP statistics for a peer. Alternatively, you can use the [show rip statistics peer all](#) and [clear rip statistics peer all](#) command to display and clear RIP statistics for all peers.

Example: Configuring Point-to-Multipoint RIP Networks

This example shows how to configure a point-to-multipoint RIP network.

- [Requirements on page 2948](#)
- [Overview on page 2948](#)
- [Configuration on page 2950](#)
- [Verification on page 2952](#)

Requirements

This example uses the following hardware and software components:

- M Series routers, MX Series routers, T Series routers, or SRX Series devices
- Junos OS Release 12.1 or later

Overview

In a RIP network, a device can have a single peer or multiple peers for an interface. However, the demand circuit feature implementation in a RIP network requires the use of a single RIP peer.

When you include the following statements, the demand circuit implementation can have multiple peers for a given RIP neighbor.

- Configuring the interface type to be a multipoint interface by using the **interface-type (Protocols RIP) p2mp** statement.
- Enabling dynamic peer discovery by using the **dynamic-peers** statement (SRX Series devices only).

NOTE: To configure the **dynamic-peers** statement, IPsec tunnels must be set up by configuring IPsec parameters. See *Configuring Security Associations for IPsec on an ES PIC* for more details.

- Configuring peers by using the **peer address** statement.

```
[edit]
protocols {
  rip {
    group red {
      neighbor fe-0/1/3 {
        interface-type (Protocols RIP) p2mp;
        peer address; (or use dynamic-peers;)
      }
    }
  }
}
```

The **show rip statistics peer** command can be used to display the RIP statistics at the peer level.

Topology

In this example, Devices R1, R2, and R3 form a point-to-multipoint network. R1 is connected to R2 and to R3 as a point-to-multipoint connection through a switch that places all devices in the same broadcast domain. RIP demand circuits are configured on all three devices. The two peers to R1 are configured statically by using the **peer address** statement. The **dynamic-peers** statement is not used here.

Figure 37 on page 2949 shows the topology used in this example.

Figure 37: Configuring a Point-to-Multipoint RIP Network

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```
set interfaces fe-0/1/3 unit 0 family inet address 23.1.1.1/24
set policy-options policy-statement accept-rip-routes term from-direct from protocol direct
set policy-options policy-statement accept-rip-routes term from-direct then accept
set policy-options policy-statement accept-rip-routes term from-rip from protocol rip
set policy-options policy-statement accept-rip-routes term from-rip then accept
set protocols rip traceoptions file R1.log size 4m world-readable
set protocols rip traceoptions flag all detail
set protocols rip group red export accept-rip-routes
set protocols rip group red neighbor fe-0/1/3.0 interface-type p2mp
set protocols rip group red neighbor fe-0/1/3.0 peer 23.1.1.2
set protocols rip group red neighbor fe-0/1/3.0 peer 23.1.1.3
set protocols rip group red neighbor fe-0/1/3.0 demand-circuit
set protocols rip group red neighbor fe-0/1/3.0 max-retrans-time 10
```

Similarly, configure Devices R2 and R3, omitting the **peer address** configuration statement.

Configuring a Point-to-Multipoint RIP Network (with Demand Circuits)

Step-by-Step Procedure The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure the point-to-multipoint feature across a RIP network:

1. Configure the device interface.

```
[edit interfaces fe-0/1/3 unit 0]
user@R1# set family inet address 23.1.1.1/24
```
2. Define a policy for exporting RIP routes from the routing table to the protocol for transmission through the network.

```
[edit policy-options policy-statement accept-rip-routes]
user@R1# set term from-direct from protocol direct
user@R1# set term from-direct then accept
user@R1# set term from-rip from protocol rip
user@R1# set term from-rip then accept
```
3. Configure RIP and a RIP group with the defined export policy and point-to-multipoint configuration statements.

```
[edit protocols rip]
user@R1# set traceoptions file R1.log size 4m world-readable
user@R1# set traceoptions flag all detail
user@R1# set group red export accept-rip-routes
user@R1# set group red neighbor fe-0/1/3.0 interface-type p2mp
user@R1# set group red neighbor fe-0/1/3.0 peer 23.1.1.2
user@R1# set group red neighbor fe-0/1/3.0 peer 23.1.1.3
user@R1# set group red neighbor fe-0/1/3.0 demand-circuit
```

```
user@R1# set group red neighbor fe-0/1/3.0 max-retrans-time 10
```

Similarly, configure Devices R2 and R3, omitting the **peer address** configuration statement.

NOTE: Configuring **max-retrans-time** is optional. In the absence of this configuration statement, the default retransmission time of 180 seconds is configured.

The configuration used in this example is for a RIP network with demand circuits. To configure RIP for networks without demand circuits, exclude the **demand-circuit** and **max-retrans-time** statements from the configuration and check the resulting output. For more information about configuring RIP demand circuits, see [“Example: Configuring RIP Demand Circuits” on page 2986](#).

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, and **show protocols rip** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@R1# show interfaces
fe-0/1/3 {
  unit 0 {
    family inet {
      address 23.1.1.1/24;
    }
  }
}

user@R1# show protocols rip
traceoptions {
  file R1.log size 4m world-readable;
  flag all detail;
}
group red {
  export accept-rip-routes;
  neighbor fe-0/1/3.0 {
    interface-type p2mp;
    peer 23.1.1.2;
    peer 23.1.1.3;
    demand-circuit;
    max-retrans-time 10;
  }
}

user@R1# show policy-options
policy-statement accept-rip-routes {
  term from-direct {
    from protocol direct;
    then accept;
  }
}
```

```
}  
term from-rip {  
    from protocol rip;  
    then accept;  
}  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying the Point-to-Multipoint RIP Network

Purpose Verify that the RIP network is functional with the point-to-multipoint feature configured.

Action From operational mode, run the **show rip neighbor** command.

```
user@R1> show rip neighbor
```

Neighbor	Local State	Source Address	Destination Address	Send Mode	Receive Mode	In Met
fe-0/1/3.0(DC)	Up	23.1.1.1	23.1.1.2	unicast	unicast	1
fe-0/1/3.0(DC)	Up	23.1.1.1	23.1.1.3	unicast	unicast	1

From operational mode, run the **show rip statistics peer address** command.

```
user@R1> show rip statistics peer 23.1.1.2
```

RIPv2 info: port 520; holddown 120s.

rts learned	rts held down	rqsts dropped	resps dropped

Example: Applying Policies to RIP Routes Imported from Neighbors

- [Understanding RIP Import Policy on page 2954](#)
- [Example: Applying Policies to RIP Routes Imported from Neighbors on page 2954](#)

Understanding RIP Import Policy

The default RIP import policy is to accept all received RIP routes that pass a sanity check. To filter routes being imported by the local routing device from its neighbors, include the **import** statement, and list the names of one or more policies to be evaluated. If you specify more than one policy, they are evaluated in order (first to last) and the first matching policy is applied to the route. If no match is found, the local routing device does not import any routes.

Example: Applying Policies to RIP Routes Imported from Neighbors

This example shows how to configure an import policy in a RIP network.

- [Requirements on page 2954](#)
- [Overview on page 2954](#)
- [Configuration on page 2955](#)
- [Verification on page 2958](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

Overview

In this example, Device R1 has an import policy that accepts the 10/8 and 192.168/16 RIP routes and rejects all other RIP routes. This means that the 172.16/16 RIP routes are excluded from Device R1's routing table.

An export policy is also shown because an export policy is required as part of the minimum configuration for RIP.

[Figure 38 on page 2955](#) shows the topology used in this example.

Figure 38: RIP Import Policy Network Topology

"CLI Quick Configuration" on page 2955 shows the configuration for all of the devices in Figure 38 on page 2955. The section "Step-by-Step Procedure" on page 2956 describes the steps on Device R1.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip import rip-import
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set policy-options policy-statement rip-import term 1 from protocol rip
set policy-options policy-statement rip-import term 1 from route-filter 10.0.0.0/8 orlonger
set policy-options policy-statement rip-import term 1 from route-filter 192.168.0.0/16
  orlonger
set policy-options policy-statement rip-import term 1 then accept
set policy-options policy-statement rip-import term 2 then reject

```

Device R2

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

Device R3

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32

```

```
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure a RIP import policy:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

```
user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled.

You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

5. Configure the import policy.

```
[edit policy-options policy-statement rip-import]
user@R1# set term 1 from protocol rip
user@R1# set term 1 from route-filter 10.0.0.0/8 orlonger
user@R1# set term 1 from route-filter 192.168.0.0/16 orlonger
user@R1# set term 1 then accept
user@R1# set term 2 then reject
```

6. Apply the import policy.

```
[edit protocols rip]
user@R1# set import rip-import
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  import rip-import;
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1;
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}
policy-statement rip-import {
  term 1 {
    from {
      protocol rip;
      route-filter 10.0.0.0/8 orlonger;
      route-filter 192.168.0.0/16 orlonger;
    }
    then accept;
  }
  term 2 {
    then reject;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Looking at the Routes That Device R2 Is Advertising to Device R1 on page 2958](#)
- [Looking at the Routes That Device R1 Is Receiving from Device R2 on page 2958](#)
- [Checking the Routing Table on page 2958](#)
- [Testing the Import Policy on page 2959](#)

Looking at the Routes That Device R2 Is Advertising to Device R1

Purpose Verify that Device R2 is sending the expected routes.

Action From operational mode, enter the **show route advertising-protocol rip** command.

```
user@R2> show route advertising-protocol rip 10.0.0.2
```

```
inet.0: 11 destinations, 11 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
10.0.0.4/30      *[Direct/0] 2d 01:17:44
                  > via fe-1/2/0.5
172.16.2.2/32    *[Direct/0] 2d 04:09:52
                  > via lo0.2
172.16.3.3/32    *[RIP/100] 23:40:02, metric 2, tag 0
                  > to 10.0.0.6 via fe-1/2/0.5
192.168.2.2/32   *[Direct/0] 2d 04:09:52
                  > via lo0.2
192.168.3.3/32   *[RIP/100] 23:40:02, metric 2, tag 0
                  > to 10.0.0.6 via fe-1/2/0.5
```

Meaning Device R2 is sending 172.16/16 routes to Device R1.

Looking at the Routes That Device R1 Is Receiving from Device R2

Purpose Verify that Device R1 is receiving the expected routes.

Action From operational mode, enter the **show route receive-protocol rip** command.

```
user@R1> show route receive-protocol rip 10.0.0.2
```

```
inet.0: 8 destinations, 8 routes (8 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
10.0.0.4/30      *[RIP/100] 01:06:03, metric 2, tag 0
                  > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32    *[RIP/100] 01:06:03, metric 2, tag 0
                  > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32    *[RIP/100] 01:06:03, metric 3, tag 0
                  > to 10.0.0.2 via fe-1/2/0.1
```

Meaning The output shows that the 172.16/16 routes are excluded.

Checking the Routing Table

Purpose Verify that the routing table is populated with the expected routes.

Action From operational mode, enter the **show route protocol rip** command.

```
user@R1> show route protocol rip

inet.0: 8 destinations, 8 routes (8 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30      *[RIP/100] 00:54:34, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32   *[RIP/100] 00:54:34, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32   *[RIP/100] 00:54:34, metric 3, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
224.0.0.9/32     *[RIP/100] 00:49:00, metric 1
                 MultiRecv
```

Meaning The output shows that the routes have been learned from Device R2 and Device R3.

If you delete or deactivate the import policy, the routing table contains the 172.16/16 routes.

Testing the Import Policy

Purpose By using the **test policy** command, monitor the number of rejected prefixes.

Action From operational mode, enter the **test policy rip-import 172.16/16** command.

```
user@R1> test policy rip-import 172.16/16
Policy rip-import: 0 prefix accepted, 1 prefix rejected
```

Meaning The output shows that the policy rejected one prefix.

Understanding Traffic Control with Metrics in a RIP Network

To tune a RIP network and to control traffic flowing through the network, you increase or decrease the cost of the paths through the network. RIP provides two ways to modify the path cost: an incoming metric and an outgoing metric, which are each set to 1 by default. In other words, by default, the metric of routes that RIP imports from a neighbor or exports to a neighbor is incremented by 1. These routes include those learned from RIP as well as those learned from other protocols. The metrics are attributes that specify the cost of any route advertised through a host. By increasing or decreasing the metrics—and thus the cost—of links throughout the network, you can control packet transmission across the network.

The incoming metric modifies the cost of an individual segment when a route across the segment is imported into the routing table. For example, if you set the incoming metric on the segment to **3**, the individual segment cost along the link is changed from 1 to **3**. The increased cost affects all route calculations through that link. Other routes that were previously excluded because of a high hop count might now be included in the router's forwarding table.

The outgoing metric modifies the path cost for all the routes advertised out of a particular interface. Unlike the incoming metric, the outgoing metric modifies the routes that other routers are learning and thereby controls the way they send traffic.

If an exported route was learned from a member of the same RIP group, the metric associated with that route is the normal RIP metric. For example, a RIP route with a metric of 5 learned from a neighbor configured with an incoming metric of 2 is advertised with a combined metric of 7 when advertised to neighbors in the same group. However, if this route was learned from a RIP neighbor in a different group or from a different protocol, the route is advertised with the metric value configured in the outgoing metric for that group.

You might want to increase the metric of routes to decrease the likelihood that a particular route is selected and installed in the routing table. This process is sometimes referred to as *route poisoning*. Some reasons that you might want to poison a route are that the route is relatively expensive to use, or it has relatively low bandwidth.

A route with a higher metric than another route becomes the active route only when the lower-metric route becomes unavailable. In this way, the higher-metric route serves as a backup path.

One way to increase the metric of imported routes is to configure an import policy. Another way is to include the **metric-in** statement in the RIP neighbor configuration. One way to increase the metric of export routes is to configure an export policy. Another way is to include the **metric-out** statement in the RIP neighbor configuration.

Example: Controlling Traffic in a RIP Network with an Incoming Metric

This example shows how to control traffic with an incoming metric.

- [Requirements on page 2960](#)
- [Overview on page 2960](#)
- [Configuration on page 2961](#)
- [Verification on page 2961](#)

Requirements

Before you begin, define RIP groups, and add interfaces to the groups. Then configure a routing policy to export directly connected routes and routes learned through the RIP routing exchanges. See [“Example: Configuring a Basic RIP Network” on page 2922](#).

Overview

In this example, routes to Router D are received by Router A across both of its RIP-enabled interfaces as shown in [Figure 39 on page 2961](#). Because the route through Router B and the route through Router C have the same number of hops, both routes are imported into

the forwarding table. However, because the T3 link from Router B to Router D has a higher bandwidth than the T1 link from Router C to Router D, you want traffic to flow from Router A through Router B to Router D.

Figure 39: Controlling Traffic in a RIP Network with the Incoming Metric

To force this flow, you can modify the route metrics as they are imported into Router A's routing table. By setting the incoming metric on the interface from Router A to Router C, you modify the metric on all routes received through that interface. Setting the incoming route metric on Router A changes only the routes in Router A's routing table, and affects only how Router A sends traffic to Router D. Router D's route selection is based on its own routing table, which, by default, includes no adjusted metric values.

In the example, Router C receives a route advertisement from Router D and readvertises the route to Router A. When Router A receives the route, it applies the incoming metric on the interface. Instead of incrementing the metric by 1 (the default), Router A increments it by 3 (the configured incoming metric), giving the route from Router A to Router D through Router C a total path metric of 4. Because the route through Router B has a metric of 2, it becomes the preferred route for all traffic from Router A to Router D.

This example uses a RIP group called **alpha 1** on interface **g3-0/0/0**.

Configuration

Step-by-Step Procedure

To control traffic with an incoming metric:

1. Enable RIP on the interface.

```
[edit protocols rip]
user@host# set group alpha1 neighbor ge-0/0/0
```
2. Set the incoming metric.

```
[edit protocols rip]
user@host# set metric-in 3
```
3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Verification

To verify that the configuration is working properly, enter the **show route protocols rip** command.

Example: Controlling Traffic in a RIP Network with an Outgoing Metric

This example shows how to control traffic with an outgoing metric.

- [Requirements on page 2962](#)
- [Overview on page 2962](#)
- [Configuration on page 2963](#)
- [Verification on page 2963](#)

Requirements

Before you begin:

- Define RIP groups, and add interfaces to the groups. Then configure a routing policy to export directly connected routes and routes learned through RIP routing exchanges. See [“Example: Configuring a Basic RIP Network” on page 2922](#).
- Control traffic with an incoming metric. See [“Example: Controlling Traffic in a RIP Network with an Incoming Metric” on page 2960](#).

Overview

In this example, each route from Router A to Router D has two hops as shown in [Figure 40 on page 2962](#). However, because the link from Router A to Router B in the RIP group has a higher bandwidth than the link from Router A to Router C in RIP group Alpha 1, you want traffic from Router D to Router A to flow through Router B. To control the way Router D sends traffic to Router A, you can alter the routes that Router D receives by configuring the outgoing metric on Router A's interfaces in the Alpha 1 RIP group.

Figure 40: Controlling Traffic in a RIP Network with the Outgoing Metric

If the outgoing metric for the Alpha 1 RIP group—the A-to-C link—is changed to 3, Router D calculates the total path metric from Router A through Router C as 4. In contrast, the unchanged default total path metric to Router A through Router B in the RIP group is 2. The fact that Router A's interfaces belong to two different RIP groups allows you to configure two different outgoing metrics on its interfaces, because you configure path metrics at the group level.

By configuring the outgoing metric, you control the way Router A sends traffic to Router D. By configuring the outgoing metric on the same router, you control the way Router D sends traffic to Router A.

This example uses an outgoing metric of 3.

Configuration

Step-by-Step Procedure To control traffic with an outgoing metric:

1. Set the outgoing metric.

```
[edit protocols rip group alpha1]  
user@host# set metric-out 3
```
2. If you are done configuring the device, commit the configuration.

```
[edit]  
user@host# commit
```

Verification

To verify that the configuration is working properly, enter the **show protocols rip** command.

Example: Configuring the Metric Value Added to Imported RIP Routes

This example shows how to change the default metric to be added to incoming routes to control the route selection process.

- [Requirements on page 2963](#)
- [Overview on page 2963](#)
- [Configuration on page 2964](#)
- [Verification on page 2967](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

Overview

Normally, when multiple routes are available, RIP selects the route with the lowest hop count. Changing the default metric enables you to control the route selection process such that a route with a higher hop count can be preferred over of a route with a lower hop count.

[Figure 41 on page 2964](#) shows the topology used in this example.

Figure 41: RIP Incoming Metrics Network Topology

Device R1 has two potential paths to reach 172.16.2.2/32. The default behavior is to send traffic out the 0.1/30 interface facing Device R2. Suppose, though, that the path through Device R3 is less expensive to use or has higher bandwidth links. This example shows how to use the **metric-in** statement to ensure that Device R1 uses the path through Device R3 to reach 172.16.2.2/32. “[CLI Quick Configuration](#)” on page 2964 shows the configuration for all of the devices in Figure 41 on page 2964. The section “[Step-by-Step Procedure](#)” on page 2965 describes the steps on Device R1.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```
set interfaces fe-1/2/0 unit 1 description to-R2
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces ge-1/2/1 unit 10 description to-R3
set interfaces ge-1/2/1 unit 10 family inet address 10.0.0.10/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group primary export advertise-routes-through-rip
set protocols rip group primary neighbor ge-1/2/1.10
set protocols rip group secondary export advertise-routes-through-rip
set protocols rip group secondary neighbor fe-1/2/0.1 metric-in 4
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

Device R2

```
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces ge-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor ge-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

Device R3

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces ge-1/2/1 unit 9 family inet address 10.0.0.9/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip group rip-group neighbor ge-1/2/1.9
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure a RIP metrics:

1. Configure the network interfaces.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 description to-R2
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

user@R1# set ge-1/2/1 unit 10 description to-R3
user@R1# set ge-1/2/1 unit 10 family inet address 10.0.0.10/30

user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32

```

2. Create the RIP groups and add the interfaces.

To configure RIP in Junos OS, you must configure one or more groups that contain the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

For the interface that is facing Device R2, the **metric-in 4** setting causes this route to be less likely to be chosen as the active route.

```

[edit protocols rip]
user@R1# set group primary neighbor ge-1/2/1.10
user@R1# set group secondary neighbor fe-1/2/0.1 metric-in 4

```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```

[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept

```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```

[edit protocols rip]
user@R1# set group primary export advertise-routes-through-rip
user@R1# set group secondary export advertise-routes-through-rip

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    description to-R2;
    family inet {
      address 10.0.0.1/30;
    }
  }
}
ge-1/2/1 {
  unit 10 {
    description to-R3;
    family inet {
      address 10.0.0.10/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  group primary {
    export advertise-routes-through-rip;
    neighbor ge-1/2/1.10;
  }
  group secondary {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1 {
      metric-in 4;
    }
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying That the Expected Route Is Active on page 2967](#)
- [Removing the metric-in Statement on page 2967](#)

Verifying That the Expected Route Is Active

Purpose Make sure that to reach 172.16.2.2/32, Device R1 uses the path through Device R3.

Action From operational mode, enter the **show route 172.16.2.2** command.

```
user@R1> show route 172.16.2.2
inet.0: 12 destinations, 12 routes (12 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.2.2/32      *[RIP/100] 00:15:46, metric 3, tag 0
                  > to 10.0.0.9 via ge-1/2/1.10
```

Meaning The **to 10.0.0.9 via ge-1/2/1.10** output shows that Device R1 uses the path through Device R3 to reach 172.16.2.2/32. The metric for this route is 3.

Removing the metric-in Statement

Purpose Delete or deactivate the **metric-in** statement to see what happens to the 172.16.2.2/32 route.

Action 1. From configuration mode, deactivate the **metric-in** statement.

```
[edit protocols rip group secondary neighbor fe-1/2/0.1]
user@R1# deactivate metric-in
user@R1# commit
```

2. From operational mode, enter the **show route 172.16.2.2** command.

```
user@R1> show route 172.16.2.2
inet.0: 12 destinations, 12 routes (12 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.2.2/32      *[RIP/100] 00:00:06, metric 2, tag 0
                  > to 10.0.0.2 via fe-1/2/0.1
```

Meaning The **to 10.0.0.2 via fe-1/2/0.1** output shows that Device R1 uses the path through Device R2 to reach 172.16.2.2/32. The metric for this route is 2.

Understanding the Sending and Receiving of RIPv1 and RIPv2 Packets

RIP version 1 (RIPv1) and RIP version 2 (RIPv2) can run simultaneously. This might make sense when you are migrating a RIPv1 network to a RIPv2 network. This also allows interoperation with a device that supports RIPv1 but not RIPv2.

By default, when RIP is enabled on an interface, Junos OS receives both RIPv1 and RIPv2 packets and sends only RIPv2 packets. You can configure this behavior by including the [send](#) and [receive](#) statements in the RIP configuration.

Example: Configuring the Sending and Receiving of RIPv1 and RIPv2 Packets

This example shows how to configure whether the RIP update messages conform to RIP version 1 (RIPv1) only, to RIP version 2 (RIPv2) only, or to both versions. You can also disable the sending or receiving of update messages.

Requirements

No special configuration beyond device initialization is required before configuring this example.

Overview

By default, when RIP is enabled on an interface, Junos OS receives both RIPv1 and RIPv2 packets and sends only RIPv2 packets.

[Figure 42 on page 2968](#) shows the topology used in this example.

Figure 42: Sending and Receiving RIPv1 and RIPv2 Packets Network Topology

In this example, Device R1 is configured to receive only RIPv2 packets.

[“CLI Quick Configuration” on page 2969](#) shows the configuration for all of the devices in [Figure 42 on page 2968](#). The section [“Step-by-Step Procedure” on page 2969](#) describes the steps on Device R1.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1 receive version-2
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

Device R2

```
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

Device R3

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure a RIP packet versions that can be received:

1. Configure the network interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP groups and add the interfaces.

To configure RIP in Junos OS, you must configure one or more groups that contain the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

For the interface that is facing Device R2, the **receive version-2** setting causes this interface to accept only RIPv2 packets.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1 receive version-2
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1 {
      receive version-2;
    }
  }
}
```

```

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying That the Receive Mode Is Set to RIPv2 Only

Purpose Make sure that the interfacing Device R2 is configured to receive only RIPv2 packets, instead of both RIPv1 and RIPv2 packets.

Action From operational mode, enter the **show rip neighbor** command.

```
user@R1> show rip neighbor
```

Neighbor	Local State	Source Address	Destination Address	Send Mode	Receive Mode	In Met
fe-1/2/0.1	Up	10.0.0.1	224.0.0.9	mcast	v2 only	1

Meaning In the output, the **Receive Mode** field displays **v2 only**. The default **Receive Mode** is **both**.

Example: Redistributing Routes Among RIP Instances

- [Understanding Route Redistribution Among RIP instances on page 2971](#)
- [Example: Redistributing Routes Between Two RIP Instances on page 2972](#)

Understanding Route Redistribution Among RIP instances

You can redistribute routes among RIP processes. Another way to say this is to export RIP routes from one RIP instance to other RIP instances.

In Junos OS, route redistribution among routing instances is accomplished by using routing table groups, also called RIB groups. Routing table groups allow you to import and export routes from a protocol within one routing table into another routing table.

NOTE: In contrast, the policy-based import and export functions allow you import and export routes between different protocols within the same routing table.

Consider the following partial example:

```
protocols {
```

```
    rip {
      rib-group inet-to-voice;
    }
  }
  routing-instances {
    voice {
      protocols {
        rip {
          rib-group voice-to-inet;
        }
      }
    }
  }
  routing-options {
    rib-groups {
      inet-to-voice {
        import-rib [ inet.0 voice.inet.0 ];
      }
      voice-to-inet {
        import-rib [ voice.inet.0 inet.0 ];
      }
    }
  }
}
```

The way to read the **import-rib** statement is as follows. Take the routes from the protocol (RIP, in this case), and import them into the primary (or local) routing table and also into any other routing tables listed after this. The primary routing table is the routing table where the routing table group is being used. That would be either **inet.0** if used in the main routing instance or **voice.inet.0** if used within the routing instance. In the **inet-to-voice** routing table group, **inet.0** is listed first because this routing table group is used in the main routing instance. In the **voice-to-inet** routing table group, **voice.inet.0** is listed first because this routing table group is used in the voice routing instance.

Example: Redistributing Routes Between Two RIP Instances

This example shows how to configure a RIP routing instance and control the redistribution of RIP routes between the routing instance and the master instance.

- [Requirements on page 2972](#)
- [Overview on page 2972](#)
- [Configuration on page 2973](#)
- [Verification on page 2976](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

Overview

When you create a routing instance called **voice**, Junos OS creates a routing table called **voice.inet.0**. The example shows how to install routes learned through the master RIP instance into the **voice.inet.0** routing table. The example also shows how to install routes learned through the voice routing instance into **inet.0**. This is done by configuring routing

table groups. RIP routes are installed into each routing table that belongs to a routing table group.

Figure 43 on page 2973 shows the topology used in this example.

Figure 43: Redistributing Routes Between RIP Instances Network Topology

"CLI Quick Configuration" on page 2973 shows the configuration for all of the devices in Figure 43 on page 2973. The section "Step-by-Step Procedure" on page 2974 describes the steps on Device R2.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group to-R2 export advertise-routes-through-rip
set protocols rip group to-R2 neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

Device R2
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip rib-group inet-to-voice
set protocols rip group to-R3 export advertise-routes-through-rip
set protocols rip group to-R3 neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set routing-instances voice protocols rip group to-R1 export advertise-routes-through-rip
set routing-instances voice interface fe-1/2/0.2
set routing-instances voice protocols rip rib-group voice-to-inet
set routing-instances voice protocols rip group to-R1 neighbor fe-1/2/0.2
set routing-options rib-groups inet-to-voice import-rib inet.0
  
```

```
set routing-options rib-groups inet-to-voice import-rib voice.inet.0
set routing-options rib-groups voice-to-inet import-rib voice.inet.0
set routing-options rib-groups voice-to-inet import-rib inet.0
```

Device R3

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group to-R2 export advertise-routes-through-rip
set protocols rip group to-R2 neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To redistribute RIP routes between routing instances:

1. Configure the network interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 2 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 5 family inet address 10.0.0.5/30

user@R2# set lo0 unit 2 family inet address 192.168.2.2/32
user@R2# set lo0 unit 2 family inet address 172.16.2.2/32
```
2. Create the routing instance, and add one or more interfaces to the routing instance.

```
[edit routing-instances voice]
user@R2# set interface fe-1/2/0.2
```
3. Create the RIP groups and add the interfaces.

```
[edit protocols rip group to-R3]
user@R2# set neighbor fe-1/2/1.5

[edit routing-instances voice protocols rip group to-R1]
user@R2# set neighbor fe-1/2/0.2
```
4. Create the routing table groups.

```
[edit routing-options rib-groups]
user@R2# set inet-to-voice import-rib inet.0
user@R2# set inet-to-voice import-rib voice.inet.0

user@R2# set voice-to-inet import-rib voice.inet.0
user@R2# set voice-to-inet import-rib inet.0
```
5. Apply the routing table groups.

```
[edit protocols rip]
user@R2# set rib-group inet-to-voice
```

```
[edit routing-instances voice protocols rip]
user@R2# set rib-group voice-to-inet
```

6. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R2# set from protocol direct
user@R2# set from protocol rip
user@R2# set then accept
```

7. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group to-R3]
user@R2# set export advertise-routes-through-rip
```

```
[edit routing-instances voice protocols rip group to-R1]
user@R2# set export advertise-routes-through-rip
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, **show routing-instances**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
fe-1/2/1 {
  unit 5 {
    family inet {
      address 10.0.0.5/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.2/32;
      address 172.16.2.2/32;
    }
  }
}

user@R2# show protocols
rip {
  rib-group inet-to-voice;
  group to-R3 {
    export advertise-routes-through-rip;
    neighbor fe-1/2/1.5;
  }
}
```

```
user@R2# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}

user@R2# show routing-instances
voice {
  interface fe-1/2/0.2;
  protocols {
    rip {
      rib-group voice-to-inet;
      group to-R1 {
        export advertise-routes-through-rip;
        neighbor fe-1/2/0.2;
      }
    }
  }
}

user@R2# show routing-options
rib-groups {
  inet-to-voice {
    import-rib [ inet.0 voice.inet.0 ];
  }
  voice-to-inet {
    import-rib [ voice.inet.0 inet.0 ];
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Checking the Routing Tables

Purpose Make sure that the routing tables contain the expected routes.

Action From operational mode, enter the **show route protocol rip** command.

```
user@R2> show route protocol rip
inet.0: 9 destinations, 9 routes (9 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.0.1/32      *[RIP/100] 01:58:14, metric 2, tag 0
                  > to 10.0.0.1 via fe-1/2/0.2
172.16.3.3/32     *[RIP/100] 02:06:03, metric 2, tag 0
                  > to 10.0.0.6 via fe-1/2/0.5
192.168.1.1/32    *[RIP/100] 01:58:14, metric 2, tag 0
                  > to 10.0.0.1 via fe-1/2/0.2
192.168.3.3/32    *[RIP/100] 02:06:03, metric 2, tag 0
                  > to 10.0.0.6 via fe-1/2/0.5
224.0.0.9/32      *[RIP/100] 01:44:13, metric 1
                  MultiRecv
```

```
voice.inet.0: 7 destinations, 7 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
172.16.0.1/32      *[RIP/100] 02:06:03, metric 2, tag 0
                  > to 10.0.0.1 via fe-1/2/0.2
172.16.3.3/32      *[RIP/100] 01:58:14, metric 2, tag 0
                  > to 10.0.0.6 via fe-1/2/0.5
192.168.1.1/32     *[RIP/100] 02:06:03, metric 2, tag 0
                  > to 10.0.0.1 via fe-1/2/0.2
192.168.3.3/32     *[RIP/100] 01:58:14, metric 2, tag 0
                  > to 10.0.0.6 via fe-1/2/0.5
224.0.0.9/32       *[RIP/100] 01:44:13, metric 1
                  MultiRecv
```

Meaning The output shows that both routing tables contain all of the RIP routes.

Example: Configuring RIP Timers

- [Understanding RIP Timers on page 2977](#)
- [Example: Configuring RIP Timers on page 2978](#)

Understanding RIP Timers

RIP uses several timers to regulate its operation.

The update interval is the interval at which routes that are learned by RIP are advertised to neighbors. This timer controls the interval between routing updates. The update interval is set to 30 seconds, by default, with a small random amount of time added when the timer is reset. This added time prevents congestion that can occur if all routing devices update their neighbors simultaneously.

To configure the update time interval, include the **update-interval** statement:

```
update-interval seconds;
```

seconds can be a value from 10 through 60.

You can set a route timeout interval. If a route is not refreshed after being installed in the routing table by the specified time interval, the route is marked as invalid and is removed from the routing table after the hold-down period expires.

To configure the route timeout for RIP, include the **route-timeout** statement:

```
route-timeout seconds;
```

seconds can be a value from 30 through 360. The default value is 180 seconds.

RIP routes expire when either a route timeout limit is met or a route metric reaches infinity, and the route is no longer valid. However, the expired route is retained in the routing table for a specified period so that neighbors can be notified that the route has been dropped.

This time period is set by configuring the hold-down timer. Upon expiration of the hold-down timer, the route is removed from the routing table.

To configure the hold-down timer for RIP, include the **holddown** statement:

holddown *seconds*;

seconds can be a value from 10 through 180. The default value is 120 seconds.

NOTE: In Junos OS Release 11.1 and later, a retransmission timer is available for RIP demand circuits.

Generally, we recommend against changing the RIP timers, unless the effects of a change are well understood. The route timeout should be at least three times the update interval. The hold-down timer must be greater than the route timeout. Normally, the default values are best left in effect for standard operations.

Example: Configuring RIP Timers

This example shows how to configure the RIP update interval and how to monitor the impact of the change.

- [Requirements on page 2978](#)
- [Overview on page 2978](#)
- [Configuration on page 2979](#)
- [Verification on page 2981](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

Overview

In this example, Device R2 has an update interval of 60 seconds for its neighbor, Device R1, and an update interval of 10 seconds for its neighbor, Device R3.

This example is not necessarily practical, but it is shown for demonstration purposes. Generally, we recommend against changing the RIP timers, unless the effects of a change are well understood. Normally, the default values are best left in effect for standard operations.

An export policy is also shown because an export policy is required as part of the minimum configuration for RIP.

[Figure 44 on page 2979](#) shows the topology used in this example.

Figure 44: RIP Timers Network Topology

"CLI Quick Configuration" on page 2979 shows the configuration for all of the devices in Figure 44 on page 2979. The section "Step-by-Step Procedure" on page 2980 describes the steps on Device R2.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group rip-group export advertise-routes-through-rip

set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip

```

```
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure the RIP update interval:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 2 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 5 family inet address 10.0.0.5/30
```

```
user@R2# set lo0 unit 2 family inet address 192.168.2.2/32
user@R2# set lo0 unit 2 family inet address 172.16.2.2/32
```

2. Configure different update intervals for the two RIP neighbors.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R2# set neighbor fe-1/2/0.2 update-interval 60
user@R2# set neighbor fe-1/2/1.5 update-interval 10
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R2# set from protocol direct
user@R2# set from protocol rip
user@R2# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R2# set export advertise-routes-through-rip
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
```

```

fe-1/2/1 {
  unit 5 {
    family inet {
      address 10.0.0.5/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.2/32;
      address 172.16.2.2/32;
    }
  }
}

user@R2# show protocols
rip {
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.2 {
      update-interval 60;
    }
    neighbor fe-1/2/1.5 {
      update-interval 10;
    }
  }
}

user@R2# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Checking the RIP Updates Sent by Device R2 on page 2981](#)
- [Checking the RIP Updates Received by Device R2 on page 2982](#)
- [Checking the RIP Updates Received by Device R3 on page 2983](#)

Checking the RIP Updates Sent by Device R2

Purpose Make sure that the RIP update packets are sent at the expected interval.

Action From operational mode, enter the **show rip statistics** command.

```

user@R2> show rip statistics
RIPv2 info: port 520; holddown 120s.
      rts learned  rts held down  rqsts dropped  resps dropped
              4              2              0              0

```

fe-1/2/0.2: 2 routes learned; 5 routes advertised; timeout 180s; update interval 60s

Counter	Total	Last 5 min	Last minute
-----	-----	-----	-----
Updates Sent	123	5	1
Triggered Updates Sent	0	0	0
Responses Sent	0	0	0
Bad Messages	0	0	0
RIPv1 Updates Received	0	0	0
RIPv1 Bad Route Entries	0	0	0
RIPv1 Updates Ignored	0	0	0
RIPv2 Updates Received	244	10	2
RIPv2 Bad Route Entries	0	0	0
RIPv2 Updates Ignored	0	0	0
Authentication Failures	0	0	0
RIP Requests Received	0	0	0
RIP Requests Ignored	0	0	0
none	0	0	0

fe-1/2/1.5: 2 routes learned; 5 routes advertised; timeout 180s; update interval 10s

Counter	Total	Last 5 min	Last minute
-----	-----	-----	-----
Updates Sent	734	32	6
Triggered Updates Sent	0	0	0
Responses Sent	0	0	0
Bad Messages	0	0	0
RIPv1 Updates Received	0	0	0
RIPv1 Bad Route Entries	0	0	0
RIPv1 Updates Ignored	0	0	0
RIPv2 Updates Received	245	11	2
RIPv2 Bad Route Entries	0	0	0
RIPv2 Updates Ignored	0	0	0
Authentication Failures	0	0	0
RIP Requests Received	0	0	0
RIP Requests Ignored	0	0	0
none	0	0	0

Meaning The **update interval** field shows that the interval is 60 seconds for Neighbor R1 and 10 seconds for Neighbor R3. The **Updates Sent** field shows that Device R2 is sending updates to Device R1 at roughly 1/6 of the rate that it is sending updates to Device R3.

Checking the RIP Updates Received by Device R2

Purpose Make sure that the RIP update packets are sent at the expected interval.

Action From operational mode, enter the **show rip statistics** command.

```
user@R1> show rip statistics
```

```
RIPv2 info: port 520; holddown 120s.
```

```
    rts learned  rts held down  rqsts dropped  resps dropped
          5             0             0             0
```

fe-1/2/0.1: 5 routes learned; 2 routes advertised; timeout 180s; update interval 30s

Counter	Total	Last 5 min	Last minute
-----	-----	-----	-----
Updates Sent	312	10	2

Triggered Updates Sent	2	0	0
Responses Sent	0	0	0
Bad Messages	0	0	0
RIPv1 Updates Received	0	0	0
RIPv1 Bad Route Entries	0	0	0
RIPv1 Updates Ignored	0	0	0
RIPv2 Updates Received	181	5	1
RIPv2 Bad Route Entries	0	0	0
RIPv2 Updates Ignored	0	0	0
Authentication Failures	0	0	0
RIP Requests Received	1	0	0
RIP Requests Ignored	0	0	0
none	0	0	0

Meaning The **RIPv2 Updates Received** field shows the number of updates received from Device R2.

Checking the RIP Updates Received by Device R3

Purpose Make sure that the RIP update packets are sent at the expected interval.

Action From operational mode, enter the **show rip statistics** command.

```
user@R3> show rip statistics
```

```
RIPv2 info: port 520; holddown 120s.
```

```
    rts learned  rts held down  rqsts dropped  resps dropped
           5             0             0             0
```

```
fe-1/2/0.6: 5 routes learned; 2 routes advertised; timeout 180s; update interval 30s
```

Counter	Total	Last 5 min	Last minute
-----	-----	-----	-----
Updates Sent	314	11	2
Triggered Updates Sent	1	0	0
Responses Sent	0	0	0
Bad Messages	0	0	0
RIPv1 Updates Received	0	0	0
RIPv1 Bad Route Entries	0	0	0
RIPv1 Updates Ignored	0	0	0
RIPv2 Updates Received	827	31	6
RIPv2 Bad Route Entries	0	0	0
RIPv2 Updates Ignored	0	0	0
Authentication Failures	0	0	0
RIP Requests Received	0	0	0
RIP Requests Ignored	0	0	0
none	0	0	0

Meaning The **RIPv2 Updates Received** field shows the number of updates received from Device R2.

RIP Demand Circuits Overview

RIP periodically sends routing information (RIP packets) to neighboring devices. These periodic broadcasts can consume bandwidth resources and interfere with network traffic by preventing WAN circuits from being closed. Demand circuits for RIP is defined in RFC 2091 and overcomes these issues by exchanging incremental updates on demand.

A demand circuit is a point-to-point connection between two neighboring interfaces configured for RIP. Demand circuits preserve bandwidth by establishing a link when data needs to be transferred, and terminating the link when the data transfer is complete. Demand circuits increase the efficiency of RIP on the configured interfaces by offering minimal network overhead in terms of messages passed between the demand circuit end points, thus conserving resources and reducing costs.

By configuring RIP demand circuits, a specific event triggers the device to send an update, thereby eliminating the periodic transmission of RIP packets over the neighboring interface. To save overhead, the device sends RIP information only when changes occur in the routing database, such as:

- The device is first powered on
- The device receives a request for route update information
- A change occurs in the network
- The demand circuit goes down or comes up

The device sends update requests, update responses, and acknowledgments. In addition, the device retransmits updates and requests until valid acknowledgments are received. The device dynamically learns RIP neighbors. If the neighboring interface goes down, RIP flushes routes learned from the neighbor's IP address.

Routes learned from demand circuits do not age like other RIP entries because demand circuits are in a permanent state. Routes in a permanent state are only removed under the following conditions:

- A formerly reachable route changes to unreachable in an incoming response
- The demand circuit is down due to an excessive number of unacknowledged retransmissions

You can also set the RIP hold-down timer and the RIP demand circuit retransmission timer to regulate performance. The demand circuit uses these timers to determine if there is a change that requires update messages to be sent. There is also a database timer that runs only when RIP flushes learned routes from the routing table.

This topic includes the following sections:

- [RIP Demand Circuit Packets on page 2985](#)

- [Timers Used by RIP Demand Circuits on page 2985](#)

RIP Demand Circuit Packets

When you configure an interface for RIP demand circuits, the supported command field packet types are different than those for RIP version 1 and RIP version 2. RIP packets for RIP demand circuits contain three additional packet types and an extended 4-byte update header. Both RIP version 1 and RIP version 2 support the three packet types and the extended 4-byte header. [Table 241 on page 2985](#) describes the three packet types.

Table 241: RIP Demand Circuit Packet Types

Packet Type	Description
Update Request	Update request messages seek information for the device's routing table. This message is sent when the device is first powered on or when a down demand circuit comes up. The device sends this message every 5 seconds (by default) until an update response message is received.
Update Response	Update response messages are sent in response to an update request message, which occurs when the device is first powered on or when a down demand circuit comes up. Each update response message contains a sequence number that the neighbor uses to acknowledge the update request.
Update Acknowledge	Update acknowledge messages are sent in response to every update response message received by the neighbor.

NOTE: These packets are only valid on interfaces configured for RIP demand circuits. If a demand circuit receives a RIP packet that does not contain these packet types, it silently discards the packet and logs an error message similar to the following:

Ignoring RIP packet with invalid version 0 from neighbor 10.0.0.0 and source 10.0.0.1

Timers Used by RIP Demand Circuits

RIP demand circuits use the RIP hold-down timer and the RIP demand circuit retransmission timer to regulate performance and to determine if there is a change in the network that requires the device to send update messages. The hold-down timer is a global RIP timer that affects the entire RIP configuration. Whatever range you configure for RIP applies to RIP demand circuits. The retransmission timer affects only RIP demand circuits. In addition, there is a database timer that runs only when RIP flushes learned routes from the routing table.

- **Hold-down timer (global RIP timer)**—Use the hold-down timer to configure the number of seconds that RIP waits before updating the routing table. The value of the hold-down timer affects the entire RIP configuration, not just the demand circuit interfaces. The hold-down timer starts when a route timeout limit is met, when a formerly reachable route is unreachable, or when a demand circuit interface is down. When the hold-down

timer is running, routes are advertised as unreachable on other interfaces. When the hold-down timer expires, the route is removed from the routing table if all destinations are aware that the route is unreachable or the remaining destinations are down. By default, RIP waits 120 seconds between routing table updates. The range is from 10 to 180 seconds.

- Retransmission timer (RIP demand circuit timer)—RIP demand circuits send update messages every 5 seconds to an unresponsive peer. Use the retransmission timer to limit the number of times a demand circuit resends update messages to an unresponsive peer. If the configured retransmission threshold is reached, routes from the next hop router are marked as unreachable and the hold-down timer starts. The value of the retransmission timer affects only the demand circuit interfaces. To determine the number of times to resend the update message, use the following calculation:

$$5 \text{ seconds} \times \text{number of retransmissions} = \text{retransmission seconds}$$

The retransmission range is from 5 through 180 seconds, which corresponds to sending an update message a minimum of 1 time (5 seconds) and a maximum of 36 times (180 seconds).

- Database timer (global timeout timer)—Routes learned from demand circuits do not age like other RIP entries because demand circuits are in a permanent state. On a RIP demand circuit, the database timer starts upon receipt of the update response message with the flush flag sent from a RIP demand circuit peer. When the neighbor receives this message, all routes from that peer are flushed, and the database timer starts and runs for the configured route timeout interval. When the database timer is running, routes are still advertised as reachable on other interfaces. When the database timer expires, the device advertises all routes from its peer as unreachable.

Example: Configuring RIP Demand Circuits

This example describes how to configure an interface as a RIP demand circuit.

- [Requirements on page 2986](#)
- [Overview on page 2986](#)
- [Configuration on page 2987](#)
- [Verification on page 2988](#)

Requirements

Before you begin, configure the device interfaces. See the *Router Interfaces* or the *Junos OS Interfaces Configuration Guide for Security Devices*.

Overview

A demand circuit is a point-to-point connection between two neighboring interfaces configured for RIP. Demand circuits increase the efficiency of RIP on the configured interfaces by eliminating the periodic transmission of RIP packets. Demand circuits preserve bandwidth by establishing a link when data needs to be transferred, and terminating the link when the data transfer is complete. In this example, two devices are connected using SONET/SDH interfaces.

NOTE: When you configure RIP demand circuits, any silent removal of the RIP configuration goes unnoticed by the RIP peer and leads to stale entries in the routing table. To clear the stale entries, deactivate and reactivate RIP on the neighboring devices.

In this example, you configure interface **so-0/1/0** with the following settings:

- **demand-circuit**—Configures the interface as a demand circuit. To complete the demand circuit, you must configure both ends of the pair as demand circuits.
- **max-retrans-time**—RIP demand circuits send update messages every 5 seconds to an unresponsive peer. Use the retransmission timer to limit the number of times a demand circuit resends update messages to an unresponsive peer. If the configured retransmission threshold is reached, routes from the next-hop router are marked as unreachable, and the hold-down timer starts. The value of the retransmission timer affects only the demand circuit interfaces. To determine the number of times to resend the update message, use the following calculation:

$$5 \text{ seconds} \times \text{retransmissions} = \text{retransmission seconds}$$

For example, if you want the demand circuit to send only two update messages to an unresponsive peer, the calculation is: $5 \times 2 = 10$. When you configure the retransmission timer, you enter 10 seconds.

The retransmission range is from 5 through 180 seconds, which corresponds to sending an update message a minimum of 1 time (5 seconds) and a maximum of 36 times (180 seconds).

Configuration

In the following example, you configure a neighboring interface to be a RIP demand circuit and save the configuration.

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands in the CLI at the **[edit]** hierarchy level.

```
set interfaces so-0/1/0 unit 0 family inet address 192.0.2.0/24
set protocols rip group group1 neighbor so-0/1/0 demand-circuit
set protocols rip group group1 neighbor so-0/1/0 max-retrans-time 10
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure a RIP demand circuit on one neighboring interface:

1. Configure the interface.

```
[edit interfaces]
```

```
user@host# set so-0/1/0 unit 0 family inet address 192.0.2.0/24
```

2. Configure the neighbor as a demand circuit.

```
[edit protocols rip]
user@host# set group group1 neighbor so-0/1/0 demand-circuit
```

3. Configure the demand circuit retransmission timer.

```
[edit protocols rip]
user@host# set group group1 neighbor so-0/1/0 max-retrans-time 10
```

4. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

NOTE: Repeat this entire configuration on the other neighboring interface.

Results

Confirm your configuration by entering the **show interfaces** and **show protocols** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
so-0/1/0 {
  unit 0 {
    family inet {
      address 192.0.2.0/24;
    }
  }
}

user@host# show protocols
rip {
  group group1 {
    neighbor so-0/1/0 {
      demand-circuit;
      max-retrans-time 10;
    }
  }
}
```

Verification

Confirm that the configuration is working properly.

Verifying a Demand Circuit Configuration

Purpose Verify that the demand circuit configuration is working.

Action To verify that the demand circuit configuration is in effect, use the **show rip neighbor** operational mode command.

```
user@host> show rip neighbor
```

Neighbor	State	Source Address	Destination Address	Send Mode	Receive Mode	In Met
so-0/1/0.0(DC)	Up	10.10.10.2	224.0.0.9	mcast	both	1

When you configure demand circuits, the **show rip neighbor** command displays a DC flag next to the neighboring interface configured for demand circuits.

NOTE: If you configure demand circuits at the [edit protocols rip group *group-name* neighbor *neighbor-name*] hierarchy level, the output shows only the neighboring interface that you specifically configured as a demand circuit. If you configure demand circuits at the [edit protocols rip group *group-name*] hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits.

Related Documentation

- [Example: Configuring RIP Timers on page 2977](#)

Example: Tracing RIP Protocol Traffic

- [Understanding RIP Trace Operations on page 2989](#)
- [Example: Tracing RIP Protocol Traffic on page 2990](#)

Understanding RIP Trace Operations

You can trace various types of RIP protocol traffic to help debug RIP protocol issues.

To trace RIP protocol traffic, include the **traceoptions** statement at the [edit protocols rip] hierarchy level:

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
```

You can specify the following RIP protocol-specific trace options using the **flag** statement:

- **auth**—RIP authentication
- **error**—RIP error packets
- **expiration**—RIP route expiration processing
- **holddown**—RIP hold-down processing
- **nsr-synchronization**—Nonstop active routing synchronization events
- **packets**—All RIP packets
- **request**—RIP information packets
- **trigger**—RIP triggered updates
- **update**—RIP update packets

You can optionally specify one or more of the following flag modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

NOTE: Use the **detail** flag modifier with caution as this may cause the CPU to become very busy.

Global tracing options are inherited from the configuration set by the **traceoptions** statement at the **[edit routing-options]** hierarchy level. You can override the following global trace options for the RIP protocol using the **traceoptions flag** statement included at the **[edit protocols rip]** hierarchy level:

- **all**—All tracing operations
- **general**—All normal operations and routing table changes (a combination of the normal and route trace operations)
- **normal**—Normal events
- **policy**—Policy processing
- **route**—Routing information
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

NOTE: Use the trace flag **all** with caution because this may cause the CPU to become very busy.

Example: Tracing RIP Protocol Traffic

This example shows how to trace RIP protocol operations.

- [Requirements on page 2990](#)
- [Overview on page 2990](#)
- [Configuration on page 2991](#)
- [Verification on page 2993](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

Overview

In this example, Device R1 is set to trace routing information updates.

An export policy is also shown because an export policy is required as part of the minimum configuration for RIP.

[Figure 45 on page 2991](#) shows the topology used in this example.

Figure 45: RIP Trace Operations Network Topology

[“CLI Quick Configuration” on page 2991](#) shows the configuration for all of the devices in [Figure 45 on page 2991](#). The section [“Step-by-Step Procedure” on page 2992](#) describes the steps on Device R1.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

- Device R1**
- ```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip traceoptions file rip-trace-file
set protocols rip traceoptions flag route
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```
- Device R2**
- ```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```
- Device R3**
- ```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32

```

```
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
 direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
 rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure the RIP update interval:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

```
user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Configure the RIP group, and add the interface to the group.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Configure RIP tracing operations.

```
[edit protocols rip traceoptions]
user@R1# set file rip-trace-file
user@R1# set flag route
```

4. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

5. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

user@R1# show interfaces
fe-1/2/0 {
 unit 1 {
 family inet {
 address 10.0.0.1/30;
 }
 }
}
lo0 {
 unit 1 {
 family inet {
 address 172.16.0.1/32;
 address 192.168.1.1/32;
 }
 }
}

user@R1# show protocols
rip {
 traceoptions {
 file rip-trace-file;
 flag route;
 }
 group rip-group {
 export advertise-routes-through-rip;
 neighbor fe-1/2/0.1;
 }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
 term 1 {
 from protocol [direct rip];
 then accept;
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

### Checking the Log File

**Purpose** Make sure that the RIP route updates are logged in the configured log file.

**Action** 1. Deactivate the extra loopback interface address on Device R3.

```

[edit interfaces lo0 unit 3 family inet]
user@R3# deactivate address 172.16.3.3/32
user@R3# commit

```

2. From operational mode on Device R1, enter the **show log rip-trace-file** command with the **| match 172.16.3.3** option.

```

user@R1> show log rip-trace-file | match 172.16.3.3

```

```

Mar 1 11:39:53.975192 Setting RIPv2 rtbit on route 172.16.3.3/32, tsi =
0xbb69228
Mar 1 11:39:59.847118 172.16.3.3/32: metric-in: 16, change: 3 -> 16; # gw:

Mar 1 11:39:59.847568 CHANGE 172.16.3.3/32 nhid 591 gw 10.0.0.2
RIP pref 100/0 metric 3/0 fe-1/2/0.1 <Delete Int>
Mar 1 11:39:59.847629 Best route to 172.16.3.3/32 got deleted. Doing route calculation
on the stored rte-info

```

**Meaning** The output shows that the route to 172.16.3.3/32 was deleted.

### *Verifying a RIP Configuration*

To verify a RIP configuration, perform the following tasks:

- [Verifying the Exchange of RIP Messages on page 2994](#)
- [Verifying the RIP-Enabled Interfaces on page 2995](#)
- [Verifying Reachability of All Hosts in the RIP Network on page 2996](#)

### *Verifying the Exchange of RIP Messages*

**Purpose** Verify that RIP messages are being sent and received on all RIP-enabled interfaces.

**Action** From the CLI, enter the **show rip statistics** command.

## Sample Output

```

user@host> show rip statistics
RIPv2 info: port 520; holddown 120s.
 rts learned rts held down rqsts dropped resps dropped
 10 0 0 0

t1-0/0/2.0: 0 routes learned; 13 routes advertised; timeout 120s; update interval
45s
Counter Total Last 5 min Last minute

Updates Sent 2855 11 2
Triggered Updates Sent 5 0 0
Responses Sent 0 0 0
Bad Messages 0 0 0
RIPv1 Updates Received 0 0 0
RIPv1 Bad Route Entries 0 0 0
RIPv1 Updates Ignored 0 0 0
RIPv2 Updates Received 41 0 0
RIPv2 Bad Route Entries 0 0 0
RIPv2 Updates Ignored 0 0 0
Authentication Failures 0 0 0
RIP Requests Received 0 0 0
RIP Requests Ignored 0 0 0

ge-0/0/1.0: 10 routes learned; 3 routes advertised; timeout 180s; update interval
30s
Counter Total Last 5 min Last minute

```

|                         |      |    |   |
|-------------------------|------|----|---|
| Updates Sent            | 2855 | 11 | 2 |
| Triggered Updates Sent  | 3    | 0  | 0 |
| Responses Sent          | 0    | 0  | 0 |
| Bad Messages            | 1    | 0  | 0 |
| RIPv1 Updates Received  | 0    | 0  | 0 |
| RIPv1 Bad Route Entries | 0    | 0  | 0 |
| RIPv1 Updates Ignored   | 0    | 0  | 0 |
| RIPv2 Updates Received  | 2864 | 11 | 2 |
| RIPv2 Bad Route Entries | 14   | 0  | 0 |
| RIPv2 Updates Ignored   | 0    | 0  | 0 |
| Authentication Failures | 0    | 0  | 0 |
| RIP Requests Received   | 0    | 0  | 0 |
| RIP Requests Ignored    | 0    | 0  | 0 |

**Meaning** The output shows the number of RIP routes learned. It also shows the number of RIP updates sent and received on the RIP-enabled interfaces. Verify the following information:

- The number of RIP routes learned matches the number of expected routes learned. Subnets learned by direct connectivity through an outgoing interface are not listed as RIP routes.
- RIP updates are being sent on each RIP-enabled interface. If no updates are being sent, the routing policy might not be configured to export routes.
- RIP updates are being received on each RIP-enabled interface. If no updates are being received, the routing policy might not be configured to export routes on the host connected to that subnet. The lack of updates might also indicate an authentication error.

#### *Verifying the RIP-Enabled Interfaces*

**Purpose** Verify that all the RIP-enabled interfaces are available and active.

**Action** From the CLI, enter the **show rip neighbor** command.

### Sample Output

```
user@host> show rip neighbor
Source Destination Send Receive In
Neighbor State Address Address Mode Mode Met

ge-0/0/0.0 Dn (null) (null) mcast both 1
ge-0/0/1.0 Up 192.168.220.5 224.0.0.9 mcast both 1
```

**Meaning** The output shows a list of the RIP neighbors that are configured on the device. Verify the following information:

- Each configured interface is present. Interfaces are listed in alphabetical order.
- Each configured interface is up. The state of the interface is listed in the **Destination State** column. A state of **Up** indicates that the link is passing RIP traffic. A state of **Dn** indicates that the link is not passing RIP traffic. In a point-to-point link, this state generally means that either the end point is not configured for RIP or the link is unavailable.

### ***Verifying Reachability of All Hosts in the RIP Network***

**Purpose** By using the traceroute tool on each loopback address in the network, verify that all hosts in the RIP network are reachable from each Juniper Networks device.

**Action** For each device in the RIP network:

1. In the J-Web interface, select **Troubleshoot>Traceroute**.
2. In the Remote Host box, type the name of a host for which you want to verify reachability from the device.
3. Click **Start**. Output appears on a separate page.

### **Sample Output**

```
1 172.17.40.254 (172.17.40.254) 0.362 ms 0.284 ms 0.251 ms
2 routera-fxp0.eng1ab.mycompany.net (192.168.71.246) 0.251 ms 0.235 ms 0.200 ms
```

**Meaning** Each numbered row in the output indicates a routing hop in the path to the host. The three-time increments indicate the round-trip time (RTT) between the device and the hop for each traceroute packet.

To ensure that the RIP network is healthy, verify the following information:

- The final hop in the list is the host you want to reach.
- The number of expected hops to the host matches the number of hops in the traceroute output. The appearance of more hops than expected in the output indicates that a network segment is probably unreachable. It might also indicate that the incoming or outgoing metric on one or more hosts has been set unexpectedly.

| <b>Description</b>              | Configure the type of authentication for RIP route queries received on an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>                  | If you do not include this statement and the <b>authentication-key</b> statement, RIP authentication is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <b>type</b> —Authentication type: <ul style="list-style-type: none"><li>• <b>md5</b>—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing device uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme.</li><li>• <b>none</b>—Disable authentication. If <b>none</b> is configured, the configured authentication key is ignored.</li><li>• <b>simple</b>—Use a simple password. The password is included in the transmitted packet, which makes this method of authentication relatively insecure. The password can be from 1 through 16 contiguous letters or digits long.</li></ul>                                                                                                                                                                                                                                                                                                                          |
| <b>Required Privilege Level</b> | <b>routing</b> —To view this statement in the configuration.<br><b>routing-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>         | Configure bidirectional failure detection timers and authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>authentication algorithm <i>algorithm-name</i></b>—Configure the algorithm used to authenticate the specified BFD session: <b>simple-password</b>, <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, or <b>meticulous-keyed-sha-1</b>.</p> <p><b>authentication key-chain <i>key-chain-name</i></b>—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the <b>authentication-key-chains key-chain</b> statement at the [edit security] hierarchy level.</p>                                                                                                                                                                                                                            |

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication is not configured at both ends of the BFD session.

**detection-time threshold *milliseconds***—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**minimum-interval *milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**Range:** 1 through 255,000 milliseconds

**minimum-receive-interval *milliseconds***—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

**Range:** 1 through 255,000 milliseconds

**multiplier *number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds***—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** automatic

| <b>Description</b>              | <p>Some of the reserved fields in RIP version 1 packets must be zero, whereas in RIP version 2 packets, most of these reserved fields can contain nonzero values. By default, RIP discards version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications.</p> <p>If you find that you are receiving RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero, you can configure RIP to receive these packets even though they are being sent in violation of the specifications in RFC 1058 and RFC 2453.</p> <p>Check whether the reserved fields in a RIP packet are zero:</p> <ul style="list-style-type: none"> <li>• <b>check-zero</b>—Discard version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications.</li> <li>• <b>no-check-zero</b>—Receive RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero. This is in spite of the fact that they are being sent in violation of the specifications in RFC 1058 and RFC 2453.</li> </ul> |
| <b>Default</b>                  | check-zero                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Configure a neighboring interface to act as a RIP demand circuit. To complete the demand circuit, you must configure both ends of the pair as demand circuits. When configured, the device sends RIP information only when changes occur in the routing database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>                  | Disabled. You must explicitly configure two neighboring interfaces to act as a RIP demand circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>              | <p>Apply a policy to routes being exported to the neighbors.</p> <p>By default, RIP does not export routes it has learned to its neighbors. To enable RIP to export routes, apply one or more export policies.</p> <p>If no routes match the policies, the local routing device does not export any routes to its neighbors. Export policies override any metric values determined through calculations involving the values configured with the <a href="#">metric-in</a> and <a href="#">metric-out</a> statements.</p> <div><p><b>NOTE:</b> The export policy on RIP does not support manipulating routing information of the next hop.</p></div> |
| <b>Options</b>                  | <i>policy-names</i> —Name of one or more policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>RIP demand circuits send update messages every 5 seconds to an unresponsive peer. Configure the retransmission timer to limit the number of times the demand circuit resends update messages to an unresponsive peer. If the configured retransmission threshold is reached, routes from the next hop router are marked as unreachable and the hold-down timer starts. You must configure a pair of RIP demand circuits for this timer to take effect.</p> <p>To determine the number of times to resend the update message, use the following calculation:</p> $5 \text{ seconds} \times \text{number of retransmissions} = \text{retransmission seconds}$                                                                                                                                                      |
| <b>Options</b>                  | <p><b>seconds</b>—The total amount of time the demand circuit resends update messages to an unresponsive peer. The seconds range corresponds to sending an update message a minimum of 1 time (5 seconds) and a maximum of 36 times (180 seconds).</p> <p><b>Range:</b> 5 through 180 seconds</p> <p><b>Default:</b> 5 seconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | Specify the metric to add to incoming routes when the routing device advertises into RIP routes that were learned from other protocols. Use this statement to configure the routing device to prefer RIP routes learned through a specific neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Specify the metric value to add to routes transmitted to the neighbor. Use this statement to control how other routing devices prefer RIP routes sent from this neighbor.</p> <p>If you have included the <b>export</b> statement, RIP exports routes it has learned to the neighbors configured by including the <b>neighbor</b> statement.</p> <p>The metric associated with a RIP route (unless modified by an export policy) is the normal RIP metric. For example, a RIP route with a metric of 5 learned from a neighbor configured with a <b>metric-in</b> value of 2 is advertised with a combined metric of 7 when advertised to RIP neighbors in the same group. However, if this route was learned from a RIP neighbor in a different group or from a different protocol, the route is advertised with the metric value configured for that group with the <b>metric-out</b> statement.</p> <p>The metric for a route can be modified with an export policy. That metric is seen when the route is exported to the next hop.</p> <p>To increase the metric for routes advertised outside a group, include the <b>metric-out</b> statement.</p> |
| <b>Options</b>                  | <b><i>metric</i></b> —Metric value.<br><b>Range:</b> 1 through 16<br><b>Default:</b> 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

         rip **group** *group-name*],  
     [edit protocols rip **group** *group-name*],  
     [edit routing-instances *routing-instance-name* protocols rip **group** *group-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
     Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure neighbor-specific RIP parameters, thereby overriding the defaults set for the routing device.

**Options** *neighbor-name*—Name of an interface over which a routing device communicates to its neighbors.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

---

## peer (Protocols RIP)

---

**Syntax** `peer IP address;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols rip group *group-name* neighbor *neighbor-name*],  
[edit protocols rip group *group-name* neighbor *neighbor-name*]

**Release Information** Statement introduced in Junos OS Release 11.4.

**Description** Configure a static peer for an interface in a point-to-multipoint RIP network.

**Options** *address*—IP address of the static peer to be configured.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the route timeout interval for RIP. If a route is not refreshed after being installed in the routing table by the specified timeout interval, the route is marked as invalid and is removed from the routing table after the hold-down period expires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Configure an additional routing entity for a router. You can create multiple instances of BGP, IS-IS, OSPF, OSPFv3, and RIP for a router. You can also create multiple routing instances for separating routing tables, routing policies, and interfaces for individual wholesale subscribers (retailers) in a Layer 3 wholesale network.</p> <p>Each routing instance consist of the following:</p> <ul style="list-style-type: none"> <li>• A set of routing tables</li> <li>• A set of interfaces that belong to these routing tables</li> <li>• A set of routing option configurations</li> </ul> <p>Each routing instance has a unique name and a corresponding IP unicast table. For example, if you configure a routing instance with the name <b>my-instance</b>, its corresponding IP unicast table is my-instance.inet.0. All routes for <b>my-instance</b> are installed into my-instance.inet.0.</p> <p>Routes are installed into the default routing instance inet.0 by default, unless a routing instance is specified.</p> <p>In Junos OS Release 9.0 and later, you can no longer specify a routing-instance name of <i>master</i>, <i>default</i>, or <i>bgp</i> or include special characters within the name of a routing instance.</p> <p>In Junos OS Release 9.6 and later, you can include a slash (/) in a routing-instance name only if a logical system is not configured. That is, you cannot include the slash character in a routing-instance name if a logical system other than the default is explicitly configured. Routing-instance names, further, are restricted from having the form <code>__.*__</code> (beginning and ending with underscores). The colon : character cannot be used when multipotology routing (MTR) is enabled.</p> |
| <b>Default</b>                  | Routing instances are disabled for the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                          |
| <b>Description</b>         | Set RIP protocol-level tracing options.                                                                                                                                                                                                                                                                                                                 |

**NOTE:** The `traceoptions` statement is not supported on QFabric systems.

**Default** The default RIP protocol-level trace options are inherited from the global `traceoptions` statement.

**Options** **disable**—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

**file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIP tracing output in the file `/var/log/rip-log`.

**files *number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file.0***, then ***trace-file.1***, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

### RIP Tracing Options

- **auth**—RIP authentication
- **error**—RIP error packets

- **expiration**—RIP route expiration processing
- **holddown**—RIP hold-down processing
- **nsr-synchronization**—Nonstop routing synchronization events
- **packets**—All RIP packets
- **request**—RIP information packets such as request, poll, and poll entry packets
- **trigger**—RIP triggered updates
- **update**—RIP update packets

#### Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **receive-detail**—Provide detailed trace information for packets being received.
- **send**—Trace the packets being transmitted.
- **send-detail**—Provide detailed trace information for packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>              | Configure the interval at which routes learned by RIP are sent to neighbors. This timer controls the interval between routing updates. This timer is set to 30 seconds, by default, with a small random amount of time added when the timer is reset. This added time prevents congestion that can happen if all routing devices update their neighbors simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <b>seconds</b> —Estimated time to wait before making updates to the routing table.<br><b>Range:</b> 10 through 60 seconds<br><b>Default:</b> 30 seconds                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### ***Routing Protocol Process Memory FAQs Overview***

Junos OS is based on the FreeBSD Unix operating system. The open source software is modified and hardened to operate in the device's specialized environment. For example, some executables have been deleted, while other utilities were de-emphasized. Additionally, certain software processes were added to enhance the routing functionality. The result of this transformation is the kernel, the heart of the Junos OS software.

The kernel is responsible for operating multiple processes that perform the actual functions of the device. Each process operates in its own protected memory space, while the communication among all the processes is still controlled by the kernel. This separation provides isolation between the processes, and resiliency in the event of a process failure. This is important in a core routing platform because a single process failure does not cause the entire device to cease functioning.

Some of the common software processes include the routing protocol process (rpd) that controls the device's protocols, the device control process (dcd) that controls the device's interfaces, the management process (mgd) that controls user access to the device, the chassis process (chassisd) that controls the device's properties itself, and the Packet Forwarding Engine process (pfed) that controls the communication between the device's Packet Forwarding Engine and the Routing Engine. The kernel also generates specialized processes as needed for additional functionality, such as SNMP, the Virtual Router Redundancy Protocol (VRRP), and Class of Service (CoS).

The routing protocol process is a software process within the Routing Engine software, which controls the routing protocols that run on the device. Its functionality includes all protocol messages, routing table updates, and implementation of routing policies.

The routing protocol process starts all configured routing protocols and handles all routing messages. It maintains one or more routing tables, which consolidate the routing information learned from all routing protocols. From this routing information, the routing protocol process determines the active routes to network destinations and installs these routes into the Routing Engine's forwarding table. Finally, it implements routing policy, which allows you to control the routing information that is transferred between the routing protocols and the routing table. Using routing policy, you can filter and limit the transfer of information as well as set properties associated with specific routes.

### ***Routing Protocol Process Memory FAQs***

The following sections present the most frequently asked questions and answers related to the routing protocol process memory utilization, operation, interpretation of related command outputs, and troubleshooting the software process.

### ***Frequently Asked Questions: Routing Protocol Process Memory***

This section presents frequently asked questions and answers related to the memory usage of the routing protocol process.

#### **Why does the routing protocol process use excessive memory?**

The routing protocol process uses hundreds of megabytes of RAM in the Routing Engine to store information needed for the operation of routing and related protocols, such as BGP, OSPF, IS-IS, RSVP, LDP and MPLS. Such huge consumption of memory is common for the process, as the information it stores includes routes, next hops, interfaces, routing policies, labels, and label-switched paths (LSPs). Because access to the RAM memory is much faster than access to the hard disk, most of the routing protocol process information is stored in the RAM memory instead of using the hard disk space. This ensures that the performance of the routing protocol process is maximized.

#### **How can I check the amount of memory the routing protocol process is using?**

You can check routing protocol process memory usage by entering the **show system processes** and the **show task memory** Junos OS command-line interface (CLI) operational mode commands.

The **show system processes** command displays information about software processes that are running on the device and that have controlling terminals. The **show task memory** command displays memory utilization for routing protocol tasks on the Routing Engine.

You can check the routing protocol process memory usage by using the **show system processes** command with the **extensive** option. The **show task memory** command displays a report generated by the routing protocol process on its own memory usage. However, this report does not display all the memory used by the process. The value reported by the routing protocol process does not account for the memory used for the **TEXT** and **STACK** segments, or the memory used by the process's internal memory manager. Further, the Resident Set Size value includes shared library pages used by the routing protocol process.

For more information about checking the routing protocol process memory usage, see *Check Routing Protocol Process (rpd) Memory Usage*.

For more information, see the [show system processes](#) command and the **show task memory** command.

#### **I just deleted a large number of routes from the routing protocol process. Why is it still using so much memory?**

The **show system processes extensive** command displays a **RES** value measured in kilobytes. This value represents the amount of program memory resident in the physical memory. This is also known as RSS or Resident Set Size. The **RES** value includes shared library pages used by the process. Any amount of memory freed by the process might still be considered part of the **RES** value. Generally, the kernel delays the migrating of memory out of the **Inact** queue into the **Cache** or **Free** list unless there is a memory shortage. This can lead to large discrepancies between the values reported by the routing

protocol process and the kernel, even after the routing protocol process has freed a large amount of memory.

### ***Frequently Asked Questions: Interpreting Routing Protocol Process-Related Command Outputs***

This section presents frequently asked questions and answers about the routing protocol process-related Junos OS command-line interface (CLI) command outputs that are used to display the memory usage of the routing protocol process.

#### **How do I interpret memory numbers displayed in the show system processes extensive command output?**

The **show system processes extensive** command displays exhaustive system process information about software processes that are running on the device and have controlling terminals. This command is equivalent to the UNIX **top** command. However, the UNIX **top** command shows real-time memory usage, with the memory values constantly changing, while the **show system processes extensive** command provides a snapshot of memory usage in a given moment.

To check overall CPU and memory usage, enter the **show system processes extensive** command. Refer to [Table 242 on page 3034](#) for information about the **show system processes extensive** commands output fields.

Table 242 on page 3034 describes the output fields that represent the memory values for the **show system processes extensive** command. Output fields are listed in the approximate order in which they appear.

Table 242: show system processes extensive Output Fields

| Field Name    | Field Description                                                                                                                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mem</b>    | Information about physical and virtual memory allocation.                                                                                                                                                                         |
| <b>Active</b> | Memory allocated and actively used by the program.                                                                                                                                                                                |
| <b>Inact</b>  | Memory allocated but not recently used or memory freed by the programs. Inactive memory remains mapped in the address space of one or more processes and, therefore, counts toward the RSS value of those processes.              |
| <b>Wired</b>  | Memory that is not eligible to be swapped, usually used for in-kernel memory structures and/or memory physically locked by a process.                                                                                             |
| <b>Cache</b>  | Memory that is not associated with any program and does not need to be swapped before being reused.                                                                                                                               |
| <b>Buf</b>    | Size of memory buffer used to hold data recently called from the disk.                                                                                                                                                            |
| <b>Free</b>   | Memory that is not associated with any programs. Memory freed by a process can become <b>Inactive</b> , <b>Cache</b> , or <b>Free</b> , depending on the method used by the process to free the memory.                           |
| <b>Swap</b>   | Information about swap memory. <ul style="list-style-type: none"> <li>• Total—Total memory available to be swapped to disk.</li> <li>• Used—Memory swapped to disk.</li> <li>• Free—Memory available for further swap.</li> </ul> |

The rest of the command output displays information about the memory usage of each process. The **SIZE** field indicates the size of the virtual address space, and the **RES** field indicates the amount of the program in physical memory, which is also known as RSS or Resident Set Size. For more information, see the [show system processes](#) command.

#### What is the difference between Active and Inact memory that is displayed by the show system processes extensive command?

When the system is under memory pressure, the pageout process reuses memory from the free, cache, inact and, if necessary, active pages. When the pageout process runs, it scans memory to see which pages are good candidates to be unmapped and freed up. Thus, the distinction between **Active** and **Inact** memory is only used by the pageout process to determine which pool of pages to free first at the time of a memory shortage.

The pageout process first scans the **Inact** list, and checks whether the pages on this list have been accessed since the time they have been listed here. The pages that have been accessed are moved from the **Inact** list to the **Active** list. On the other hand, pages that have not been accessed become prime candidates to be freed by the pageout process. If the pageout process cannot produce enough free pages from the **Inact** list, pages from the **Active** list get freed up.

Because the pageout process runs only when the system is under memory pressure, the pages on the **Inact** list remain untouched – even if they have not been accessed recently – when the amount of **Free** memory is adequate.

### How do I interpret memory numbers displayed in the show task memory command output?

The **show task memory** command provides a comprehensive picture of the memory utilization for routing protocol tasks on the Routing Engine. The routing protocol process is the main task that uses Routing Engine memory.

To check routing process memory usage, enter the **show task memory** command. Refer to [Table 243 on page 3035](#) for information about the **show task memory** command output fields.

```
user@host> show task memory
Memory Size (kB) %Available When
Currently In Use: 29417 3% now
Maximum Ever Used: 33882 4% 00/02/11 22:07:03
Available: 756281 100% now
```

[Table 243 on page 3035](#) describes the output fields for the **show task memory** command. Output fields are listed in the approximate order in which they appear.

**Table 243: show task memory Output Fields**

| Field Name                      | Field Description                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Memory Currently In Use</b>  | Memory currently in use. Dynamically allocated memory plus the <b>DATA</b> segment memory in kilobytes. |
| <b>Memory Maximum Ever Used</b> | Maximum memory ever used.                                                                               |
| <b>Memory Available</b>         | Memory currently available.                                                                             |

The **show task memory** command does not display all the memory used by the routing protocol process. This value does not account for the memory used for the **TEXT** and **STACK** segments, or the memory used by the routing protocol process's internal memory manager.

### Why is the Currently In Use value less than the RES value?

The **show task memory** command displays a **Currently In Use** value measured in kilobytes. This value represents the memory currently in use. It is the dynamically allocated memory plus the **DATA** segment memory. The **show system processes extensive** command displays

a **RES** value measured in kilobytes. This value represents the amount of program memory resident in the physical memory. This is also known as RSS or Resident Set Size.

The **Currently In Use** value does not account for all of the memory that the routing protocol process uses. This value does not include the memory used for the **TEXT** and the **STACK** segments, and a small percentage of memory used by the routing protocol process's internal memory manager. Further, the **RES** value includes shared library pages used by the routing protocol process.

Any amount of memory freed by the routing protocol process might still be considered part of the **RES** value. Generally, the kernel delays the migrating of memory out of the **Inact** queue into the **Cache** or **Free** list unless there is a memory shortage. This can lead to large discrepancies between the **Currently In Use** value and the **RES** value.

### ***Frequently Asked Questions: Routing Protocol Process Memory Swapping***

This section presents frequently asked questions and answers related to the memory swapping of the routing protocol process from the Routing Engine memory to the hard disk memory.

#### **How do I monitor swap activity?**

When the system is under memory pressure, the pageout process reuses memory from the free, cache, inactive and, if necessary, active pages. You can monitor the swap activity by viewing the syslog message reported by the kernel during periods of high pageout activity.

The syslog message appears as follows:

```
Mar 3 20:08:02 olympic /kernel: High pageout rate!! 277 pages/sec.
```

You can use the **vmstat -s** command to print the statistics for the swapout activity. The displayed statistics appear as follows:

```
0 swap pager pageouts
0 swap pager pages paged out
```

The **swap pager pageouts** is the number of pageout operations to the swap device, and the **swap pager pages paged out** is the number of pages paged out to the swap device.

#### **Why does the system start swapping when I try to dump core using the request system core-dumps command?**

The **request system core-dumps** command displays a list of system core files created when the device has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, path, and filename. You can use the **core-filename** option and the **core-file-info**, **brief**, and **detail** options to display more information about the specified core-dump files.

You can use the **request system core-dumps** command to perform a non-fatal core-dump without aborting the routing protocol process. To do this, the routing protocol process is forked, generating a second copy, and then aborted. This process can double the memory consumed by the two copies of the routing protocol processes, pushing the system into swap.

**Why does the show system processes extensive command show that memory is swapped to disk although there is plenty of free memory?**

Memory can remain swapped out indefinitely if it is not accessed again. Therefore, the **show system processes extensive** command shows that memory is swapped to disk even though there is plenty of free memory, and such a situation is not unusual.

***Frequently Asked Questions: Troubleshooting the Routing Protocol Process***

This section presents frequently asked questions and answers related to a shortage of memory and memory leakage by the routing protocol process.

**What does the RPD\_OS\_MEMHIGH message mean?**

The **RPD\_OS\_MEMHIGH** message is written into the system message file if the routing protocol process is running out of memory. This message alerts you that the routing protocol process is using the indicated amount and percentage of Routing Engine memory, which is considered excessive. This message is generated either because the routing protocol process is leaking memory or the use of system resources is excessive, perhaps because routing filters are misconfigured or the configured network topology is very complex.

When the memory utilization for the routing protocol process is using all available Routing Engine DRAM memory (Routing Engines with maximum 2 GB DRAM) or reaches the limit of 2 GB of memory (Routing Engines with 4 GB DRAM), a message of the following form is written every minute in the syslog message file:

**RPD\_OS\_MEMHIGH:** Using 188830 KB of memory, 100 percent of available

This message includes the amount, in kilobytes and/or the percentage, of the available memory in use.

This message should not appear under normal conditions, as any further memory allocations usually require a portion of existing memory to be written to swap. As a recommended solution, increase the amount of RAM in the Routing Engine. For more information, go to <http://kb.juniper.net/InfoCenter/index?page=content&id=KB14186>.

**What can I do when there is a memory shortage even after a swap?**

It is not recommended for the system to operate in this state, notwithstanding the existence of swap. The protocols that run in the routing protocol process usually have a real-time requirement that cannot reliably withstand the latency of being swapped to hard disk. If the memory shortage has not resulted from a memory leak, then either a reduction in the memory usage or an upgrade to a higher memory-capacity Routing Engine is required.

**How do I determine whether there is a memory leak in the routing protocol process?**

Memory leaks are typically the result of a seemingly unbounded growth in the memory usage of a process as reported by the **show system processes extensive** command.

There are two classes of memory leaks that the routing protocol process can experience.

- The first class occurs when the allocated memory that is no longer in use is not freed. This class of leak can usually be fixed by taking several samples of the **show task memory detail** command over a period of time and comparing the deltas.
- The second class occurs when there is a late access to freed memory. If the access is not outside the mapped address space, the kernel backfills the accessed page with real memory. This backfill is done without the knowledge of the routing protocol process's internal memory allocator, which makes this class of leak much more difficult to resolve. If a memory leak of this class is suspected, writing the state of the system to a disk file (creating a core file) is suggested.

A large discrepancy between the **RES** value and the **Currently In Use** value might indicate a memory leak. However, large discrepancies can also occur for legitimate reasons. For example, the memory used for the **TEXT** and **STACK** segments or the memory used by the routing protocol process's internal memory manager might not be displayed. Further, the **RES** value includes shared library pages used by the process.

#### What is the task\_timer?

The source of a routing protocol process memory leak can usually be identified by dumping the timers for each task. You can use the **show task task-name** command to display routing protocol tasks on the Routing Engine. Tasks can be baseline tasks performed regardless of the device's configuration, and other tasks that depend on the device configuration.

For more information, see the **show task** command.

#### Monitoring RIP Routing Information

**Purpose** Use the monitoring functionality to monitor RIP routing on routing devices.

**Action** To view RIP routing information in the J-Web interface, select **Monitor > Routing > RIP Information**.

To view RIP routing information in the CLI, enter the following CLI commands:

- **show rip statistics**
- **show rip neighbor**

**Meaning** [Table 244 on page 3038](#) summarizes key output fields in the RIP routing display in the J-Web interface.

Table 244: Summary of Key RIP Routing Output Fields

| Field          | Values | Additional Information |
|----------------|--------|------------------------|
| RIP Statistics |        |                        |

Table 244: Summary of Key RIP Routing Output Fields (*continued*)

| Field                    | Values                                                                                 | Additional Information                                                                                                |
|--------------------------|----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Protocol Name            | The RIP protocol name.                                                                 |                                                                                                                       |
| Port number              | The port on which RIP is enabled.                                                      |                                                                                                                       |
| Hold down time           | The interval during which routes are neither advertised nor updated.                   |                                                                                                                       |
| Global routes learned    | Number of RIP routes learned on the logical interface.                                 |                                                                                                                       |
| Global routes held down  | Number of RIP routes that are not advertised or updated during the hold-down interval. |                                                                                                                       |
| Global request dropped   | Number of requests dropped.                                                            |                                                                                                                       |
| Global responses dropped | Number of responses dropped.                                                           |                                                                                                                       |
| <b>RIP Neighbors</b>     |                                                                                        |                                                                                                                       |
| Neighbor                 | Name of the RIP neighbor.                                                              | This value is the name of the interface on which RIP is enabled. Click the name to see the details for this neighbor. |
| State                    | State of the RIP connection: <b>Up</b> or <b>Dn</b> (Down).                            |                                                                                                                       |
| Source Address           | Local source address.                                                                  | This value is the configured address of the interface on which RIP is enabled.                                        |
| Destination Address      | Destination address.                                                                   | This value is the configured address of the immediate RIP adjacency.                                                  |
| Send Mode                | The mode of sending RIP messages.                                                      |                                                                                                                       |
| Receive Mode             | The mode in which messages are received.                                               |                                                                                                                       |
| In Metric                | Value of the incoming metric configured for the RIP neighbor.                          |                                                                                                                       |

- adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.
- all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.
- all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.
- all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.
- all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).
- ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.
- application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
- audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.
- auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.
- autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.
- captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.
- ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.
- chassis-control**—(Optional) Restart the chassis management process.
- class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.
- clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

**datapath-trace-service**—(Optional) Restart the packet path tracing process.

**dhcp**—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

**dhcp-service**—(Optional) Restart the Dynamic Host Configuration Protocol process.

**dialer-services**—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

**diameter-service**—(Optional) Restart the diameter process.

**disk-monitoring**—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

**dls**—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

**dot1x-protocol**—(EX Series switches only) (Optional) Restart the port-based network access control process.

**dynamic-flow-capture**—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**ethernet-switching**—(EX Series switches only) (Optional) Restart the Ethernet switching process.

**event-processing**—(Optional) Restart the event process (eventd).

**fibre-channel**—(QFX Series only) (Optional) Restart the Fibre Channel process.

**firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

**gracefully**—(Optional) Restart the software process.

**iccp-service**—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

**immediately**—(Optional) Immediately restart the software process.

**interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**ipsec-key-management**—(Optional) Restart the IPsec key management process.

**isdn-signaling**—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

**kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Restart the Layer 2 address flooding and learning process.

**l2cpd-service**—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

**l2tp-universal-edge**—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

**lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific T1600 router that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**license-service**—(EX Series switches only) (Optional) Restart the feature license management process.

**link-management**— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**— (EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**— (MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***— (MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**mib-process**— (Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**— (Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**— (EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**— (Optional) Restart the MPLS Periodic Traceroute process.

**mspd**— (Optional) Restart the Multiservice process.

**multicast-snooping**— (EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**— (Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**network-access-service**— (J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

**nfsd-service**— (Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**packet-triggered-subscribers**—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Restart the Peer Selection Service process.

**pgcp-service**—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

**pgm**—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

**pic-services-logging**—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**pki-service**—(Optional) Restart the PKI Service process.

**ppp**—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

**pppoe**—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**protected-system-domain-service**—(Optional) Restart the Protected System Domain (PSD) process.

**redundancy-interface-process**—(Optional) Restart the ASP redundancy process.

**remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

**root-system-domain-service**—(Optional) Restart the Root System Domain (RSD) service.

**routing**—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

**routing <logical-system *logical-system-name*>**—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

**sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

**sdk-service**—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**sfc number**—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with **0**.

**service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**services**—(Optional) Restart a service.

**services pgcp gateway gateway-name**—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

**sflow-service**—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

**snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oamd**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol

tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

**vrrp**—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

**Required Privilege Level** reset

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

## show policy

**Table 245: show policy Output Fields**

| Field Name         | Field Description               |
|--------------------|---------------------------------|
| <i>policy-name</i> | Name of the policy listed.      |
| <i>term</i>        | Policy term listed.             |
| <i>from</i>        | Match condition for the policy. |
| <i>then</i>        | Action for the policy.          |

## Sample Output

### show policy

```
user@host> show policy
```

```
Configured policies:
__vrf-export-red-internal__
__vrf-import-red-internal__
red-export
all_routes
```

### **show policy policy-name**

```
user@host> show policy test-statics
Policy test-statics:
 from
 3.0.0.0/8 accept
 3.1.0.0/16 accept
 then reject
```

### **show policy (Multicast Scoping)**

```
user@host> show policy test-statics
Policy test-statics:
 from
 multicast-scoping == 8
```

## show policy conditions

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 246: show policy conditions Output Fields**

| Field Name              | Field Description                                                                                                                                  | Level of Output |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Condition</b>        | Name of configured condition.                                                                                                                      | All levels      |
| <b>event</b>            | Condition type. If the <b>if-route-exists</b> option is configured, the event type is:<br><b>Existence of a route in a specific routing table.</b> | All levels      |
| <b>Dependent routes</b> | List of routes dependent on the condition, along with the latest generation number.                                                                | <b>detail</b>   |
| <b>Condition tables</b> | List of routing tables associated with the condition, along with the latest generation number and number of dependencies.                          | All levels      |

Table 246: show policy conditions Output Fields (*continued*)

| Field Name                 | Field Description                                                         | Level of Output |
|----------------------------|---------------------------------------------------------------------------|-----------------|
| If-route-exists conditions | List of conditions configured to look for a route in the specified table. | All levels      |

## Sample Output

### show policy conditions detail

```
user@host> show policy conditions detail
Configured conditions:
Condition cond1, event: Existence of a route in a specific routing table
Dependent routes:
 4.4.4.4/32, generation 3
 6.6.6.6/32, generation 3
 10.10.10.10/32, generation 3

Condition cond2, event: Existence of a route in a specific routing table
Dependent routes:
None

Condition tables:
Table inet.0, generation 4, dependencies 3, If-route-exists conditions: cond1
(static) cond2 (static)
```

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                     |

**Table 248: show rip neighbor Output Fields**

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Neighbor</b> | <p>Name of the RIP neighbor.</p> <p><b>NOTE:</b> Beginning with Junos OS Release 11.1, when you configure demand circuits, the output displays a demand circuit (DC) flag next to neighbor interfaces configured for demand circuits.</p> <p>If you configure demand circuits at the <b>[edit protocols rip group <i>group-name</i> neighbor <i>neighbor-name</i>]</b> hierarchy level, the output shows only the neighboring interface that you specifically configured as a demand circuit. If you configure demand circuits at the <b>[edit protocols rip group <i>group-name</i>]</b> hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits.</p> |

Table 248: show rip neighbor Output Fields (*continued*)

| Field Name                 | Field Description                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------------|
| <b>State</b>               | State of the connection: <b>Up</b> or <b>Dn</b> (Down).                                                  |
| <b>Source Address</b>      | Address of the port on the local router.                                                                 |
| <b>Destination Address</b> | Address of the port on the remote router.                                                                |
| <b>Send Mode</b>           | Send options: <b>broadcast</b> , <b>multicast</b> , <b>none</b> , or <b>version 1</b> .                  |
| <b>Receive Mode</b>        | Type of packets to accept: <b>both</b> , <b>none</b> , <b>version 1</b> , or <b>version 2</b> .          |
| <b>In Met</b>              | Metric added to incoming routes when advertising into RIP routes that were learned from other protocols. |

## Sample Output

### show rip neighbor

```

user@host> show rip neighbor
Neighbor Local Source Destination Send Receive In
 State Address Address Mode Mode Met

ge-2/3/0.0 Up 192.168.9.105 192.168.9.107 bcast both 1
at-5/1/1.42 Dn (null) (null) mcast v2 only 3
at-5/1/0.42 Dn (null) (null) mcast both 3
at-5/1/0.0 Up 20.0.0.1 224.0.0.9 mcast both 3
so-0/0/0.0 Up 192.168.9.97 224.0.0.9 mcast both 3

```

### show rip neighbor (With Demand Circuits Configured)

```

user@host> show rip neighbor
Neighbor Local Source Destination Send Receive In
 State Address Address Mode Mode Met

so-0/1/0.0(DC) Up 10.10.10.2 224.0.0.9 mcast both 1
so-0/2/0.0(DC) Up 13.13.13.2 224.0.0.9 mcast both 1

```

| <i>routing-table-name</i>       | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>number destinations</i>      | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>number routes</i>            | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul> |
| <i>destination-prefix</i>       | <p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>                                                                                                                                                                      |
| <b>[ protocol, preference ]</b> | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                               |

Table 250: show route Output Fields (*continued*)

| Field Name                                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>weeks:days</i><br><i>hours:minutes:seconds</i> | How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>metric</b>                                     | Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>localpref</b>                                  | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>from</b>                                       | Interface from which the route was received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>AS path</b>                                    | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>                           | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>to</b>                                         | <p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 250: show route Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>via</b> | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).</li> </ul> |

## Sample Output

### show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <i>routing-table-name</i>                    | Name of the routing table—for example, inet.0.                                                                                                                                                                                                                                                                                                                                                                 | All levels              |
| <i>number destinations</i>                   | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                        | All levels              |
| <i>number routes</i>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                          | All levels              |
| <b>Prefix</b>                                | Destination prefix.                                                                                                                                                                                                                                                                                                                                                                                            | <b>brief none</b>       |
| <i>destination-prefix (entry, announced)</i> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                          | <b>detail extensive</b> |
| <b>BGP group and type</b>                    | BGP group name and type ( <b>Internal</b> or <b>External</b> ).                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Route Distinguisher</b>                   | Unique 64-bit prefix augmenting each IP subnet.                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Advertised Label</b>                      | Incoming label advertised by the LDP. When an IP packet enters a label-switched path (LSP), the ingress router examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label.          | <b>detail extensive</b> |
| <b>Label-Base, range</b>                     | First label in a block of labels and label block size. A remote PE router uses this first label when sending traffic toward the advertising PE router.                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>VPN Label</b>                             | Virtual private network (VPN) label. Packets are sent between CE and PE routers by advertising VPN labels. VPN labels transit over either an RSVP or an LDP LSP tunnel.                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Nexthop</b>                               | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.<br><br>If the next-hop advertisement to the peer is <b>Self</b> , and the RIB-out next hop is a specific IP address, the RIB-out IP address is included in the extensive output. See <a href="#">show route advertising-protocol bgp extensive all (Next Hop Self with RIB-out IP Address)</a> on page 3076. | All levels              |
| <b>MED</b>                                   | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                                                                                       | <b>brief</b>            |
| <b>Lclpref or Localpref</b>                  | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                  | All levels              |

Table 251: show route advertising-protocol Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output         |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>AS path</b>             | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if configured on the router, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels              |
| <b>Communities</b>         | Community path attribute for the route. See the output field table for the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |

| <b>List of Sample Output</b>       | <a href="#">show route all on page 3078</a>                                                                                                                                                                                                                                                                                                   |
| <b>Output Fields</b>               | In Junos OS Release 9.5 and later, only the output fields for the <b>show route all</b> command display all routing tables, including private, or hidden, routing tables. The output field table of the <a href="#">show route</a> command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later. |

## Sample Output

### show route all

The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```

user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0 *[MPLS/0] 2d 02:24:39, metric 1
 Receive
1 *[MPLS/0] 2d 02:24:39, metric 1
 Receive
2 *[MPLS/0] 2d 02:24:39, metric 1
 Receive
800017 *[VPLS/7] 1d 14:00:16
 > via vt-3/2/0.32769, Pop
800018 *[VPLS/7] 1d 14:00:26
 > via vt-3/2/0.32772, Pop

user@host> show route all
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete

```

+ = Active Route, - = Last Active, \* = Both

|                |                                                    |

**Table 252: show route detail Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                         |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 252: show route detail Output Fields (*continued*)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| label stacking                                 | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| [ <i>protocol, preference</i> ]                | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                            |
| Level                                          | <p>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Route Distinguisher                            | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Next-hop type                                  | Type of next hop. For a description of possible values for this field, see <a href="#">Table 253 on page 3089</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 252: show route detail Output Fields (*continued*)

| Field Name                                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path<br/>lsp-path-name</b>         | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
